MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Inserts time ranges of source tracks.
Notes: Requires Mac OS X 10.8.

Inserts the timeRanges of multiple source tracks into a track of a composition.
timeRanges: Specifies the timeRanges to be inserted.
tracks: Specifies the source tracks to be inserted. Only AVAssetTracks of AVURLAssets are supported.
startTime: Specifies the time at which the inserted tracks are to be presented by the composition track. You may pass kCMTimeInvalid for startTime to indicate that the timeRanges should be appended to the end of the track.
error: Describes failures that may be reported to the user, e.g. the asset that was selected for insertion in the composition is restricted by copy-protection.
Returns a boolean value indicating the success of the insertion.

This method is equivalent to (but more efficient than) calling insertTimeRange for each timeRange/track pair.
If this method returns an error, none of the time ranges will be inserted into the composition track.
To specify an empty time range, pass NSNull for the track and a time range of starting at kCMTimeInvalid with a duration of the desired empty edit.

18.63.8 removeTimeRange(timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Removes a specified time range from the receiver.
Notes: timeRange: The time range to be removed.

Removing a time range does not cause the track to be removed from the composition. Instead it removes or truncates track segments that intersect with the time range.

18.63.9 scaleTimeRange(timeRange as CMTimeRangeMBS, duration as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Changes the duration of a time range in the receiver.
Notes: timeRange: The time range of the track to be scaled.
duration: The new duration of timeRange.

Each track segment affected by the scaling operation will be presented at a rate equal to source.duration / target.duration of its resulting timeMapping.

18.63.10 setCompositionTrackSegments(segments() as AVCompositionTrackSegmentMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets the composition track's array of track segments.
Notes: The timeMapping.target.start of the first track segment must be kCMTimeZero, and the timeMapping.target.start of each subsequent track segment must equal CMTimeRangeGetEnd(<#previousTrackSegment#>.timeMapping.target). You can use validateTrackSegments to ensure that an array of track segments conforms to this rule.

18.63.11 validateTrackSegments(trackSegments() as AVCompositionTrackSegmentMBS, byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given array of track segments conform to the timing rules for a composition track.
Notes: trackSegments: An array of AVCompositionTrackSegment objects.
error: If validation fails, on return contains an NSError object that describes the problem.

Returns true if the track segments in trackSegments conform to the timing rules for a composition track, otherwise false.

You can use this method to ensure that an array of track segments is suitable for setting as the value of the trackSegments property. The timeMapping.target.start of the first track segment must be kCMTimeZero, and the timeMapping.target.start of each subsequent track segment must equal CMTimeRangeGetEnd(<#previousTrackSegment#>.timeMapping.target).

If you want to modify the existing trackSegments array, you can create a mutable copy of it, modify the mutable array, and then validate the mutable array using this method.

18.63.12 Properties

18.63.13 extendedLanguageTag as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The language tag associated with the track, as an RFC 4646 language tag.
Notes: If not set, the value is nil.
(Read and Write computed property)

18.63.14 languageCode as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The language associated with the track, as an ISO 639-2/T language code.
Notes: If not set, the value is nil.
(Read and Write computed property)

18.63.15 naturalTimeScale as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The timescale in which time values for the track can be operated upon without extraneous numerical conversion.
Notes: If not set, the value is the natural time scale of the first non-empty edit, or 600 if there are no non-empty edits.

Set the value to 0 to revert to the default behavior.
(Read and Write computed property)

18.63.16 preferredTransform as CGAffineTransformMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The preferred transformation of the visual media data for display purposes.
Notes: If not set, the value is CGAffineTransformIdentity.
(Read and Write computed property)

18.63.17 preferredVolume as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The preferred volume of the audible media data.
Notes: If not set, the value is 1.0.
(Read and Write computed property)

18.64 class AVMutableMetadataItemMBS

18.64.1 class AVMutableMetadataItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVMutableMetadataItem is a mutable subclass of AVMetadataItem that lets you build collections of metadata to be written to asset files using AVAssetExportSession.
Notes: You can initialize a mutable metadata item from an existing AVMetadataItem object or with a one or more of the basic properties of a metadata item: a key, a key space, a locale, and a value.
Subclass of the AVMetadataItemMBS class.

18.64.2 Methods

18.64.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.
Example:

```
Var e as AVAssetExportSessionMBS // your export session
Var asset as AVAssetMBS // your asset

// query metadata
Var a() as AVMetadataItemMBS = asset.metadata

// make new
Var m as new AVMutableMetadataItemMBS

// add common key with author
m.keySpace = AVFoundationMBS.AVMetadataKeySpaceCommon
m.key = AVFoundationMBS.AVMetadataCommonKeyAuthor
m.Value = "Hello World"

// append to array and use as metadata:
a.Append m
e.setMetadata a
```

See also:

- 18.64.4 Constructor(other as AVMetadataItemMBS)

18.64.4 Constructor(other as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The copy constructor to initialize with a mutable copy of the given object.
See also:

- 18.64.3 Constructor 3740

18.64.5 metadataItem as AVMutableMetadataItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new mutable metadata item.

18.64.6 Properties

18.64.7 duration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the metadata item's duration.
Notes: (Read and Write computed property)

18.64.8 extraAttributes as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Provides a dictionary of the metadata item's additional attributes.
Notes: (Read and Write computed property)

18.64.9 key as Variant

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the metadata item's key.
Notes: (Read and Write computed property)

18.64.10 keySpace as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the key space of the metadata item's key.
Notes: This is typically the default key space for the metadata container in which the metadata item is stored.
(Read and Write computed property)

18.64.11 locale as NSLocaleMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the metadata item's locale.
Notes: The locale may be nil if no locale information is available for the item.
(Read and Write computed property)

18.64.12 time as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the metadata item's timestamp.
Notes: (Read and Write computed property)

18.64.13 value as Variant

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the metadata item's value.
Notes: (Read and Write computed property)

18.65 class AVMutableTimedMetadataGroupMBS

18.65.1 class AVMutableTimedMetadataGroupMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVMutableTimedMetadataGroup object to represent a mutable collection of metadata items.
Notes: Subclass of the AVTimedMetadataGroupMBS class.

18.65.2 Methods

18.65.3 Constructor(items() as AVMetadataItemMBS, timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 18.65.4 Constructor(other as AVTimedMetadataGroupMBS) 3743

18.65.4 Constructor(other as AVTimedMetadataGroupMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The copy constructor to initialize with a mutable copy of the given object.
See also:

- 18.65.3 Constructor(items() as AVMetadataItemMBS, timeRange as CMTimeRangeMBS) 3743

18.65.5 items as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The metadata items in the group.

18.65.6 setItems(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets the metadata items in the group.

18.65.7 Properties

18.65.8 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range of the metadata.
Notes: (Read and Write computed property)

18.66 class AVMutableVideoCompositionInstructionMBS

18.66.1 class AVMutableVideoCompositionInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVMutableVideoCompositionInstruction object represents an operation to be performed by a compositor.
Notes: An AVVideoComposition object maintains an array of instructions to perform its composition.
Subclass of the AVVideoCompositionInstructionMBS class.
Blog Entries

18.66.2 Methods

18.66.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 18.66.4 Constructor(other as AVVideoCompositionInstructionMBS) 3745

18.66.4 Constructor(other as AVVideoCompositionInstructionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The copy constructor to initialize with a mutable copy of the given object.
See also:

- 18.66.3 Constructor 3745

18.66.5 layerInstructions as AVVideoCompositionLayerInstructionMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of instances of AVVideoCompositionLayerInstruction that specify how video frames from source tracks should be layered and composed.
Notes: Tracks are layered in the composition according to the top-to-bottom order of the layerInstructions array; the track with trackID of the first instruction in the array will be layered on top, with the track with the trackID of the second instruction immediately underneath, and so on.

If the property value is nil, the output is a fill of the background color.

18.66.6 setLayerInstructions(items() as AVVideoCompositionLayerInstructionMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets an array of instances of AVVideoCompositionLayerInstruction that specify how video frames from source tracks should be layered and composed.
Notes: Tracks are layered in the composition according to the top-to-bottom order of the layerInstructions array; the track with trackID of the first instruction in the array will be layered on top, with the track with the trackID of the second instruction immediately underneath, and so on.

If the property value is nil, the output is a fill of the background color.

18.66.7 videoCompositionInstruction as AVMutableVideoCompositionInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new mutable video composition instruction.

18.66.8 Properties

18.66.9 backgroundColor as Variant

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The background color of the composition.
Notes: Value must be CGColorMBS.
Only solid BGRA colors are supported; patterns and other supported colors are ignored. If the rendered pixel buffer does not have alpha, the alpha value of the background color is ignored.

If the background color is nil, the video compositor uses a default background color of opaque black.
(Read and Write computed property)

18.66.10 enablePostProcessing as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether post processing is required for the video composition instruction.
Notes: If no post processing is required for the whole duration of the video composition instruction, set this property to false to make the composition process more efficient.

The value is true by default.
(Read and Write computed property)

18.66.11 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range during which the instruction is effective.
Notes: If the time range is invalid, the video compositor will ignore it.
(Read and Write computed property)

18.67 class AVMutableVideoCompositionLayerInstructionMBS

18.67.1 class AVMutableVideoCompositionLayerInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVMutableVideoCompositionLayerInstruction is a mutable subclass of AVVideoCompositionLayerInstruction that you use to modify the transform and opacity ramps to apply to a given track in an AV composition.
Notes: Subclass of the AVVideoCompositionLayerInstructionMBS class.

18.67.2 Methods

18.67.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 18.67.4 Constructor(other as AVMutableVideoCompositionLayerInstructionMBS) 3748

18.67.4 Constructor(other as AVMutableVideoCompositionLayerInstructionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The copy constructor to initialize with a mutable copy of the given object.
See also:

- 18.67.3 Constructor 3748

18.67.5 setCropRectangle(cropRectangle as CGRectMBS, time as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Sets a value of the crop rectangle at a time within the time range of the instruction.
Notes: cropRectangle: The crop rectangle to be applied at the specified time.
time: A time value within the timeRange of the composition instruction.

The origin of the crop rectangle is the top-left corner of the buffer clean aperture rectangle. The crop rectangle is defined in square pixel space, that is, without taking the pixel aspect ratio into account. Crop rectangles extending outside of the clean aperture, are cropped to the clean aperture.

Sets a fixed crop rectangle to apply from time until the next time at which a crop rectangle is set; this is the same as setting a flat ramp for that time range.

Before the first specified time for which a crop rectangle is set, the crop rectangle is held constant to CGRectInfinite and after the last time for which a crop rectangle is set, the crop rectangle is held constant at that last value.
Available in OS X v10.9 and later.

18.67.6 setCropRectangleRampFromStartCropRectangle(startCropRectangle as CGRectMBS, endCropRectangle as CGRectMBS, timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Sets a crop rectangle ramp to apply during the specified time range.
Notes: startCropRectangle: The crop rectangle to be applied at the starting time of the timeRange.
endCropRectangle: The crop rectangle to be applied at the end time of the timeRange.
timeRange: The time range over which the value of the opacity is interpolated between startCropRectangle and endCropRectangle.

The origin of the crop rectangle is the top-left corner of the buffer clean aperture rectangle. The crop rectangle is defined in square pixel space, that is, without taking the pixel aspect ratio into account. Crop rectangles extending outside of the clean aperture, are cropped to the clean aperture.

During a crop rectangle ramp, the rectangle is interpolated between the values set at the ramp's start time and end time. When the starting or ending rectangle is empty, interpolations take into account the origin and size of the empty rectangle.

Before the first specified time for which a crop rectangle is set, the crop rectangle is held constant to CGRectInfinite and after the last time for which a crop rectangle is set, the crop rectangle is held constant at that last value.
Available in OS X v10.9 and later.

18.67.7 setOpacity(opacity as Double, time as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets a value of the opacity at a time within the time range of the instruction.
Notes: opacity: The opacity to be applied at time. The value must be between 0.0 and 1.0.
time: A time value within the time range of the composition instruction.

Sets a fixed opacity to apply from the specified time until the next time at which an opacity is set; this is the same as setting a flat ramp for that time range. Before the first time for which an opacity is set, the opacity is held constant at 1.0; after the last specified time, the opacity is held constant at the last value.
See also:

- 18.67.8 setOpacity(startOpacity as Double, endOpacity as Double, timeRange as CMTimeRangeMBS) 3750

18.67.8 setOpacity(startOpacity as Double, endOpacity as Double, timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets an opacity ramp to apply during a specified time range.
Notes: startOpacity: The opacity to be applied at the start time of timeRange. The value must be between 0.0 and 1.0.
endOpacity: The opacity to be applied at the end time of timeRange. The value must be between 0.0 and 1.0.
timeRange: The time range over which the value of the opacity will be interpolated between startOpacity and endOpacity.

During an opacity ramp, opacity is computed using a linear interpolation. Before the first time for which an opacity is set, the opacity is held constant at 1.0; after the last specified time, the opacity is held constant at the last value.
See also:

- 18.67.7 setOpacity(opacity as Double, time as CMTimeMBS) 3749

18.67.9 setTransform(transform as CGAffineTransformMBS, time as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets a value of the transform at a time within the time range of the instruction.
Notes: transform: The transform to be applied at time.
time: A time value within the time range of the composition instruction.

Sets a fixed transform to apply from the specified time until the next time at which a transform is set. This is the same as setting a flat ramp for that time range. Before the first specified time for which a transform is set, the affine transform is held constant at the value of CGAffineTransformIdentity; after the last time for which a transform is set, the affine transform is held constant at that last value.

18.67.10 setTransformRamp(startTransform as CGAffineTransformMBS, endTransform as CGAffineTransformMBS, timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Sets a transform ramp to apply during a given time range.
Notes: startTransform: The transform to be applied at the starting time of timeRange.
endTransform: The transform to be applied at the end time of timeRange.
timeRange: The time range over which the value of the transform is interpolated between startTransform and endTransform.

During a transform ramp, the affine transform is interpolated between the values set at the ramp's start time and end time. Before the first specified time for which a transform is set, the affine transform is held constant at the value of CGAffineTransformIdentity; after the last time for which a transform is set, the affine transform is held constant at that last value.

Available in OS X v10.7 and later.

18.67.11 videoCompositionLayerInstruction as AVMutableVideoCompositionLayerInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new mutable video composition layer instruction.
Notes: Returns a new mutable video composition layer instruction with no transform or opacity ramps and trackID initialized to kCMPersistentTrackID_Invalid.

18.67.12 videoCompositionLayerInstructionWithAssetTrack(track as AVAssetTrackMBS) as AVMutableVideoCompositionLayerInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new mutable video composition layer instruction for the given track.
Notes: track: The asset track to which to apply the instruction.

Returns a new mutable video composition layer instruction with no transform or opacity ramps and trackID initialized to the track ID of track.

18.67.13 Properties

18.67.14 trackID as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The trackID of the source track to which the compositor will apply the instruction.
Notes: (Read and Write computed property)

18.68 class AVMutableVideoCompositionMBS

18.68.1 class AVMutableVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVMutableVideoComposition object represents a mutable video composition.
Notes: Subclass of the AVVideoCompositionMBS class.

18.68.2 Methods

18.68.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a new mutable video composition.
See also:

- 18.68.4 Constructor(other as AVVideoCompositionMBS) 3753

18.68.4 Constructor(other as AVVideoCompositionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The copy constructor to initialize with a mutable copy of the given object.
See also:

- 18.68.3 Constructor 3753

18.68.5 mutableVideoComposition as AVMutableVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Returns a new mutable video composition.

18.68.6 mutableVideoCompositionWithPropertiesOfAsset(asset as AVAssetMBS) as AVMutableVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Returns a new mutable video composition with the specified asset properties.
Notes: asset: An instance of AVAsset. Ensure that the duration and tracks properties of the asset are already loaded before invoking this method.
Returns a newly created and initialized instance of AVMutableVideoComposition.

The returned AVMutableVideoComposition has instructions that respect the spatial properties and time ranges of the specified asset's video tracks.

It also has the following values for its properties:

- A value for frameDuration short enough to accommodate the greatest nominalFrameRate among the asset's video tracks. If the nominalFrameRate of all of the asset's video tracks is 0, a default framerate of 30fps is used.
- If the specified asset is an instance of AVComposition, the renderSize is set to the naturalSize of the AVComposition; otherwise the renderSize will be set to a value that encompasses all of the asset's video tracks.
- A renderScale of 1.0.
- The animationTool property set to nil.

Available in OS X v10.9 and later.

18.68.7 setInstructions(items() as AVVideoCompositionInstructionMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets the video composition instructions.

18.68.8 Properties

18.68.9 animationTool as AVVideoCompositionCoreAnimationToolMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A special video composition tool for use with Core Animation.
Notes: This attribute may be nil.

(Read and Write computed property)

18.68.10 frameDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The interval for which the video composition should render composed video frames.
Notes: (Read and Write computed property)

18.68.11 renderSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The render size.
Notes: (Read and Write computed property)

18.69 class AVOutputSettingsAssistantMBS

18.69.1 class AVOutputSettingsAssistantMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The helper class to configure output settings.
Notes: A class, each instance of which specifies a set of parameters for configuring objects that use output settings dictionaries, for example AVAssetWriter & AVAssetWriterInput, so that the resulting media file conforms to some specific criteria.

Instances of AVOutputSettingsAssistant are typically created using a string constant representing a specific preset configuration, such as AVOutputSettingsPreset1280x720. Once you have an instance, its properties can be used as a guide for creating and configuring an AVAssetWriter object and one or more AVAssetWriterInput objects. If all the suggested properties are respected, the resulting media file will conform to the criteria implied by the preset. Alternatively, the properties of an instance can be used as a "base" configuration which can be customized to suit your individual needs.

The recommendations made by an instance get better as you tell it more about the format of your source data. For example, if you set the sourceVideoFormat property, the recommendation made by the videoSettings property will ensure that your video frames are not scaled up from a smaller size.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.69.2 Methods

18.69.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 or later.

18.69.4 AVOutputSettingsPreset1280x720 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the predefined presets.

18.69.5 AVOutputSettingsPreset1920x1080 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the predefined presets.

18.69.6 AVOutputSettingsPreset640x480 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the predefined presets.

18.69.7 AVOutputSettingsPreset960x540 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the predefined presets.

18.69.8 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The private constructor.

18.69.9 outputSettingsAssistantWithPreset(presetIdentifier as string) as AVOutputSettingsAssistantMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns an instance of AVOutputSettingsAssistant corresponding to the given preset.
Notes: presetIdentifier: The string identifier, for example AVOutputSettingsPreset1280x720, for the desired preset.

Returns an instance of AVOutputSettingsAssistant with properties corresponding to the given preset, or nil if there is no such preset.

The properties of the returned object can be used as a guide for creating and configuring an AVAssetWriter object and one or more AVAssetWriterInput objects. If all the suggested properties are respected in creating the AVAssetWriter, the resulting media file will conform to the criteria implied by the preset.

18.69.10 Properties

18.69.11 audioSettings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A dictionary of key/value pairs, as specified in AVAudioSettings.h, to be used when e.g. creating an instance of AVAssetWriterInput.
Notes: The value of this property may change as a result of setting a new value for the sourceAudioFormat property.
(Read only property)

18.69.12 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.69.13 outputFileType as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A UTI indicating the type of file to be written, to be used when e.g. creating an instance of AVAssetWriter.
Notes: Use UTTypeCopyPreferredTagWithClass / kUTTagClassFilenameExtension to get a suitable file extension for a given file type.
(Read only property)

18.69.14 videoSettings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A dictionary of key/value pairs, as specified in AVVideoSettings.h, to be used when e.g. creating an instance of AVAssetWriterInput.
Notes: The value of this property may change as a result of setting a new value for the sourceVideoFormat property.
(Read only property)

18.70 class AVPixelAspectRatioMBS

18.70.1 class AVPixelAspectRatioMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The class for pixel aspect ratio.

18.70.2 Properties

18.70.3 horizontalSpacing as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The horizontal spacing of the pixelAspectRatio property.
Notes: (Read and Write property)

18.70.4 verticalSpacing as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The vertical spacing of the pixelAspectRatio property.
Notes: (Read and Write property)

18.71 class AVPlaybackSpeedMBS

18.71.1 class AVPlaybackSpeedMBS

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: An object that represents a user-selectable playback speed in a playback user interface.
Blog Entries

- News from the MBS Xojo Plugins Version 25.0
- MBS Xojo Plugins, version 24.6pr1

18.71.2 Methods

18.71.3 Constructor(Rate as double, localizedName as String)

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: Creates a playback speed with a rate and localized name.
Example:

```
Var a As New AVPlaybackSpeedMBS( 1, "test")

MessageBox a.localizedNumericName // shows 1.0x
```

18.71.4 systemDefaultSpeeds as AVPlaybackSpeedMBS()

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: A list of playback speeds the system uses by default.
Example:

```
Var list() As String
Var systemDefaultSpeeds() As AVPlaybackSpeedMBS = AVPlaybackSpeedMBS.systemDefaultSpeeds

For Each p As AVPlaybackSpeedMBS In systemDefaultSpeeds
list.Add p.localizedName+" "+p.localizedNumericName
Next

MessageBox Join(list, EndOfLine) // shows them all
```

18.71.5 Properties

18.71.6 Handle as Integer

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.71.7 localizedName as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: A localized name for a speed that,Äôs suitable for display in a user interface.
Notes: Use this value to represent the speed in a user interface where space allows. Use the localizedNumericName where limited space is available.
(Read only property)

18.71.8 localizedNumericName as String

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: A localized numeric name for a speed that,Äôs suitable for display in a user interface.
Notes: Use this value to represent the speed in a user interface where limited space is available. Represent the speed using its localizedName value where space allows.
(Read only property)

18.71.9 rate as Double

MBS iOS Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The playback rate to use when you select this speed.
Notes: (Read only property)

18.72 class AVPlayerItemAccessLogEventMBS

18.72.1 class AVPlayerItemAccessLogEventMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVPlayerItemAccessLogEvent object represents a single item in an AVPlayerItem object's access log.
Notes: An AVPlayerItemAccessLog object provides named properties for accessing the data fields of each log event. None of the properties of this class are observable using key-value observing.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.72.2 Methods

18.72.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.72.4 Properties

18.72.5 downloadOverdue as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The total number of times the download of the segments took too long. (read-only)
Notes: The value of the property is negative if unknown.
This property corresponds to "c-overdue".
This property is not compatible with key-value observing.
Available in OS X v10.9 and later.
(Read only property)

18.72.6 durationWatched as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The accumulated duration of the media played, in seconds. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.7 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.72.8 indicatedBitrate as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The throughput required to play the stream, as advertised by the server, in bits per second. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.9 mediaRequestsWWAN as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Number of network read requests over WWAN. (read-only)
Notes: The value of the property is negative if unknown.
Corresponds to "sc-wwan-count".
This property is not compatible with key-value observing.
Available in OS X v10.9 and later.
(Read only property)

18.72.10 numberOfBytesTransferred as Int64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The accumulated number of bytes transferred by the item. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.11 numberOfDroppedVideoFrames as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The total number of dropped video frames (read-only)
Notes: The value of this property is negative if unknown.

(Read only property)

18.72.12 numberOfMediaRequests as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A count of media read requests from the server to this client. (read-only)
Notes: For HTTP live streaming, this property contains the count of media requests downloaded from the server. For progressive-style HTTP media downloads, it contains a count of HTTP GET (byte-range) requests for the resource.
The value of this property is negative if unknown.
Available in OS X v10.9 and later.#
(Read only property)

18.72.13 numberOfSegmentsDownloaded as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A count of the media segments downloaded from the server to this client. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.14 numberOfServerAddressChanges as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A count of changes to the server address over the last uninterrupted period of playback. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.15 numberOfStalls as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The total number of playback stalls encountered. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.16 observedBitrate as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The empirical throughput across all media downloaded, in bits per second. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.17 observedBitrateStandardDeviation as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Standard deviation of observed segment download bit rates. (read-only)
Notes: The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)

18.72.18 observedMaxBitrate as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Maximum observed segment download bit rate. (read-only)
Notes: The value of the property is negative if unknown.
Available in OS X v10.9 and later.#
(Read only property)

18.72.19 observedMinBitrate as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Minimum observed segment download bit rate. (read-only)
Notes: The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)

18.72.20 playbackSessionID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A GUID that identifies the playback session. (read-only)
Notes: This value is used in HTTP requests.
The value of this property is nil if unknown.

(Read only property)

18.72.21 playbackStartDate as date

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time at which playback began for this event. (read-only)
Notes: The value of this property is nil if unknown.
(Read only property)

18.72.22 playbackStartDateTime as DateTime

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date and time at which playback began for this event. (read-only)
Notes: The value of this property is nil if unknown.
(Read only property)

18.72.23 playbackStartOffset as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An offset into the playlist where the last uninterrupted period of playback began, in seconds (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.24 playbackType as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The playback type: live, VOD, or from a file. (read-only)
Notes: If nil is returned the playback type is unknown.
Available in OS X v10.9 and later.
(Read only property)

18.72.25 segmentsDownloadedDuration as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The accumulated duration of the media downloaded, in seconds. (read-only)
Notes: The value of this property is negative if unknown.
(Read only property)

18.72.26 serverAddress as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The IP address of the server that was the source of the last delivered media segment. (read-only)
Notes: The value of this property is nil if unknown.
(Read only property)

18.72.27 startupTime as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The accumulated duration, in seconds, until player item is ready to play. (read-only)
Notes: The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)

18.72.28 switchBitrate as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Bandwidth that caused a switch (up or down). (read-only)
Notes: The value of the property is negative if unknown.
Available in OS X v10.9 and later.
(Read only property)

18.72.29 transferDuration as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The accumulated duration, in seconds, of active network transfer of bytes. (read-only)
Notes: The value of the property is negative if unknown.
Corresponds to "c-transfer-duration".
This property is not compatible with key-value observing.
Available in OS X v10.9 and later.
(Read only property)

18.72.30 URI as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URI of the playback item (read-only)
Notes: The value of this property may be nil if the URI is unknown.
(Read only property)

18.73 class AVPlayerItemAccessLogMBS

18.73.1 class AVPlayerItemAccessLogMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVPlayerItemAccessLog object to retrieve the access log associated with an AVPlayerItem object.
Notes: An AVPlayerItemAccessLog object accumulates key metrics about network playback and presents them as a collection of AVPlayerItemAccessLogEvent instances. Each event instance collates the data that relates to each uninterrupted period of playback.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.73.2 Methods

18.73.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.73.4 events as AVPlayerItemAccessLogEventMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A chronologically ordered array of AVPlayerItemAccessLogEvent objects. (read-only)
Notes: The array contains AVPlayerItemAccessLogEvent objects that represent the chronological sequence of events contained in the access log.

This property is not observable using key-value observing.

18.73.5 extendedLogData as MemoryBlock

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a serialized representation of the access log in the Extended Log File Format.
Notes: A serialized representation of the access log in the Extended Log File Format.

This method converts the web server access log into a textual format that conforms to the W3C Extended Log File Format for web server log files. For more information, see http://www.w3.org/pub/WWW/TR/WD-logfile.html.

18.73.6 extendedLogDataStringEncoding as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the string ecoding of the extended log data.
Notes: The string encoding of the data returned by extendedLogData.

18.73.7 Properties

18.73.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.74 class AVPlayerItemErrorLogEventMBS

18.74.1 class AVPlayerItemErrorLogEventMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVPlayerItemErrorLogEvent object represents a single item in an AVPlayerItem object's error log.
Notes: An AVPlayerItemErrorLogEvent object provides named properties for accessing the data fields of each log event. None of the properties of this class are observable using key-value observing.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.74.2 Methods

18.74.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.74.4 date as date

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when the error occurred. (read-only)
Notes: The property corresponds to "date".
The value of this property may be nil if the date is unknown.

18.74.5 dateTime as dateTime

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date and time when the error occurred. (read-only)
Notes: The property corresponds to "date".
The value of this property may be nil if the date is unknown.

18.74.6 errorComment as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A description of the error encountered (read-only)
Notes: The value of this property may be nil if further information is not available.

18.74.7 errorDomain as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The domain of the error. (read-only)

18.74.8 errorStatusCode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A unique error code identifier. (read-only)

18.74.9 playbackSessionID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A GUID that identifies the playback session. (read-only)
Notes: The value of this property is used in HTTP requests, and may be nil if the GUID is unknown.

18.74.10 serverAddress as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The IP address of the server that was the source of the error. (read-only)
Notes: The value of this property can be either an IPv4 or IPv6 address, and may be nil if the address is unknown.

18.74.11 URI as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URI of the playback item (read-only)
Notes: The value of this property may be nil if the URI is unknown.

18.74.12 Properties

18.74.13 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.75 class AVPlayerItemErrorLogMBS

18.75.1 class AVPlayerItemErrorLogMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVPlayerItemErrorLog object to retrieve the error log associated with an AVPlayerItem object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.75.2 Methods

18.75.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.75.4 events as AVPlayerItemErrorLogEventMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A chronologically ordered array of AVPlayerItemErrorLogEvent objects. (read-only)
Notes: The array contains AVPlayerItemErrorLogEvent objects that represent the chronological sequence of events contained in the error log.

This property is not observable using key-value observing.

18.75.5 extendedLogData as MemoryBlock

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a serialized representation of the error log in the Extended Log File Format.
Notes: A serialized representation of the error log in the Extended Log File Format.

Discussion
This method converts the web server error log into a textual format that conforms to the W3C Extended Log File Format for web server log files. For more information, see http://www.w3.org/pub/WWW/TR/WD-logfile.html.

18.75.6 extendedLogDataStringEncoding as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the string ecoding of the extended log data.
Notes: The string encoding of the data returned by extendedLogData.

18.75.7 Properties

18.75.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.76 class AVPlayerItemLegibleOutputMBS

18.76.1 class AVPlayerItemLegibleOutputMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A subclass of AVPlayerItemOutput that can vend media with a legible characteristic as NSAttributedStrings.
Notes: Subclass of the AVPlayerItemOutputMBS class.

18.76.2 Methods

18.76.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 or later.

18.76.4 AVPlayerItemLegibleOutputTextStylingResolutionDefault as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the text styling mode.
Notes: Specify this level of text styling resolution to receive attributed strings from an AVPlayerItemLegibleOutput that include the same level of styling information that AVFoundation would use itself to render text within an AVPlayerLayer. The text styling will accommodate user-level Media Accessibility settings.

18.76.5 AVPlayerItemLegibleOutputTextStylingResolutionSourceAndRulesOnly as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the text styling mode.
Notes: Specify this level of text styling resolution to receive only the styling present in the source media and the styling provided via AVPlayerItem.textStyleRules.
This level of resolution excludes styling provided by the user-level Media Accessibility settings. You would typically use it if you wish to override the styling specified in source media. If you do this, you are strongly encouraged to allow your custom styling in turn to be overriden by user preferences for text styling that are available as Media Accessibility settings.

18.76.6 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The standard constructor.
See also:

- 18.76.7 Constructor(subTypes() as string) 3777

18.76.7 Constructor(subTypes() as string)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Returns an instance of AVPlayerItemLegibleOutput with filtering enabled for AVPlayerItemLegibleOutputPushDelegate's legibleOutput:didOutputAttributedStrings:nativeSampleBuffers:forItemTime:.

subtypes: Array of strings with 4 letter codes.

Add media subtype FourCC number objects to the subtypes array to elect to receive that type as a CMSampleBuffer instead of an NSAttributedString. Initializing an AVPlayerItemLegibleOutput using the Constructor method is equivalent to calling Constructor with an empty array, which means that all legible data, regardless of media subtype, will be delivered using NSAttributedString in a common format.

If a media subtype for which there is no legible data in the current player item is included in the media subtypes array, no error will occur. AVPlayerItemLegibleOutput will not vend closed caption data as CMSampleBuffers, so it is an error to include 'c608' in the media subtypes array.
See also:

- 18.76.6 Constructor 3777

18.76.8 Properties

18.76.9 advanceIntervalForDelegateInvocation as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Permits advance invocation of the associated delegate, if any.
Notes: If it is possible, an AVPlayerItemLegibleOutput will message its delegate advanceIntervalForDelegateInvocation seconds earlier than otherwise. If the value you provide is large, effectively requesting provision of samples earlier than the AVPlayerItemLegibleOutput is prepared to act on them, the delegate will be invoked as soon as possible.
(Read and Write property)

18.76.10 textStylingResolution as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A string identifier indicating the degree of text styling to be applied to attributed strings vended by the receiver.
Notes: Valid values are AVPlayerItemLegibleOutputTextStylingResolutionDefault and AVPlayerItemLegibleOutputTextStylingResolutionSourceAndRulesOnly. An NSInvalidArgumentException is raised if this property is set to any other value. The default value is AVPlayerItemLegibleOutputTextStylingResolutionDefault, which indicates that attributed strings vended by the receiver will include the same level of styling information that would be used if AVFoundation were rendering the text via AVPlayerLayer.
(Read and Write property)

18.77 class AVPlayerItemMBS

18.77.1 class AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVPlayerItem represents the presentation state of an asset that's played by an AVPlayer object, and lets you observe that state.
Notes: A object carries a reference to an AVAsset object and presentation settings for that asset, including track enabled state. If you need to inspect the media assets themselves, you should message the AVAsset object itself.

You can initialize a player item using an URL (playerItemWithURL and Constructor); the resource types referenced by the URL may include, but aren't necessarily limited to, those with the following corresponding UTIs:

kUTTypeQuickTimeMovie, (.mov, .qt)
kUTTypeMPEG4 (.mp4)
"public.3gpp" (.3gp, .3gpp)
kUTTypeMPEG4Audio (.m4a)
"com.apple.coreaudio-format" (.caf)
"com.microsoft.waveform-audio" (.wav)
"public.aiff-audio" (.aif)
"public.aifc-audio" (also .aif)
"org.3gpp.adaptive-multi-rate-audio" (.amr)

If you want to play an asset more than once within a sequence of items, you must create independent instances of AVPlayerItem for each placement in the player's queue.

- News from the MBS Xojo Plugins Version 22.3

18.77.2 Methods

18.77.3 accessLog as AVPlayerItemAccessLogMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an object that represents a snapshot of the network access log.
Notes: An object that represents a snapshot of the network access log. The returned value can be nil.
If the method returns nil, there is no logging information currently available for the player item.

18.77.4 addOutput(output as AVPlayerItemOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds the specified player item output object to the receiver.
Notes: output: The player item output object to associate with the item.

When you add an AVPlayerItemOutput object to an item, the samples associated with that output object are processed according to the rules for mixing, composing, or excluding content that the AVPlayer object honors for the specific media type. For example, video media is composed according to the instructions provided by the player item's video composition object and audio media is mixed according to the parameters of its audio mix object.
Available in OS X v10.8 and later.

18.77.5 automaticallyLoadedAssetKeys as String()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An array of property keys defined by the asset property. (read-only)
Notes: The value of each key in automaticallyLoadedAssetKeys will be automatically be loaded by the asset before the receiver achieves the status AVPlayerItemStatusReadyToPlay; i.e. when the item is ready to play, the value of invoking statusOfValueForKey on the asset property value will be AVKeyValueStatusLoaded. If loading of any of the values fails, the status property of the receiver will change to AVPlayerItemStatus-Failed.
Available in OS X v10.9 and later.

18.77.6 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.77.7 cancelContentAuthorizationRequest

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Causes the currently outstanding content authorization request to be cancelled.
Notes: Calling this method while a content authorization request is pending will cause that request to be cancelled and its completion handler to be invoked with a status of AVContentAuthorizationCancelled.

This method does not block.

18.77.8 cancelPendingSeeks

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancel any pending seek requests and invoke the corresponding completion handlers if present.
Notes: Use this method to cancel and release the completion handlers of pending seeks.
The finished parameter of the completion handlers will be set to false.

18.77.9 Constructor(asset as AVAssetMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a new player item for a given asset.
See also:

- 18.77.10 Constructor(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) 3781
- 18.77.11 Constructor(file as folderitem) 3782
- 18.77.12 Constructor(URL as string) 3782

18.77.10 Constructor(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Initializes a player item with an array of AVAsset keys.
Notes: asset: An instance of AVAsset.
automaticallyLoadedAssetKeys: An array of strings, each representing a property defined by AVAsset.

Returns an initialized instance of AVPlayerItem.

The value of each key in automaticallyLoadedAssetKeys will be automatically be loaded by the underlying AVAsset before the receiver achieves the status AVPlayerItemStatusReadyToPlay; i.e. when the item is ready to play, the value returned by invoking the asset property's statusOfValueForKey method will be one of the terminal status values, either AVKeyValueStatusLoaded, AVKeyValueStatusFailed, or AVKeyValueStatusCancelled.

Important: The asset property keys "playable" and "compatibleWithSavedPhotosAlbum" are not eligible for automatic loading by AVPlayerItem. You must use the AVAsset method loadValuesAsynchronously-

ForKeys:completionHandler: to load the values of those properties asynchronously.

Available in OS X v10.9 and later.

- 18.77.9 Constructor(asset as AVAssetMBS) 3781
- 18.77.11 Constructor(file as folderitem) 3782
- 18.77.12 Constructor(URL as string) 3782

18.77.11 Constructor(file as folderitem)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Prepares a player item with a given file.
Notes: file: A folderitem.

This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItemStatusReadyToPlay.
If the URL contains no valid data or otherwise can't be used by the player item, the status later changes to AVPlayerItemStatusFailed.

- 18.77.9 Constructor(asset as AVAssetMBS) 3781
- 18.77.10 Constructor(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) 3781
- 18.77.12 Constructor(URL as string) 3782

18.77.12 Constructor(URL as string)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Prepares a player item with a given URL.
Notes: URL: An URL.

This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItemStatusReadyToPlay.
If the URL contains no valid data or otherwise can't be used by the player item, the status later changes to AVPlayerItemStatusFailed.

- 18.77.11 Constructor(file as folderitem) 3782

18.77.13 copy as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.77.14 errorLog as AVPlayerItemErrorLogMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an object that represents a snapshot of the error log.
Notes: An object that represents a snapshot of the error log. The returned value can be nil.
If the method returns nil, there is no logging information currently available for the player item.

18.77.15 loadedTimeRanges as CMTimeRangeMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time ranges of the item that have been loaded. (read-only)

18.77.16 outputs as AVPlayerItemOutputMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The outputs associated with the item. (read-only)
Notes: This property contains the collection of AVPlayerItemOutput objects used to transfer media data to the player object.
Available in OS X v10.8 and later.

18.77.17 playerItemWithAsset(asset as AVAssetMBS) as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new player item for a given asset.
See also:

• 18.77.18 playerItemWithAsset(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) as AVPlayerItemMBS 3784

18.77.18 playerItemWithAsset(asset as AVAssetMBS, automaticallyLoadedAssetKeys() as string) as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates and initializes a player item with an array of AVAsset keys.
Notes: asset: An instance of AVAsset.
automaticallyLoadedAssetKeys: An array of strings, each representing a property key defined by AVAsset.
Returns an initialized instance of AVPlayerItem.

The value of each key in automaticallyLoadedAssetKeys will be automatically be loaded by the underlying AVAsset before the receiver achieves the status AVPlayerItemStatusReadyToPlay; i.e. when the item is ready to play, the value returned by invoking the asset property's statusOfValueForKey:error: method will be one of the terminal status values, either AVKeyValueStatusLoaded, AVKeyValueStatusFailed, or AVKeyValueStatusCancelled.

Important: The asset property keys "playable" and "compatibleWithSavedPhotosAlbum" are not eligible for automatic loading by AVPlayerItem. You must use the AVAsset method loadValuesAsynchronouslyForKeys:completionHandler: to load the values of those properties asynchronously.

Available in OS X v10.9 and later.
See also:

• 18.77.17 playerItemWithAsset(asset as AVAssetMBS) as AVPlayerItemMBS 3783

18.77.19 playerItemWithFile(file as folderitem) as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new player item, prepared to use a given folderitem.
Notes: File: A folderitem.
Returns a new player item, prepared to use folderitem.

This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItemStatusReadyToPlay.
If the URL contains no valid data or otherwise can't be used by the player item, the status later changes to AVPlayerItemStatusFailed.

18.77.20 playerItemWithURL(URL as string) as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new player item, prepared to use a given URL.
Notes: URL: An URL.
Returns a new player item, prepared to use URL.

This method immediately returns the item, but with the status AVPlayerItemStatusUnknown.
If the URL contains valid data that can be used by the player item, the status later changes to AVPlayerItemStatusReadyToPlay.
If the URL contains no valid data or otherwise can't be used by the player item, the status later changes to AVPlayerItemStatusFailed.

18.77.21 removeOutput(output as AVPlayerItemOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Removes the specified player item output object from the receiver.
Notes: output: The player item output object to remove.
Available in OS X v10.8 and later.

18.77.22 requestContentAuthorizationAsynchronously(timeoutInterval as Double, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Causes appropriate action to be taken to allow the user to authorize the content for playback.
Notes: timeoutInterval: The maximum amount of time in seconds to wait for the user to authorize the content before calling the handler block with a timeout result.

Calling this method will present the user with the opportunity to authorize the content (for example, by launching iTunes and prompting the user to enter their Apple ID and password).

When the user has taken action (or the timeout has elapsed), the AVFoundationMBS.requestContentAuthorizationCompleted event is invoked. You determine the status of the authorization attempt by checking the value of the contentAuthorizationRequestStatus property.

Even if the status indicates a completed authorization, the content may still not be authorized (for example, if the user authorizes an Apple ID other than that associated with the content). You should re-check the value of contentAuthorizationRequestStatus to verify whether the content has actually been authorized before continuing. It is not necessary to call this method if the value of contentAuthorizationRequestStatus

is already true.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.77.23 seekableTimeRanges as CMTimeRangeMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of time ranges within which it is possible to seek. (read-only)

18.77.24 seekToDate(date as date, fireEvent as boolean = false, tag as Variant = nil) as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the playback cursor to the time given by the specified date object.
Notes: date: The time to which to seek.

If fireEvent is true, the AVFoundationMBS.playerItemSeekToDateFinished event is called.

Use this method to seek to a specified time in the item item and be notified when the operation completes. If the seek request completes without being interrupted (either by another seek request or by any other operation), the completion handler you provide is executed with the finished parameter set to true.

If another seek request is already in progress when you call this method, the completion handler for the in-progress seek request is executed immediately with the finished parameter set to NO.
Available in OS X v10.9 and later.

18.77.25 seekToDateTime(date as dateTime, fireEvent as boolean = false, tag as variant = nil) as boolean

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Moves the playback cursor to the time given by the specified date object.
Notes: date: The time to which to seek.

If fireEvent is true, the AVFoundationMBS.playerItemSeekToDateFinished event is called.

Use this method to seek to a specified time in the item item and be notified when the operation completes. If the seek request completes without being interrupted (either by another seek request or by any other operation), the completion handler you provide is executed with the finished parameter set to true.

If another seek request is already in progress when you call this method, the completion handler for the in-progress seek request is executed immediately with the finished parameter set to NO.
Available in OS X v10.9 and later.

18.77.26 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Moves the playback cursor to a given time.
Notes: time: The time to which to move the playback cursor.
If fireEvent is true, the AVFoundationMBS.playerItemSeekToTimeFinished event will be called later.

Use this method to seek to a specified time in the item item and be notified when the operation completes. If the seek request completes without being interrupted (either by another seek request or by any other operation), the event is executed with the finished parameter set to true.

If another seek request is already in progress when you call this method, the completion handler for the in-progress seek request is executed immediately with the finished parameter set to false.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.77.27 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil) 3787

18.77.27 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Moves the playback cursor within a specified time bound.
Notes: time: The time to which you would like to move the playback cursor.
toleranceBefore: The tolerance allowed before time.
toleranceAfter: The tolerance allowed after time.

The time seeked to will be within the range [time-beforeTolerance, time+afterTolerance] , and may differ from the specified time for efficiency. If you pass kCMTimeZero for both toleranceBefore and toleranceAfter (to request sample accurate seeking), you may incur additional decoding delay.

Passing kCMTimePositiveInfinity for both toleranceBefore and toleranceAfter is the same as messaging seekToTime directly.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.77.26 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil) 3787

18.77.28 selectedMediaOptionInMediaSelectionGroup(mediaSelectionGroup as AVMediaSelectionGroupMBS) as AVMediaSelectionOptionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the media selection option that's currently selected from the specified group.
Notes: mediaSelectionGroup: A media selection group obtained from the player item's asset.

Returns an instance of AVMediaSelectionOption that describes the currently selection option in the group.

If the value of the allowsEmptySelection property of mediaSelectionGroup is true, the currently selected option in the group may be nil.
Available in OS X v10.8 and later.

18.77.29 selectMediaOption(mediaSelectionOption as AVMediaSelectionOptionMBS, mediaSelectionGroup as AVMediaSelectionGroupMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Selects the media option described by a specified instance of AVMediaSelectionOption in a given media selection group and deselects all other options in that group.
Notes: mediaSelectionOption: The option to select.
If the value of the allowsEmptySelection property of mediaSelectionGroup is true, you can pass nil to deselect all media selection options in the group.
mediaSelectionGroup: The media selection group, obtained from the receiver's asset, that contains mediaSelectionOption.

If mediaSelectionOption isn't a member of the mediaSelectionGroup, no change in presentation state will

result.

If multiple options within a group meet your criteria for selection according to locale or other considerations, and if these options are otherwise indistinguishable to you according to media characteristics that are meaningful for your application, content is typically authored so that the first available option that meets your criteria is appropriate for selection.
Available in OS X v10.8 and later.

18.77.30 selectMediaOptionAutomaticallyInMediaSelectionGroup(mediaSelectionGroup as AVMediaSelectionGroupMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Selects the media option in the specified media selection group that best matches the receiver's automatic selection criteria.
Notes: mediaSelectionGroup: The media selection group, obtained from the receiver's asset, that contains the specified option.

This method has no effect unless the appliesMediaSelectionCriteriaAutomatically property of the associated AVPlayer is true and unless automatic media selection has previously been overridden by invoking sselectMediaOption:inMediaSelectionGroup.
Available in OS X v10.9 and later.

18.77.31 setTextStyleRules(rules() as AVTextStyleRuleMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Sets the textStyleRules array.

18.77.32 stepByCount(stepCount as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Moves the player's current item's current time forward or backward by a specified number of steps.
Notes: stepCount: The number of steps by which to move.
A positive number steps forward, a negative number steps backward.

The size of each step depends on the receiver's enabled AVPlayerItemTrack objects (see tracks).

18.77.33 textStyleRules as AVTextStyleRuleMBS()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An array of text style rules to apply to subtitles and other legible text.
Notes: You can use this property to assign an array of AVTextStyleRule objects to the item. Each rule specifies both the style information and the range of text to which that styling should apply.
Available in OS X v10.9 and later.

18.77.34 timedMetadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The timed metadata played most recently by the media stream. (read-only)
Notes: The array contains instances of AVMetadataItem.

18.77.35 tracks as AVPlayerItemTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of AVPlayerItemTrack objects. (read-only)
Notes: This property can change dynamically during playback.
You can observe this property using key-value observing.

18.77.36 Properties

18.77.37 asset as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The underlying asset provided during initialization. (read-only)
Notes: (Read only property)

18.77.38 audioMix as AVAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The audio mix parameters to be applied during playback.
Notes: (Read and Write property)

18.77.39 audioTimePitchAlgorithm as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The processing algorithm used to manage audio pitch for scaled audio edits.
Notes: The supported constants are defined in Time Pitch Algorithm Settings.
An NSInvalidArgumentException will be raised if this property is set to a value other than the defined constants.
Available in OS X v10.9 and later.
(Read and Write property)

18.77.40 canPlayFastForward as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item can be played at rates greater than 1.0. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

18.77.41 canPlayFastReverse as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item can be played at rates less than –1.0. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

18.77.42 canPlayReverse as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item can be played with a rate of -1.0. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

18.77.43 canPlaySlowForward as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item can be played at a rate between 0.0 and 1.0. (read-only)
Notes: Available in OS X v10.8 and later.

(Read only property)

18.77.44 canPlaySlowReverse as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item can be played at a rate between -1.0 and 0.0. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

18.77.45 canStepBackward as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item supports stepping backward. (read-only)
Notes: Once the item becomes ready to play, the value of this property does not change. This behavior applies even when boundary conditions, such as when the item's current time is kCMTimeZero, have been reached.
Available in OS X v10.8 and later.
(Read only property)

18.77.46 canStepForward as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item supports stepping forward. (read-only)
Notes: Once the item becomes ready to play, the value of this property does not change. This behavior applies even when boundary conditions, such as when the item's current time is equal to its end time, have been reached.
Available in OS X v10.8 and later.
(Read only property)

18.77.47 contentAuthorizationRequestStatus as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the status of the most recent call to requestContentAuthorizationAsynchronouslyWithTimeoutInterval. (read-only)
Notes: This property reports the authorization status as determined by the most recent call to requestContentAuthorizationAsynchronouslyWithTimeoutInterval.

The value will be AVContentAuthorizationUnknown before the first call and between the time a request call is made and just prior to the completion handler being executed (thus it is safe to query this property from the event).

This value is not key-value observable.
(Read only property)

18.77.48 currentDate as date

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current time of the item as a date object.
Notes: The current time of the item as a date object, or nil if playback is not mapped to any date.
(Read only property)

18.77.49 currentDateTime as DateTime

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns the current time of the item as a date object.
Notes: The current time of the item as a date object, or nil if playback is not mapped to any date.
(Read only property)

18.77.50 currentTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the current time of the item.
Notes: (Read only property)

18.77.51 customVideoCompositor as AVVideoCompositingMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The custom video compositor, if any. (read-only)
Notes: The custom video compositor instance that is used during image generation is accessible via this property after the value of AVPlayerItemStatusFailed is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only

occur once that has happened.

If the value of AVPlayerItemStatusFailed is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged: message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use.
Available in OS X v10.9 and later.
(Read only property)

18.77.52 duration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the duration of the item. (read-only)
Notes: Indicates the duration of the item, not considering either its forwardPlaybackEndTime or reverse-PlaybackEndTime.
(Read only property)

18.77.53 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: If the receiver's status is AVPlayerItemStatusFailed, this describes the error that caused the failure. (read-only)
Notes: The value of this property is an error that describes what caused the receiver to no longer be able to be played.
If the receiver's status is not AVPlayerItemStatusFailed, the value of this property is nil.
(Read only property)

18.77.54 forwardPlaybackEndTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time at which forward playback ends.
Notes: The value indicated the time at which playback should end when the playback rate is positive (see AVPlayer's rate property).

The default value is kCMTimeInvalid, which indicates that no end time for forward playback is specified. In this case, the effective end time for forward playback is the item's duration.

The value of this property has no effect on playback when the rate is negative.
(Read and Write property)

18.77.55 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.77.56 isApplicationAuthorizedForPlayback as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the application can be used to play the content. (read-only)
Notes: This property reports whether or not the calling application is authorized to play the content associated with the item.

Application authorization is independent of content authorization (see contentAuthorizedForPlayback) and that both must be granted in order for an application to be allowed to play protected content. Also, unlike content authorization, application authorization is not dependent on user credentials (that is, if applicationAuthorizedForPlayback is false, there are no means to obtain authorization).

This property is not key-value observable.
(Read only property)

18.77.57 isAuthorizationRequiredForPlayback as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether or not authorization is required to play the content. (read-only)
Notes: This property reports whether authorization is required for the item's content to be played. If it does not require authorization, then none of the other authorization-related methods or properties apply (though they will return sensible values where possible).

This property is not key-value observable.
(Read only property)

18.77.58 isContentAuthorizedForPlayback as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the content has been authorized by the user (for example, by authorizing the content's associated account in iTunes). (read-only)
Notes: This property reports whether the user has provided the necessary credentials to the system in order for the content to be decrypted for playback.

Content authorization is independent of application authorization (see applicationAuthorizedForPlayback) and that both must be granted in order for an application to be allowed to play protected content.

This property is not key-value observable.
(Read only property)

18.77.59 isPlaybackBufferEmpty as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether playback has consumed all buffered media and that playback will stall or end. (read-only)
Notes: (Read only property)

18.77.60 isPlaybackBufferFull as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the internal media buffer is full and that further I/O is suspended. (read-only)
Notes: Despite the playback buffer reaching capacity there might not exist sufficient statistical data to support a playbackLikelyToKeepUp prediction of true.
(Read only property)

18.77.61 isPlaybackLikelyToKeepUp as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the item will likely play through without stalling (read-only)
Notes: This property communicates a prediction of playability. Factors considered in this prediction include I/O throughput and media decode performance. It is possible for playbackLikelyToKeepUp to indicate false while the property playbackBufferFull indicates true. In this event the playback buffer has reached capacity but there isn't the statistical data to support a prediction that playback is likely to keep up in the future. It is up to you to decide whether to continue media playback.

(Read only property)

18.77.62 nowPlayingInfo as Dictionary

MBS AVFoundation Plugin, Plugin Version: 25.0, Platform: macOS, Targets: iOS only.

Function: The current now playing information for the player item.
Notes: See MPNowPlayingInfoCenterMBS class.
To clear the now playing info center dictionary, set it to nil.
(Read and Write property)

18.77.63 presentationSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The size at which the visual portion of the item is presented by the player. (read-only)
Notes: You can scale the presentation size to fit within the bounds of a player layer using its videoGravity property. You can also scale the presentation size arbitrarily using the frame property of an AVPlayerLayer object.
(Read only property)

18.77.64 reversePlaybackEndTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time at which reverse playback ends.
Notes: The value indicated the time at which playback should end when the playback rate is negative (see AVPlayer's rate property).

The default value is kCMTimeInvalid, which indicates that no end time for reverse playback is specified. In this case, the effective end time for reverse playback is kCMTimeZero.

The value of this property has no effect on playback when the rate is positive.
(Read and Write property)

18.77.65 seekingWaitsForVideoCompositionRendering as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the item's timing follows the displayed video frame when

seeking with a video composition.
Notes: By default, item timing is updated as quickly as possible during seeking. Specifically, the item does not wait for new frames to be rendered when seeking during normal playback. In most situations, the latency between the completion of a seek operation and the display of a video frame at the new time is negligible. However, when video compositions are in use, the processing of video may introduce noticeable latency. Setting the value of this property to true causes the item's timing to be updated only after the corresponding video frame has been displayed. For example, this allows an AVSynchronizedLayer object associated with the item to remain in sync with the displayed video.

This property has no effect on items whose videoComposition property is nil.
Available in OS X v10.9 and later.
(Read and Write property)

18.77.66 status as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The status of the player item. (read-only)
Notes: For example, whether the item is playable. For values: AVPlayerItemStatusUnknown, AVPlayerItemStatusReadyToPlay and AVPlayerItemStatusFailed.
(Read only property)

18.77.67 videoComposition as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The video composition settings to be applied during playback.
Notes: (Read and Write property)

18.77.68 Constants

Authorization Status

Constant	Value	Description
AVContentAuthorizationBusy	4	The last call to request content authorization could not be completed bec another asset is currently attempting authorization.
AVContentAuthorizationCancelled	2	The last call to request content authorization was cancelled by the user.
AVContentAuthorizationCompleted	1	The last completed call to request content authorization completed.
AVContentAuthorizationNotAvailable	5	The last call to request content authorization could not be completed bec there was no known mechanism by which to attempt authorization.
AVContentAuthorizationNotPossible	6	The last call to request content authorization could not be completed non-recoverable way (for example, a newer version of iTunes is required).
AVContentAuthorizationTimedOut	3	The last call to request content authorization was cancelled because the tim interval was reached.
AVContentAuthorizationUnknown	0	No call to request content authorization has completed yet.

Status Constants

Constant	Value	Description
AVPlayerItemStatusFailed	2	The item cannot be played.
AVPlayerItemStatusReadyToPlay	1	The item is ready to play.
AVPlayerItemStatusUnknown	0	The item's status is unknown.

18.78 class AVPlayerItemOutputMBS

18.78.1 class AVPlayerItemOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The AVPlayerItemOutput class is an abstract class that defines the common interface for moving samples from an asset to an AVPlayer object.
Notes: You do not create instances of this class directly but instead use one of the concrete subclasses that manage specific types of assets.

This class provides basic methods for converting time values to the timebase of the item. It also provides an option to suppress rendering of the output associated with the specific instance of this class.

Available in OS X v10.8 and later.

18.78.2 Methods

18.78.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.78.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The default constructor.

18.78.5 itemTimeForHostTime(hostTimeInSeconds as Double) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Converts a host time (specified in seconds) to the item's timebase.
Notes: hostTimeInSeconds: A host time value, specified in seconds. For example, you might specify the time value returned by the CACurrentMediaTime function or the timestamp from a CADisplayLink object for this parameter.

Returns the equivalent time in the item's timebase.

The timestamp associated with a CADisplayLink object represents the time of the most recent screen refresh, which is usually a time in the past. If you want to find the time associated with the next screen refresh, you need to increment the timestamp by the value in the display link's duration property.

18.78.6 itemTimeForMachAbsoluteTime(machAbsoluteTime as Int64) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Converts a Mach host time to the item's timebase.
Notes: machAbsoluteTime: The Mach host time to convert. You typically retrieve this value using the mach_absolute_time function.

Returns the equivalent time in the item's timebase.
Available in OS X v10.8 and later.

18.78.7 Properties

18.78.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.78.9 suppressesPlayerRendering as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean indicating whether the player object renders the receiver's output.
Notes: When the value of this property is false (the default), the player object handles the rendering of the receiver's associated output. You can change the value of this property to true if you want to suppress the rendering of the media data associated with this object.
Available in OS X v10.8 and later.
(Read and Write property)

18.79 class AVPlayerItemTrackMBS

18.79.1 class AVPlayerItemTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The track of a player item.
Notes: You use an AVPlayerItemTrack object to modify the presentation state of an asset track (AVAsset-Track) being presented by an AVPlayer object.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.79.2 Methods

18.79.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.79.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.79.5 Properties

18.79.6 assetTrack as AVAssetTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The asset track for which the player item represents presentation state. (read-only)
Notes: (Read only property)

18.79.7 currentVideoFrameRate as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: For video media types, indicates the current frame rate of the track as it plays. (read-only)
Notes: If the media type of the assetTrack is AVMediaTypeVideo, the property indicates the current frame rate of the track as it plays, in units of frames per second.

If the item is not playing, or if the media type of the track is not video, the value of this property is 0.0.

This property is not key-value observable.
Available in OS X v10.9 and later.
(Read only property)

18.79.8 Enabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the track is enabled for presentation during playback.
Notes: (Read and Write property)

18.79.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.80 class AVPlayerItemVideoOutputMBS

18.80.1 class AVPlayerItemVideoOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The AVPlayerItemVideoOutput lets you coordinate the output of content associated with a Core Video pixel buffer.
Notes: Available in OS X v10.8 and later.
This class can call the outputSequenceWasFlushed and outputMediaDataWillChange events in the AVFoundationMBS class.
Subclass of the AVPlayerItemOutputMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.5pr4

18.80.2 Methods

18.80.3 Constructor(pixelBufferAttributes as dictionary)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes and returns a video output object using the specified pixel buffer attributes.
Notes: pixelBufferAttributes; The pixel buffer attributes required for video output. For a list of pixel buffer attributes you can include in this dictionary, see the CVPixelBuffer.h header file in the Core Video framework.

18.80.4 copyCIImageForItemTime(time as CMTimeMBS) as Variant

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Acquires and returns an image that is appropriate to display at the specified time.
Notes: itemTime: The time at which you want to retrieve the image from the item.
outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no longer needed.

Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.

Returns CIImageMBS object.
Available in OS X v10.8 and later.
See also:

- 18.80.5 copyCIImageForItemTime(time as CMTimeMBS, byref outItemTimeForDisplay as CMTimeMBS) as Variant 3805

18.80.5 copyCIImageForItemTime(time as CMTimeMBS, byref outItemTimeForDisplay as CMTimeMBS) as Variant

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Acquires and returns an image that is appropriate to display at the specified time.
Notes: itemTime: The time at which you want to retrieve the image from the item.
outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no longer needed.

Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.

Returns CIImageMBS object.
Available in OS X v10.8 and later.
See also:

- 18.80.4 copyCIImageForItemTime(time as CMTimeMBS) as Variant 3804

18.80.6 copyPixelBufferForItemTime(time as CMTimeMBS) as CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Acquires and returns an image that is appropriate to display at the specified time.
Notes: itemTime: The time at which you want to retrieve the image from the item.
outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no

longer needed.

Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.

Returns CVPixelBufferMBS object.
Available in OS X v10.8 and later.
See also:

- 18.80.7 copyPixelBufferForItemTime(time as CMTimeMBS, byref outItemTimeForDisplay as CMTimeMBS) as CVPixelBufferMBS 3806

18.80.7 copyPixelBufferForItemTime(time as CMTimeMBS, byref outItemTimeForDisplay as CMTimeMBS) as CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Acquires and returns an image that is appropriate to display at the specified time.
Notes: itemTime: The time at which you want to retrieve the image from the item.
outItemTimeForDisplay: Optional, the time by which you intend to use the returned pixel buffer.

Returns a pixel buffer containing the image data to display or nil if nothing should be displayed at the specified time. The caller is responsible for calling CVBufferRelease on the returned data when it is no longer needed.

Typically, you call this method in response to a CVDisplayLink callback or a CADisplayLink delegate method call when the hasNewPixelBufferForItemTime method also returns true.

After calling this method, the video output object marks the pixel buffer data as having been acquired. This causes the hasNewPixelBufferForItemTime method to return false unless newer data becomes available.

Available in OS X v10.8 and later.
See also:

- 18.80.6 copyPixelBufferForItemTime(time as CMTimeMBS) as CVPixelBufferMBS 3805

18.80.8 hasNewPixelBufferForItemTime(time as CMTimeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether video output is available for the specified item time.
Notes: itemTime: The item time to query. The time value is relative to the AVPlayerItem object with which the receiver is associated.

Returns true if there is available video output that has not been previously acquired or false if there is not.

This method returns true if the video data at the specified time has not yet been acquired or is different from the video that was acquired previously. If you require multiple objects to acquire video output from the same AVPlayerItem object, you should create separate AVPlayerItemVideoOutput objects for each.
Available in OS X v10.8 and later.

18.80.9 requestNotificationOfMediaDataChangeWithAdvanceInterval(time as Double)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Informs the receiver that the video out put client is entering a quiescent state.
Notes: interval: The amount of time to wait before notifying the delegate of the media change.

Call this method before you suspend your use of a CVDisplayLinkRef type or a CADisplayLink object. After the interval expires, the video output object notifies its delegate that it should resume the display link. If the interval value you specify is large, the delegate is notified as soon as possible rather than waiting.

Do not call this method repeatedly to force the delegate to be notified for each sample.

18.80.10 setDelegate

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets the delegate so the events are called for this instance.
Notes: The constructor (if used) sets this for you automatically.

18.81 class AVPlayerLayerMBS

18.81.1 class AVPlayerLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVPlayerLayer is a subclass of CALayer to which an AVPlayer object can direct its visual output.
Notes: The videoGravity property defines how the video content is displayed within the player layer's bounds rect.

The value for the contents key of a player layer is opaque and effectively read-only.

During playback, AVPlayer may compensate for temporal drift between its visual output and its audible output to one or more independently-clocked audio output devices by adjusting the timing of its associated player layers. The effects of these adjustments are usually very small; however, clients that wish to remain entirely unaffected by such adjustments may wish to place other layers for which timing is important into independently timed subtrees of their layer trees.

You can create arbitrary numbers of player layers with the same AVPlayer object. Only the most-recently-created player layer will actually display the video content on-screen.
Subclass of the CALayerMBS class.

18.81.2 Methods

18.81.3 Constructor(player as AVPlayerMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a player layer to display the visual output of a specified player.
Notes: player: The player for which the player layer displays visual output.

18.81.4 isReadyForDisplay as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the first video frame has been made ready for display for the current item of the associated player. (read-only)
Notes: Use this property as an indicator of when best to show or animate-in a player layer into view. An player layer may be displayed, or made visible, while this property is false, however the layer will not have any user-visible content until the value becomes true.

This property remains false for a player's currentItem whose asset contains no enabled video tracks.

18.81.5 playerLayerWithPlayer(player as AVPlayerMBS) as AVPlayerLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a player layer to display the visual output of a specified player.
Notes: player: The player for which the player layer displays visual output.

Returns a player layer configured to display the visual output of player.

18.81.6 videoRect as CGRectMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The current size and position of the video image as displayed within the receiver's bounds. (read-only)
Notes: Available in OS X v10.9 and later.

18.81.7 Properties

18.81.8 player as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The player for which the player layer displays visual output.
Notes: (Read and Write computed property)

18.81.9 videoGravity as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Specifies how the video is displayed within a player layer's bounds.
Notes: Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill, and AVLayerVideoGravityResize.
This property is animatable.
(Read and Write computed property)

18.82 class AVPlayerLooperMBS

18.82.1 class AVPlayerLooperMBS

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: AVPlayerLooperMBS is a helper object that repeatedly plays an AVPlayerItemMBS with an AVQueuePlayerMBS.
Example:

```
// Create player and configure
Var player As New AVQueuePlayerMBS
Var playerLayer As New AVPlayerLayerMBS(player)
player.pause

// Create looping item
Var file As FolderItem = SpecialFolder.Desktop.Child("loop.mov")
Var itemToLoop As New AVPlayerItemMBS(file)

// Create looping helper object. Loop item segment from 5sec to 7sec
Var startTime As CMTimeMBS = CMTimeMBS.Make(5000, 1000)
Var duration As CMTimeMBS = CMTimeMBS.Make(2000, 1000)
Var timeRange As CMTimeRangeMBS = CMTimeRangeMBS.Make(startTime, duration)
Var looper As New AVPlayerLooperMBS(player, itemToLoop, timeRange)

// Perform any other set up operations like setting AVPlayerItemDataOutputs on the looping item replicas
// Start playback
player.play

// itemToLoop between 5s and 7s plays repeatedly
'....
// To end the looping
looper.disableLooping
// Player will play through the end of the current looping item
```

Notes: The same result can be accomplished with AVQueuePlayer directly, but AVPlayerLooper provides a simpler interface to loop a single AVPlayerItem with an option to specify a time range. AVPlayerLooper only supports looping for forward playback (positive player rate). Behavior is undefined for negative player rate.

Note that the transition at the loop point is not guaranteed to be gapless.

Requires macOS 10.13, iOS 10.0 or newer.

Xojo Developer Magazine

- 21.1, page 33: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

18.82.2 Methods

18.82.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on macOS 10.12 or newer as well as on iOS 10.0 or newer.

18.82.4 Constructor(player as AVQueuePlayerMBS, item as AVPlayerItemMBS)

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: Returns an instance of AVPlayerLooper to loop specified AVPlayerItem with specified AVQueuePlayerMBS.
Notes: Equivalent to other constructor and passing in kCMTimeRangeInvalid for timeRange parameter.
See also:

- 18.82.5 Constructor(player as AVQueuePlayerMBS, item as AVPlayerItemMBS, loopRange as CMTimeRangeMBS) 3811

18.82.5 Constructor(player as AVQueuePlayerMBS, item as AVPlayerItemMBS, loopRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: Returns an instance of AVPlayerLooper to loop specified AVPlayerItem within the specified time range with specified AVQueuePlayerMBS.
Notes: loopRange: Playback time range in [0, itemToLoop's duration] . kCMTimeRangeInvalid means [0, itemToLoop's duration] .

The specified AVPlayerItem will be used as a template to generate at least 3 AVPlayerItem replicas and the replicas will be inserted into specified AVQueuePlayer's play queue to accomplish the looping playback. The specified AVPlayerItem should have its asset's duration property loaded beforehand so looping setup work would not be blocked until the duration value is known. Otherwise, AVPlayerLooper's status property is

AVPlayerLooperStatusUnknown until the duration property is loaded. The specified AVPlayerItem will not be used in the actual looping playback. Furthermore, AVPlayerItem replicas will be generated at initialization time so any changes made to the specified AVPlayerItem's property afterwards will not be reflected in the replicas used for looping playback. Specified CMTimeRange will limit each item loop iteration to playing within the specified time range. To play from beginning and the whole duration of the item, specify kCMTimeRangeInvalid for the range parameter. Time range will be accomplished by seeking to range start time and setting AVPlayerItem's forwardPlaybackEndTime property on the looping item replicas. Client should not modify AVQueuePlayer's play queue while AVPlayerLooper is performing the looping. AVPlayerLooper will insert the replica items before any existing items in the specified AVQueuePlayer's play queue and change the actionAtItemEnd to AVPlayerActionAtItemEndAdvance if required. AVQueuePlayer's play queue and actionAtItemEnd will be restored when disableLooping method is called and then current looping item replicas completes playback or when AVPlayerLooper is destroyed. While AVPlayerLooper is being initialized, the specified AVQueuePlayer will be paused (rate of 0.0) if necessary and the original player rate will be restored after initialization completes. The client shall set the specified AVQueuePlayer's rate to 0 beforehand if additional set-up work needs to be performed after AVPlayerLooper initialization and before starting looping playback. An NSInvalidArgumentException will be raised if the player and template item are not specified or the template item has a 0 duration. An NSInvalidArgumentException will be raised if a valid time range has a duration of 0 or is not contained within time 0 and duration of the templateItem.
See also:

- 18.82.4 Constructor(player as AVQueuePlayerMBS, item as AVPlayerItemMBS) 3811

18.82.6 disableLooping

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: Disables the item looping.
Notes: AVPlayerLooper will stop performing player queue operations for looping and let the current looping item replica play to the end. The player's original actionAtItemEnd property will be restored afterwards. After this method is called, the value of the receiver's status property will be AVPlayerLooperStatusCancelled.

18.82.7 loopingPlayerItems as AVPlayerItemMBS()

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: Returns an array containing replicas of specified AVPlayerItem used to accomplish the looping.
Notes: AVPlayerLooper creates replicas of the template AVPlayerItem using -copyWithZone: and inserts the replicas in the specified AVQueuePlayer to accomplish the looping. The AVPlayerItem replicas are for informational purposes and to allow the client to apply properties that are not transferred from the template AVPlayerItem to the replicas. The client can determine the number of replicas created and can listen for notifications and property changes from the replicas if desired. AVPlayerItemOutputs and AVPlayerItemMediaDataCollectors are not transferred to the replicas so the client should add them to each replica if desired. The client shall not modify the properties on the replicas that would disrupt looping playback. Examples of such properties are playhead time/date, selected media option, and forward playback end time.

This property is key value observable.

Returns an array containing replicas of specified AVPlayerItem.

18.82.8 Properties

18.82.9 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: If the receiver's status is AVPlayerLooperStatusFailed, this describes the error that caused the failure.
Notes: The value of this property is a NSError that describes what caused the receiver to not be able to perform looping playback. If the receiver's status is not AVPlayerLooperStatusFailed, the value of this property is nil.
(Read only property)

18.82.10 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: The internal reference object.
Notes: (Read only property)

18.82.11 item as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: The item used.
Notes: (Read only property)

18.82.12 loopCount as Integer

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: Number of times the specified AVPlayerItem has been played.
Notes: Starts at 0 and increments when the player starts playback of the AVPlayerItem again.
(Read only property)

18.82.13 status as Integer

MBS AVFoundation Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: All.

Function: The ability of the receiver to be used for looping playback.
Notes: The value of this property is an AVPlayerLooperStatus that indicates whether the receiver is ready for looping playback. When the value of this property is AVPlayerStatusFailed, the receiver can no longer be used for playback and a new instance needs to be created in its place. When this happens, clients can check the value of the error property to determine the nature of the failure. This property is key value observable. (Read only property)

18.82.14 Constants

Status

Constant	Value	Description
StatusCancelled	3	Indicates that the looper is no longer looping because -disableLooping was invoked.
StatusFailed	2	Indicates that the looper is not able to perform looping playback because of an error. The error is described by the value of the error property.
StatusReady	1	Indicates that the looper is ready for looping playback.
StatusUnknown	0	Indicates that the status of the looper is not yet known.

18.83 class AVPlayerMBS

18.83.1 class AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVPlayer object to implement controllers and user interfaces for single- or multiple-item playback.
Notes: The multiple-item case supports advanced behaviors.

AVPlayer works equally well with local and remote media files, providing you with appropriate information about readiness to play or about the need to await additional data before continuing.

You can display the visual content of items played by an instance of AVPlayer in a CoreAnimation layer of class AVPlayerLayer; to synchronize real-time playback with other CoreAnimation layers, you can use AVSynchronizedLayer. You cannot use an instance of AVVideoCompositionCoreAnimationTool with an AVPlayer object; for offline rendering you should instead use AVAssetExportSession.

You can observe the status of a player using key-value observing. So that you can add and remove observers safely, AVPlayer serializes notifications of changes that occur dynamically during playback on a dispatch queue. By default, this queue is the main queue . To ensure safe access to a player's nonatomic properties while dynamic changes in playback state may be reported, you must serialize access with the receiver's notification queue. In the common case, such serialization is naturally achieved by invoking AVPlayer's various methods on the main thread or queue.

18.83.2 Methods

18.83.3 addBoundaryTimeObserverForTime(time as CMTimeMBS, tag as variant = nil) as AVPlayerTimeObserverMBS

MBS AVFoundation Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Requests invocation of a event when specified time are traversed during normal playback.
Notes: time: A CMTimeMBS value representing the times at which to invoke event.
Returns an opaque object that you pass as the argument to removeTimeObserver to stop observation.

You must retain the returned value as long as you want the time observer to be invoked by the player. Each invocation of this method should be paired with a corresponding call to removeTimeObserver. This is done automatically for you by AVPlayerTimeObserverMBS class destructor.

Calls AVFoundationMBS.BoundaryTimeObserver event passing tag value.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.83.4 addBoundaryTimeObserverForTimes(times() as CMTimeMBS, tag as Variant = nil) as AVPlayerTimeObserverMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Requests invocation of a event when specified times are traversed during normal playback.
Notes: times: An array of NSValue objects containing CMTime values representing the times at which to invoke event.
Returns an opaque object that you pass as the argument to removeTimeObserver to stop observation.

You must retain the returned value as long as you want the time observer to be invoked by the player. Each invocation of this method should be paired with a corresponding call to removeTimeObserver. This is done automatically for you by AVPlayerTimeObserverMBS class destructor.

Calls AVFoundationMBS.BoundaryTimeObserver event passing tag value.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.83.5 addLoopTimeObserver(atTime as CMTimeMBS, jumpToTime as CMTimeMBS) as AVPlayerTimeObserverMBS

MBS AVFoundation Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Requests invocation of a code to jump in time to another position.
Notes: atTime: A CMTimeMBS value representing the times at which to invoke event.
jumpToTime: The CMTImeMBS where to jump to.

Returns an opaque object that you pass as the argument to removeTimeObserver to stop observation.

You must retain the returned value as long as you want the time observer to be invoked by the player. Each invocation of this method should be paired with a corresponding call to removeTimeObserver. This is done automatically for you by AVPlayerTimeObserverMBS class destructor.

18.83.6 addPeriodicTimeObserverForInterval(interval as CMTimeMBS, tag as Variant = nil) as AVPlayerTimeObserverMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Requests invocation of a given event during playback to report changing time.
Notes: interval: The interval of invocation of the event during normal playback, according to progress of the current time of the player.
The event takes a single parameter:

Returns an opaque object that you pass as the argument to removeTimeObserver to cancel observation.

You must retain the returned value as long as you want the time observer to be invoked by the player. Each invocation of this method should be paired with a corresponding call to removeTimeObserver. This is done automatically for you by AVPlayerTimeObserverMBS class destructor.

The AVFoundationMBS.PeriodicTimeObserver event is invoked periodically at the interval specified, interpreted according to the timeline of the current item. The event is also invoked whenever time jumps and whenever playback starts or stops. If the interval corresponds to a very short interval in real time, the player may invoke the event less frequently than requested. Even so, the player will invoke the event sufficiently often for the client to update indications of the current time appropriately in its end-user interface.

Special Considerations
Releasing the observer object without invoking removeTimeObserver: will result in undefined behavior.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can

cause memory reference cycles.

18.83.7 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.83.8 cancelPendingPrerolls

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancels the preloading of media data.
Notes: This method cancels any pending operations to prepare the render pipeline for the current item.
Available in OS X v10.8 and later.

18.83.9 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The default constructor.
See also:

- 18.83.10 Constructor(File as folderitem) 3818
- 18.83.11 Constructor(item as AVPlayerItemMBS) 3819
- 18.83.12 Constructor(URL as string) 3819

18.83.10 Constructor(File as folderitem)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a new player to play a single audiovisual resource referenced by a given file.
Notes: File: A folderitem that identifies an audiovisual resource.
This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.
See also:

- 18.83.9 Constructor 3818
- 18.83.11 Constructor(item as AVPlayerItemMBS) 3819
- 18.83.12 Constructor(URL as string) 3819

18.83.11 Constructor(item as AVPlayerItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a new player to play a given single audiovisual item.
Notes: You can use this method to play items for which you have an existing AVAsset object (see Constructor in AVPlayerItem).
See also:

- 18.83.9 Constructor 3818
- 18.83.10 Constructor(File as folderitem) 3818
- 18.83.12 Constructor(URL as string) 3819

18.83.12 Constructor(URL as string)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a new player to play a single audiovisual resource referenced by a given URL.
Notes: URL: An URL that identifies an audiovisual resource.
This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.
See also:

- 18.83.9 Constructor 3818
- 18.83.10 Constructor(File as folderitem) 3818
- 18.83.11 Constructor(item as AVPlayerItemMBS) 3819

18.83.13 mediaSelectionCriteriaForMediaCharacteristic(mediaCharacteristic as string) as AVPlayerMediaSelectionCriteriaMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns the automatic selection criteria for media that has the specified media characteristic.
Notes: mediaCharacteristic: The media characteristic for which the selection criteria is to be returned. Supported values include AVMediaCharacteristicAudible, AVMediaCharacteristicLegible, and AVMediaCharacteristicVisual.

Returns the automatic media selection criteria for mediaCharacteristic.

Available in OS X v10.9 and later.

18.83.14 pause

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Pauses playback.
Notes: This is the same as setting rate to 0.0.

18.83.15 play

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Begins playback of the current item.
Notes: This is the same as setting rate to 1.0.

18.83.16 playerWithFile(File as folderitem) as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new player to play a single audiovisual resource referenced by a given file.
Notes: File: A folderitem that identifies an audiovisual resource.
Returns a new player initialized to play the audiovisual resource specified by folderitem.
This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.

18.83.17 playerWithPlayerItem(item as AVPlayerItemMBS) as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new player initialized to play a given single audiovisual item
Notes: item: A player item.
Returns a new player, initialized to play item.

You can use this method to play items for which an AVAsset object has previously been created (see Constructor in AVPlayerItem).

18.83.18 playerWithURL(URL as string) as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new player to play a single audiovisual resource referenced by a given URL.
Notes: URL: An URL that identifies an audiovisual resource.
Returns a new player initialized to play the audiovisual resource specified by URL.

This method implicitly creates an AVPlayerItem object. You can get the player item using currentItem.

18.83.19 prerollAtRate(rate as Double, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Begins loading media data to prime the media pipelines for playback.
Notes: rate: The playback rate to use when determining how much data to load.

Calls AVFoundationMBS.prerollAtRateFinished event when the player finishes the load attempt.

This method loads data starting at the item's current playback time. The current rate for the playback item should always be 0 prior to calling this method. After the method calls the completion handler, you can change the item's playback rate to begin playback.

If the player object is not ready to play (its status property is not AVPlayerStatusReadyToPlay), this method throws an exception.
Available in OS X v10.8 and later.

18.83.20 removeTimeObserver(observer as AVPlayerTimeObserverMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancels a previously registered time observer.
Notes: observer: An object returned by a previous call to addPeriodicTimeObserverForInterval or addBoundaryTimeObserverForTimes.

Upon return, the caller is guaranteed that no new time observer event will begin executing. Depending on the calling thread and the queue used to add the time observer, an in-flight block may continue to execute after this method returns. You can guarantee synchronous time observer removal by enqueuing the call to removeTimeObserver on the main queue (do it in main event).

You should use this method to explicitly cancel each time observer added using addPeriodicTimeObserverForInterval and addBoundaryTimeObserverForTimes.

18.83.21 replaceCurrentItemWithPlayerItem(item as AVPlayerItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Replaces the player item with a new player item.

Notes: item: A player item.

You can only use this method with players created without queues. If the player was not initialized with a single item and no queue, the method throws an exception.

The item replacement occurs asynchronously; observe the currentItem property to find out when the replacement will/did occur.

Special Considerations
The new item must have the same compositor as the item it replaces, or have no compositor.

18.83.22 seekToDate(date as date, fireEvent as boolean = false, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the playback cursor to the specified time.
Notes: If FireEvent is true, the AVFoundationMBS.playerSeekToDateFinished event is called.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.83.23 seekToDate(date as dateTime, fireEvent as boolean = false, tag as variant = nil) 3822

18.83.23 seekToDate(date as dateTime, fireEvent as boolean = false, tag as variant = nil)

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Moves the playback cursor to the specified time.
Notes: If FireEvent is true, the AVFoundationMBS.playerSeekToDateFinished event is called.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.83.22 seekToDate(date as date, fireEvent as boolean = false, tag as Variant = nil) 3822

18.83.24 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Moves the playback cursor to a given time.
Notes: time: The time to which to move the playback cursor.

Use this method to seek to a specified time for the current player item and be notified when the operation completes. If the seek request completes without being interrupted (either by another seek request or by any other operation), the AVFoundationMBS.playerSeekToTimeFinished is executed with the finished parameter set to true.

If another seek request is already in progress when you call this method, the event for the in-progress seek request is executed immediately with the finished parameter set to false.

If fireevent is true, the AVFoundationMBS.playerSeekToTimeFinished event is run later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.83.25 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil) 3823

18.83.25 seekToTime(time as CMTimeMBS, toleranceBefore as CMTimeMBS, toleranceAfter as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Moves the playback cursor within a specified time bound and invokes the event when the seek operation has either been completed or been interrupted.
Notes: If fireevent is true, the AVFoundationMBS.playerSeekToTimeFinished event is run later.

time: The time to which you would like to move the playback cursor.
toleranceBefore: The tolerance allowed before time.
toleranceAfter: The tolerance allowed after time.

Use this method to seek to a specified time for the current player item and to be notified when the seek operation is complete.

The time seeked to will be within the range [time-beforeTolerance, time+afterTolerance] , and may differ from the specified time for efficiency. If you pass kCMTimeZero for both toleranceBefore and toleranceAfter (to request sample accurate seeking), you may incur additional decoding delay.

Invoking this method with toleranceBefore set to kCMTimePositiveInfinity and toleranceAfter set to kCMTimePositiveInfinity is the same as invoking seekToTime:.

The completion handler for any prior seek request that is still in process will be invoked immediately with the finished parameter set to false. If the new request completes without being interrupted by another seek request or by any other operation the event will be invoked with the finished parameter set to true.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.83.24 seekToTime(time as CMTimeMBS, fireEvent as boolean = false, tag as Variant = nil) 3823

18.83.26 setMediaSelectionCriteria(criteria as AVPlayerMediaSelectionCriteriaMBS, mediaCharacteristic as string)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Applies automatic selection criteria for media that has the specified media characteristic.
Notes: criteria: An instance of AVPlayerMediaSelectionCriteria that specifies the selection criteria.
mediaCharacteristic: The media characteristic for which the selection criteria are to be applied. Supported values include AVMediaCharacteristicAudible, AVMediaCharacteristicLegible, and AVMediaCharacteristicVisual.

Criteria will be applied to an AVPlayerItem instance when:

- It is made ready to play.
- Specific media selections are made by the AVPlayerItem instance using the method selectMediaOption in a different group. The automatic choice in one group may be influenced by a specific selection in another group.
- Underlying system preferences change, e.g. system language, accessibility captions.

Specific selections made by the AVPlayerItem instance using the method selectMediaOption method within any group will override automatic selection in that group until the player item receives a selectMediaOptionAutomaticallyInMediaSelectionGroup message.

Available in OS X v10.9 and later.

18.83.27 setRate(rate as Double, time as CMTimeMBS, HostTime as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Synchronizes the playback rate and time of the current item with an external source.
Notes: rate: The playback rate for the item.
itemTime: The precise time at which to match playback of the item. To use the current item's current time, specify kCMTimeInvalid.
hostClockTime: The host time at which to synchronize playback. If you specify kCMTimeInvalid, the rate and time are set together without any external synchronization.

This method adjusts the current item's timebase so that the time in itemTime is in sync with the time in hostClockTime. Thus, if hostClockTime specifies a time in the past, the item's timebase is adjusted to make it appear as if the item has been running at the specified rate since itemTime. And if hostClockTime specifies a time in the future, playback is adjusted backward (if possible) so that the value in itemTime occurs at the precise moment the host's clock reaches the value in hostClockTime. If there is no content to play before the time specified by itemTime, playback holds until the two times come into sync.

This method does not ensure that media data is loaded before the timebase starts moving. However, if you specify a host time in the near future, that would give you some time to load the media data and prepare for playback.

18.83.28 Properties

18.83.29 ActionAtItemEnd as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The action to perform when an item has finished playing.
Notes: (Read and Write property)

18.83.30 appliesMediaSelectionCriteriaAutomatically as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Indicates whether the receiver should apply the current selection criteria automatically to AVPlayerItems.
Notes: By default, AVPlayer applies selection criteria based on system preferences. To override the default

criteria for any media selection group, use setMediaSelectionCriteria method.
(Read and Write property)

18.83.31 audioOutputDeviceUniqueID as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Specifies the unique ID of the Core Audio output device used to play audio.
Notes: By default, the value of this property is nil, indicating that the default audio output device is used. Otherwise the value of this property is a string containing the unique ID of the Core Audio output device to be used for audio output.
Core Audio's kAudioDevicePropertyDeviceUID is a suitable source of audio output device unique IDs.
(Read and Write property)

18.83.32 ClosedCaptionDisplayEnabled as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the player uses closed captioning.
Notes: (Read and Write property)

18.83.33 currentItem as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The player's current item. (read-only)
Notes: (Read only property)

18.83.34 currentTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the current time of the current item.
Notes: (Read only property)

18.83.35 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: If the receiver's status is AVPlayerStatusFailed, this describes the error that caused the failure. (read-only)
Notes: The value of this property is an error object that describes what caused the receiver to no longer be able to play items. If the receiver's status is not AVPlayerStatusFailed, the value of this property is nil.
(Read only property)

18.83.36 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.83.37 Muted as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the audio output of the player is muted.
Notes: (Read and Write property)

18.83.38 Playing as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Whether asset is playing.
Notes: Returns true when playing.
(Read only property)

18.83.39 rate as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The current rate of playback.
Notes: 0.0 means "stopped", 1.0 means "play at the natural rate of the current item".
(Read and Write property)

18.83.40 status as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the player can be used for playback. (read-only)
Notes: When the value of this property is AVPlayerStatusFailed, you can no longer use the player for playback and you need to create a new instance to replace it. If this happens, you can check the value of the error property to determine the nature of the failure.

This property is key value observable using key-value observing.
(Read only property)

18.83.41 volume as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the current audio volume of the player.
Notes: 0.0 means "silence all audio," 1.0 means "play at the full volume of the current item."
(Read and Write property)

18.83.42 Constants

Actions for the item end Constants

Constant	Value	Description
AVPlayerActionAtItemEndAdvance	0	Indicates that the player should advance to the next item, if there is one.
AVPlayerActionAtItemEndNone	2	Indicates that the player should do nothing.
AVPlayerActionAtItemEndPause	1	Indicates that the player should pause playing.

Status Constants

Constant	Value	Description
AVPlayerStatusFailed	2	Indicates that the player can no longer play AVPlayerItem instances because of an error. The error is described by the value of the player's error property.
AVPlayerStatusReadyToPlay	1	Indicates that the player is ready to play AVPlayerItem instances.
AVPlayerStatusUnknown	0	Indicates that the status of the player is not yet known because it has not tried to load new media resources for playback.

18.84 class AVPlayerMediaSelectionCriteriaMBS

18.84.1 class AVPlayerMediaSelectionCriteriaMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The AVPlayerMediaSelectionCriteria class specifies the preferred languages and media characteristics for an AVPlayer instance.
Notes: The languages and media characteristics of assets containing media selection options that an AVPlayer instance should attempt to select automatically when preparing and playing items. The languages and media characteristics are specified in the preferred order.

18.84.2 Methods

18.84.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.

18.84.4 Constructor(preferredLanguages() as string, preferredMediaCharacteristics() as string)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns an initialized media selection criteria instance with the specified settings.
Notes: preferredLanguages: An array of strings containing language identifiers, in the preferred order. Can be nil.
preferredMediaCharacteristics: An array of strings indicating additional media characteristics, the preferred order. Can be nil.
Supported media characteristics are defined in AVMediaSelectionOption Constants and Media Characteristics.

Returns an initialized AVPlayerMediaSelectionCriteria instance.

When making selections, AVPlayer treats the preferredLanguages as the paramount criterion and the preference for preferredMediaCharacteristics as secondary.

The objects in the preferredLanguages array are indicated using BCP 47 language identifiers or ISO 639-2/T language codes.

If no option with any of the preferredLanguages is available, a selection is made according to the default enabling and disabling of media options as stored in the asset.

The preferredMediaCharacteristics are used when selecting media for the AVPlayer.

For example, desirable characteristics of legible media may include AVMediaCharacteristicTranscribesSpokenDialogForAccessibility and AVMediaCharacteristicDescribesMusicAndSoundForAccessibility.

Similarly, desirable characteristics of audible media may include AVMediaCharacteristicDescribesVideoForAccessibility.

If no option is found that possesses all of the desired characteristics, the option that best matches the desired characteristics will be selected.
Available in OS X v10.9 and later.

18.84.5 preferredLanguages as String()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The array of preferred languages in the order of desirability. (read-only)
Notes: Available in OS X v10.9 and later.

18.84.6 preferredMediaCharacteristics as String()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The array of preferred media characteristics in the order of desirability. (read-only)
Notes: Available in OS X v10.9 and later.

18.84.7 Properties

18.84.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.85 class AVPlayerTimeObserverMBS

18.85.1 class AVPlayerTimeObserverMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The class for an observer.
Notes: You keep reference to this class, so you can cancel time observer later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.85.2 Methods

18.85.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.85.4 Destructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The destructor.
Notes: Automatically cancels this observer if it was not cancelled.

18.86 control AVPlayerViewControllerControlMBS

18.86.1 control AVPlayerViewControllerControlMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: iOS only.

Function: The control to host a AVPlayerViewControllerMBS.
Notes: A player view controller makes it simple to add media playback capabilities to your app that match the styling and features of the native system players. Using this object also means that your app automatically adopts the new features and styling of future operating system releases.

18.86.2 Properties

18.86.3 AVPlayerViewController as AVPlayerViewControllerMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: iOS only.

Function: The reference to the controller used for this control.
Notes: (Read only property)

18.86.4 View as NSViewMBS

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: iOS only.

Function: The used view.
Notes: (Read only property)

18.86.5 Events

18.86.6 Close

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to close.

18.86.7 DidStartPictureInPicture

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when Picture in Picture starts.

18.86.8 DidStopPictureInPicture

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when Picture in Picture stops.
Notes: Don,Äôt restore your app,Äôs user interface in your implementation of this method. Instead, do it in the restoreUserInterfaceForPictureInPictureStop method.

18.86.9 failedToStartPictureInPicture(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when Picture in Picture fails to start.
Notes: error: An error object that describes the failure.

18.86.10 GotFocus

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: The control got focus.
Notes: Not implemented.

18.86.11 LostFocus

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: The control lost focus.
Notes: Not implemented.

18.86.12 Open

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to was created and you can initialize it.

18.86.13 restoreUserInterfaceForFullScreenExit

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you to restore the app,Äôs user interface after returning from a full-screen presentation.

18.86.14 RestoreUserInterfaceForPictureInPictureStop

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when Picture in Picture is about to stop so you can restore your app,Äôs user interface.
Notes: Implement this method to reestablish your playback user interface when PiP ends. The framework calls this method no matter how PiP ends, whether it,Äôs because the user ended playback, the user tapped the button to return ongoing video playback to your app, or the video finished playing on its own.

18.86.15 ShouldAutomaticallyDismissAtPictureInPictureStart as Boolean

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Asks you whether the player view controller automatically dismisses itself when Picture in Picture starts.
Notes: Retrun true to indicate that the player view controller automatically dismisses itself; otherwise false.

Implement this method and return false to prevent the player view controller from automatically dismissing when Picture in Picture starts.

18.86.16 willBeginFullScreenPresentation

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when the player view controller is about to start full-screen display.
Notes: This method isn,Äôt called if you embed the player view controller as a child of the presented view controller.

18.86.17 willEndFullScreenPresentation

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when the player view controller is about to end full-screen display.

18.86.18 WillStartPictureInPicture

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when Picture in Picture is about to start.
Notes: Implement this method to update your player user interface, such as hiding or disabling playback controls, prior to PiP starting.

18.86.19 WillStopPictureInPicture

MBS iOS Plugin, Plugin Version: 25.1, Platform: iOS, Targets: Desktop & iOS.

Function: Tells you when Picture in Picture is about to stop.
Notes: Implement this method to update the state of your user interface, like presenting or enabling playback controls.

18.87 class AVPlayerViewControllerMBS

18.87.1 class AVPlayerViewControllerMBS

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A view controller that displays content from a player and presents a native user interface to control playback.
Notes: A player view controller makes it simple to add media playback capabilities to your app that match the styling and features of the native system players. Using this object also means that your app automatically adopts the new features and styling of future operating system releases.

18.87.2 Methods

18.87.3 Constructor

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The constructor.

18.87.4 Destructor

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The destructor.

18.87.5 Present

MBS iOS Plugin, Plugin Version: 25.2, Platform: iOS, Targets: iOS only.

Function: Presents the view controller fullscreen.

18.87.6 selectSpeed(speed as AVPlaybackSpeedMBS)

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Selects a specified playback speed.
Notes: If you call this method with a speed that isn,Äôt contained in the speeds property, the system ignores the call.

18.87.7 speeds as AVPlaybackSpeedMBS()

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A list of user-selectable playback speeds to show in the playback speed control.
Notes: By default, this property value equals systemDefaultSpeeds. Setting this property to an empty array hides the playback speed selection user interface.
To set the playback speed programmatically, call the selectSpeed method, or set the value of the defaultRate property on the view controller,Äôs associated player object.

18.87.8 VideoGravityResize as String

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The constants define how the video is displayed within a layer's bounds rectangle.
Notes: Specifies that the video should be stretched to fill the layer's bounds.

18.87.9 VideoGravityResizeAspect as String

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The constants define how the video is displayed within a layer's bounds rectangle.
Notes: Specifies that the player should preserve the video's aspect ratio and fit the video within the layer's bounds.

18.87.10 VideoGravityResizeAspectFill as String

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The constants define how the video is displayed within a layer's bounds rectangle.
Notes: Specifies that the player should preserve the video's aspect ratio and fill the layer's bounds.

18.87.11 Properties

18.87.12 allowsPictureInPicturePlayback as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the player allows Picture in Picture playback.
Notes: Set this value to false to disable Picture in Picture playback. The default value is true.
(Read and Write property)

18.87.13 allowsVideoFrameAnalysis as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether to perform video frame analysis.
Notes: If the value is true, a player view controller tries to find objects, text, and people when you pause media playback. If it finds an object, the user is able to interact with it using a long press to present a context menu.
The default value is true.
(Read and Write property)

18.87.14 canStartPictureInPictureAutomaticallyFromInline as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether Picture in Picture starts automatically when transitioning to the background when the view controller presents its content inline.
Notes: (Read and Write property)

18.87.15 contentOverlayView as NSViewMBS

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A view that displays between the video content and the playback controls.
Notes: Use the content overlay view to add noninteractive custom views, such as a logo or watermark, between the video content and the controls.
(Read only property)

18.87.16 entersFullScreenWhenPlaybackBegins as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the player automatically displays in full screen when the user taps the play button.
Notes: The default value is false.
(Read and Write property)

18.87.17 exitsFullScreenWhenPlaybackEnds as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the player exits full-screen mode when playback ends.
Notes: If you enqueue multiple player items, the player exits full-screen mode after it plays all remaining items in the queue.
The default value is false.
(Read and Write property)

18.87.18 player as Variant

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The player object that provides the media content for the view controller to display.
Notes: Value must be a AVPlayerMBS. We use variant to reduce dependency to other plugins.
(Read and Write property)

18.87.19 readyForDisplay as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the player item,Äôs first video frame is ready for display.
Notes: (Read only property)

18.87.20 requiresLinearPlayback as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the player allows the user to skip media content.
Notes: If this value is false (the default), the controller,Äôs user interface allows a user to fast-forward, scrub, or skip ahead to content later in the player,Äôs presentation. To prevent the user from skipping content—for example, while presenting a legal notice or other mandatory interstitial content—set this property,Äôs value to true.

To track when the player is presenting content for which you might require linear playback, use the interstitialTimeRanges property of the view controller,Äôs player item to define the time ranges of the interstitial content. The view controller then sends willPresentInterstitialTimeRange and didPresentInterstitialTimeRange events when the content is playing. Implement these methods to enable or disable the requiresLinearPlayback property as needed.
(Read and Write property)

18.87.21 selectedSpeed as AVPlaybackSpeedMBS

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The currently selected playback speed.
Notes: This value reflects the associated player,Äôs defaultRate property value. If you set the defaultRate to a value that doesn,Äôt match a speed contained in the speeds property, the system sets this value to nil.
(Read only property)

18.87.22 showsPlaybackControls as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the player view controller shows playback controls.
Notes: Set this property to false if you don,Äôt want the system-provided playback controls visible over your content. Hiding the playback controls can be useful in situations where you need a non-interactive video presentation, such as a video splash screen.
The default value is true.

Don,Äôt use this property to change the visibility of the playback controls while the player view controller is onscreen. Doing so creates or destroys user interface elements.
(Read and Write property)

18.87.23 showsTimecodes as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the player view displays timecodes, if available.
Notes: The default value is false.
(Read and Write property)

18.87.24 updatesNowPlayingInfoCenter as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the view controller updates Now Playing information.
Notes: (Read and Write property)

18.87.25 videoBounds as NSRectMBS

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: The size and position of the video image within the bounds of the view controller,Äôs view.
Notes: The size and position of this rectangle depend on the aspect ratio of the media (like 16:9 or 4:3), the bounds of the player view controller,Äôs view, and the view controller,Äôs videoGravity.
This property is key-value observable.
(Read only property)

18.87.26 videoGravity as String

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: A string that specifies how the video displays within the bounds of the view controller,Äôs view.
Notes: The player view controller supports the following video gravity values: VideoGravityResizeAspect, VideoGravityResizeAspectFill, and VideoGravityResize.
The default value is VideoGravityResizeAspect.
(Read and Write property)

18.87.27 Events

18.87.28 DidStartPictureInPicture

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when Picture in Picture starts.

18.87.29 DidStopPictureInPicture

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when Picture in Picture stops.
Notes: Don,Äôt restore your app,Äôs user interface in your implementation of this method. Instead, do it in the restoreUserInterfaceForPictureInPictureStop method.

18.87.30 failedToStartPictureInPicture(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when Picture in Picture fails to start.
Notes: error: An error object that describes the failure.

18.87.31 restoreUserInterfaceForFullScreenExit

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you to restore the app,Äôs user interface after returning from a full-screen presentation.

18.87.32 RestoreUserInterfaceForPictureInPictureStop

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when Picture in Picture is about to stop so you can restore your app,Äôs user interface.
Notes: Implement this method to reestablish your playback user interface when PiP ends. The framework calls this method no matter how PiP ends, whether it,Äôs because the user ended playback, the user tapped the button to return ongoing video playback to your app, or the video finished playing on its own.

18.87.33 ShouldAutomaticallyDismissAtPictureInPictureStart as Boolean

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Asks you whether the player view controller automatically dismisses itself when Picture in Picture starts.
Notes: Retrun true to indicate that the player view controller automatically dismisses itself; otherwise false.

Implement this method and return false to prevent the player view controller from automatically dismissing when Picture in Picture starts.

18.87.34 willBeginFullScreenPresentation

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when the player view controller is about to start full-screen display.
Notes: This method isn,Äôt called if you embed the player view controller as a child of the presented view controller.

18.87.35 willEndFullScreenPresentation

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when the player view controller is about to end full-screen display.

18.87.36 WillStartPictureInPicture

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when Picture in Picture is about to start.
Notes: Implement this method to update your player user interface, such as hiding or disabling playback controls, prior to PiP starting.

18.87.37 WillStopPictureInPicture

MBS iOS Plugin, Plugin Version: 25.0, Platform: iOS, Targets: iOS only.

Function: Tells you when Picture in Picture is about to stop.
Notes: Implement this method to update the state of your user interface, like presenting or enabling playback controls.

18.88 control AVPlayerViewControlMBS

18.88.1 control AVPlayerViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The player control for Mac.
Notes: AVPlayerView is a subclass of NSView that can be used to display the visual content of an AVPlayer object and the standard playback controls.
MBS Plugin wraps this as a control for Xojo.
Please notice this is 64-bit only and requires MacOS 10.9 or newer.

18.88.2 Methods

18.88.3 Available as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.

18.88.4 beginTrimming

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Sets the controls panel into trimming mode and blocks until the user selects either the Trim or the Cancel button.
Notes: Triggers TrimmingCompleted later.

18.88.5 flashChapterNumber(chapterNumber as Integer, chapterTitle as String)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Display the provided chapter number and title momentarily.
Notes: chapterNumber: The chapter number (required).
chapterTitle: The chapter title (optional).

18.88.6 Properties

18.88.7 actionPopUpButtonMenu as NSMenuMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The action popup menu.
Notes: Clients can set this property in order to show an action pop up button. Default is nil.
(Read and Write property)

18.88.8 allowsPictureInPicturePlayback as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Whether or not the receiver allows Picture in Picture playback.
Notes: Default is false.
Available in MacOS 10.15 or later.
(Read and Write property)

18.88.9 canBeginTrimming as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Whether or not the current media can be trimmed.
Notes: (Read only property)

18.88.10 contentOverlayView as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Use the content overlay view to add additional custom views between the video content and the controls.

Notes: (Read only property)

18.88.11 controlsStyle as Integer

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The style of the playback controls pane currently associated with the view.
Notes: (Read and Write property)

18.88.12 player as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The player from which to source the media content for the view.
Notes: (Read and Write property)

18.88.13 readyForDisplay as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Boolean indicating that the first video frame has been made ready for display for the current item of the associated AVPlayer.
Notes: (Read only property)

18.88.14 showsFrameSteppingButtons as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Replace scanning controls in the playback UI with frame stepping buttons.
Notes: Default is false.
(Read and Write property)

18.88.15 showsFullScreenToggleButton as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Whether or not the controls pane will show a full screen toggle button.
Notes: Default is false.
(Read and Write property)

18.88.16 showsSharingServiceButton as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Whether or not the controls pane will show a sharing service button when the current player item can be shared.
Notes: Default is false.
(Read and Write property)

18.88.17 showsTimecodes as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: If timecodes are available, allow the AVPlayerView controls to enter timecode mode.
Notes: Default is false.
Available in MacOS 10.15 or later.
(Read and Write property)

18.88.18 updatesNowPlayingInfoCenter as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Whether or not the now playing info center should be updated.
Notes: Default is true.
(Read and Write property)

18.88.19 videoBounds as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The current size and position of the video image as displayed within the receiver's view's bounds.
Notes: (Read only property)

18.88.20 videoGravity as String

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: A string defining how the video is displayed within an AVPlayerLayer bounds rect.
Notes: Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill and AVLayerVideoGravityResize. AVLayerVideoGravityResizeAspect is default.
See <AVFoundation/AVAnimation.h>for a description of these options.

(Read and Write property)

18.88.21 View as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The reference to the AVPlayerView object.
Notes: (Read only property)

18.88.22 Events

18.88.23 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

18.88.24 Close

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

18.88.25 Closing

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

18.88.26 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

18.88.27 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

18.88.28 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

18.88.29 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

18.88.30 FocusLost

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.88.31 FocusReceived

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

18.88.32 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

18.88.33 GotFocus

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

18.88.34 LostFocus

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.88.35 MenuBarSelected

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

18.88.36 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

18.88.37 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

18.88.38 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

18.88.39 Open

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

18.88.40 Opening

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

18.88.41 playerViewDidStartPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture did start.

18.88.42 playerViewDidStopPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture did stop.

18.88.43 playerViewFailedToStartPictureInPicture(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture failed to start.
Notes: error: An error describing why it failed.

18.88.44 playerViewRestoreUserInterfaceForPictureInPictureStop as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to restore the user interface before Picture in Picture stops.
Notes: Please return true if you restored it or false if not, so we can call completion handler passing the value.
Default is to pass true if you don't implement this event.

18.88.45 playerViewShouldAutomaticallyDismissAtPictureInPictureStart as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Control can implement this event and return false to prevent player view from automatically being miniaturized or losing focus when Picture in Picture starts.
Notes: If you implement this, please return true or false.
By default we return false if you don't

18.88.46 playerViewWillStartPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture will start.

18.88.47 playerViewWillStopPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture will stop.

18.88.48 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

18.88.49 TrimmingCompleted(result as Integer)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The event handler that is executed when the user selects either the Trim or Cancel button in the trimming UI.

18.88.50 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

18.88.51 Constants

Control Styles

Constant	Value	Description
ControlsStyleDefault	1	The default controls pane is associated with the view.
ControlsStyleFloating	2	The floating controls pane is associated with the view.
ControlsStyleInline	1	The inline controls pane is associated with the view.
ControlsStyleMinimal	3	The minimal controls pane is associated with the view.
ControlsStyleNone	0	No controls pane is associated with the view.

Trim Results

Constant	Value	Description
TrimCancelButton	1	The user selected the Cancel button.
TrimOKButton	0	The user selected the Trim button.

18.89 class AVQueuePlayerMBS

18.89.1 class AVQueuePlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVQueuePlayer is a subclass of AVPlayer you use to play a number of items in sequence.
Notes: Subclass of the AVPlayerMBS class.
Blog Entries

- News from the MBS Xojo Plugins Version 22.3
- MBS Xojo Plugins, version 22.3pr1

18.89.2 Methods

18.89.3 advanceToNextItem

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Ends playback of the current item and initiates playback of the next item in the player's queue.
Notes: This method also removes the current item from the play queue.

18.89.4 appendItem(item as AVPlayerItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Places given player item in the queue.
Notes: item: The item to be inserted.

18.89.5 canAppendItem(item as AVPlayerItemMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given player item can be appended into the player's queue.
Notes: item: The AVPlayerItem object to test.

Returns true if item can be appended to the queue, otherwise false.
Adding the same item to a player at more than one position in the queue is not supported.

18.89.6 canInsertItem(item as AVPlayerItemMBS, afterItem as AVPlayerItemMBS = nil) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given player item can be inserted into the player's queue.
Notes: item: The AVPlayerItem object to test.
afterItem: The item that item is to follow in the queue. Pass nil to test whether item can be appended to the queue.

Returns true if item can be appended to the queue, otherwise false.
Adding the same item to a player at more than one position in the queue is not supported.

18.89.7 Constructor(items() as AVPlayerItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an instance of AVQueuePlayer by enqueueing the player items from a given array.
Notes: items: An array of AVPlayerItem objects with which initially to populate the player's queue.
Creates an instance of AVQueuePlayer initialized to play the player items in items.

18.89.8 insertItem(item as AVPlayerItemMBS, afterItem as AVPlayerItemMBS = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Places given player item after a specified item in the queue.
Notes: item: The item to be inserted.
afterItem: The item that the newly inserted item should follow in the queue. Pass nil to append the item to the queue.

18.89.9 items as AVPlayerItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of the currently enqueued items.
Notes: The array contains AVPlayerItem objects.

18.89.10 queuePlayerWithItems(items() as AVPlayerItemMBS) as AVQueuePlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an instance of AVQueuePlayer initialized to play items from a given array.
Notes: items: An array of AVPlayerItem objects with which initially to populate the player's queue.

Returns an instance of AVQueuePlayer initialized to play the player items in items.

18.89.11 removeAllItems

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Removes all the items from the queue.
Notes: This has the side-effect of stopping playback by the player.

18.89.12 removeItem(item as AVPlayerItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Removes a given player item from the queue.
Notes: item: The item to be removed.

If item is currently playing, this has the same effect as advanceToNextItem.

18.90 class AVRouteDetectorMBS

18.90.1 class AVRouteDetectorMBS

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: An object that detects the presences of media playback routes.
Notes: When route detection is enabled, AVRouteDetector reports whether multiple playback routes have been detected. If this is the case, AVRoutePickerViewControlMBS can be used to allow users to pick from the set of available routes. By default, route detection is disabled.

Available on MacOS 10.13 or newer.

- 18.3, page 10: News

18.90.2 Methods

18.90.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: Whether to class is available.
Notes: Returns true on MacOS 10.13 or newer.

18.90.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: The constructor.

18.90.5 Destructor

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: The destructor

18.90.6 Properties

18.90.7 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

18.90.8 MultipleRoutesDetected as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether more playback routes than the local playback route have been detected.
Notes: When the value of this property changes MultipleRoutesDetectedDidChange event is called.
(Read only property)

18.90.9 RouteDetectionEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether route detection is enabled.
Notes: The default value is false.
Route detection significantly increases power consumption and must be turned off when it's no longer needed.
(Read and Write property)

18.90.10 Events

18.90.11 MultipleRoutesDetectedDidChange

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: The event called when MultipleRoutesDetected property changed.

18.91 control AVRoutePickerViewControlMBS

18.91.1 control AVRoutePickerViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: An object that displays controls for picking playback routes.
Notes: Available on MacOS 10.15 or newer.

Xojo Developer Magazine

- 18.3, page 10: News

18.91.2 Properties

18.91.3 player as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: The player for which to perform routing operations.
Notes: (Read and Write property)

18.91.4 routePickerButtonBordered as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: Whether or not the picker button has a border.
Notes: Default is true.
(Read and Write property)

18.91.5 View as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: The view object.
Notes: (Read only property)

18.91.6 Available as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.
Notes: (Read and Write computed property)

18.91.7 routePickerButtonColorForState(state as integer) as NSColorMBS

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: Defines the color for the button for a given state.
Notes: (Read and Write computed property)

18.91.8 Events

18.91.9 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

18.91.10 Close

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

18.91.11 Closing

Plugin Version: 20.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

18.91.12 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

18.91.13 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

18.91.14 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

18.91.15 DidEndPresentingRoutes

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: Tells you that the route picker view has finished presenting routes to the user.

18.91.16 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

18.91.17 FocusLost

Plugin Version: 20.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.91.18 FocusReceived

Plugin Version: 20.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

18.91.19 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

18.91.20 GotFocus

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

18.91.21 LostFocus

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.91.22 MenuBarSelected

Plugin Version: 20.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

18.91.23 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

18.91.24 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

18.91.25 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

18.91.26 Open

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

18.91.27 Opening

Plugin Version: 20.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

18.91.28 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

18.91.29 WillBeginPresentingRoutes

MBS AVFoundation Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop only.

Function: Tells you that the route picker view will start presenting routes to the user.

18.91.30 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

18.91.31 Constants

Button States

Constant	Value	Description
StateActive	2	Active state of the picker. The picker has this state when AirPlay is active.
StateActiveHighlighted	3	Highlighted state of the active picker. The picker has this state when it is highlighted and AirPlay is active.
StateNormal	0	Normal or default state of the picker.
StateNormalHighlighted	1	Highlighted state of the picker. The picker has this state when a mouse-down event occurs inside the button. It loses this highlight when a mouse-up event occurs.

18.92 class AVSampleBufferDisplayLayerMBS

18.92.1 class AVSampleBufferDisplayLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVSampleBufferDisplayLayer is a subclass of CALayer that can decompress and display compressed or uncompressed video frames.
Notes: Subclass of the CALayerMBS class.

18.92.2 Methods

18.92.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The default constructor.

18.92.4 enqueueSampleBuffer(sampleBuffer as CMSampleBufferMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sends a sample buffer for display.
Notes: If sampleBuffer has the kCMSampleAttachmentKey_DoNotDisplay attachment set to True, the frame will be decoded but not displayed. Otherwise, if sampleBuffer has the kCMSampleAttachmentKey_DisplayImmediately attachment set to True, the decoded image will be displayed as soon as possible, replacing all previously enqueued images regardless of their timestamps. Otherwise, the decoded image will be displayed at sampleBuffer's output presentation timestamp, as interpreted by the control timebase (or the mach_absolute_time timeline if there is no control timebase). To schedule the removal of previous images at a specific timestamp, enqueue a marker sample buffer containing no samples, with the kCMSampleBufferAttachmentKey_EmptyMedia attachment set to kCFBooleanTrue. IMPORTANT NOTE: attachments with the kCMSampleAttachmentKey_ prefix must be set via CMSampleBufferGetSampleAttachmentsArray and CFDictionarySetValue. Attachments with the kCMSampleBufferAttachmentKey_ prefix must be set via CMSetAttachment.

18.92.5 flush

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Instructs the layer to discard pending enqueued sample buffers.
Notes: It is not possible to determine which sample buffers have been decoded, so the next frame passed

to enqueueSampleBuffer should be an IDR frame (also known as a key frame or sync sample).

18.92.6 flushAndRemoveImage

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Instructs the layer to discard pending enqueued sample buffers and remove any currently displayed image.
Notes: It is not possible to determine which sample buffers have been decoded, so the next frame passed to enqueueSampleBuffer should be an IDR frame (also known as a key frame or sync sample).

18.92.7 requestMediaDataWhenReady(tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Instructs the target to invoke a client-supplied block repeatedly, at its convenience, in order to gather sample buffers for display.
Notes: The block should enqueue sample buffers to the layer either until the layer's readyForMoreMediaData property becomes false or until there is no more data to supply. When the layer has decoded enough of the media data it has received that it becomes ready for more media data again, it will invoke the block again in order to obtain more. If this function is called multiple times, only the last call is effective.
Call stopRequestingMediaData to cancel this request.
Each call to requestMediaDataWhenReady should be paired
with a corresponding call to stopRequestingMediaData. Releasing the
AVSampleBufferDisplayLayer without a call to stopRequestingMediaData will result in undefined behavior.
Calls SampleBufferDisplayLayerMediaDataWhenReady event on AVFoundationMBS class.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.92.8 stopRequestingMediaData

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancels any current requestMediaDataWhenReady call.
Notes: This method may be called from outside the block or from within the block.

18.92.9 Properties

18.92.10 isReadyForMoreMediaData as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the readiness of the layer to accept more sample buffers.
Notes: AVSampleBufferDisplayLayer keeps track of the occupancy levels of its internal queues for the benefit of clients that enqueue sample buffers from non-real-time sources – i.e., clients that can supply sample buffers faster than they are consumed, and so need to decide when to hold back. Clients enqueueing sample buffers from non-real-time sources may hold off from generating or obtaining more sample buffers to enqueue when the value of readyForMoreMediaData is false. It is safe to call enqueueSampleBuffer when readyForMoreMediaData is false, but it is a bad idea to enqueue sample buffers without bound. To help with control of the non-real-time supply of sample buffers, such clients can use requestMediaDataWhenReady in order to specify a block that the layer should invoke whenever it's ready for sample buffers to be appended.
The value of readyForMoreMediaData will often change from false to true asynchronously, as previously supplied sample buffers are decoded and displayed.
This property is not key value observable.
(Read only property)

18.92.11 videoGravity as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A string defining how the video is displayed within an AVSampleBufferDisplayLayer bounds rect.
Notes: Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill and AVLayerVideoGravityResize. AVLayerVideoGravityResizeAspect is default.
See AVFoundationMBS class for a description of these options.
(Read and Write property)

18.93 class AVSynchronizedLayerMBS

18.93.1 class AVSynchronizedLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVSynchronizedLayer a subclass of CALayer with layer timing that synchronizes with a specific AVPlayerItem.
Notes: You can create an arbitrary number of synchronized layers from the same AVPlayerItem object.

A synchronized layer is similar to a CATransformLayer object in that it doesn't display anything itself, it just confers state upon its layer subtree. AVSynchronizedLayer confers is timing state, synchronizing the timing of layers in its subtree with that of a player item.
Subclass of the CALayerMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.93.2 Methods

18.93.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.93.4 synchronizedLayerWithPlayerItem(playerItem as AVPlayerItemMBS) as AVSynchronizedLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new synchronized layer with timing synchronized with a given player item.
Notes: playerItem: A player item.

Returns a new synchronized layer with timing synchronized with playerItem.

18.93.5 Properties

18.93.6 playerItem as AVPlayerItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The player item to which the timing of the layer is synchronized.
Notes: (Read and Write computed property)

18.94 class AVTextStyleRuleMBS

18.94.1 class AVTextStyleRuleMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: AVTextStyleRule represents a set of text styling attributes that can be applied to some or all of the text of legible media, such as subtitles and closed captions..

18.94.2 Methods

18.94.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9.

18.94.4 Constructor(textMarkupAttributes as dictionary)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes.
Notes: textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable in text markup. Eligible keys are defined in <CoreMedia/CMTextMarkup.h>.
See also:

- 18.94.5 Constructor(textMarkupAttributes as dictionary, textSelector as string) 3873

18.94.5 Constructor(textMarkupAttributes as dictionary, textSelector as string)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes and an identifier for the range or ranges of text to which the attributes should be applied.
Notes: textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable in text markup. Eligible keys are defined in <CoreMedia/CMTextMarkup.h>.
textSelector: An identifier for the range or ranges of text to which the attributes should be applied. Eligible identifiers are determined by the format and content of the legible media. A value of nil indicates that the textMarkupAttributes should be applied as default styles for all text unless overridden by content markup or other applicable text selectors.
Returns an instance of AVTextStyleRule
See also:

- 18.94.4 Constructor(textMarkupAttributes as dictionary) 3873

18.94.6 copy as AVTextStyleRuleMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates a copy of the style rule.

18.94.7 textStyleRuleWithTextMarkupAttributes(textMarkupAttributes as Dictionary) as AVTextStyleRuleMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes..
Notes: textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable in text markup. Eligible keys are defined in <CoreMedia/CMTextMarkup.h>.
Returns an instance of AVTextStyleRule
Equivalent to invoking textStyleRuleWithTextMarkupAttributes with a value of nil for textSelector.
See also:

- 18.94.8 textStyleRuleWithTextMarkupAttributes(textMarkupAttributes as Dictionary, textSelector as string) as AVTextStyleRuleMBS 3874

18.94.8 textStyleRuleWithTextMarkupAttributes(textMarkupAttributes as Dictionary, textSelector as string) as AVTextStyleRuleMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates an instance of AVTextStyleRule with the specified text markup attributes and an identifier for the range or ranges of text to which the attributes should be applied.
Notes: textMarkupAttributes: A dictionary with keys representing text style attributes that are specifiable in text markup. Eligible keys are defined in <CoreMedia/CMTextMarkup.h>.
textSelector: An identifier for the range or ranges of text to which the attributes should be applied. Eligible identifiers are determined by the format and content of the legible media. A value of nil indicates that the textMarkupAttributes should be applied as default styles for all text unless overridden by content markup or other applicable text selectors.
Returns an instance of AVTextStyleRule
See also:

- 18.94.7 textStyleRuleWithTextMarkupAttributes(textMarkupAttributes as Dictionary) as AVTextStyleRuleMBS 3874

18.94.9 Properties

18.94.10 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.94.11 textMarkupAttributes as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A dictionary with keys representing text style attributes that are specifiable in text markup.
Notes: Eligible keys and the expected types of their corresponding values are defined in <CoreMedia/CMTextMarkup.h>.
(Read only property)

18.94.12 textSelector as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A string that identifies the range or ranges of text to which the attributes should be applied.
Notes: A value of nil indicates that the textMarkupAttributes should be applied as default styles for all text unless overridden by content markup or other applicable text selectors.
The syntax of text selectors is determined by the format of the legible media. Eligible selectors may be determined by the content of the legible media (e.g. CSS selectors that are valid for a specific WebVTT document).
(Read only property)

18.95 class AVTimeCodeMBS

18.95.1 class AVTimeCodeMBS

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: The class for a time code.
Notes: The data class used by AVAssetMBS.readTimeCodeObjects to store details on time codes.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 17.5pr9

Videos

- Presentation from Munich conference about MBS Plugins.

Xojo Developer Magazine

- 16.1, page 9: News

18.95.2 Methods

18.95.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: Private constructor.

18.95.4 Properties

18.95.5 duration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: The duration.
Notes: (Read only property)

18.95.6 frameNumber as Int64

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: The frame number.
Notes: (Read only property)

18.95.7 frameQuanta as UInt32

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: Returns the frames/sec for timecode (eg. 30) OR frames/tick for counter mode
Notes: (Read only property)

18.95.8 presentationTimeStamp as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: The earliest presentation timestamp.
Notes: (Read only property)

18.95.9 tcFlag as UInt32

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: The time zone flags.
Notes: Can be combination of

kDropFrame	1
k24HourMax	2
kNegTimesOK	4

(Read only property)

18.95.10 timecode as String

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: The timecode as formatted number.
Notes: Format is 2 digit hours, double colon, 2 digit minutes, double colon, 2 digit seconds, double colon, 2 digit frames.
e.g. "01:02:03:04"

(Read only property)

18.95.11 type as String

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: The type of timecode.
Notes: Can be tmcd for 32-bit time code or tc64 for 64-bit timecode.
(Read only property)

18.96 class AVTimedMetadataGroupMBS

18.96.1 class AVTimedMetadataGroupMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVTimedMetadataGroup object to represent a collection of metadata items.
Notes: AV Foundation also provides a mutable subclass, AVMutableTimedMetadataGroup.

18.96.2 Methods

18.96.3 Constructor(items() as AVMetadataItemMBS, timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a metadata group initialized with given metadata items.
Notes: items: An array of AVMetadataItem objects.
timeRange: The time range of the metadata contained in items.

18.96.4 copy as AVTimedMetadataGroupMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.96.5 items as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The metadata items in the group. (read-only)
Notes: The array contains instances of AVMetadataItem.

18.96.6 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range of the metadata. (read-only)

18.96.7 Properties

18.96.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.97 class AVURLAssetMBS

18.97.1 class AVURLAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVURLAsset is a concrete subclass of AVAsset that you use to initialize an asset from an URL..
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var u as AVURLAssetMBS = AVURLAssetMBS.URLAssetWithFile(f)
Var a() as AVAssetTrackMBS = u.tracks

MsgBox str(UBound(a)+1)+" tracks."
```

Notes: Subclass of the AVAssetMBS class.

18.97.2 Methods

18.97.3 audiovisualMIMETypes as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of the MIME types the AVURLAsset class understands.
Example:

```
MsgBox Join(AVURLAssetMBS.audiovisualMIMETypes, EndOfLine)
```

Notes: See also MimeTypeToFileExtensionMBS function.

18.97.4 audiovisualTypes as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of the file types the AVURLAsset class understands.
Example:

```
MsgBox Join(AVURLAssetMBS.audiovisualTypes, EndOfLine)
```

18.97.5 compatibleTrackForCompositionTrack(compositionTrack as AVCompositionTrackMBS) as AVAssetTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset track from which any time range can be inserted into a given composition track.
Notes: compositionTrack: The composition track for which a compatible AVAssetTrack object is requested.

Returns an asset track managed by the receiver from which any time range can be inserted into a given composition track.

You insert the track into using insertTimeRange (AVMutableCompositionTrack). This method is the logical complement of mutableTrackCompatibleWithTrack.

18.97.6 Constructor(File as folderitem, options as dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an asset for inspection of a resource referenced by a given file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var u as AVURLAssetMBS = new AVURLAssetMBS(f)
MsgBox str(U.duration.Seconds)+" seconds long"
```

Notes: file: A folderitem that references the container file to be represented by the asset.
options: A dictionary that contains options for the initialization of the asset.
See also:

- 18.97.7 Constructor(URL as string, options as dictionary = nil) 3882

18.97.7 Constructor(URL as string, options as dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an asset for inspection of a resource referenced by a given URL.
Notes: URL: An URL that references the container file to be represented by the asset.
options: A dictionary that contains options for the initialization of the asset.
See also:

- 18.97.6 Constructor(File as folderitem, options as dictionary = nil) 3882

18.97.8 isPlayableExtendedMIMEType(extendedMIMEType as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether an asset is playable with the codec(s) and container type specified in a given extended MIME type.
Notes: Returns true if an asset is playable with the codec(s) and container type specified in extendedMIME-Type, otherwise false.
See also FileExtensionToMimeTypeMBS function.

18.97.9 URLAssetWithFile(File as folderitem, options as dictionary = nil) as AVURLAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset for inspection of a resource referenced by a given file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var u as AVURLAssetMBS = AVURLAssetMBS.URLAssetWithFile(f)

MsgBox str(u.duration.Seconds)+" seconds video."
```

Notes: File: A folderitem that references the container file to be represented by the asset.
options: A dictionary that contains options for the initialization of the asset.

Returns an asset initialized for inspection of a resource referenced by folderitem.

18.97.10 URLAssetWithURL(URL as string, options as dictionary = nil) as AVURLAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset for inspection of a resource referenced by a given URL.
Notes: URL: An URL that references the container file to be represented by the asset.
options: A dictionary that contains options for the initialization of the asset.

Returns an asset initialized for inspection of a resource referenced by URL.

18.97.11 Properties

18.97.12 resourceLoader as AVAssetResourceLoaderMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The resource loader associated with the asset. (read-only)
Notes: During loading, the resource loader object may be asked to assist in the loading of a resource. For example, a resource that requires decryption might result in the resource loader being asked to provide the appropriate decryption keys. You can assign a delegate object to the resource loader object and use your delegate to intercept these requests and provide an appropriate response.
Available on Mac OS X 10.9 or later.
(Read only property)

18.97.13 URL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URL with which the asset was initialized. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var u as AVURLAssetMBS = new AVURLAssetMBS(f)
MsgBox u.URL
```

Notes: (Read only property)

18.98 class AVVideoCompositingMBS

18.98.1 class AVVideoCompositingMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The AVVideoCompositing protocol defines properties and methods that custom video compositors must implement.
Notes: For each AV Foundation object of class AVPlayerItem, AVAssetExportSession, AVAssetImageGenerator, or AVAssetReaderVideoCompositionOutput that has a non-nil value for its videoComposition property, and the value of the customVideoCompositorClass property of the AVVideoComposition is not nil, AV Foundation creates and uses an instance of that custom video compositor class to process the instructions contained in the AVVideoComposition.

The custom video compositor instance will be created when you assign videoComposition an instance of AVVideoComposition that's associated with a different custom video compositor class than the object was previously using.

When creating instances of custom video compositors, AV Foundation initializes them by calling init and then makes them available as the value of the customVideoCompositor property of the object to which it was assigned. You then can do any additional setup or configuration to the custom compositor.

Custom video compositor instances will then be retained by the AV Foundation object for as long as the value of its videoComposition property indicates that an instance of the same custom video compositor class should be used, even if the value is changed from one instance of AVVideoComposition to another instance that's associated with the same custom video compositor class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.5pr3

18.98.2 Methods

18.98.3 cancelAllPendingVideoCompositionRequests

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Directs a custom video compositor object to cancel or finish all pending video composition requests.
Notes: Upon receiving this message, a custom video compositor must block until it has either cancelled all pending frame requests, and called the finishCancelledRequest method for each of them. If cancellation is not possible, the method must block until it has finished processing of all the frames and called the finishWithComposedVideoFrame method for each of them.
Available in OS X v10.9 and later.

18.98.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The private constructor.
Notes: Initializes an instance of the class that implements the video compositing protocol. (required)
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

18.98.5 renderContextChanged(newRenderContext as AVVideoCompositionRenderContextMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Invoked to notify the custom compositor that a composition will switch to a different render context. (required)
Notes: newRenderContext: The new render context that will be handling video composition.

Instances of classes implementing the AVVideoComposting protocol must implement this method to be notified when the AVVideoCompositionRenderContext instance handing a video composition changes. AVVideoCompositionRenderContext instances being immutable, such a change will occur every time there is a change in the video composition parameters.
Available in OS X v10.9 and later.

18.98.6 startVideoCompositionRequest(asyncVideoCompositionRequest as AVAsynchronousVideoCompositionRequestMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Directs a custom video compositor object to create a new pixel buffer composed asynchronously from a collection of sources. (required)
Notes: asyncVideoCompositionRequest: An instance of AVAsynchronousVideoCompositionRequest that provides context for the requested composition.

The custom compositor is expected to invoke, either subsequently or immediately, the asyncVideoCompositionRequest object's finishWithComposedVideoFrame or finishWithError methods.

If you intend to finish rendering the frame after handling of this message returns, you must retain asyncVideoCompositionRequest until after composition is finished.

Note that if the custom compositor's implementation of this method returns without finishing the composition immediately, it may be invoked again with another composition request before the prior request

is finished; in such cases the custom compositor should be prepared to manage multiple composition requests.

If the rendered frame is exactly the same as one of the source frames, with no letterboxing, pillboxing or cropping needed, then the appropriate source pixel buffer may be returned, after CFRetain has been called on it).
Available in OS X v10.9 and later.

18.98.7 Properties

18.98.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.98.9 requiredPixelBufferAttributesForRenderContext as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns the pixel buffer attributes required by the video compositor for new buffers created for processing. (required) (read-only)
Notes: The property is required to provide a kCVPixelBufferPixelFormatTypeKey key in the dictionary, along with attributes for which the compositor needs specific values to work properly. Omitted attributes will be supplied by the composition engine to allow for the best performance. If the attribute kCVPixelBufferPixelFormatTypeKey key is not in the dictionary an exception will be raised. The value of the kCVPixelBufferPixelFormatTypeKey is an array of kCVPixelFormatType_* constants as defined in Pixel_Format_Types.

The value of requiredPixelBufferAttributesForRenderContext is retrieved prior to the creation of a new render context; the combination of the attributes in the returned value and the additional attributes supplied by the composition engine will be used in the creation of subsequent render context's pixelBuffers.

This property is queried once before any composition request is sent to the compositor. Changing required buffer attributes afterwards is not supported.
Available in OS X v10.9 and later.
(Read only property)

18.98.10 sourcePixelBufferAttributes as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns the kinds of source frame pixel buffer attributes a video compositor can accept as input. (required) (read-only)
Notes: The property is required to provide a kCVPixelBufferPixelFormatTypeKey key in the dictionary, along with attributes for which the compositor needs specific values to work properly. Omitted attributes will be supplied by the composition engine to allow for the best performance. If the attribute kCVPixelBufferPixelFormatTypeKey key is not in the dictionary an exception will be raised. The value of the kCVPixelBufferPixelFormatTypeKey is an array of kCVPixelFormatType_* constants as defined in Pixel_Format_Types.

If the custom compositor is meant to be used with an AVVideoCompositionCoreAnimationTool created using the videoCompositionCoreAnimationToolWithAdditionalLayer:asTrackID: method, kCVPixelFormatType_32BGRA should be included as one of the supported pixel format types.

Missing attributes will be set by the composition engine to values allowing the best performance.

This property is queried once before any composition request is sent to the compositor. Changing source buffer attributes afterwards is not supported.
Available in OS X v10.9 and later.
(Read only property)

18.99 class AVVideoCompositionCoreAnimationToolMBS

18.99.1 class AVVideoCompositionCoreAnimationToolMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVVideoCompositionCoreAnimationTool object to incorporate Core Animation in a video composition.
Notes: Any animations will be interpreted on the video's timeline, not real-time, so you should:

1. Set animations' beginTime property to 1e-100 rather than 0 (which CoreAnimation replaces with CACurrentMediaTime);
2. Set animations' removedOnCompletion property to false so they are not automatically removed.

18.99.2 Methods

18.99.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.99.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The default constructor.

18.99.5 videoCompositionCoreAnimationToolWithAdditionalLayer(layer as CALayerMBS, trackID as Integer) as AVVideoCompositionCoreAnimationToolMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Add a Core Animation layer to the video composition.
Notes: layer: The Core Animation layer to add.
trackID: A track ID to identify the track.

trackID should not match any real trackID in the source.

Return a new animation tool for the layer.

You use this method to include a Core Animation layer as an individual track input in video composition. Video composition instructions should reference trackID where the rendered animation should be included.

18.99.6 videoCompositionCoreAnimationToolWithPostProcessingAsVideoLayer(videoLayer as CALayerMBS, animationLayer as CALayerMBS) as AVVideoCompositionCoreAnimationToolMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Composes the composited video frames with a Core Animation layer.
Notes: videoLayer: A video layer.
animationLayer: An animation layer.

Returns a new animation tool for the composition.
Place composited video frames in videoLayer and render animationLayer to produce the final frame.

18.99.7 videoCompositionCoreAnimationToolWithPostProcessingAsVideoLayers(videoLayers() as CALayerMBS, animationLayer as CALayerMBS) as AVVideoCompositionCoreAnimationToolMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Composes the composited video frames with the Core Animation layer.
Notes: videoLayers: An array containing the video layers
animationLayer: The animation layer.

Returns a new AVVideoCompositionCoreAnimationTool instance with the composited video frames and the rendered animation layer.

Duplicates the composited video frames in each videoLayer and renders animationLayer to produce the final frame. The videoLayers should be in animationLayer's sublayer tree.

The animationLayer should not come from, or be added to, another layer tree.
Available in OS X v10.9 and later.

18.99.8 Properties

18.99.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.100 class AVVideoCompositionInstructionMBS

18.100.1 class AVVideoCompositionInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVVideoCompositionInstruction object represents an operation to be performed by a compositor.
Notes: An AVVideoComposition object maintains an array of instructions to perform its composition.

The is a specialty with the AVFoundation framework: There is a class and an interface with same name. The plugin only has one class for both.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.5pr3

18.100.2 Methods

18.100.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.100.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.100.5 copy as AVVideoCompositionInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.100.6 mutableCopy as AVMutableVideoCompositionInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates an editable copy of the object.

18.100.7 requiredSourceTrackIDs as Integer()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An array of video track IDs required to compose frames for this instruction. (required) (read-only)
Notes: Available in OS X v10.9 and later.

18.100.8 Properties

18.100.9 containsTweening as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A Boolean value that returns whether the composition contains tweening. (required) (read-only)
Notes: If YES, rendering a frame from the same source buffers and the same composition instruction at two different compositionTime may yield different output frames. If NO, two such compositions will yield the same frame.

The media pipeline may be able to avoid some duplicate processing when this property is set to false.
Available in OS X v10.9 and later.
(Read only property)

18.100.10 enablePostProcessing as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether post processing is required for the video composition instruction. (read-only)
Notes: A value of false indicates that no post processing is required for the whole duration of the video composition instruction. The composition process is more efficient if the value is false.

The value is true by default.
(Read only property)

18.100.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.100.12 passthroughTrackID as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns the track ID if a single source frame should be displayed for the duration of the instruction. (required) (read-only)
Notes: If for the duration of the instruction, the video composition result is one of the source frames, this property returns the corresponding track ID. The compositor won't be run for the duration of the instruction and the proper source frame is used instead.

The dimensions, clean aperture and pixel aspect ratio of the source buffer are matched to the required values automatically.
Available in OS X v10.9 and later.
(Read only property)

18.100.13 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range during which the instruction is effective. (read-only)
Notes: If the time range is invalid, the video compositor will ignore it.
(Read only property)

18.101 class AVVideoCompositionLayerInstructionMBS

18.101.1 class AVVideoCompositionLayerInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVVideoCompositionLayerInstruction object represents the transform and opacity ramps to apply to a given track.

18.101.2 Methods

18.101.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.101.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The default constructor.

18.101.5 copy as AVVideoCompositionLayerInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.101.6 getCropRectangleRampForTime(time as CMTimeMBS, byref startCropRectangle as CGRectMBS, byref endCropRectangle as CGRectMBS, byref timeRange as CMTimeRangeMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Obtains the crop rectangle ramp that includes the specified time.
Notes: time: If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.

startCropRectangle: A CGRect to receive the starting crop rectangle value for the crop rectangle ramp.
endCropRectangle: A CGRect to receive the ending crop rectangle value for the crop rectangle ramp.
timeRange: A CMTimeRange to receive the time range of the crop rectangle ramp.

Returns false will be returned if the specified time is beyond the duration of the last crop rectangle ramp that has been set.
Available in OS X v10.9 and later.

18.101.7 getOpacityRampForTime(time as CMTimeMBS, byref startOpacity as Double, byref endOpacity as Double, byref timeRange as CMTimeRangeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Obtains the opacity ramp that includes a specified time.
Notes: time: If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.
startOpacity: a float to receive the starting opacity value for the opacity ramp.
endOpacity: a float to receive the ending opacity value for the opacity ramp.
timeRange: a CMTimeRange to receive the time range of the opacity ramp.

Returns true if values are returned successfully, otherwise false. False is returned if time is beyond the duration of the last opacity ramp that has been set.

18.101.8 getTransformRampForTime(time as CMTimeMBS, byref startTransform as CGAffineTransformMBS, byref endOpacity as CGAffineTransformMBS, byref timeRange as CMTimeRangeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Obtains the transform ramp that includes a specified time.
Notes: time
If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.
startTransform: A float to receive the starting transform value for the transform ramp.
endTransform: A float to receive the ending transform value for the transform ramp.
timeRange: A CMTimeRange to receive the time range of the transform ramp.
Returns true if values are returned successfully, otherwise false. False is returned if time is beyond the duration of the last transform ramp that has been set.

18.101.9 mutableCopy as AVMutableVideoCompositionLayerInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates an editable copy of the object.

18.101.10 trackID as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The trackID of the source track to which the compositor will apply the instruction. (read-only)

18.101.11 Properties

18.101.12 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.102 class AVVideoCompositionMBS

18.102.1 class AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVVideoComposition object represents an immutable video composition.
Notes: The AVFoundation framework also provides a mutable subclass, AVMutableVideoComposition, that you can use to create new videos.

18.102.2 Methods

18.102.3 animationTool as AVVideoCompositionCoreAnimationToolMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A video composition tool to use with Core Animation in offline rendering. (read-only)
Notes: This attribute may be nil.

You set an animation tool if you are using the composition in conjunction with AVAssetExportSession for offline rendering, rather than with AVPlayer.

18.102.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.102.5 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.

18.102.6 copy as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.102.7 frameDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The interval for which the video composition should render composed video frames. (read-only)
Notes: This property only applies when the composition is enabled.

18.102.8 instructions as AVVideoCompositionInstructionMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The video composition instructions. (read-only)
Notes: The array contains of instances of AVVideoCompositionInstruction.

For the first instruction in the array, timeRange.start must be less than or equal to the earliest time for which playback or other processing will be attempted (typically kCMTimeZero). For subsequent instructions, timeRange.start must be equal to the prior instruction's end time. The end time of the last instruction must be greater than or equal to the latest time for which playback or other processing will be attempted (typically be the duration of the asset with which the instance of AVVideoComposition is associated).

18.102.9 isValidForAsset(asset as AVAssetMBS, timerange as CMTimeRangeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the time ranges of the composition's instructions conform to validation requirements.
Notes: asset: An AVAsset object, if you wish to validate the time ranges of the instructions against the duration of the asset and the track IDs of the layer instructions against the asset's tracks. Pass nil to skip that validation.
timeRange: A time range.
Only those instructions with time ranges that overlap with this time range will be validated. To validate all instructions that may be used for playback or other processing, regardless of time range, pass CMTimeRangeMake(kCMTimeZero, kCMTimePositiveInfinity).

Returns true if the time ranges of the composition's instructions conform to validation requirements, otherwise false.

This method may call events videoCompositionShouldContinueValidatingAfterFindingInvalidValueForKey,

videoCompositionShouldContinueValidatingAfterFindingInvalidTrackIDInInstruction, videoCompositionShouldContinueValidatingAfterFindingInvalidTimeRangeInInstruction or videoCompositionShouldContinueValidatingAfterFindingEmptyTimeRange on AVFoundationMBS class.

In the course of validation, the receiver will invoke its events (if there is one) with reference to any trouble spots in the video composition.

This method raises an exception if the event modifies the receiver's array of instructions or the array of layer instructions of any AVVideoCompositionInstruction object contained therein during validation.

18.102.10 mutableCopy as AVMutableVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates an editable copy of the object.

18.102.11 renderSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The size at which the video composition should render. (read-only)
Notes: This property only applies when the composition is enabled.

18.102.12 videoCompositionWithPropertiesOfAsset(asset as AVAssetMBS) as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates and returns a video composition object configured to present the video tracks of the specified asset.
Notes: asset: The asset whose configuration matches the intended use of the video composition.

Returns a new video composition object.

This method creates the video composition object and configures it with the values and instructions suitable for presenting the video tracks of the specified asset. The returned object contains instructions that respect the spatial properties and time ranges of the specified asset's video tracks. It also configures the object properties in the following way:

- The value of the frameDuration property is set to a value short enough to accommodate the greatest nominal frame rate value among the asset's video tracks, as indicated by the nominalFrameRate property of each track. If all of the asset tracks have a nominal frame rate of 0, a frame rate of 30 frames per second is used, with the frame duration set accordingly.
- The value assigned to the renderSize property depends on whether the asset is an AVComposition object. If it is, the value is set to the value of the naturalSize property of the composition. If it is not, the value is set to a value that encompasses all of the asset's video tracks.
- The value of the renderScale property is set to 1.0.
- The value of the animationTool property is set to nil.

Available in OS X v10.9 and later.

18.102.13 Properties

18.102.14 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.103 class AVVideoCompositionRenderContextMBS

18.103.1 class AVVideoCompositionRenderContextMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The AVVideoCompositionRenderContext class defines the context within which custom compositors render new output pixels buffers.
Notes: An instance of AVVideoCompositionRenderContext provides size and scaling information and offers a service for efficiently providing pixel buffers from a managed pool of buffers.
Available in OS X v10.9 and later.

18.103.2 Methods

18.103.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 or later.

18.103.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The constructor.

18.103.5 newPixelBuffer as CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns a pixel buffer to use for rendering.
Notes: The buffer's kCVImageBufferCleanApertureKey and kCVImageBufferPixelAspectRatioKey attachments are set to match the current composition processor properties.
You are responsible for calling CVBufferRelease on the pixel buffer.
Available in OS X v10.9 and later.

18.103.6 Properties

18.103.7 edgeWidths as AVEdgeWidthsMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The thickness of the edge processing region on the left, top, right and bottom edges, in pixels. (read-only)
Notes: Available in OS X v10.9 and later.
(Read only property)

18.103.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.103.9 highQualityRendering as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The rendering quality to use. (read-only)
Notes: Specifies that the custom compositor should use higher quality, potentially slower algorithms.
Generally this property is true for non-real-time use cases.
Available in OS X v10.9 and later.
(Read only property)

18.103.10 pixelAspectRatio as AVPixelAspectRatioMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The pixel aspect ratio for rendered frames. (read-only)
Notes: Available in OS X v10.9 and later.
(Read only property)

18.103.11 renderScale as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A scaling ratio that is applied when rendering frames. (read-only)

Notes: Available in OS X v10.9 and later.
(Read only property)

18.103.12 renderTransform as CGAffineTransformMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Transform to apply to the source image (read-only)
Notes: The transform to apply to the source image incorporating the renderScale, pixelAspectRatio, and edgeWidths.
The coordinate system origin is the top left corner of the buffer.
Available in OS X v10.9 and later.
(Read only property)

18.103.13 size as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The width and height for rendering frames. (read-only)
Notes: Available in OS X v10.9 and later.
(Read only property)

18.103.14 videoComposition as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The video composition being rendered.
Notes: Available in OS X v10.9 and later.
(Read only property)

18.104 class CMFormatDescriptionMBS

18.104.1 class CMFormatDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The class for a format description.
Notes: CMFormatDescriptions are immutable Core Foundation objects that describe media data of various types, including audio, video, and muxed media data. There are two types of API: media-type-agnostic APIs (supported by all CMFormatDescriptions) and media-type-specific APIs. The media-type-agnostic APIs are prefixed with CMFormatDescription, and the media-type-specific APIs are prefixed with CMAudioFormat-Description CMVideoFormatDescription, and so on.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.104.2 Methods

18.104.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.104.4 Equal(other as CMFormatDescriptionMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Checks if two descriptions are equal.

18.104.5 Extensions as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Queries extensions to the description.

18.104.6 MediaSubType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Queries media sub type.

18.104.7 MediaType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Queries media type.

18.104.8 Name as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Queries the name of this format description.

18.104.9 Properties

18.104.10 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.105 class CMSampleBufferMBS

18.105.1 class CMSampleBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: CMSampleBuffers are CF objects containing zero or more compressed (or uncompressed) samples of a particular media type (audio, video, muxed, etc), that are used to move media sample data through the media system.
Notes: A CMSampleBuffer can contain a CMBlockBuffer of one or more media samples or a CVImageBuffer, a reference to the format description for the stream of CMSampleBuffers, size and timing information for each of the contained media samples, and both buffer-level and sample-level attachments. The buffer-level attachments of a CMSampleBuffer are distinct from the attachments of its contained CMBlockBuffer. An example of a sample-level attachment is an annotation about video frame dependencies (eg. "droppable", "other frames depend on me", "I depend on other frames", etc). Each sample (video frame) in the CMSampleBuffer would need its own attachment in this case. Another sample-level attachment example is SMPTE timecode acquired during capture. To get and set a CMSampleBuffer's buffer-level attachments, use the APIs in in CMAttachmentBearer.h (CMGetAttachment et al).
It is possible for a CMSampleBuffer to describe samples it does not yet contain. For example, some media services may have access to sample size, timing and format information before the data is read. Such services may create CMSampleBuffers with that information and insert them into queues early, and attach (or fill) the CMBlockBuffers of media data later, when the data becomes ready. To this end, CMSampleBuffers have the concept of data-readiness, which can be tested, set, forced to become ready "now", etc. It is also possible for a CMSampleBuffer to contain nothing but a special buffer-level attachment that describes a media stream event (eg. "discontinuity: drain and reset decoder before processing the next CMSampleBuffer"). Such a special attachment can also be attached to regular CMSampleBuffers (ie. that contain media sample data), and if so, the event it describes is defined to occur after the samples in that CMSampleBuffer.

The MBS Plugin implements a subset of what's available. If you need more, please do not hesitate to contact us.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.105.2 Methods

18.105.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.105.4 Copy as CMSampleBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.105.5 CopySampleBufferForRange(pos as Integer, len as Integer) as CMSampleBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a CMSampleBuffer containing a range of samples from an existing CMSampleBuffer.
Notes: Samples containing non-interleaved audio are currently not supported.

18.105.6 Invalidate

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Makes the sample buffer invalid, calling any installed invalidation callback.
Notes: An invalid sample buffer cannot be used – all accessors will return kCMSampleBufferError_Invalidated.
It is not a good idea to do this to a sample buffer that another module may be accessing concurrently.
Example of use: the invalidation callback could cancel pending I/O.

18.105.7 MakeDataReady

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Makes a CMSampleBuffer's data ready, by calling the client's MakeDataReadyCallback.
Notes: The CMSampleBufferMakeDataReadyCallback is passed in by the client during creation. It must return 0 if successful, and in that case, CMSampleBufferMakeDataReady will set the data readiness of the CMSampleBuffer to true. Example of usage: when it is time to actually use the data. Example of callback routine: a routine to force a scheduled read to complete. If the CMSampleBuffer is not ready, and there is no CMSampleBufferMakeDataReadyCallback to call, kCMSampleBufferError_BufferNotReady will be returned. Similarly, if the CMSampleBuffer is not ready, and the CMSampleBufferMakeDataReadyCallback fails and returns an error, kCMSampleBufferError_BufferNotReady will be returned.

18.105.8 SampleSize(index as Integer) as UInt64

MBS AVFoundation Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Returns the size in bytes of a specified sample in a CMSampleBuffer.
Notes: Size in bytes of the specified sample in the CMSampleBuffer.
If the sample index is not in the range 0 .. numSamples-1, a size of 0 will be returned. If there are no sample sizes in this CMSampleBuffer, a size of 0 will be returned. This will be true, for example, if the samples in the buffer are non-contiguous (eg. non-interleaved audio, where the channel values for a single sample are scattered through the buffer), or if this CMSampleBuffer contains a CVImageBuffer.

18.105.9 SetDataReady

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Marks a CMSampleBuffer's data as "ready".
Notes: There is no way to undo this operation. The only way to get an "unready" CMSampleBuffer is to call CMSampleBufferCreate with the dataReady parameter set to false. Example of usage: in a read completion routine.

18.105.10 Properties

18.105.11 DataIsReady as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns whether or not a CMSampleBuffer's data is ready.
Notes: Whether or not the CMSampleBuffer's data is ready. True is returned for special marker buffers, even though they have no data. False is returned if there is an error.
(Read only property)

18.105.12 DecodeTimeStamp as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the numerically earliest decode timestamp of all the samples in a CMSampleBuffer.
Notes: The returned decode timestamp is always the decode timestamp of the first sample in the buffer, since even out-of-presentation-order samples are expected to be in decode order in the buffer.
Numerically earliest sample decode timestamp in the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.
(Read only property)

18.105.13 Duration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the total duration of a CMSampleBuffer.
Notes: If the buffer contains out-of-presentation-order samples, any gaps in the presentation timeline are not represented in the returned duration.
The returned duration is simply the sum of all the individual sample durations.
Returns the duration of the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.
(Read only property)

18.105.14 FormatDescription as CMFormatDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the format description of the samples in a CMSampleBuffer.
Notes: Nil is returned if there is an error.
(Read only property)

18.105.15 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.105.16 ImageBuffer as CVImageBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a CMSampleBuffer's CVImageBuffer of media data.
Notes: The result will be nil if the CMSampleBuffer does not contain a CVImageBuffer, if the CMSampleBuffer contains a CMBlockBuffer, or if there is some other error.
(Read only property)

18.105.17 IsValid as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Queries whether a sample buffer is still valid.
Notes: Returns false if buffer is nil or Invalidate was called, true otherwise.
Does not perform any kind of exhaustive validation of the sample buffer.

(Read only property)

18.105.18 Lasterror as Integer

MBS AVFoundation Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The last error code.
Notes: See error code constants.
Looking with debugger on properties of this class will change the lasterror code!
(Read and Write property)

18.105.19 NumberOfSamples as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the number of media samples in a CMSampleBuffer.
Notes: The number of media samples in the CMSampleBuffer. 0 is returned if there is an error.
(Read only property)

18.105.20 OutputDecodeTimeStamp as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the output decode timestamp of the CMSampleBuffer.
Notes: For consistency with OutputPresentationTimeStamp, this is calculated as: OutputPresentationTimeStamp + ((DecodeTimeStamp - PresentationTimeStamp) / SpeedMultiplier).
CMInvalidTime is returned if there is an error.
(Read only property)

18.105.21 OutputDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the output duration of a CMSampleBuffer.
Notes: The OutputDuration is the duration minus any trimmed duration, all divided by the SpeedMultiplier: (Duration - TrimDurationAtStart - TrimDurationAtEnd) / SpeedMultiplier
Returns the output duration of the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.
(Read only property)

18.105.22 OutputPresentationTimeStamp as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the output presentation timestamp of the CMSampleBuffer.
Notes: The output presentation timestamp is the time at which the decoded, trimmed, stretched and possibly reversed samples should commence being presented.
If CMSampleBufferSetOutputPresentationTimeStamp has been called to explicitly set the output PTS, CMSampleBufferGetOutputPresentationTimeStamp returns it.
If not, CMSampleBufferGetOutputPresentationTimeStamp calculates its result as (PresentationTimeStamp + TrimDurationAtStart) unless kCMSampleBufferAttachmentKey_Reverse is kCFBooleanTrue, in which case it calculates the result as (PresentationTimeStamp + Duration - TrimDurationAtEnd).
These are generally correct for un-stretched, un-shifted playback.
For general forward playback in a scaled edit, the OutputPresentationTimeStamp should be set to:
((PresentationTimeStamp + TrimDurationAtStart - EditStartMediaTime) / EditSpeedMultiplier) + EditStartTrackTime.
For general reversed playback:
((PresentationTimeStamp + Duration - TrimDurationAtEnd - EditStartMediaTime) / EditSpeedMultiplier) + EditStartTrackTime.
Returns kCMTimeInvalid is returned if there is an error.
(Read and Write property)

18.105.23 PresentationTimeStamp as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the numerically earliest presentation timestamp of all the samples in a CMSampleBuffer.
Notes: For in-presentation-order samples, this is the presentation timestamp of the first sample.
For out-of-presentation-order samples, this is the presentation timestamp of the sample that will be presented first, which is not necessarily the first sample in the buffer.
Returns numerically earliest sample presentation timestamp in the CMSampleBuffer. kCMTimeInvalid is returned if there is an error.
(Read only property)

18.105.24 Text as String

MBS AVFoundation Plugin, Plugin Version: 15.4, Platform: macOS, Targets: All.

Function: For text samples, provides the text.
Notes: (Read only property)

18.105.25 TotalSampleSize as UInt64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the total size in bytes of sample data in a CMSampleBuffer.
Notes: If there are no sample sizes in this CMSampleBuffer, a size of 0 will be returned.
(Read only property)

18.105.26 Constants

Error Codes

Constant	Value	Description
kAllocationFailed	-12730	An allocation failed.
kAlreadyHasDataBuffer	-12732	Attempt was made to set a dataBuffer on a CMSampleBuffer that already ha one.
kArrayTooSmall	-12737	Output array was not large enough for the array being requested.
kBufferHasNoSampleSizes	-12735	Attempt to get sample size information when there was none.
kBufferHasNoSampleTimingInfo	-12736	Attempt to get sample timing information when there was none.
kBufferNotReady	-12733	Buffer could not be made ready.
kCannotSubdivide	-12739	Sample buffer does not contain sample sizes. This can happen when the sample in the buffer are non-contiguous (eg. non-interleaved audio, where the channe values for a single sample are scattered through the buffer).
kInvalidated	-12744	the sample buffer was invalidated.
kInvalidEntryCount	-12738	Timing info or size array entry count was not 0, 1, or numSamples.
kInvalidMediaFormat	-12743	The format of the given media does not match the given format descriptio (eg. a format description paired with a CVImageBuffer that fails CMVideo FormatDescriptionMatchesImageBuffer).
kInvalidMediaTypeForOperation	-12741	The media type specified by a format description is not valid for the give operation (eg. a CMSampleBuffer with a non-audio format description passe to GetAudioStreamPacketDescriptions).
kInvalidSampleData	-12742	Buffer contains bad data. Only returned by CMSampleBuffer functions tha inspect its sample data.
kRequiredParameterMissing	-12731	Nil or 0 was passed for a required parameter.
kSampleIndexOutOfRange	-12734	Sample index was not between 0 and numSamples-1, inclusive.
kSampleTimingInfoInvalid	-12740	Buffer unexpectedly contains a non-numeric sample timing info.

18.106 class CMTimeMappingMBS

18.106.1 class CMTimeMappingMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A class to specify the mapping of a segment of one time line into another.
Notes: A CMTimeMapping specifies the mapping of a segment of one time line (called the source) into another time line (called the target). When used for movie edit lists, the source time line is the media and the target time line is the track or movie.

18.106.2 Methods

18.106.3 Constructor(source as CMTimeRangeMBS, target as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes the time mapping object.

18.106.4 Properties

18.106.5 Source as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range on the source time line.
Notes: For an empty edit, source.start is an invalid CMTime, in which case source.duration is ignored. Otherwise, source.start is the starting time within the source, and source.duration is the duration of the source timeline to be mapped to the target time range.
(Read and Write property)

18.106.6 Target as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range on the target time line.
Notes: If target.duration and source.duration are different, then the source segment should be played at the rate source.duration /target.duration to fit.
(Read and Write property)

18.107 class CMTimeMBS

18.107.1 class CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: CMTime is a class representing times (either timestamps or durations).
Example:

```
Var t as new CMTimeMBS(1200, 600)
MsgBox t.Description
```

Notes: A CMTime is represented as a rational number, with a numerator (an int64 value), and a denominator (an int32 timescale). Conceptually, the timescale specifies the fraction of a second each unit in the numerator occupies. Thus if the timescale is 4, each unit represents a quarter of a second; if the timescale is 10, each unit represents a tenth of a second, and so on. In addition to a simple time value, a CMTime can represent non-numeric values: +infinity, -infinity, and indefinite. Using a flag CMTime indicates whether the time been rounded at some point.

CMTimes contain an epoch number, which is usually set to 0, but can be used to distinguish unrelated timelines: for example, it could be incremented each time through a presentation loop, to differentiate between time N in loop 0 from time N in loop 1.

Additional functions for managing dates and times are described in Time Utilities Reference. Note that CMTime is designed for media timelines whereas functions in Time Utilities Reference are designed for working with wall-clock time in Core Foundation framework; see also AV Foundation Constants Reference.

- 12.2, page 45: Moving to AVFoundation, Leaving QuickTime behind by Christian Schmitz

18.107.2 Methods

18.107.3 AbsoluteValue as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the absolute value of a CMTime.
Notes: Same as the argument time, with sign inverted if negative.

18.107.4 Add(other as CMTimeMBS) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the sum of two CMTimes.
Notes: self: CMTime to be added.
other: Another CMTime to be added.
Returns the sum of the two CMTimes (addend1 + addend2).

If the operands both have the same timescale, the timescale of the result will be the same as the operands' timescale. If the operands have different timescales, the timescale of the result will be the least common multiple of the operands' timescales. If that LCM timescale is greater than kCMTimeMaxTimescale, the result timescale will be kCMTimeMaxTimescale, and default rounding will be applied when converting the result to this timescale. If the result value overflows, the result timescale will be repeatedly halved until the result value no longer overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale == 1, then the result will be either positive or negative infinity, depending on the direction of the overflow.

If any rounding occurs for any reason, the result's kCMTimeFlags_HasBeenRounded flag will be set. This flag will also be set if either of the operands has kCMTimeFlags_HasBeenRounded set. If either of the operands is invalid, the result will be invalid. If the operands are valid, but just one operand is infinite, the result will be similarly infinite. If the operands are valid, and both are infinite, the results will be as follows:

+infinity + +infinity == +infinity
-infinity + -infinity == -infinity

+infinity + -infinity == invalid

-infinity + +infinity == invalid

If the operands are valid, not infinite, and either or both is indefinite, the result will be indefinite. If the two operands are numeric (i.e.. valid, not infinite, not indefinite), but have different nonzero epochs, the result will be invalid. If they have the same nonzero epoch, the result will have epoch zero (a duration). Times in different epochs cannot be added or subtracted, because epoch length is unknown. Times in epoch zero are considered to be durations and can be added to times in other epochs. Times in different epochs can be compared, however, because numerically greater epochs always occur after numerically lesser epochs.

18.107.5 Compare(other as CMTimeMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the numerical relationship of two CMTimes.
Notes: self: First CMTime in comparison.

other: Second CMTime in comparison.

Returns the numerical relationship of the two CMTimes.

-1 is returned if time1 is less than time2.
1 is returned if time1 is greater than time2.
0 is returned if time1 and time2 are equal.

If the two CMTimes are numeric (i.e.. not invalid, infinite, or indefinite), and have different epochs, it is considered that times in numerically larger epochs are always greater than times in numerically smaller epochs. Since this routine will be used to sort lists by time, it needs to give all values (even invalid and indefinite ones) a strict ordering to guarantee that sort algorithms terminate safely. The order chosen is somewhat arbitrary: -infinity <all finite values <indefinite <+infinity <invalid

Invalid CMTimes are considered to be equal to other invalid CMTimes, and greater than any other CMTime. Positive infinity is considered to be less than any invalid CMTime, equal to itself, and greater than any other CMTime. An indefinite CMTime is considered to be less than any invalid CMTime, less than positive infinity, equal to itself, and greater than any other CMTime. Negative infinity is considered to be equal to itself, and less than any other CMTime.

18.107.6 Constructor(Value as Int64, Timescale as Integer, Flags as Integer = 1, Epoch as Int64 = 0)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a new time object with the given field values.
Example:

```
Var t as new CMTimeMBS(1200, 600)
MsgBox t.Description
```

18.107.7 ConvertScale(newTimescale as Integer, RoundingMethod as Integer = 1) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new CMTime containing the source CMTime converted to a new timescale (rounding as requested).
Example:

```
Var t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(123.4, 600)
Var u as CMTimeMBS = t.ConvertScale(300, t.kCMTimeRoundingMethod_Default)
MsgBox t.Description+EndOfLine+u.Description
```

Notes: self: Source CMTime.
newTimescale: The timescale to which the source CMTime is converted.
RoundingMethod: The requested rounding method.

Returns the converted CMTime.
If the value needs to be rounded, the kCMTimeFlags_HasBeenRounded flag will be set. See constants for a discussion of the various rounding methods available. If the source time is non-numeric (i.e.. infinite, indefinite, invalid), the result will be similarly non-numeric.

18.107.8 Description as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a description of the time.
Example:

```
Var t as new CMTimeMBS(1200, 600)
MsgBox t.Description
```

18.107.9 kCMTimeIndefinite as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Predefined time.
Notes: Use this constant to initialize an indefinite CMTime (for example, the duration of a live broadcast). Do not test against this using (time = kCMTimeIndefinite), there are many CMTimes other than this that are also indefinite. Use time.IsIndefinite instead.

18.107.10 kCMTimeInvalid as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Predefined time.
Example:

```
Var t as CMTimeMBS = CMTimeMBS.kCMTimeInvalid
MsgBox "Invalid: "+str(t.IsInvalid)
```

Notes: Use this constant to initialize an invalid CMTime.
All fields are 0. Do not test against this using (time = kCMTimeInvalid), there are many CMTimes other

than this that are also invalid. Use time.IsInvalid instead.

18.107.11 kCMTimeNegativeInfinity as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Predefined time.
Notes: Use this constant to initialize a CMTime to -infinity.
Do not test against this using (time = kCMTimeNegativeInfinity), there are many CMTimes other than this that are also -infinity. Use time.IsNegativeInfinity instead.

18.107.12 kCMTimePositiveInfinity as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Predefined time.
Notes: Use this constant to initialize a CMTime to +infinity.
Do not test against this using (time = kCMTimePositiveInfinity), there are many CMTimes other than this that are also +infinity. Use time.IsPositiveInfinity instead.

18.107.13 kCMTimeZero as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Predefined time.
Notes: Use this constant to initialize a CMTime to 0.
Do not test against this using (time = kCMTimeZero), there are many CMTimes other than this that are also 0. Use time.Compare(kCMTimeZero) instead.

18.107.14 Make(value as Int64, timescale as Integer) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Makes a valid CMTime with value and timescale.
Example:

```
Var t as CMTimeMBS = CMTimeMBS.Make(1234, 600)
MsgBox t.Description
```

Notes: Epoch is implied to be 0.

value: Initializes the value field of the resulting CMTime.
timescale: Initializes the timescale field of the resulting CMTime.

Returns the resulting CMTime

18.107.15 MakeWithEpoch(value as Int64, timescale as Integer, Epoch as Int64) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Makes a valid CMTime with value, scale and epoch.
Notes: value: Initializes the value field of the resulting CMTime.
timescale: Initializes the scale field of the resulting CMTime.
epoch: Initializes the epoch field of the resulting CMTime.

Returns the resulting CMTime.

18.107.16 MakeWithSeconds(seconds as Double, preferredTimeScale as Int32 = 600) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Makes a CMTime from a Float number of seconds, and a preferred timescale.
Example:

```
Var t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(123.4, 600)
MsgBox t.Description
```

Notes: seconds: Initializes the seconds field of the resulting CMTime.
preferredTimeScale: Initializes the preferredTimeScale field of the resulting CMTime.

Returns the resulting CMTime.

The epoch of the result will be zero. If preferredTimeScale is <= 0, the result will be an invalid CMTime. If the preferred timescale will cause an overflow, the timescale will be halved repeatedly until the overflow goes away, or the timescale is 1. If it still overflows at that point, the result will be +/- infinity. The kCMTimeFlags_HasBeenRounded flag will be set if the result, when converted back to seconds, is not exactly equal to the original seconds value.

18.107.17 Maximum(t1 as CMTimeMBS, t2 as CMTimeMBS) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the greater of two CMTimes.
Example:

```
Var t1 as new CMTimeMBS(1200, 600)
Var t2 as new CMTimeMBS(70, 30)

Var mi as CMTimeMBS = CMTimeMBS.Minimum(t1,t2)
Var ma as CMTimeMBS = CMTimeMBS.Maximum(t1,t2)

MsgBox "with "+t1.Description+_
" and "+t2.description+_
" the minimum is "+mi.Description+_
" and maximum is "+ma.Description
```

18.107.18 Minimum(t1 as CMTimeMBS, t2 as CMTimeMBS) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the lesser of two CMTimes.
Example:

```
Var t1 as new CMTimeMBS(1200, 600)
Var t2 as new CMTimeMBS(70, 30)

Var mi as CMTimeMBS = CMTimeMBS.Minimum(t1,t2)
Var ma as CMTimeMBS = CMTimeMBS.Maximum(t1,t2)

MsgBox "with "+t1.Description+_
" and "+t2.description+_
" the minimum is "+mi.Description+_
" and maximum is "+ma.Description
```

18.107.19 Multiply(multiplier as Integer) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the product of a CMTime and a 32-bit integer.
Example:

```
Var t as new CMTimeMBS(1200, 600)
MsgBox str(T.Seconds)+" seconds"
t = t.Multiply(2)
```

```
MsgBox str(T.Seconds)+" seconds"
```

Notes: self: The CMTime that will be multiplied.
multiplier: A 32-bit integer. CMTime time and multiplier will be multiplied.

Returns the product of the CMTime and the 32-bit integer.

The result will have the same timescale as the CMTime operand. If the result value overflows, the result timescale will be repeatedly halved until the result value no longer overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale == 1, then the result will be either positive or negative infinity, depending on the direction of the overflow. If any rounding occurs for any reason, the result's kCMTimeFlags_HasBeenRounded flag will be set. This flag will also be set if the CMTime operand has kCMTimeFlags_HasBeenRounded set. If the CMTime operand is invalid, the result will be invalid. If the CMTime operand is valid, but infinite, the result will be infinite, and of an appropriate sign, give the signs of both operands. If the CMTime operand is valid, but indefinite, the result will be indefinite.

18.107.20 MultiplyByFloat(multiplier as Double) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the product of a CMTime and a 64-bit float.
Example:

```
Var t as new CMTimeMBS(1200, 600)
MsgBox str(T.Seconds)+" seconds"
t = t.MultiplyByFloat(2.0)
MsgBox str(T.Seconds)+" seconds"
```

Notes: time: The CMTime that will be multiplied.
multiplier: A 64-bit float. CMTime time and multiplier will be multiplied.

Returns the product of the CMTime and the 64-bit float.

The result will initially have the same timescale as the CMTime operand. If the result timescale is less than 65536, it will be repeatedly doubled until it is at least 65536. If the result value overflows, the result timescale will be repeatedly halved until the result value no longer overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale == 1, then the result will be either positive or negative infinity, depending on the direction of the overflow. If any rounding occurs for any reason, the result's kCMTimeFlags_HasBeenRounded flag will be set. This flag will also be set if the CMTime operand has kCMTimeFlags_HasBeenRounded set. If the CMTime operand is invalid, the result will be invalid. If the CMTime operand is valid, but infinite, the result will be infinite, and of an appropriate sign, given the signs of both operands. If the CMTime operand is valid, but indefinite,

the result will be indefinite.

18.107.21 Show

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Prints a description of the CMTime.
Example:

```
Var t as new CMTimeMBS(1200, 600)
t.show
```

18.107.22 Subtract(other as CMTimeMBS) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the difference of two CMTimes.
Notes: self: The CMTime from which the subtrahend will be subtracted.
other: The CMTime that will be subtracted from the minuend.

Returns the difference of the two CMTimes (minuend - subtrahend).

If the operands both have the same timescale, the timescale of the result will be the same as the operands' timescale. If the operands have different timescales, the timescale of the result will be the least common multiple of the operands' timescales. If that LCM timescale is greater than kCMTimeMaxTimescale, the result timescale will be kCMTimeMaxTimescale, and default rounding will be applied when converting the result to this timescale.

If the result value overflows, the result timescale will be repeatedly halved until the result value no longer overflows. Again, default rounding will be applied when converting the result to this timescale. If the result value still overflows when timescale = 1, then the result will be either positive or negative infinity, depending on the direction of the overflow.

If any rounding occurs for any reason, the result's kCMTimeFlags_HasBeenRounded flag will be set. This flag will also be set if either of the operands has kCMTimeFlags_HasBeenRounded set. If either of the operands is invalid, the result will be invalid. If the operands are valid, but just one operand is infinite, the result will be similarly infinite. If the operands are valid, and both are infinite, the results will be as follows:

+infinity - +infinity == invalid
-infinity - -infinity == invalid
+infinity - -infinity == +infinity
-infinity - +infinity == -infinity

If the operands are valid, not infinite, and either or both is indefinite, the result will be indefinite. If the two operands are numeric (i.e.. valid, not infinite, not indefinite), but have different nonzero epochs, the result will be invalid. If they have the same nonzero epoch, the result will have epoch zero (a duration). Times in different epochs cannot be added or subtracted, because epoch length is unknown. Times in epoch zero are considered to be durations and can be subtracted from times in other epochs. Times in different epochs can be compared, however, because numerically greater epochs always occur after numerically lesser epochs.

18.107.23 Properties

18.107.24 Epoch as Int64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The epoch of the CMTime.
Notes: You use the epoch to differentiate between equal timestamps that are actually different because of looping, multi-item sequencing, and so on.
The epoch is used during comparison: greater epochs happen after lesser ones. Addition or subtraction is only possible within a single epoch, however, since the epoch length may be unknown or variable.

The epoch is typically 0, but you might use a different value, for example, in a loop.
(Read and Write property)

18.107.25 Flags as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A bitfield representing the flags set for the CMTime.
Notes: For example, kCMTimeFlags_Valid. See constants for possible values.
(Read and Write property)

18.107.26 HasBeenRounded as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given time has been rounded.
Notes: Returns true if the CMTime has been rounded, otherwise false (the time is completely accurate).
(Read only property)

18.107.27 IsIndefinite as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns whether a CMTime is indefinite.
Notes: Returns true if the CMTime is indefinite, false if it is not.
(Read only property)

18.107.28 IsInvalid as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given time is invalid.
Example:

```
Var t as new CMTimeMBS(1200, 600)
MsgBox "Invalid: "+str(t.IsInvalid)

t = CMTimeMBS.kCMTimeInvalid
MsgBox "Invalid: "+str(t.IsInvalid)
```

Notes: Returns true if the CMTime is invalid, otherwise false.
(Read only property)

18.107.29 IsNegativeInfinity as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given time is negative infinity.
Notes: Returns true if the CMTime is negative infinity, otherwise false.

Use this instead of (myTime = kCMTimeNegativeInfinity), since there are many CMTime structs that represent positive infinity. This is because the non-flags fields are ignored, so they can contain anything.
(Read only property)

18.107.30 IsNumeric as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given time is numeric.
Notes: Returns true if the CMTime is numeric, otherwise false. Returns false if the CMTime is invalid, indefinite, or +/- infinity.

A numeric time contains a usable value/timescale/epoch.
(Read only property)

18.107.31 IsPositiveInfinity as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given time is positive infinity.
Notes: Returns true if the CMTime is positive infinity, otherwise false.

Use this instead of (myTime = kCMTimePositiveInfinity), since there are many CMTime structs that represent positive infinity. This is because the non-flags fields are ignored, so they can contain anything.
(Read only property)

18.107.32 IsValid as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given time is valid.
Example:

```
Var t as new CMTimeMBS(1200, 600)
MsgBox "valid: "+str(t.IsValid)
```

Notes: Return true if the CMTime is valid, otherwise false.
(Read only property)

18.107.33 Seconds as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The number of seconds.
Example:

```
Var t as new CMTimeMBS(1200, 600)
t.show
```

Notes: If the CMTime is invalid or indefinite, NaN is returned. If the CMTime is infinite, +/- infinity is returned. If the CMTime is numeric, epoch is ignored, and time.value / time.timescale is returned. The division is done in Float64, so the fraction is not lost in the returned result.
(Read only property)

18.107.34 Timescale as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The timescale of the CMTime.
Notes: value/timescale = seconds.
(Read and Write property)

18.107.35 Value as Int64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The value of the CMTime.
Notes: value/timescale = seconds.
(Read and Write property)

18.107.36 Constants

Constants

Constant	Value	Description
kCMTimeMaxTimescale	&h7fffffff	A constant to define the maximum timescale.

Flags

Constant	Value	Description
kCMTimeFlags_HasBeenRounded	2	Indicates that the time has been rounded.
kCMTimeFlags_ImpliedValueFlagsMask	28	Indicates that the time is +infinity, -infinity, or indefinite. Use this value with bitwiseAnd on the flags.
kCMTimeFlags_Indefinite	16	Indicates that the time is indefinite.
kCMTimeFlags_NegativeInfinity	8	Indicates that the time is -infinity.
kCMTimeFlags_PositiveInfinity	4	Indicates that the time is +infinity.
kCMTimeFlags_Valid	1	Indicates that the time is valid.

Rounding Methods

Constant	Value	Description
kCMTimeRoundingMethod_Default	1	Synonym for kCMTimeRoundingMethod_RoundH
kCMTimeRoundingMethod_QuickTime	4	Use kCMTimeRoundingMethod_RoundTowardZer to smaller scale (that is, from more precision to les TimeRoundingMethod_RoundAwayFromZero if c larger scale (i.e. from less precision to more precisio Also, never round a negative number down to 0; magnitude negative CMTime in this case (-1/newT
kCMTimeRoundingMethod_RoundAwayFromZero	3	Round away from zero if abs(fraction) is >0.
kCMTimeRoundingMethod_RoundHalfAwayFromZero	1	Round towards zero if abs(fraction) is <0.5, away fr 0.5.
kCMTimeRoundingMethod_RoundTowardNegativeInfinity	6	Round towards -infinity if fraction is not 0.
kCMTimeRoundingMethod_RoundTowardPositiveInfinity	5	Round towards +infinity if fraction is not 0.
kCMTimeRoundingMethod_RoundTowardZero	2	Round towards zero if fraction is not 0.

18.108 class CMTimeRangeMBS

18.108.1 class CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The class that represent time ranges.
Example:

```
Var t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5) // start at 5
Var d as CMTimeMBS = CMTimeMBS.MakeWithSeconds(10) // duration 10
Var r as CMTimeRangeMBS = CMTimeRangeMBS.Make(t,d)
```

Notes: A CMTimeRange is represented as two CMTime structs, one that specifies the start time of the range and another that specifies the duration of the range. A time range does not include the end time that would be calculated by adding the duration to the start time.

18.108.2 Methods

18.108.3 AllTimeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a special timerange to cover all times.
Notes: From zero to infinity.

18.108.4 Constructor(start as CMTimeMBS, duration as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a new range with given values.
Example:

```
Var t as CMTimeMBS = new CMTimeMBS( 5*600, 600, kCMTimeFlags_Valid) // start at 5
Var d as CMTimeMBS = new CMTimeMBS(10*600, 600, kCMTimeFlags_Valid) // duration 10
Var r as CMTimeRangeMBS = new CMTimeRangeMBS(t,d)
```

18.108.5 ContainsTime(time as CMTimeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether a time is contained within a time range.
Notes: time: CMTime to be tested for inclusion.
Returns true if the specified time is contained within the specified time range, false if it is not.

This function returns a Boolean value that indicates whether the time specified by the time parameter is contained within the range specified by the range parameter.

18.108.6 ContainsTimeRange(timeRange as CMTimeRangeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean that indicates whether a given time range is contained within another time range.
Notes: range1: The CMTimeRange being interrogated.
range2: CMTimeRange to be tested for inclusion.

Returns true if the second time range is contained within the first time range, false if it is not.
This function returns a Boolean value that indicates whether the time range specified by the range1 parameter contains the range specified by the range2 parameter.

18.108.7 Description as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a String with a description of a CMTimeRange.

18.108.8 Equal(range1 as CMTimeRangeMBS, range2 as CMTimeRangeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether two CMTimeRanges are identical.
Notes: range1: CMTimeRange to be compared for equality.
range2: Another CMTimeRange to be compared for equality.

Returns true if the two time ranges are identical, false if they differ.
This function returns a Boolean value that indicates whether the time ranges specified by the range1 and range2 parameters are identical.

18.108.9 Intersection(range1 as CMTimeRangeMBS, range2 as CMTimeRangeMBS) as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the intersection of two CMTimeRanges.
Notes: range1: CMTimeRange to be intersected.
range2: Another CMTimeRange to be intersected.

Returns the intersection of the two CMTimeRanges.
This function returns a CMTimeRange structure that represents the intersection of the time ranges specified by the range1 and range2 parameters. This is the largest range that both ranges include.

18.108.10 kCMTimeRangeInvalid as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Use this constant to generate an invalid CMTimeRange.

18.108.11 kCMTimeRangeZero as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Use this constant to generate an empty CMTimeRange at 0.

18.108.12 Make(start as CMTimeMBS, duration as CMTimeMBS) as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a valid CMTimeRange with the given start time and duration.
Example:

```
Var t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5) // start at 5
Var d as CMTimeMBS = CMTimeMBS.MakeWithSeconds(10) // duration 10
Var r as CMTimeRangeMBS = CMTimeRangeMBS.Make(t,d)
```

Notes: start: CMTime for initializing the start field of the resulting CMTimeRange.
duration: CMTime for initializing the duration field of the resulting CMTimeRange.

Returns the resulting CMTimeRange.

The duration parameter must have an epoch of 0; otherwise an invalid time range will be returned.

18.108.13 Show

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Prints a description of the CMTimeRange to stderr (similar to CFShow).

18.108.14 TimeRangeFromTimeToTime(start as CMTimeMBS, EndTime as CMTimeMBS) as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a valid CMTimeRange from the given start and end time.
Notes: start: CMTime structure representing start time for creating the range.
EndTime: CMTime structure representing end time for creating the range.
Returns the resulting CMTimeRange.

18.108.15 Union(range1 as CMTimeRangeMBS, range2 as CMTimeRangeMBS) as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the union of two CMTimeRanges.
Notes: range1: CMTimeRange to be unified.
range2: Another CMTimeRange to be unified.

Returns the union of the two CMTimeRanges.

This function returns a CMTimeRange that represents the union of the time ranges specified by the range1 and range2 parameters. This is the smallest range that includes all times that are in either range.

18.108.16 Properties

18.108.17 Duration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The duration.

Notes: (Read and Write property)

18.108.18 EndTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a CMTime structure representing the end of a time range.
Notes: range: The CMTimeRange from which to find the end of time range.
Returns a CMTime representing the end of the specified time range.

This function returns a CMTime structure that indicates the end of the time range specified by the range parameter. ContainsTime(range, range.EndTime) is always false.
(Read only property)

18.108.19 IsEmpty as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given CMTimeRange has a duration of 0.
Notes: Returns true if range has a duration of 0; otherwise, false.
(Read only property)

18.108.20 IsIndefinite as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given CMTimeRange is indefinite.
Notes: Returns true if range is indefinite; otherwise, false.
An indefinite time range has either an indefinite start or an indefinite duration, or both.
(Read only property)

18.108.21 IsInvalid as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given CMTimeRange is invalid.
Notes: Returns true if range is invalid; otherwise, false.
(Read only property)

18.108.22 IsValid as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given CMTimeRange is valid.
Notes: Returns true if range is valid; otherwise, false.
(Read only property)

18.108.23 Start as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The start time.
Notes: (Read and Write property)

18.109 class CVImageBufferMBS

18.109.1 class CVImageBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Core Video image buffers provides a convenient interface for managing different types of image data.
Example:

```
Var p as new Picture(300, 200)
Var b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width)+" x "+str(b.Height)
```

Notes: Pixel buffers and Core Video OpenGL buffers derive from the Core Video image buffer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.109.2 Methods

18.109.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.109.4 JPEG(CompressionFactor as Double = 0.8) as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns JPEG compressed image data.
Notes: Compression Factor is in range from 0 to 1.0.
Returns memoryblock with jpeg data or nil in case of error.

18.109.5 Properties

18.109.6 CIImage as Variant

MBS AVFoundation Plugin, Plugin Version: 13.2, Platforms: macOS, iOS, Targets: All.

Function: The CIImage object for drawing into picture.
Notes: Each time you call this function a new CIImage object is created, so cache it if possible.
Value is a CIImageMBS. We use variant to reduce dependency to other plugins.
(Read only property)

18.109.7 Context as CGContextMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The CGContext for this picture.
Notes: (Read only property)

18.109.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

18.109.9 IsFlipped as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns whether the image is flipped vertically or not.
Notes: True if 0,0 in the texture is upper left, false if 0,0 is lower left.
(Read only property)

18.109.10 Lasterror as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The last error.
Notes: (Read and Write property)

18.109.11 NSImage as Variant

MBS AVFoundation Plugin, Plugin Version: 15.2, Platforms: macOS, iOS, Targets: All.

Function: Queries image buffer as NSImageMBS object.
Notes: Result is NSImageMBS object or nil in case of error.
(Read only property)

18.109.12 Picture as Picture

MBS AVFoundation Plugin, Plugin Version: 13.2, Platforms: macOS, iOS, Targets: All.

Function: The picture this image buffer references to.
Notes: (Read only property)

18.110 class CVPixelBufferMBS

18.110.1 class CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Core Video pixel buffer is an image buffer that holds pixels in main memory.
Example:

```
Var p as new Picture(300, 200)
Var b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width)+" x "+str(b.Height)
```

Notes: Applications generating frames, compressing or decompressing video, or using Core Image can all make use of Core Video pixel buffers.
Subclass of the CVImageBufferMBS class.

18.110.2 Methods

18.110.3 BaseAddressOfPlane(planeIndex as Integer) as Ptr

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the base address of the plane at the specified plane index.
Notes: planeIndex: The index of the plane.

Returns the base address of the plane, or NULL for nonplanar pixel buffers.
Retrieving the base address for a pixel buffer requires that the buffer base address be locked by a successful call to LockBaseAddress.

18.110.4 BytesPerRowOfPlane(planeIndex as Integer) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the number of bytes per row for a plane at the specified index in the pixel buffer.
Notes: planeIndex: The index of the plane whose bytes-per-row value you want to obtain.

Returns the number of row bytes of the plane, or nil for nonplanar pixel buffers.

18.110.5 CIImage as Variant

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates CIImageMBS object for given pixel buffer.
Notes: Value is a CIImageMBS. We use variant to reduce dependency to other plugins.

18.110.6 Constructor(pic as picture)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a pixel buffer for a picture.
Example:

```
// Let's test the class:

// get a picture
Var p As Picture = LogoMBS(500)

// load into CVPixelBufferMBS
Var c As New CVPixelBufferMBS(p)

// ask back as JPEG
Var JPEGData As MemoryBlock = c.JPEG(0.8)

// show it
ImageViewer1.Image = Picture.FromData(JPEGData)
```

Notes: Only for Cocoa target.
This function takes the existing picture and creates a pixelbuffer referencing it. Also we setup the CGContext object and stores it in Context property. Also picture property is set to the current picture.

Implemented for iOS in version 22.3 of MBS Plugin.

18.110.7 Constructor(Width as Integer, Height as Integer, PixelFormat as Integer, data as MemoryBlock, bytesPerRow as Integer, pixelBufferAttributes as Dictionary)

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a pixel buffer for a given size and pixel format containing data specified by a memory location.
Notes: width: The width of the pixel buffer, in pixels.
height: The height of the pixel buffer, in pixels.
pixelFormatType: The pixel format identified by its respective four character code
baseAddress: The memoryblock referenced by the PixelBuffer with the data.
bytesPerRow: The row bytes of the pixel storage memory.
pixelBufferAttributes: A Core Foundation dictionary with additional attributes for a pixel buffer. This parameter is optional.

Returns a Core Video result code. See Core Video Constants for possible values.
Some of the parameters specified in this call override equivalent pixel buffer attributes. For example, if you define the kCVPixelBufferWidth and kCVPixelBufferHeight keys in the pixel buffer attributes parameter (pixelBufferAttributes), these values are overridden by the width and height parameters.
See also:

- 18.110.6 Constructor(pic as picture) 3939
- 18.110.8 Constructor(Width as Integer, Height as Integer, PixelFormat as Integer, pixelBufferAttributes as Dictionary) 3941
- 18.110.9 Constructor(Width as Integer, Height as Integer, PixelFormat as String, data as MemoryBlock, bytesPerRow as Integer, pixelBufferAttributes as Dictionary) 3941
- 18.110.10 Constructor(Width as Integer, Height as Integer, PixelFormat as String, pixelBufferAttributes as Dictionary) 3942

18.110.8 Constructor(Width as Integer, Height as Integer, PixelFormat as Integer, pixelBufferAttributes as Dictionary)

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a single pixel buffer for a given size and pixel format.
Notes: width: Width of the pixel buffer, in pixels.
height: Height of the pixel buffer, in pixels.
pixelFormatType: The pixel format identified by its respective four-character code.
pixelBufferAttributes: A dictionary with additional attributes for a pixel buffer. This parameter is optional.

Raises exception on failure with error code included.

This function allocates the necessary memory based on the pixel dimensions, format, and extended pixels described in the pixel buffer,Äôs attributes.

Some of the parameters specified in this call override equivalent pixel buffer attributes. For example, if you define the kCVPixelBufferWidth and kCVPixelBufferHeight keys in the pixel buffer attributes parameter (pixelBufferAttributes), these values are overridden by the width and height parameters.

18.110.9 Constructor(Width as Integer, Height as Integer, PixelFormat as String, data as MemoryBlock, bytesPerRow as Integer, pixelBufferAttributes as Dictionary)

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a pixel buffer for a given size and pixel format containing data specified by a memory location.
Notes: width: The width of the pixel buffer, in pixels.
height: The height of the pixel buffer, in pixels.
pixelFormatType: The pixel format identified by its respective four character code
baseAddress: The memoryblock referenced by the PixelBuffer with the data.
bytesPerRow: The row bytes of the pixel storage memory.
pixelBufferAttributes: A Core Foundation dictionary with additional attributes for a pixel buffer. This

parameter is optional.

Returns a Core Video result code. See Core Video Constants for possible values.
Some of the parameters specified in this call override equivalent pixel buffer attributes. For example, if you define the kCVPixelBufferWidth and kCVPixelBufferHeight keys in the pixel buffer attributes parameter (pixelBufferAttributes), these values are overridden by the width and height parameters.

- 18.110.10 Constructor(Width as Integer, Height as Integer, PixelFormat as String, pixelBufferAttributes as Dictionary) 3942

18.110.10 Constructor(Width as Integer, Height as Integer, PixelFormat as String, pixelBufferAttributes as Dictionary)

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates a single pixel buffer for a given size and pixel format.
Notes: width: Width of the pixel buffer, in pixels.
height: Height of the pixel buffer, in pixels.
pixelFormatType: The pixel format identified by its respective four-character code.
pixelBufferAttributes: A dictionary with additional attributes for a pixel buffer. This parameter is optional.

Raises exception on failure with error code included.

This function allocates the necessary memory based on the pixel dimensions, format, and extended pixels described in the pixel buffer,Äôs attributes.

Some of the parameters specified in this call override equivalent pixel buffer attributes. For example, if you define the kCVPixelBufferWidth and kCVPixelBufferHeight keys in the pixel buffer attributes parameter (pixelBufferAttributes), these values are overridden by the width and height parameters.

18.110.11 FillExtendedPixels

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Fills the extended pixels of the pixel buffer.
Notes: This function replicates edge pixels to fill the entire extended region of the image.

18.110.12 Flush

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Flushes output to the image buffer.
Notes: Anything not yet drawn is drawn now.

18.110.13 GetExtendedPixels(byref extraColumnsOnLeft as Integer, byref extraColumnsOnRight as Integer, byref extraRowsOnTop as Integer, byref extraRowsOnBottom as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the amount of extended pixel padding in the pixel buffer.
Notes: extraColumnsOnLeft: On output, the pixel row padding to the left.
extraColumnsOnRight: On output, the pixel row padding to the right.
extraRowsOnTop: On output, the pixel row padding to the top.
extraRowsOnBottom: On output, the pixel row padding to the bottom.

18.110.14 HeightOfPlane(planeIndex as Integer) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the height of the plane at planeIndex in the pixel buffer.
Notes: planeIndex: The index of the plane.
Returns the height of the buffer, in pixels, or 0 for nonplanar pixel buffers.

18.110.15 kCVPixelBufferBytesPerRowAlignmentKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Indicates the number of bytes per row in the pixel buffer (type Number).

18.110.16 kCVPixelBufferCGBitmapContextCompatibilityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Indicates whether the pixel buffer is compatible with Core Graphics bitmap contexts (type Boolean).

18.110.17 kCVPixelBufferCGImageCompatibilityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Indicates whether the pixel buffer is compatible with CGImage types (type Boolean).

18.110.18 kCVPixelBufferExtendedPixelsBottomKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The number of pixels padding the bottom of the image (type Number).

18.110.19 kCVPixelBufferExtendedPixelsLeftKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The number of pixels padding the left of the image (type Number).

18.110.20 kCVPixelBufferExtendedPixelsRightKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The number of pixels padding the right of the image (type Number).

18.110.21 kCVPixelBufferExtendedPixelsTopKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The number of pixels padding the top of the image (type Number).

18.110.22 kCVPixelBufferHeightKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The height of the pixel buffer (type Number).

18.110.23 kCVPixelBufferIOSurfaceCoreAnimationCompatibilityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: A boolean value

18.110.24 kCVPixelBufferIOSurfaceOpenGLFBOCompatibilityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Ensures that the CVPixelBuffer's IOSurfaceRef can be displayed in an CoreAnimation CALayer.

18.110.25 kCVPixelBufferIOSurfaceOpenGLTextureCompatibilityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Ensures that CGLTexImageIOSurface2D() will succeed in creating a valid texture object from the CVPixelBuffer's IOSurface AND that the resulting texture may be used as a color buffer attachment to a OpenGL frame buffer object.

18.110.26 kCVPixelBufferIOSurfacePropertiesKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Indicates optional properties in the IOSurface framework (type Dictionary). An empty dictionary indicates default values.
Presence of this key requests allocation via the IOSurface framework.

18.110.27 kCVPixelBufferMemoryAllocatorKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The allocator used with this buffer (type CFAllocatorRef).

18.110.28 kCVPixelBufferOpenGLCompatibilityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Indicates whether the pixel buffer is compatible with Core Graphics bitmap contexts (type Boolean).

18.110.29 kCVPixelBufferPixelFormatTypeKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The pixel format for this buffer (type Number, or type Array containing an array of Number types (actually type OSType)). For a listing of common pixel formats, see the QuickTime Ice Floe Dispatch 20.

18.110.30 kCVPixelBufferPlaneAlignmentKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: Specifies the alignment of the planes within the buffer. Planes will start on a byte number which is a multiple of this value. (type Number).

18.110.31 kCVPixelBufferWidthKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: The width of the pixel buffer (type Number).

18.110.32 LockBaseAddress(flags as Integer = 0)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Locks the base address of the pixel buffer.
Notes: lockFlags: You can pass zero or kLockReadonly.

18.110.33 PixelBufferWithCGImage(CGImage as Variant) as CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a pixel buffer for a CGImage by making a copy of the picture.
Notes: Image parameter must be a CGImageMBS object.
For Carbon and Cocoa.
Returns nil on any error.

18.110.34 PixelBufferWithHandle(Handle as Integer) as CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Creates pixel buffer object with handle.
Notes: Handle must be a CVPixelBufferRef, which we retain.

18.110.35 PixelBufferWithPicture(pic as picture) as CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a pixel buffer for a picture by making a copy of the picture.
Example:

```
Var p as new Picture(300, 200)
Var b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width)+" x "+str(b.Height)
```

Notes: For Carbon and Cocoa.
Returns nil on any error.

18.110.36 PixelData as MemoryBlock

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Copies pixel data into MemoryBlock.
Notes: Returns nil in case of error.
Works only on non planar pixel buffers.

18.110.37 SetPixelData(data as MemoryBlock) as Boolean

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Copies pixel data from MemoryBlock into pixel buffer.
Notes: Returns false in case of error and true for success.
Works only on non planar pixel buffers.

18.110.38 UnlockBaseAddress(flags as Integer = 0)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Unlocks the base address of the pixel buffer.

18.110.39 WidthOfPlane(planeIndex as Integer) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the width of the plane at a given index in the pixel buffer.
Notes: pixelBuffer: The pixel buffer whose plane width you want to obtain.
planeIndex: The plane index that contains the plane's width value.

Returns the width of the plane, in pixels, or 0 for nonplanar pixel buffers.

18.110.40 Properties

18.110.41 BaseAddress as Ptr

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the base address of the pixel buffer.
Notes: For chunky buffers, returns a pointer to the pixel at (0,0) in the buffer.

For planar buffers, returns a pointer to a PlanarComponentInfo structure (as defined by QuickTime in ImageCodec.h).

Retrieving the base address for a pixel buffer requires that the buffer base address be locked via a successful call to CVPixelBufferLockBaseAddress.
(Read only property)

18.110.42 BytesPerRow as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the number of bytes per row of the pixel buffer.
Example:

```
Var p as new Picture(300, 200)
Var b as new CVPixelBufferMBS(p)
MsgBox str(b.BytesPerRow)
```

Notes: The number of bytes per row of the image data. For planar buffers, this function returns a rowBytes value such that bytesPerRow * height covers the entire image, including all planes.
(Read only property)

18.110.43 DataSize as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the data size for contiguous planes of the pixel buffer.
Example:

```
Var p as new Picture(300, 200)
Var b as new CVPixelBufferMBS(p)
MsgBox str(b.DataSize)
```

Notes: (Read only property)

18.110.44 Height as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the height of the pixel buffer.
Example:

```
Var p as new Picture(300, 200)
Var b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
MsgBox str(b.Width)+" x "+str(b.Height)
```

Notes: (Read only property)

18.110.45 IsPlanar as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Determines whether the pixel buffer is planar.
Notes: Returns true if the pixel buffer was created using CVPixelBufferCreateWithPlanarBytes; otherwise, false.
(Read only property)

18.110.46 PixelFormatType as String

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the pixel format type of the pixel buffer.
Notes: Returns a four-character code OSType identifier for the pixel format.
(Read only property)

18.110.47 PlaneCount as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns number of planes of the pixel buffer.
Notes: Returns the number of planes. Returns 0 for nonplanar pixel buffers.
(Read only property)

18.110.48 Width as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the width of the pixel buffer.
Example:

```
Var p as new Picture(300, 200)
Var b as CVPixelBufferMBS = CVPixelBufferMBS.PixelBufferWithPicture(p)
```

MsgBox str(b.Width)+" x "+str(b.Height)

Notes: (Read only property)

18.110.49 Constants

Constants

Constant	Value	Description
kLockReadonly	1	The flag for LockBaseAddress function. If you are not going to modify the data while you hold the lock, you should set this flag to avoid potentially invalidating any existing caches of the buffer contents. This flag should be passed both to the lock and unlock functions. Non-symmetrical usage of this flag will result in undefined behavior.

Pixel Formats

Constant	Value	Description
kCVPixelFormatType_128RGBAFloat	"RGfA"	128 bit RGBA IEEE float, 32-bit little-endian
kCVPixelFormatType_14Bayer_BGGR	"bgg4"	Bayer 14-bit Little-Endian, packed in 16-bits, with G R G R...
kCVPixelFormatType_14Bayer_GBRG	"gbr4"	Bayer 14-bit Little-Endian, packed in 16-bits, with R G R G...
kCVPixelFormatType_14Bayer_GRBG	"grb4"	Bayer 14-bit Little-Endian, packed in 16-bits, with B G B G...
kCVPixelFormatType_14Bayer_RGGB	"rgg4"	Bayer 14-bit Little-Endian, packed in 16-bits, with G B G B...
kCVPixelFormatType_16BE555	&h00000010	16 bit BE RGB 555. Available in OS X v10.5 and later.
kCVPixelFormatType_16BE565	"B565"	16 bit BE RGB 565. Available in OS X v10.5 and later.
kCVPixelFormatType_16Gray	"b16g"	16 bit Grayscale, 16-bit big-endian samples, b Available in OS X v10.5 and later.
kCVPixelFormatType_16LE555	"L555"	16 bit LE RGB 555. Available in OS X v10.5 and later.
kCVPixelFormatType_16LE5551	"5551"	16 bit LE RGB 5551. Available in OS X v10.5 and later.
kCVPixelFormatType_16LE565	"L565"	16 bit LE RGB 565. Available in OS X v10.5 and later.
kCVPixelFormatType_1IndexedGray_WhiteIsZero	&h00000021	1 bit indexed gray, white is zero. Available in OS X v10.5 and later.
kCVPixelFormatType_1Monochrome	&h00000001	1 bit indexed. Available in OS X v10.5 and later.
kCVPixelFormatType_24BGR	"24BG"	24 bit BGR. Available in OS X v10.5 and later.
kCVPixelFormatType_24RGB	&h00000018	24 bit RGB. Available in OS X v10.5 and later.
kCVPixelFormatType_2Indexed	&h00000002	2 bit indexed. Available in OS X v10.5 and later.
kCVPixelFormatType_2IndexedGray_WhiteIsZero	&h00000022	2 bit indexed gray, white is zero. Available in OS X v10.5 and later.
kCVPixelFormatType_30RGB	"R10k"	30 bit RGB, 10-bit big-endian samples, 2 unu cant end).
kCVPixelFormatType_30RGBLEPackedWideGamut	"w30r"	little-endian RGB101010, 2 MSB are zero, wi
kCVPixelFormatType_32ABGR	"ABGR"	32 bit ABGR. Available in OS X v10.5 and later.
kCVPixelFormatType_32AlphaGray	"b32a"	32 bit AlphaGray, 16-bit big-endian samples, Available in OS X v10.5 and later.
kCVPixelFormatType_32ARGB	&h00000020	32 bit ARGB. Available in OS X v10.5 and later.
kCVPixelFormatType_32BGRA	"BGRA"	32 bit BGRA. Available in OS X v10.5 and later.
kCVPixelFormatType_32RGBA	"RGBA"	32 bit RGBA. Available in OS X v10.5 and later.
kCVPixelFormatType_420YpCbCr10BiPlanarFullRange	"xf20"	2 plane YCbCr10 4:2:0, each 10 bits in the MS 0-1023)
kCVPixelFormatType_420YpCbCr10BiPlanarVideoRange	"x420"	2 plane YCbCr10 4:2:0, each 10 bits in the MS [64,940] chroma= [64,960])
kCVPixelFormatType_420YpCbCr8BiPlanarFullRange	"420f"	Bi-Planar Component Y'CbCr 8-bit 4:2:0, full [1,255]). baseAddr points to a big-endian C BiPlanar structure.
kCVPixelFormatType_420YpCbCr8BiPlanarVideoRange	"420v"	Bi-Planar Component Y'CbCr 8-bit 4:2:0, chroma= [16,240]). baseAddr points to a b Info_YCbCrBiPlanar structure.
kCVPixelFormatType_420YpCbCr8Planar	"y420"	Planar Component Y'CbCr 8-bit 4:2:0. base PlanarPixelBufferInfo_YCbCrPlanar struct.

18.111 control DesktopAVCaptureViewControlMBS

18.111.1 control DesktopAVCaptureViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The capture control for Mac.
Notes: AVCaptureView is a subclass of NSView that can be used to display standard user interface controls for capturing media data.
MBS Plugin wraps this as a control for Xojo.
Please notice this is 64-bit only and requires MacOS 10.9 or newer.

18.111.2 Methods

18.111.3 Available as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.

18.111.4 setSession(session as AVCaptureSessionMBS, showVideoPreview as boolean, showAudioPreview as boolean)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sets the session represented by this view.
Notes: session: The session to be represented.
showVideoPreview: Whether or not video preview should be shown. If YES, capture inputs for video media data will be added, removed, or modified depending on device availability and user selection.
showAudioPreview: Whether or not audio preview should be shown. If YES, capture inputs for audio media data will be added, removed, or modified depending on device availability and user selection.

The view must either show audio preview or video preview or both. Furthermore, the view may modify the capture session, for example, to access media data for preview or when the user select a new capture source. Only the default session is started and stopped automatically. The provided session must be manually started and stopped.

18.111.5 Properties

18.111.6 controlsStyle as Integer

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The style of the capture controls pane associated with the view.
Notes: (Read and Write property)

18.111.7 fileOutput as AVCaptureFileOutputMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A capture file output used to record media data.
Notes: The value of this property is the first instance of AVCaptureFileOutput contained in the session's outputs array or nil if no such instance is found. In the latter case the capture view's start recording button will be disabled. However, the controls for choosing input sources may still be enabled.
(Read only property)

18.111.8 session as AVCaptureSessionMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A capture session represented by this view.
Notes: Modifying the capture session will impact its visual representation in the view. The default value is

a session configured for movie file recordings of audio and video media data. Use setSession() to change the value of this property.
(Read only property)

18.111.9 videoGravity as String

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A string defining how the video is displayed within the views bounds rect.
Notes: Options are AVLayerVideoGravityResize, AVLayerVideoGravityResizeAspect and AVLayerVideoGravityResizeAspectFill. AVLayerVideoGravityResizeAspect is default. See <AVFoundation/AVAnimation.h>for a description of these options.
(Read and Write property)

18.111.10 View as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The reference to the AVCaptureView object.
Notes: (Read only property)

18.111.11 Events

18.111.12 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

18.111.13 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

18.111.14 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

18.111.15 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

18.111.16 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

18.111.17 FocusLost

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.111.18 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

18.111.19 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

18.111.20 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

18.111.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

18.111.22 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

18.111.23 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

18.111.24 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

18.111.25 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

18.111.26 startRecordingToFileOutput(fileOutput as AVCaptureFileOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that a new media recording should be started.
Notes: If captureFileOutput is an instance of AVCaptureMovieFileOutput this can be achieved by calling startRecordingToOutputFileURL on the captureFileOutput.

18.111.27 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

18.111.28 Constants

Constants Groups

Constant	Value	Description
ControlsStyleDefault	0	The default controls pane is associated with the view.
ControlsStyleFloating	1	The floating controls pane for media recordings is associated with the view.
ControlsStyleInline	0	The inline controls pane for media recording is associated with the view.
ControlsStyleInlineDeviceSelection	2	The inline controls pane for selection capture devices is associated with tl view.

18.112 control DesktopAVPlayerViewControlMBS

18.112.1 control DesktopAVPlayerViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The player control for Mac.
Notes: AVPlayerView is a subclass of NSView that can be used to display the visual content of an AVPlayer object and the standard playback controls.
MBS Plugin wraps this as a control for Xojo.
Please notice this is 64-bit only and requires MacOS 10.9 or newer.

18.112.2 Methods

18.112.3 Available as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.

18.112.4 beginTrimming

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sets the controls panel into trimming mode and blocks until the user selects either the Trim or the Cancel button.
Notes: Triggers TrimmingCompleted later.

18.112.5 flashChapterNumber(chapterNumber as Integer, chapterTitle as String)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Display the provided chapter number and title momentarily.
Notes: chapterNumber: The chapter number (required).
chapterTitle: The chapter title (optional).

18.112.6 Properties

18.112.7 actionPopUpButtonMenu as NSMenuMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The action popup menu.
Notes: Clients can set this property in order to show an action pop up button. Default is nil.
(Read and Write property)

18.112.8 allowsPictureInPicturePlayback as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not the receiver allows Picture in Picture playback.
Notes: Default is false.
Available in MacOS 10.15 or later.
(Read and Write property)

18.112.9 canBeginTrimming as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not the current media can be trimmed.
Notes: (Read only property)

18.112.10 contentOverlayView as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Use the content overlay view to add additional custom views between the video content and the controls.

Notes: (Read only property)

18.112.11 controlsStyle as Integer

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The style of the playback controls pane currently associated with the view.
Notes: (Read and Write property)

18.112.12 player as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The player from which to source the media content for the view.
Notes: (Read and Write property)

18.112.13 readyForDisplay as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Boolean indicating that the first video frame has been made ready for display for the current item of the associated AVPlayer.
Notes: (Read only property)

18.112.14 showsFrameSteppingButtons as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Replace scanning controls in the playback UI with frame stepping buttons.
Notes: Default is false.
(Read and Write property)

18.112.15 showsFullScreenToggleButton as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not the controls pane will show a full screen toggle button.
Notes: Default is false.
(Read and Write property)

18.112.16 showsSharingServiceButton as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not the controls pane will show a sharing service button when the current player item can be shared.
Notes: Default is false.
(Read and Write property)

18.112.17 showsTimecodes as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: If timecodes are available, allow the AVPlayerView controls to enter timecode mode.
Notes: Default is false.
Available in MacOS 10.15 or later.
(Read and Write property)

18.112.18 updatesNowPlayingInfoCenter as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not the now playing info center should be updated.
Notes: Default is true.
(Read and Write property)

18.112.19 videoBounds as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The current size and position of the video image as displayed within the receiver's view's bounds.
Notes: (Read only property)

18.112.20 videoGravity as String

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A string defining how the video is displayed within an AVPlayerLayer bounds rect.
Notes: Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill and AVLayerVideoGravityResize. AVLayerVideoGravityResizeAspect is default.
See <AVFoundation/AVAnimation.h>for a description of these options.

(Read and Write property)

18.112.21 View as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The reference to the AVPlayerView object.
Notes: (Read only property)

18.112.22 Events

18.112.23 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

18.112.24 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

18.112.25 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

18.112.26 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or

false to give others a chance.

18.112.27 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

18.112.28 FocusLost

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.112.29 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

18.112.30 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

18.112.31 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

18.112.32 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

18.112.33 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

18.112.34 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

18.112.35 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

18.112.36 playerViewDidStartPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture did start.

18.112.37 playerViewDidStopPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture did stop.

18.112.38 playerViewFailedToStartPictureInPicture(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture failed to start.
Notes: error: An error describing why it failed.

18.112.39 playerViewRestoreUserInterfaceForPictureInPictureStop as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to restore the user interface before Picture in Picture stops.
Notes: Please return true if you restored it or false if not, so we can call completion handler passing the value.
Default is to pass true if you don't implement this event.

18.112.40 playerViewShouldAutomaticallyDismissAtPictureInPictureStart as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Control can implement this event and return false to prevent player view from automatically being miniaturized or losing focus when Picture in Picture starts.
Notes: If you implement this, please return true or false.
By default we return false if you don't

18.112.41 playerViewWillStartPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture will start.

18.112.42 playerViewWillStopPictureInPicture

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Control can implement this method to be notified when Picture in Picture will stop.

18.112.43 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

18.112.44 TrimmingCompleted(result as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event handler that is executed when the user selects either the Trim or Cancel button in the trimming UI.

18.112.45 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

18.112.46 Constants

Control Styles

Constant	Value	Description
ControlsStyleDefault	1	The default controls pane is associated with the view.
ControlsStyleFloating	2	The floating controls pane is associated with the view.
ControlsStyleInline	1	The inline controls pane is associated with the view.
ControlsStyleMinimal	3	The minimal controls pane is associated with the view.
ControlsStyleNone	0	No controls pane is associated with the view.

Trim Results

Constant	Value	Description
TrimCancelButton	1	The user selected the Cancel button.
TrimOKButton	0	The user selected the Trim button.

18.113 control DesktopAVRoutePickerViewControlMBS

18.113.1 control DesktopAVRoutePickerViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: An object that displays controls for picking playback routes.
Notes: Available on MacOS 10.15 or newer.

18.113.2 Properties

18.113.3 player as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The player for which to perform routing operations.
Notes: (Read and Write property)

18.113.4 routePickerButtonBordered as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether or not the picker button has a border.
Notes: Default is true.
(Read and Write property)

18.113.5 View as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view object.
Notes: (Read only property)

18.113.6 Available as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.
Notes: (Read and Write computed property)

18.113.7 routePickerButtonColorForState(state as integer) as NSColorMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Defines the color for the button for a given state.
Notes: (Read and Write computed property)

18.113.8 Events

18.113.9 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

18.113.10 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

18.113.11 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

18.113.12 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

18.113.13 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

18.113.14 DidEndPresentingRoutes

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells you that the route picker view has finished presenting routes to the user.

18.113.15 FocusLost

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.113.16 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

18.113.17 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

18.113.18 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

18.113.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

18.113.20 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

18.113.21 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

18.113.22 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

18.113.23 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

18.113.24 WillBeginPresentingRoutes

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells you that the route picker view will start presenting routes to the user.

18.113.25 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

18.113.26 Constants

Button States

Constant	Value	Description
StateActive	2	Active state of the picker. The picker has this state when AirPlay is active.
StateActiveHighlighted	3	Highlighted state of the active picker. The picker has this state when it is highlighted and AirPlay is active.
StateNormal	0	Normal or default state of the picker.
StateNormalHighlighted	1	Highlighted state of the picker. The picker has this state when a mouse-down event occurs inside the button. It loses this highlight when a mouse-up event occurs.

18.114 class DesktopMoviePlayer

18.114.1 class DesktopMoviePlayer

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Extends the Movieplayer class inside Xojo.

18.114.2 Methods

18.114.3 AVAssetMBS as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the AVAsset for this movieplayer.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("Der Hausbau.m4v")
Var m as movie = f.OpenAsMovie

MoviePlayer1.movie = m
MoviePlayer1.play

Var asset as AVAssetMBS = MoviePlayer1.AVAssetMBS
MsgBox str(asset.duration.Seconds)+" seconds"
```

Notes: Useful in order to use plugin functions on a movieplayer, e.g. query meta data.

18.114.4 AVPlayerLayerMBS as AVPlayerLayerMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the AVPlayerLayer for this movieplayer.
Notes: Only for Cocoa target in Xojo.

18.114.5 AVPlayerMBS as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the AVPlayer for this movieplayer.
Notes: Only for Cocoa target.

18.115 class Movie

18.115.1 class Movie

Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extends the Movie class inside Xojo.

18.115.2 Methods

18.115.3 AVAssetMBS as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the AVAsset for this movie.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as movie = f.OpenAsMovie
Var asset as AVAssetMBS = m.AVAssetMBS
MsgBox str(asset.duration.Seconds)+" seconds"
```

Notes: Useful in order to use plugin functions on a movie object, e.g. query meta data.
Only for Cocoa target in Xojo 2014.

18.116 class MoviePlayer

18.116.1 class MoviePlayer

Platform: macOS, Targets: Desktop only.

Function: Extends the Movieplayer class inside Xojo.

18.116.2 Methods

18.116.3 AVAssetMBS as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the AVAsset for this movieplayer.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("Der Hausbau.m4v")
Var m as movie = f.OpenAsMovie

MoviePlayer1.movie = m
MoviePlayer1.play

Var asset as AVAssetMBS = MoviePlayer1.AVAssetMBS
MsgBox str(asset.duration.Seconds)+" seconds"
```

Notes: Useful in order to use plugin functions on a movieplayer, e.g. query meta data.
Only for Cocoa target.

18.116.4 AVPlayerLayerMBS as AVPlayerLayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the AVPlayerLayer for this movieplayer.
Notes: Only for Cocoa target in Xojo.

18.116.5 AVPlayerMBS as AVPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the AVPlayer for this movieplayer.
Notes: Only for Cocoa target.

18.117 class SDAVAssetExportSessionMBS

18.117.1 class SDAVAssetExportSessionMBS

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The SDAVAssetExportSession class for media export.
Notes: Based on open source SDAVAssetExportSession class:
https://github.com/rs/SDAVAssetExportSession

AVAssetExportSessionMBS drop-in replacement with customizable audio & video settings.

An SDAVAssetExportSessionMBS object transcodes the contents of an AVAsset source object to create an output of the form described by a specified audio and video settings.

After you have initialized an export session with the asset that contains the source media, and the output file type (outputFileType), and various other settings you can start the export running by invoking exportAsynchronously. Because the export is performed asynchronously, this method returns immediately—you can use progress to check on the progress. Depending on the capabilities of the device, some exports may be queued when multiple exports are attempted. When this happens, the status of a queued export will indicate that it's waiting (StatusWaiting).

The exportAsynchronouslyCompleted event is called whether the export fails, completes, or is cancelled. Upon completion, the status property indicates whether the export has completed successfully. If it has failed, the value of the error property supplies additional information about the reason for the failure.
Available in OS X v10.9 and later in 64-bit.

18.117.2 Methods

18.117.3 available as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer in 64-bit applications.

18.117.4 cancelExport

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Cancels the execution of an export session.

18.117.5 Constructor(asset as AVAssetMBS)

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Initializes an asset export session with a specified asset and preset.
Notes: asset: The asset you want to export.

18.117.6 exportAsynchronously

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Starts the asynchronous execution of an export session.
Notes: This method starts an asynchronous export operation and returns immediately. status signals the terminal state of the export session, and if a failure occurs, error describes the problem.

This method calls AVFoundationMBS.exportAsynchronouslyCompleted event later. Tag is passed so you can pass information needed to finish work.

If internal preparation for export fails, event is invoked synchronously. The event may also be called asynchronously, after the method returns, in the following cases:

- If a failure occurs during the export, including failures of loading, re-encoding, or writing media data to the output.
- If cancelExport is invoked.
- After the export session succeeds, having completely written its output to the outputURL.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.117.7 exportMT

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Starts the synchronous execution of an export session.
Notes: Same as exportAsynchronously, but run synchronous, so the plugin waits.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

18.117.8 exportSessionWithAsset(asset as AVAssetMBS) as AVAssetExportSessionMBS

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Returns an asset export session configured with a specified asset and preset.
Notes: asset: The asset you want to export.

Returns an asset export session initialized to export asset.

18.117.9 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Returns the metadata to be written to the output file by the export session.

18.117.10 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Sets the metadata to be written to the output file by the export session.
Notes: If the array is empty, any existing metadata in the exported asset will be translated as accurately as possible into the appropriate metadata key space for the output file and written to the output.

18.117.11 Properties

18.117.12 asset as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The asset with which the export session was initialized. (read-only)
Notes: (Read only property)

18.117.13 audioMix as AVAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Indicates whether non-default audio mixing is enabled for export, and supplies the parameters for audio mixing.
Notes: (Read and Write property)

18.117.14 audioSettings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The audio settings to use.
Example:

```
Var encoder as SDAVAssetExportSessionMBS // your exporter instance

Var audioSettings As New Dictionary

audioSettings.Value(AVFoundationMBS.AVFormatIDKey) = OSTypeFromStringMBS(AVFoundationMBS.kAudioFormatMPEG4AAC)
audioSettings.Value(AVFoundationMBS.AVNumberOfChannelsKey) = 2
audioSettings.Value(AVFoundationMBS.AVSampleRateKey) = 44100
audioSettings.Value(AVFoundationMBS.AVEncoderBitRateKey) = 128000
encoder.audioSettings = audioSettings
```

Notes: Please create new dictionary, set values and assign the final dictionary to this property.
If you query the settings, you get a copy of the dictionary.
(Read and Write property)

18.117.15 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Describes the error that occurred if the export status is AVAssetExportSessionStatusFailed or AVAssetExportSessionStatusCancelled. (read-only)
Notes: If there is no error to report, the value of this property is nil.
(Read only property)

18.117.16 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

18.117.17 outputFile as FolderItem

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The file of the export session's output.
Example:

```
Var encoder as SDAVAssetExportSessionMBS // your exporter instance

encoder.outputFile = SpecialFolder.Desktop.Child("output.mp4")
```

Notes: (Read and Write property)

18.117.18 outputFileType as String

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The type of file to be written by the session.
Example:

```
Var encoder as SDAVAssetExportSessionMBS // your exporter instance

encoder.outputFileType = AVFoundationMBS.AVFileTypeMPEG4
```

Notes: The value is a UTI string corresponding to the file type to use when writing the asset. For a list of constants specifying UTIs for standard file types, see AV Foundation Constants Reference.
(Read and Write property)

18.117.19 outputURL as String

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The URL of the export session's output.
Notes: (Read and Write property)

18.117.20 progress as Double

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The progress of the export on a scale from 0 to 1. (read-only)
Notes: A value of 0 means the export has not yet begun, 1 means the export is complete.
(Read only property)

18.117.21 shouldOptimizeForNetworkUse as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Indicates whether the movie should be optimized for network use.
Notes: (Read and Write property)

18.117.22 Status as Integer

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The status of the export session. (read-only)
Notes: See status constants.
(Read only property)

18.117.23 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The time range to be exported from the source.
Notes: The default time range of an export session is kCMTimeZero to kCMTimePositiveInfinity, meaning that (modulo a possible limit on file length) the full duration of the asset will be exported.
(Read and Write property)

18.117.24 videoComposition as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Indicates whether video composition is enabled for export, and supplies the instructions for video composition.
Notes: (Read and Write property)

18.117.25 videoInputSettings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The video input settings to use.
Notes: Please create new dictionary, set values and assign the final dictionary to this property.
If you query the settings, you get a copy of the dictionary.
(Read and Write property)

18.117.26 videoSettings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: The video settings to use.
Example:

```
Var encoder as SDAVAssetExportSessionMBS // your exporter instance

Var CompressionProperties As New Dictionary
CompressionProperties.Value(AVFoundationMBS.AVVideoAverageBitRateKey) = 6000000
CompressionProperties.Value(AVFoundationMBS.AVVideoProfileLevelKey) = AVFoundationMBS.AVVideo-
ProfileLevelH264High40

Var videoSettings As New Dictionary

videoSettings.Value(AVFoundationMBS.AVVideoCodecKey) = AVFoundationMBS.AVVideoCodecH264
videoSettings.Value(AVFoundationMBS.AVVideoWidthKey) = 1920
videoSettings.Value(AVFoundationMBS.AVVideoHeightKey) = 1080
videoSettings.Value(AVFoundationMBS.AVVideoCompressionPropertiesKey) = CompressionProperties
encoder.videoSettings = videoSettings
```

Notes: Please create new dictionary, set values and assign the final dictionary to this property.
If you query the settings, you get a copy of the dictionary.
(Read and Write property)

18.117.27 Events

18.117.28 exportAsynchronouslyCompleted

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Returns the identifiers compatible with a given asset.
Notes: asset: An asset that is ready to be exported.

Returns an array of strings representing the identifiers compatible with asset.

The array is a complete list of the valid identifiers that can be used with exportSessionWithAsset with the

specified asset.

Not all export presets are compatible with all assets. For example, a video-only asset is not compatible with an audio-only preset. This method returns only the identifiers for presets that are compatible with the given asset.

In order to ensure that the setup and running of an export operation will succeed using a given preset, you should not make significant changes to the asset (such as adding or deleting tracks) between retrieving compatible identifiers and performing the export operation.

If the asset's tracks are not currently loaded, they may be loaded by this method before any checks are performed.

18.117.29 Constants

Status Constants

Constant	Value	Description
StatusCancelled	5	Indicates that the export session was cancelled.
StatusCompleted	3	Indicates that the export session completed successfully.
StatusExporting	2	Indicates that the export session is in progress.
StatusFailed	4	Indicates that the export session failed.
StatusUnknown	0	Indicates that the status is unknown.
StatusWaiting	1	Indicates that the session is waiting to export more data.

18.118 class Sound

18.118.1 class Sound

Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in sound class in Xojo.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp4")
Var s as sound = f.OpenAsSound
Var a as AVAudioPlayerMBS = s.AVAudioPlayerMBS
MsgBox str(a.duration)+" seconds long"
call a.play
```

18.118.2 Methods

18.118.3 AVAudioPlayerMBS as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The audio player for this sound.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp4")
Var s as sound = f.OpenAsSound
Var a as AVAudioPlayerMBS = s.AVAudioPlayerMBS
MsgBox str(a.duration)+" seconds long"
call a.play
```

Notes: Xojo uses AVAudioPlayer for playing sounds in version 2013r4 and newer.
This function returns the player object, so you change more settings.

Chapter 19

AVFoundationNode

19.1 class AVAudio3DPointMBS

19.1.1 class AVAudio3DPointMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Class representing a point in 3D space.
Notes: This class is used by classes dealing with 3D audio such as those that adopt the AVAudioMixing protocol and the AVAudioEnvironmentNode class and represents a point in 3D space, in meters.

19.1.2 Methods

19.1.3 Constructor(x as Double = 0.0, y as Double = 0.0, z as Double = 0.0)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.1.4 Properties

19.1.5 x as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location on the x-axis, in meters.
Notes: (Read and Write property)

19.1.6 y as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location on the y-axis, in meters.
Notes: (Read and Write property)

19.1.7 z as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location on the z-axis, in meters.
Notes: (Read and Write property)

19.2 class AVAudioBufferMBS

19.2.1 class AVAudioBufferMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioBuffer class represents a buffer of audio data and its format.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

19.2.2 Methods

19.2.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.2.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.2.5 copy as AVAudioBufferMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates a read only copy of the buffer.

19.2.6 mutableCopy as AVAudioBufferMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates a mutable copy of the buffer.

19.2.7 Properties

19.2.8 byteCapacity as UInt32

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The buffer's capacity in bytes.
Notes: Available on MacOS 10.13 or newer.
(Read and Write property)

19.2.9 byteLength as UInt32

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The current number of valid bytes in the buffer.
Notes: Can be changed as part of an operation that modifies the contents.

Available on MacOS 10.13 or newer.
(Read only property)

19.2.10 format as AVAudioFormatMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The format of the audio in the buffer.
Notes: (Read only property)

19.2.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.3 class AVAudioChannelLayoutMBS

19.3.1 class AVAudioChannelLayoutMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioChannelLayout class describes the roles of a set of audio channels.
Example:

```
Function StereoLeftFormat() As AVAudioFormatMBS
// stereo format, left channel only

Var qlayout as new QTAudioChannelLayoutMBS

Var d1 as new QTAudioChannelDescriptionMBS
Var d2 as new QTAudioChannelDescriptionMBS

d1.ChannelFlags = QTAudioChannelDescriptionMBS.kAudioChannelFlags_AllOff
d1.ChannelLabel = QTAudioChannelDescriptionMBS.kAudioChannelLabel_Discrete_3

d2.ChannelFlags = QTAudioChannelDescriptionMBS.kAudioChannelFlags_AllOff
d2.ChannelLabel = QTAudioChannelDescriptionMBS.kAudioChannelLabel_Unused

qlayout.ChannelLayoutTag = QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_UseChannelDescriptions

qlayout.NumberChannelDescriptions=2
qlayout.ChannelDescriptions(0)=d1
qlayout.ChannelDescriptions(1)=d2

Var layout as new AVAudioChannelLayoutMBS(qlayout)
Var pf as new AVAudioFormatMBS(44100, layout)

Return pf
End Function
```

Notes: This object is a thin wrapper for the AudioChannelLayout structure.

19.3.2 Methods

19.3.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.

Notes: Should return true on OS X 10.10 and newer.

19.3.4 Constructor(Layout as QTAudioChannelLayoutMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initialize an audio channel layout object using an existing one.
Example:

```
Function StereoFormat() As AVAudioFormatMBS
// stereo format with standard layout tag
Var qlayout as new QTAudioChannelLayoutMBS

qlayout.ChannelLayoutTag = QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_Stereo

Var layout as new AVAudioChannelLayoutMBS(qlayout)
Var pf as new AVAudioFormatMBS(44100, layout)

Return pf
End Function
```

Notes: If the provided audio channel layout object,Äôs tag is kAudioChannelLayoutTag_UseChannelDescriptions, this initializer attempts to convert it to a more specific tag.
See also:

- 19.3.5 Constructor(LayoutTag as Integer) 3994

19.3.5 Constructor(LayoutTag as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initialize an audio channel layout object using a layout tag.
Example:

```
Function StereoFormat() As AVAudioFormatMBS
// stereo format with standard layout tag

Var layout as new AVAudioChannelLayoutMBS(QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_Stereo)
Var pf as new AVAudioFormatMBS(44100, layout)

Return pf
End Function
```

Notes: See QTAudioChannelLayoutMBS class for constants.
See also:

• 19.3.4 Constructor(Layout as QTAudioChannelLayoutMBS) 3994

19.3.6 isEqual(other as AVAudioChannelLayoutMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Determines whether another audio channel layout is exactly equal to this layout.
Notes: other: The AVAudioChannelLayout object to compare against.

Returns true if they are equal; otherwise false.

19.3.7 layoutWithLayout(Layout as QTAudioChannelLayoutMBS) as AVAudioChannelLayoutMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates a new audio channel layout object from an existing one.

19.3.8 layoutWithLayoutTag(LayoutTag as Integer) as AVAudioChannelLayoutMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates a new audio channel layout object using an audio channel layout tag.
Notes: If the provided audio channel layout object,Äôs tag is kAudioChannelLayoutTag_UseChannelDescriptions, this initializer attempts to convert it to a more specific tag.

19.3.9 Properties

19.3.10 channelCount as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The number of channels of audio data.
Notes: (Read only property)

19.3.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.3.12 layout as QTAudioChannelLayoutMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The underlying audio channel layout.
Notes: See QTAudioChannelLayoutMBS class for details.
(Read only property)

19.3.13 layoutTag as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio channel,Äôs underlying layout tag.
Notes: See QTAudioChannelLayoutMBS class for constants.
(Read only property)

19.4 class AVAudioComponentDescriptionMBS

19.4.1 class AVAudioComponentDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Identifying information for an audio component.

19.4.2 Methods

19.4.3 Constructor(componentType as string = """, componentSubType as string = """, componentManufacturer as string = """, componentFlags as UInt32 = 0, componentFlagsMask as UInt32 = 0)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.4.4 Properties

19.4.5 componentFlags as UInt32

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The flags.
Notes: Set this value to zero.
(Read and Write property)

19.4.6 componentFlagsMask as UInt32

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The mask of flags set.
Notes: Set this value to zero.
(Read and Write property)

19.4.7 componentManufacturer as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The unique vendor identifier, registered with Apple, for the audio component.
Notes: (Read and Write property)

19.4.8 componentSubType as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: A 4-byte code that you can use to indicate the purpose of a component.
Notes: For example, you could use lpas or lowp as a mnemonic indication that an audio unit is a low-pass filter.
(Read and Write property)

19.4.9 componentType as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: A unique 4-byte code identifying the interface for the component.
Notes: (Read and Write property)

19.5 class AVAudioEngineMBS

19.5.1 class AVAudioEngineMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioEngine class defines a group of connected AVAudioNode objects, known as audio nodes.
Notes: You use audio nodes to generate audio signals, process them, and perform audio input and output.

You create each audio node separately and attach it to the audio engine. You can perform all audio node operations during runtime—connecting them, disconnecting them, and removing them—with only minor limitations:

- Reconnect audio nodes only when they are upstream of a mixer..
- If you remove an audio node that has differing input and output channel counts, or which is a mixer, the result will likely be a broken graph.

19.5.2 Methods

19.5.3 attachedNodes as AVAudioNodeMBS()

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: Set of all nodes attached to the engine.
Notes: Available in macOS 10.15 or newer.
Available in iOS 10.13 or newer.

19.5.4 attachNode(node as AVAudioNodeMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Attaches a new audio node to the audio engine.
Notes: node: The audio node to be attached to the audio engine.

To support the instantiation of arbitrary AVAudioNode subclasses, instances are created externally to the audio engine but are unusable until attached to the audio engine using this method.

19.5.5 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.5.6 AVAudioEngineConfigurationChangeNotification as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Posted when the audio engine configuration changes.
Notes: When the audio engine,Äôs I/O unit observes a change to the audio input or output hardware,Äôs channel count or sample rate, the audio engine stops, uninitializes itself, and issues this notification.

19.5.7 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, bus1 as Integer, bus2 as Integer, format as AVAudioFormatMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Establish a connection between two audio nodes, specifying the input and output busses.
Notes: node1: The source audio node.
node2: The destination audio node.
bus1: The output bus of the source audio node.
bus2: The input bus of the destination audio node.
format: If not nil, the format of the source audio node,Äôs output bus is set to this AVAudioFormat object. In all cases, the format of the destination audio node,Äôs input bus is set to match that of the source audio node,Äôs output bus.

Audio nodes have input and output busses (AVAudioNodeBus). Use this method to establish connections between audio nodes. Connections are always one-to-one, never one-to-many or many-to-one.
See also:

- 19.5.8 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, format as AVAudioFormatMBS) 4001

19.5.8 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, format as AVAudioFormatMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Establishes a connection between two audio nodes.
Notes: node1: The source audio node.
node2: The destination audio node.
format: If not nil, the format of the source audio node,Äôs output bus is set to this AVAudioFormat object. In all cases, the format of the destination audio node,Äôs input bus is set to match that of the source audio node,Äôs output bus.

This method calls connect method using bus 0 for the source audio node, and bus 0 for the destination audio node, except in the case of a destination which is a mixer, in which case the destination is the mixer,Äôs nextAvailableInputBus.
See also:

- 19.5.7 connect(node1 as AVAudioNodeMBS, node2 as AVAudioNodeMBS, bus1 as Integer, bus2 as Integer, format as AVAudioFormatMBS) 4000

19.5.9 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.5.10 Destructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The destructor.

19.5.11 detachNode(node as AVAudioNodeMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Detaches a audio node previously attached to the audio engine.
Notes: node: The audio node to be detached from the audio engine.

If necessary, the audio engine will safely disconnect the audio node before detaching it.

19.5.12 disableManualRenderingMode

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: Sets the engine to render to or from an audio device.

19.5.13 disconnectNodeInput(node as AVAudioNodeMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Removes all input connections of the audio node.
Notes: node: The audio node whose inputs you want to disconnect.

Connections are broken on each of the audio node,Äôs input buses.
See also:

- 19.5.14 disconnectNodeInput(node as AVAudioNodeMBS, bus as Integer) 4002

19.5.14 disconnectNodeInput(node as AVAudioNodeMBS, bus as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Removes the input connection of an audio node on the specified bus.
Notes: node: The audio node whose input is to be disconnected.
bus: The destination,Äôs input bus to be disconnected.
See also:

- 19.5.13 disconnectNodeInput(node as AVAudioNodeMBS) 4002

19.5.15 disconnectNodeOutput(node as AVAudioNodeMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Remove all output connections of an audio node.
Notes: node: The audio node whose outputs are to be disconnected.
See also:

- 19.5.16 disconnectNodeOutput(node as AVAudioNodeMBS, bus as Integer) 4003

19.5.16 disconnectNodeOutput(node as AVAudioNodeMBS, bus as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Remove the output connection of an audio node on the specified bus.
Notes: node: The audio node whose output is to be disconnected.
bus: The destination,Äôs output bus to disconnect.
See also:

- 19.5.15 disconnectNodeOutput(node as AVAudioNodeMBS) 4002

19.5.17 enableManualRenderingMode(mode as Integer, pcmFormat as AVAudioFormatMBS, maximumFrameCount as UInt32, byref error as NSErrorMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: Sets the engine to operate in manual rendering mode with the specified render format and maximum frame count.
Notes: Use this method to configure the engine to render in response to requests from the client. You must stop the engine before calling this method. The render format must be a PCM format and match the format of the rendering buffer.
The input data in manual rendering mode can be supplied through the source nodes. See AVAudioPlayerNode and AVAudioInputNode.

19.5.18 pause

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Pauses the audio engine.
Notes: Stops the flow of audio through the audio engine but does not deallocate the resources allocated by prepare.
You resume the audio engine by invoking startAndReturnError again.

19.5.19 prepare

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Prepares the audio engine for starting.
Notes: This method preallocates many of the resources that the audio engine requires in order to start. Use it in order to start audio input or output more responsively.

19.5.20 renderOffline(numberOfFrames as UInt32, buffer as AVAudioPCMBufferMBS, byref error as NSErrorMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: Makes a render call to the engine operating in the offline manual rendering mode.

19.5.21 reset

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Resets all of the audio nodes in the audio engine.
Notes: This methods resets all of the audio nodes in the audio engine. Use it, for example, to silence reverb and delay tails.

19.5.22 startAndReturnError(byref error as NSErrorMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Starts the audio engine.
Notes: Error: Returns, by-reference, a description of the error.

Returns true if the audio engine started successfully; otherwise, false.
This method invokes the prepare method if it has not already been called since stop was invoked.
It then starts the audio hardware via the AVAudioInputNode and/or AVAudioOutputNode instances in the audio engine.

Errors can occur when:

- There is problem in the structure of the graph. Input can't be routed to output or to a recording tap through converter type nodes.
- An AVAudioSession error occurred
- The driver failed to start the hardware

19.5.23 stop

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Stop the audio engine.
Notes: Releases the resources allocated by the prepare method.

19.5.24 Properties

19.5.25 autoShutdownEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: When auto shutdown is enabled, the engine can start and stop the audio hardware dynamically, to conserve power. This is the enforced behavior on watchOS and can be optionally enabled on other platforms.
Notes: To conserve power, it is advised that the client pause/stop the engine when not in use.
But when auto shutdown is enabled, the engine will stop the audio hardware if it was running idle for a certain duration, and restart it later when required.
Note that, because this operation is dynamic, it may affect the start times of the source nodes (e.g. AVAudioPlayerNodeMBS), if the engine has to resume from its shutdown state.

On watchOS, auto shutdown is always enabled. On other platforms, it is disabled by default, but the client can enable it if needed.

This property is applicable only when the engine is rendering to/from an audio device. If the value is changed when the engine is in manual rendering mode, it will take effect whenever the engine is switched to render to/from the audio device.

Available on MacOS 10.13 or newer.
(Read and Write property)

19.5.26 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.5.27 InManualRenderingMode as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Whether or not the engine is operating in manual rendering mode, i.e. not connected to an audio device and rendering in response to the requests from the client.
Notes: Manual rendering is currently not supported in MBS Plugins.

Available on MacOS 10.13 or newer.
(Read only property)

19.5.28 inputNode as AVAudioInputNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio engine,Äôs singleton input audio node.
Notes: The audio engine creates a singleton on demand when inputNode is first accessed. To receive input, connect another audio node from the output of the input audio node, or create a recording tap on it.

The AVAudioSesssion instance and/or the availability of hardware features determine whether an app can perform input. Check the input format of input node (specifically, the hardware format) for a non-zero sample rate and channel count to see if input is enabled.
(Read only property)

19.5.29 mainMixerNode as AVAudioMixerNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio engine,Äôs optional singleton main mixer node.
Notes: When the property is first accessed the audio engine constructs a singleton main mixer and connects it to the outputNode on demand. You can then connect additional audio nodes to the mixer.

By default, the mixer's output format (sample rate and channel count) will track the format of the output node. It is possible to make the connection explicitly with a different format.
(Read only property)

19.5.30 manualRenderingFormat as AVAudioFormatMBS

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: The render format of the engine in manual rendering mode.
Notes: (Read only property)

19.5.31 manualRenderingMaximumFrameCount as UInt32

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: The maximum number of PCM sample frames the engine can produce in any single render call in manual rendering mode.
Notes: If you get this property when the engine isn't in manual rendering mode, it returns zero.

(Read only property)

19.5.32 manualRenderingMode as Integer

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: The manual rendering mode configured on the engine.
Notes: Either ManualRenderingModeOffline or ManualRenderingModeRealtime.
(Read only property)

19.5.33 manualRenderingSampleTime as Int64

MBS AVFoundation Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: An indication of where the engine is on its render timeline in manual rendering mode.
Notes: (Read only property)

19.5.34 outputNode as AVAudioOutputNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio engine,Äôs singleton output audio node.
Notes: When this property is first accessed the audio engine creates a singleton on demand. Connect another audio node to the input of the output audio node, or obtain a mixer that is connected by default, using the mainMixerNode property.

The AVAudioSesssion instance and/or the availability of hardware features determine whether an app can perform output. Check the output format of output node (specifically, the hardware format) for a non-zero sample rate and channel count to see if output is enabled.
(Read only property)

19.5.35 running as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns the audio engine,Äôs running state.
Notes: The value is true if the audio engine is running, otherwise, false.
(Read only property)

19.5.36 Events

19.5.37 ConfigurationChanged(notification as NSNotificationMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Posted when the audio engine configuration changes.
Notes: When the audio engine,Äôs I/O unit observes a change to the audio input or output hardware,Äôs channel count or sample rate, the audio engine stops, uninitializes itself, and issues this notification.

19.5.38 Constants

Error Codes

Constant	Value	Description
ManualRenderingErrorInitialized	-80801	An operation that can,Äôt be performed because the engine hasn,Äôt stop running.
ManualRenderingErrorInvalidMode	-80800	An operation that can,Äôt be performed because the engine is not in mar rendering mode or the right variant of it.
ManualRenderingErrorNotRunning	-80802	An operation that can,Äôt be performed because the engine hasn,Äôt star running.

Rendering Modes

Constant	Value	Description
ManualRenderingModeOffline	0	An engine that operates in an offline mode.
ManualRenderingModeRealtime	1	An engine that operates under real-time constraints and doesn't make blocking calls while rendering.

Manual Rendering Status

Constant	Value	Description
ManualRenderingStatusCannotDoInCurrentContext	2	An operation that can't be performed under current co try again later.
ManualRenderingStatusError	-1	A problem that occurred during rendering, resulting in
ManualRenderingStatusInsufficientDataFromInputNode	1	A condition in which not enough input data was retur to satisfy the render request at the time of the request
ManualRenderingStatusSuccess	0	A status that indicates that all of the requested data wa

19.6 class AVAudioEnvironmentDistanceAttenuationParametersMBS

19.6.1 class AVAudioEnvironmentDistanceAttenuationParametersMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioEnvironmentDistanceAttenuationParameters class specifies the attenuation distance, the gradual loss in audio intensity, and characteristics.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

19.6.2 Methods

19.6.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.6.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.6.5 Properties

19.6.6 distanceAttenuationModel as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The distance attenuation model describing the drop-off in gain as the source moves away from the listener.
Notes: The default value is the AVAudioEnvironmentDistanceAttenuationModelInverse attenuation model.
(Read and Write property)

19.6.7 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.6.8 maximumDistance as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The distance, in meters, beyond which no further attenuation is applied.
Notes: The default value is 100000.0 meters.
This property is relevant for the AVAudioEnvironmentDistanceAttenuationModelInverse attenuation model.
(Read and Write property)

19.6.9 referenceDistance as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The minimum distance, in meters, at which attenuation is applied.
Notes: The default value is 1.0 meter.

This property is relevant for the AVAudioEnvironmentDistanceAttenuationModelInverse and AVAudioEnvironmentDistanceAttenuationModelLinear attenuation models.
(Read and Write property)

19.6.10 rolloffFactor as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Determines the attenuation curve.
Notes: A higher value results in a steeper attenuation curve. The default value is 1.0. The value must be greater than 0.0.

This property is relevant for the AVAudioEnvironmentDistanceAttenuationModelExponential, AVAudioEnvironmentDistanceAttenuationModelInverse, and AVAudioEnvironmentDistanceAttenuationModelLinear attenuation models.
(Read and Write property)

19.6.11 Constants

Distance attenuation models

Constant	Value	Description
DistanceAttenuationModelExponential	1	Calculated as distanceGain = (distance / referenceDistance) ^(-rolloffFa
DistanceAttenuationModelInverse	2	Calculated as distanceGain = referenceDistance / (referenceDistance + r Factor * (distance –referenceDistance)).
DistanceAttenuationModelLinear	3	Calculated as distanceGain = (1 –rolloffFactor * (distance –referenceDis / (maximumDistance –referenceDistance)).

19.7 class AVAudioEnvironmentNodeMBS

19.7.1 class AVAudioEnvironmentNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioEnvironmentNode class is a mixer node that simulates a 3D audio environment.
Notes: Any node that conforms to the AVAudioMixing protocol (for example, AVAudioPlayerNode) can act as a source in this environment.

The environment has an implicit ,Äúlistener,Äù. By controlling the listener,Äôs position and orientation, the application controls the way the user experiences the virtual world. In addition, this node also defines properties for distance attenuation and reverberation that help characterize the environment.

It is important to note that only inputs with a mono channel connection format to the environment node are spatialized. If the input is stereo, the audio is passed through without being spatialized. Currently inputs with connection formats of more than 2 channels are not supported.

In order to set the environment node,Äôs output to a multichannel format, use an AVAudioFormatMBS having one of the following Audio Channel Layout Tags.

- kAudioChannelLayoutTag_AudioUnit_4
- kAudioChannelLayoutTag_AudioUnit_5_0
- kAudioChannelLayoutTag_AudioUnit_6_0
- kAudioChannelLayoutTag_AudioUnit_7_0
- kAudioChannelLayoutTag_AudioUnit_7_0_Front
- kAudioChannelLayoutTag_AudioUnit_8

Subclass of the AVAudioNodeMBS class.

19.7.2 Methods

19.7.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.7.4 Properties

19.7.5 distanceAttenuationParameters as AVAudioEnvironmentDistanceAttenuationParametersMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The distance attenuation parameters for the environment.
Notes: (Read only property)

19.7.6 nextAvailableInputBus as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Finds an unused input bus.
Notes: This method finds and returns the first input bus to which no other node is connected.
(Read only property)

19.7.7 obstruction as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.7.8 occlusion as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.7.9 outputVolume as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The mixer's output volume.
Notes: This accesses the mixer's output volume (0.0-1.0, inclusive).
(Read and Write property)

19.7.10 pan as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's stereo pan.
Notes: The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.7.11 position as AVAudio3DPointMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location of the source in the 3D environment.
Notes: The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.7.12 rate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Changes the playback rate of the input signal.
Notes: A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.7.13 renderingAlgorithm as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Type of rendering algorithm used.
Notes: Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.7.14 reverbBlend as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Controls the blend of dry and reverb processed audio.
Notes: This property controls the amount of the source,Äôs audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.7.15 reverbParameters as AVAudioEnvironmentReverbParametersMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The reverb parameters for the environment.
Notes: (Read only property)

19.7.16 volume as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's input volume.
Notes: The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.
(Read and Write property)

19.8 class AVAudioEnvironmentReverbParametersMBS

19.8.1 class AVAudioEnvironmentReverbParametersMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioEnvironmentReverbParameters class encapsulates the parameters that you use to control the reverb of the AVAudioEnvironmentNode class.
Notes: Reverberation can be used to simulate the acoustic characteristics of an environment. The AVAudioEnvironmentNode class has a built-in reverb that describes the space that the listener is in.

The reverb also has a single filter that sits at the end of the chain. You can use this filter to shape the overall sound of the reverb. For instance, select one of the reverb presets to simulate the general space and then use the filter to brighten or darken the overall sound.

You cannot create a standalone instance of AVAudioEnvironmentReverbParameters. Only an instance vended by a source object, such as an AVAudioEnvironmentNode instance is valid.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

19.8.2 Methods

19.8.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.8.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.8.5 loadFactoryReverbPreset(preset as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Loads one of the reverbs factory presets.
Notes: Loading a factory reverb preset changes the sound of the reverb. This is independent of the filter

which follows the reverb in the signal chain.

19.8.6 Properties

19.8.7 enable as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Enables the reverberation.
Notes: The default value is false.
(Read and Write property)

19.8.8 filterParameters as AVAudioUnitEQFilterParametersMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The filter that applies to the output of the reverb.
Notes: (Read only property)

19.8.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.8.10 level as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The master level, in decibels, of the reverb.
Notes: The default value is 0.0. The values must be within the range of -40 to 40 dB.
(Read and Write property)

19.9 class AVAudioFileMBS

19.9.1 class AVAudioFileMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioFile class represents an audio file that can be opened for reading or writing.
Notes: Regardless of the file,Äôs actual format, you read and write the file using AVAudioPCMBuffer objects, that contain samples in AVAudioCommonFormat, referred to as the file,Äôs processing format. Conversions are performed to and from the file,Äôs actual format.

Reads and writes are always sequential, but random access is possible by setting the framePosition property.
Blog Entries

- Write audio file with samples using AVFoundation
- MBS Xojo / Real Studio Plugins, version 15.4pr1

19.9.2 Methods

19.9.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.9.4 Constructor(File as FolderItem, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Opens a file for reading.
Notes: file: The path of the file to read.
Error: Returns, by-reference, a description of the error, if an error occurs.
See also:

- 19.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 4019
- 19.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS) 4019
- 19.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 4020

19.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Open a file for reading using a specified processing format.
Notes: file: The path of the file to read.
format: The processing format to use when reading from the file.
interleaved: Whether to use an interleaved processing format.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns an initialized audio file object for reading.

The file format me be is deinterleaved float, that is AVAudioPCMFormatFloat32. The processing format refers to the buffers read from the file. The content is read and converted from the file format to the processing format. The processing format must be at the same sample rate as the actual file contents and must be linear PCM, whether or not the processing buffer is interleaved float is determined by the interleaved parameter.

- 19.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS) 4019
- 19.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 4020

19.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Open a file for writing.
Notes: file: The path of the file to create for writing.
settings: The format of the file to create. (See the settings property in the AVAudioRecorder class.)
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns an initialized audio file object for writing.

The file type to create is inferred from the file extension of fileURL. This method will overwrite a file at the specified URL if a file already exists.

The file is opened for writing using the standard format, AVAudioPCMFormatFloat32.
See also:

- 19.9.4 Constructor(File as FolderItem, byref error as NSErrorMBS) 4018
- 19.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 4019
- 19.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 4020

19.9.7 Constructor(File as FolderItem, settings as Dictionary, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Open a file for writing using a specified processing format.
Notes: file: The path to write the file.
settings: The format of the file to create.
format: The processing format to use when writing to the file.
interleaved: Whether to use an interleaved processing format.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns an initialized audio file object for writing.

The file type to create is inferred from the file extension of file.
This method will overwrite a file at the specified URL if a file already exists.
See also:

- 19.9.4 Constructor(File as FolderItem, byref error as NSErrorMBS) 4018
- 19.9.5 Constructor(File as FolderItem, commonFormat as Integer, Interleaved as Boolean, byref error as NSErrorMBS) 4019
- 19.9.6 Constructor(File as FolderItem, settings as Dictionary, byref error as NSErrorMBS) 4019

19.9.8 fileDuration(file as folderItem) as Double

MBS AVFoundation Plugin, Plugin Version: 15.4, Platform: macOS, Targets: All.

Function: Queries duration of an audio file.
Notes: This uses different AVAudioFile API than rest of AVAudioFileMBS class.
We discovered a bug in Apples frameworks to report wrong length for some MP3 files and this function seems to be closer to the real duration of the file.

19.9.9 readIntoBuffer(buffer as AVAudioPCMBufferMBS, byref error as NSErrorMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buffer from which to read into the file.
Notes: buffer: The buffer from which to read the file. Its format must match the file,Äôs processing format.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true, if the read was successful; otherwise false.

Reading sequentially from the framePosition property, attempts to fill the buffer to its capacity. On return, the buffer,Äôs length property indicates the number of sample frames successfully read.
See also:

- 19.9.10 readIntoBuffer(buffer as AVAudioPCMBufferMBS, frameCount as Integer, byref error as NSErrorMBS) as Boolean 4021

19.9.10 readIntoBuffer(buffer as AVAudioPCMBufferMBS, frameCount as Integer, byref error as NSErrorMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Read a portion of a buffer.
Notes: buffer: The buffer from which to read the file. Its format must match the file,Äôs processing format.
frames: The number of frames to read.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true, if the read was successful; otherwise false.

Like the read method, but can be used to read fewer frames than the buffer frameCapacity.
See also:

- 19.9.9 readIntoBuffer(buffer as AVAudioPCMBufferMBS, byref error as NSErrorMBS) as Boolean 4021

19.9.11 writeFromBuffer(buffer as AVAudioPCMBufferMBS, byref error as NSErrorMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Write a buffer.
Notes: buffer: The buffer from which to write to the file. Its format must match the file,Äôs processing format.

Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true, if the read was successful.

Writes sequentially. The buffer's frameLength signifies how much of the buffer is to be written.

19.9.12 Properties

19.9.13 fileFormat as AVAudioFormatMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The on-disk format of the file.
Notes: (Read only property)

19.9.14 FramePosition as Int64

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The position in the file at which the next read or write operation will occur.
Notes: Set the framePosition property to perform a seek before a read or write. A read or write operation advances the frame position value by the number of frames read or written.
(Read and Write property)

19.9.15 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.9.16 Length as Int64

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The number of sample frames in the file.
Notes: This can be computationally expensive to compute for the first time.
(Read only property)

19.9.17 processingFormat as AVAudioFormatMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The processing format of the file.
Notes: (Read only property)

19.9.18 URL as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The URL the file is reading or writing.
Notes: (Read only property)

19.10 class AVAudioFormatMBS

19.10.1 class AVAudioFormatMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioFormat class wraps a Core Audio AudioStreamBasicDescription struct, with convenience initializers and accessors for common formats, including Core Audio,Äôs standard deinterleaved 32-bit floating point format.
Notes: Instances of this class are immutable.
Blog Entries

- Write audio file with samples using AVFoundation

19.10.2 Methods

19.10.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated audio format instance.
Notes: format: The audio format. See AVAudioCommonFormat for values.
sampleRate: The sample rate, in hertz.
channels: The channel count.
interleaved: True if the audio format is interleaved; otherwise false.
See also:

- 19.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS) 4025
- 19.10.6 Constructor(sampleRate as Double, channels as Integer) 4025
- 19.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS) 4025
- 19.10.8 Constructor(Settings as Dictionary) 4026

19.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated audio format instance with the specified auto format, sample rate, interleaved format and channel layout.
Notes: format: The audio format. See AVAudioCommonFormat for values.
sampleRate: The sample rate, in hertz.
interleaved: True if the audio format is interleaved; otherwise false.
layout: The channel layout. Must not be nil.
See also:

- 19.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 4024
- 19.10.6 Constructor(sampleRate as Double, channels as Integer) 4025
- 19.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS) 4025
- 19.10.8 Constructor(Settings as Dictionary) 4026

19.10.6 Constructor(sampleRate as Double, channels as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated audio format instance with the specified sample rate and channel count.
Notes: sampleRate: The sample rate, in hertz.
channels: The channel count.

The returned AVAudioFormat instance uses the AVAudioPCMFormatFloat32 format.
See also:

- 19.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 4024
- 19.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS) 4025
- 19.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS) 4025
- 19.10.8 Constructor(Settings as Dictionary) 4026

19.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated audio format instance as a deinterleaved float with the specified sample rate and channel layout.
Example:

```
Function StereoFormat() As AVAudioFormatMBS
// stereo format with standard layout tag
Var qlayout as new QTAudioChannelLayoutMBS

qlayout.ChannelLayoutTag = QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_Stereo

Var layout as new AVAudioChannelLayoutMBS(qlayout)
Var pf as new AVAudioFormatMBS(44100, layout)

Return pf
End Function
```

Notes: sampleRate: The sample rate, in hertz.
layout: The channel layout. Must not be nil.

The returned AVAudioFormat instance uses the AVAudioPCMFormatFloat32 format.
See also:

- 19.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 4024
- 19.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS) 4025
- 19.10.6 Constructor(sampleRate as Double, channels as Integer) 4025
- 19.10.8 Constructor(Settings as Dictionary) 4026

19.10.8 Constructor(Settings as Dictionary)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated audio format instance using a settings dictionary.
Notes: settings: The settings dictionary. See AV Foundation Audio Settings Constants for supported key/value pairs.
Many settings dictionary elements pertain to encoder settings, not the basic format, and will be ignored.
See also:

- 19.10.4 Constructor(format as Integer, sampleRate as Double, channels as Integer, interleaved as Boolean) 4024
- 19.10.5 Constructor(format as Integer, sampleRate as Double, interleaved as Boolean, layout as AVAudioChannelLayoutMBS) 4025

- 19.10.6 Constructor(sampleRate as Double, channels as Integer) 4025
- 19.10.7 Constructor(sampleRate as Double, layout as AVAudioChannelLayoutMBS) 4025

19.10.9 isEqual(other as AVAudioFormatMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the audo format instance and a given object have identical format settings.
Notes: object: The object to be compared.

Returns true if the receiver and object are equal, otherwise false.

This method defines what it means for instances to be equal. The two objects are considered equal if and only if they return identical values for all the settings.

19.10.10 Properties

19.10.11 channelCount as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The number of channels of audio data.
Notes: (Read only property)

19.10.12 channelLayout as AVAudioChannelLayoutMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The underlying audio channel layout.
Notes: The value is the underlying AVAudioChannelLayout instance.
(Read only property)

19.10.13 commonFormat as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns the common format identifier.
Notes: (Read only property)

19.10.14 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.10.15 Interleaved as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Describes whether the samples are interleaved.
Notes: For non-PCM formats, this value is undefined.
(Read only property)

19.10.16 sampleRate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio format sampling rate in hertz.
Notes: (Read only property)

19.10.17 settings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The format represented as a dictionary with keys from AVAudioSettings.
Notes: Not all formats representable by an AudioStreamBasicDescription struct (the underlying implementation) can be represented in a settings dictionary; in that case, nil is returned.
(Read only property)

19.10.18 Standard as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Describes whether the format is deinterleaved native-endian float.
Notes: True if the format is deinterleaved native-endian float (AVAudioPCMFormatFloat32), otherwise false.
(Read only property)

19.10.19 Constants

Common audio formats

Constant	Value	Description
AVAudioOtherFormat	0	A format which is not 16/32bit integer or 32/64bit float.
AVAudioPCMFormatFloat32	1	Native-endian floats. This is the standard format.
AVAudioPCMFormatFloat64	2	Native-endian doubles.
AVAudioPCMFormatInt16	3	Signed 16-bit native-endian integers.
AVAudioPCMFormatInt32	4	Signed 32-bit native-endian integers.

19.11 class AVAudioInputNodeMBS

19.11.1 class AVAudioInputNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioInputNode class represents a node that connects to the system's audio input.
Notes: This node has one element. The format of the input scope reflects the audio hardware sample rate and channel count. The format of the output scope is initially the same as that of the input, but you may set it to a different format, in which case the node will convert.
Subclass of the AVAudioIONodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

19.11.2 Methods

19.11.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.11.4 Properties

19.11.5 obstruction as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.11.6 occlusion as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Both the direct and reverb paths of sound between the

source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.11.7 pan as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's stereo pan.
Notes: The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.11.8 position as AVAudio3DPointMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location of the source in the 3D environment.
Notes: The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.11.9 rate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Changes the playback rate of the input signal.
Notes: A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.11.10 renderingAlgorithm as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Type of rendering algorithm used.
Notes: Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.

The rendering algorithms differ in terms of quality and cpu cost. AVAudio3DMixingRenderingAlgorithmEqualPowerPanning is the simplest panning algorithm and also the least expensive computationally.

If the AVAudioEnvironmentNode instance is set to a multichannel output format, only certain rendering algorithms know how to render to all of the output channels (currently AVAudio3DMixingRenderingAlgorithmSoundField). If any of the other rendering algorithms are selected, the AVAudioEnvironmentNode instance will render to only the first two output channels.

With the exception of AVAudio3DMixingRenderingAlgorithmSoundField, while the mixer is rendering to multi channel hardware, audio data will only be rendered to channels 1 & 2.
(Read and Write property)

19.11.11 reverbBlend as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Controls the blend of dry and reverb processed audio.
Notes: This property controls the amount of the source,Äôs audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.11.12 volume as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's input volume.
Notes: The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.
(Read and Write property)

19.11.13 Constants

Rendering Algorithms

Constant	Value	Description
RenderingAlgorithmEqualPowerPanning	0	Pans the data of the mixer bus into a stereo field. This algorithm is ar to the pan knob found on a mixing board channel strip.
RenderingAlgorithmHRTF	2	The Head Related Transfer Function is a high quality algorithm usin ing to emulate 3 dimensional space in headphones. HRTF is a cpu i algorithm.
RenderingAlgorithmHRTFHQ	6	Higher quality HRTF rendering algorithm compared to AVAudio3DMix deringAlgorithmHRTF. Improvements have been made to the overall frequency response and l tion of sources in a 3D space. Available in MacOS 10.13 or newer.
RenderingAlgorithmSoundField	3	Designed for rendering to multi channel hardware. The mixer takes da rendered with SoundField and distributes it amongst all the output c with a weighting toward the location in which the sound derives. It effective for ambient sounds, which may derive from a specific location i yet should be heard through the listener,Äôs entire space.
RenderingAlgorithmSphericalHead	1	Designed to emulate 3 dimensional space in headphones by simulatin aural time delays and other spatial cues. This algorithm is slightly le intensive than AVAudio3DMixingRenderingAlgorithmHRTF.
RenderingAlgorithmStereoPassThrough	5	This algorithm should be used when no localization is desired for the data. Setting this algorithm tells the mixer to take mono/stereo input a it directly to channels 1 & 2 without localization.

19.12 class AVAudioIONodeMBS

19.12.1 class AVAudioIONodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioIONode class is the base class for nodes that connects to the system's audio input or output.
Notes: Subclass of the AVAudioNodeMBS class.

19.12.2 Methods

19.12.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.12.4 Properties

19.12.5 audioUnit as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The node's underlying audio unit, if any.
Notes: Value is the handle.
(Read only property)

19.12.6 presentationLatency as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The presentation, or hardware, latency.
Notes: (Read only property)

19.13 class AVAudioMixerNodeMBS

19.13.1 class AVAudioMixerNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioMixerNode class represents a node that mixes its inputs to a single output.
Notes: Mixers may have any number of inputs. The mixer node accepts input at any sample rate and efficiently combines sample rate conversions. It also accepts any channel count and will correctly upmix or downmix to the output channel count.
Subclass of the AVAudioNodeMBS class.

19.13.2 Methods

19.13.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The construtor.

19.13.4 Properties

19.13.5 nextAvailableInputBus as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns an unused input bus.
Notes: This method finds and returns the first input bus to which no other node is connected.
(Read only property)

19.13.6 obstruction as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.

(Read and Write property)

19.13.7 occlusion as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.13.8 pan as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's stereo pan.
Notes: The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.13.9 position as AVAudio3DPointMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location of the source in the 3D environment.
Notes: The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.13.10 rate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Changes the playback rate of the input signal.
Notes: A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.13.11 renderingAlgorithm as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Type of rendering algorithm used.
Notes: Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.13.12 reverbBlend as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Controls the blend of dry and reverb processed audio.
Notes: This property controls the amount of the source,Äôs audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.13.13 volume as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's input volume.
Notes: The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.
(Read and Write property)

19.14 class AVAudioNodeMBS

19.14.1 class AVAudioNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioNode class is an abstract class for an audio generation, processing, or I/O block.
Notes: AVAudioEngine objects contain instances of various AVAudioNode subclasses. This base class provides certain common functionality.

Nodes have input and output busses, which can be thought of as connection points. For example, an effect typically has one input bus and one output bus. A mixer typically has multiple input busses and one output bus.

Busses have formats, expressed in terms of sample rate and channel count. When making connections between nodes, often the format must match exactly. However, there are exceptions such as the AVAudioMixerNode and AVAudioOutputNode classes.

Nodes do not currently provide useful functionality until attached to an engine.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- [ANN] MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 15.3

19.14.2 Methods

19.14.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.14.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.14.5 inputFormatForBus(busIndex as Integer) as AVAudioFormatMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns the input format for the specified bus.
Notes: Returns an AVAudioFormatMBS object representing the input format of the bus.

19.14.6 installTapOnBus(busIndex as Integer, bufferSize as UInt32 = 0, format as AVAudioFormatMBS = nil, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Installs an audio tap on the bus to record, monitor, and observe the output of the node.
Notes: bus: The node output bus to which to attach the tap.
bufferSize: The requested size of the incoming buffers. The implementation may choose another size.
format: If non-nil, attempts to apply this as the format of the specified output bus.

This should only be done when attaching to an output bus which is not connected to another node; an error will result otherwise. The tap and connection formats (if non-nil) on the specified bus should be identical. Otherwise, the latter operation will override any previously set format.

For AVAudioOutputNode, tap format must be specified as nil.

The plugin calls the Tap event with the data periodically.

Only one tap may be installed on any bus. Taps may be safely installed and removed while the engine is running.

19.14.7 nameForInputBus(busIndex as Integer) as string

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The name of an input bus.

19.14.8 nameForOutputBus(busIndex as Integer) as string

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The name of the output bus.

19.14.9 outputFormatForBus(busIndex as Integer) as AVAudioFormatMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns the output format for the specified bus.
Notes: Returns an AVAudioFormatMBS object representing the input format of the bus.

19.14.10 removeTapOnBus(busIndex as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Removes an audio tap on a bus.
Notes: bus: The node output bus whose tap is to be removed.

19.14.11 reset

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Clear a unit's previous processing state.

19.14.12 Properties

19.14.13 AUAudioUnitHandle as Integer

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: An AUAudioUnit wrapping or underlying the implementation's AudioUnit.
Notes: This provides an AUAudioUnit which either wraps or underlies the implementation's AudioUnit, depending on how that audio unit is packaged. Applications can interact with this AUAudioUnit to control custom properties, select presets, change parameters, etc.

No operations that may conflict with state maintained by the engine should be performed directly on the audio unit. These include changing initialization state, stream formats, channel layouts or connections to other audio units.

Available on MacOS 10.13 or newer.
(Read only property)

19.14.14 engine as AVAudioEngineMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio engine of the node.
Notes: Returns nil if the node is not attached to an audio engine.
(Read only property)

19.14.15 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.14.16 lastRenderTime as AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The time for which the node most recently rendered.
Notes: Return nil if the engine is not running or if the node is not connected to an input or output node.
(Read only property)

19.14.17 latency as Double

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The processing latency of the node, in seconds.
Notes: This property reflects the delay between when an impulse in the audio stream arrives at the input vs. output of the node. This should reflect the delay due to signal processing (e.g. filters, FFT's, etc.), not delay or reverberation which is being applied as an effect. A value of zero indicates either no latency or an unknown latency.

Available on MacOS 10.13 or newer.
(Read only property)

19.14.18 numberOfInputs as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The number of input busses for the node.
Notes: (Read only property)

19.14.19 numberOfOutputs as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The number of output busses for the node.
Notes: (Read only property)

19.14.20 outputPresentationLatency as Double

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The maximum render pipeline latency downstream of the node, in seconds.
Notes: This describes the maximum time it will take for the audio at the output of a node to be presented. For instance, the output presentation latency of the output node in the engine is:

- zero in manual rendering mode
- the presentation latency of the device itself when rendering to an audio device (see AVAudioIONodeMBS.presentationLatency)

The output presentation latency of a node connected directly to the output node is the output node's presentation latency plus the output node's processing latency (see latency).

For a node which is exclusively in the input node chain (i.e. not connected to engine's output node), this property reflects the latency for the output of this node to be presented at the output of the terminating node in the input chain.

A value of zero indicates either an unknown or no latency.

Note that this latency value can change as the engine is reconfigured (started/stopped, connections made/altered downstream of this node etc.). So it is recommended not to cache this value and fetch it whenever it's needed.

Available on MacOS 10.13 or newer.
(Read only property)

19.14.21 Events

19.14.22 Tap(bus as Integer, bufferSize as UInt32, format as AVAudioFormatMBS, buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The tap event.
Notes: Called after using installTapOnBus periodically.

19.15 class AVAudioOutputNodeMBS

19.15.1 class AVAudioOutputNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioOutputNode class represents a audio node that connects to the system's audio output.
Notes: This audio node has one element. The format of the output scope reflects the audio hardware sample rate and channel count. The format of the input scope is initially the same as that of the output, but you may set it to a different format, in which case the audio node will convert.
Subclass of the AVAudioIONodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 20.0pr5

19.15.2 Methods

19.15.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.15.4 Properties

19.15.5 CurrentDeviceID as UInt32

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Get or set the current device.
Notes: Please check OutputDevices dictionary for which devices are available.
(Read and Write property)

19.15.6 DefaultDeviceID as UInt32

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the Core Audio ID of the default device.
Notes: (Read only property)

19.15.7 OutputDevices as Dictionary

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries a dictionary with output devices.
Example:

```
Var e As New AVAudioEngineMBS
Var a As AVAudioOutputNodeMBS = e.outputNode
Var d As Dictionary = a.OutputDevices

For Each key As Variant In d.keys
Var name as string = d.Value(key)

MsgBox key+": "+name
Next
```

Notes: Key is the ID and value is the name of the device.
(Read only property)

19.16 class AVAudioPCMBufferMBS

19.16.1 class AVAudioPCMBufferMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioPCMBuffer class is a subclass of AVAudioBuffer for use with PCM audio formats.
Notes: The PCM buffer class also provides methods useful for manipulating buffers of audio in PCM format.
Subclass of the AVAudioBufferMBS class.

19.16.2 Methods

19.16.3 Constructor(format as AVAudioFormatMBS, frameCapacity as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated PCM audio buffer instance for PCM audio data.
Notes: format: The format of the PCM audio to be contained in the buffer.
frameCapacity: The capacity of the buffer in PCM sample frames.

19.16.4 floatChannelDataCopy(ChannelIndex as Integer) as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Copies buffer's audio samples as floating point values.
Notes: Returns memoryblock with samples only for the given channel.
Handles stride automatically for you.

19.16.5 int16ChannelDataCopy(ChannelIndex as Integer) as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Copies buffer's audio samples as 16-bit integer point values.
Notes: Returns memoryblock with samples only for the given channel.
Handles stride automatically for you.

19.16.6 int32ChannelDataCopy(ChannelIndex as Integer) as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Copies buffer's audio samples as 32-bit integer point values.
Notes: Returns memoryblock with samples only for the given channel.
Handles stride automatically for you.

19.16.7 level(ChannelIndex as Integer) as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Calculates level for a channel.
Notes: Value returned is between around 0.0 (nothing) to 1.0 (maximum).
Negative values are for errors.

19.16.8 setFloatChannelData(ChannelIndex as Integer, Data as Memoryblock) as boolean

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Writes channel to the buffer.
Notes: Please set frameLength to a matching value.
Data.size should be frameLength * 4.

Returns true on success or false on failure.
Handles stride automatically for you.

19.16.9 setInt16ChannelData(ChannelIndex as Integer, Data as Memoryblock) as boolean

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Writes channel to the buffer.
Notes: Please set frameLength to a matching value.
Data.size should be frameLength * 2.

Returns true on success or false on failure.
Handles stride automatically for you.

19.16.10 setInt32ChannelData(ChannelIndex as Integer, Data as Memoryblock) as boolean

MBS AVFoundation Plugin, Plugin Version: 20.3, Platform: macOS, Targets: All.

Function: Writes channel to the buffer.
Notes: Please set frameLength to a matching value.
Data.size should be frameLength * 4.

Returns true on success or false on failure.
Handles stride automatically for you.

19.16.11 Properties

19.16.12 floatChannelData as Ptr

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buffer's audio samples as floating point values.
Notes: The floatChannelData property returns pointers to the buffer,Äôs audio samples, if the buffer,Äôs format is 32-bit float. It returns nil if it is another format.

The returned pointer is to format.channelCount pointers to float. Each of these pointers is to frameLength valid samples, which are spaced by stride samples.

If the format is not interleaved, as with the standard deinterleaved float format, then the pointers will be to separate chunks of memory and the stride property value is 1.

If the format is interleaved, then the pointers will refer to the same buffer of interleaved samples, each offset by 1 frame, and the stride property value is the number of interleaved channels.
(Read only property)

19.16.13 frameCapacity as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buffer's capacity, in audio sample frames.
Notes: (Read only property)

19.16.14 frameLength as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The current number of valid sample frames in the buffer.
Notes: You may modify the length of the buffer as part of an operation that modifies its contents. The length must be less than or equal to the frameCapacity. Modifying frameLength will update the mDataByteSize field in each of the underlying AudioBufferList struct,Äôs AudioBuffer struct correspondingly, and vice versa. Note that in the case of deinterleaved formats, the mDataByteSize field will refers the size of one channel,Äôs worth of audio samples.

The length must be less than or equal to the frameCapacity. In the case of deinterleaved formats, frameCapacity will refer to the size of one channel,Äôs worth of audio samples.
(Read and Write property)

19.16.15 int16ChannelData as Ptr

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Access the buffer's 16bit integer audio samples.
Notes: The int16ChannelData property returns the buffer's audio samples if the buffer's format has 2-byte integer samples, or nil if it is another format.

See floatChannelData for more information.
(Read only property)

19.16.16 int32ChannelData as Ptr

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Access the buffer's 32-bit integer audio samples.
Notes: The int32ChannelData property returns the buffer's audio samples if the buffer's format has 4-byte integer samples, or nil if it is another format.

See floatChannelData for more information.
(Read only property)

19.16.17 stride as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buffer's number of interleaved channels.
Notes: (Read only property)

19.17 class AVAudioPlayerNodeMBS

19.17.1 class AVAudioPlayerNodeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioPlayerNode class plays buffers or segments of audio files.
Notes: AVAudioPlayerNode supports scheduling the playback of AVAudioBuffer instances, or segments of audio files opened via AVAudioFile. Buffers and segments may be scheduled at specific points in time, or to play immediately following preceding segments.

Normally, you will want to configure the node,Äôs output format with the same number of channels as are in the files and buffers to be played. Otherwise, channels will be dropped or added as required. It is usually better to use an AVAudioMixerNode to do this.

Similarly, when playing file segments, the node will sample rate convert if necessary, but it is often preferable to configure the node,Äôs output sample rate to match that of the file(s) and use a mixer to perform the rate conversion.

When playing buffers, there is an implicit assumption that the buffers are at the same sample rate as the node,Äôs output format.

This class overrides the AVAudioNode method reset and unschedules all previously scheduled buffers and file segments, and also returns the player timeline to sample time 0.

Player Timeline
The usual AVAudioNode sample times (as observed by lastRenderTime) have an arbitrary zero point. AVAudioPlayerNode superimposes a second ,Äúplayer timeline,Äù on top of this, to reflect when the player was started, and intervals during which it was paused. The methods nodeTimeForPlayerTime and playerTimeForNodeTime convert between the two.

Scheduling Playback Time
The scheduleBuffer, scheduleFile, and scheduleSegment methods take an AVAudioTime when parameter. This is interpreted as follows:

- If the when parameter is nil:
  - If there have been previous commands, the new one is played immediately following the last one.
  - Otherwise, if the node is playing, the event is played in the very near future.
  - Otherwise, the command is played at sample time 0.
- If the when parameter is a sample time, the parameter is interpreted as such.
- If the when parameter is a host time it is ignored unless sample time not valid.

The scheduling methods will fail if:

- A buffer's channel count does not match that of the node's output format.
- A file can't be accessed.
- An AVAudioTime specifies neither a valid sample time or host time.
- A segment's start frame or frame count is negative.

Subclass of the AVAudioNodeMBS class.
Blog Entries

- MBS Xojo Plugins, version 18.4pr4

19.17.2 Methods

19.17.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.17.4 nodeTimeForPlayerTime(playerTime as AVAudioTimeMBS) as AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Convert from player time to node time.
Notes: playerTime: A time relative to the player,Äôs start time.

Returns a node time.

This method and its inverse playerTimeForNodeTime are discussed in The Player Timeline. If the player is not playing when this method is called, nil is returned.

19.17.5 pause

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Pause playback.
Notes: The player's sample time does not advance while the node is paused.

19.17.6 play

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Start or resume playback immediately.
Notes: This is equivalent to playAtTime with a value of nil.

19.17.7 playAtTime(time as AVAudioTimeMBS = nil)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Start or resume playback at a specific time.
Example:

```
Var p As AVAudioPlayerNodeMBS // your player node
Var t As AVAudioTimeMBS = AVAudioTimeMBS.timeWithSampleTime(60000, 1000) // 60s

p.playAtTime(t)
```

Notes: when: The node time at which to start or resume playback. Passing nil starts playback immediately.

This node is initially paused. Requests to play buffers or file segments are enqueued, and any necessary decoding begins immediately. Playback does not begin, however, until the player has started playing, via this method.

19.17.8 playerTimeForNodeTime(nodeTime as AVAudioTimeMBS) as AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Convert from node time to player time.
Notes: nodeTime: The node time.

Returns a time relative to the player,Äôs start time.

This method and its inverse nodeTimeForPlayerTime are discussed in The Player Timeline. If the player is not playing when this method is called, nil is returned.

19.17.9 prepareWithFrameCount(frameCount as UInt32)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Prepares previously scheduled file regions or buffers for playback.
Notes: frameCount: The number of sample frames of data to be prepared before returning.

19.17.10 scheduleBuffer(buffer as AVAudioPCMBufferMBS, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Schedule playing samples from an audio buffer.
Notes: buffer: The buffer to play.

Calls scheduleBufferCompleted event later when playback is done.
time will be nil and options be zero in that case.

Schedules the buffer to be played following any previously scheduled commands.
See also:

- 19.17.11 scheduleBuffer(buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil) 4054
- 19.17.12 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, tag as Variant = nil) 4055
- 19.17.13 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil) 4055

19.17.11 scheduleBuffer(buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Schedule playing samples from an audio buffer at the specified time and with the specified playback options.
Notes: buffer: The buffer to play.
when: The time at which to play the buffer.
options: Playback options.

Calls later scheduleBufferCompleted event after the buffer has completely played or the player is stopped.
See also:

- 19.17.10 scheduleBuffer(buffer as AVAudioPCMBufferMBS, tag as Variant = nil) 4054
- 19.17.12 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, tag as Variant = nil) 4055

- 19.17.13 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil) 4055

19.17.12 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Schedule playing samples from an AVAudioBuffer.
Notes: buffer: the buffer to play
callbackType: option to specify when the completion handler must be called

The scheduleBufferCompleted event is called after the buffer has been consumed by the player or has finished playing back or the player is stopped.

Schedules the buffer to be played following any previously scheduled commands.

Available in MacOS 10.13 or newer.
See also:

- 19.17.10 scheduleBuffer(buffer as AVAudioPCMBufferMBS, tag as Variant = nil) 4054
- 19.17.11 scheduleBuffer(buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil) 4054
- 19.17.13 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil) 4055

19.17.13 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Schedule playing samples from an AVAudioBuffer.
Notes: buffer: the buffer to play
time: the time at which to play the buffer. see the discussion of timestamps, above.
options: options for looping, interrupting other buffers, etc.
callbackType: option to specify when the completion handler must be called.

The scheduleBufferCompleted event is called after the buffer has been consumed by the player or has finished playing back or the player is stopped.

Available in MacOS 10.13 or newer.
See also:

- 19.17.10 scheduleBuffer(buffer as AVAudioPCMBufferMBS, tag as Variant = nil) 4054
- 19.17.11 scheduleBuffer(buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant = nil) 4054
- 19.17.12 scheduleBuffer(callbackType as Integer, buffer as AVAudioPCMBufferMBS, tag as Variant = nil) 4055

19.17.14 scheduleFile(callbackType as Integer, file as AVAudioFileMBS, time as AVAudioTimeMBS, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Schedule playing of an entire audio file.
Notes: file: the file to play
time: the time at which to play the file. see the discussion of timestamps, above.
callbackType: option to specify when the completion handler must be called

The scheduleFileCompleted event is called after the file has been consumed by the player or has finished playing back or the player is stopped.

Available in MacOS 10.13 or newer.
See also:

- 19.17.15 scheduleFile(file as AVAudioFileMBS, time as AVAudioTimeMBS, tag as Variant = nil) 4056

19.17.15 scheduleFile(file as AVAudioFileMBS, time as AVAudioTimeMBS, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Schedule playing of an entire audio file.
Notes: file: The file to play.
when: The time at which to play the buffer.

Calls later scheduleFileCompleted event when playback is done.
See also:

- 19.17.14 scheduleFile(callbackType as Integer, file as AVAudioFileMBS, time as AVAudioTimeMBS, tag as Variant = nil) 4056

19.17.16 scheduleSegment(callbackType as Integer, file as AVAudioFileMBS, time as AVAudioTimeMBS, startFrame as Int64, frameCount as Int64, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Schedule playing a segment of an audio file.
Notes: file: the file to play
startFrame: the starting frame position in the stream
frameCount: the number of frames to play
time: the time at which to play the region. see the discussion of timestamps, above.
callbackType: option to specify when the completion handler must be called

The scheduleSegmentCompleted event is called after the segment has been consumed by the player or has finished playing back or the player is stopped.

Available in MacOS 10.13 or newer.
See also:

- 19.17.17 scheduleSegment(file as AVAudioFileMBS, time as AVAudioTimeMBS, startFrame as Int64, frameCount as Int64, tag as Variant = nil) 4057

19.17.17 scheduleSegment(file as AVAudioFileMBS, time as AVAudioTimeMBS, startFrame as Int64, frameCount as Int64, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Schedule playing a segment of an audio file.
Notes: file: The audio file of the file to play.
startFrame: The starting frame position in the stream.
frameCount: The number of frames to play.
when: The time at which to play the buffer.

Calls later scheduleSegmentCompleted event.
See also:

- 19.17.16 scheduleSegment(callbackType as Integer, file as AVAudioFileMBS, time as AVAudioTimeMBS, startFrame as Int64, frameCount as Int64, tag as Variant = nil) 4057

19.17.18 stop

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Clear all of the node's previously scheduled events and stop playback.
Notes: All of the node,Äôs previously scheduled events are cleared, including any that are in the middle

of playing. The node,Äôs sample time (and therefore the times to which new events are to be scheduled) is reset to 0, and will not proceed until the node is started again by sending a play or playAtTime message.

19.17.19 Properties

19.17.20 obstruction as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Only the direct path of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.17.21 occlusion as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.17.22 pan as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's stereo pan.
Notes: The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.17.23 Playing as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Indicates whether or not the player is playing.
Notes: (Read only property)

19.17.24 position as AVAudio3DPointMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location of the source in the 3D environment.
Notes: The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.17.25 rate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Changes the playback rate of the input signal.
Notes: A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.17.26 renderingAlgorithm as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Type of rendering algorithm used.
Notes: Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.17.27 reverbBlend as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Controls the blend of dry and reverb processed audio.
Notes: This property controls the amount of the source,Äôs audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.17.28 volume as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's input volume.
Notes: The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.
(Read and Write property)

19.17.29 Events

19.17.30 scheduleBufferCompleted(callbackType as Integer, buffer as AVAudioPCMBufferMBS, time as AVAudioTimeMBS, options as Integer, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Called after the buffer has completely played or the player is stopped.
Notes: callbackType: The requested callback type or -1 for older APIs.

19.17.31 scheduleFileCompleted(callbackType as Integer, file as AVAudioFileMBS, time as AVAudioTimeMBS, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Called after the file has completely played or the player is stopped.
Notes: callbackType: The requested callback type or -1 for older APIs.

19.17.32 scheduleSegmentCompleted(callbackType as Integer, file as AVAudioFileMBS, startFrame as Int64, frameCount as Int64, time as AVAudioTimeMBS, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Called after the segment has completely played or the player is stopped.
Notes: callbackType: The requested callback type or -1 for older APIs.

19.17.33 Constants

Options controlling buffer scheduling

Constant	Value	Description
BufferInterrupts	2	The buffer interrupts any buffer already playing.
BufferInterruptsAtLoop	4	The buffer interrupts any buffer already playing, at its loop point.
BufferLoops	1	The buffer loops indefinitely.

Completion Handler Modes

Constant	Value	Description
CompletionDataConsumed	0	The buffer or file data has been consumed by the player.
CompletionDataPlayedBack	2	Applicable only when the engine is rendering to/from an audio device. The buffer or file has finished playing. This accounts for both (small) signal processing latencies downstream of the player in the engine, as well as (possibly significant) latency in the audio playback device.
CompletionDataRendered	1	The buffer or file data has been rendered (i.e. output) by the player. This does not account for any signal processing latencies downstream of the player in the engine (see AVAudioNodeMBS.outputPresentationLatency).

19.18 class AVAudioTimeMBS

19.18.1 class AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioTime class is used by AVAudioEngine to represent time.
Example:

```
Var t As AVAudioTimeMBS = AVAudioTimeMBS.timeWithSampleTime(60000, 1000) // 60s
```

Notes: Instances of the class are immutable.
A single moment in time may be represented in two different ways:

- Using mach_absolute_time(), the system's basic clock. Referred to as ‚Äúhost time.‚Äù
- Audio samples at a particular sample rate.

A single AVAudioTime instance may contain either or both representations; it might represent only a sample time, only a host time, or both.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

19.18.2 Methods

19.18.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.18.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.18.5 extrapolateTimeFromAnchor(anchorTime as AVAudioTimeMBS) as AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates an audio time object by converting between host and sample time.
Notes: anchorTime: An AVAudioTime instance with a more complete AudioTimeStamp than that of the receiver.

Returns a newly created and initialized AVAudioTime instance with the extrapolated time.

If anchorTime is an AVAudioTime instance where both host time and sample time are valid, and the receiver is another timestamp where only one of the two is valid, this method returns a new AVAudioTime instance copied from the receiver and where any additional valid fields provided by the anchor are also valid.

19.18.6 hostTimeForSeconds(Seconds as Double) as UInt64

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Converts seconds to host time.
Notes: seconds: The number of seconds.
Returns the seconds represented as host time.

19.18.7 secondsForHostTime(HostTime as UInt64) as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Converts host time to seconds.
Notes: hostTime: The host time.
Returns the host time represented as seconds.

19.18.8 timeWithHostTime(HostTime as UInt64) as AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates an audio time object with the specified host time.
Notes: hostTime: The host time.
Returns a newly created and initialized AVAudioTime instance with the extrapolated time.
See also:

- 19.18.9 timeWithHostTime(hostTime as UInt64, SampleTime as Int64, sampleRate as Double) as AVAudioTimeMBS

19.18.9 timeWithHostTime(hostTime as UInt64, SampleTime as Int64, sampleRate as Double) as AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates an audio time object with the specified host time, sample time, and sample rate.
Notes: hostTime: The host time.
sampleTime: The sample time.
sampleRate: The sample rate.

Returns a newly created and initialized AVAudioTime instance with the specified host time, sample time, and sample rate.
See also:

- 19.18.8 timeWithHostTime(HostTime as UInt64) as AVAudioTimeMBS 4063

19.18.10 timeWithSampleTime(SampleTime as Int64, sampleRate as Double) as AVAudioTimeMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Creates an audio time object with the specified sample time and sample rate.
Example:

```
Var t As AVAudioTimeMBS = AVAudioTimeMBS.timeWithSampleTime(60000, 1000) // 60s
```

Notes: sampleTime: The sample time.
sampleRate: The sample rate.

Returns a newly created and initialized AVAudioTime instance with the specified sample time and sample rate.

19.18.11 Properties

19.18.12 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.18.13 hostTime as UInt64

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The host time.
Notes: (Read only property)

19.18.14 hostTimeValid as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether the host time value is valid.
Notes: True if the hostTime property is valid, otherwise false.
(Read only property)

19.18.15 sampleRate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The sample rate at which the sample time is being expressed.
Notes: (Read only property)

19.18.16 sampleTime as Int64

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The time as a number of audio samples, as tracked by the current audio device.
Notes: (Read only property)

19.18.17 sampleTimeValid as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether the sample time and sample rate properties are valid.
Notes: (Read only property)

19.19 class AVAudioUnitComponentManagerMBS

19.19.1 class AVAudioUnitComponentManagerMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitComponentManager class is a singleton object that provides a way to find audio components that are registered with the system.
Notes: It provides methods to search and query various information about the audio components without opening them. Currently, only audio components that are audio units can only be searched.

The class also supports predefined system tags and arbitrary user tags. Each audio unit can be tagged as part of its definition. AudioUnit Hosts such as Logic or GarageBand can present groupings of audio units based on the tags.

Searching for audio units can be done in various ways:

- Using a NSPredicate instance that contains search strings for tags or descriptions
- Using a block to match on a custom criteria.
- Using an AudioComponentDescription.

Available in OS X v10.10 and later.

19.19.2 Methods

19.19.3 allComponents as AVAudioUnitComponentMBS()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Finds all components.
Example:

```
// Needs OS X 10.10 or newer
Var m as new AVAudioUnitComponentManagerMBS

Var a() as AVAudioUnitComponentMBS = m.allComponents

for each c as AVAudioUnitComponentMBS in a
Var d as AVAudioComponentDescriptionMBS = c.audioComponentDescription
'List.AddRow c.Name, c.ManufacturerName, c.LlocalizedTypeName, c.VersionString, d.componentType+"
"+d.componentSubType
```

```
// we look for the mixer
// AUMixer Apple Mixer 1.6.0 aumx smxr

if d.componentType = "aumx" and d.componentSubType = "smxr" then
Var aa as new AVAudioUnitMBS(d)
MsgBox aa.Name
end if

next
```

19.19.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.19.5 AVAudioUnitComponentTagsDidChangeNotification as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The notification name for the notification sent when tags changed.

19.19.6 componentsMatchingDescription(Description as AVAudioComponentDescriptionMBS) as AVAudioUnitComponentMBS()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: An array of audio component objects that matches the description.
Notes: description: The AudioComponentDescription struct to match. The type, subtype and manufacturer fields are used to search for matching audio units. A value of "" or 0 for any of these fields is a wildcard and returns the first match found.

19.19.7 componentsPassingTest(tag as Variant = nil) as AVAudioUnitComponentMBS()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: An array of audio components that pass the Test event.
Notes: For each AudioComponent found by the manager, the Test event will be called. If the block returns

true then the AVAudioComponent instance is added to the array.

19.19.8 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.19.9 Destructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The destructor.

19.19.10 sharedAudioUnitComponentManager as AVAudioUnitComponentManagerMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns the shared component manager.

19.19.11 standardLocalizedTagNames as string()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: An array of the the localized standard system tags defined by the audio units.

19.19.12 tagNames as string()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: An array of all tags associated with the current user, as well as all system tags defined by the audio units.

19.19.13 Properties

19.19.14 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.19.15 Events

19.19.16 TagsDidChange(notification as NSNotificationMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The event called when tags changed.

19.19.17 Test(component as AVAudioUnitComponentMBS, byref stop as Boolean, tag as Variant) as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The event to apply to the audio unit components.
Notes: Component: The component to test.
stop: A reference to a Boolean value. The block can set the value to true to stop further processing of the search. The stop argument is an out-only argument. You should only ever set this Boolean to true within the event.

The event returns a Boolean value that indicates whether comp passed the test.

19.20 class AVAudioUnitComponentMBS

19.20.1 class AVAudioUnitComponentMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitComponent class provides details about an audio unit such as: type, subtype, manufacturer, and location.
Example:

```
// Needs OS X 10.10 or newer
Var m as new AVAudioUnitComponentManagerMBS

Var a() as AVAudioUnitComponentMBS = m.allComponents

for each c as AVAudioUnitComponentMBS in a
Var d as AVAudioComponentDescriptionMBS = c.audioComponentDescription
'List.AddRow c.Name, c.ManufacturerName, c.LlocalizedTypeName, c.VersionString, d.componentType+"
"+d.componentSubType

// we look for the mixer
// AUMixer Apple Mixer 1.6.0 aumx smxr

if d.componentType = "aumx" and d.componentSubType = "smxr" then
Var aa as new AVAudioUnitMBS(d)
MsgBox aa.Name
end if

next
```

Notes: User tags can be added to the AVAudioUnitComponent which can be queried later for display.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

19.20.2 Methods

19.20.3 allTagNames as string()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: An array of tag names for the audio unit component.

19.20.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether this class is available for use.
Notes: Should return true on OS X 10.10 and newer.

19.20.5 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.20.6 SetUserTagNames(tags() as string)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets an array of tags created by the user.

19.20.7 supportsNumberOfChannels(numInputChannels as Integer, numOutputChannels as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the audio unit component supports the specified number of input and output channels.
Notes: numInputChannels: The number of input channels.
numOutputChannels: The number of output channels.

Returns true if the audio unit component supports the specified number of input and output channels, otherwise false.

19.20.8 userTagNames as string()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of tags created by the user.

19.20.9 Properties

19.20.10 audioComponentDescription as AVAudioComponentDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AudioComponentDescription of the audio unit component.
Notes: (Read only property)

19.20.11 componentFile as FolderItem

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The folderitem of the audio unit component.
Notes: (Read only property)

19.20.12 componentURL as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The URL of the audio unit component.
Notes: (Read only property)

19.20.13 configurationDictionary as Dictionary

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The audio unit component,Äôs configuration dictionary.
Notes: (Read only property)

19.20.14 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

19.20.15 hasCustomView as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the audio unit component has a custom view.
Notes: True if the component has a custom view, otherwise false.
(Read only property)

19.20.16 hasMIDIInput as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether the audio unit component has midi input.
Notes: (Read only property)

19.20.17 hasMIDIOutput as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether the audio unit component has midi output.
Notes: (Read only property)

19.20.18 iconFile as FolderItem

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The folderitem of an icon the represents the audio unit component.
Notes: (Read only property)

19.20.19 iconURL as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The URL of an icon the represents the audio unit component.
Notes: (Read only property)

19.20.20 LocalizedTypeName as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The localized type name of the component.
Notes: (Read only property)

19.20.21 ManufacturerName as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The name of the manufacturer of the audio unit component.
Notes: (Read only property)

19.20.22 Name as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The name of the audio unit component.
Notes: (Read only property)

19.20.23 passesAUVal as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether the audio unit component passes the AUVal.
Notes: True if the component passes the AUVal, otherwise false.
(Read only property)

19.20.24 SandboxSafe as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether the audio unit component is safe for sandboxing.
Notes: True if the component is safe for sandboxing, otherwise false. This only applies to the current process.
(Read only property)

19.20.25 TypeName as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio unit component type.
Notes: (Read only property)

19.20.26 Version as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio unit component version number.
Notes: The version number is an NSNumber comprised of a hexadecimal number with major, minor, and a dot-release format: 0xMMMMmmDD.
(Read only property)

19.20.27 VersionString as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: A string representing the audio unit component version number.
Notes: (Read only property)

19.21 class AVAudioUnitDelayMBS

19.21.1 class AVAudioUnitDelayMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitDelay class is an AVAudioUnitEffect subclass that implements a delay effect.
Notes: A delay unit delays the input signal by the specified time interval and then blends it with the input signal. The amount of high frequency roll-off can also be controlled in order to simulate the effect of a tape delay.
Subclass of the AVAudioUnitEffectMBS class.

19.21.2 Methods

19.21.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.21.4 Properties

19.21.5 delayTime as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The time taken by the delayed input signal to reach the output.
Notes: The delay is specified in seconds. The default value is 1. The valid range of values is 0 to 2 seconds.
(Read and Write property)

19.21.6 feedback as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The amount of the output signal fed back into the delay line.
Notes: The feedback is specified as a percentage. The default value is 50%. The valid range of values is -100% to 100%.
(Read and Write property)

19.21.7 lowPassCutoff as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The cutoff frequency, in Hz, above which high frequency content is rolled off.
Notes: The default value is 15000 Hz. The valid range of values is 10 Hz through (sampleRate/2).
(Read and Write property)

19.21.8 wetDryMix as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The blend of the wet and dry signals.
Notes: The blend is specified as a percentage. The default value is 100%. The valid range of values is 0% (all dry) through 100% (all wet).
(Read and Write property)

19.22 class AVAudioUnitDistortionMBS

19.22.1 class AVAudioUnitDistortionMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitDistortion class is an AVAudioUnitEffect subclass that implements a multi-stage distortion effect.
Notes: Subclass of the AVAudioUnitEffectMBS class.

19.22.2 Methods

19.22.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.22.4 loadFactoryPreset(preset as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Configures the audio distortion unit by loading a distortion preset.
Notes: preset: The distortion preset. See AVAudioUnitDistortionPreset for possible values.

19.22.5 Properties

19.22.6 preGain as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The gain, in decibels, applied to the signal before being distorted.
Notes: The default value is -6 db. The valid range of values is -80 db to 20 db.
(Read and Write property)

19.22.7 wetDryMix as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The blend of the distorted and dry signals.
Notes: The blend is specified as a percentage. The default value is 50%. The range is 0% (all dry) through 100% (all wet).
(Read and Write property)

19.22.8 Constants

Preset Audio Distortions

Constant	Value	Description
PresetDrumsBitBrush	0	Preset that provides a ,ÄúDrumsBitBrush,Äù distortion.
PresetDrumsBufferBeats	1	Preset that provides a ,ÄúDrumsBuffersBitBrush,Äù distortion.
PresetDrumsLoFi	2	Preset that provides a ,ÄúDrumsLoFi,Äù distortion.
PresetMultiBrokenSpeaker	3	Preset that provides a ,ÄúMultiBrokenSpeaker,Äù distortion.
PresetMultiCellphoneConcert	4	Preset that provides a ,ÄúMultiCellphoneConcert,Äù distortion.
PresetMultiDecimated1	5	Preset that provides a ,ÄúMultiDecimated1,Äù distortion.
PresetMultiDecimated2	6	Preset that provides a ,ÄúMultiDecimated2,Äù distortion.
PresetMultiDecimated3	7	Preset that provides a ,ÄúMultiDecimated3,Äù distortion.
PresetMultiDecimated4	8	Preset that provides a ,ÄúMultiDecimated4,Äù distortion.
PresetMultiDistortedCubed	10	Preset that provides a ,ÄúMultiDistortedCubed,Äù distortion.
PresetMultiDistortedFunk	9	Preset that provides a ,ÄúMultiDistortedFunk,Äù distortion.
PresetMultiDistortedSquared	11	Preset that provides a ,ÄúMultiDistortedSquared,Äù distortion.
PresetMultiEcho1	12	Preset that provides a ,ÄúMultiEcho1,Äù distortion.
PresetMultiEcho2	13	Preset that provides a ,ÄúMultiEcho2,Äù distortion.
PresetMultiEchoTight1	14	Preset that provides a ,ÄúMultiEchoTight1,Äù distortion.
PresetMultiEchoTight2	15	Preset that provides a ,ÄúMultiEchoTight2,Äù distortion.
PresetMultiEverythingIsBroken	16	Preset that provides a ,ÄúMultiEverythingIsBroken,Äù distortion.
PresetSpeechAlienChatter	17	Preset that provides a ,ÄúSpeechAlienChatter,Äù distortion.
PresetSpeechCosmicInterference	18	Preset that provides a ,ÄúSpeechCosmicInterference,Äù distortion.
PresetSpeechGoldenPi	19	Preset that provides a ,ÄúSpeechGoldenPi,Äù distortion.
PresetSpeechRadioTower	20	Preset that provides a ,ÄúSpeechRadioTower,Äù distortion.
PresetSpeechWaves	21	Preset that provides a ,ÄúSpeechWaves,Äù distortion.

19.23 class AVAudioUnitEffectMBS

19.23.1 class AVAudioUnitEffectMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: An AVAudioUnitEffect class that processes audio in real-time using AudioUnits of type: effect, music effect, panner, remote effect or remote music effect.
Notes: These effects run in real-time and process some number of audio input samples to produce number of audio output samples. A delay unit is an example of an effect unit.
Subclass of the AVAudioUnitMBS class.

19.23.2 Methods

19.23.3 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes an AVAudioUnitEffect object.
Notes: audioComponentDescription: AudioComponentDescription of the AudioUnit to be instantiated.

The audioComponentDescription must be one of these types kAudioUnitType_Effect, kAudioUnitType_MusicEffect, kAudioUnitType_Panner, kAudioUnitType_RemoteEffect, or kAudioUnitType_RemoteMusicEffect.

19.23.4 Properties

19.23.5 bypass as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Bypass state of the AudioUnit.
Notes: (Read and Write property)

19.24 class AVAudioUnitEQFilterParametersMBS

19.24.1 class AVAudioUnitEQFilterParametersMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitEQFilterParameters class encapsulates the parameters used by an AVAudioUnitEQ instance.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

19.24.2 Methods

19.24.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.

19.24.4 Properties

19.24.5 bandwidth as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The bandwidth of the EQ filter, in octaves.
Notes: The value range of values is 0.05 to 5.0 octaves.
(Read and Write property)

19.24.6 bypass as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The bypass state of the EQ filter band.
Notes: True if the bypass is active, otherwise false.
(Read and Write property)

19.24.7 filterType as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The EQ filter type.
Notes: The default value is AVAudioUnitEQFilterTypeParametric.
(Read and Write property)

19.24.8 frequency as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The frequency of the EQ filter, in hertz.
Notes: The valid range of values is 20 Hz through (SampleRate/2).
(Read and Write property)

19.24.9 gain as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The gain of the EQ filter, in decibels.
Notes: The default value is 0 db. The valid range of values is -96 db through 24 db.
(Read and Write property)

19.24.10 Constants

Filter Types

Constant	Value	Description
FilterTypeBandPass	5	Band pass filter. The required parameters are: frequency (center) and bandwidth.
FilterTypeBandStop	6	Band stop filter (,Äúnotch filter,Äù). The required parameters are: frequency (center) and bandwidth.
FilterTypeHighPass	2	Simple Butterworth 2nd order high pass filter. The required parameters are: frequency (-3 dB cutoff at specified frequency).
FilterTypeHighShelf	8	High shelf filter. The required parameters are: frequency (center) and gain.
FilterTypeLowPass	1	Simple Butterworth 2nd order low pass filter. The required parameters are: frequency (-3 dB cutoff at specified frequency).
FilterTypeLowShelf	7	Low shelf filter. The required parameters are: frequency (center) and gain.
FilterTypeParametric	0	Parametric filter based on Butterworth analog prototype. The required parameters are: frequency (center), bandwidth, and gain.
FilterTypeResonantHighPass	4	High pass filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (-3 dB cutoff at specified frequency) and bandwidth.
FilterTypeResonantHighShelf	10	High shelf filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (center), bandwidth, and gain.
FilterTypeResonantLowPass	3	Low pass filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (-3 dB cutoff at specified frequency) and bandwidth.
FilterTypeResonantLowShelf	9	Low shelf filter with resonance support (using the bandwidth parameter). The required parameters are: frequency (center), bandwidth, and gain.

19.25 class AVAudioUnitEQMBS

19.25.1 class AVAudioUnitEQMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitEQ class is an AVAudioUnitEffect subclass that implements a multi-band equalizer.
Notes: The AVAudioUnitEQFilterParameters class encapsulates the filter parameters that are returned in the bands property array.
Subclass of the AVAudioUnitEffectMBS class.

19.25.2 Methods

19.25.3 bands as AVAudioUnitEQFilterParametersMBS()

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: An array of AVAudioUnitEQFilterParameters objects.
Notes: The number of elements in the array is equal to the number of bands.

19.25.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 19.25.5 Constructor(bands as Integer) 4084

19.25.5 Constructor(bands as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated AVAudioUnitEQ instance.
Notes: Bands: The number of bands created by the EQ.
See also:

- 19.25.4 Constructor 4084

19.25.6 Properties

19.25.7 globalGain as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The overall gain adjustment applied to the signal, in decibels.
Notes: The default value is 0 db. The valid range of values is -96 db to 24 db.
(Read and Write property)

19.26 class AVAudioUnitGeneratorMBS

19.26.1 class AVAudioUnitGeneratorMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitGenerator is an AVAudioUnit subclass that generates audio output.
Notes: An AVAudioUnitGenerator represents an AudioUnit of type kAudioUnitType_Generator or kAudioUnitType_RemoteGenerator. A generator will have no audio input, but will produce audio output. An example is a tone generator.
Subclass of the AVAudioUnitMBS class.

19.26.2 Methods

19.26.3 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated AVAudioUnitGenerator instance.
Notes: audioComponentDescription: The audio component description.

The AudioComponentDescription struct componentType field must be kAudioUnitType_Generator or kAudioUnitType_RemoteGenerator.

19.26.4 Properties

19.26.5 bypass as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The bypass state of the audio unit.
Notes: True if the bypass state is enabled, otherwise false.
(Read and Write property)

19.26.6 obstruction as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct path of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Only the direct path of sound between the source and listener

are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.26.7 occlusion as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Simulates filtering of the direct and reverb paths of sound due to an obstacle.
Notes: The value of obstruction is in decibels. Both the direct and reverb paths of sound between the source and listener are blocked.

The default value is 0.0. The range of valid values is -100 to 0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.26.8 pan as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's stereo pan.
Notes: The default value is 0.0. A value in the range -1.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.26.9 position as AVAudio3DPointMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The location of the source in the 3D environment.
Notes: The coordinates are specified in meters. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.26.10 rate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Changes the playback rate of the input signal.
Notes: A value of 2.0 results in the output audio playing one octave higher. A value of 0.5, results in the output audio playing one octave lower.

The default value is 1.0. The range of valid values is 0.5 to 2.0. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.26.11 renderingAlgorithm as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Type of rendering algorithm used.
Notes: Depending on the current output format of the AVAudioEnvironmentNode instance, only a subset of the rendering algorithms may be supported. An array of valid rendering algorithms is retrieved by calling the applicableRenderingAlgorithms function of the AVAudioEnvironmentNode instance.

The default rendering algorithm is AVAudio3DMixingRenderingAlgorithmEqualPowerPanning. This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.26.12 reverbBlend as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Controls the blend of dry and reverb processed audio.
Notes: This property controls the amount of the source,Äôs audio that will be processed by the reverb by the AVAudioEnvironmentNode instance. A value of 0.5 will result in an equal blend of dry and processed (wet) audio.

The default is 0.0. The range of valid values is 0.0 (completely dry) to 1.0 (completely wet). This property is currently implemented only by the AVAudioEnvironmentNode class mixer.
(Read and Write property)

19.26.13 volume as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The buss's input volume.
Notes: The default value is 1.0. The range of valid values are 0.0 to 1.0. This property is currently implemented only by the AVAudioEnvironmentNode and AVAudioMixerNode class mixers.

(Read and Write property)

19.27 class AVAudioUnitMBS

19.27.1 class AVAudioUnitMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnit class is a subclass of the AVAudioNode class that, depending on the type of the audio unit, processes audio either in real-time or non real-time.
Notes: Subclass of the AVAudioNodeMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.3pr3

19.27.2 Methods

19.27.3 AddPropertyListener(ID as UInt32)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Registeres to receive notifications for when a property changes.
Notes: When an audio unit property value changes, a PropertyListener event can be called by the audio unit to inform interested parties that this event has occurred.

You must call RemovePropertyListener when you are done with the audio unit.

Lasterror is set.

19.27.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 19.27.5 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS) 4090

19.27.5 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Private constructor. Initializes a newly allocated audio component specified by the description.
Example:

```
// Needs OS X 10.10 or newer
Var m as new AVAudioUnitComponentManagerMBS

Var a() as AVAudioUnitComponentMBS = m.allComponents

for each c as AVAudioUnitComponentMBS in a
Var d as AVAudioComponentDescriptionMBS = c.audioComponentDescription
'List.AddRow c.Name, c.ManufacturerName, c.LlocalizedTypeName, c.VersionString, d.componentType+"
"+d.componentSubType

// we look for the mixer
// AUMixer Apple Mixer 1.6.0 aumx smxr

if d.componentType = "aumx" and d.componentSubType = "smxr" then
Var aa as new AVAudioUnitMBS(d)
MsgBox aa.Name
end if

next
```

Notes: audioComponentDescription: The description of the audio unit to be initialized.
See also:

- 19.27.4 Constructor 4090

19.27.6 CreateView(PreferredSize as NSSizeMBS) as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Creates view if possible for the audio unit.
Example:

```
// audiounit is property of window
Var audiounit as new AVAudioUnitTimePitchMBS

Var preferredSize as new NSSizeMBS(200,100)
// view is property of window
Var view as NSViewMBS = audiounit.CreateView(preferredSize)

Var w as new NSWindowMBS(self)

// set position
view.setFrameOrigin(new NSPointMBS(100, 100))

// add to window
w.contentView.addSubview view
```

Notes: Returns nil in case of error.
PreferredSize is the preferred size of the control.

19.27.7 Destructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The destructor.

19.27.8 GetParameter(ID as UInt32, Scope as UInt32, Element as UInt32) as Single

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Get the value of a parameter as specified by its ID, scope and element.
Notes: Lasterror is set.
If no error occurs, the result is the parameter value.
Please check Apples documentation for possible parameters.

19.27.9 GetProperty(ID as UInt32, Scope as UInt32, Element as UInt32) as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Retrieves the value of a specified property.
Notes: The plugin queries the data size, creates a memoryblock, queries the value and returns it.
Lasterror is set.

19.27.10 GetPropertyInfo(ID as UInt32, Scope as UInt32, Element as UInt32, byref WriteAble as Boolean) as UInt32

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Retrieves information about a specified property.
Notes: The API can be used to retrieve both the size of the property, and whether it is writable or not. In order to get a general answer on the capability of an audio unit, this function should be called before the audio unit is initialized (as some properties are writable when the audio unit is initialized, and others not)
Lasterror is set.

19.27.11 installLevelMonitor(CallsPerSecond as Integer, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Installs the handler to call LevelMonitor event regularly.
Notes: CallsPerSecond can be between 5 and 50. Tag is stored and passed to the event.

19.27.12 RemovePropertyListener(ID as UInt32)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Remove a previously registered property listener.

19.27.13 SetParameter(ID as UInt32, Scope as UInt32, Element as UInt32, Value as Single, inBufferOffsetInFrames as UInt32 = 0)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Set the value of a parameter as specified by its ID, scope and element.
Notes: Parameter IDs are consistent across all of the elements in a scope - so for a mixer, the "input volume" parameter can be applied on any input, and the particular input is specified by the elementID.

Lasterror is set.
Please check Apples documentation for possible parameters.

19.27.14 SetProperty(ID as UInt32, Scope as UInt32, Element as UInt32, data as Memoryblock)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sets the value of a specified property.
Notes: Some properties can be cleared by passing data = nil.
Lasterror is set.

19.27.15 Properties

19.27.16 audioComponentDescription as AVAudioComponentDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio compression description of the underlying Core Audio audio unit.
Notes: (Read only property)

19.27.17 audioUnitHandle as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The internal handle for the audio unit.
Notes: (Read only property)

19.27.18 lastError as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The last error code for the property/parameter functions.
Notes: Zero means no error.
(Read and Write property)

19.27.19 ManufacturerName as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The name of the manufacturer of the audio unit.
Notes: (Read only property)

19.27.20 Name as String

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The name of the audio unit.
Notes: (Read only property)

19.27.21 Version as Integer

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The version number of the audio unit.
Notes: (Read only property)

19.27.22 Events

19.27.23 LevelMonitor(Level0 as Double, Level1 as Double, Level2 as Double, Level3 as Double, Level4 as Double, Level5 as Double, Level6 as Double, Level7 as Double, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Reports level values.
Notes: We pass 8 level parameters for up to 8 channels.

19.27.24 PropertyListener(ID as UInt32, Scope as UInt32, Element as UInt32)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The property listener event.
Notes: When you listen for changes on a property, this event can be called.
Either synchronous on main thread or when received on other threads, the plugin will run it asynchronously on main thread.

19.28 class AVAudioUnitMIDIInstrumentMBS

19.28.1 class AVAudioUnitMIDIInstrumentMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitMIDIInstrument class is an abstract class representing music devices or remote instruments.
Notes: An AVAudioUnitMIDIInstrument subclass can be used in a chain that processes realtime input (live) and has general concept of music events, for example, notes.

Available in OS X v10.10 and later.
Subclass of the AVAudioUnitMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.4pr1

19.28.2 Methods

19.28.3 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a MIDI instrument audio unit with the specified component description.
Notes: description: The AudioComponentDescription struct. The component of type must be kAudioUnitType_MusicDevice or kAudioUnitType_RemoteInstrument.

19.28.4 sendController(Controller as Integer, Value as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Send a MIDI ,Äúcontroller,Äù event to the instrument.
Notes: controller: Specifies a standard MIDI controller number. The valid range is 0 to 127.
value: Value for the controller. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

19.28.5 sendMIDIEvent(midiStatus as Integer, data1 as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends a MIDI event which contains one data byte to the instrument.
Notes: midiStatus: The STATUS value of the MIDI event.
data1: The data byte of the MIDI event.
See also:

- 19.28.6 sendMIDIEvent(midiStatus as Integer, data1 as Integer, data2 as Integer) 4097

19.28.6 sendMIDIEvent(midiStatus as Integer, data1 as Integer, data2 as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends a MIDI event which contains two data bytes to the instrument.
Notes: midiStatus: The STATUS value of the MIDI event.
data1: The first data byte of the MIDI event.
data2: The first data byte of the MIDI event.
See also:

- 19.28.5 sendMIDIEvent(midiStatus as Integer, data1 as Integer) 4096

19.28.7 sendMIDISysExEvent(data as MemoryBlock)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends a MIDI ‚ÄúSystem Exclusive‚Äù event to the instrument.
Notes: midiData: A memoryblock object containing the complete SysEx data including start(F0) and termination(F7) bytes.

19.28.8 sendPitchBend(pitchbend as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends MIDI ‚ÄúPitch Bend‚Äù event to the instrument.
Notes: pitchbend: Value of the pitchbend. The valid range of values is 0 to 16383.
channel: The channel number to which the event is sent.

If this method is not invoked, then the pitch bend is the default value of 8192 (no pitch).

19.28.9 sendPressure(pressure as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends MIDI ‚Äúchannel pressure‚Äù event to the instrument.
Notes: pressure: The value of the pressure. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

19.28.10 sendPressureForKey(Key as Integer, value as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends MIDI ‚ÄúPolyphonic key pressure‚Äù event to the instrument.
Notes: key: The key (note) number to which the pressure event applies. The valid range is 0 to 127.
value: The value of the pressure. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

19.28.11 sendProgramChange(program as Integer, bankMSB as Integer, bankLSB as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends a MIDI ‚ÄúProgram Change‚Äù and ‚ÄúBank Select‚Äù events to the instrument.
Notes: program: Specifies the program (preset) number within the bank to load. The valid range is 0 to 127.
bankMSB: Specifies the most significant byte value for the bank to select. The valid range is 0 to 127.
bankLSB: Specifies the least significant byte value for the bank to select. The valid range is 0 to 127.
channel: The channel number to which the event is sent.
See also:

- 19.28.12 sendProgramChange(program as Integer, Channel as Integer) 4098

19.28.12 sendProgramChange(program as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends a MIDI ‚ÄúProgram Change‚Äù and ‚ÄúBank Select‚Äù events to the instrument.
Notes: program: Specifies the program. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

The instrument will be loaded from the bank that has been previous set by MIDI ‚ÄúBank Select‚Äù controller messages (0 and 31). If none has been set, bank 0 will be used.
See also:

- 19.28.11 sendProgramChange(program as Integer, bankMSB as Integer, bankLSB as Integer, Channel as Integer) 4098

19.28.13 startNote(note as Integer, Velocity as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends a MIDI ,ÄúNote On,Äù event to the instrument.
Notes: note: The note number (key) to play. The valid range is 0 to 127.
velocity: Specifies the volume at which the note is played. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

19.28.14 stopNote(note as Integer, Channel as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Sends a MIDI ,ÄúNote Off,Äù event to the instrument
Notes: note: The note number (key) to stop. The valid range is 0 to 127.
channel: The channel number to which the event is sent.

19.29 class AVAudioUnitReverbMBS

19.29.1 class AVAudioUnitReverbMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitReverb class is an AVAudioUnitEffect subclass that implements a reverb effect.
Notes: A reverb simulates the acoustic characteristics of a particular environment. Use the different presets to simulate a particular space and blend it in with the original signal using the wetDryMix property.
Subclass of the AVAudioUnitEffectMBS class.

19.29.2 Methods

19.29.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.29.4 loadFactoryPreset(preset as Integer)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Configures the audio unit a reverb preset.
Notes: preset: The reverb preset. See AVAudioUnitReverbPreset for the supported values.

The default value is AVAudioUnitReverbPresetMediumHall.

19.29.5 Properties

19.29.6 wetDryMix as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The blend of the wet and dry signals.
Notes: The blend is specified as a percentage. The range is 0% (all dry) through 100% (all wet).
(Read and Write property)

19.29.7 Constants

Reverb presets

Constant	Value	Description
PresetCathedral	8	The reverb preset with the acoustic characteristics of a cathedral environment.
PresetLargeChamber	7	The reverb preset with the acoustic characteristics of a large-sized chamber environment.
PresetLargeHall	4	The reverb preset with the acoustic characteristics of a large-sized hall environment.
PresetLargeHall2	12	The reverb preset with the acoustic characteristics of an alternate large-sized hall environment.
PresetLargeRoom	2	The reverb preset with the acoustic characteristics of a large-sized room environment.
PresetLargeRoom2	9	The reverb preset with the acoustic characteristics of an alternate large-sized room environment.
PresetMediumChamber	6	The reverb preset with the acoustic characteristics of a medium-sized chamber environment.
PresetMediumHall	3	The reverb preset with the acoustic characteristics of a medium-sized hall environment. This is the default value for the audio unit.
PresetMediumHall2	10	The reverb preset with the acoustic characteristics of an alternate medium-sized hall environment.
PresetMediumHall3	11	The reverb preset with the acoustic characteristics of an alternate medium-sized hall environment.
PresetMediumRoom	1	The reverb preset with the acoustic characteristics of a medium-sized room environment.
PresetPlate	5	The reverb preset with the acoustic characteristics of a plate environment.
PresetSmallRoom	0	The reverb preset with the acoustic characteristics of a small-sized room environment.

19.30 class AVAudioUnitSamplerMBS

19.30.1 class AVAudioUnitSamplerMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitSampler class encapsulates Apple's Sampler Audio Unit.
Notes: The sampler audio unit can be configured by loading different types of instruments such as an ,Äú.aupreset,Äù file, a DLS or SF2 sound bank, an EXS24 instrument, a single audio file or with an array of audio files. The output is a single stereo bus.
Subclass of the AVAudioUnitMIDIInstrumentMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.4pr1

19.30.2 Methods

19.30.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 19.30.4 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS) 4102

19.30.4 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a MIDI instrument audio unit with the specified component description.
See also:

- 19.30.3 Constructor 4102

19.30.5 loadAudioFilesAtFiles(Files() as folderitem, byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Configures the sampler by loading the specified audio files.
Notes: Files: An array of files for the audio files.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true if the sampler was configured with the audio file(s); otherwise false.

The audio files are loaded into a new instrument with each audio file placed into its own sampler zone. Any information contained in the audio file regarding their placement in the instrument, for example, root key, key range, will be used.

19.30.6 loadAudioFilesAtURLs(URLs() as string, byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Configures the sampler by loading the specified audio files.
Notes: URLs: An array of URLs for the audio files.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true if the sampler was configured with the audio file(s); otherwise false.

The audio files are loaded into a new instrument with each audio file placed into its own sampler zone. Any information contained in the audio file regarding their placement in the instrument, for example, root key, key range, will be used.

19.30.7 loadInstrumentAtFile(File as folderitem, byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Configures the sampler with the specified instrument file.
Notes: File: The file containing the instrument.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true if the sampler was configured with the instrument file; otherwise false.

The instrument can be of one of the following types: Logic or GarageBand EXS24, sampler,Äôs native .aupreset file or an audio file, for example, ,Äú.caf,Äù, ,Äú.aiff,Äù, ,Äú.wav,Äù, or ,Äú.mp3,Äù.

In the case of single audio file, it is loaded into a new default instrument and any information contained in the audio file regarding its placement in the instrument, for example, root key, key range, will be used.

19.30.8 loadInstrumentAtURL(URL as string, byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Configures the sampler with the specified instrument file.
Notes: URL: The URL of the file containing the instrument.
Error: Returns, by-reference, a description of the error, if an error occurs.

Returns true if the sampler was configured with the instrument file; otherwise false.

The instrument can be of one of the following types: Logic or GarageBand EXS24, sampler,Äôs native .aupreset file or an audio file, for example, ,Äú.caf,Äù, ,Äú.aiff,Äù, ,Äú.wav,Äù, or ,Äú.mp3,Äù.

In the case of single audio file, it is loaded into a new default instrument and any information contained in the audio file regarding its placement in the instrument, for example, root key, key range, will be used.

19.30.9 loadSoundBankInstrumentAtFile(bankFile as folderitem, program as Integer, bankMSB as Integer, bankLSB as Integer, byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: loads a specific instrument from the specified sound bank.
Notes: bankFile: Soundbank file. The file can be either a DLS bank (.dls) or a SoundFont bank (.sf2).
program: program number for the instrument to load
bankMSB: MSB for the bank number for the instrument to load. This is usually 0x79 for melodic instruments and 0x78 for percussion instruments.
bankLSB: LSB for the bank number for the instrument to load. This is often 0, and represents the "bank variation".
Error: the status of the operation

This method reads from file and allocates memory, so it should not be called on a real time thread.

19.30.10 loadSoundBankInstrumentAtURL(bankURL as string, program as Integer, bankMSB as Integer, bankLSB as Integer, byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: loads a specific instrument from the specified sound bank.
Notes: bankURL: URL for a Soundbank file. The file can be either a DLS bank (.dls) or a SoundFont bank

(.sf2).
program: program number for the instrument to load
bankMSB: MSB for the bank number for the instrument to load. This is usually 0x79 for melodic instruments and 0x78 for percussion instruments.
bankLSB: LSB for the bank number for the instrument to load. This is often 0, and represents the "bank variation".
Error: the status of the operation

This method reads from file and allocates memory, so it should not be called on a real time thread.

19.30.11 Properties

19.30.12 globalTuning as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Adjusts the tuning of all the notes played.
Notes: The tuning unit is cents. The default value is 0.0. The range of valid values is -2400 to 2400 cents.
(Read and Write property)

19.30.13 masterGain as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Adjusts the gain, in decibels, of all the notes played.
Notes: The default value is 0.0 db. The range of valid values is -90.0 db to 12.0 db.
(Read and Write property)

19.30.14 stereoPan as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Adjusts the stereo panning for all the notes played.
Notes: The default value is 0.0. The range of valid values is -1.0 to 1.0.
(Read and Write property)

19.31 class AVAudioUnitTimeEffectMBS

19.31.1 class AVAudioUnitTimeEffectMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitTimeEffect class is an AVAudioUnit subclass that processes audio in non-realtime.
Notes: An AVAudioUnitTimeEffect instance represents an AVAudioUnit of type ,Äúaufc,Äù (kAudioUnitType_FormatConverter). These effects do not process audio in real-time. The AVAudioUnitVarispeed class is an example of a time effect unit.
Subclass of the AVAudioUnitMBS class.

19.31.2 Methods

19.31.3 Constructor(audioComponentDescription as AVAudioComponentDescriptionMBS)

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Initializes a newly allocated audio component specified by the description.
Notes: audioComponentDescription: The description of the audio unit to be initialized. The componentType field of the description struct must be kAudioUnitType_FormatConverter (,Äúaufc,Äù).

If the componentType field of the audioComponentDescription struct is not kAudioUnitType_FormatConverter an exception is raised.

19.31.4 Properties

19.31.5 bypass as Boolean

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Returns the bypass state of the audio unit.
Notes: If true then the audio unit processing is being bypassed.
(Read and Write property)

19.32 class AVAudioUnitTimePitchMBS

19.32.1 class AVAudioUnitTimePitchMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitTimePitch class is an AVAudioUnitTimeEffect subclass that provides good quality playback rate and pitch shifting independent of each other.
Notes: Subclass of the AVAudioUnitTimeEffectMBS class.

19.32.2 Methods

19.32.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.32.4 Properties

19.32.5 overlap as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The amount of overlap between segments of the input audio signal.
Notes: A higher value results in fewer artifacts in the output signal.

The default value is 8.0. The range of values is 3.0 to 32.0.
(Read and Write property)

19.32.6 pitch as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The amount by which the input signal is pitch shifted.
Notes: The pitch is measured in ,Äúcents,Äù, a logarithmic value used for measuring musical intervals. One octave is equal to 1200 cents. One musical semitone is equal to 100 cents.

The default value is 1.0. The range of values is -2400 to 2400.
(Read and Write property)

19.32.7 rate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The playback rate of the input signal.
Notes: The default value is 1.0. The range of supported values is 1/32 to 32.0.
(Read and Write property)

19.33 class AVAudioUnitVarispeedMBS

19.33.1 class AVAudioUnitVarispeedMBS

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The AVAudioUnitVarispeed class is an AVAudioUnitTimeEffect subclass that allows control of the playback rate.
Notes: Subclass of the AVAudioUnitTimeEffectMBS class.

19.33.2 Methods

19.33.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The constructor.

19.33.4 Properties

19.33.5 Rate as Double

MBS AVFoundation Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The audio playback rate.
Notes: The varispeed audio unit resamples the input signal, as a result changing the playback rate also changes the pitch. For example, changing the rate to 2.0 results in the output audio playing one octave higher. Similarly changing the rate to 0.5, results in the output audio playing one octave lower.

The pitch is measured in ‚Äúcents‚Äù, a logarithmic value used for measuring musical intervals. One octave is equal to 1200 cents. One musical semitone is equal to 100 cents.

Using the rate value you calculate the pitch (in cents) using the formula pitch = 1200.0 * log2(rate). Conversely, you calculate the appropriate rate for a desired pitch with the formula rate = pow(2, cents/1200.0).

The default value is 1.0. The range of values is 0.25 to 4.0. The unit of rate is unspecified.
(Read and Write property)

Chapter 20

AVMovie

20.1 class AVFragmentedMovieMBS

20.1.1 class AVFragmentedMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The movie class for fragmented movies.
Notes: A subclass of AVMovie for handling fragmented movie files. An AVFragmentedMovie is capable of changing the values of certain of its properties and those of its tracks, if it's associated with an instance of AVFragmentedMovieMinder when one or more movie fragments are appended to the movie file.
Subclass of the AVMovieMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.0pr5

20.1.2 Methods

20.1.3 AVFragmentedMovieContainsMovieFragmentsDidChangeNotification as string

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted after the value of @"containsMovieFragments" has already been loaded and the AVFragmentedMovie is added to an AVFragmentedMovieMinder, either when 1) movie fragments are detected in the movie file on disk after it had previously contained none or when 2) no movie fragments are detected in the movie file on disk after it had previously contained one or more.

20.1.4 AVFragmentedMovieDurationDidChangeNotification as string

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted when the duration of an AVFragmentedMovie changes while it's being minded by an AVFragmentedMovieMinder, but only for changes that occur after the status of the value of @"duration" has reached AVKeyValueStatusLoaded.

20.1.5 AVFragmentedMovieWasDefragmentedNotification as string

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted when the movie file on disk is defragmented while an AVFragmentedMovie is being minded by an AVFragmentedMovieMinder, but only if the defragmentation occurs after the status of the value of @"canContainMovieFragments" has reached AVKeyValueStatusLoaded.

20.1.6 Constructor

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The private constructor.

20.1.7 fragmentedMovieTracks as AVFragmentedMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The tracks in a movie.
Notes: The value of this property is an array of tracks the movie contains; the tracks are of type AVFragmentedMovieTrack.

20.1.8 fragmentedMovieTracksWithMediaCharacteristic(mediaCharacteristic as string) as AVFragmentedMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an array of AVFragmentedMovieTracks of the asset that present media with the specified characteristic.
Notes: mediaCharacteristic: The media characteristic according to which the receiver filters its AVFragmentedMovieTracks. (Media characteristics are defined in AVMediaFormat.h)

An array of AVFragmentedMovieTracks; may be empty if no tracks with the specified characteristic are available.
Becomes callable without blocking when the key "tracks" has been loaded

20.1.9 fragmentedMovieTracksWithMediaType(mediaType as string) as AVFragmentedMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an array of AVFragmentedMovieTracks of the asset that present media of the specified media type.
Notes: mediaType: The media type according to which the receiver filters its AVFragmentedMovieTracks. (Media types are defined in AVMediaFormat.h)
An array of AVFragmentedMovieTracks; may be empty if no tracks of the specified media type are available.
Becomes callable without blocking when the key "tracks" has been loaded

20.1.10 fragmentedMovieTrackWithTrackID(ID as Integer) as AVFragmentedMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an instance of AVFragmentedMovieTrack that represents the track of the specified trackID.
Notes: ID: The trackID of the requested AVFragmentedMovieTrack.

An instance of AVFragmentedMovieTrack; may be nil if no track of the specified trackID is available.
Becomes callable without blocking when the key "tracks" has been loaded

20.2 class AVFragmentedMovieTrackMBS

20.2.1 class AVFragmentedMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The class for a movie track from a fragmented movie.
Notes: A subclass of AVMovieTrack for handling tracks of fragmented movie files. An AVFragmentedMovieTrack is capable of changing the values of certain of its properties, if its parent movie is associated with an instance of AVFragmentedMovieMinder when one or more movie fragments are appended to the movie file. Subclass of the AVMovieTrackMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo / Real Studio Plugins, version 16.0pr5

20.2.2 Methods

20.2.3 AVFragmentedMovieTrackSegmentsDidChangeNotification as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the notification names for fragmented movies.
Notes: Posted when the array of segments of an AVFragmentedMovieTrack changes while the associated instance of AVFragmentedMovie is being minded by an AVFragmentedMovieMinder, but only for changes that occur after the status of the value of @"segments" has reached AVKeyValueStatusLoaded.

20.2.4 AVFragmentedMovieTrackTimeRangeDidChangeNotification as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the notification names for fragmented movies.
Notes: Posted when the timeRange of an AVFragmentedMovieTrack changes while the associated instance of AVFragmentedMovie is being minded by an AVFragmentedMovieMinder, but only for changes that occur after the status of the value of "timeRange" has reached AVKeyValueStatusLoaded.

20.2.5 AVFragmentedMovieTrackTotalSampleDataLengthDidChangeNotification as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the notification names for fragmented movies.
Notes: This notification name has been deprecated. Use either AVFragmentedMovieTrackTimeRange-

DidChangeNotification or AVFragmentedMovieTrackSegmentsDidChangeNotification instead; in either case, you can assume that timing changes to fragmented tracks result in changes to the total length of the sample data used by the track.

20.2.6 Constructor

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The private constructor.

20.3 class AVMediaDataStorageMBS

20.3.1 class AVMediaDataStorageMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The class for media storage.
Notes: Available on OS X 10.11 and newer.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.0pr5

20.3.2 Methods

20.3.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Example:

```
if not AVMediaDataStorageMBS.available then
MsgBox "This application requires a newer OS X version."
end if
```

Notes: Returns true on OS X 10.11.

20.3.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 20.3.5 Constructor(File as FolderItem, Options as Dictionary = nil) 4116
- 20.3.6 Constructor(URL as String, Options as Dictionary = nil) 4117

20.3.5 Constructor(File as FolderItem, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMediaDataStorage object associated with a folderitem.
Notes: File: A folderitem that specifies a file where sample data that is added to a movie or track should

be written.
options: A dictionary object that contains keys for specifying options for the initialization of the AVMediaDataStorage object. Currently no keys are defined.

Raises exception if things go wrong.
See also:

- 20.3.4 Constructor 4116
- 20.3.6 Constructor(URL as String, Options as Dictionary = nil) 4117

20.3.6 Constructor(URL as String, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMediaDataStorage object associated with a file URL.
Notes: URL: An URL that specifies a file where sample data that is added to a movie or track should be written.
options: A dictionary object that contains keys for specifying options for the initialization of the AVMediaDataStorage object. Currently no keys are defined.

Raises exception if things go wrong.
See also:

- 20.3.4 Constructor 4116
- 20.3.5 Constructor(File as FolderItem, Options as Dictionary = nil) 4116

20.3.7 Properties

20.3.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

20.3.9 URL as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The URL from which the receiver was initialized; may be "".
Notes: (Read only property)

20.4 class AVMovieMBS

20.4.1 class AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: AVMovie represents the audiovisual containers in a file that conforms to the QuickTime movie file format or to one of the related ISO base media file formats (such as MPEG-4).
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

MsgBox str(m.duration.Seconds)+" seconds."
```

Notes: AVMovie supports operations involving the format-specific portions of the QuickTime Movie model that are not supported by AVAsset. For instance, you can retrieve the movie header from an existing QuickTime movie file. You can also use AVMovie to write a movie header into a new file, thereby creating a reference movie.

A mutable subclass of AVMovie, AVMutableMovie, provides methods that support the familiar Movie editing model; for instance, you can use AVMutableMovie to copy media data from one track and paste that data into another track. You can also use AVMutableMovie to establish track references from one track to another (for example, to set one track as a chapter track of another track). If you want to perform editing operations on individual tracks, you can use the associated classes AVMovieTrack and AVMutableMovieTrack.

You need to use AVMovie and AVMutableMovie only when operating on format-specific features of a QuickTime or ISO base media file. You generally do not need to use these classes just to open and play QuickTime movie files or ISO base media files. Instead, you can use the classes AVURLAsset and AVPlayerItem. If however you already have an AVMutableMovie and want to play it or inspect it, you can make an immutable snapshot of the AVMutableMovie.
Subclass of the AVAssetMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.0pr5

20.4.2 Methods

20.4.3 available as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Example:

```
if not AVMovieMBS.available then
```

```
MsgBox "This application requires a newer OS X version."
end if
```

Notes: Returns true on OS X 10.10.

20.4.4 AVMovieReferenceRestrictionsKey as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Indicates the restrictions used by the movie when resolving references to external media data.
Notes: The value of this key is an NSNumber wrapping an AVAssetReferenceRestrictions enum value or the logical combination of multiple such values. See AVAsset.h for the declaration of the AVAssetReferenceRestrictions enum.
Some movies can contain references to media data stored outside the movie's container, for example in another file. This key can be used to specify a policy to use when these references are encountered. If a movie contains one or more references of a type that is forbidden by the reference restrictions, loading of movie properties will fail. In addition, such a movie cannot be used with other AVFoundation modules, such as AVPlayerItem or AVAssetExportSession.

20.4.5 Constructor

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 20.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil) 4119
- 20.4.7 Constructor(File as FolderItem, Options as Dictionary = nil) 4120
- 20.4.8 Constructor(URL as String, Options as Dictionary = nil) 4121

20.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Notes: data: An Memoryblock containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.

You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire

movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

In case of error raises an exception.

Available on OS X 10.11.
See also:

- 20.4.5 Constructor 4119
- 20.4.7 Constructor(File as FolderItem, Options as Dictionary = nil) 4120
- 20.4.8 Constructor(URL as String, Options as Dictionary = nil) 4121

20.4.7 Constructor(File as FolderItem, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

MsgBox str(m.duration.Seconds)+" seconds."
```

Notes: File: A folderitem that specifies a file containing a movie header.
options: A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.

By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

Raises exception if something goes wrong.
See also:

- 20.4.5 Constructor 4119
- 20.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil) 4119
- 20.4.8 Constructor(URL as String, Options as Dictionary = nil) 4121

20.4.8 Constructor(URL as String, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: URL: An URL that specifies a file containing a movie header.
options: A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

Raises exception if something goes wrong.
See also:

- 20.4.5 Constructor 4119
- 20.4.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil) 4119
- 20.4.7 Constructor(File as FolderItem, Options as Dictionary = nil) 4120

20.4.9 copy as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a copy of the movie.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

Var c as AVMutableMovieMBS = m.mutableCopy

Break // now edit

Var k as AVMovieMBS = c.copy

break // now we have k with snapshot and can still edit c
```

20.4.10 movieHeaderWithFileType(fileType as String, byref error as NSErrorMBS) as MemoryBlock

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a memoryblock object containing the movie header of the AVMovie object.
Notes: fileType: A UTI indicating the specific file format of the movie header (e.g. AVFileTypeQuickTimeMovie for a QuickTime movie).
Error: If an error occurs reading the movie header, describes the nature of the failure.

The movie header will be a pure reference movie, with no base URL, suitable for use on the pasteboard.
Returns memoryblock in case of success or nil in case of error.

Available on OS X 10.11 or newer.

20.4.11 movieTracks as AVMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The tracks in a movie.
Notes: The value of this property is an array of tracks the movie contains; the tracks are of type AVMovieTrack.

20.4.12 movieTracksWithMediaCharacteristic(mediaCharacteristic as string) as AVMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an array of AVMovieTracks of the asset that present media with the specified characteristic.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

Var videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaCharacteristic(AVFoundationMBS.AVMediaCharacteristicVisual)

MsgBox str(UBound(videotracks)+1)+" visual tracks"
```

Notes: mediaCharacteristic: The media characteristic according to which the receiver filters its AVMovieTracks. (Media characteristics are defined in AVMediaFormat.h)
An array of AVMovieTracks; may be empty if no tracks with the specified characteristic are available.
Becomes callable without blocking when the key "tracks" has been loaded.

20.4.13 movieTracksWithMediaType(mediaType as string) as AVMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an array of AVMovieTracks of the asset that present media of the specified media type.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

Var videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaType(AVFoundationMBS.AVMediaTypeVideo)

MsgBox str(UBound(videotracks)+1)+" video tracks"
```

Notes: mediaType: The media type according to which the receiver filters its AVMovieTracks. (Media types are defined in AVMediaFormat.h)
An array of AVMovieTracks; may be empty if no tracks of the specified media type are available.
Becomes callable without blocking when the key "tracks" has been loaded.

20.4.14 movieTrackWithTrackID(ID as Integer) as AVMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an instance of AVMovieTrack that represents the track of the specified trackID.
Notes: ID: The trackID of the requested AVMovieTrack.

Returns n instance of AVMovieTrack; may be nil if no track of the specified trackID is available.
Becomes callable without blocking when the key "tracks" has been loaded

20.4.15 movieTypes as String()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides the file types the AVMovie class understands.
Example:

```
MsgBox join(AVMovieMBS.movieTypes, EndOfLine)
```

Notes: Returns an array of UTIs identifying the file types the AVMovie class understands.

20.4.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Notes: data: An Memoryblock/String containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 20.4.17 movieWithData(Data as String, Options as Dictionary = nil) as AVMovieMBS 4124

20.4.17 movieWithData(Data as String, Options as Dictionary = nil) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Example:

```
// load movie in memory
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var b as BinaryStream = BinaryStream.Open(f)

// now open it from memory
Var s as string = b.Read(b.Length)
Var m as AVMovieMBS = AVMovieMBS.movieWithData(s)

MsgBox str(m.duration.Seconds)+" seconds."
```

Notes: data: An Memoryblock/String containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any

of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 20.4.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVMovieMBS 4124

20.4.18 movieWithFile(File as FolderItem, Options as Dictionary = nil) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as AVMovieMBS = AVMovieMBS.movieWithFile(f)

MsgBox str(m.duration.Seconds)+" seconds."
```

Notes: File: A folderitem that specifies a file containing a movie header.
options: A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

20.4.19 movieWithURL(URL as String, Options as Dictionary = nil) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: URL: An URL that specifies a file containing a movie header.
options: A Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

20.4.20 mutableCopy as AVMutableMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a mutable copy of the movie.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

Var c as AVMutableMovieMBS = m.mutableCopy

Break // now edit

Var k as AVMovieMBS = c.copy

break // now we have k with snapshot and can still edit c
```

20.4.21 writeMovieHeaderToFile(File as FolderItem, fileType as String, options as Integer, byref error as NSErrorMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Writes the movie header to a destination file.
Notes: File: A folderitem indicating where to write the movie header.
fileType: A UTI indicating the specific file format (e.g. AVFileTypeQuickTimeMovie for a QuickTime movie).
options: An integer whose bits specify options for the writing of the movie header. Can be AVMovieWritingTruncateDestinationToMovieHeaderOnly.
Error: If an error occurs writing the movie header, describes the nature of the failure.

Data references in the output movie header are adjusted to be relative to the destination URL. Note that modifications to instances of AVMutableMovie, to their constituent AVMutableMovieTracks, or to their collections of metadata are committed to storage when their movie headers are written.

20.4.22 writeMovieHeaderToURL(URL as String, fileType as String, options as Integer, byref error as NSErrorMBS) as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Writes the movie header to a destination URL.
Notes: URL: An URL indicating where to write the movie header.
fileType: A UTI indicating the specific file format (e.g. AVFileTypeQuickTimeMovie for a QuickTime movie).

options: An integer whose bits specify options for the writing of the movie header. Can be AVMovieWritingTruncateDestinationToMovieHeaderOnly.
Error: If an error occurs writing the movie header, describes the nature of the failure.

Data references in the output movie header are adjusted to be relative to the destination URL. Note that modifications to instances of AVMutableMovie, to their constituent AVMutableMovieTracks, or to their collections of metadata are committed to storage when their movie headers are written.

20.4.23 Properties

20.4.24 canContainMovieFragments as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Indicates whether the movie file is capable of being extended by fragments.
Notes: The value of this property is true if an 'mvex' box is present in the 'moov' box. The 'mvex' box is necessary in order to signal the possible presence of later 'moof' boxes.
(Read only property)

20.4.25 containsMovieFragments as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Indicates whether the movie file is extended by at least one movie fragment.
Notes: The value of this property is YES if canContainMovieFragments is YES and at least one 'moof' box is present after the 'moov' box.
Available on OS X 10.11 or newer.
(Read only property)

20.4.26 Data as MemoryBlock

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The data block with which the instance of AVMovie was initialized; may be nil.
Notes: Available on OS X 10.11 or newer.
(Read only property)

20.4.27 defaultMediaDataStorage as AVMediaDataStorageMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The default storage container for media data added to a movie.
Notes: The value of this property is an AVMediaDataStorage object that indicates where sample data that is added to a movie should be written by default.
(Read only property)

20.4.28 URL as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The URL with which the instance of AVMovie was initialized; may be "".
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

MsgBox m.URL
```

Notes: (Read only property)

20.4.29 Constants

Constants

Constant	Value	Description
AVMovieWritingTruncateDestinationToMovieHeaderOnly	1	One of the options for writeMovieHeaderToURL. If set, writing the movie header will truncate all existi file and write a new movie header, thereby creating a A file type box will be written at the beginning of tl the movie header will remove any existing movie hea and write a new movie header, preserving any othe destination file was empty, a file type box will be wr the file. You would not want to use the AVMovieWritin MovieHeaderOnly option if you had written sample file using (for example) insertTimeRange with copy since that data would be lost.

20.5 class AVMovieTrackMBS

20.5.1 class AVMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: AVMovieTrack represents the tracks of audiovisual containers in a file that conforms to the QuickTime movie file format or to one of the related ISO base media file formats (such as MPEG-4).
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

Var videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaCharacteristic(AVFoundationMBS.AV-
MediaCharacteristicFrameBased)

for each videotrack as AVMovieTrackMBS in videotracks
Var s as CGSizeMBS = videotrack.naturalSize
MsgBox str(s.Width)+" x "+ str(s.Height)
next
```

Notes: Subclass of the AVAssetTrackMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.0pr5

20.5.2 Methods

20.5.3 available as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Example:

```
if not AVMovieTrackMBS.available then
MsgBox "This application requires a newer OS X version."
end if
```

Notes: Returns true on OS X 10.10.

20.5.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The private constructor.

20.5.5 Properties

20.5.6 alternateGroupID as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: An integer indicating the track as a member of a particular alternate group.
Notes: (Read only property)

20.5.7 mediaDataStorage as AVMediaDataStorageMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The storage container for media data added to a track.
Notes: The value of this property is an AVMediaDataStorage object that indicates the location at which media data inserted or appended to the track will be written.
(Read only property)

20.5.8 mediaDecodeTimeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CMTimeRange indicating the range of decode times for the track's media.
Notes: (Read only property)

20.5.9 mediaPresentationTimeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CMTimeRange indicating the range of presentation times for the track's media.
Notes: (Read only property)

20.6 class AVMutableMovieMBS

20.6.1 class AVMutableMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: AVMutableMovie adds to its immutable superclass, AVMovie, several categories of methods for editing QuickTime movie files, e.g. inserting and removing time ranges of media, adding and removing tracks, and modifying the metadata collections stored therein.
Notes: By default, after creating an AVMutableMovie the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

Available in OS X 10.11.
Subclass of the AVMovieMBS class.

20.6.2 Methods

20.6.3 addMutableTracksCopyingSettingsFromTracks(existingTracks() as AVMovieTrackMBS, options as Dictionary) as AVMutableMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Adds one or more empty tracks to the target movie, copying track settings from the source tracks.
Notes: existingTracks: An array of AVMovieTrack objects.
options: An dictionary object that contains keys for specifying options for the initialization of the new AVMutableMovieTrack objects. Currently no keys are defined; pass nil for default initialization behavior.
Returns An array of AVMutableMovieTrack objects; the index of a track in this array is the same as the index of its source track in the existingTracks array.
This method creates one or more empty tracks in the target movie and configures those tracks with settings (such as track userdata and metadata, width, height, and preferred volume) copied from the source tracks in the existingTracks array. Also, properties involving pairs of tracks (such as track references) are copied from the source tracks to the target tracks.

20.6.4 addMutableTrackWithMediaType(mediaType as String, track as AVMovieTrackMBS, options as Dictionary) as AVMutableMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Adds an empty track to the target movie.
Notes:

mediaType:	The media type of the new track (e.g. AVMediaTypeVideo for a video track).
track:	If you wish to transfer settings from an existing track, including track userdata and metadata, width, height, preferred volume, etc., pass a reference to an AVMovieTrack representing that track. Otherwise pass nil.

options: An Dictionary object that contains keys for specifying options for the initialization of the new AVMutableMovieTrack object. Currently no keys are defined; pass nil for default initialization behavior.
Returns An AVMutableMovieTrack object or nil in case of error.
The trackID of the newly added track is a property of the returned instance of AVMutableMovieTrack.

20.6.5 Constructor

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The constructor to create blank new movie.
See also:

- 20.6.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil) 4132
- 20.6.7 Constructor(Data as MemoryBlock, Options as Dictionary = nil, byref error as NSErrorMBS) 4133
- 20.6.8 Constructor(File as FolderItem, Options as Dictionary = nil) 4134
- 20.6.9 Constructor(File as FolderItem, Options as Dictionary = nil, byref error as NSErrorMBS) 4135
- 20.6.10 Constructor(Movie as AVMovieMBS = nil, Options as Dictionary = nil, byref error as NSErrorMBS) 4136
- 20.6.11 Constructor(URL as String, Options as Dictionary = nil) 4136
- 20.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 4137

20.6.6 Constructor(Data as MemoryBlock, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a Memoryblock/string.
Notes: data: A memoryblock containing a movie header.
options: An dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Raises exception in case of error.

You can use this method to operate on movie headers that are not stored in files. In general you should avoid loading an entire movie file with its media data into an instance of memoryblock!

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an memoryblock and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 20.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 4137

20.6.7 Constructor(Data as MemoryBlock, Options as Dictionary = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a Memoryblock/string.
Notes: data: A memoryblock containing a movie header.
options: An dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Raises exception in case of error.

You can use this method to operate on movie headers that are not stored in files. In general you should avoid loading an entire movie file with its media data into an instance of memoryblock!

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an memoryblock and then append sample buffers to any of its tracks, you must first set one of these properties to indicate

where the sample data should be written.

- 20.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 4137

20.6.8 Constructor(File as FolderItem, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: File: An folderitem that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

20.6.9 Constructor(File as FolderItem, Options as Dictionary = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: File: An folderitem that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 20.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 4137

20.6.10 Constructor(Movie as AVMovieMBS = nil, Options as Dictionary = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object without tracks (and therefore without media).
Notes: movie: If you wish to transfer settings from an existing movie (including movie userdata and metadata, preferred rate, preferred volume, etc.), pass a reference to an AVMovie object representing that movie. Otherwise pass nil. The userdata and metadata from the source movie may need to be converted if the format of that movie differs from fileType; you may wish to inspect the userdata or metadata of the receiver to ensure that important data was copied.
options: A dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined; pass nil for default initialization behavior.
Error: If an error occurs creating a movie, describes the nature of the failure.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 20.6.11 Constructor(URL as String, Options as Dictionary = nil) 4136
- 20.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 4137

20.6.11 Constructor(URL as String, Options as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: URL: An URL that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.

Error: If an error occurs creating a movie, describes the nature of the failure. Optional.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 20.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS) 4137

20.6.12 Constructor(URL as String, Options as Dictionary = nil, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: URL: An URL that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure. Optional.

Raises exception in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

- 20.6.11 Constructor(URL as String, Options as Dictionary = nil) 4136

20.6.13 insertEmptyTimeRange(timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Adds an empty time range to the target movie.
Notes: timeRange: The time range to be made empty. Note that you cannot add empty time ranges to the end of a movie.

20.6.14 insertTimeRange(timeRange as CMTimeRangeMBS, asset as AVAssetMBS, atTime as CMTimeMBS, copySampleData as Boolean, byref Error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Inserts all the tracks of a timeRange of an asset into a movie.
Notes:

timeRange:	The time range of the asset to be inserted.
asset:	An AVAsset object indicating the source of the inserted media. Only instances of AVURLAsset and AVComposition are supported. Must not be nil.

startTime: The time in the target movie at which the media is to be inserted.
copySampleData: A boolean value that indicates whether sample data is to be copied from the source to the destination during edits. If true, the sample data is written to the location specified by the track property mediaDataStorage if non-nil, or else by the movie property defaultMediaDataStorage if non-nil; if both are nil, the method will fail and return false. If false, sample data will not be written and sample references to the samples in their original container will be added as necessary.
Note that in this case, this method will fail if the source AVAsset is not able to provide sample reference information for the original container.
Error: If the insertion fails, an error object that describes the nature of the failure.

Returns A boolean value that indicates the success of the insertion.

This method may add new tracks to the target movie to ensure that all tracks of the asset are represented in the inserted timeRange.
Existing content at the specified startTime will be pushed out by the duration of timeRange.

20.6.15 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A collection of metadata stored by the movie.
Notes: The value of this property is an array of AVMetadataItem objects representing the collection of metadata stored by the movie.

20.6.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a Memoryblock/string.
Notes: data: A memoryblock/string containing a movie header.
options: An dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

You can use this method to operate on movie headers that are not stored in files. In general you should avoid loading an entire movie file with its media data into an instance of memoryblock!

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an memoryblock and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 20.6.17 movieWithData(Data as String, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

20.6.17 movieWithData(Data as String, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a Memoryblock/string.
Notes: data: A memoryblock/string containing a movie header.
options: An dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

You can use this method to operate on movie headers that are not stored in files. In general you should avoid loading an entire movie file with its media data into an instance of memoryblock!

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an memoryblock and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 20.6.16 movieWithData(Data as MemoryBlock, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS 4139

20.6.18 movieWithFile(File as FolderItem, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: File: An folderitem that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

20.6.19 movieWithSettingsFromMovie(Movie as AVMovieMBS, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object without tracks (and therefore without media).
Notes: movie: If you wish to transfer settings from an existing movie (including movie userdata and metadata, preferred rate, preferred volume, etc.), pass a reference to an AVMovie object representing that movie. Otherwise pass nil. The userdata and metadata from the source movie may need to be converted if the format of that movie differs from fileType; you may wish to inspect the userdata or metadata of the receiver to ensure that important data was copied.
options: A dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined; pass nil for default initialization behavior.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil. If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

20.6.20 movieWithURL(URL as String, Options as Dictionary = nil, byref Error as NSErrorMBS) as AVMovieMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMutableMovie object from a movie header stored in a QuickTime movie file or ISO base media file.
Notes: URL: An URL that specifies a file containing a movie header.
options: An Dictionary object that contains keys for specifying options for the initialization of the AVMutableMovie object. Currently no keys are defined.
Error: If an error occurs creating a movie, describes the nature of the failure.

Returns An AVMutableMovie object or nil in case of error.

By default, the defaultMediaDataStorage property will be nil and each associated AVMutableMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from a file and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.

20.6.21 mutableMovieTracks as AVMutableMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The tracks in a mutable movie.
Notes: The value of this property is an array of tracks the mutable movie contains; the tracks are of type AVMutableMovieTrack.

20.6.22 mutableMovieTracksWithMediaCharacteristic(mediaCharacteristic as string) as AVMutableMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an array of AVMutableMovieTracks of the asset that present media with the specified characteristic.
Notes: mediaCharacteristic: The media characteristic according to which the receiver filters its AVMutableMovieTracks. (Media characteristics are defined in AVMediaFormat.h)
An array of AVMutableMovieTracks; may be empty if no tracks with the specified characteristic are available.
Becomes callable without blocking when the key "tracks" has been loaded.

20.6.23 mutableMovieTracksWithMediaType(mediaType as string) as AVMutableMovieTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an array of AVMutableMovieTracks of the asset that present media of the specified media type.
Notes: mediaType: The media type according to which the receiver filters its AVMutableMovieTracks. (Media types are defined in AVMediaFormat.h)
An array of AVMutableMovieTracks; may be empty if no tracks of the specified media type are available.
Becomes callable without blocking when the key "tracks" has been loaded.

20.6.24 mutableMovieTrackWithTrackID(ID as Integer) as AVMutableMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides an instance of AVMutableMovieTrack that represents the track of the specified trackID.
Notes: ID: The trackID of the requested AVMutableMovieTrack.

An instance of AVMutableMovieTrack; may be nil if no track of the specified trackID is available.

Becomes callable without blocking when the key "tracks" has been loaded.

20.6.25 mutableTrackCompatibleWithTrack(track as AVAssetTrackMBS) as AVMutableMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Provides a reference to a track of a mutable movie into which any time range of an AVAssetTrack can be inserted (via insertTimeRange:ofTrack).
Notes: track: A reference to the AVAssetTrack from which a time range may be inserted.
Returns An AVMutableMovieTrack that can accommodate the insertion.
If no such track is available, the result is nil. A new track of the same media type as the AVAssetTrack can be created via addMutableTrackWithMediaType, and this new track will be compatible.

For best performance, the number of tracks in a movie should be kept to a minimum, corresponding to the number for which media data must be presented in parallel. If media data of the same type is to be presented serially, even from multiple assets, a single track of that media type should be used. This method, mutableTrackCompatibleWithTrack, can help the client to identify an existing target track for an insertion.

20.6.26 removeTimeRange(timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Removes a specified time range from a movie.
Notes: timeRange: The time range to be removed.

20.6.27 removeTrack(track as AVMovieTrackMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Removes a track from the target movie.
Notes: track: The track to be removed.

20.6.28 scaleTimeRange(timeRange as CMTimeRangeMBS, duration as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Changes the duration of a time range of a movie.
Notes: timeRange: The time range to be scaled.

duration: The new duration of the time range.

20.6.29 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Sets the metadata.

20.6.30 Properties

20.6.31 defaultMediaDataStorage as AVMediaDataStorageMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The default storage container for media data added to a movie.
Notes: The value of this property is an AVMediaDataStorage object that indicates where sample data that is added to a movie should be written, for any track for whose mediaDataStorage property is nil.
(Read and Write property)

20.6.32 interleavingPeriod as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CMTime that indicates the duration for interleaving runs of samples of each track.
Notes: The default interleaving period is 0.5 seconds.
(Read and Write property)

20.6.33 modified as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Whether a movie has been modified.
Notes: The value of this property is a boolean that indicates whether the AVMutableMovie object has been modified since it was created, was last written, or had its modified state cleared via assignment Modified = false.
(Read and Write property)

20.6.34 preferredRate as Double

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The natural rate at which the movie is to be played; often but not always 1.0.
Notes: (Read and Write property)

20.6.35 preferredTransform as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CGAffineTransform indicating the transform specified in the movie's storage container as the preferred transformation of the visual media data for display purposes; the value is often but not always CGAffineTransformIdentity.
Notes: (Read and Write property)

20.6.36 preferredVolume as Double

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The preferred volume of the audible media data of the movie; often but not always 1.0.
Notes: (Read and Write property)

20.6.37 timescale as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: For file types that contain a 'moov' atom, such as QuickTime Movie files, specifies the time scale of the movie.
Notes: The default movie time scale is 600. In certain cases, you may want to set this to a different value. For instance, a movie that contains a single audio track should typically have the movie time scale set to the media time scale of that track.

This property should be set on a new empty movie before any edits are performed on the movie.
(Read and Write property)

20.7 class AVMutableMovieTrackMBS

20.7.1 class AVMutableMovieTrackMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: AVMutableMovieTrack provides the track-level editing interface of an AVMutableMovie.
Notes: Media can be inserted into a movie track and other editing operations performed via an instance of this class.
Available on OS X 10.11.
Subclass of the AVMovieTrackMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.0pr5

20.7.2 Methods

20.7.3 addTrackAssociationToTrack(movieTrack as AVMovieTrackMBS, trackAssociationType as String)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Establishes a track association of a specific type between two tracks.
Notes: movieTrack: An AVMovieTrack object that is to be associated with the receiver.
trackAssociationType: The type of track association to add between the receiver and the specified movieTrack (for instance, AVTrackAssociationTypeChapterList).

20.7.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The private constructor.

20.7.5 insertEmptyTimeRange(timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Adds an empty time range to the target track.
Notes: timeRange: The time range to be made empty. Note that you cannot add empty time ranges to the end of a track.

20.7.6 insertTimeRange(timeRange as CMTimeRangeMBS, assetTrack as AVAssetTrackMBS, atTime as CMTimeMBS, copySampleData as Boolean, byref Error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Inserts a portion of an AVAssetTrack object into the target movie.
Notes: timeRange: The time range from the track from which media is to be inserted.
track: An AVAssetTrack object indicating the source of the inserted media. Only AVAssetTracks of AVURLAssets and AVCompositions are supported. Must not be nil.
startTime: The time in the target track at which the media is to be inserted.
copySampleData: A boolean value that indicates whether sample data is to be copied form the source to the destination during edits.

If true, the sample data is written to the file specified by the track property mediaDataStorage if non-nil, or else by the movie property defaultMediaDataStorage if non-nil; if both are nil, the method will fail and return NO.
If false, sample data will not be written and sample references to the samples in their original container will be added
as necessary. Note that in this case, this method will fail if the original samples are fragmented.

Error: If the insertion fails, describes the nature of the failure.

Returns a boolean value that indicates the success of the insertion.

20.7.7 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A collection of metadata stored by the track.
Notes: The value of this property is an array of AVMetadataItem objects representing the collection of metadata stored by the track.

20.7.8 removeTimeRange(timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Removes a specified time range from a track.
Notes: timeRange: The time range to be removed.

20.7.9 removeTrackAssociationToTrack(movieTrack as AVMovieTrackMBS, trackAssociationType as String)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Removes a track association of a specific type between two tracks.
Notes: movieTrack: An AVMovieTrack object that is associated with the receiver.
trackAssociationType: The type of track association to remove between the receiver and the specified movieTrack (for instance, AVTrackAssociationTypeChapterList).

20.7.10 scaleTimeRange(timeRange as CMTimeRangeMBS, duration as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Changes the duration of a time range of a track.
Notes: timeRange: The time range to be scaled.
duration: The new duration of the time range.

20.7.11 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Sets the metadata items.

20.7.12 Properties

20.7.13 alternateGroupID as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: An integer indicating the track as a member of a particular alternate group.
Notes: (Read and Write property)

20.7.14 cleanApertureDimensions as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CGSize indicating the clean aperture dimensions of the track.
Notes: (Read and Write property)

20.7.15 Enabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A boolean value indicating whether the track is enabled by default for presentation.
Notes: (Read and Write property)

20.7.16 encodedPixelsDimensions as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CGSize indicating the dimensions encoded pixels dimensions of the track.
Notes: (Read and Write property)

20.7.17 extendedLanguageTag as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The language tag associated with the track.
Notes: The value of this property is an IETF BCP 47 (RFC 4646) language identifier indicating the language tag associated with the track; may be "" if no language tag is indicated.
(Read and Write property)

20.7.18 hasProtectedContent as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Whether a track contains protected content.
Notes: The value of this property is a boolean that indicates whether the track contains protected content.
(Read only property)

20.7.19 languageCode as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The language associated with the track.
Notes: The value of this property is an ISO 639-2/T language code indicating the language associated with the track; may be "" if no language is indicated.
(Read and Write property)

20.7.20 layer as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The layer level of the visual media data of the track.
Notes: (Read and Write property)

20.7.21 mediaDataStorage as AVMediaDataStorageMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The storage container for media data added to a track.
Notes: The value of this property is an AVMediaDataStorage object that indicates the location at which media data inserted or appended to the track will be written.
(Read and Write property)

20.7.22 Modified as Boolean

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Whether a track has been modified.
Notes: The value of this property is a boolean that indicates whether the AVMutableMovieTrack object has been modified since it was created, was last written, or had its modified state cleared via an assignment: Modified = false.
(Read and Write property)

20.7.23 naturalSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CGSize indicating the dimensions at which the visual media data of the track should be displayed.
Notes: (Read and Write property)

20.7.24 preferredMediaChunkAlignment as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: For file types that support media chunk alignment, the boundary for media chunk alignment (in bytes).
Notes: The default value is 0, which means that the receiver will choose an appropriate default value.
A value of 1 implies that no padding should be used to achieve a particular chunk alignment. It is an error

to set a negative value for chunk alignment.
(Read and Write property)

20.7.25 preferredMediaChunkDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: For file types that support media chunk durations, the maximum duration to be used for each chunk of sample data written to the file.
Notes: The total duration of the samples in a chunk will be no greater than this preferred chunk duration, or the duration of a single sample if the sample's duration is greater than this preferred chunk duration.

The default value is kCMTimeInvalid, which means that the receiver will choose an appropriate default chunk duration. It is an error to set a chunk duration that is negative or non-numeric.

This property and preferredMediaChunkSize, which also specifies the size of a chunk, are mutually exclusive. Thus, if both properties are set, the last setting is honored.
(Read and Write property)

20.7.26 preferredMediaChunkSize as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: For file types that support media chunk sizes, the maximum size (in bytes) to be used for each chunk of sample data written to the file.
Notes: The total size of the samples in a chunk will be no larger than this preferred chunk size, or the size of a single sample if the sample is larger than this preferred chunk size.

The default value is 0, which means that the receiver will choose an appropriate default chunk size. It is an error to set a negative chunk size.

This property and preferredMediaChunkDuration, which also specifies the size of a chunk, are mutually exclusive.
Thus, if both properties are set, the last setting is honored.
(Read and Write property)

20.7.27 preferredTransform as CGAffineTransformMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CGAffineTransform indicating the transform specified in the track's storage container as the preferred transformation of the visual media data for display purposes; the value is often but not always CGAffineTransformIdentity.
Notes: (Read and Write property)

20.7.28 preferredVolume as Double

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The preferred volume of the audible media data of the track; often but not always 1.0.
Notes: (Read and Write property)

20.7.29 productionApertureDimensions as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CGSize indicating the production aperture dimensions of the track.
Notes: (Read and Write property)

20.7.30 sampleReferenceBaseURL as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: For file types that support writing sample references, such as QuickTime Movie files, specifies the base URL that sample references are relative to; may be nil.
Notes: If the value of this property can be resolved as an absolute URL, the sample locations written to the file when appending sample references to this track will be relative to this URL. The URL must point to a location contained by any common parent directory of the locations that will be referenced. For example, setting the sampleReferenceBaseURL property to "file:///Users/johnappleseed/Movies/" and appending sample buffers that refer to "file:///Users/johnappleseed/Movies/data/movie1.mov" will cause the sample reference "data/movie1.mov" to be written to the movie file.

If the value of the property cannot be resolved as an absolute URL or if it points to a location that is not contained by any common parent directory of the locations that will be referenced, the location will be written unmodified.

The default value is "", which means that the location will be written unmodified.
(Read and Write property)

20.7.31 timescale as Integer

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: For file types that contain a 'moov' atom, such as QuickTime Movie files, specifies the time scale of the track's media.
Notes: The default media time scale is 0.
This property should be set on a new empty track before any edits are performed on the track.
(Read and Write property)

Chapter 21

Barcode

21.1 class BarcodeGeneratorMBS

21.1.1 class BarcodeGeneratorMBS

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to generate barcodes.
Example:

```
Var b as new BarcodeGeneratorMBS
b.Symbology = b.BarcodeQrcode
b.Scale = 2
b.BorderWidth = 4
b.Encode "Hello Xojo Developer!"
Backdrop = b.Picture
```

Notes: The MBS Plugin uses the zint library (BSD license).
Please also see the manual for Zint (included in examples) for special options for individual barcodes.

21.1.2 Methods

21.1.3 Constructor

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

21.1.4 Destructor

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

21.1.5 EANChecksum(text as string) as string

MBS Barcode Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates checksums for EAN.
Example:

```
// returns "3" for 12 digit EAN:
MsgBox BarcodeGeneratorMBS.EANChecksum("425098421626")
```

Notes: Returns checksum character.

For EAN 8, please use UPCChecksum function.

21.1.6 Encode(text as string, width as single = 0, height as single = 0, RotationAngle as Integer = 0)

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encodes a barcode.
Example:

```
Var b as new BarcodeGeneratorMBS
b.Symbology = b.BarcodeQrcode
b.Scale = 2
b.BorderWidth = 4
b.Encode "Hello Xojo Developer!"
Backdrop = b.Picture
```

Notes: If width is zero, we use automatic width.
If height is zero, we use automatic height. Default height for some 2D bars is 30 units.
RotationAngle can be 0, 90, 180 or 270.
You can set options before calling and query other properties (like picture after this)

For the size, be aware that some types like UPC codes have fixed size depending on content. Or the size class for QRCode is calculated based on the text length.

21.1.7 FilterSwissQRCode(text as String, AllowEndOfLine as boolean = false) as String

MBS Barcode Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filters characters for Swiss QR code for payments.
Example:

```
Var s As String = "Hello World ,â§ ¬´,àë,Ç¨®,Ä†Œ© Êó • Êú¨ÂõΩ"
Var t As String = BarcodeGeneratorMBS.FilterSwissQRCode(s)

// shows Hello World <= ¬´,Ç¨®
MessageBox t
```

Notes: We pass through allowed characters:

- Basic-Latin (Unicodepoint U+0020 - U+007E)
- Latin1-Supplement (Unicodepoint U+00A0 - U+00FF)
- Latin Extended-A (Unicodepoint U+0100 - U+017F)

And these individual characters:

- »ò - (LATIN CAPITAL LETTER S WITH COMMA BELOW, Unicodepoint U+0218)
- »ô - (LATIN SMALL LETTER S WITH COMMA BELOW, Unicodepoint U+0219)
- »ö - (LATIN CAPITAL LETTER T WITH COMMA BELOW, Unicodepoint U+021A)
- »õ - (LATIN SMALL LETTER T WITH COMMA BELOW, Unicodepoint U+021B)
- ,Ç¨ - (EURO SIGN, Unicodepoint U+20AC)

For other characters, we try to translate them to allowed characters, e.g ¬º is changed to 1/4.

If AllowEndOfLine is true, we pass through Char(13) for newline characters.

21.1.8 ISBNChecksum(text as string) as string

MBS Barcode Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates checksums for ISBN 10 and 13.
Example:

```
// returns 6 for 9 digit ISBN:
MsgBox BarcodeGeneratorMBS.ISBNChecksum("074755100")
```

Notes: Returns checksum character.

21.1.9 LibVersion as string

MBS Barcode Plugin, Plugin Version: 19.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries zint library version.
Notes: e.g. "2.6.3"

21.1.10 SVG as String

MBS Barcode Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates SVG as text.
Example:

```
Var z as new BarcodeGeneratorMBS

// try QR Code
z.Symbology = BarcodeGeneratorMBS.BarcodeQrcode
z.Encode "Hello World"

Var s1 as string = z.SVG

// try SVG
z.Symbology = BarcodeGeneratorMBS.BarcodeEanX
z.Encode "123456789012"

Var s2 as string = z.SVG

break // check SVG
```

Notes: Lasterror and ErrorText are set.

21.1.11 UPCChecksum(text as string) as string

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates UPC checksum.

Example:

```
Var s as string = "24796"
MsgBox BarcodeGeneratorMBS.UPCChecksum(s)
```

Notes: String must contain numbers.

21.1.12 ValidSymbologyID(ID as Integer) as Boolean

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this Symbology ID is valid.
Notes: Returns true on success or false on failure.

21.1.13 WritePS(path as string) as Integer

MBS Barcode Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write PS file.
Example:

```
Var z as new BarcodeGeneratorMBS

z.Symbology = BarcodeGeneratorMBS.BarcodeUpca
z.Encode "72527270270"

Var f as FolderItem = SpecialFolder.Desktop.Child("barcode.eps")
Var e as Integer = z.WritePS(f.NativePath)
if z.ErrorText.len >0 then
MsgBox z.ErrorText
else
MsgBox "OK"
end if
```

Notes: Returns error code. Lasterror and ErrorText is also set.
File path should be ASCII only (other characters not guaranteed) and maybe point to temp file somewhere.

21.1.14 WriteSVG(path as string) as Integer

MBS Barcode Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write SVG file.
Example:

```
Var z as new BarcodeGeneratorMBS

z.Symbology = BarcodeGeneratorMBS.BarcodeUpca
z.Encode "72527270270"

Var f as FolderItem = SpecialFolder.Desktop.Child("barcode.svg")
Var e as Integer = z.WriteSVG(f.NativePath)
if z.ErrorText.len >0 then
MsgBox z.ErrorText
else
MsgBox "OK"
end if
```

Notes: Returns error code. Lasterror is set.
ErrorText is also set.
File path should be ASCII only (other characters not guaranteed) and maybe point to temp file somewhere.

21.1.15 Properties

21.1.16 BackColor as Color

MBS Barcode Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The background color.
Example:

```
Var z As New BarcodeGeneratorMBS

z.BackColor = &cFFCCFF
```

Notes: By default white.
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.17 BitmapByteLength as Integer

MBS Barcode Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The byte length of a bitmap.
Notes: (Read only property)

21.1.18 BitmapHeight as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Height of stored bitmap image (in pixels).
Notes: (Read only property)

21.1.19 BitmapWidth as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width of stored bitmap image (in pixels).
Notes: (Read only property)

21.1.20 BorderWidth as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Border width.
Example:

```
Var z As New BarcodeGeneratorMBS

z.ForeColor = &c8888FF
z.BackColor = &c000000

// add 20 pixel border around
z.BorderWidth = 20
z.OutputOptions = z.OutputOptionBox
```

Notes: Default 0.
Please set before Encode to take effect while encoding barcode.
Only used if OutputOptions includes flag OutputOptionBox or flag OutputOptionBind.
(Read and Write property)

21.1.21 DotSize as Single

MBS Barcode Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The dot size.
Notes: (Read and Write property)

21.1.22 ECI as Integer

MBS Barcode Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: ECI field.
Notes: (Read and Write property)

21.1.23 ErrorText as String

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Error message in the event that an error occurred.
Notes: (Read only property)

21.1.24 FontSize as Integer

MBS Barcode Plugin, Plugin Version: 19.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font size.
Notes: (Read and Write property)

21.1.25 ForeColor as Color

MBS Barcode Plugin, Plugin Version: 14.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The foreground color.
Example:

```
Var z As New BarcodeGeneratorMBS

z.ForeColor = &c88FFFF
z.BackColor = &c000000
```

Notes: By default black.
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.26 GuardDescent as Single

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Height in X-dimensions that EAN/UPC guard bars descend.
Notes: Default is 5.
(Read and Write property)

21.1.27 Height as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Symbol height.
Notes: Default 50.
(Read and Write property)

21.1.28 InputMode as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set encoding of input data.
Notes: Default binary mode.
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.29 LastError as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Example:

```
Var z As New BarcodeGeneratorMBS

// do something and then check error:

Var e as integer = z.LastError
Var error as string

Select case e
case z.ErrorTooLong
error = "ErrorTooLong"
case z.ErrorInvalidData
error = "ErrorInvalidData"
case z.ErrorInvalidCheck
error = "ErrorInvalidCheck"
case z.ErrorInvalidOption
```

```
error = "ErrorInvalidOption"
case z.ErrorEncodingProblem
error = "ErrorEncodingProblem"
case z.ErrorFileAccess
error = "ErrorFileAccess"
case z.ErrorMemory
error = "ErrorMemory"
end Select
```

Notes: (Read and Write property)

21.1.30 Option1 as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Symbology specific options.
Notes: Please set before Encode to take effect while encoding barcode.
See zint_manual_242.pdf coming with examples for details.

For QRCode:
The ECC Level with values from 1 = low, 2 = middle, 3 = better, 4 high. Default is low.

For MaxiCode:
The mode for the maxi code.

For PDF 417:
Optional a number between 0 and 8 where the number of codewords used for check information is determined by 2^(value + 1).
(Read and Write property)

21.1.31 Option2 as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Symbology specific options.
Notes: Please set before Encode to take effect while encoding barcode.
See zint_manual_242.pdf coming with examples for details.

For QRCode:
Version code from 1 to 40. Default is 0 to auto select.

For Data Matrix:
Size from 1 to 30. 0 is auto. See table in zint manual pdf.

For Code 39:
You can set Option2 to 1 to add module 43 checksum.

For PDF 417:
The number of columns between 1 and 30.
(Read and Write property)

21.1.32 Option3 as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Symbology specific options.
Notes: Please set before Encode to take effect while encoding barcode.
See zint_manual_242.pdf coming with examples for details.
(Read and Write property)

21.1.33 OutputOptions as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Binding or box parameters.
Example:

```
Var b as new BarcodeGeneratorMBS
b.OutputOptions = b.OutputOptionBoldText
```

Notes: Use OutputOptionBind, OutputOptionBox or OutputOptionNone.
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.34 Picture as Picture

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The barcode picture.
Example:

```
Var z As New BarcodeGeneratorMBS
```

```
z.Symbology = BarcodeGeneratorMBS.BarcodeQrcode
z.Encode "MBS Plugin"

Var pic As Picture = z.picture
If z.LastError <>0 Then
MessageBox "LastError: "+Str(z.LastError)
Else
window1.Backdrop = pic
End If
```

Notes: (Read and Write property)

21.1.35 Rows as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of rows used by the symbol or, if using barcode stacking, the row to be used by the next symbol.
Notes: (Read only property)

21.1.36 Scale as Single

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scale factor for adjusting size of image.
Example:

```
Var b as new BarcodeGeneratorMBS
b.Symbology = b.BarcodeQrcode
b.Scale = 4
b.BorderWidth = 4
b.Encode "Hello Xojo Developer!"
Backdrop = b.Picture
```

Notes: Default is 1.0
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.37 ShowText as Boolean

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to show the text below the barcode.
Notes: Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.38 StructuredAppend as ZintStructuredAppendMBS

MBS Barcode Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Structured Append info.
Example:

```
// try sequence
Var StructuredAppend As New ZintStructuredAppendMBS
StructuredAppend.ID = "123"
StructuredAppend.Index = 4 // part 4 of 4
StructuredAppend.Count = 4

Var b As New BarcodeGeneratorMBS
b.StructuredAppend = StructuredAppend
b.Symbology = b.BarcodeQrcode
b.Encode "Hello Xojo Developer!"

Var pic As Picture = b.Picture

Var f As FolderItem = SpecialFolder.Desktop.Child("barcode.jpg")
call pic.Save(f, Picture.Formats.JPEG)

Var result As ZXingReaderResultMBS = ZxingBarcodeMBS.ReadBarcode(pic)

MessageBox result.Text+" "+result.sequenceId+" "+_
result.sequenceIndex.ToString+"/"+result.sequenceSize.ToString
// shows 3 of 4 since here it is zero based!
```

Notes: Default is nil for none.
(Read and Write property)

21.1.39 Symbology as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Symbology to use.
Example:

```
Var z As New BarcodeGeneratorMBS
```

```
z.Symbology = BarcodeGeneratorMBS.BarcodeEanx
z.Encode "54321"

Var pic As Picture = z.picture
Var e As Integer = z.LastError
break
```

Notes: e.g. BarcodeEANX.
Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.40 Text as String

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Human readable text, which usually consists of the input data plus one or more check digits.
Example:

```
Var z As New BarcodeGeneratorMBS

z.Symbology = BarcodeGeneratorMBS.BarcodeEanx
z.Encode "54321"

Var pic As Picture = z.picture
Var e As Integer = z.LastError
break
```

Notes: Uses UTF-8 formatting.
(Read only property)

21.1.41 Vector as ZintVectorMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vector information.
Notes: You can check this classes and draw the barcode yourself.
For Example with DynaPDF as vector graphics.

Only available after you called Encode method.
(Read and Write property)

21.1.42 WarnLevel as Integer

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The warning level.
Notes: Affects error/warning value returned by Zint API.
(Read and Write property)

21.1.43 WhitespaceHeight as Integer

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Height in X-dimensions of whitespace above & below the barcode.
Example:

```
Var z As New BarcodeGeneratorMBS

z.WhitespaceHeight = 20
z.WhitespaceWidth = 20
```

Notes: (Read and Write property)

21.1.44 WhitespaceWidth as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the whitespace.
Example:

```
Var z As New BarcodeGeneratorMBS

z.WhitespaceHeight = 20
z.WhitespaceWidth = 20
```

Notes: Please set before Encode to take effect while encoding barcode.
(Read and Write property)

21.1.45 Width as Integer

MBS Barcode Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width of the generated symbol.
Notes: (Read only property)

21.1.46 Constants

Constants

Constant	Value	Description
OptionSquare	100	One of the options. An extra feature is available for Data Matrix symbols which allows Zint to automatically resize the symbol as required but also prevents Zint from using rectangular symbols. To set this mode set the value Option3 = OptionSquare.

Symbology constants

Constant	Value	Description
BarcodeAuspost	63	Australia Post Standard Customer
BarcodeAusredirect	68	Australia Post Redirection
BarcodeAusreply	66	Australia Post Reply Paid
BarcodeAusroute	67	Australia Post Routing
BarcodeAzrune	128	Aztec Runes
BarcodeAztec	92	Aztec Code
BarcodeC25Iata	4	Code 2 of 5 IATA
BarcodeC25Ind	7	Code 2 of 5 Industrial
BarcodeC25Inter	3	Interleaved 2 of 5
BarcodeC25Logic	6	Code 2 of 5 Data Logic
BarcodeC25Matrix	2	Standard Code 2 of 5
BarcodeChannel	140	Channel Code
BarcodeCodabar	18	Codabar
BarcodeCodablockf	74	Coda Block F
BarcodeCode11	1	Code 11
BarcodeCode128	20	Code 128 (automatic subset switching)
BarcodeCode128B	60	Code 128 (Subset B)
BarcodeCode16K	23	Code 16K
BarcodeCode32	129	Code 32
BarcodeCode39	8	Code 3 of 9 (Code 39)
BarcodeCode49	24	Code 49
BarcodeCode93	25	Code 93
BarcodeCodeone	141	Code One
BarcodeDaft	93	DAFT Code
BarcodeDatamatrix	71	Data Matrix
BarcodeDotCode	115	DotCode
BarcodeDPD	96	DPD Code.
BarcodeDpident	22	Deutsche Post Identcode
BarcodeDpleit	21	Deutsche Post Leitcode
BarcodeEan128	16	GS1-128
BarcodeEan128Cc	131	Composite Symbol with GS1-128 linear component
BarcodeEan13	13	
BarcodeEan14	72	EAN-14
BarcodeEan8	13	
BarcodeEANCheck	14	EAN Checks
BarcodeEanx	13	EAN
BarcodeEanxCc	130	Composite Symbol with EAN linear component
BarcodeExcode39	9	Extended Code 3 of 9 (Code 39+)
BarcodeFim	49	FIM
BarcodeFlat	28	Flattermarken
BarcodeGridmatrix	142	Grid Matrix
BarcodeHanXin	116	HanXin
BarcodeHibc128	98	HIBC Code 128
BarcodeHibc39	99	HIBC Code 39
BarcodeHibcAztec	112	HIBC Aztec Code
BarcodeHibcBlockf	110	HIBC Block F
BarcodeHibcDm	102	HIBC Data Matrix
BarcodeHibcMicpdf	108	HIBC MicroPDF417
BarcodeHibcPdf	106	HIBC PDF417
BarcodeHibcQr	104	HIBC QR Code
BarcodeIsbnx	69	ISBN (EAN-13 with verification stage)
BarcodeItf14	89	ITF-14
BarcodeJapanpost	76	Japanese Post
BarcodeKix	90	Dutch Post KIX Code
BarcodeKoreapost	77	Korea Post
BarcodeLogmars	50	LOGMARS
BarcodeMailMark	121	Mailmark
BarcodeMaxicode	57	Maxicode

Error Constants

Constant	Value	Description
ErrorEncodingProblem	9	A problem has occurred during encoding of the data. This should never happen. Please contact the developer if you encounter this error.
ErrorFileAccess	10	Zint was unable to open the requested output file. This is usually a file permissions problem.
ErrorFileWrite	12	Error writing to output file.
ErrorInvalidCheck	7	An ISBN with an incorrect check digit has been entered. No symbol has been generated.
ErrorInvalidData	6	The data to be encoded includes characters which are not permitted by the selected symbology (e.g. alphabetic characters in an EAN symbol). No symbol has been generated.
ErrorInvalidOption	8	One of the values in zint_struct was set incorrectly and Zint was unable to guess what it should have been. No symbol has been generated.
ErrorMemory	11	Zint ran out of memory. This should only be a problem with legacy systems.
ErrorNonComppilant	14	Error reporting that symbol created is not compliant with standards.
ErrorTooLong	5	The input data is too long or too short for the selected symbology. No symbol has been generated.
ErrorUsesECI	13	Error reporting that ECI is needed.
WarnInvalidOption	2	One of the values was set incorrectly but Zint has made a guess at what it should have been and generated a barcode accordingly.
WarnUseECI	3	The warning to use ECI.

Input Modes

Constant	Value	Description
InputModeData	0	Uses full ASCII range interpreted as Latin-1 or binary data.
InputModeEscape	8	Additional flag to escape.
InputModeGS1	2	Encodes GS1 data using FNC1 characters.
InputModeKanji	3	Kanji
InputModeSJIS	4	SJJS
InputModeUnicode	1	Uses pre-formatted UTF-8 input.

Output Options

Constant	Value	Description
OptionDMRE	101	
OutputOptionBind	2	Boundary bars above and below the symbol and between rows if stacking mu tiple symbols. You can set BorderWidth for the size of the bind.
OutputOptionBoldText	64	Use bold text.
OutputOptionBox	4	Add a box surrounding the symbol and whitespace. You can set BorderWidth for the size of the box.
OutputOptionCMYKColors	128	use CMYK colors for Postscript output. For images, you can use plugin functions to convert RGB to CMYK if neede
OutputOptionDottyMode	256	Raster in dotty mode.
OutputOptionGS1_GS_Separator	512	Use GS Separator for DataMatrix.
OutputOptionNoASCII	1	No longer used.
OutputOptionNone	0	No box or boundary bars.
OutputOptionNoQuietZones	4096	Disable quiet zones, notably those with defaults as listed above.
OutputOptionQuietZones	2048	Add compliant quiet zones (additional to any specified whitespace) Note: CODE16K, CODE49, CODABLOCKF, ITF14, EAN/UPC have defau quiet zones
OutputOptionReaderInit	16	Include reader initialize sequence in barcode.
OutputOptionSmallText	32	Use small text.
OutputOptionStdOut	8	Write to stdout.

21.2 class BarcodeScannerMBS

21.2.1 class BarcodeScannerMBS

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use zxing classes instead.
Function: A class to read a barcode from a given picture.
Notes: Deprecated in favor of new zxing classes.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr1
- MBS Real Studio Plugins, version 13.1pr11

21.2.2 Methods

21.2.3 Scan(p as picture) as boolean

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scans for a barcode on the picture.
Notes: The barcode is searched on the middle vertical line from the left to right.

So the picture you pass can be as small as just one pixel height.
The barcode should be horizontal centered in that picture for best results.

Returns true on success and false on failure.
See also:

- 21.2.4 Scan(p as picture, lines() as Integer) as boolean 4175

21.2.4 Scan(p as picture, lines() as Integer) as boolean

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scans for a barcode on the picture.
Example:

```
Var i as Integer
Var lines(-1) as Integer
Var b as BarcodeScannerMBS
Var p as Picture
// set b to your scanner and p to your picture
```

```
for i=0 to 99
lines.append i*10 // search every 10th line on a 1000 pixel high image.
next

if b.scan(p,lines) then
// ok
end if
```

Notes: The barcode is searched on the lines with the given offsets from the left to right.

The lines array must have at least one entry specifying the lines to search on.
If the values in the lines array are out of bounds, they are ignored. The first line has the value 0.

So the picture you pass can be as small as just one pixel height.
The barcode should be horizontal centered in that picture for best results.

Returns true on success and false on failure.
See also:

- 21.2.3 Scan(p as picture) as boolean 4175

21.2.5 Properties

21.2.6 Barcode as String

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The barcode result of the last scan.
Notes: If the last scan was successful, this property has a value.
If the last scan failed, this property is empty.
(Read and Write property)

21.2.7 CheckDigits as Boolean

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to calculate the checksum.
Notes: Normal 12 or 13 digit barcodes have the last number being a checksum.
If it does not match, the barcode is declined.

Default is false.
(Read and Write property)

21.2.8 LastBarcode as String

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The barcode result of the last successful scan.
Notes: If a scan fails, this value still has the value of the last successful scan.
(Read and Write property)

21.2.9 LastPicture as Picture

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last picture used for the scan.
Notes: (Read and Write property)

21.2.10 MinimumLength as Integer

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minimum length of barcodes.
Notes: Set to 0 to disable.

To avoid false barcodes, any barcode is rejected which does not have the sufficient length.

Default is 13.
(Read and Write property)

21.2.11 Mode as Integer

MBS Picture Plugin, Plugin Version: 8.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mode of the scanner.
Notes: Mode 0 is to scan EANs.
Mode 1 is to scan 2/5 family barcodes.
(Read and Write property)

21.3 class ZBarMBS

21.3.1 class ZBarMBS

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for scanning barcodes with zbar.
Example:

```
// get some picture
Var p As Picture = Picture.Open(file)
If p <>Nil Then

// scan it
Var symbols() As ZBarMBS = ZBarMBS.Scan(p)

// show results
For Each symbol As ZBarMBS In symbols
MsgBox symbol.Name+": "+symbol.Text
Next
End If
```

Notes: We can use the zbar library to scan pictures for barcodes in Xojo:

ZBar is an open source software suite for reading bar codes from various sources, such as video streams, image files and raw intensity sensors. It supports many popular symbologies (types of bar codes) including EAN-13/UPC-A, UPC-E, EAN-8, Code 128, Code 39, Interleaved 2 of 5 and QR Code.

ZBar is licensed under the GNU LGPL 2.1 to enable development of both open source and commercial projects.

Since the library is under LGPL license, we can't embed it within the plugin and you need to provide a DLL/dylib/so file to the plugin to load library

zbar Homepage:
http://zbar.sourceforge.net

See also ZxingBarcodeMBS module and for macOS VNDetectBarcodesRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

21.3.2 Methods

21.3.3 Components as ZBarMBS()

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Components of a barcode.
Notes: If this is a composed barcode, you may get the individual parts here.
Maybe nil if no components are available.

21.3.4 Constructor

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

21.3.5 LibraryLoaded as Boolean

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the library is loaded.

21.3.6 LibraryLoadError as Integer

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last error code from loading the zlib library.

21.3.7 LibraryLoadErrorMessage as String

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last error message from loading the zlib library.

21.3.8 LoadLibrary(file as folderitem) as boolean

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the zbar library.
Example:

```
#If TargetMacOS Then

Const libname = "libzbar.0.dylib"

Var LibFile As FolderItem = GetFolderItem(libname)

If ZBarMBS.LoadLibrary(LibFile) Then
'MsgBox "ZBar loaded."
Else
MsgBox "Failed to load ZBar library: "+ZBarMBS.LibraryLoadErrorMessage
End If
#EndIf
```

Notes: Please pass path to zbar.dll on Windows, libzbar.dylib on macOS and libzbar.so on Linux.
Returns true on success and false on failure.

See LibraryLoadErrorMessage and LibraryLoadError properties for error details.

We have libraries for you here:
https://www.monkeybreadsoftware.de/xojo/download/plugin/Libs/
See also:

- 21.3.9 LoadLibrary(path as string) as boolean 4180

21.3.9 LoadLibrary(path as string) as boolean

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the zbar library.
Example:

```
#If TargetLinux Then
```

```
Const libname = "libzbar.so.0"
// /usr/lib/x86_64-linux-gnu/libzbar.so.0

If ZBarMBS.LoadLibrary(libname) Then

'MsgBox "ZBar loaded."

Else

MsgBox "Failed to load ZBar library: "+ZBarMBS.LibraryLoadErrorMessage

End If
#endif
```

Notes: Please pass path to zbar.dll on Windows, libzbar.dylib on macOS and libzbar.so on Linux.
Returns true on success and false on failure.

See LibraryLoadErrorMessage and LibraryLoadError properties for error details.

We have libraries for you here:
https://www.monkeybreadsoftware.de/xojo/download/plugin/Libs/
See also:

- 21.3.8 LoadLibrary(file as folderitem) as boolean 4180

21.3.10 Scan(pic as Picture, AllowedTypes as Integer = 0) as ZBarMBS()

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs barcode detection.
Example:

```
// get some picture
Var p As Picture = Picture.Open(file)
If p <>Nil Then

// scan it
Var symbols() As ZBarMBS = ZBarMBS.Scan(p)

// show results
For Each symbol As ZBarMBS In symbols
MsgBox symbol.Name+": "+symbol.Text
Next
End If
```

Notes: Returns an array of detected barcodes.

Works best with black & white picture, so you may enhance contrast.
If AllowedTypes is zero, all types are enabled.
Otherwise use bitwiseOr() to combine types you like and pass them as AllowedTypes.

21.3.11 Properties

21.3.12 BoundsBottom as Integer

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Bottom of bounding rectangle.
Notes: (Read only property)

21.3.13 BoundsLeft as Integer

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Left of bounding rectangle.
Notes: (Read only property)

21.3.14 BoundsRight as Integer

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Right of bounding rectangle.
Notes: (Read only property)

21.3.15 BoundsTop as Integer

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Top of bounding rectangle.
Notes: (Read only property)

21.3.16 Data as MemoryBlock

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The RAW data from the barcode.
Notes: (Read and Write property)

21.3.17 HasComponents as Boolean

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether we have an array of components.
Notes: (Read only property)

21.3.18 Name as String

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the barcode type.
Notes: (Read and Write property)

21.3.19 Picture as Picture

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The picture scanned.
Notes: (Read only property)

21.3.20 Quality as Integer

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The quality rating.
Notes: Value depends on what barcode type is used.
But in general if you get two barcodes detected, you may pick the higher one.
(Read only property)

21.3.21 Text as String

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The barcode content.
Notes: If data is valid UTF-8, this will be a string with UTF-8 text of the barcode.
Otherwise we default to Windows ANSI encoding.

(Read only property)

21.3.22 Type as Integer

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type of the barcode.
Notes: See constants.
Maybe a combination of a flag for add-ons and the type, e.g. kSymbolTypeEAN13 + kSymbolTypeAddOn5
(Read only property)

21.3.23 Version as String

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries version number of zbar library.
Notes: Returns for example "0.10".
(Read only property)

21.3.24 XML as String

MBS Barcode Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries XML of the barcode.
Notes: (Read only property)

21.3.25 Constants

Symbol Types

Constant	Value	Description
kSymbolTypeAddOn	&h0700	add-on flag mask
kSymbolTypeAddOn2	&h0200	2-digit add-on flag
kSymbolTypeAddOn5	&h0500	5-digit add-on flag
kSymbolTypeCODE128	128	Code 128
kSymbolTypeCODE39	39	Code 39.
kSymbolTypeEAN13	13	EAN-13
kSymbolTypeEAN8	8	EAN-8
kSymbolTypeI25	25	Interleaved 2 of 5.
kSymbolTypeISBN10	10	ISBN-10 (from EAN-13).
kSymbolTypeISBN13	14	ISBN-13 (from EAN-13).
kSymbolTypeNone	0	no symbol decoded.
kSymbolTypePartial	1	intermediate status
kSymbolTypePDF417	57	PDF417.
kSymbolTypeQRCode	64	QR Code.
kSymbolTypeSymbol	&h00ff	mask for base symbol type
kSymbolTypeUPCA	12	UPC-A
kSymbolTypeUPCE	9	UPC-E

21.4 class ZintStructuredAppendMBS

21.4.1 class ZintStructuredAppendMBS

MBS Barcode Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Structured Append info.
Example:

```
Var z As New BarcodeGeneratorMBS

Var StructuredAppend As New ZintStructuredAppendMBS
StructuredAppend.Index = 1
StructuredAppend.Count = 4
StructuredAppend.id = "123"
z.StructuredAppend = StructuredAppend

z.Symbology = BarcodeGeneratorMBS.BarcodeQrcode
z.Encode "Hello World"

Var pic As Picture = z.picture
break // check picture in debugger
```

Notes: Ignored unless count is set to non-zero value.
Blog Entries

- QRCode with sequences in Xojo
- MBS Xojo Plugins, version 25.6pr5

21.4.2 Properties

21.4.3 Count as Integer

MBS Barcode Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of symbols in Structured Append sequence.
Notes: Set >= 2 to add SA Info.
(Read and Write property)

21.4.4 ID as String

MBS Barcode Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Optional ID to distinguish sequence.
Notes: ASCII text and maximal 32 characters long.
(Read and Write property)

21.4.5 Index as Integer

MBS Barcode Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position in Structured Append sequence.
Notes: 1-based. Must be <= 'count'.

In some barcodes the index is stored 0 based, so we subtract 1 for that case.
(Read and Write property)

21.5 class ZintVectorCircleMBS

21.5.1 class ZintVectorCircleMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a circle to draw.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

21.5.2 Methods

21.5.3 Constructor

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

21.5.4 Properties

21.5.5 ColorNumber as Integer

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color value as integer.
Notes: Non-zero for draw with background colour (else draw with foreground colour)
(Read only property)

21.5.6 ColorValue as Color

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color value.
Notes: (Read only property)

21.5.7 Diameter as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diameter for this circle.
Notes: (Read only property)

21.5.8 NextObject as ZintVectorCircleMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next circle object in the chain.
Notes: This is nil on the last object in the chain.
(Read and Write property)

21.5.9 Width as Single

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width of circle perimeter (circumference). 0 for fill (disc)
Notes: (Read only property)

21.5.10 X as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The X coordinate.
Notes: (Read only property)

21.5.11 Y as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Y coordinate.
Notes: (Read only property)

21.6 class ZintVectorHexagonMBS

21.6.1 class ZintVectorHexagonMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a hexagon to draw.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

21.6.2 Methods

21.6.3 Constructor

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

21.6.4 Properties

21.6.5 Diameter as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diameter of the hexagon.
Notes: (Read only property)

21.6.6 NextObject as ZintVectorHexagonMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next hexagon object in the chain.
Notes: This is nil on the last object in the chain.
(Read and Write property)

21.6.7 Rotation as Integer

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotation of the hexagon.
Notes: Can be 0, 90, 180, 270 degrees.
(Read and Write property)

21.6.8 X as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The X coordinate.
Notes: (Read only property)

21.6.9 Y as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Y coordinate.
Notes: (Read only property)

21.7 class ZintVectorMBS

21.7.1 class ZintVectorMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for vector information.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

21.7.2 Methods

21.7.3 Circles as ZintVectorCircleMBS()

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all the cirlce objects.

21.7.4 Constructor

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

21.7.5 Hexagons as ZintVectorHexagonMBS()

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all the hexagon objects.

21.7.6 Rectangles as ZintVectorRectMBS()

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all the rectangle objects.

21.7.7 Strings as ZintVectorStringMBS()

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all the string objects.

21.7.8 Properties

21.7.9 FirstCircle as ZintVectorCircleMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first ring object in the chain of circle objects.
Notes: (Read and Write property)

21.7.10 FirstHexagon as ZintVectorHexagonMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first hexagon object in the chain of hexagon objects.
Notes: (Read and Write property)

21.7.11 FirstRectangle as ZintVectorRectMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first line object in the chain of rectangle objects.
Notes: (Read and Write property)

21.7.12 FirstString as ZintVectorStringMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first string object in the chain of string objects.
Notes: (Read and Write property)

21.7.13 Height as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the barcode.
Notes: (Read only property)

21.7.14 Width as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the barcode.
Notes: (Read only property)

21.8 class ZintVectorRectMBS

21.8.1 class ZintVectorRectMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a rectangle to draw.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

21.8.2 Methods

21.8.3 Constructor

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

21.8.4 Properties

21.8.5 ColorNumber as Integer

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color value as integer.
Notes: -1 for foreground, 1-8 for Cyan, Blue, Magenta, Red, Yellow, Green, Black, White
(Read only property)

21.8.6 ColorValue as Color

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color value.
Notes: (Read only property)

21.8.7 Height as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the line.
Notes: (Read only property)

21.8.8 NextObject as ZintVectorRectMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next rectangle object in the chain.
Notes: This is nil on the last object in the chain.
(Read and Write property)

21.8.9 Width as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the line.
Notes: You need to know the orientation of the barcode to know how to draw it
(Read only property)

21.8.10 X as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The X coordinate.
Notes: (Read only property)

21.8.11 Y as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Y coordinate.
Notes: (Read only property)

21.9 class ZintVectorStringMBS

21.9.1 class ZintVectorStringMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a string to draw.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

21.9.2 Methods

21.9.3 Constructor

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

21.9.4 Properties

21.9.5 FontSize as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font size.
Notes: (Read only property)

21.9.6 HAlign as Integer

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Horizontal alignment.
Notes: Value is 0 for centre, 1 for left, 2 for right.
(Read and Write property)

21.9.7 Length as Integer

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length of the text in characters.
Notes: (Read and Write property)

21.9.8 NextObject as ZintVectorStringMBS

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The next string object in the chain.
Notes: This is nil on the last object in the chain.
(Read and Write property)

21.9.9 Rotation as Integer

MBS Barcode Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotation of the hexagon.
Notes: Can be 0, 90, 180, 270 degrees.
(Read and Write property)

21.9.10 Text as String

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text.
Notes: Plugin assumes string is in UTF-8.
(Read and Write property)

21.9.11 Width as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the string.
Notes: (Read only property)

21.9.12 X as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The X coordinate.
Notes: (Read only property)

21.9.13 Y as Single

MBS Barcode Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Y coordinate.
Notes: (Read only property)

21.9.14 Constants

Horizontal Alignments

Constant	Value	Description
HAlignCenter	0	Center
HAlignLeft	1	Left
HAlignRight	2	Right

21.10 module ZxingBarcodeMBS

21.10.1 module ZxingBarcodeMBS

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The module for globals on zxing barcode detection.
Example:

```
Var b As New BarcodeGeneratorMBS
b.Symbology = b.BarcodeQrcode
b.Encode "Hello Xojo Developer!"
Var pic As Picture = b.Picture

Var result As ZXingReaderResultMBS = ZxingBarcodeMBS.ReadBarcode(pic)

MessageBox result.Text
```

Notes: See also ZBarMBS class and for macOS VNDetectBarcodesRequestMBS class.

21.10.2 Methods

21.10.3 BarcodeFormatFromString(BarcodeFormat as String) as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts a barcode format to integer.
Example:

```
Var f As Integer = ZxingBarcodeMBS.BarcodeFormatFromString("EAN-13")

Break // f = 512
```

21.10.4 BarcodeFormatsFromString(BarcodeFormats as String) as Integer()

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts barcode formats to integer.
Example:

```
Var formats() As Integer = ZxingBarcodeMBS.BarcodeFormatsFromString("EAN-8 | EAN-13")

Break
```

21.10.5 BarcodeFormatsToString(BarcodeFormats() as Integer) as String

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts a barcode formats value to text.
Example:

```
Var s As String
Var f() As Integer

f.add ZXingReaderOptionsMBS.BarcodeFormatEAN13
f.add ZXingReaderOptionsMBS.BarcodeFormatEAN8

s = ZxingBarcodeMBS.BarcodeFormatsToString(f)
MessageBox s // EAN-8, EAN-13
```

21.10.6 BarcodeFormatToString(BarcodeFormat as Integer) as String

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts one barcode format value to text.
Example:

```
Var s As String
Var f As Integer

f = ZXingReaderOptionsMBS.BarcodeFormatEAN13
s = ZxingBarcodeMBS.BarcodeFormatToString(f)
```

```
MessageBox s // EAN-13
```

21.10.7 CharacterSetFromString(text as String) as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts a text name for a character set to an integer value.
Example:

```
Var f As Integer

f = ZxingBarcodeMBS.CharacterSetFromString("UTF-8")

Break // f = 29
```

21.10.8 CharacterSetToString(value as Integer) as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts a character set value to a text for display.
Example:

```
Var s As String

s = ZxingBarcodeMBS.CharacterSetToString(ZXingReaderOptionsMBS.CharacterSetUTF8)

MessageBox s // UTF-8
```

21.10.9 ReadBarcode(Pic as Picture, Options as ZXingReaderOptionsMBS = nil) as ZXingReaderResultMBS

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Read barcode from a picture.
Example:

```
Var b As New BarcodeGeneratorMBS
b.Symbology = b.BarcodeQrcode
b.Encode "Hello Xojo Developer!"
Var pic As Picture = b.Picture

Var result As ZXingReaderResultMBS = ZxingBarcodeMBS.ReadBarcode(pic)
```

MessageBox result.Text

Notes: Options: optional ReaderOptions to parameterize / speed up detection.

21.10.10 ReadBarcodes(Pic as Picture, Options as ZXingReaderOptionsMBS = nil) as ZXingReaderResultMBS()

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Read barcodes from a picture.
Example:

```
// try sequence
Var StructuredAppend As New ZintStructuredAppendMBS
StructuredAppend.ID = "123"
StructuredAppend.Index = 4 // part 4 of 4
StructuredAppend.Count = 4

Var b As New BarcodeGeneratorMBS
b.StructuredAppend = StructuredAppend
b.Symbology = b.BarcodeQrcode
b.Encode "Hello Xojo Developer!"

Var pic As Picture = b.Picture

Var f As FolderItem = SpecialFolder.Desktop.Child("barcode.jpg")
call pic.Save(f, Picture.Formats.JPEG)

Var result As ZXingReaderResultMBS = ZxingBarcodeMBS.ReadBarcode(pic)

MessageBox result.Text+" "+result.sequenceId+" "+_
result.sequenceIndex.ToString+"/"+result.sequenceSize.ToString
// shows 3 of 4 since here it is zero based!
```

Notes: Options: optional ReaderOptions to parameterize / speed up detection.
Returns list of result objects, which can be empty.

21.10.11 Properties

21.10.12 Version as String

MBS Barcode Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the version of the zxing library.
Notes: Currently returns version 2.3.
(Read only property)

21.11 class ZXingReaderOptionsMBS

21.11.1 class ZXingReaderOptionsMBS

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for reader options.
Notes: Default is true for tryHarder, tryRotate, tryInvert, tryDownscale, 3 for downscaleFactor, EanAddOnSymbol is ignore, binarizer is local average and text mode is HRI.

Function: Queries the format constant.
Notes: None of the barcodes

21.11.44 BarcodeFormatOtherBarcode as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: Other barcodes

21.11.45 BarcodeFormatPDF417 as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: PDF417

21.11.46 BarcodeFormatPZN as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: Pharmazentralnummer

21.11.47 BarcodeFormatQRCode as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: QR Code

21.11.48 BarcodeFormatQRCodeModel1 as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: QR Code Model 1

21.11.49 BarcodeFormatQRCodeModel2 as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: QR Code Model 2

21.11.50 BarcodeFormatRMQRCode as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: rMQR Code

21.11.51 BarcodeFormatsFromString(BarcodeFormats as String) as Integer()

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts barcode formats to integer.
Example:

```
Var formats() As Integer = ZxingBarcodeMBS.BarcodeFormatsFromString("EAN-8 | EAN-13")

Break
```

21.11.52 BarcodeFormatsToString(BarcodeFormats() as Integer) as String

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts a barcode formats value to text.
Example:

```
Var s As String
Var f() As Integer

f.add ZXingReaderOptionsMBS.BarcodeFormatEAN13
f.add ZXingReaderOptionsMBS.BarcodeFormatEAN8

s = ZxingBarcodeMBS.BarcodeFormatsToString(f)
MessageBox s // EAN-8, EAN-13
```

21.11.53 BarcodeFormatToString(BarcodeFormat as Integer) as String

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts one barcode format value to text.
Example:

```
Var s As String
Var f As Integer

f = ZXingReaderOptionsMBS.BarcodeFormatEAN13
s = ZxingBarcodeMBS.BarcodeFormatToString(f)
MessageBox s // EAN-13
```

21.11.54 BarcodeFormatUPCA as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: UPC-A

21.11.55 BarcodeFormatUPCE as Integer

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the format constant.
Notes: UPC-E

21.11.56 Constructor

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

21.11.57 formats as Integer()

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries currently set formats.

21.11.58 setFormats(values() as Integer)

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the formats.
Example:

```
Var options As New ZXingReaderOptionsMBS

options.setFormats(array(options.BarcodeFormatQRCode, options.BarcodeFormatMicroQRCode))

MessageBox options.FormatNames
```

21.11.59 supportedFormats as Integer()

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the list of supported format identifiers.
Example:

```
Var f() As Integer = ZXingReaderOptionsMBS.supportedFormats

Break
```

21.11.60 Properties

21.11.61 binarizer as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Binarizer to use internally when using the ReadBarcode function.
Example:

```
Var o As New ZXingReaderOptionsMBS
o.binarizer = o.BinarizerLocalAverage
```

Notes: Specify which algorithm to use for the grayscale to binary transformation. The difference is how to get to a threshold value T which results in a bit value R = L <= T.

Default is local average.
(Read and Write property)

21.11.62 characterSet as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies fallback character set to use instead of auto-detecting it (when applicable)
Example:

```
Var o As New ZXingReaderOptionsMBS
o.characterSet = o.CharacterSetUTF8
```

Notes: Default is unknown.
(Read and Write property)

21.11.63 eanAddOnSymbol as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specify whether to ignore, read or require EAN-2/5 add-on symbols while scanning EAN/UPC codes.
Example:

```
Var o As New ZXingReaderOptionsMBS
o.eanAddOnSymbol = o.EanAddOnSymbolRead
```

Notes: Default is Ignore.
(Read and Write property)

21.11.64 FormatNames as String

MBS Barcode Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The list of formats.
Example:

```
Var options As New ZXingReaderOptionsMBS

options.setFormats(array(options.BarcodeFormatQRCode, options.BarcodeFormatMicroQRCode))

MessageBox options.FormatNames
```

Notes: As text so you can see it in debugging.
(Read only property)

21.11.65 isPure as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set to true if the input contains nothing but a single perfectly aligned barcode (generated image)
Notes: Default is false.
(Read and Write property)

21.11.66 maxNumberOfSymbols as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The maximum number of symbols (barcodes) to detect / look for in the image with ReadBarcodes.
Notes: Default is 255.
(Read and Write property)

21.11.67 minLineCount as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of scan lines in a linear barcode that have to be equal to accept the result.
Notes: Default is 2.
(Read and Write property)

21.11.68 returnErrors as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: If true, return the barcodes with errors as well (e.g. checksum errors.
Notes: Default is false.
(Read and Write property)

21.11.69 textMode as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the TextMode that controls the return of the text property.
Notes: Default is HRI.
(Read and Write property)

21.11.70 tryCode39ExtendedMode as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: If true, the Code-39 reader will try to read extended mode.
Notes: Default is false.
(Read and Write property)

21.11.71 tryDownscale as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Also try detecting code in downscaled images (depending on image size).
Notes: Default is true.
(Read and Write property)

21.11.72 tryHarder as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Spend more time to try to find a barcode; optimize for accuracy, not speed.
Notes: Default is true.
(Read and Write property)

21.11.73 tryInvert as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Also try detecting inverted (”reversed reflectance”) codes if the format allows for those.
Notes: Default is true.
(Read and Write property)

21.11.74 tryRotate as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Also try detecting code in 90, 180 and 270 degree rotated images.
Notes: Default is true.
(Read and Write property)

21.11.75 validateCode39CheckSum as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assume Code-39 codes employ a check digit and validate it.
Notes: Default is false.
(Read and Write property)

21.11.76 validateITFCheckSum as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assume ITF codes employ a GS1 check digit and validate it.
Notes: (Read and Write property)

21.11.77 Constants

Binarizer Modes

Constant	Value	Description
BinarizerBoolCast	3	T = 0, fastest possible
BinarizerFixedThreshold	2	T = 127
BinarizerGlobalHistogram	1	T = valley between the 2 largest peaks in the histogram (per line in linear case)
BinarizerLocalAverage	0	T = average of neighboring pixels for matrix and GlobalHistogram for linear (HybridBinarizer)

Character Sets

Constant	Value	Description
CharacterSetASCII	1	ASCII
CharacterSetBig5	23	Big5
CharacterSetBinary	33	Binary
CharacterSetCp1250	18	Cp1250
CharacterSetCp1251	19	Cp1251
CharacterSetCp1252	20	Cp1252
CharacterSetCp1256	21	Cp1256
CharacterSetCp437	17	Cp437
CharacterSetEUC_JP	26	EUC_JP
CharacterSetEUC_KR	27	EUC_KR
CharacterSetGB18030	25	GB18030
CharacterSetGB2312	24	GB2312
CharacterSetISO8859_1	2	ISO8859_1
CharacterSetISO8859_10	11	ISO8859_10
CharacterSetISO8859_11	12	ISO8859_11
CharacterSetISO8859_13	13	ISO8859_13
CharacterSetISO8859_14	14	ISO8859_14
CharacterSetISO8859_15	15	ISO8859_15
CharacterSetISO8859_16	16	ISO8859_16
CharacterSetISO8859_2	3	ISO8859_2
CharacterSetISO8859_3	4	ISO8859_3
CharacterSetISO8859_4	5	ISO8859_4
CharacterSetISO8859_5	6	ISO8859_5
CharacterSetISO8859_6	7	ISO8859_6
CharacterSetISO8859_7	8	ISO8859_7
CharacterSetISO8859_8	9	ISO8859_8
CharacterSetISO8859_9	10	ISO8859_9
CharacterSetShift_JIS	22	Shift_JIS
CharacterSetUnknown	0	Unknown encoding
CharacterSetUTF16BE	28	UTF16BE
CharacterSetUTF16LE	30	UTF16LE
CharacterSetUTF32BE	31	UTF32BE
CharacterSetUTF32LE	32	UTF32LE
CharacterSetUTF8	29	UTF8

EAN Add-on Symbol Handling

Constant	Value	Description
EanAddOnSymbolIgnore	0	Ignore any Add-On symbol during read/scan
EanAddOnSymbolRead	1	Read EAN-2/EAN-5 Add-On symbol if found
EanAddOnSymbolRequire	2	Require EAN-2/EAN-5 Add-On symbol to be present

Text Modes

Constant	Value	Description
TextModeECI	1	standard content following the ECI protocol with every character set ECI segment transcoded to unicode
TextModeEscaped	4	Use the EscapeNonGraphical() function (e.g. ASCII 29 will be transcoded to "<GS>")
TextModeHex	3	bytes() transcoded to ASCII string of HEX values
TextModeHRI	2	Human Readable Interpretation (dependent on the ContentType)
TextModePlain	0	bytes() transcoded to unicode based on ECI info or guessed charset (the default mode prior to 2.0)

21.12 class ZXingReaderResultMBS

21.12.1 class ZXingReaderResultMBS

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a barcode result.
Blog Entries

- MBS Xojo Plugins, version 26.2pr4
- News from the MBS Xojo Plugins Version 24.4
- Read barcodes with newer zxing classes

21.12.2 Methods

21.12.3 Constructor

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

21.12.4 text(TextMode as Integer) as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the bytes() content rendered to unicode/utf8 text accoring to specified TextMode.
See also:

- 21.12.30 text as String 4228

21.12.5 Properties

21.12.6 bottomLeftX as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Bottom left X coordinate.
(Read only property)

21.12.7 bottomLeftY as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Bottom left Y coordinate.
(Read only property)

21.12.8 bottomRightX as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Bottom right X coordinate.
(Read only property)

21.12.9 bottomRightY as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Bottom right Y coordinate.
(Read only property)

21.12.10 bytes as MemoryBlock

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The raw / standard content without any modifications like character set conversions.
Notes: (Read only property)

21.12.11 bytesECI as MemoryBlock

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The raw / standard content following the ECI protocol.
Notes: (Read only property)

21.12.12 contentType as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gives a hint to the type of content found (Text/Binary/GS1/etc.)
Notes: (Read only property)

21.12.13 ecLevel as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the error correction level of the symbol (empty string if not applicable)
Notes: (Read only property)

21.12.14 errorLocation as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the error location in C++ source code.
Notes: (Read only property)

21.12.15 errorMessage as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries error message from barcode reader.
Notes: Only set if errorType property is not 0.
(Read only property)

21.12.16 errorType as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type of error.
Notes: Value is zero, if not error happened.
Value 1 means format error, 2 means checksum error and 3 means unsupported operation.
(Read only property)

21.12.17 format as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The format of the found barcode.
Notes: (Read only property)

21.12.18 hasECI as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies wheter or not an ECI tag was found.
Notes: (Read only property)

21.12.19 isInverted as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the symbol inverted / has reveresed reflectance.
Notes: (Read only property)

21.12.20 isLastInSequence as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is the last one of a sequence.
Notes: (Read only property)

21.12.21 isMirrored as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Is the symbol mirrored (currently only supported by QRCode and DataMatrix)
Notes: (Read only property)

21.12.22 isPartOfSequence as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is a part of a sequence.
Notes: (Read only property)

21.12.23 isValid as Boolean

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is a valid result.
Notes: (Read only property)

21.12.24 lineCount as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: How many lines have been detected with this code (applies only to linear symbologies)
Notes: (Read only property)

21.12.25 orientation as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Orientation of barcode in degree.
Notes: (Read only property)

21.12.26 sequenceId as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Id to check if a set of symbols belongs to the same structured append sequence.
Notes: If the symbology does not support this feature, the returned value is empty (see MaxiCode).
For QR Code, this is the parity integer converted to a string.
For PDF417 and DataMatrix, this is the "fileId".
(Read only property)

21.12.27 sequenceIndex as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 0-based index of this symbol in a structured append sequence.
Notes: (Read only property)

21.12.28 sequenceSize as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of symbols in a structured append sequence.
Notes: If this is not part of a structured append sequence, the returned value is -1.
If it is a structured append symbol but the total number of symbols is unknown, the returned value is 0 (see PDF417 if optional "Segment Count" not given).
(Read only property)

21.12.29 symbologyIdentifier as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Symbology identifier "] cm" where "c" is symbology code character, "m" the modifier.
Notes: (Read only property)

21.12.30 text as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the bytes() content rendered to unicode/utf8 text accoring to the TextMode set in the ReaderOptions.
Notes: (Read only property)
See also:

- 21.12.4 text(TextMode as Integer) as String 4223

21.12.31 topLeftX as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Top left X coordinate.
(Read only property)

21.12.32 topLeftY as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Top left Y coordinate.
(Read only property)

21.12.33 topRightX as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Top right X coordinate.
(Read only property)

21.12.34 topRightY as Integer

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Position of the barcode.
Notes: Top right Y coordinate.
(Read only property)

21.12.35 version as String

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Version of QRCode / DataMatrix / Aztec version or size.
Notes: (Read only property)

21.12.36 Constants

Content Types

Constant	Value	Description
ContentTypeBinary	1	Binary
ContentTypeGS1	3	GS1
ContentTypeISO15434	4	ISO 15434
ContentTypeMixed	2	Mixed
ContentTypeText	0	Text
ContentTypeUnknownECI	5	Unknown ECI

Error Types

Constant	Value	Description
ErrorTypeChecksum	2	Checksum error
ErrorTypeFormat	1	Format error
ErrorTypeNone	0	No error
ErrorTypeUnsupported	3	Unsupported operation.

21.13 class ZxingRuntimeExceptionMBS

21.13.1 class ZxingRuntimeExceptionMBS

MBS Barcode Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The exception class to catch C++ exceptions.
Notes: Subclass of the RuntimeException class.
Blog Entries

- News from the MBS Xojo Plugins Version 24.4
- Read barcodes with newer zxing classes

Chapter 22

Base 64

22.1 Globals

22.1.1 DecodeBase64MBS(s as string) as string

MBS Encryption Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes the base 64 text string into its original binary data.
Notes: Improved in MBS Plugin 2.7. Memory needed is around lenb(s)*2.
Text returned has chr(13) as newline character. If you need different one, you can use ReplaceLineEndings() function in Xojo.

If you need yielding for better threading, please use method in Base64MBS class.

22.1.2 EncodeBase64MBS(s as string, breakposition as integer = 0, breakstring as string = "") as string

MBS Encryption Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encodes the binary data in the string into a base64 text string.
Notes: Improved in MBS Plugin 2.7 to support breakposition and breakstring. If you don't need them, just pass 0 and "". Memory needed is around lenb(s)*2.8.

If you need yielding for better threading, please use method in Base64MBS class.

22.1.3 DecodeBase64URLMBS(s as string) as string

MBS Encryption Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes Base64URL encoded data.
Example:

```
Var s As String = "Hello World. Just a test!"

TextArea1.Text = EncodeBase64URLMBS(s)
TextArea2.Text = DecodeBase64URLMBS(TextArea1.Text)
```

Blog Entries

- MBS Xojo Plugins, version 20.3pr9
- JWT RS256 authentication in Xojo

22.1.4 EncodeBase64URLMBS(s as string, breakposition as integer = 0, breakstring as string = "") as string

MBS Encryption Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Base64 encodes some data with URL safe encoding.
Example:

```
Var s As String = "Hello World. Just a test!"

TextArea1.Text = EncodeBase64URLMBS(s)
TextArea2.Text = DecodeBase64URLMBS(TextArea1.Text)
```

Notes: Similar to normal Base64, but + replaced by - and / by _ and the = on the end are omitted.
Blog Entries

- MBS Xojo Plugins, version 20.3pr9
- JWT RS256 authentication in Xojo

22.1.5 uuDecodeMBS(data as string, byref name as string, byref mode as Integer) as string

MBS Encryption Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: UU Decoding.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.uu")
Var b as BinaryStream = BinaryStream.Open(f)

Var name as string
Var mode as Integer

Var s as String = b.Read(b.Length)
Var d as string = uuDecodeMBS(s, name, mode)

Var p as Picture = Picture.FromData(d)

Backdrop = p
```

Notes: Decodes UU encoded data. name and mode properties are filled.
Returns empty text if something goes wrong.
Raises out of memory exception in case of low memory situation.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr4

22.1.6 uuEncodeMBS(data as string, name as string, mode as Integer = &o755) as string

MBS Encryption Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: UU Encoding.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.Open(f)
Var s as string = b.Read(b.Length)

Var d as string = uuEncodeMBS(s, "test")

f = SpecialFolder.Desktop.Child("test.txt")
b = BinaryStream.Create(f, true)

b.Write d
```

Notes: Encodes binary data as text similar to Base64.
The data is prefixed with file name and mode.

Returns empty text if something goes wrong.
Raises out of memory exception in case of low memory situation.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr4

22.2 class Base64MBS

22.2.1 class Base64MBS

MBS Encryption Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encodes and decodes Base64 with events.
Notes: The global functions may be faster as they don't use events.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr6
- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr8

22.2.2 Methods

22.2.3 DecodeBase64(s as string) as string

MBS Encryption Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes the base 64 text string into its original binary data.
Notes: Memory needed is around lenb(s)*2.

22.2.4 EncodeBase64(s as string, breakposition as Integer, breakstring as string) as string

MBS Encryption Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encodes the binary data in the string into a base64 text string.
Notes: Improved in MBS Plugin 2.7 to support breakposition and breakstring. If you don't need them, just pass 0 and "". Memory needed is around lenb(s)*2.8.

22.2.5 Properties

22.2.6 Yield as Boolean

MBS Encryption Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the class should give CPU time to Xojo so windows can be updated and other threads go on.
Notes: Default is false.
(Read and Write property)

22.2.7 Events

22.2.8 Finished(wascanceled as boolean)

MBS Encryption Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Called when the encoding function returns.
Notes: wascanceled is true if the Working Event got a true returned.

22.2.9 Start

MBS Encryption Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Called when encoding or decoding is started.

22.2.10 Working(percent as Double) as boolean

MBS Encryption Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Called after each 4 KB chunk.
Notes: You can return true to cancel the process.

Chapter 23

Basic

23.1 Globals

23.1.1 DifferenceMBS(extends StartDate as date, EndDate as date) as DateDifferenceMBS

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calculates the difference between two dates.
Example:

```
Var d as date
Var e as date
Var r as DateDifferenceMBS
Var s as string

d=new date
d.Year=2008
d.Month=7
d.Day=2
d.Hour=10
d.Minute=48
d.Second=22

e=new date
e.Year=2010
e.Month=7
e.Day=1
e.Hour=10
e.Minute=36
e.Second=0
```

```
r=d.DifferenceMBS(e)

s= "Years: "+str(r.Year)+EndOfLine
s=s+"Months: "+str(r.month)+EndOfLine
s=s+"Days: "+str(r.day)+EndOfLine
s=s+"Hours: "+str(r.hour)+EndOfLine
s=s+"Minutes: "+str(r.Minute)+EndOfLine
s=s+"Seconds: "+str(r.Second)+EndOfLine

MsgBox s

// shows: "Years: 1 Months: 11 Days: 29 Hours: 22 Minutes: 47 Seconds: 38"
```

Notes: Returns nil on any errors. (one of the dates is nil or property getter don't work)
Valid only for dates from the gregorian calendar.

Calculates the difference between the older and newer date. The dates are sorted, so the difference is always a positive.
You can see Swap property to see if first date is after second date.
See also:

- 23.1.2 DifferenceMBS(extends StartDate as dateTime, EndDate as dateTime) as DateDifferenceMBS 4240

23.1.2 DifferenceMBS(extends StartDate as dateTime, EndDate as dateTime) as DateDifferenceMBS

MBS Util Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the difference between two dates.
Notes: Returns nil on any errors. (one of the dates is nil or property getter don't work)
Valid only for dates from the gregorian calendar.

Calculates the difference between the older and newer date. The dates are sorted, so the difference is always a positive.
You can see Swap property to see if first date is after second date.
Please make sure both dates are in the same timezone.
See also:

- 23.1.1 DifferenceMBS(extends StartDate as date, EndDate as date) as DateDifferenceMBS 4239

23.1.3 ReturnErrPtrMBS as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** A callback to use for GS8.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

23.1.4 ReturnInPtrMBS as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** A callback to use for GS8.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

23.1.5 ReturnOutPtrMBS as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** A callback to use for GS8.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

23.1.6 HideCursorMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Hides the mouse Cursor.
Example:

HideCursorMBS

23.1.7 ShowCursorMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Shows the mouse Cursor.
Example:

ShowCursorMBS

23.1.8 cloneMemoryBlockMBS(s as memoryblock) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the memoryblock.
Example:

```
Var m as MemoryBlock = "Hello"
Var n as MemoryBlock = cloneMemoryBlockMBS(m)

m.Byte(1)=asc("a")
n.Byte(1)=asc("u")

Var a as string = m
Var b as string = n

MsgBox a+" "+b
```

Notes: May return nil on low memory conditions.

23.1.9 cloneMemoryBlockWithLengthMBS(s as memoryblock,len as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the memoryblock.
Example:

```
Var m as MemoryBlock = "Hello"
Var n as MemoryBlock = cloneMemoryBlockWithLengthMBS(m,5)

m.Byte(1)=asc("a")
n.Byte(1)=asc("u")

Var a as string = m
Var b as string = n

MsgBox a+" "+b
```

Notes: May return nil on low memory conditions.

23.1.10 cloneStringMBS(s as string) as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the string.
Notes: May return "" on low memory conditions.
The encoding of the string is copied in RB 4.5 or newer.

23.1.11 MemoryBlockToStringMBS(s as memoryblock) as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the content of the memoryblock as a string.
Example:

```
Var m as MemoryBlock = NewMemoryBlock(6)

m.CString(0)="Hello"

MsgBox MemoryBlockToStringMBS(m)
```

Notes: May return "" on low memory conditions.
As some memoryblocks don't have a known length, you can provide one as a second parameter.

23.1.12 MemoryBlockToStringWithLengthMBS(s as memoryblock,len as Integer) as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the content of the memoryblock as a string.
Example:

```
Var m as MemoryBlock = NewMemoryBlock(6)

m.CString(0)="Hello"

MsgBox MemoryBlockToStringWithLengthMBS(m,5)
```

Notes: May return "" on low memory conditions.
As some memoryblocks don't have a known length, you can provide one as a second parameter.

23.1.13 OSTypeFromStringMBS(str as string) as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer representing a 4 byte String.

Example:

```
MsgBox str(OSTypeFromStringMBS("MBSP"))
```

Notes: This OSType datatype is used on Mac OS for 4 letter codes.
e.g. the type and creator code for a file.
Blog Entries

- Write audio file with samples using AVFoundation

23.1.14 StringFromOSTypeMBS(value as Integer) as string

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a 4 byte string for the given integer.
Example:

```
MsgBox StringFromOSTypeMBS(1296192336) // shows MBSP
```

Notes: This OSType datatype is used on Mac OS for 4 letter codes.
e.g. the type and creator code for a file.

23.1.15 StringToMemoryBlockMBS(s as string) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a copy of the content of the string as a memoryblock.
Example:

```
Var m as MemoryBlock = StringToMemoryBlockMBS("Hello")

MsgBox m.StringValue(0,5)
```

Notes: May return nil on low memory conditions.

23.1.16 BitwiseXORStringBytesMBS(s as string, v as Integer) as string

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bitwise XOR with a string's bytes.
Example:

```
Var a as string = "Hello"
Var b as string = BitwiseXORStringBytesMBS(a,1) // encode
```

```
Var c as string = BitwiseXORStringBytesMBS(b,1) // decode
MsgBox b
MsgBox c
```

Notes: Memory usage is around lenb(s)*2.
Returns nil on low memory.
v should be in range of 0 to 255.
If you use this function two times on a string, you get the original back.
Any encoding information is lost.
Blog Entries

- MBS Xojo Plugins, version 17.3pr1

23.1.17 Color2IntegerMBS(colorValue as Color) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the RGB value of the color as an integer.
Example:

```
Var c as color
Var i as UInt32

c=rgb(255,255,255)
i=Color2IntegerMBS(c)

MsgBox hex(i) // FFFFFF

c=rgb(&h12,&H34,&h56)
i=Color2IntegerMBS(c)

MsgBox hex(i) // 123456
```

Notes: Same as:
i=c.red*65536+c.green*256+c.blue
Blog Entries

- MBS Real Studio Plugins, version 11.3pr14

23.1.18 Integer2ColorMBS(intValue as UInt32) as Color

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the integer as if it is a color.
Example:

```
Var c as color
Var i as UInt32
c=Integer2ColorMBS(i)
```

Notes: Same as:
c=rgb(i\65536 mod 256, i\256 mod 256, i mod 256)
Blog Entries

- MBS Real Studio Plugins, version 11.3pr14

23.2 class DateDifferenceMBS

23.2.1 class DateDifferenceMBS

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to calculate the difference between two dates.
Example:

```
// calculate difference between now and a date in 2008.

Var d as date
Var r as DateDifferenceMBS
Var s as string
Var c as Clipboard

d=new date
d.Year=2008
d.Month=7
d.Day=2
d.Hour=10
d.Minute=48
d.Second=22

Var e as new date // today

r=new DateDifferenceMBS(d, e)

s= "Years: "+str(r.Year)+EndOfLine
s=s+"Months: "+str(r.month)+EndOfLine
s=s+"Days: "+str(r.day)+EndOfLine
s=s+"Hours: "+str(r.hour)+EndOfLine
s=s+"Minutes: "+str(r.Minute)+EndOfLine
s=s+"Seconds: "+str(r.Second)+EndOfLine

MsgBox s
```

Notes: Calculates the difference between the older and newer date. The dates are sorted, so the difference is always a positive.
You can see Swap property to see if first date is after second date.

This class allows you to know exactly how many months/years are between two dates. Something that TotalSeconds calculations will not give you!

23.2.2 Methods

23.2.3 Calc(StartDate as date, EndDate as date) as boolean

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calculates the difference between two dates.
Example:

```
Var d as date
Var e as date
Var r as DateDifferenceMBS
Var s as string
Var c as Clipboard

d=new date
d.Year=2008
d.Month=7
d.Day=2
d.Hour=10
d.Minute=48
d.Second=22
```

```
e=new date
e.Year=2010
e.Month=7
e.Day=1
e.Hour=10
e.Minute=36
e.Second=0

r=new DateDifferenceMBS

if r.Calc(d,e) then

s= "Years: "+str(r.Year)+EndOfLine
s=s+"Months: "+str(r.month)+EndOfLine
s=s+"Days: "+str(r.day)+EndOfLine
s=s+"Hours: "+str(r.hour)+EndOfLine
s=s+"Minutes: "+str(r.Minute)+EndOfLine
s=s+"Seconds: "+str(r.Second)+EndOfLine

MsgBox s

// shows: "Years: 1 Months: 11 Days: 29 Hours: 22 Minutes: 47 Seconds: 38"
end if
```

Notes: Returns false on any errors and true on success.
Valid only for dates from the gregorian calendar.
Sets ready property.

Calculates the difference between the older and newer date. The dates are sorted, so the difference is always a positive.
You can see Swap property to see if first date is after second date.
See also:

- 23.2.4 Calc(StartDate as dateTime, EndDate as dateTime) as boolean 4248

23.2.4 Calc(StartDate as dateTime, EndDate as dateTime) as boolean

MBS Util Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the difference between two dates.
Notes: Returns false on any errors and true on success.
Valid only for dates from the gregorian calendar.
Sets ready property.

Calculates the difference between the older and newer date. The dates are sorted, so the difference is always

a positive.
You can see Swap property to see if first date is after second date.

Please make sure both dates are in the same timezone.
See also:

- 23.2.3 Calc(StartDate as date, EndDate as date) as boolean 4247

23.2.5 Constructor

MBS Util Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The dummy constructor doing nothing.
See also:

- 23.2.6 Constructor(StartDate as date, EndDate as date) 4249
- 23.2.7 Constructor(StartDate as dateTime, EndDate as dateTime) 4249

23.2.6 Constructor(StartDate as date, EndDate as date)

MBS Util Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calculates the difference between two dates.
Notes: Internally calls Calc and sets ready property.
See also:

- 23.2.5 Constructor 4249
- 23.2.7 Constructor(StartDate as dateTime, EndDate as dateTime) 4249

23.2.7 Constructor(StartDate as dateTime, EndDate as dateTime)

MBS Util Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the difference between two dates.
Notes: Internally calls Calc and sets ready property.
Please make sure both dates are in the same timezone.
See also:

- 23.2.5 Constructor 4249
- 23.2.6 Constructor(StartDate as date, EndDate as date) 4249

23.2.8 isLeapYear(year as Integer) as boolean

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether a year is a leap year.
Example:

```
if DateDifferenceMBS.isLeapYear(2004) then
msgbox "2004 is a leap year"
else
msgbox "2004 is not a leap year"
end if
```

Notes: Valid only for dates from the gregorian calendar.

23.2.9 Properties

23.2.10 Day as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The day of the date difference.
Notes: (Read only property)

23.2.11 EndDate as Variant

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The end date used to do the calculation.
Notes: Value can be DateTime or Date depending of method used.
(Read only property)

23.2.12 EndDay as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The day of the end date.
Notes: (Read only property)

23.2.13 EndHour as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hour of the end date.
Notes: (Read only property)

23.2.14 EndMinute as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minute of the end date.
Notes: (Read only property)

23.2.15 EndMonth as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The month of the end date.
Notes: (Read only property)

23.2.16 EndSecond as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second of the end date.
Notes: (Read only property)

23.2.17 EndTotalSeconds as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total seconds value of the end date.
Notes: (Read and Write property)

23.2.18 EndYear as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The year of the end date.
Notes: (Read only property)

23.2.19 Hour as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hour of the date difference.
Notes: (Read only property)

23.2.20 Minute as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minute of the date difference.
Notes: (Read only property)

23.2.21 Month as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The month of the date difference.
Notes: (Read only property)

23.2.22 Ready as Boolean

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the date calculation has been performed.
Notes: Using the constructor with nil dates can lead into an invalid state in which ready is false.
(Read only property)

23.2.23 Second as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second of the date difference.
Notes: (Read only property)

23.2.24 StartDate as Variant

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The start date of the date used.
Notes: Value can be DateTime or Date depending of method used.
(Read only property)

23.2.25 StartDay as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The day of the start date.
Notes: (Read only property)

23.2.26 StartHour as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hour of the start date.
Notes: (Read only property)

23.2.27 StartMinute as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minute of the start date.
Notes: (Read only property)

23.2.28 StartMonth as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The month of the start date.
Notes: (Read only property)

23.2.29 StartSecond as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second of the start date.
Notes: (Read only property)

23.2.30 StartTotalSeconds as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total seconds value of the start date.
Notes: (Read and Write property)

23.2.31 StartYear as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The year of the start date.
Notes: (Read only property)

23.2.32 Swap as Boolean

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether dates have been swapped.
Notes: Dates are swapped if enddate is before startdate.
(Read only property)

23.2.33 TotalDay as Integer

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of days between
Example:

```
Var d as new date(2011, 9, 25)
Var e as new date(2012, 1, 1)

Var diff as new DateDifferenceMBS

if diff.Calc(d, e) then
MsgBox str(diff.TotalDay)+" days between dates." // should be 98
end if
```

Notes: Our day, month and year properties are about how many days, months and years are between start and end dates.
This property gives you the total number of days.
So day may be 6 and month be 3 and totaldays could be 98 if there are two months with 31 days included and one with 30 days.
(Read only property)

23.2.34 TotalSeconds as Double

MBS Util Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total seconds value of the difference between the dates.
Notes: (Read and Write property)

23.2.35 Year as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The year of the date difference.
Notes: (Read only property)

23.3 class UniversalCharacterDetectionMBS

23.3.1 class UniversalCharacterDetectionMBS

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for univeral character encoding detection.
Notes: Based on the Mozilla project.

You can pass a string with bytes to this class and receive an encoding as answer. Similar to the GuessJapaneseEncoding function built into Xojo.

Possible encoding names used by this class: Big5, EUC-JP, EUC-KR, x-euc-tw, gb18030, windows-1252, UTF-8, UTF-16BE, X-ISO-10646-UCS-4-3412, UTF-32BE, X-ISO-10646-UCS-4-2143, UTF-32LE, UTF-16LE.
Blog Entries

23.3.2 Methods

23.3.3 AddData(data as string)

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Passes more data to the engine for analysis.
Notes: The string encoding from Xojo is ignored. Only the raw data bytes are examined.

23.3.4 Constructor(filter as Integer)

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: filter: which languages to detect or ignore. Use the filter* constants.

23.3.5 Finish

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Notify the engine that data no more data will come.
Notes: This method can fire the Report event.

23.3.6 Properties

23.3.7 LastCharSet as String

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last character set reported in the report event.
Notes: (Read and Write property)

23.3.8 Events

23.3.9 Report(Charset as string)

MBS Util Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called when an encoding was detected.
Notes: This event allows you to pass more and more data and as soon as the event fires you can decide to stop probing.

23.3.10 Constants

Constants

Constant	Value	Description
FilterAll	31	One of the language filter constants. All languages.
FilterChinese	3	One of the language filter constants. Traditional and Simplified Chinese together.
FilterChineseSimplified	1	One of the language filter constants. Simplified Chinese.
FilterChineseTraditional	2	One of the language filter constants. Traditional Chinese.
FilterCJK	15	One of the language filter constants. Chinese, Japanese and Korean together.
FilterJapanese	4	One of the language filter constants. Japanese
FilterKorean	8	One of the language filter constants. Korean
FilterNonCJK	16	One of the language filter constants. Non Chineses/Japanes/Korean languages.

Chapter 24

Bluetooth

24.1 class CBATTRequestMBS

24.1.1 class CBATTRequestMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The CBATTRequest class represents Attribute Protocol (ATT) read and write requests from remote central devices (represented by CBCentral objects).
Notes: Remote centrals use these ATT requests to read and write characteristic values on local peripherals (represented by CBPeripheralManager objects). Local peripherals, on the other hand, use the properties of CBATTRequest objects to respond to the read and write requests appropriately, using the respondToRequest:withResult: method of the CBPeripheralManager class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.1.2 Methods

24.1.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on macOS 10.9 or newer.

24.1.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.1.5 Properties

24.1.6 central as CBCentralMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The remote central device that originated the request.
Notes: (Read only property)

24.1.7 characteristic as CBCharacteristicMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The characteristic whose value is to be read or written.
Notes: (Read only property)

24.1.8 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

24.1.9 offset as UInt64

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The zero-based index of the first byte for the read or write request.
Notes: You can use the value of this property to ensure that the ATT request is attempting to read or write within the proper bounds of the characteristic,Äôs value. For an example of how to take a request,Äôs offset property into account when responding to a read or write request, see Responding to Read and Write Requests from a Central in Apple documentation.
(Read only property)

24.1.10 value as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The data being read or written.
Notes: The value of this property differs according to the type of request. For read requests, the property of this value is nil and should be set before responding to the remote central through the respondToRequest method. For write requests, the value of this property is the data that is to be written to the characteristic,Äôs value.
(Read and Write property)

24.2 class CBAttributeMBS

24.2.1 class CBAttributeMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: CBAttribute is an abstract base class that defines behavior common to the collection of objects that represent aspects of services offered by a peripheral.
Notes: Concrete subclasses of CBAttribute (and their mutable counterparts) are used to represent the services a peripheral offers, the characteristics of those services, and the descriptors attached to those characteristics. The concrete subclasses are:

- CBService
- CBCharacteristic
- CBDescriptor

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.2.2 Methods

24.2.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on macOS 10.13 or newer.

24.2.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.2.5 Properties

24.2.6 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

24.2.7 UUID as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The Bluetooth-specific UUID of the attribute.
Notes: This property is a 128-bit UUID that identifies the attribute.
(Read only property)

24.3 class CBCentralManagerMBS

24.3.1 class CBCentralManagerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: CBCentralManager objects are used to manage discovered or connected remote peripheral devices (represented by CBPeripheral objects), including scanning for, discovering, and connecting to advertising peripherals.
Notes: Before you call CBCentralManager methods, the state of the central manager object must be powered on, as indicated by the CBCentralManagerStatePoweredOn constant. This state indicates that the central device (your iPhone or iPad, for instance) supports Bluetooth low energy and that Bluetooth is on and available to use.

Please build as 64-bit as 32-bit is no longer supported well by Apple.
Subclass of the CBManagerMBS class.
Blog Entries

- MBS Xojo Plugins, version 21.6pr3

24.3.2 Methods

24.3.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.7 or later.

24.3.4 cancelPeripheralConnection(Peripheral as CBPeripheralMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Cancels an active or pending local connection to a peripheral.
Notes: peripheral: The peripheral to which the central manager is either trying to connect or has already connected.

This method is nonblocking, and any CBPeripheral class commands that are still pending to peripheral may or may not complete. Because other apps may still have a connection to the peripheral, canceling a local connection does not guarantee that the underlying physical link is immediately disconnected. From the app,Äôs perspective, however, the peripheral is considered disconnected, and the central manager object calls the didDisconnectPeripheral event.

24.3.5 CBATTErrorDomain as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The domain for Core Bluetooth ATT errors.
Notes: This value is used in the NSError class.

24.3.6 CBCentralManagerOptionRestoreIdentifierKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the CBCentralManager method.
Notes: A string containing a unique identifier (UID) for the central manager that is being instantiated. The system uses this UID to identify a specific central manager. As a result, the UID must remain the same for subsequent executions of the app in order for the central manager to be successfully restored.

24.3.7 CBCentralManagerOptionShowPowerAlertKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the CBCentralManager method.
Notes: A Boolean value that specifies whether the system should display a warning dialog to the user if Bluetooth is powered off when the central manager is instantiated.
The value for this key is a number. If the key is not specified, the default value is false.

24.3.8 CBCentralManagerRestoredStatePeripheralsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the options keys.
Notes: See connectPeripheral method.
An array of CBPeripheral objects containing all peripherals that were connected or pending connection at the time the application was terminated by the system. When possible, all known information for each peripheral will be restored, including any discovered services, characteristics and descriptors, as well as characteristic notification states.

24.3.9 CBCentralManagerRestoredStateScanOptionsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the options keys.
Notes: A dictionary containing the scan options at the time the application was terminated by the system.

See also scanForPeripheralsWithServices method.

24.3.10 CBCentralManagerRestoredStateScanServicesKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the options keys.
Notes: An array of CBUUID objects containing the service(s) being scanned for at the time the application was terminated by the system.
See also scanForPeripheralsWithServices method.

24.3.11 CBCentralManagerScanOptionAllowDuplicatesKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the scanForPeripheralsWithServices method.
Notes: A Boolean value that specifies whether the scan should run without duplicate filtering.
The value for this key is a number. If true, filtering is disabled and a discovery event is generated each time the central receives an advertising packet from the peripheral. Disabling this filtering can have an adverse effect on battery life and should be used only if necessary. If false, multiple discoveries of the same peripheral are coalesced into a single discovery event. If the key is not specified, the default value is false.

24.3.12 CBCentralManagerScanOptionSolicitedServiceUUIDsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the scanForPeripheralsWithServices method.
Notes: An array of service UUIDs (represented by CBUUID objects) that you want to scan for.
Specifying this scan option causes the central manager to also scan for peripherals soliciting any of the services contained in the array.

24.3.13 CBConnectPeripheralOptionNotifyOnConnectionKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the connectPeripheral method.
Notes: A Boolean value that specifies whether the system should display an alert for a given peripheral if the app is suspended when a successful connection is made.
The value for this key is a number. This key is useful for apps that have not specified the bluetooth-central background mode and cannot display their own alert. If more than one app has requested notification for a given peripheral, the one that was most recently in the foreground receives the alert. If the key is not

specified, the default value is false.

24.3.14 CBConnectPeripheralOptionNotifyOnDisconnectionKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the connectPeripheral method.
Notes: A Boolean value that specifies whether the system should display a disconnection alert for a given peripheral if the app is suspended at the time of the disconnection.
The value for this key is a number. This key is useful for apps that have not specified the bluetooth-central background mode and cannot display their own alert. If more than one app has requested notification for a given peripheral, the one that was most recently in the foreground receives the alert. If the key is not specified, the default value is false.

24.3.15 CBConnectPeripheralOptionNotifyOnNotificationKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the connectPeripheral method.
Notes: A Boolean value that specifies whether the system should display an alert for all notifications received from a given peripheral if the app is suspended at the time.
The value for this key is a number. This key is useful for apps that have not specified the bluetooth-central background mode and cannot display their own alert. If more than one app has requested notification for a given peripheral, the one that was most recently in the foreground receives the alert. If the key is not specified, the default value is false.

24.3.16 CBErrorDomain as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The domain for Core Bluetooth errors.
Notes: This value is used in the NSError class.

24.3.17 connectPeripheral(peripheral as CBPeripheralMBS, options as Dictionary = nil)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Establishes a local connection to a peripheral.
Notes: peripheral: The peripheral to which the central is attempting to connect.
options: A dictionary to customize the behavior of the connection. For available options, see Peripheral

Connection Options.

If a local connection to a peripheral is successfully established, the central manager object calls the centralManager:didConnectPeripheral: method of its delegate object. If the connection attempt fails, the central manager object calls the didFailToConnectPeripheral event. Attempts to connect to a peripheral do not time out. To explicitly cancel a pending connection to a peripheral, call the cancelPeripheralConnection method. The cancelPeripheralConnection method is implicitly called when peripheral is deallocated.

24.3.18 Constructor(options as dictionary = nil)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Initializes the central manager.
Notes: options: An optional dictionary containing initialization options for a central manager.

24.3.19 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The destructor.

24.3.20 retrieveConnectedPeripheralsWithServices(serviceUUIDs() as CBUUIDMBS) as CBPeripheralMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns a list of the peripherals (containing any of the specified services) currently connected to the system.
Notes: serviceUUIDs: A list of service UUIDs (represented by CBUUID objects).

Returns a list of the peripherals that are currently connected to the system and that contain any of the services specified in the serviceUUID parameter.

The list of connected peripherals can include those that are connected by other apps and that will need to be connected locally using the connectPeripheral method before they can be used.

24.3.21 retrievePeripheralsWithIdentifiers(identifiers() as NSUUIDMBS) as CBPeripheralMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns a list of known peripherals by their identifiers.
Notes: identifiers: A list of peripheral identifiers (represented by NSUUID objects) from which CBPeripheral objects can be retrieved.

Returns a list of peripherals that the central manager is able to match to the provided identifiers.

24.3.22 scanForPeripheralsWithServices(serviceUUIDs() as CBUUIDMBS = nil, options as Dictionary = nil)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Scans for peripherals that are advertising services.
Notes: serviceUUIDs: An array of CBUUID objects that the app is interested in. In this case, each CBUUID object represents the UUID of a service that a peripheral is advertising.
options: An optional dictionary specifying options to customize the scan. For available options, see Peripheral Scanning Options.

You can provide an array of CBUUID objects—representing service UUIDs—in the serviceUUIDs parameter. When you do, the central manager returns only peripherals that advertise the services you specify (recommended). If the serviceUUIDs parameter is nil, all discovered peripherals are returned regardless of their supported services (not recommended). If the central manager is already scanning with different parameters, the provided parameters replace them. When the central manager object discovers a peripheral, it calls the didDiscoverPeripheral event.
Apps that have specified the bluetooth-central background mode are allowed to scan while in the background. That said, they must explicitly scan for one or more services by specifying them in the serviceUUIDs parameter. The CBCentralManager scan option is ignored while scanning in the background.

24.3.23 stopScan

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Asks the central manager to stop scanning for peripherals.

24.3.24 Properties

24.3.25 isScanning as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether or not the central is currently scanning.
Notes: (Read only property)

24.3.26 Events

24.3.27 DidConnectPeripheral(peripheral as CBPeripheralMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a connection is successfully created with a peripheral.
Notes: peripheral: The peripheral that has been connected to the system.

This method is invoked when a call to connectPeripheral is successful. You typically implement this method to set the peripheral,Äôs delegate and to discover its services.

24.3.28 DidDisconnectPeripheral(peripheral as CBPeripheralMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when an existing connection with a peripheral is torn down.
Notes: peripheral: The peripheral that has been disconnected.
error: If an error occurred, the cause of the failure.

This method is invoked when a peripheral connected via the connectPeripheral method is disconnected. If the disconnection was not initiated by cancelPeripheralConnection, the cause is detailed in error. After this method is called, no more methods are invoked on the peripheral device,Äôs CBPeripheralDelegate object. Note that when a peripheral is disconnected, all of its services, characteristics, and characteristic descriptors are invalidated.

24.3.29 DidDiscoverPeripheral(peripheral as CBPeripheralMBS, advertisementData as Dictionary, RSSI as String)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when the central manager discovers a peripheral while scanning.
Notes: peripheral: The discovered peripheral.
advertisementData: A dictionary containing any advertisement data.
RSSI: The current received signal strength indicator (RSSI) of the peripheral, in decibels.

The advertisement data can be accessed through the keys listed in Advertisement Data Retrieval Keys. You must retain a local copy of the peripheral if any command is to be performed on it. In use cases where it makes sense for your app to automatically connect to a peripheral that is located within a certain range, you can use RSSI data to determine the proximity of a discovered peripheral device.

24.3.30 DidFailToConnectPeripheral(peripheral as CBPeripheralMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when the central manager fails to create a connection with a peripheral.
Notes: peripheral: The peripheral that failed to connect.
error: The cause of the failure.

This method is invoked when a connection initiated via the connectPeripheral method fails to complete. Because connection attempts do not time out, a failed connection usually indicates a transient issue, in which case you may attempt to connect to the peripheral again.

24.3.31 DidUpdateState

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when the central manager,Äôs state is updated.
Notes: You implement this required method to ensure that Bluetooth low energy is supported and available to use on the central device. You should issue commands to the central manager only when the state of the central manager is powered on, as indicated by the CBCentralManagerStatePoweredOn constant. A state with a value lower than CBCentralManagerStatePoweredOn implies that scanning has stopped and that any connected peripherals have been disconnected. If the state moves below CBCentralManagerStatePoweredOff, all CBPeripheral objects obtained from this central manager become invalid and must be retrieved or discovered again. For a complete list and discussion of the possible values representing the state of the central manager, see the CBCentralManagerState enumeration in CBCentralManager.

24.3.32 WillRestoreState(dict as dictionary)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when the central manager is about to be restored by the system.

Notes: dict: A dictionary containing information about the central manager that was preserved by the system at the time the app was terminated. For the available keys to this dictionary, see Central Manager State Restoration Options.

For apps that opt in to the state preservation and restoration feature of Core Bluetooth, this is the first method invoked when your app is relaunched into the background to complete some Bluetooth-related task. Use this method to synchronize the state of your app with the state of the Bluetooth system.

24.3.33 Constants

Att Errors

Constant	Value	Description
CBATTErrorAttributeNotFound	&h0A	The attribute is not found within the specified attribute handle ra
CBATTErrorAttributeNotLong	&h0B	The attribute cannot be read or written using the ATT read blob
CBATTErrorInsufficientAuthentication	5	The attribute requires authentication before its value can be read
CBATTErrorInsufficientAuthorization	8	The attribute requires authorization before its value can be read o
CBATTErrorInsufficientEncryption	&h0F	The attribute requires encryption before its value can be read or w
CBATTErrorInsufficientEncryptionKeySize	&h0C	The encryption key size used for encrypting this link is insufficient
CBATTErrorInsufficientResources	&h11	Resources are insufficient to complete the ATT request.
CBATTErrorInvalidAttributeValueLength	&h0D	The length of the attribute,Äôs value is invalid for the intended op
CBATTErrorInvalidHandle	1	The attribute handle is invalid on this peripheral.
CBATTErrorInvalidOffset	7	The specified offset value was past the end of the attribute,Äôs val
CBATTErrorInvalidPdu	4	The attribute Protocol Data Unit (PDU) or ,Äúmessage,Äù is inva
CBATTErrorPrepareQueueFull	9	The prepare queue is full, because too many prepare write requests queued.
CBATTErrorReadNotPermitted	2	The attribute,Äôs value cannot be read.
CBATTErrorRequestNotSupported	6	The attribute server does not support the request received by the
CBATTErrorSuccess	0	The ATT command or request successfully completed.
CBATTErrorUnlikelyError	&h0E	The ATT request has encountered an unlikely error and therefore c completed.
CBATTErrorUnsupportedGroupType	&h10	The attribute type is not a supported grouping attribute as defined b layer specification.
CBATTErrorWriteNotPermitted	3	The attribute,Äôs value cannot be written.

States

Constant	Value	Description
CBCentralManagerStatePoweredOff	4	Bluetooth is currently powered off.
CBCentralManagerStatePoweredOn	5	Bluetooth is currently powered on and is available to use.
CBCentralManagerStateResetting	1	The connection with the system service was momentarily lost; an upd imminent.
CBCentralManagerStateUnauthorized	3	The app is not authorized to use the Bluetooth low energy peripheral/s role.
CBCentralManagerStateUnknown	0	The current state of the peripheral manager is unknown; an update is imm
CBCentralManagerStateUnsupported	2	The platform doesn't support the Bluetooth low energy peripheral/serve

Errors

Constant	Value	Description
CBErrorAlreadyAdvertising	9	The peripheral is already advertising.
CBErrorConnectionFailed	10	The connection failed.
CBErrorConnectionLimitReached	11	The device already has the maximum number of connections.
CBErrorConnectionTimeout	6	The connection timed out.
CBErrorEncryptionTimedOut	15	Timeout in encryption.
CBErrorInvalidHandle	2	The specified attribute handle is invalid.
CBErrorInvalidParameters	1	The specified parameters are invalid.
CBErrorNotConnected	3	The device is not currently connected.
CBErrorOperationCancelled	5	The operation is canceled.
CBErrorOperationNotSupported	13	Operation not supported.
CBErrorOutOfSpace	4	The device has run out of space to complete the intended operation.
CBErrorPeerRemovedPairingInformation	14	Peer removed pairing information, e.g. pairing was reset on the other
CBErrorPeripheralDisconnected	7	The peripheral disconnected.
CBErrorTooManyLEPairedDevices	16	Too many paired devices for Bluetooth LE.
CBErrorUnknown	0	An unknown error occurred.
CBErrorUnkownDevice	12	Unknown device.
CBErrorUUIDNotAllowed	8	The specified UUID is not permitted.

24.4 class CBCentralMBS

24.4.1 class CBCentralMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The central CoreBluetooth class.
Notes: The CBCentral class represents remote central devices that have connected to an app implementing the peripheral role on a local device. That is, when you are implementing the peripheral role using the CBPeripheralManager class, centrals that connect to your local peripheral are represented as CBCentral objects. Remote centrals are identified by universally unique identifiers (UUIDs), represented by NSUUID objects.
Subclass of the CBPeerMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.4.2 Methods

24.4.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.9 or newer.

24.4.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.4.5 Properties

24.4.6 maximumUpdateValueLength as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The maximum amount of data, in bytes, that the central can receive in a single notification or indication.
Notes: (Read only property)

24.5 class CBCharacteristicMBS

24.5.1 class CBCharacteristicMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The class for a service characteristic.
Notes: CBCharacteristic and its subclass CBMutableCharacteristic represent further information about a peripheral,Äôs service. CBCharacteristic objects in particular represent the characteristics of a remote peripheral,Äôs service (remote peripheral devices are represented by CBPeripheral objects). A characteristic contains a single value and any number of descriptors describing that value. The properties of a characteristic determine how the value of the characteristic can be used and how the descriptors can be accessed.
Subclass of the CBAttributeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.5.2 Methods

24.5.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.5.4 descriptors as CBDescriptorMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A list of the descriptors that have been discovered in this characteristic.
Notes: The value of this property is an array of CBDescriptor objects that represent a characteristic,Äôs descriptors. Characteristic descriptors provide more information about a characteristic,Äôs value. For example, they may describe the value in human-readable form and describe how the value should be formatted for presentation purposes. For more information about characteristic descriptors, see CBDescriptor.

24.5.5 Properties

24.5.6 isBroadcasted as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Whether the characteristic is currently broadcasted or not.
Notes: Available in MacOS 10.9 or newer.

(Read only property)

24.5.7 isNotifying as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the characteristic is currently notifying a subscribed central of its value.
Notes: True if you have enabled notifications or indications for the characteristic by successfully calling the setNotifyValue method of the CBPeripheral class. If the value of this property is true, the peripheral updates the subscribed central that it is connected to whenever the characteristic,Äôs value has changed. If the value of the property is false, notifications (or indications) have not been enabled for the characteristic, and the peripheral does not update the central that it is connected to whenever the characteristic,Äôs value has changed.
(Read only property)

24.5.8 properties as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The properties of the characteristic.
Notes: The properties of a characteristic determine how the characteristic,Äôs value and descriptors can be used and accessed. For a list of the possible values representing the properties of a characteristic, see constants.
(Read only property)

24.5.9 service as CBServiceMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The service that this characteristic belongs to.
Notes: (Read only property)

24.5.10 value as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The value of the characteristic.
Notes: This property contains the value of the characteristic. For example, a temperature measurement characteristic of a health thermometer service may have a value that indicates a temperature in Celsius.

(Read only property)

24.5.11 Constants

Property Constants

Constant	Value	Description
kPropertyAuthenticatedSignedWrites	&h40	Signed writes of the characteristic,Äôs value are permitted, without a re from the peripheral to indicate that the write was successful.
kPropertyBroadcast	1	The characteristic,Äôs value can be broadcast using a characteristic con tion descriptor.
kPropertyExtendedProperties	&h80	Additional characteristic properties are defined in the characteristic ex properties descriptor.
kPropertyIndicate	&h20	Indications of the characteristic,Äôs value are permitted, with a respons the central to indicate that the indication was received.
kPropertyIndicateEncryptionRequired	&h200	Only trusted devices can enable indications of the characteristic,Äôs va
kPropertyNotify	&h10	Notifications of the characteristic,Äôs value are permitted, without a re from the central to indicate that the notification was received.
kPropertyNotifyEncryptionRequired	&h100	Only trusted devices can enable notifications of the characteristic,Äôs v
kPropertyRead	2	The characteristic,Äôs value can be read.
kPropertyWrite	8	The characteristic,Äôs value can be written, with a response from the peri to indicate that the write was successful.
kPropertyWriteWithoutResponse	4	The characteristic,Äôs value can be written, without a response from t ripheral to indicate that the write was successful.

24.6 class CBDescriptorMBS

24.6.1 class CBDescriptorMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The CoreBluetooth class for a characteristic description.
Notes: CBDescriptor and it subclass CBMutableDescriptor represent a descriptor of a peripheral,Äôs characteristic. CBDescriptor objects in particular represent the descriptors of a remote peripheral,Äôs characteristic (remote peripheral devices are represented by CBPeripheral objects). Descriptors provide further information about a characteristic,Äôs value. For example, they may describe the value in human-readable form and describe how the value should be formatted for presentation purposes. Characteristic descriptors also indicate whether a characteristic,Äôs value is configured on a server (a peripheral) to indicate or notify a client (a central) when the value of the characteristic changes.

There are six predefined types of descriptors that—along with their corresponding value types—are detailed in CBUUID. CBDescriptor lists the predefined types of descriptors and the CBUUIDMBS constants that are used to represent them.

Descriptor type	Descriptor constant
Characteristic extended properties	CBUUIDMBS.CBUUIDCharacteristicExtendedPropertiesString
Characteristic user description	CBUUIDMBS.CBUUIDCharacteristicUserDescriptionString
Client characteristic configuration	CBUUIDMBS.CBUUIDClientCharacteristicConfigurationString
Server characteristic configuration	CBUUIDMBS.CBUUIDServerCharacteristicConfigurationString
Characteristic format	CBUUIDMBS.CBUUIDCharacteristicFormatString
Characteristic aggregate format	CBUUIDMBS.CBUUIDCharacteristicAggregateFormatString

Subclass of the CBAttributeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.6.2 Methods

24.6.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.7 or newer.

24.6.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.6.5 Properties

24.6.6 Characteristic as CBCharacteristicMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The characteristic that this descriptor belongs to.
Notes: (Read only property)

24.6.7 Value as Variant

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The value of the descriptor.
Notes: The value types for the various types of descriptors are detailed in CBUUID.
You can read the value of a descriptor by calling the readValueForDescriptor: method of the CBPeripheral class. You can write the value of a descriptor by calling the writeValue method of the CBPeripheral class. That said, you cannot use the writeValue method to write the value of a client configuration descriptor (CBUUIDClientCharacteristicConfigurationString); instead, you should use the setNotifyValue method of the CBPeripheral class to configure client indications or notifications of a characteristic,Äôs value on a server.
(Read only property)

24.7 class CBL2CAPChannelMBS

24.7.1 class CBL2CAPChannelMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A CBL2CAPChannel represents a live L2CAP connection to a remote device.

24.7.2 Methods

24.7.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on MacOS 10.13.

24.7.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The constructor.

24.7.5 Properties

24.7.6 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

24.7.7 inputStream as NSInputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: An NSStream used for reading data from the remote peer.
Notes: (Read only property)

24.7.8 outputStream as NSOutputStreamMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: An NSStream used for writing data to the peer.
Notes: (Read only property)

24.7.9 peer as CBPeerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The peer connected to the channel.
Notes: (Read only property)

24.7.10 PSM as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The PSM (Protocol/Service Multiplexer) of the channel.
Notes: (Read only property)

24.8 class CBManagerMBS

24.8.1 class CBManagerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The abstract base class for Core Bluetooth manager objects (central and peripheral).
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 19.4pr3

24.8.2 Methods

24.8.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on MacOS 10.13 or newer.

24.8.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.8.5 Properties

24.8.6 authorization as Integer

MBS Bluetooth Plugin, Plugin Version: 19.4, Platform: macOS, Targets: All.

Function: Queries the authorization state.
Notes: Requires MacOS 10.15 or newer.
(Read only property)

24.8.7 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

24.8.8 State as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The state of the manager.
Notes: (Read only property)

24.8.9 Constants

Authorization States

Constant	Value	Description
kAuthorizationStatusAuthorized	3	This app is authorized to share data using Bluetooth services while in background state.
kAuthorizationStatusDenied	2	The user explicitly denied this app from sharing data using Bluetooth serv while in the background state.
kAuthorizationStatusNotDetermined	0	The user has not yet made a choice regarding whether this app can share using Bluetooth services while in the background state.
kAuthorizationStatusRestricted	1	This app is not authorized to share data using Bluetooth services while in background state. The user cannot change this app,Äôs status, possibly to active restrictions such as parental controls being in place.

States

Constant	Value	Description
kStatePoweredOff	4	Bluetooth is currently powered off.
kStatePoweredOn	5	Bluetooth is currently powered on and available to use.
kStateResetting	1	The connection with the system service was momentarily lost, update imminent.
kStateUnauthorized	3	The application is not authorized to use the Bluetooth Low Energy role.
kStateUnknown	0	State unknown, update imminent.
kStateUnsupported	2	The platform doesn't support the Bluetooth Low Energy Central/Client role.

24.9 class CBMutableCharacteristicMBS

24.9.1 class CBMutableCharacteristicMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: CBMutableCharacteristic objects represent the characteristics of a local peripheral,Äôs service (local peripheral devices are represented by CBPeripheralManager objects).
Notes: This class adds write access to many of the properties in the CBCharacteristic class it inherits from.

You use this class to create a characteristic and to set its properties and permissions as desired. After you create a characteristic and add it to a local service, you can publish it (and the service) to the peripheral,Äôs local database using the addService method of the CBPeripheralManager class. After you publish a characteristic, the characteristic is cached and you can no longer make changes to it.
Subclass of the CBCharacteristicMBS class.

24.9.2 Methods

24.9.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on MacOS 10.9 or later.

24.9.4 Constructor(UUID as CBUUIDMBS, properties as Integer, value as MemoryBlock, permissions as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns a newly initialized mutable characteristic with specified permissions, properties, and value.
Notes: UUID: A 128-bit UUID that identifies the characteristic.
properties: The properties of the characteristic.
value: The characteristic value to be cached. If nil, the value is dynamic and will be requested on demand.
permissions: The permissions of the characteristic value.

Returns a newly initialized mutable characteristic.

If you specify a value for the characteristic, the value is cached and its properties and permissions are set to CBCharacteristicPropertyRead and CBAttributePermissionsReadable, respectively. Therefore, if you need the value of a characteristic to be writeable, or if you expect the value to change during the lifetime of the pub-

lished service to which the characteristic belongs, you must specify the value to be nil. So doing ensures that the value is treated dynamically and requested by the peripheral manager whenever the peripheral manager receives a read or write request from a central. When the peripheral manager receives a read or write request from a central, it calls the didReceiveReadRequest or the didReceiveWriteRequests event, respectively.

24.9.5 setDescriptors(Descriptors() as CBDescriptorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Set the list of descriptors that describe the characteristic.
Notes: The value of this property is an array of CBDescriptor objects that represent a characteristic,Äôs descriptors. Characteristic descriptors provide more information about a characteristic,Äôs value. For example, they may describe the value in human-readable form and describe how the value should be formatted for presentation purposes. For more information about characteristic descriptors, see CBDescriptor.

24.9.6 subscribedCentrals as CBDescriptorMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A list of centrals currently subscribed to the characteristic,Äôs value.
Notes: The value of this property is an array of CBCentral objects that are currently subscribed to the characteristic,Äôs value. The array is empty if the characteristic is not configured to support notifications or indications. Even if the characteristic is configured to support notifications or indications, the array is empty if no centrals are currently subscribing to the characteristic,Äôs value.

24.9.7 Properties

24.9.8 permissions as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The permissions of the characteristic value.
Notes: Characteristic permissions represent the read, write, and encryption permissions for a characteristic,Äôs value. For a complete list and discussion of the characteristic permissions that may be set, see constants.
(Read and Write property)

24.9.9 properties as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The properties of the characteristic.
Notes: The properties of a characteristic determine how the characteristic,Äôs value and descriptors can be used and accessed. The characteristic properties CBCharacteristicPropertyBroadcast and CBCharacteristicPropertyExtendedProperties are not allowed for mutable characteristics. That is, you cannot set these properties when you initialize a CBMutableCharacteristic object using the Constructor method. For a list of the possible values representing the properties of a characteristic, see the CBCharacteristicProperties enumeration in CBCharacteristic.
(Read and Write property)

24.9.10 value as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The value of the characteristic.
Notes: This property contains the value of the characteristic. For example, a temperature measurement characteristic of a health thermometer service may have a value that indicates a temperature in Celsius.
(Read and Write property)

24.9.11 Constants

Permissions Flags

Constant	Value	Description
kReadable	1	The characteristic,Äôs value has read-only permission.
kReadEncryptionRequired	4	The characteristic,Äôs value is readable only by trusted devices.
kWriteable	2	The characteristic,Äôs value has write-only permission.
kWriteEncryptionRequired	8	The characteristic,Äôs value is writeable only by trusted devices.

24.10 class CBMutableDescriptorMBS

24.10.1 class CBMutableDescriptorMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: CBMutableDescriptor objects represent the descriptors of a local peripheral,Äôs characteristic (local peripheral devices are represented by CBPeripheralManager objects).
Notes: You use the CBMutableDescriptor class to create a local characteristic descriptor. After you create a descriptor and associate it with a local characteristic, you can publish it (along with the characteristic and local service to which it belongs) to the peripheral,Äôs local database via the addService: method of the CBPeripheralManager class. After you publish a local descriptor, the descriptor is cached and you can no longer make changes to it.
There are six predefined types of descriptors that—along with their corresponding value types—are detailed in CBUUID. That said, only two of these are currently supported when creating local, mutable descriptors: the characteristic user description descriptor and the characteristic format descriptor, represented by the CBUUID constants CBUUIDCharacteristicUserDescriptionString and CBUUIDCharacteristicFormatString, respectively. The system automatically creates the characteristic extended properties descriptor and the client characteristic configuration descriptor, depending on the properties of the characteristic to which the descriptor belongs.
Subclass of the CBDescriptorMBS class.

24.10.2 Methods

24.10.3 Constructor(UUID as CBUUIDMBS, value as variant)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns a newly initialized mutable descriptor with a specified value.
Notes: UUID: A 128-bit UUID that identifies the characteristic. You must use only one of the two currently supported descriptor types: CBUUIDCharacteristicUserDescriptionString or CBUUIDCharacteristicFormatString. For more details about these descriptor types, see CBUUID.

value: The descriptor value to be cached. This value is required (that is, it must not be nil) and cannot be updated dynamically after the descriptor has been published.

Returns a newly initialized mutable descriptor.

The value type of value depends on the type of descriptor.

- The value type of a characteristic user description descriptor (CBUUIDCharacteristicUserDescriptionString) is a string that can be used to provide a human-readable description of the characteristic,Äôs value.

- The value type of a characteristic format descriptor (CBUUIDCharacteristicFormatString) is a memoryblock that can be used to specify how the characteristic,Äôs value should be formatted for presentation purposes.

If you want to create a local characteristic format descriptor, the descriptor,Äôs value must conform to the attribute value of the characteristic format descriptor as defined in the Bluetooth 4.0 specification, Volume 3, Part G, Section 3.3.3.5 (for more information, see Bluetooth 4.0 Characteristic Presentation Format).

24.11 class CBMutableServiceMBS

24.11.1 class CBMutableServiceMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The CBMutableService class adds write access to all of the properties in the CBService class it inherits from.
Notes: You use this class to create a service or an included service on a local peripheral device (represented by a CBPeripheralManager object). After you create a service, you can add it to the peripheral,Äôs local database using the addService method of the CBPeripheralManager class. After you add a service to the peripheral,Äôs local database, the service is cached and you can no longer make changes to it.
Subclass of the CBServiceMBS class.

24.11.2 Methods

24.11.3 Constructor(UUID as CBUUIDMBS, isPrimary as Boolean)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns a newly initialized mutable service specified by UUID and service type.
Notes: UUID: A 128-bit UUID that identifies the service.
isPrimary: A Boolean value indicating whether the type of service is primary or secondary. If the value is true, the type of service is primary. If the value is false, the type of service is secondary.

24.11.4 setCharacteristics(characteristics() as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Sets list of characteristics of a service.
Notes: An array containing CBCharacteristic objects that represent a service,Äôs characteristics. Characteristics provide further details about a peripheral,Äôs service. For example, a heart rate service may contain one characteristic that describes the intended body location of the device,Äôs heart rate sensor and another characteristic that transmits heart rate measurement data.

24.11.5 setIncludedServices(includedServices() as CBServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Sets the list of included services.
Notes: A service of a peripheral may contain a reference to other services that are available on the peripheral. These other services are the included services of the service.

24.12 class CBPeerMBS

24.12.1 class CBPeerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The CBPeer class is an abstract base class that defines common behavior for objects representing remote devices.
Notes: You typically do not create instances of either CBPeer or its concrete subclasses. Instead, the system creates them for you during the process of peer discovery.

Your app running on the local device takes the role of either a central (by creating an instance of CBCentralManager) or a peripheral (by creating an instance of CBPeripheralManager), and interacts through the manager with remote devices in the opposite role. During the process of peer discovery, where a central device scans for peripherals advertising services, the system creates objects from the concrete subclasses of CBPeer to represent discovered remote devices.

The concrete subclasses of CBPeer are:

- CBPeripheralMBS
- CBCentralMBS

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.12.2 Methods

24.12.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS 10.13 or newer.

24.12.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.12.5 copy as CBPeerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates a copy.

24.12.6 Properties

24.12.7 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

24.12.8 identifier as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The UUID associated with the peer.
Notes: The value of this property represents the unique identifier of the peer. The first time a local manager encounters a peer, the system assigns the peer a UUID, represented by a new NSUUID object. Peers are identified by NSUUID UUIDs instead of by the CBUUID objects that identify a peripheral,Äôs services, characteristics, and characteristic descriptors.
(Read only property)

24.13 class CBPeripheralManagerMBS

24.13.1 class CBPeripheralManagerMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The CoreBluetooth peripheral manager class.
Notes: CBPeripheralManager objects are used to manage published services within the local peripheral device,Äôs Generic Attribute Profile (GATT) database and to advertise these services to central devices (represented by CBCentral objects). While a service is in the database, it is visible to, and can be accessed by, any connected central. That said, if your app has not specified the bluetooth-peripheral background mode, the contents of its services become disabled when it is in the background or in a suspended state; any remote central trying to access the service,Äôs characteristic value or characteristic descriptors receives an error.

Before you call CBPeripheralManager methods, the state of the peripheral manager object must be powered on, as indicated by the kStatePoweredOn. This state indicates that the peripheral device (your iPhone or iPad, for instance) supports Bluetooth low energy and that its Bluetooth is on and available to use.
Subclass of the CBManagerMBS class.

24.13.2 Methods

24.13.3 addService(service as CBMutableServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Publishes a service and any of its associated characteristics and characteristic descriptors to the local GATT database.
Notes: service: The service you want to publish.

When you add a service to the database, the peripheral manager calls the didAddService:error event. If the service contains any included services, you must publish them first.

24.13.4 authorizationStatus as integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns the app,Äôs authorization status for sharing data while in the background state.
Notes: A value indicating whether the app is authorized to share data using Bluetooth services while in the background. For a list of the possible values, see constants.

The authorization status of a given app is managed by the system and determined by several factors. Apps

must be explicitly authorized to share data using Bluetooth services while in the background state. The system automatically displays a request for user authorization when your app first attempts to use Bluetooth services to share data.
Calling this method does not prompt the user for access. Instead, you use this method to detect restricted access and simply hide any affected UI features from the user.

Deprecated in MacOS 10.15 in favor of CBManagerMBS' authorization property.

24.13.5 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Checks whether this class is available.
Notes: Returns true for MacOS 10.9 or newer.

24.13.6 CBPeripheralManagerOptionRestoreIdentifierKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the Constructor.
Notes: A string containing a unique identifier (UID) for the peripheral manager that is being instantiated. The system uses this UID to identify a specific peripheral manager. As a result, the UID must remain the same for subsequent executions of the app in order for the peripheral manager to be successfully restored.

24.13.7 CBPeripheralManagerOptionShowPowerAlertKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the Constructor.
Notes: A Boolean value that specifies whether the system should display a warning dialog to the user if Bluetooth is powered off when the peripheral manager is instantiated.
The value for this key is a boolean. If the key is not specified, the default value is false.

24.13.8 CBPeripheralManagerRestoredStateAdvertisementDataKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the constructor.
Notes: A dictionary containing the data that the peripheral manager was advertising at the time the app was terminated by the system.

24.13.9 CBPeripheralManagerRestoredStateServicesKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used to pass options to the constructor.
Notes: An array of CBMutableService objects that contains all of the services that were published to the local peripheral,Äôs database at the time the app was terminated by the system.

24.13.10 Constructor(options as Dictionary = nil)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Initializes the peripheral manager.

24.13.11 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The destructor.

24.13.12 removeAllServices

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Removes all published services from the local GATT database.
Notes: Because the GATT database is shared among apps on the local peripheral device, this method removes only the services that you have added using the addService method. Any services that have been published by other apps on the local peripheral device are not removed from the GATT database.

24.13.13 removeService(service as CBMutableServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Removes a specified published service from the local GATT database.
Notes: service: The service you want to remove.

Because the GATT database is shared among apps on the local peripheral device, more than one instance of a service may exist in the database. As a result, this method removes only the instance of the service that your app added to the database (using the addService method). If the service is included by any other services, you must remove them first.

24.13.14 respondToRequest(request as CBATTRequestMBS, error as integer)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Responds to a read or write request from a connected central.
Notes: request: The read or write request that was received from the connected central. For more information about read and write requests, see CBATTRequest.
result: The result of attempting to fulfill the request. For a list of possible results, see Core Bluetooth Constants.

When the peripheral manager receives a request (represented as a CBATTRequest object) from a connected central to read or write a characteristic,Äôs value, it calls the didReceiveReadRequest or didReceiveWriteRequests event. Each time one of these events is called, you call this method to respond to the corresponding read or write request.

24.13.15 setDesiredConnectionLatency(latency as integer, central as CBCentralMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Sets the desired connection latency for an existing connection to a central device.
Notes: latency: The desired connection latency. For a list of the possible connection latency values that you may set for the peripheral manager, see CBPeripheralManagerConnectionLatency.
central: The central that the peripheral manager is currently connected to.

The latency of a peripheral-central connection controls how frequently messages can be exchanged between the peripheral and the central to which the peripheral is connected. By setting a desired connection latency, you manage the relationship between the frequency with which data is exchanged and the resulting battery performance of the peripheral device. When you call this method to set the connection latency, note that connection latency changes are not guaranteed. And so, the resultant latency may vary. If you do not explicitly set a latency, the connection latency is set to the latency that was chosen by the central device when the connection was first established. Typically, it is not necessary to change the connection latency.

24.13.16 startAdvertising(advertisementData as Dictionary)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you start advertising the local peripheral device,Äôs data.
Notes: error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the startAdvertising method to begin advertising the local peripheral device,Äôs data. If successful, the error parameter is nil. If there is a problem advertising the data, the error parameter returns the cause of the failure.

24.13.17 stopAdvertising

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Stops advertising peripheral manager data.
Notes: Call this method when you no longer want to advertise peripheral manager data.

24.13.18 updateValue(value as MemoryBlock, characteristic as CBMutableCharacteristicMBS, onSubscribedCentrals() as CBCentralMBS = nil) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Sends an updated characteristic value to one or more subscribed centrals, via a notification or indication.
Notes: value: The characteristic value you want to send via a notification or indication.
characteristic: The characteristic whose value has changed.
centrals: A list of centrals (represented by CBCentral objects) that have subscribed to receive updates of the characteristic,Äôs value. If nil, all subscribed centrals are updated. Centrals that have not subscribed to a characteristic,Äôs value are ignored.

Returns true if the update is successfully sent to the subscribed central or centrals. false if the update is not successfully sent because the underlying transmit queue is full.

You use this method to send updates of a characteristic,Äôs value—through a notification or indication—to selected centrals that have subscribed to that characteristic,Äôs value. If the method returns false because the underlying transmit queue is full, the peripheral manager calls the peripheralManagerIsReadyToUpdateSubscribers event when more space in the transmit queue becomes available. After this delegate method is called, you may resend the update.
If the length of the value parameter exceeds the length of the maximumUpdateValueLength property of a subscribed CBCentral, the value parameter is truncated accordingly.

24.13.19 Properties

24.13.20 isAdvertising as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the peripheral is currently advertising data.
Notes: true if the peripheral is currently advertising data as a result of you successfully calling the star-

tAdvertising method. false if the peripheral is not currently advertising data.
(Read only property)

24.13.21 Events

24.13.22 DidAddService(service as CBServiceMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you publish a service, and any of its associated characteristics and characteristic descriptors, to the local Generic Attribute Profile (GATT) database.
Notes: service: The service that was added to the local GATT database.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the addService method to publish a service to the local peripheral,Äôs GATT database. If the service is successfully published to the local database, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.13.23 DidOpenL2CAPChannel(channel as CBL2CAPChannelMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Did open L2CAP channel.

24.13.24 DidPublishL2CAPChannel(PSM as Integer, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: This event is the response to a publishL2CAPChannel call.
Notes: PSM: The PSM of the channel that was published.
error: If an error occurred, the cause of the failure.

The PSM will contain the PSM that was assigned for the published channel

24.13.25 DidReceiveReadRequest(Request as CBATTRequestMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a local peripheral device receives an Attribute Protocol (ATT) read request for a characteristic that has a dynamic value.
Notes: request: A CBATTRequest object that represents a request to read a characteristic,Äôs value.

Each time this method is invoked, you call the respondToRequest method of the CBPeripheralManager class exactly once to respond to the read request.

24.13.26 DidReceiveWriteRequests(requests() as CBATTRequestMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a local peripheral device receives an Attribute Protocol (ATT) write request for a characteristic that has a dynamic value.
Notes: requests: A list of one or more CBATTRequest objects, each representing a request to write the value of a characteristic.

In the same way that you respond to a read request, each time this method is invoked, you call the respondToRequest:withResult: method of the CBPeripheralManager class exactly once. If the requests parameter contains multiple requests, treat them as you would a single request—if any individual request cannot be fulfilled, you should not fulfill any of them. Instead, call the respondToRequest method immediately, and provide a result that indicates the cause of the failure.

When you respond to a write request, note that the first parameter of the respondToRequest method expects a single CBATTRequest object, even though you received an array of them from the didReceiveWriteRequests event. To respond properly, pass in the first request of the requests array.

24.13.27 DidStartAdvertising(error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Adverising did start.
Notes: error: If an error occurred, the cause of the failure.

This event returns the result of a startAdvertising call. If advertisement could not be started, the cause will be detailed in the error parameter.

24.13.28 DidSubscribeToCharacteristic(central as CBCentralMBS, characteristic as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a remote central device subscribes to a characteristic,Äôs value.
Notes: central: The remote central device that subscribed to the characteristic,Äôs value.
characteristic: The characteristic whose value has been subscribed to.

This method is invoked when a remote central device subscribes to the value of one of the local peripheral,Äôs characteristics, by enabling notifications or indications on the characteristic,Äôs value. You should use the invocation of this method as a cue to start sending the subscribed central updates as the characteristic,Äôs value changes. To send updated characteristic values to subscribed centrals, use the updateValue method of the CBPeripheralManager class.

24.13.29 DidUnpublishL2CAPChannel(PSM as Integer, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: This event is the response to a unpublishL2CAPChannel call.
Notes: PSM: The PSM of the channel that was published.
error: If an error occurred, the cause of the failure.

24.13.30 DidUnsubscribeFromCharacteristic(central as CBCentralMBS, characteristic as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a remote central device unsubscribes from a characteristic,Äôs value.
Notes: central: The remote central device that subscribed to the characteristic,Äôs value.
characteristic: The characteristic whose value has been unsubscribed from.

This method is invoked when a remote central device unsubscribes from the value of one of the local peripheral,Äôs characteristics, by disabling notifications or indications on the characteristic,Äôs value. You should use the invocation of this method as a cue to stop sending the subscribed central updates as the characteristic,Äôs value changes.

24.13.31 DidUpdateState

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when the peripheral manager's state is updated.
Notes: You implement this required method to ensure that Bluetooth low energy is supported and available to use on the local peripheral device. Issue commands to the peripheral manager only when the state of the peripheral manager is powered on, as indicated by the kStatePoweredOn constant. A state with a value lower than CBPeripheralManagerStatePoweredOn implies that advertising has stopped and that any connected

centrals have been disconnected. If the state moves below CBPeripheralManagerStatePoweredOff, advertising has stopped and must be explicitly restarted. In addition, the local database is cleared and all services must be explicitly added again. For a complete list and discussion of the possible values representing the state of the peripheral manager, see the CBPeripheralManagerState enumeration in CBPeripheralManager.

24.13.32 IsReadyToUpdateSubscribers

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a local peripheral device is again ready to send characteristic value updates.
Notes: When a call to the updateValue method fails because the underlying queue used to transmit the updated characteristic value is full, the peripheralManagerIsReadyToUpdateSubscribers: method is invoked when more space in the transmit queue becomes available. You can then implement this event to resend the value.

24.13.33 WillRestoreState(dic as dictionary)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when the peripheral manager is about to be restored by the system.
Notes: dict: A dictionary containing information about the peripheral manager that was preserved by the system at the time the app was terminated. For the available keys to this dictionary, see Peripheral Manager State Restoration Options.

For apps that opt in to the state preservation and restoration feature of Core Bluetooth, this is the first method invoked when your app is relaunched into the background to complete some Bluetooth-related task. Use this method to synchronize the state of your app with the state of the Bluetooth system.

24.13.34 Constants

Authorization States

Constant	Value	Description
kAuthorizationStatusAuthorized	3	This app is authorized to share data using Bluetooth services while in background state.
kAuthorizationStatusDenied	2	The user explicitly denied this app from sharing data using Bluetooth serv while in the background state.
kAuthorizationStatusNotDetermined	0	The user has not yet made a choice regarding whether this app can share using Bluetooth services while in the background state.
kAuthorizationStatusRestricted	1	This app is not authorized to share data using Bluetooth services while in background state. The user cannot change this app,Äôs status, possibly to active restrictions such as parental controls being in place.

Latencies

Constant	Value	Description
kConnectionLatencyHigh	2	Extending battery life has priority over rapid communication.
kConnectionLatencyLow	0	Rapid communication has priority over battery life.
kConnectionLatencyMedium	1	A balance exits between communication frequency and battery life.

States

Constant	Value	Description
kStatePoweredOff	4	Bluetooth is currently powered off.
kStatePoweredOn	5	Bluetooth is currently powered on and is available to use.
kStateResetting	1	The connection with the system service was momentarily lost; an update is imminent.
kStateUnauthorized	3	The app is not authorized to use the Bluetooth low energy peripheral/server role.
kStateUnknown	0	The current state of the peripheral manager is unknown; an update is imminent.
kStateUnsupported	2	The platform doesn't support the Bluetooth low energy peripheral/server role.

24.14 class CBPeripheralMBS

24.14.1 class CBPeripheralMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The CBPeripheral class represents remote peripheral devices that your app—by means of a central manager (an instance of CBCentralManager)—has discovered advertising or is currently connected to.
Notes: Peripherals are identified by universally unique identifiers (UUIDs), represented by NSUUID objects. Peripherals may contain one or more services or provide useful information about their connected signal strength.

You use this class to discover, explore, and interact with the services available on a remote peripheral that supports Bluetooth low energy. A service encapsulates the way part of the device behaves. For example, one service of a heart rate monitor may be to expose heart rate data from the monitor,Äôs heart rate sensor. Services themselves are made up of characteristics or included services (references to other services). Characteristics provide further details about a peripheral,Äôs service. For example, the heart rate service just described may contain one characteristic that describes the intended body location of the device,Äôs heart rate sensor and another characteristic that transmits heart rate measurement data. Finally, characteristics contain any number of descriptors that provide more information about the characteristic,Äôs value, such as a human-readable description and a way to format the value.
Subclass of the CBPeerMBS class.

24.14.2 Methods

24.14.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS 10.7 and newer.

24.14.4 Constructor(Peripheral as CBPeripheralMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The constructor.
Notes: You can subclass this class and fill events. Than when you get a Peripheral, you can call this constructor to make a new object of your subclass with the given Peripheral and connect the event.

24.14.5 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The destructor.

24.14.6 discoverCharacteristics(characteristicUUIDs() as CBUUIDMBS = nil, service as CBServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Discovers the specified characteristics of a service.
Notes: characteristicUUIDs: An array of CBUUID objects that you are interested in. Here, each CBUUID object represents a UUID that identifies the type of a characteristic you want to discover.
service: The service whose characteristics you want to discover.

An array of CBUUID objects—representing characteristic UUIDs—can be provided in the characteristicUUIDs parameter. As a result, the peripheral returns only the characteristics of the service that your app is interested in (recommended). If the characteristicUUIDs parameter is nil, all the characteristics of the service are returned; setting the parameter to nil is considerably slower and is not recommended. When the peripheral discovers one or more characteristics of the specified service, it calls the didDiscoverCharacteristicsForService event. If the characteristics of a service are successfully discovered, you can access them through the service,Äôs characteristics property.

24.14.7 discoverDescriptorsForCharacteristic(Characteristic as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Discovers the descriptors of a characteristic.
Notes: characteristic: The characteristic whose descriptors you want to discover.

When the peripheral discovers one or more descriptors of the specified characteristic, it calls the didDiscoverDescriptorsForCharacteristic event. If the descriptors of a characteristic are successfully discovered, you can access them through the characteristic,Äôs descriptors property.

24.14.8 discoverIncludedServices(includedServiceUUIDs() as CBUUIDMBS = nil, service as CBServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Discovers the specified included services of a service.
Notes: includedServiceUUIDs: An array of CBUUID objects that you are interested in. Here, each CBUUID object represents a UUID that identifies the type of included service you want to discover.
service: The service whose included services you want to discover.

You can provide an array of CBUUID objects—representing included service UUIDs—in the includedServiceUUIDs parameter. When you do, the peripheral returns only the included services of the service that your app is interested in (recommended). If the includedServicesUUIDs parameter is nil, all the included services of the service are returned; setting the parameter to nil is considerably slower and is not recommended. When the peripheral discovers one or more included services of the specified service, it calls the didDiscoverIncludedServicesForService event. If the included services of a service are successfully discovered, you can access them through the service's includedServices property.

24.14.9 discoverServices(serviceUUIDs() as CBUUIDMBS = nil)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Discovers the specified services of the peripheral.
Notes: serviceUUIDs: An array of CBUUID objects that you are interested in. Here, each CBUUID object represents a UUID that identifies the type of service you want to discover.

You can provide an array of CBUUID objects—representing service UUIDs—in the serviceUUIDs parameter. When you do, the peripheral returns only the services of the peripheral that your app is interested in (recommended). If the servicesUUIDs parameter is nil, all the available services of the peripheral are returned; setting the parameter to nil is considerably slower and is not recommended. When the peripheral discovers one or more services, it calls the didDiscoverServices event. If the services of the peripheral are successfully discovered, you can access them through the peripheral,Äôs services property.

24.14.10 maximumWriteValueLengthForType(Type as Integer) as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The maximum amount of data, in bytes, that can be sent to a characteristic in a single write type.
Notes: Type can be kWriteWithResponse or kWriteWithoutResponse.

24.14.11 readRSSI

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Retrieves the current RSSI value for the peripheral while it is connected to the central manager.
Notes: In macOS, when you call this method to retrieve the RSSI of the peripheral while it is currently

connected to the central manager, the peripheral calls the peripheralDidUpdateRSSI event. If the RSSI value of the peripheral is successfully retrieved, you can access it through the peripheral,Äôs RSSI property.

24.14.12 readValueForCharacteristic(Characteristic as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Retrieves the value of a specified characteristic.
Notes: characteristic: The characteristic whose value you want to read.

When you call this method to read the value of a characteristic, the peripheral calls the peripheral:didUpdateValueForCharacteristic:error: method of its delegate object. If the value of the characteristic is successfully retrieved, you can access it through the characteristic,Äôs value property.
Not all characteristics are guaranteed to have a readable value. You can determine whether a characteristic,Äôs value is readable by accessing the relevant properties of the CBCharacteristicProperties enumeration, which are detailed in CBCharacteristic.

24.14.13 readValueForDescriptor(descriptor as CBDescriptorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Retrieves the value of a specified characteristic descriptor.
Notes: descriptor: The characteristic descriptor whose value you want to read.

When you call this method to read the value of a characteristic descriptor, the peripheral calls the didUpdateValueForDescriptor event. If the value of the characteristic descriptor is successfully retrieved, you can access it through the characteristic descriptor,Äôs value property.

24.14.14 services as CBServiceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A list of services on the peripheral that have been discovered.
Notes: Returns an array of services (represented by CBService objects) that were discovered on the peripheral through a successful call to the discoverServices method. If you have yet to call the discoverServices method to discover the services of the peripheral, or if there was an error in doing so, the value of this property is nil.

24.14.15 setNotifyValue(enabled as Boolean, Characteristic as CBCharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Sets notifications or indications for the value of a specified characteristic.
Notes: enabled: A Boolean value indicating whether you wish to receive notifications or indications whenever the characteristic,Äôs value changes. true if you want to enable notifications or indications for the characteristic,Äôs value. false if you do not want to receive notifications or indications whenever the characteristic,Äôs value changes.

characteristic: The specified characteristic.

When you enable notifications for the characteristic,Äôs value, the peripheral calls the didUpdateNotificationStateForCharacteristic event to indicate whether or not the action succeeded. If successful, the peripheral then calls the didUpdateValueForCharacteristic event whenever the characteristic value changes. Because it is the peripheral that chooses when to send an update, your app should be prepared to handle them as long as notifications or indications remain enabled. If the specified characteristic is configured to allow both notifications and indications, calling this method enables notifications only. You can disable notifications and indications for a characteristic,Äôs value by calling this method with the enabled parameter set to false.

24.14.16 writeValue(data as MemoryBlock, Characteristic as CBCharacteristicMBS, Type as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Writes the value of a characteristic.
Notes: data: The value to be written.
characteristic: The characteristic whose value is to be written.
type: The type of write to be executed. For a list of the possible types of writes to a characteristic,Äôs value, see CBCharacteristicWriteType.

When you call this method to write the value of a characteristic, the peripheral calls the didWriteValueForCharacteristic event only if you specified the write type as CBPeripheralMBS.kWriteWithResponse. The response you receive through the didWriteValueForCharacteristic event indicates whether the write was successful; if the write failed, it details the cause of the failure in an error. If you specify the write type as CBCharacteristicWriteWithoutResponse, the write is best-effort and not guaranteed. If the write does not succeed in this case, you are not notified nor do you receive an error indicating the cause of the failure. The data passed into the data parameter is copied, and you can dispose of it after the method returns.
Characteristics may allow only certain type of writes to be performed on their value. To determine which types of writes are permitted to a characteristic,Äôs value, you access the relevant properties of the CBCharacteristicProperties enumeration, which are detailed in CBCharacteristic.
See also:

• 24.14.17 writeValue(data as MemoryBlock, Descriptor as CBDescriptorMBS) 4308

24.14.17 writeValue(data as MemoryBlock, Descriptor as CBDescriptorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Writes the value of a characteristic descriptor.
Notes: data: The value to be written.
descriptor: The descriptor whose value is to be written.

When you call this method to write the value of a characteristic descriptor, the peripheral calls the peripheral:didWriteValueForDescriptor:error: method of its delegate object. The data passed into the data parameter is copied, and you can dispose of it after the method returns.
You cannot use this method to write the value of a client configuration descriptor (represented by the CBUUIDClientCharacteristicConfigurationString constant), which describes how notification or indications are configured for a characteristic,Äôs value with respect to a client. If you want to manage notifications or indications for a characteristic,Äôs value, you must use the setNotifyValue method instead.

- 24.14.16 writeValue(data as MemoryBlock, Characteristic as CBCharacteristicMBS, Type as Integer) 4307

24.14.18 Properties

24.14.19 CanSendWriteWithoutResponse as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: True if the remote device has space to send a write without response.
Notes: If this value is false, the value will be set to true after the current writes have been flushed, and IsReadyToSendWriteWithoutResponse event will be called.
(Read only property)

24.14.20 Name as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The name of the peripheral.
Notes: The value of this property is a string containing the device name of the peripheral. You can access this property to retrieve a human-readable name of the peripheral. There may be two types of names associated with a peripheral: one that the device advertises and another that the device publishes in its database as its Bluetooth low energy Generic Access Profile (GAP) device name. Although this property may contain either type of name, the GAP device name takes priority. This means that if a peripheral has both types of names associated with it, this property returns its GAP device name.

(Read only property)

24.14.21 RSSI as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The RSSI, in decibels, of the peripheral.
Notes: Returns a number, in decibels, that indicates the RSSI of the peripheral while it is currently connected to the central manager. You can use a connected peripheral,Äôs RSSI property to determine the peripheral,Äôs proximity. The default value of this property is nil and is set the first time you successfully call the readRSSI method.
(Read only property)

24.14.22 State as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The current connection state of the peripheral.
Notes: The value of this property represents the current connection state of the peripheral. For a list of the possible values of this property, see CBPeripheralState.
(Read only property)

24.14.23 Events

24.14.24 DidDiscoverCharacteristicsForService(service as CBServiceMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you discover the characteristics of a specified service.
Notes: peripheral: The peripheral providing this information.
service: The service that the characteristics belong to.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the discoverCharacteristics method. If the characteristics of the specified service are successfully discovered, you can access them through the service's characteristics property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.25 DidDiscoverDescriptorsForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you discover the descriptors of a specified characteristic.
Notes: peripheral: The peripheral providing this information.
characteristic: The characteristic that the characteristic descriptors belong to.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the discoverDescriptorsForCharacteristic method. If the characteristic descriptors of the specified characteristic are successfully discovered, you can access them through the characteristic,Äôs descriptors property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.26 DidDiscoverIncludedServicesForService(service as CBServiceMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you discover the included services of a specified service.
Notes: peripheral: The peripheral providing this information.
service: The CBService object containing the included service.
error: If an error occurred, the cause of the failure.

This event is invoked when you app calls the discoverIncludedServices method. If the included services of the specified service are successfully discovered, you can access them through the service,Äôs includedServices property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.27 DidDiscoverServices(error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you discover the peripheral,Äôs available services.
Notes: peripheral: The peripheral that the services belong to.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the discoverServices method. If the services of the peripheral are successfully discovered, you can access them through the peripheral,Äôs services property. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.28 DidModifyServices(invalidatedServices() as CBServiceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a peripheral,Äôs services have changed.
Notes: invalidatedServices: A list of services that have been invalidated.

This method is invoked whenever one or more services of a peripheral have changed. A peripheral,Äôs services have changed if:

- A service is removed from the peripheral,Äôs database
- A new service is added to the peripheral,Äôs database
- A service that was previously removed from the peripheral,Äôs database is readded to the database at a different location

If you previously discovered any of the services that have changed, they are provided in the invalidatedServices parameter and can no longer be used. You can use the discoverServices method to discover any new services that have been added to the peripheral,Äôs database or to find out whether any of the invalidated services that you were using (and want to continue using) have been added back to a different location in the peripheral,Äôs database.

24.14.29 DidOpenL2CAPChannel(channel as CBL2CAPChannelMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Called when channel is opened.

24.14.30 DidReadRSSI(RSSI as String, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked after you call readRSSI to retrieve the value of the peripheral,Äôs current RSSI while it is connected to the central manager.
Notes: peripheral: The peripheral providing this information.
RSSI: The RSSI, in decibels, of the peripheral.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the readRSSI method. If successful, the error parameter is nil and the parameter RSSI reports the receiver,Äôs signal strength, in decibels. If unsuccessful, the error parameter returns the cause of the failure.

24.14.31 DidUpdateName

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when a peripheral,Äôs name changes.
Notes: The event is invoked whenever the peripheral device,Äôs Generic Access Profile (GAP) device name has changed. Since a peripheral device can change its GAP device name, you can implement this method if your app needs to display the current name of the peripheral device.

24.14.32 DidUpdateNotificationStateForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when the peripheral receives a request to start or stop providing notifications for a specified characteristic,Äôs value.
Notes: characteristic: The characteristic for which notifications of its value are to be configured.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the setNotifyValue method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.33 DidUpdateRSSI(error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you retrieve the value of the peripheral,Äôs current RSSI while it is connected to the central manager.
Notes: error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the readRSSI method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.34 DidUpdateValueForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you retrieve a specified characteristic,Äôs value, or when the peripheral device notifies your app that the characteristic,Äôs value has changed.
Notes: peripheral: The peripheral providing this information.
characteristic: The characteristic whose value has been retrieved.

error: If an error occurred, the cause of the failure.

This method is invoked when your app calls the readValueForCharacteristic: method, or when the peripheral notifies your app that the value of the characteristic for which notifications and indications are enabled (via a successful call to setNotifyValue for Characteristic) has changed. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.35 DidUpdateValueForDescriptor(descriptor as CBDescriptorMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you retrieve a specified characteristic descriptor,Äôs value.
Notes: peripheral: The peripheral providing this information.
descriptor: The characteristic descriptor whose value has been retrieved.
error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the readValueForDescriptor method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.36 DidWriteValueForCharacteristic(characteristic as CBCharacteristicMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you write data to a characteristic,Äôs value.
Notes: peripheral: The peripheral providing this information.
characteristic: The characteristic whose value has been written.
error: If an error occurred, the cause of the failure.

This event is invoked only when your app calls the writeValue for Characteristic method with the CBCharacteristicWriteWithResponse constant specified as the write type. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.37 DidWriteValueForDescriptor(descriptor as CBDescriptorMBS, error as NSErrorMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Invoked when you write data to a characteristic descriptor,Äôs value.
Notes: descriptor: The characteristic descriptor whose value has been written.

error: If an error occurred, the cause of the failure.

This event is invoked when your app calls the writeValue for Descriptor method. If successful, the error parameter is nil. If unsuccessful, the error parameter returns the cause of the failure.

24.14.38 IsReadyToSendWriteWithoutResponse

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The peripheral providing this update..
Notes: This event is invoked after a failed call to writeValue for Characteristic, when peripheral is again ready to send characteristic value updates.

24.14.39 Constants

Constants

Constant	Value	Description
kWriteWithoutResponse	1	One of the constants to specify which type of write is to be performed on a CBCharacteristic. Writes without response.
kWriteWithResponse	0	One of the constants to specify which type of write is to be performed on a CBCharacteristic. Write with Response.

States

Constant	Value	Description
kStateConnected	2	The peripheral is currently connected to the central manager.
kStateConnecting	1	The peripheral is currently in the process of connecting to the central manager.
kStateDisconnected	0	The peripheral is currently not connected to the central manager.
kStateDisconnecting	3	The peripheral is currently in the process of disconnecting from the central manager.

24.15 class CBServiceMBS

24.15.1 class CBServiceMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The class for a service.
Notes: CBService and its subclass CBMutableService represent a peripheral,Äôs service—a collection of data and associated behaviors for accomplishing a function or feature of a device (or portions of that device). CBService objects in particular represent services of a remote peripheral device (represented by a CBPeripheral object). Services are either primary or secondary and may contain a number of characteristics or included services (references to other services).
Subclass of the CBAttributeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.15.2 Methods

24.15.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.7 or newer.

24.15.4 characteristics as CBCharacteristicMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A list of characteristics that have been discovered in this service.
Notes: This array contains CBCharacteristic objects that represent a service,Äôs characteristics. Characteristics provide further details about a peripheral,Äôs service. For example, a heart rate service may contain one characteristic that describes the intended body location of the device,Äôs heart rate sensor and another characteristic that transmits heart rate measurement data.

24.15.5 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.15.6 includedServices as CBServiceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A list of included services that have been discovered in this service.
Notes: This array contains CBService objects that represent the included services of a service. A service of a peripheral may contain a reference to other services that are available on the peripheral. These other services are the included services of the service and can be discovered using the discoverIncludedServices method of the CBPeripheral class.

24.15.7 Properties

24.15.8 isPrimary as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the type of service is primary or secondary.
Notes: A peripheral,Äôs service is either primary or secondary. A primary service describes the primary function of a device and can be included by another service. A secondary service describes a service that is relevant only in the context of another service that has referenced it. For example, the primary service of a heart rate monitor may be to expose heart rate data from the monitor,Äôs heart rate sensor, whereas a secondary service may be to expose the sensor,Äôs battery data. If the value of this property is true, the type of service is primary. If the value of this property is false, the type of service is secondary.
(Read only property)

24.15.9 peripheral as CBPeripheralMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The peripheral to which this service belongs.
Notes: (Read only property)

24.16 class CBUUIDMBS

24.16.1 class CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The class for UUIDs in CoreBluetooth.
Notes: Instances of the CBUUID class represent the 128-bit universally unique identifiers (UUIDs) of attributes used in Bluetooth low energy communication, such as a peripheral,Äôs services, characteristics, and characteristic descriptors. This class provides a number of factory methods for dealing with long UUIDs when developing your app. For example, instead of passing around the string representation of a 128-bit Bluetooth low energy attribute in your code, you can create a CBUUID object that represents it, and pass that around instead.

Though not all UUIDs that identify Bluetooth-specific attributes are predefined by the Bluetooth Special Interest Group (SIG), Bluetooth SIG has defined and published a number of commonly used UUIDs that have been shortened to 16-bits or 32-bits for convenience. The CBUUID class provides methods that automatically transform these predefined shorter UUIDs into their 128-bit equivalent UUIDs. When you create a CBUUID object from a predefined 16-bit or 32-bit UUID, Core Bluetooth pre-fills the rest of the 128-bit UUID with the Bluetooth base UUID, which is defined in the Bluetooth 4.0 specification, Volume 3, Part F, Section 3.2.1.
In addition to providing methods for creating CBUUID objects, this class defines constants that represent the UUIDs of the Bluetooth-defined characteristic descriptors, which are defined in the Bluetooth 4.0 specification, Volume 3, Part G, Section 3.3.3.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.16.2 Methods

24.16.3 Available as boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns treu on macOS 10.7 or newer.

24.16.4 CBAdvertisementDataIsConnectable as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: A Boolean value that indicates whether the advertising event type is connectable.
The value for this key is a boolean. You can use this value to determine whether a peripheral is connectable at a particular moment.

24.16.5 CBAdvertisementDataLocalNameKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: A string containing the local name of a peripheral.

24.16.6 CBAdvertisementDataManufacturerDataKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: A memoryblock containing the manufacturer data of a peripheral.

24.16.7 CBAdvertisementDataOverflowServiceUUIDsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: An array of one or more CBUUID objects, representing CBService UUIDs that were found in the ,Äúoverflow,Äù area of the advertisement data.
Due to the nature of the data stored in this area, UUIDs listed here are ,Äúbest effort,Äù and may not always be accurate. For details about the overflow area of advertisement data, see the startAdvertising: method in CBPeripheralManager.

24.16.8 CBAdvertisementDataServiceDataKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: A dictionary containing service-specific advertisement data.
The keys are CBUUID objects, representing CBService UUIDs. The values are NSData objects, representing service-specific data.

24.16.9 CBAdvertisementDataServiceUUIDsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: An array of service UUIDs.

24.16.10 CBAdvertisementDataSolicitedServiceUUIDsKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: An array of one or more CBUUID objects, representing CBService UUIDs.

24.16.11 CBAdvertisementDataTxPowerLevelKey as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the keys used in an advertisementData dictionary.
Notes: A number containing the transmit power of a peripheral.
This key and value are available if the broadcaster (peripheral) provides its Tx power level in its advertising packet. Using the RSSI value and the Tx power level, it is possible to calculate path loss.

24.16.12 CBUUIDCharacteristicAggregateFormatString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The string representation of the UUID for the aggregate descriptor.

24.16.13 CBUUIDCharacteristicExtendedPropertiesString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The string representation of the UUID for the extended properties descriptor.
Notes: The corresponding value for this descriptor is a number.

24.16.14 CBUUIDCharacteristicFormatString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The string representation of the UUID for the presentation format descriptor.
Notes: The corresponding value for this descriptor is a memoryblock.

24.16.15 CBUUIDCharacteristicUserDescriptionString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The string representation of the UUID for the user description descriptor.
Notes: The corresponding value for this descriptor is a string.

24.16.16 CBUUIDCharacteristicValidRangeString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The string representation of the UUID for the valid range descriptor.

24.16.17 CBUUIDClientCharacteristicConfigurationString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The string representation of the UUID for the client configuration descriptor.
Notes: The corresponding value for this descriptor is a number.

24.16.18 CBUUIDL2CAPPSMCharacteristicString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: One of the characteristics keys.
Notes: The PSM (a little endian uint16_t) of an L2CAP Channel associated with the GATT service containing this characteristic. Servers can publish this characteristic with the UUID ABDD3056-28FA-441D-A470-55A75A52553A

24.16.19 CBUUIDServerCharacteristicConfigurationString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The string representation of the UUID for the server configuration descriptor.
Notes: The corresponding value for this descriptor is a number.

24.16.20 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

24.16.21 copy as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

24.16.22 isEqual(other as CBUUIDMBS) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Checks whether two UUIDs are equal.
Notes: Returns true if both are equal.

24.16.23 Operator_Compare(other as CBUUIDMBS) as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Compares two objects for Xojo's comparison operators.

24.16.24 UUIDWithData(mem as MemoryBlock) as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns a CBUUID object from a 16-bit, 32-bit, or 128-bit UUID data container.
Notes: This method is useful when the UUID of a Bluetooth attribute is formatted in raw bytes.

24.16.25 UUIDWithNSUUID(uuid as NSUUIDMBS) as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns a CBUUID object from an NSUUID object.

24.16.26 UUIDWithString(s as string) as CBUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns a CBUUID object from a 16-bit, 32-bit, or 128-bit UUID string.
Notes: Specify 128-bit UUIDs as a string of hexadecimal digits punctuated by hyphens, for example, 68753A44-4D6F-1226-9C60-0050E4C00067. Specify 16-bit or 32-bit UUIDs as a string of 4 or 8 hexadecimal digits, respectively.

24.16.27 Properties

24.16.28 data as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The data of the UUID.
Notes: (Read only property)

24.16.29 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

24.16.30 UUIDString as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The UUID represented as a string.
Notes: (Read only property)

24.17 class IOBluetoothDeviceInquiryMBS

24.17.1 class IOBluetoothDeviceInquiryMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Object representing a device inquiry that finds Bluetooth devices in-range of the computer, and (optionally) retrieves name information for them.
Notes: You should only use this object if your application needs to know about in-range devices and cannot use the GUI provided by the IOBluetoothUI framework. It will not let you perform unlimited back-to-back inquiries, but will instead throttle the number of attempted inquiries if too many are attempted within a small window of time.

Important Note: DO NOT perform remote name requests on devices from events or while this object is in use. If you wish to do your own remote name requests on devices, do them after you have stopped this object. If you do not heed this warning, you could potentially deadlock your process.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.17.2 Methods

24.17.3 clearFoundDevices

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes all found devices from the inquiry object.

24.17.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an inquiry object.
Notes: The inquiry is not automatically started. You musts call start on it to start the search for in-range devices.

24.17.5 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

24.17.6 foundDevices as IOBluetoothDeviceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns found IOBluetoothDevice objects as an array.
Notes: Will not return nil. If there are no devices found, returns an array with length of 0.

24.17.7 setSearchCriteria(ServiceClassMajor as Integer, MajorDeviceClass as Integer, MinorDeviceClass as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Use this method to set the criteria for the device search.
Notes: inServiceClassMajor: Set the major service class for found devices. Set to kBluetoothServiceClassMajorAny for all devices. See BluetoothAssignedNumbers.h for possible values.
inMajorDeviceClass: Set the major device class for found devices. Set to kBluetoothDeviceClassMajorAny for all devices. See BluetoothAssignedNumbers.h for possible values.
inMinorDeviceClass: Set the minor device class for found devices. Set to kBluetoothDeviceClassMinorAny for all devices. See BluetoothAssignedNumbers.h for possible values.

The default inquiry object will search for all types of devices. If you wish to find only keyboards, for example, you might use this method like this:

setSearchCriteria(kBluetoothServiceClassMajorAny, kBluetoothDeviceClassMajorPeripheral, kBluetoothDeviceClassMinorPeripheral1Keyboard)

However, we recommend only using this if you are certain of the device class you are looking for, as some devices may report a different/unexpected device class, and the search may miss the device you are interested in.

24.17.8 Start

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tells inquiry object to begin the inquiry and name updating process, if specified.
Notes: Sets lasterror to kIOReturnSuccess if start was successful. Returns kIOReturnBusy if the object is already in process. May return other IOReturn values, as appropriate.

Calling start multiple times in rapid succession or back-to-back will probably not produce the intended results. Inquiries are throttled if they are called too quickly in succession.

24.17.9 Stop

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Halts the inquiry object.
Notes: Could either stop the search for new devices, or the updating of found device names.

Lasterror is set to kIOReturnSuccess if the inquiry is successfully stopped. Or set to kIOReturnNotPermitted if the inquiry object is already stopped. May set other IOReturn values, as appropriate.

24.17.10 Properties

24.17.11 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.17.12 inquiryLength as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The length of the inquiry that is performed each time start is used on an inquiry object.
Notes: seconds: Number of seconds the inquiry will search for in-range devices before refreshing device names, if specified.

Returns number of seconds the search will be performed.

A default of 10 seconds is used, unless a different value is specified using this method. Note that if you have called -start again too quickly, your inquiry may actually take much longer than what length you specify, as inquiries are throttled in the system. Also note that if you have the inquiry object updating device names for you, the whole inquiry process could be much longer than the specified length, depending on the number of devices found and how responsive to name requests they are. If you -must- have a strict inquiry length, disable name updates. In other words, this ”length” only refers to the actual device discovery portion of the whole inquiry process.
(Read and Write property)

24.17.13 Lasterror as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

24.17.14 searchType as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The devices that are found.
Notes: searchType: Bluetooth versions the search will discover.

A default of kIOBluetoothDeviceSearchClassic is used, unless a different value is specified using this property.
(Read and Write property)

24.17.15 updateNewDeviceNames as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether or not the inquiry object will retrieve the names of devices found during the search.
Notes: Pass true if names are to be updated, otherwise pass false.
The default value for the inquiry object is true, unless this property is used to change it.
(Read and Write property)

24.17.16 Events

24.17.17 Complete(error as Integer, aborted as Boolean)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Inquiry is stopped.
Notes: error: Error code. kIOReturnSuccess if the inquiry completed without incident.
aborted: True if user called stop on the inquiry.

When the inquiry is completely stopped, this delegate method will be invoked. It will supply an error code value, kIOReturnSuccess if the inquiry stopped without problem, otherwise a non-kIOReturnSuccess error code will be supplied.

24.17.18 DeviceFound(device as IOBluetoothDeviceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A new device has been found.
Notes: You do not need to retain the device - it will be held in the internal storage of the inquiry, and can be accessed later using foundDevices.

24.17.19 DeviceNameUpdated(device as IOBluetoothDeviceMBS, devicesRemaining as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A device name has been retrieved.
Notes: Also indicates how many devices are left to be updated.

device: IOBluetoothDevice that was updated.
devicesRemaining: Number of devices remaining to update.

24.17.20 Started

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: This event will be delivered when the inquiry actually starts.
Notes: Since the inquiry could be throttled, this message may not be received immediately after called -start.

24.17.21 UpdatingDeviceNamesStarted(devicesRemaining as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The inquiry has begun updating device names that were found during the search.
Notes: devicesRemaining: Number of devices remaining to update.

24.17.22 Constants

Search Types

Constant	Value	Description
kIOBluetoothDeviceSearchClassic	1	Normal Bluetooth
kIOBluetoothDeviceSearchLE	2	Bluetooth LE

24.18 class IOBluetoothDeviceMBS

24.18.1 class IOBluetoothDeviceMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An instance of IOBluetoothDevice represents a single remote Bluetooth device.
Notes: An IOBluetoothDevice object may exist independent of the existence of a baseband connection with the target device. Using this object, a client can request creation and destruction of baseband connections, and request the opening of L2CAP and RFCOMM channels on the remote device. Many of the other APIs in the IOBluetooth framework will return this object, or it's C counterpart (IOBluetoothDeviceRef).
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4
- Bluetooth for Xojo

24.18.2 Methods

24.18.3 addToFavorites

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds the target device to the user's favorite devices list.
Notes: Lasterror is set to kIOReturnSuccess if the device was successfully added to the user's list of favorite devices.

24.18.4 closeConnection

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Close down the baseband connection to the device.
Notes: Lasterror is set to kIOReturnSuccess if the connection has successfully been closed.

This method is synchronous and will not return until the connection has been closed (or the command failed). In the future this API will be changed to allow asynchronous operation.

24.18.5 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

24.18.6 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

24.18.7 deviceWithAddressString(Address as String) as IOBluetoothDeviceMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the IOBluetoothDevice object for the given BluetoothDeviceAddress.
Notes: Within a single application, there will be only one instance of IOBluetoothDevice for a given remote device address.
The string should be of the form xx:xx:xx:xx:xx:xx

24.18.8 favoriteDevices as IOBluetoothDeviceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets an array of the user's favorite devices.
Notes: Returns an array of device objects representing the user's favorite devices. If the user has no favorites, nil is returned.

24.18.9 openConnection

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create a baseband connection to the device.
Notes: Lasterror is set to kIOReturnSuccess if the connection was successfully created.

This method is synchronous and will not return until either a connection has been established or the create connection has failed (perhaps timed out).

If authentication or a non-default page timeout is required the method openConnectionAsync() should be used instead.

As of OS X 10.7, this method will no longer mask out "Connection Exists" 'errors' with a success result

code; your code must account for the cases where the baseband connection is already open.

24.18.10 openConnectionAsync

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create a baseband connection to the device.
Notes: Sets lasterror to kIOReturnSuccess if the connection was successfully created (or if asynchronous, if the CREATE_CONNECTION command was successfully issued).

The open connection call is asynchronous and on completion of the CREATE_CONNECTION command, the connectionCompleted event will be called on the specified target. If no target is specified, the call is synchronous and will not return until the connection is open or the CREATE_CONNECTION call has failed. This call with proceed without authentication required, and using the default page timeout value. If authentication or a non-default page timeout is required the method openConnectionAsync() with timeout should be used instead.

As of OS X 10.7, this method will no longer mask out "Connection Exists" 'errors' with a success result code; your code must account for the cases where the baseband connection is already open.
See also:

- 24.18.11 openConnectionAsync(timeout as integer, authenticationRequired as boolean) 4330

24.18.11 openConnectionAsync(timeout as integer, authenticationRequired as boolean)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create a baseband connection to the device with timeout.
Notes: Sets lasterror to kIOReturnSuccess if the connection was successfully created (or if asynchronous, if the CREATE_CONNECTION command was successfully issued).

The open connection call is asynchronous and on completion of the CREATE_CONNECTION command, the connectionCompleted event will be called on the specified target. If no target is specified, the call is synchronous and will not return until the connection is open or the CREATE_CONNECTION call has failed.

As of OS X 10.7, this method will no longer mask out "Connection Exists" 'errors' with a success result code; your code must account for the cases where the baseband connection is already open.
See also:

- 24.18.10 openConnectionAsync 4330

24.18.12 pairedDevices as IOBluetoothDeviceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets an array of all of the paired devices on the system.
Notes: Returns an array of device objects for all of the paired devices on the system. If there are no paired devices, nil is returned.

The paired devices are currently NOT stored per user, so this is all devices paired by any user.

24.18.13 performSDPQuery

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs an SDP query on the target device.
Notes: Lasterror is set to kIOReturnSuccess if the SDP query was successfully started.

As a result of this call, a baseband connection will be built to the device (if not already connected). Then, an L2CAP channel will be opened to the SDP server on the device. At that point, a Service Search Attribute request will be issued with a UUID of 0x0100 (L2CAP) and an attribute range of 0 - &hffff specified. This will cause the SDP server to return all attributes of all L2CAP-derived services on the device. The results essentially encompass all services on the device. This function is always asynchronous.

When the SDP query is complete (or an error is encountered), the SDPQueryCompleted event will be called.

24.18.14 recentDevices(numDevices as Integer = 0) as IOBluetoothDeviceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets an array of recently used Bluetooth devices.
Notes: numDevices: The number of devices to return.

Returns an array of device objects recently used by the system. If no devices have been accessed, nil is returned.

The resulting array contains IOBluetoothDevice objects sorted in reverse chronological order. The most recently accessed devices are first. If the numDevices parameter is 0, all devices accessed by the system are returned. If numDevices is non-zero, only the most recent devices are returned.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.18.15 remoteNameRequest

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Issues a remote name request to the target device.
Notes: Lasterror is set to kIOReturnSuccess if the remote name request was successfully issued (and if synchronous, if the request completed successfully).

Later remoteNameRequestCompleted is called with result.

This call with operate with the default page timeout value. If a different page timeout value is desired, please pass pageTimeoutValue parameter.
See also:

- 24.18.16 remoteNameRequest(pageTimeoutValue as Integer) 4332

24.18.16 remoteNameRequest(pageTimeoutValue as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Issues a remote name request to the target device.
Notes: Lasterror is set to kIOReturnSuccess if the remote name request was successfully issued (and if synchronous, if the request completed successfully).

Later remoteNameRequestCompleted is called with result.

This call with operate with the default page timeout value. If a different page timeout value is desired, please pass pageTimeoutValue parameter.
See also:

- 24.18.15 remoteNameRequest 4332

24.18.17 removeFromFavorites

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the target device from the user's favorite devices list.
Notes: Lasterror is set to kIOReturnSuccess if the device was successfully removed from the user's list of favorite devices.

This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.18.18 requestAuthentication

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Requests that the existing baseband connection be authenticated.
Notes: Returns kIOReturnSuccess if the connection has been successfully been authenticated. Returns an error if authentication fails or no baseband connection exists.

In order to authenticate a baseband connection, a link key needs to be generated as a result of the pairing process. This call will synchronously initiate the pairing process with the target device and not return until the authentication process is complete. This API will be updated to allow for asynchronous operation.

24.18.19 SendL2CAPEchoRequest(Data as MemoryBlock)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Send an echo request over the L2CAP connection to a remote device.
Notes: data: Buffer to send.

Lasterror is set to kIOReturnSuccess if the echo request was able to be sent.

The current implementation returns when the request has been sent, but does not indicate when a response is received. Also, the baseband connection must be up for the echo request to be sent. In the future, this method will also open the connection if necessary. The API will be updated to allow the client to be informed when the echo response has been received (both synchronously and asynchronously).

24.18.20 ServiceRecordForUUID(sdpUUID as IOBluetoothSDPUUIDMBS) as IOBluetoothSDPServiceRecordMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Search for a service record containing the given UUID.
Notes: sdpUUID: UUID value to search for.

Returns the first service record that contains the given uuid. If no service record is found, nil is returned.

This method searches through the device's services to find a service that contains the given UUID. Only the first service record will be returned. This method only operates on services that have already been queried. It will not initiate a new query. This method should probably be updated to return an array of service records if more than one contains the UUID.

24.18.21 services as IOBluetoothSDPServiceRecordMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets an array of service records for the device.
Notes: Returns an array of service records for the device if an SDP query has been performed. If no SDP query has been performed, nil is returned.

The resulting array contains IOBluetoothSDPServiceRecord objects. The service records are only present if an SDP query has been done on the target object. This can be determined by calling LastServicesUpdate. It will return the last date/time of the SDP query. To initiate an SDP query on a device, use performSDP-Query: as defined above.
Instead of allowing individual clients to query for different services and service attributes, the system request all of the device's services and service attributes.

24.18.22 setSupervisionTimeout(timeout as integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the connection supervision timeout.
Notes: timeout: A client-supplied link supervision timeout value to use to monitor the connection. The timeout value should be specified in slots, so you can use the BluetoothGetSlotsFromSeconds macro to get the proper value. e.g. BluetoothGetSlotsFromSeconds(5.0) will give yield the proper number of slots (8000) for 5 seconds.

Sets lasterror to kIOReturnSuccess if it was possible to set the connection supervision timeout.

This method is only available in macOS 10.5 (Bluetooth v2.0) or later.

24.18.23 Properties

24.18.24 addressString as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the Bluetooth device address for the target device.
Notes: (Read only property)

24.18.25 classOfDevice as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the full class of device value for the remote device.
Notes: This value is only meaningful if the target device has been seen during an inquiry. This can be by checking the result of LastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.26 ClockOffset as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the clock offset value of the device.
Notes: This value is only meaningful if the target device has been seen during an inquiry. This can be by checking the result of LastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.27 deviceClassMajor as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the major device class of the device.
Notes: This value is only meaningful if the target device has been seen during an inquiry. This can be by checking the result of LastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.28 deviceClassMinor as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the minor service class of the device.
Notes: This value is only meaningful if the target device has been seen during an inquiry. This can be by checking the result of LastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.29 EncryptionMode as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the encryption mode for the baseband connection.
Notes: Returns the encryption mode for the baseband connection. If no baseband connection is present, kEncryptionDisabled is returned.

This method only returns a valid result if a baseband connection is present (isConnected returns true).
(Read only property)

24.18.30 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.18.31 isConnected as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether a baseband connection to the device exists.
Notes: Returns true if a baseband connection to the device exists.
(Read only property)

24.18.32 isFavorite as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Reports whether the target device is a favorite for the user.
Notes: Returns true if the target device is a favorite for the user, false if not.
(Read only property)

24.18.33 isIncoming as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the device connection was generated by the remote host.
Notes: Returns true if the device connection was generated by the remote host. False if the connection was generated by some other device that connected to the local host.
(Read only property)

24.18.34 isPaired as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the target device is paired.
Notes: Returns true if the target device is paired, false if not.
(Read only property)

24.18.35 Lasterror as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

24.18.36 LastInquiryUpdate as Date

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the date/time of the last time the device was returned during an inquiry.
Notes: Returns the date/time of the last time the device was seen during an inquiry. If the device has never been seen during an inquiry, nil is returned.
(Read only property)

24.18.37 LastInquiryUpdateDateTime as DateTime

MBS Bluetooth Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the date/time of the last time the device was returned during an inquiry.
Notes: Returns the date/time of the last time the device was seen during an inquiry. If the device has never been seen during an inquiry, nil is returned.
(Read only property)

24.18.38 lastNameUpdate as Date

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the date/time of the last successful remote name request.
Notes: (Read only property)

24.18.39 lastNameUpdateDateTime as DateTime

MBS Bluetooth Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the date/time of the last successful remote name request.
Notes: (Read only property)

24.18.40 LastServicesUpdate as Date

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the date/time of the last SDP query.
Notes: Returns the date/time of the last SDP query. If an SDP query has never been performed on the device, nil is returned.
(Read only property)

24.18.41 LastServicesUpdateDateTime as DateTime

MBS Bluetooth Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the date/time of the last SDP query.
Notes: Returns the date/time of the last SDP query. If an SDP query has never been performed on the device, nil is returned.
(Read only property)

24.18.42 LinkType as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the link type for the baseband connection.
Notes: Returns the link type for the baseband connection. If no baseband connection is present, kBluetoothLinkTypeNone is returned.
(Read only property)

24.18.43 name as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the human readable name of the remote device.
Notes: This only returns a value if a remote name request has been performed on the target device. If a successful remote name request has not been completed, nil is returned. To perform a remote name request, call remoteNameRequest. If a remote name request has been successfully completed, the method LastNameUpdate will return the date/time of the last successful request.
(Read only property)

24.18.44 nameOrAddress as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the human readable name of the remote device.
Notes: If the name is not present, it will return a string containing the device's address.

If a remote name request has been successfully completed, the device name will be returned. If not, a string containg the device address in the format of "XX-XX-XX-XX-XX-XX" will be returned.
(Read only property)

24.18.45 PageScanMode as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the page scan mode for the device.
Notes: Returns the value for the page scan mode for the device.

This value is only meaningful if the target device has been seen during an inquiry. This can be by checking the result of LastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.46 PageScanPeriodMode as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the value of the page scan period mode for the device.
Notes: Returns page scan period mode value for the device.

This value is only meaningful if the target device has been seen during an inquiry. This can be by checking the result of getLastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.47 PageScanRepetitionMode as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the value of the page scan repetition mode for the device.
Notes: Returns the page scan repetition mode value for this device.

This value is only meaningful if the target device has been seen during an inquiry. This can be by checking

the result of LastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.48 rawRSSI as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the raw RSSI device (if connected).
Notes: This value is the perceived RSSI value, not relative the the golden range (see RSSI for that value). This value will not available on all Bluetooth modules. If the value cannot be read (e.g. the device is disconnected) or is not available on a module, a value of +127 will be returned.
(Read only property)

24.18.49 RecentAccessDate as Date

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the date/time of the most recent access of the target device.
Notes: Returns the date/time of the most recent access of the target device. If the device has not been accessed, nil is returned.

This is the date that recentDevices uses to sort its list of the most recently accessed devices.
This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
(Read only property)

24.18.50 RecentAccessDateTime as DateTime

MBS Bluetooth Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the date/time of the most recent access of the target device.
Notes: Returns the date/time of the most recent access of the target device. If the device has not been accessed, nil is returned.

This is the date that recentDevices uses to sort its list of the most recently accessed devices.
This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
(Read only property)

24.18.51 RSSI as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the RSSI device (if connected), above or below the golden range.
Notes: If the RSSI is within the golden range, a value of 0 is returned. For the actual RSSI value, use getRawRSSI. For more information, see the Bluetooth 4.0 Core Specification.

Returns the RSSI of the device. If the value cannot be read (e.g. the device is disconnected), a value of +127 will be returned.
(Read only property)

24.18.52 serviceClassMajor as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the major service class of the device.
Notes: This value is only meaningful if the target device has been seen during an inquiry. This can be by checking the result of LastInquiryUpdate. If nil is returned, then the device hasn't been seen.
(Read only property)

24.18.53 Events

24.18.54 connectionCompleted(status as integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event called when openConnectionAsync completes.

24.18.55 remoteNameRequestCompleted(status as integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when remoteNameRequest completes.

24.18.56 SDPQueryCompleted(status as integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when performSDPQuery completes.

24.18.57 Constants

Link Types

Constant	Value	Description
kBluetoothACLConnection	1	ACL Connection
kBluetoothESCOConnection	2	ESCO Connection
kBluetoothLinkTypeNone	255	None set
kBluetoothSCOConnection	0	SCO Connection

Bluetooth Page Scan Modes

Constant	Value	Description
kBluetoothPageScanModeMandatory	0	Mandatory
kBluetoothPageScanModeOptional1	1	Optional 1
kBluetoothPageScanModeOptional2	2	Optional 2
kBluetoothPageScanModeOptional3	3	Optional 3

Bluetooth Page Scan Period Modes

Constant	Value	Description
kBluetoothPageScanPeriodModeP0	0	P0
kBluetoothPageScanPeriodModeP1	1	P1
kBluetoothPageScanPeriodModeP2	2	P2

Bluetooth Page Scan Repetition Modes

Constant	Value	Description
kBluetoothPageScanRepetitionModeR0	0	R0
kBluetoothPageScanRepetitionModeR1	1	R1
kBluetoothPageScanRepetitionModeR2	2	R2

Encryption Modes

Constant	Value	Description
kEncryptionDisabled	0	Encryption Disabled
kEncryptionForBothPointToPointAndBroadcastPackets	2	Encryption for both point to point and broadcast pack
kEncryptionOnlyForPointToPointPackets	1	Encryption only to point to point packets.

24.19 class IOBluetoothDeviceSelectorControllerMBS

24.19.1 class IOBluetoothDeviceSelectorControllerMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: A NSWindowController subclass to display a window to initiate pairing to other bluetooth devices.
Notes: Implementation of a window controller to return an array of selected bluetooth devices. This class will handle connecting to the Bluetooth Daemon for the purposes of searches, and displaying the results. This controller will return an array of IOBluetoothDevice objects to the user.
Subclass of the NSWindowControllerMBS class.

24.19.2 Methods

24.19.3 addAllowedUUID(allowedUUID as IOBluetoothSDPUUIDMBS)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Adds a UUID to the list of UUIDs that are used to validate the user's selection.
Notes: allowedUUID: UUID that a device may contain to be selected

The user's device selection gets validated against the UUIDs passed to addAllowedUUID or addAllowedUUIDArray. Each call to those methods essentially adds a filter that the selected device gets validated with. If any of the filters match, the device is considered valid. If they all fail, the device is not valid and the user is presented with an error code that the device does not support the required services. The UUID passed to addAllowedUUID is the only UUID that must be present in the device's SDP service records. Alternatively, all of the UUIDs in the UUID array passed to addAllowedUUIDArray must be present.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.19.4 addAllowedUUIDArray(allowedUUIDs() as IOBluetoothSDPUUIDMBS)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Adds an array of UUIDs to the list of UUIDs that are used to validate the user's selection.
Notes: allowedUUIDArray: An NSArray of UUIDs that all must be present in a device for it to be selectable.

The user's device selection gets validated against the UUIDs passed to addAllowedUUID or addAllowedUUIDArray. Each call to those methods essentially adds a filter that the selected device gets validated with. If any of the filters match, the device is considered valid. If they all fail, the device is not valid and the user is presented with an error code that the device does not support the required services. The UUID passed to addAllowedUUID is the only UUID that must be present in the device's SDP service records. Alternatively, all of the UUIDs in the UUID array passed to addAllowedUUIDArray must be present.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.19.5 beginSheetModalForWindow(win as DesktopWindow, tag as variant = nil)

MBS Bluetooth Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Runs the device selector panel as a sheet on the target window.
Notes: win: Window to attach the device selector panel to as a sheet.

Returns kIOReturnSuccess if the sheet modal session was started.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
See also:

- 24.19.6 beginSheetModalForWindow(win as window, tag as variant = nil) 4344

24.19.6 beginSheetModalForWindow(win as window, tag as variant = nil)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Runs the device selector panel as a sheet on the target window.
Notes: win: Window to attach the device selector panel to as a sheet.

Returns kIOReturnSuccess if the sheet modal session was started.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
See also:

- 24.19.5 beginSheetModalForWindow(win as DesktopWindow, tag as variant = nil) 4344

24.19.7 clearAllowedUUIDs

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Resets the controller back to the default state where it will accept any device the user selects.
Notes: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.19.8 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new device selector controller.

24.19.9 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.

24.19.10 Results as IOBluetoothDeviceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Returns the result of the user's selection.
Notes: Returns an array of IOBluetoothDevice objects corresponding to the user's selection. If the user cancelled the panel, nil will be returned.

There will only be results if the panel has been run, the user has successfully made a selection and that selection has been validated. If kIOBluetoothUISuccess was returned for the session, there should be valid results. Currently only a single device is allowed to be selected, so the results array will only contain one object. However in the future multiple selection will be supported.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.19.11 runModal as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Runs the device selector panel in a modal session to allow the user to select a Bluetooth device.
Notes: Returns kIOBluetoothUISuccess if a successful, validated device selection was made by the user. Returns kIOBluetoothUIUserCanceledErr if the user cancelled the panel. These return values are the same as NSRunStoppedResponse and NSRunAbortedResponse respectively. They are the standard values used in a modal session.

The controller will use the panel attributes to filter what devices the user sees. The allowed UUIDs will be used to validate the selection the user makes. Only when a selection has been validated (or the panel cancelled), will this method return.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.19.12 Properties

24.19.13 Cancel as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The title of the default/cancel button in the device selector panel.
Notes: String that appears in the default/cancel button in the device selector panel.
The prompt text should be localized for best user experience.
NOTE: This method is only available in macOS 10.9 or later.
(Read and Write property)

24.19.14 Description as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The description text that appears in the device selector panel.
Notes: String that appears in the description section of the device selector panel.
The description text should be localized for best user experience.
NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
(Read and Write property)

24.19.15 Header as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The header text that appears in the device selector panel.
Notes: String that appears in the description section of the device selector panel.
The description text should be localized for best user experience.
NOTE: This method is only available in macOS 10.9 or later.
(Read and Write property)

24.19.16 Options as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The option bits that control the panel's behavior.
Notes: The service browser controller options control the behavior of the panel. Currently kIOBluetooth-ServiceBrowserControllerOptionsAutoStartInquiry is the only supported option. In the future more options will be added to control things like whether the connection to the device is closed when the controller is finished or if multiple selection is allowed.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
(Read and Write property)

24.19.17 Prompt as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The title of the default/select button in the device selector panel.
Notes: String that appears in the default/select button in the device selector panel.
The prompt text should be localized for best user experience.
NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
(Read and Write property)

24.19.18 Title as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The title of the device selector panel.
Notes: (Read and Write property)

24.19.19 Events

24.19.20 SheetDone(returnCode as Integer, tag as Variant)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Event called when sheet is done.

24.19.21 Constants

Result Codes

Constant	Value	Description
kIOBluetoothUISuccess	-1000	Return code for success.
kIOBluetoothUIUserCanceledErr	-1001	Return code for Cancelled.

Options

Constant	Value	Description
kOptionsAutoStartInquiry	1	Automatically start an inquiry when the panel is displayed. This has been deprecated in 10.5.
kOptionsDisconnectWhenDone	2	Disconnect from the device when UI operations are finished.
kOptionsNone	0	No options set.

24.20 class IOBluetoothHostControllerMBS

24.20.1 class IOBluetoothHostControllerMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: This class is a representation of a Bluetooth Host Controller Interface that is present on the local computer (either plugged in externally or available internally).
Notes: This object can be used to ask a Bluetooth HCI for certain pieces of information, and be used to make it perform certain functions.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.20.2 Methods

24.20.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the default HCI controller object.

24.20.4 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

24.20.5 setClassOfDevice(classOfDevice as Integer, seconds as double)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the current class of device value, for the specified amount of time.
Notes: Note that the time interval *must* be set and valid. The range of acceptable values is 30-120 seconds. Anything above or below will be rounded up, or down, as appropriate.

Lasterror is set to 0 on success.

24.20.6 Properties

24.20.7 addressAsString as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convenience routine to get the HCI controller's Bluetooth address as an NSString object.
Notes: Returns empty string if the address could not be retrieved.
(Read only property)

24.20.8 classOfDevice as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the current class of device value.
Notes: (Read only property)

24.20.9 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.20.10 nameAsString as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the "friendly" name of HCI controller.
Notes: Returns string with the device name, nil if there is not one or it cannot be read.
(Read only property)

24.20.11 powerState as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the controller power state
Notes: The current controller's power state. This will be 1 for on, or 0 for off. Only Apple Bluetooth adapters support power off
(Read only property)

24.20.12 Events

24.20.13 PoweredOff

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event for power change and new state is off.

24.20.14 PoweredOn

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event for power change and new state is on.

24.20.15 readLinkQualityForDeviceCompleted(device as IOBluetoothDeviceMBS, HCILinkQuality as Integer, error as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: This event gets invoked when an read link quality command complete event occurs.
Notes: This could occur because you invoked it by issuing an readLinkQualityForDevice command, or someone else did from another app on the same controller.

24.20.16 readRSSIForDeviceCompleted(device as IOBluetoothDeviceMBS, HCIRSSIValue as Integer, error as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: This event gets invoked when an RSSI command complete event occurs.
Notes: This could occur because you invoked it by issuing an readRSSIForDevice command, or someone else did from another app on the same controller.

24.21 class IOBluetoothRFCOMMChannelMBS

24.21.1 class IOBluetoothRFCOMMChannelMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An instance of this class represents an rfcomm channel as defined by the Bluetooth SDP spec.
Notes: An RFCOMM channel object can be obtained by opening an rfcomm channel in a device, or by requesting a notification when a channel is created (this is commonly used to provide services).

- Bluetooth for Xojo

24.21.2 Methods

24.21.3 closeChannel

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Close the channel.
Notes: Lasterror is set to error code value. 0 if successful.

24.21.4 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

24.21.5 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

24.21.6 openRFCOMMChannelAsync(device as IOBluetoothDeviceMBS, channelID as Integer) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens a new RFCOMM channel to the target device. Returns immediately.
Notes: channelID: The RFCOMM channel ID for the new channel.

Lasterror is set tokIOReturnSuccess if the open process was successfully started (or if an existing RFCOMM channel was found). The channel must be released when the caller is done with it.

This method will begin the process of opening a new RFCOMM channel to the target device. The baseband connection to the device will be opened if it is not open already. The RFCOMM channel open process will not complete until the client has registered an incoming data listener on the new channel. The RFCOMM channel object is already retained when this function returns success; the channel must be released when the caller is done with it.
You should verify that the channel you wish to open exists on the remote device before attempting to open it, by performing an SDP query. This is recommended because the service might have been removed from the, remote device or the channel assignments for the service could have changed (this is rare, but it does happen frequently on some devices). This also works around a bug that existed in early Leopard versions in certain situations where the method would return an error; in these instances, the desired RFCOMM channel could not be opened again until the calling app was restarted.

NOTE: This method is only available in macOS 10.2.5 (Bluetooth v1.2) or later.

24.21.7 openRFCOMMChannelSync(device as IOBluetoothDeviceMBS, channelID as Integer) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens a new RFCOMM channel to the target device.
Notes: Returns only once the channel is open or failed to open.

channelID: The RFCOMM channel ID for the new channel.

Returns kIOReturnSuccess if the open process was successfully started (or if an existing RFCOMM channel was found). The channel must be released when the caller is done with it.

This method will begin the process of opening a new RFCOMM channel to the target device. The baseband connection to the device will be opened if it is not open already. The RFCOMM channel open process will not complete until the client has registered an incoming data listener on the new channel. The RFCOMM channel object is already retained when this function returns success; the channel must be released when the caller is done with it.
You should verify that the channel you wish to open exists on the remote device before attempting to open it, by performing an SDP query. This is recommended because the service might have been removed from the, remote device or the channel assignments for the service could have changed (this is rare, but it does happen frequently on some devices). This also works around a bug that existed in early Leopard versions

in certain situations where the method would return an error; in these instances, the desired RFCOMM channel could not be opened again until the calling app was restarted.

NOTE: This method is only available in macOS 10.2.5 (Bluetooth v1.2) or later.

24.21.8 sendRemoteLineStatus(lineStatus as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends an error to the remote side.
Notes: lineStatus: the error type. The error code can be NoError, OverrunError, ParityError or FramingError.

Lasterror is set to an error code value. 0 if successful.

24.21.9 setSerialParameters(speed as Integer, dataBits as Integer, parity as Integer, stopBits as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the parameters of the serial connection.
Notes: speed: the baudrate.
nBits: number of data bits.
parity: the type of parity can be NoParity, OddParity, EvenParity or MaxParity.
bitStop: number of stop bits.

See kParityType* constants.
Lasterror is set to error code value. 0 if successful.

24.21.10 writeAsync(data as MemoryBlock, tag as Variant = nil)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends a block of data in the channel asynchronously.
Notes: data: The data buffer to be sent.

Lasterror is set to kIOReturnSuccess if the data was buffered successfully.

The number of bytes to be sent must not exceed the channel MTU. If the return value is an error condition none of the data was sent. Once the data has been successfully passed to the hardware to be transmitted,

the WriteCompleted event will be called with the tag that was passed to this method.

NOTE: This method is only available in macOS 10.2.5 (Bluetooth v1.2) or later.

24.21.11 writeSync(data as MemoryBlock)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends a block of data in the channel synchronously.
Notes: data The data buffer to be sent.

Lasterror is set to kIOReturnSuccess if the data was written successfully.

Sends data through the channel. The number of bytes to be sent must not exceed the channel MTU. If the return value is an error condition none of the data was sent. This method will block until the data has been successfully sent to the hardware for transmission (or until an error occurs).

NOTE: This method is only available in macOS 10.2.5 (Bluetooth v1.2) or later.

24.21.12 Properties

24.21.13 ChannelID as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the object rfcomm channel ID.
Notes: (Read only property)

24.21.14 Device as IOBluetoothDeviceMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Bluetooth Device that carries the rfcomm data.
Notes: (Read only property)

24.21.15 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.21.16 isIncoming as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the direction of the channel. An incoming channel is one that was opened by the remote device.
Notes: Returns true if the channel was opened by the remote device, false if the channel was opened by this object.
(Read only property)

24.21.17 isOpen as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the state of the channel.
Notes: True if the channel state is open, false otherwise.

note that "not open" means closed, opening and closing.
(Read only property)

24.21.18 isTransmissionPaused as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if flow control is off.
Notes: True if the action of sending data will block the current thread, false otherwise.

Returns true if the remote device flow control is stopping out transmission. This is useful because we do not buffer data, we stop the transmitting actor. With this method the transmitter can check if sending data is going to be successful or is going to block.
(Read only property)

24.21.19 Lasterror as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.

Notes: (Read and Write property)

24.21.20 MTU as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the channel maximum transfer unit.
Notes: Returns the length of the largest chunk of data that this channel can carry. If the caller wishes to use the write:length:sleep: api the length of the data can not be bigger than the channel MTU (maximum transfer unit).
(Read only property)

24.21.21 Events

24.21.22 Closed

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Channel closed.

24.21.23 ControlSignalsChanged

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The control signals changed.

24.21.24 DataReceived(data as MemoryBlock, dataLength as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Data received.
Notes: If you receive text, please use DefineEncoding to tell Xojo about the text encoding you used.

24.21.25 FlowControlChanged

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The flow control changed.

24.21.26 OpenCompleted(status as Integer)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The open command finished.
Notes: Status is zero for success.

24.21.27 QueueSpaceAvailable

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Space is available on queue.

24.21.28 WriteCompleted(status as integer, tag as Variant)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Asynchronous write sent.

24.21.29 Constants

Line States

Constant	Value	Description
kLineStatusFramingError	3	Framing Error
kLineStatusNoError	0	No Error
kLineStatusOverrunError	1	Overrun Error
kLineStatusParityError	2	Parity Error

Parity Types

Constant	Value	Description
kParityTypeEvenParity	2	Even Parity
kParityTypeMaxParity	3	Max Parity
kParityTypeNoParity	0	No Parity
kParityTypeOddParity	1	Odd Parity

24.22 class IOBluetoothSDPDataElementMBS

24.22.1 class IOBluetoothSDPDataElementMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An instance of this class represents a single SDP data element as defined by the Bluetooth SDP spec.
Notes: The data types described by the spec have been mapped onto the base Xojo classes and data types double, Array, Memoryblock as well as IOBluetoothSDPUUID. The number and boolean types (type descriptor 1, 2 and 5) are represented as booleans with the exception of 128-bit numbers which are represented as memoryblock objects in their raw format. The UUID type (type descriptor 3) is represented by IOBluetoothSDPUUID. The string and URL types (type descriptor 4 and 8) are represented by string. The sequence types (type descriptor 6 and 7) are represented by array.

Typically, you will not need to create an IOBluetoothSDPDataElement directly, the system will do that automatically for both client and server operations. However, the current API for adding SDP services to the system does allow the use of an Dictionary based format for creating new services. The purpose for that is to allow a service to be built up completely in a text file (a plist for example) and then easily imported into an app and added to the system without a lot of tedious code to build up the entire SDP service record.

The basis for that dictionary comes from the IOBluetoothSDPDataElement. At its simplest, a data element is made up of three parts: the type descriptor, the size (from which the size descriptor is generated) and the actual value. To provide a complete representation of a data element, an dictionary with three entries can be used. Each of the three entries has a key/value pair representing one of the three attributes of a data element. The first key/value pair has a key 'DataElementType' that contains a number value with the actual type descriptor for the data element. The second pair has a key 'DataElementSize' that contains the actual size of the element in bytes. The size descriptor will be calculated based on the size and type of the element. The third pair is the value itself whose key is 'DataElementValue' and whose type corresponds to the type mapping above.
In addition to this complete description of a data element, their are some shortcuts that can be used for some of the common types and sizes.
If the 'DataElementType' value is one of the numeric types (1, 2), the 'DataElementValue' can be an memoryblock instead of an number. In that case, the numeric data is taken in network byte order (MSB first). Additionally, the 'DataElementSize' parameter may be omitted and the size will be taken from the length of the data object.
If the 'DataElementType' value is the nil type (0), no 'DataElementSize' or 'DataElementValue' entries are needed.
If the 'DataElementType' value is any of the other types, the 'DataElementSize' entry is not needed since the size will be taken directly from the value (data, array, string).
In the case where the element is an unsigned, 32-bit integer (type descriptor 1, size descriptor 4), the value itself may simply be a number (instead of a dictionary as in the previous examples). In the case where the element is a UUID (type descriptor 3), the value itself may be a data object. The UUID type will be inferred and the size taken from the length of the data object.

In the case where the element is a text string (type descriptor 4), the value may be a string object. The text

string type will be inferred and the size taken from the length of the string.
In the case where the element is a data element sequence, the value may be an array object. The type will be inferred and the size taken from the length of the array. Additionally, the array must contain sub-elements that will be parsed out individually.

24.22.2 Methods

24.22.3 Constructor(type as Integer, SizeDescriptor as Integer, Size as Integer, value as Variant)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new IOBluetoothSDPDataElement with the given attributes.
Notes: type: The type descriptor for the data element.
sizeDescriptor: The size descriptor for the data element (verify it matches the size parameter).
size: The size of the data element in bytes (make sure it is a valid size for the given size descriptor).
value: The raw value itself. This must be the base string, number, Array or Memoryblock objects. It may not be Dictionary. If a dictionary format is present, use other Constructor.

Warning - be careful using this method. There is next to no error checking done on the attributes. It is entirely possible to construct an invalid data element. It is recommended that other Constructor be used instead of this one.
See also:

- 24.22.4 Constructor(value as Variant) 4360

24.22.4 Constructor(value as Variant)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new IOBluetoothSDPDataElement with the given value.
Notes: value: The data element value of one of the specified types.

The value must follow the format listed above and must be an instance of Memoryblock, string, number, array, dictionary, IOBluetoothSDPUUID.
See also:

- 24.22.3 Constructor(type as Integer, SizeDescriptor as Integer, Size as Integer, value as Variant) 4360

24.22.5 containsDataElement(value as IOBluetoothSDPDataElementMBS) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Checks to see if the target data element is the same as the dataElement parameter or if it contains the dataElement parameter (if its a sequence type).
Notes: dataElement: The data element to compare with (and search for).

Returns true if the target either matches the given data element or if it contains the given data element.

If the target data element is not a sequence type, this method simply compares the two data elements. If it is a sequence type, it will search through the sequence (and sub-sequences) for the dataElement parameter.

24.22.6 containsValue(value as variant) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Checks to see if the target data element's value is the same as the value parameter or if it contains the value parameter.
Notes: value: The value to compare with (and search for).

Returns true if the target's value either matches the given value or if it contains the given value.

This method works just like containsDataElement except that it is comparing the value objects directly.

24.22.7 withElementValue(value as variant) as IOBluetoothSDPDataElementMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new IOBluetoothSDPDataElement with the given value.
Notes: element: The data element value of one of the specified types.

Returns the newly allocated data element object. Returns nil if there was an error parsing the element value. The returned IOBluetoothSDPDataElement object has been autoreleased, so it is not necessary for the caller to release it. If the object is to be referenced and kept around, retain should be called.

The value must follow the format listed above and must be an instance of memory block, String, number, Array, Dictionary, IOBluetoothSDPUUID.

24.22.8 withType(type as Integer, SizeDescriptor as Integer, Size as Integer, Value as variant) as IOBluetoothSDPDataElementMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new IOBluetoothSDPDataElement with the given attributes.
Notes: typeDescriptor: The type descriptor for the data element.
sizeDescriptor: The size descriptor for the data element (verify it matches the size parameter).
size: The size of the data element in bytes (make sure it is a valid size for the given size descriptor).
value: The raw value itself. This must be the base string, number, array or memoryblock objects. It may not be Dictionary. If a dictionary format is present, use other Constructor.

Returns the newly allocated data element object. Returns nil if an error is encountered (not likely due to the limited error checking currently done).

Warning - be careful using this method. There is next to no error checking done on the attributes. It is entirely possible to construct an invalid data element. It is recommended that Constructor be used instead of this one.

24.22.9 Properties

24.22.10 DataValue as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the data element is represented by a data object, it returns the value as an MemoryBlock.
Notes: Returns an MemoryBlock representation of the data element if it is a 128-bit number.
The data types represented by a data object are 128-bit versions of 1 (unsigned int) and 2 (signed int).
(Read only property)

24.22.11 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.22.12 NumberValue as Double

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the data element is represented by a number, it returns the value as a double.
Notes: The data types represented by a number are 1 (unsigned int), 2 (signed int) and 5 (boolean) except for 128-bit versions of 1 and 2.
(Read only property)

24.22.13 Size as UInt32

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the size in bytes of the target data element.
Notes: The size is valid whether the data element has a fixed or variable size descriptor.
(Read only property)

24.22.14 SizeDescriptor as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the SDP spec defined data element size descriptor for the target data element.
Notes: Returns the size descriptor for the target data element.
(Read only property)

24.22.15 StringValue as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the data element is represented by a string object, it returns the value as a string.
Notes: Returns an String representation of the data element if it is a text or URL type.
The data types represented by a string object are 4 (text string) and 8 (URL).
(Read only property)

24.22.16 TypeDescriptor as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the SDP spec defined data element type descriptor for the target data element.
Notes: Returns the type descriptor for the target data element.
(Read only property)

24.22.17 UUIDValue as IOBluetoothSDPUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the data element is a UUID (type 3), it returns the value as an IOBluetoothSDPUUID.
Notes: Returns an IOBluetoothSDPUUID representation of the data element if it is a UUID.
(Read only property)

24.22.18 Value as Variant

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the object value of the data element.
Notes: The value returned may be an Number, String, Data, Array or IOBluetoothSDPDataElement depending on the type of the data element.
(Read only property)

24.22.19 Constants

Types

Constant	Value	Description
kTypeBoolean	5	Boolean
kTypeNil	0	Nil
kTypeReservedEnd	31	End of reserved numbers
kTypeReservedStart	9	Begin of reserved numbers.
kTypeSignedInt	2	Signed integer
kTypeString	4	String
kTypeUnsignedInt	1	Unsigned integer
kTypeURL	8	URL
kTypeUUID	3	UUID

DataElement Types

Constant	Value	Description
kTypeDataElementAlternative	7	Alternative
kTypeDataElementSequence	6	Sequence

24.23 class IOBluetoothSDPServiceAttributeMBS

24.23.1 class IOBluetoothSDPServiceAttributeMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: IOBluetoothSDPServiceAttribute represents a single SDP service attribute.
Notes: A service attribute contains two components: an attribute ID and a data element.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.23.2 Methods

24.23.3 Constructor(AttributeID as Integer, value as Variant)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new service attribute with the given ID and data element.
Notes: attributeID: The attribute ID of the new service attribute.
attributeElement: The data element value of the new service attribute.

Returns self if successful. Returns nil if there was an error.

24.23.4 withID(AttributeID as Integer, value as Variant) as IOBluetoothSDPServiceAttributeMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new service attribute with the given ID and element value.
Notes: attributeID: The attribute ID of the new service attribute.
attributeElementValue: The data element value of the new service attribute

Returns the newly allocated service attribute object. Returns nil if there was an error parsing the element value. The returned IOBluetoothSDPDataElement object has been autoreleased, so it is not necessary for the caller to release it. If the object is to be referenced and kept around, retain should be called.

24.23.5 Properties

24.23.6 AttributeID as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the attribute ID for the target service attribute.
Notes: (Read only property)

24.23.7 DataElement as IOBluetoothSDPDataElementMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the data element for the target service attribute.
Notes: (Read only property)

24.23.8 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.23.9 IDDataElement as IOBluetoothSDPDataElementMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the data element representing the attribute ID for the target service attribute.
Notes: (Read only property)

24.24 class IOBluetoothSDPServiceRecordMBS

24.24.1 class IOBluetoothSDPServiceRecordMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: An instance of this class represents a single SDP service record.
Notes: As a service record, an instance of this class has an NSDictionary of service attributes. It also has a link to the IOBluetoothDevice that the service belongs to. The service dictionary is keyed off of the attribute ID of each attribute represented as a number.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.24.2 Methods

24.24.3 AttributeDataElement(attributeID as Integer) as IOBluetoothSDPDataElementMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the data element for the given attribute ID in the target service.
Notes: attributeID: The attribute ID of the desired attribute.

Returns the data element for the given attribute ID in the target service. If the service does not contain an attribute with the given ID, then nil is returned.

24.24.4 Constructor(dic as Dictionary, device as IOBluetoothDeviceMBS)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an initialized IOBluetoothSDPServiceRecord with the attributes specified in the provided service dictionary.
Notes: Provide a pointer to an IOBlueotothDevice if you wish to associate the record to a specific IOBluetoothDevice.

24.24.5 hasServiceFromArray(uuids() as IOBluetoothSDPUUIDMBS) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if any one of the UUIDs in the given array is found in the target service.
Notes: array: An array of IOBluetoothSDPUUID objects to search for in the target service.

Returns true if any of the given UUIDs are present in the service.

The given array should contain IOBluetoothSDPUUID objects. It is currently implemented such that it returns TRUE if any of the UUIDs are found. However in the future, it is likely that this will change to more closely match the functionality in the SDP spec so that it only returns TRUE if all of the given UUIDs are present. That way, both AND and OR comparisons can be implemented. Please make a note of this potential change.

24.24.6 matchesSearchArray(uuids() as IOBluetoothSDPUUIDMBS) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true any of the UUID arrays in the search array match the target service.
Notes: array: An Array of NSArrays of IOBluetoothSDPUUID objects.

Returns true if any of the UUID arrays match.

The given array should contain NSArray objects. Each sub-NSArray should contain IOBluetoothSDPUUID objects. In turn, each sub-NSArray gets passed to matchesUUIDArray If any of those returns true, then the search stops and true is returned. Essentially the master array contains the OR operations and each sub-array contains the AND operations.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.24.7 matchesUUID16(uuid16 as UInt16) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true the UUID16 is found in the target service.
Notes: uuid16: A BluetoothSDPUUID16 to search for in the target service.

Returns true if the UUID16 is present in the service.

NOTE: This method is only available in macOS 10.7 or later.

24.24.8 matchesUUIDArray(uuids() as IOBluetoothSDPUUIDMBS) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if ALL of the UUIDs in the given array is found in the target service.
Notes: array: An Array of IOBluetoothSDPUUID objects to search for in the target service.

Returns true if all of the given UUIDs are present in the service.

The given array should contain IOBluetoothSDPUUID objects. It only returns true if all of the UUIDs are found. This method is like hasServiceFromArray: except that it requires that all UUIDs match instead of any of them matching.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.24.9 publishedServiceRecordWithDictionary(dic as Dictionary) as IOBluetoothSDPServiceRecordMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a service to the local SDP server.
Notes: serviceDict: A dictionary containing the attributes for the new service

Returns an IOBluetoothSDPServiceRecord * with the attributes specified in the provided dictionary.

Each entry in the dictionary representing the service contains the individual attributes. Each attribute in the dict is keyed by a string that must begin with a hex number representing the attribute ID. The key string may contain additional characters if desired as long as they follow a space after the ID hex string. The attribute value must follow the dictionary format described by IOBluetoothSDPDataElement. This dictionary format allows a service dict to be created as a plist file and then loaded into the system rather than built up in code. See the example code for an example of how can be done.
If the service record handle, L2CAP PSM or RFCOMM channel ID specified in the dictionary are in use, an alternate one will be assigned.
In addition to attributes that represent the service itself, additional attributes may be specified that control the local behavior of the service. To specify these local attributes, an additional property titled "LocalAttributes" may be added to the root of the service dict. The value of this property must be a dictionary that contains the individual local attributes.
Currently, only two local attributes are supported: "Persistent" and "TargetApplication".
The "Persistent" local attribute must be either a boolean or number representing whether the service should be persistent. A persistent service will be saved off and restored any time the Bluetooth hardware is present. It will persist through reboots and can only be removed by calling IOBluetoothRemoveServiceWithRecordHandle(). This attribute is optional. By default, if no "Persistent" local property is present, the service will only exist temporarily. It will be removed either when IOBluetoothRemoveServiceWithRecordHandle() is called or when the client application exits.
The "TargetApplication" local attribute is used to specify an application to be launched when a remote device attempts to connect to the service (by opening either an L2CAP or RFCOMM channel of the type specified in the service). This value must be a string representing the absolute path to the target executable (not just

the .app wrapper - i.e. /System/Library/CoreServices/OBEXAgent.app/Contents/MacOS/OBEXAgent). This attribute is optional. If no "TargetApplication" local attribute is specified, no special action will take place when an incoming connection to the service is created. It is up to the client to be monitoring for the connection and to do the right thing when one appears.
The "LocalAttributes" property is optional. If it is not specified, by default the created service is transient and will be removed when the client exits.
Additional local attributes to further control incoming services will be added in the future.

24.24.10 removeServiceRecord

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the service from the local SDP server.
Notes: Lasterror is set.

24.24.11 RFCOMMChannelID as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Allows the discovery of the RFCOMM channel ID assigned to the service.
Notes: Returns the location that will get the found RFCOMM channel ID.

Lasterror is set to kIOReturnSuccess if the channel ID is found.

This method will search through the ProtoclDescriptorList attribute to find an entry with the RFCOMM UUID (UUID16: 0x0003). If one is found, it gets the second element of the data element sequence and sets the rfcommChannelID pointer to it. The channel ID only gets set when kIOReturnSuccess is returned.

24.24.12 sortedAttributes as IOBluetoothSDPServiceAttributeMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a sorted array of SDP attributes.
Notes: This method will walk all the elements of the service record and return an array of IOBluetoothSDPServiceAttribute objects sorted by attributeID.

24.24.13 withServiceDictionary(dic as Dictionary, device as IOBluetoothDeviceMBS) as IOBluetoothSDPServiceRecordMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an IOBluetoothSDPServiceRecord * with the attributes specified in the provided service dictionary.
Notes: Provide an IOBlueotothDevice if you wish to associate the record to a specific IOBluetoothDevice.

24.24.14 Properties

24.24.15 Device as IOBluetoothDeviceMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the IOBluetoothDevice that the target service belongs to.
Notes: Returns the IOBluetoothDevice that the target service belongs to. If the service is one the local host is vending, then nil is returned.
If the service is a local service (i.e. one the current host is vending out), then nil is returned.
(Read only property)

24.24.16 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.24.17 Lasterror as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The lasterror code.
Notes: (Read and Write property)

24.24.18 Properties as Dictionary

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSDictionary containing the attributes for the service.
Notes: The attribute dictionary is keyed off of the attribute id represented as an NSNumber. The values in the NSDictionary are IOBluetoothSDPDataElement objects representing the data element for the given attribute.
(Read only property)

24.24.19 ServiceName as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the service.
Notes: This is currently implemented to simply return the attribute with an id of 0x0100. In the future, it will be extended to allow name localization based on the user's chosen language or other languages.
(Read only property)

24.25 class IOBluetoothSDPUUIDMBS

24.25.1 class IOBluetoothSDPUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Represents a UUID as defined in the Bluetooth SDP spec.
Notes: The IOBluetoothSDPUUID class can represent a UUID of any valid size (16, 32 or 128 bits). It provides the ability to compare two UUIDs no matter what their size as well as the ability to promote the size of a UUID to a larger one.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.25.2 Methods

24.25.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Private constructor.

24.25.4 isEqualToUUID(other as IOBluetoothSDPUUIDMBS) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compares the target IOBluetoothSDPUUID object with the given otherUUID object.
Notes: other: The UUID object to be compared with the target.

Returns true if the UUID values of each object are equal. This includes the case where the sizes are different but the data itself is the same when the Bluetooth UUID base is applied.

This method will compare the two UUID values independent of their length.

24.25.5 uuid16(value as UInt16) as IOBluetoothSDPUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new 16-bit IOBluetoothSDPUUID with the given UUID16.

24.25.6 uuid32(value as UInt32) as IOBluetoothSDPUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new 32-bit IOBluetoothSDPUUID with the given UUID32.

24.25.7 uuidWithData(mem as MemoryBlock) as IOBluetoothSDPUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new IOBluetoothSDPUUID object from the given memoryblock.
Notes: Returns the new IOBluetoothSDPUUID object or nil on failure.
If the length of the memoryblock is invalid for a UUID, nil is returned.

24.25.8 UUIDWithLength(length as Integer) as IOBluetoothSDPUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an IOBluetoothSDPUUID object matching the target UUID, but with the given number of bytes.
Notes: Returns an IOBluetoothSDPUUID object with the same data as the target but with the given length if it is possible to do so. Otherwise, nil is returned.

If the target object is the same length as newLength, it returns itself. If newLength is greater it creates a new IOBluetoothSDPUUID object with the correct value for the given length. If newLength is smaller, it will attempt to create a new IOBluetoothSDPUUID that is smaller if the data matches the Bluetooth UUID base. This downconversion is currently unimplemented.

24.25.9 uuidWithUUID(UUID as String) as IOBluetoothSDPUUIDMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new IOBluetoothSDPUUID with the given UUID

24.25.10 Properties

24.25.11 Data as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries data as memoryblock.
Notes: (Read only property)

24.25.12 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

24.25.13 Length as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries length of data.
Notes: (Read only property)

24.26 class IOBluetoothServiceBrowserControllerMBS

24.26.1 class IOBluetoothServiceBrowserControllerMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: A NSWindowController subclass to display a window to search for and perform SDP queries on bluetooth devices within range.
Notes: This NSWindowController subclass will bring up a generic Bluetooth search and SDP browsing window allowing the user to find devices within range, perform SDP queries on a particular device, and select a SDP service to connect to. The client application can provide NSArrays of valid service UUIDs to allow, and an NSArray of valid device types to allow. The device type filter is not yet implemented.
Subclass of the NSWindowControllerMBS class.

24.26.2 Methods

24.26.3 addAllowedUUID(allowedUUID as IOBluetoothSDPUUIDMBS)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Adds a UUID to the list of UUIDs that are used to validate the user's selection.
Notes: allowedUUID: UUID that a device may contain to be selected

The user's device selection gets validated against the UUIDs passed to addAllowedUUID or addAllowedUUIDArray. Each call to those methods essentially adds a filter that the selected device gets validated with. If any of the filters match, the device is considered valid. If they all fail, the device is not valid and the user is presented with an error code that the device does not support the required services. The UUID passed to addAllowedUUID is the only UUID that must be present in the device's SDP service records. Alternatively, all of the UUIDs in the UUID array passed to addAllowedUUIDArray must be present.
NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.26.4 addAllowedUUIDArray(allowedUUIDs() as IOBluetoothSDPUUIDMBS)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Adds an array of UUIDs to the list of UUIDs that are used to validate the user's selection.
Notes: allowedUUIDArray: An NSArray of UUIDs that all must be present in a device for it to be selectable.

The user's device selection gets validated against the UUIDs passed to addAllowedUUID or addAllowedUUIDArray. Each call to those methods essentially adds a filter that the selected device gets validated with. If any of the filters match, the device is considered valid. If they all fail, the device is not valid and the user is presented with an error code that the device does not support the required services. The UUID passed to addAllowedUUID is the only UUID that must be present in the device's SDP service records. Alternatively, all of the UUIDs in the UUID array passed to addAllowedUUIDArray must be present.
NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.26.5 beginSheetModalForWindow(win as DesktopWindow, tag as variant = nil)

MBS Bluetooth Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Runs the service browser panel as a sheet on the target window.
Notes: sheetWindow: NSWindow to attach the service browser panel to as a sheet.
Tag is passed to event.

Sets lasterror to kIOReturnSuccess if the sheet modal session was started.
See also:

- 24.26.6 beginSheetModalForWindow(win as window, tag as variant = nil) 4377

24.26.6 beginSheetModalForWindow(win as window, tag as variant = nil)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Runs the service browser panel as a sheet on the target window.
Notes: sheetWindow: NSWindow to attach the service browser panel to as a sheet.
Tag is passed to event.

Sets lasterror to kIOReturnSuccess if the sheet modal session was started.
See also:

- 24.26.5 beginSheetModalForWindow(win as DesktopWindow, tag as variant = nil) 4377

24.26.7 clearAllowedUUIDs

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Resets the controller back to the default state where it will accept any device the user selects.
Notes: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.26.8 Constructor(options as Integer = 0)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Allocator work Bluetooth Service Browser window controller.
Notes: Options: Bit field for options to set in the newly allocated controller. Currently no options are available.

24.26.9 Destructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.

24.26.10 Results as IOBluetoothSDPServiceRecordMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Returns the result of the user's selection.
Notes: Returns an NSArray of IOBluetoothSDPServiceRecord objects corresponding to the user's selection. If the user cancelled the panel, nil will be returned.

There will only be results if the panel has been run, the user has successfully made a selection and that selection has been validated. If kIOBluetoothUISuccess was returned for the session, there should be valid results. Currently only a single device is allowed to be selected, so the results array will only contain one object. However in the future multiple selection will be supported.

This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.26.11 runModal as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Runs the service browser panel in a modal session to allow the user to select a service on a Bluetooth device.
Notes: Returns kIOBluetoothUISuccess if a successful, validated service selection was made by the user. Returns kIOBluetoothUIUserCanceledErr if the user cancelled the panel. These return values are the same as NSRunStoppedResponse and NSRunAbortedResponse respectively. They are the standard values used in a modal session.

The controller will use the panel attributes to filter what devices the user sees. The allowed UUIDs will be

used to validate the selection the user makes. The user will only be able to select services that match the allowed UUIDs. Only when a selection has been validated (or the panel cancelled), will this method return.

NOTE: This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

24.26.12 Properties

24.26.13 Description as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The description text that appears in the device selector panel.
Notes: The description text should be localized for best user experience.
This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
(Read and Write property)

24.26.14 Options as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The options for the window controller.
Notes: This method will set the options for the browser to new values.
(Read and Write property)

24.26.15 Prompt as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The title of the default/select button in the device selector panel.
Notes: The prompt text should be localized for best user experience.
This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.
(Read and Write property)

24.26.16 Title as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The title of the device selector panel
Notes: The panel title should be localized for best user experience.
This method is only available in macOS 10.2.4 (Bluetooth v1.1) or later.

(Read and Write property)

24.26.17 Events

24.26.18 SheetDone(returnCode as Integer, tag as Variant)

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The event called when sheet is dismissed.
Notes: The returnCode parameter will either be kIOBluetoothUISuccess or kIOBluetoothUIUserCancelled-Err as described.

24.26.19 Constants

Result Codes

Constant	Value	Description
kIOBluetoothUISuccess	-1000	
kIOBluetoothUIUserCanceledErr	-1001	

Options

Constant	Value	Description
kOptionsAutoStartInquiry	1	Automatically start an inquiry when the panel is displayed. This has been deprecated in 10.5
kOptionsDisconnectWhenDone	2	Disconnect from the device when UI operations are finished.
kOptionsNone	0	No options set.

24.27 class WindowsBluetoothDeviceIdMBS

24.27.1 class WindowsBluetoothDeviceIdMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a bluetooth device ID.
Notes: Requires Windows 10 Fall Creators Update (introduced in 10.0.16299.0)
Blog Entries

- MBS Xojo Plugins, version 23.3pr2
- The Top 10 from the MBS Xojo Plugins in 2022

- MBS Xojo Plugins, version 22.2pr6

24.27.2 Methods

24.27.3 Constructor(ID as String)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a BluetoothDeviceId object from the device ID.

24.27.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.27.5 FromID(ID as String) as WindowsBluetoothDeviceIdMBS

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a BluetoothDeviceId object from the device ID.
Notes: Returns nil in case of an error.

24.27.6 Properties

24.27.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.27.8 Id as String

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the bluetooth device ID.
Notes: (Read only property)

24.27.9 IsClassicDevice as Boolean

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a boolean indicating if this is a classic device.
Notes: (Read only property)

24.27.10 IsLowEnergyDevice as Boolean

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a boolean indicating if this is a LowEnergy device.
Notes: (Read only property)

24.28 class WindowsBlueToothDeviceInfoMBS

24.28.1 class WindowsBlueToothDeviceInfoMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: This class provides information about a Bluetooth device.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.28.2 Methods

24.28.3 Devices(SearchParameters as WindowsBlueToothDeviceSearchParameterMBS) as WindowsBlueToothDeviceInfoMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Enumerates Bluetooth devices.
Example:

```
Var p as new WindowsBlueToothDeviceSearchParameterMBS
p.ReturnAuthenticated = true
p.ReturnConnected = true
p.ReturnRemembered = true
p.ReturnUnknown = true
p.TimeoutMultiplier = 10
p.IssueInquiry = true

Var devices() as WindowsBlueToothDeviceInfoMBS = WindowsBlueToothDeviceInfoMBS.Devices(p)

Break // see in debugger
```

Notes: SearchParameters can define search parameters.

see also:
https://msdn.microsoft.com/en-us/library/windows/desktop/aa362784(v=vs.85).aspx

24.28.4 DisplayDeviceProperties(parentWindow as DesktopWindow) as boolean

MBS Bluetooth Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Starts Control Panel device information property sheet.
Notes: parentWindow: The parent window of the property sheet.

Returns true if the property sheet is successfully displayed. Returns false if the property sheet was not displayed successfully.
See also:

- 24.28.5 DisplayDeviceProperties(parentWindow as window) as boolean 4384

24.28.5 DisplayDeviceProperties(parentWindow as window) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop only.

Function: Starts Control Panel device information property sheet.
Notes: parentWindow: The parent window of the property sheet.

Returns true if the property sheet is successfully displayed. Returns false if the property sheet was not displayed successfully.
See also:

- 24.28.4 DisplayDeviceProperties(parentWindow as DesktopWindow) as boolean 4383

24.28.6 FirstDevice(SearchParameters as WindowsBlueToothDeviceSearchParameterMBS) as WindowsBlueToothDeviceInfoMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Queries first device.
Example:

```
Var p as new WindowsBlueToothDeviceSearchParameterMBS
p.ReturnAuthenticated = true
p.ReturnConnected = true
p.ReturnRemembered = true
p.ReturnUnknown = true
p.TimeoutMultiplier = 10
p.IssueInquiry = true

Var device as WindowsBlueToothDeviceInfoMBS = WindowsBlueToothDeviceInfoMBS.FirstDevice(p)

Break // see in debugger
```

Notes: SearchParameters can define search parameters.

see also:
https://msdn.microsoft.com/en-us/library/windows/desktop/aa362784(v=vs.85).aspx

24.28.7 Properties

24.28.8 Address as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Address of the device.
Notes: (Read only property)

24.28.9 Authenticated as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Specifies whether the device is authenticated, paired, or bonded.
Notes: All authenticated devices are remembered.
(Read only property)

24.28.10 ClassofDevice as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Class of the device.
Notes: (Read only property)

24.28.11 Connected as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Specifies whether the device is connected.
Notes: (Read only property)

24.28.12 LastSeen as Date

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Last time the device was seen, in the form of a date.
Notes: Can be before year 2000 to indicate never seen.
(Read only property)

24.28.13 LastUsed as Date

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Last time the device was used, in the form of a date.
Notes: Can be before year 2000 to indicate never used.
(Read only property)

24.28.14 Name as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Name of the device.
Notes: (Read only property)

24.28.15 Remembered as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Specifies whether the device is a remembered device.
Notes: Not all remembered devices are authenticated.
(Read only property)

24.29 class WindowsBlueToothDeviceMBS

24.29.1 class WindowsBlueToothDeviceMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: This class stores information about a Bluetooth device.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.29.2 Methods

24.29.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The private constructor.

24.29.4 Devices as WindowsBlueToothDeviceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Queries list of devices.

24.29.5 Services as WindowsBlueToothServiceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The list of services for this device.

24.29.6 Properties

24.29.7 Comment as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The comment.
Notes: (Read only property)

24.29.8 LocalAddress as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The Windows Sockets local address.
Notes: In a client application, pass this address to the bind function to obtain access to a network service. In a network service, pass this address to the bind function so that the service is bound to the appropriate local address.

e.g. "(78:4F:12:34:56:78)"
(Read only property)

24.29.9 Name as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The name.
Notes: e.g. "Christian Schmitz iPhone"
(Read only property)

24.29.10 RemoteAddress as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Windows Sockets remote address.
Notes: There are several uses for this remote address:

- You can use this remote address to connect to the service through the connect function. This is useful if an application performs send/receive operations that involve connection-oriented protocols.
- You can use this remote address with the sendto function when you are communicating over a connectionless (datagram) protocol. If you are using a connectionless protocol, such as UDP, sendto is typically the way you pass data to the remote system.

e.g. "(44:00:12:34:56:78)"
(Read only property)

24.29.11 SocketProtocol as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The protocol used.
Notes: The possible options for the protocol parameter are specific to the address family and socket type specified.

Name	Value	Meaning
IPPROTO_TCP	6	The Transmission Control Protocol (TCP). This is a possible value when the address family is AF_INET or AF_INET6 and the iSocketType member is SOCK_STREAM.
IPPROTO_UDP	17	The User Datagram Protocol (UDP). This is a possible value when the address family is AF_INET or AF_INET6 and the iSocketType member is SOCK_DGRAM.
IPPROTO_RM	113	The PGM protocol for reliable multicast. This is a possible value when the address family is AF_INET and the iSocketType member is SOCK_RDM. On the Windows SDK released for Windows Vista and later, this value is also called IPPROTO_PGM.

(Read only property)

24.29.12 SocketType as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The type of Windows socket.
Notes:

Name	Value	Meaning
SOCK_STREAM	1	A stream socket. This is a protocol that sends data as a stream of bytes, with no message boundaries. This socket type provides sequenced, reliable, two-way, connection-based byte streams with an OOB data transmission mechanism. This socket type uses the Transmission Control Protocol (TCP) for the Internet address family (AF_INET or AF_INET6).
SOCK_DGRAM	2	A datagram socket. This socket type supports datagrams, which are connectionless, unreliable buffers of a fixed (typically small) maximum length. This socket type uses the User Datagram Protocol (UDP) for the Internet address family (AF_INET or AF_INET6). Services use recvfrom function to obtain datagrams. The listen and accept functions do not work with datagrams.
SOCK_RDM	4	A reliable message datagram socket. This socket type preserves message boundaries in data. An example of this type is the Pragmatic General Multicast (PGM) multicast protocol implementation in Windows, often referred to as reliable multicast programming.
SOCK_SEQPACKET	5	A sequenced packet stream socket. This socket type provides a pseudo-stream packet based on datagrams.

(Read only property)

24.30 class WindowsBlueToothDeviceSearchParameterMBS

24.30.1 class WindowsBlueToothDeviceSearchParameterMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: This class specifies search criteria for Bluetooth device searches.
Blog Entries

- MBS Xojo Plugins, version 21.4pr3
- MBS Xojo Plugins, version 18.3pr4

24.30.2 Methods

24.30.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The constructor.

24.30.4 Properties

24.30.5 IssueInquiry as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: A value that specifies that a new inquiry should be issued.
Notes: (Read and Write property)

24.30.6 Radio as WindowsBlueToothRadioMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: A handle for the radio on which to perform the inquiry.
Notes: Set to nil to perform the inquiry on all local Bluetooth radios.
(Read and Write property)

24.30.7 ReturnAuthenticated as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: A value that specifies that the search should return authenticated Bluetooth devices.
Notes: (Read and Write property)

24.30.8 ReturnConnected as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: A value that specifies that the search should return connected Bluetooth devices.
Notes: (Read and Write property)

24.30.9 ReturnRemembered as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: A value that specifies that the search should return remembered Bluetooth devices.
Notes: (Read and Write property)

24.30.10 ReturnUnknown as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: A value that specifies that the search should return unknown Bluetooth devices.
Notes: (Read and Write property)

24.30.11 TimeoutMultiplier as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: A value that indicates the time out for the inquiry, expressed in increments of 1.28 seconds.
Notes: For example, an inquiry of 12.8 seconds has a cTimeoutMultiplier value of 10. The maximum value for this member is 48. When a value greater than 48 is used, the calling function immediately fails and returns E_INVALIDARG.
(Read and Write property)

24.31 class WindowsBluetoothLEAdvertisementMBS

24.31.1 class WindowsBluetoothLEAdvertisementMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a bluetooth LE advertisement.
Notes: This class is used to represent an advertisement received by the system, an advertisement pattern to filter for, or an advertisement payload that needs to be published. In the case it is generated by the system to represent an advertisement received, certain properties are automatically populated.

For more information about its usage, refer to WindowsBluetoothLEAdvertisementWatcherMBS class for receiving advertisements and the WindowsBluetoothLEAdvertisementPublisherMBS class for sending advertisements.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.31.2 Methods

24.31.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.31.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.31.5 ManufacturerData as WindowsBluetoothLEManufacturerDataMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The list of manufacturer-specific data sections.

24.31.6 ServiceUuids as String()

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the list of service UUIDs (in 128-bit GUID format) in a BluetoothLEAdvertisement.
Notes: An array of GUID, representing the list of service UUIDs in 128-bit GUID format. This property aggregates all the 16-bit, 32-bit, and 128-bit service UUIDs into a single list.
We convert this list to strings for Xojo.

24.31.7 Properties

24.31.8 Flags as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Bluetooth LE advertisement flags.
Notes: (Read only property)

24.31.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.31.10 LocalName as String

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The local name contained within the advertisement.
Notes: The local name contained within the advertisement. This property can be either the shortened or complete local name defined by the Bluetooth LE specifications.
(Read only property)

24.31.11 Constants

Flags

Constant	Value	Description
AdvertisementFlagsClassicNotSupported	4	Specifies Bluetooth BR/EDR not supported.
AdvertisementFlagsDualModeControllerCapable	8	Specifies simultaneous Bluetooth LE and BR/EDR to same (controller).
AdvertisementFlagsDualModeHostCapable	16	Specifies simultaneous Bluetooth LE and BR/EDR to same (host)
AdvertisementFlagsGeneralDiscoverableMode	2	Specifies Bluetooth LE General Discoverable Mode.
AdvertisementFlagsLimitedDiscoverableMode	1	Specifies Bluetooth LE Limited Discoverable Mode.
AdvertisementFlagsNone	0	Specifies no flag.

24.32 class WindowsBluetoothLEAdvertisementReceivedEventArgsMBS

24.32.1 class WindowsBluetoothLEAdvertisementReceivedEventArgsMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data for a Received event on a WindowsBluetoothLEAdvertisementWatcherMBS.
Notes: A WindowsBluetoothLEAdvertisementReceivedEventArgsMBS instance is created when the Received event occurs on a WindowsBluetoothLEAdvertisementWatcherMBS object.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.32.10 RawSignalStrengthInDBm as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The received signal strength indicator (RSSI) value, in dBm, for this event.
Notes: Gets the received signal strength indicator (RSSI) value, in dBm, for this received Bluetooth LE advertisement event. This value could be the raw RSSI or a filtered RSSI depending on filtering settings configured through BluetoothSignalStrengthFilter.
(Read only property)

24.32.11 Constants

Constants

Constant	Value	Description
AdvertisementTypeConnectableDirected	1	Specifies the different types of Bluetooth LE advertisement pay The advertisement is directed and indicates that the device is co not scannable. This advertisement type cannot carry data. This corresponds with the ADV_DIRECT_IND type defined in LE specifications.
AdvertisementTypeConnectableUndirected	0	Specifies the different types of Bluetooth LE advertisement pay The advertisement is undirected and indicates that the device and scannable. This advertisement type can carry data. This corresponds with the ADV_IND type defined in the Bluet fications.
AdvertisementTypeNonConnectableUndirected	3	Specifies the different types of Bluetooth LE advertisement pay The advertisement is undirected and indicates that the device is n nor scannable. This advertisement type can carry data. This corresponds with the ADV_NONCONN_IND type define tooth LE specifications.
AdvertisementTypeScannableUndirected	2	Specifies the different types of Bluetooth LE advertisement pay The advertisement is undirected and indicates that the device is not connectable. This advertisement type can carry data. This corresponds with the ADV_SCAN_IND type defined in LE specifications.
AdvertisementTypeScanResponse	4	Specifies the different types of Bluetooth LE advertisement pay This advertisement is a scan response to a scan request issued f advertisement. This advertisement type can carry data. This corresponds with the SCAN_RSP type defined in the Bluet ifications.

24.33 class WindowsBluetoothLEAdvertisementWatcherMBS

24.33.1 class WindowsBluetoothLEAdvertisementWatcherMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An object to receive Bluetooth Low Energy (LE) advertisements.
Example:

```
// use your own subclass
Watcher = New BLEAdvertisementWatcher
// e.g. output to some listbox
Watcher.list = listWatcher

// active scanning
watcher.ScanningMode = Watcher.ScanningModeActive

// start it
Watcher.Start
```

- MBS Xojo Plugins, version 22.2pr6

24.33.2 Methods

24.33.3 Available as Boolean

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this class is available.
Notes: Returns true on Windows and false otherwise.

24.33.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

24.33.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.33.6 Start

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Start the BluetoothLEAdvertisementWatcher to scan for Bluetooth LE advertisements.
Example:

```
// use your own subclass
Watcher = New BLEAdvertisementWatcher
// e.g. output to some listbox
Watcher.list = listWatcher

// active scanning
watcher.ScanningMode = Watcher.ScanningModeActive

// start it
Watcher.Start
```

Notes: This method will transition the WindowsBluetoothLEAdvertisementWatcherMBS to the Started state immediately with a pending scan request or to the Aborted state if the request failed immediately due to error.
If this method is called in the Stopping state, the request will be pended and the state will remain in the Stopping state until the request completes, at which time a new request will be sent and the state will transition to the Started state.
The WindowsBluetoothLEAdvertisementWatcherMBS will be automatically stopped when an app is suspended.

24.33.7 Stop

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stop the BluetoothLEAdvertisementWatcher and disable the scanning for Bluetooth LE advertisements.
Notes: This method will transition the WindowsBluetoothLEAdvertisementWatcherMBS to the Stopping state until the scan is cancelled in which the state will transition to the Stopped state. Calling this method in the Stopped or Aborted state has no effect. Calling this method in the Stopping state will overwrite any advertisements received in the last Start method call during that state.
The WindowsBluetoothLEAdvertisementWatcherMBS will be automatically stopped when an app is suspended.

24.33.8 Properties

24.33.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.33.10 MaxOutOfRangeTimeout as Int64

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum out of range timeout.
Notes: (Read only property)

24.33.11 MaxSamplingInterval as Int64

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum sampling interval.
Notes: (Read only property)

24.33.12 MinOutOfRangeTimeout as Int64

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum out of range timeout.
Notes: (Read only property)

24.33.13 MinSamplingInterval as Int64

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum sampling interval.
Notes: (Read only property)

24.33.14 ScanningMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the Bluetooth LE scanning mode.
Notes: (Read and Write property)

24.33.15 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the current status of the WindowsBluetoothLEAdvertisementWatcherMBS.
Notes: (Read only property)

24.33.16 Events

24.33.17 Received(Args as WindowsBluetoothLEAdvertisementReceivedEventArgsMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Notification for new Bluetooth LE advertisement events received.

24.33.18 Stopped(Error as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Notification to the app that the Bluetooth LE scanning for advertisements has been cancelled or aborted either by the app or due to an error.

24.33.19 Constants

Errors

Constant	Value	Description
ErrorConsentRequired	8	The operation requires consent.
ErrorDeviceNotConnected	3	The operation cannot be completed because the remote device is not connected.
ErrorDisabledByPolicy	5	The operation is disabled by policy.
ErrorDisabledByUser	7	The operation is disabled by the user.
ErrorNotSupported	6	The operation is not supported on the current Bluetooth radio hardware.
ErrorOtherError	4	An unexpected error has occurred.
ErrorRadioNotAvailable	1	The Bluetooth radio was not available. This error occurs when the Bluetooth radio has been turned off.
ErrorResourceInUse	2	The operation cannot be serviced because the necessary resources are currently in use.
ErrorSuccess	0	The operation was successfully completed or serviced.
ErrorTransportNotSupported	9	The transport is not supported.

Scan modes

Constant	Value	Description
ScanningModeActive	1	Specifies an active scanning mode. This indicates that scan request packets will be sent from the platform to actively query for more advertisement data of type ScanResponse.
ScanningModePassive	0	Specifies a passive scanning mode. This is the default scanning mode.

Status

Constant	Value	Description
StatusAborted	4	An error occurred during transition or scanning that stopped the watcher due to an error.
StatusCreated	0	The initial status of the watcher.
StatusStarted	1	The watcher is started.
StatusStopped	3	The watcher is stopped.
StatusStopping	2	The watcher stop command was issued.

24.34 class WindowsBluetoothLEAppearanceMBS

24.34.1 class WindowsBluetoothLEAppearanceMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides functionality to determine the Bluetooth Low Energy (LE) Appearance information for a device.

- News from the MBS Xojo Plugins Version 22.2
- MBS Xojo Plugins, version 22.2pr6

24.34.2 Methods

24.34.3 CategoryBarcodeScanner as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the barcode scanner appearance category code.

24.34.4 CategoryBloodPressure as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the blood pressure appearance category code.

24.34.5 CategoryClock as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the clock appearance category code.

24.34.6 CategoryComputer as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the computer appearance category code.

24.34.7 CategoryCycling as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cycling appearance category code.

24.34.8 CategoryDisplay as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the display appearance category code.

24.34.9 CategoryEyeGlasses as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the eye glasses appearance category code.

24.34.10 CategoryGlucoseMeter as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the glucose meter appearance category code.

24.34.11 CategoryHeartRate as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the heart rate appearance category code.

24.34.12 CategoryHumanInterfaceDevice as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the human interface device appearance category code.

24.34.13 CategoryKeyring as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the key ring appearance category code.

24.34.14 CategoryMediaPlayer as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the media player appearance category code.

24.34.15 CategoryOutdoorSportActivity as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the outdoor sport activity appearance category code.

24.34.16 CategoryPhone as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the phone appearance category code.

24.34.17 CategoryPulseOximeter as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the pulse oximeter appearance category code.

24.34.18 CategoryRemoteControl as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the remote control appearance category code.

24.34.19 CategoryRunningWalking as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the running or walking appearance category code.

24.34.20 CategoryTag as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the tag appearance category code.

24.34.21 CategoryThermometer as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the thermometer appearance category code.

24.34.22 CategoryUncategorized as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the uncategorized appearance category code.

24.34.23 CategoryWatch as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the watch appearance category code.

24.34.24 CategoryWeightScale as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the weight scale appearance category code.

24.34.25 Constructor(appearanceCategory as UInt16, appearanceSubCategory as UInt16)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a BluetoothLEAppearance object by supplying values for Category and Subcategory of the Bluetooth LE device.
See also:

- 24.34.26 Constructor(RawValue as UInt16) 4407

24.34.26 Constructor(RawValue as UInt16)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a BluetoothLEAppearance object by supplying for raw integer values representing the Category and Subcategory of the Bluetooth LE device.
See also:

- 24.34.25 Constructor(appearanceCategory as UInt16, appearanceSubCategory as UInt16) 4407

24.34.27 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.34.28 SubcategoryBarcodeScanner as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the pulse barcode scanner appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.29 SubcategoryBloodPressureArm as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the blood pressure arm appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the BloodPressure appearance category.

24.34.30 SubcategoryBloodPressureWrist as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the blood pressure wrist appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the BloodPressure appearance category.

24.34.31 SubcategoryCardReader as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the card reader appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.32 SubcategoryCyclingCadenceSensor as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cycling cadence sensor appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the Cycling appearance category.

24.34.33 SubcategoryCyclingComputer as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cycling computer appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the Cycling appearance category.

24.34.34 SubcategoryCyclingPowerSensor as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cycling power sensor appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the Cycling appearance category.

24.34.35 SubcategoryCyclingSpeedCadenceSensor as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cycling speed cadence sensor appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the Cycling appearance category.

24.34.36 SubcategoryCyclingSpeedSensor as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the cycling speed sensor appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the Cycling appearance category.

24.34.37 SubcategoryDigitalPen as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the digital pen appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.38 SubcategoryDigitizerTablet as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the digitizer tablet appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.39 SubcategoryGamepad as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the gamepad appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.40 SubcategoryGeneric as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the generic appearance subcategory code.

24.34.41 SubcategoryHeartRateBelt as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the heart rate belt appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HeartRate appearance category.

24.34.42 SubcategoryJoystick as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the joystick appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.43 SubcategoryKeyboard as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the keyboard appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.44 SubcategoryLocationDisplay as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the location display appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the OutdoorSportActivity appearance category.

24.34.45 SubcategoryLocationNavigationDisplay as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the location navigation display appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the OutdoorSportActivity appearance category.

24.34.46 SubcategoryLocationNavigationPod as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the location navigation pod appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the OutdoorSportActivity appearance category.

24.34.47 SubcategoryLocationPod as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the location pod appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the OutdoorSportActivity appearance category.

24.34.48 SubcategoryMouse as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the mouse appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the HumanInterfaceDevice appearance category.

24.34.49 SubcategoryOximeterFingertip as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the oximeter fingertip appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the PulseOximeter appearance category.

24.34.50 SubcategoryOximeterWristWorn as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the oximeter wrist worn appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the PulseOximeter appearance category.

24.34.51 SubcategoryRunningWalkingInShoe as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the running or walking in shoe appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the RunningWalking appearance category.

24.34.52 SubcategoryRunningWalkingOnHip as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the running or walking on hip appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the RunningWalking appearance category.

24.34.53 SubcategoryRunningWalkingOnShoe as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the running or walking on shoe appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the RunningWalking appearance category.

24.34.54 SubcategorySportsWatch as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the sports watch appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the RunningWalking appearance category.

24.34.55 SubcategoryThermometerEar as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the ear thermometer appearance subcategory code.
Notes: This is only applicable for Bluetooth LE devices that are part of the RunningWalking appearance category.

24.34.56 Properties

24.34.57 Category as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the appearance category value of the Bluetooth LE device.
Notes: (Read only property)

24.34.58 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.34.59 RawValue as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The appearance raw value of the Bluetooth LE device.
Notes: (Read only property)

24.34.60 SubCategory as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the appearance subcategory value of the Bluetooth LE device.
Notes: (Read only property)

24.35 class WindowsBlueToothLECharacteristicMBS

24.35.1 class WindowsBlueToothLECharacteristicMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Describes a Bluetooth Low Energy (LE) generic attribute (GATT) profile characteristic.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.35.2 Methods

24.35.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The private constructor.

24.35.4 Properties

24.35.5 AttributeHandle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The handle to the Bluetooth LE GATT profile attributes.
Notes: (Read only property)

24.35.6 CharacteristicUuid as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The Universally Unique ID (UUID) of the characteristic.
Notes: (Read only property)

24.35.7 CharacteristicValueHandle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The handle to the Bluetooth LE GATT profile characteristic value.
Notes: (Read only property)

24.35.8 HasExtendedProperties as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic has extended properties, which will be presented through a Characteristic Extended Properties descriptor.
Notes: (Read only property)

24.35.9 IsBroadcastable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic can be broadcast.
Notes: (Read only property)

24.35.10 IsIndicatable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic can be updated by the device through Handle Value Indications, and the new value will be returned through the ChangeEvent event.
Notes: (Read only property)

24.35.11 IsNotifiable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic can be updated by the device through Handle Value Notifications, and the new value will be returned through the ChangeEvent event.
Notes: (Read only property)

24.35.12 IsReadable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic can be read.
Notes: (Read only property)

24.35.13 IsSignedWritable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic can be signed writable.
Notes: (Read only property)

24.35.14 IsWritable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic can be written to.
Notes: (Read only property)

24.35.15 IsWritableWithoutResponse as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic can be written to without requiring a response.
Notes: (Read only property)

24.35.16 ServiceHandle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The handle to the Bluetooth LE GATT profile service.
Notes: (Read only property)

24.36 class WindowsBlueToothLEDescriptorMBS

24.36.1 class WindowsBlueToothLEDescriptorMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Describes a Bluetooth Low Energy (LE) generic attribute (GATT) profile descriptor.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.36.2 Methods

24.36.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The private constructor.

24.36.4 Properties

24.36.5 AttributeHandle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The handle to the Bluetooth LE GATT profile attributes.
Notes: (Read only property)

24.36.6 CharacteristicHandle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The handle to the Bluetooth LE GATT profile characteristic.
Notes: (Read only property)

24.36.7 DescriptorType as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The type of the Bluetooth LE GATT descriptor.
Notes: See WindowsBlueToothLEDescriptorValueMBS.kDescriptorType* constants.

(Read only property)

24.36.8 DescriptorUuid as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The Universally Unique ID (UUID) of the Bluetooth LE GATT descriptor.
Notes: (Read only property)

24.36.9 ServiceHandle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The handle to the Bluetooth LE GATT profile service.
Notes: (Read only property)

24.37 class WindowsBlueToothLEDescriptorValueMBS

24.37.1 class WindowsBlueToothLEDescriptorValueMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Describes a parent characteristic.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.37.2 Methods

24.37.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The private constructor.

24.37.4 Properties

24.37.5 Data as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The descriptor value data.
Notes: (Read and Write property)

24.37.6 DataSize as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The size, in bytes, of the descriptor value.
Notes: (Read only property)

24.37.7 Description as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The Universally Unique ID (UUID) that describes the format of the parent characteristic value.
Notes: Only set if DescriptorType is kDescriptorTypeCharacteristicFormat.

(Read and Write property)

24.37.8 DescriptorType as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The type of the descriptor value.
Notes: See WindowsBlueToothLEDescriptorValueMBS.kDescriptorType* constants.
(Read and Write property)

24.37.9 DescriptorUuid as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The Universally Unique ID (UUID) of the descriptor value.
Notes: (Read and Write property)

24.37.10 Exponent as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The exponent value to use to determine how the value of the characteristic value is further formatted.
Notes: Only set if DescriptorType is kDescriptorTypeCharacteristicFormat.
(Read and Write property)

24.37.11 Format as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The format of the parent characteristic value.
Notes: Only set if DescriptorType is kDescriptorTypeCharacteristicFormat.
(Read and Write property)

24.37.12 IsAuxiliariesWritable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The characteristic user description descriptor is writable.
Notes: Only set if DescriptorType is kDescriptorTypeCharacteristicExtendedProperties.

(Read and Write property)

24.37.13 IsBroadcast as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The parent characteristic value can be broadcast.
Notes: Only set if DescriptorType is kDescriptorTypeServerCharacteristicConfiguration.
(Read and Write property)

24.37.14 IsReliableWriteEnabled as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The parent characteristic value is reliable write enabled.
Notes: Only set if DescriptorType is kDescriptorTypeCharacteristicExtendedProperties.
(Read and Write property)

24.37.15 IsSubscribeToIndication as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Whether the characteristic has been registered with the device to receive Handle Value Indications.
Notes: True if the characteristic has been registered. Otherwise, false.
Only set if DescriptorType is kDescriptorTypeClientCharacteristicConfiguration.
(Read and Write property)

24.37.16 IsSubscribeToNotification as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Whether the characteristic has been registered with the device to receive Handle Value Notifications.
Notes: True if the characteristic has been registered. Otherwise, false.
Only set if DescriptorType is kDescriptorTypeClientCharacteristicConfiguration.
(Read and Write property)

24.37.17 NameSpaceValue as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The name-space where the unit is defined in the Assigned Numbers specification.
Notes: Only set if DescriptorType is kDescriptorTypeCharacteristicFormat.
(Read and Write property)

24.37.18 Unit as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The unit of the characteristic value as defined in the Assigned Numbers specification.
Notes: Only set if DescriptorType is kDescriptorTypeCharacteristicFormat.
(Read and Write property)

24.37.19 Constants

Descriptor Types

Constant	Value	Description
kDescriptorTypeCharacteristicAggregateFormat	5	The format of an aggregated characteristic value.
kDescriptorTypeCharacteristicExtendedProperties	0	The characteristic value has additional properties that desc used, or how it can be accessed.
kDescriptorTypeCharacteristicFormat	4	The format of the characteristic value.
kDescriptorTypeCharacteristicUserDescription	1	The characteristic value contains a UTF-8 string of variable textual description.
kDescriptorTypeClientCharacteristicConfiguration	2	The characteristic value may be configured by the client.
kDescriptorTypeCustomDescriptor	6	The characteristic value is customized.
kDescriptorTypeServerCharacteristicConfiguration	3	The characteristic value may be configured for the server.

24.38 class WindowsBluetoothLEDeviceMBS

24.38.1 class WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a Bluetooth LE device.
Notes: Requires Windows 10 (introduced in 10.0.10240.0)

24.38.2 Methods

24.38.3 Close

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes this Bluetooth LE device.
Notes: This may close the connection to the device if this is the only app with a connection.
Sets handle to zero.

24.38.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 24.38.5 Constructor(other as WindowsBluetoothLEDeviceMBS) 4424

24.38.5 Constructor(other as WindowsBluetoothLEDeviceMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copy constructor.
Notes: To get a new Xojo object pointing to the same device object.
See also:

- 24.38.4 Constructor 4424

24.38.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.38.7 FromBluetoothAddress(bluetoothAddress as UInt64) as WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a BluetoothLEDevice object representing the peer Bluetooth LE device with the given address.
Notes: Synchronous version, which may blocks the application until the function finished.
See also:

- 24.38.8 FromBluetoothAddress(bluetoothAddress as UInt64, BluetoothAddressType as Integer) as WindowsBluetoothLEDeviceMBS 4424

24.38.8 FromBluetoothAddress(bluetoothAddress as UInt64, BluetoothAddressType as Integer) as WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a BluetoothLEDevice object representing the peer Bluetooth LE device with the given address.
Notes: Synchronous version, which may blocks the application until the function finished.
See also:

- 24.38.7 FromBluetoothAddress(bluetoothAddress as UInt64) as WindowsBluetoothLEDeviceMBS 4424

24.38.9 FromBluetoothAddressAsync(bluetoothAddress as UInt64, BluetoothAddressType as Integer, delegateHandler as DeviceFromBluetoothAddressAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a BluetoothLEDevice object representing the peer device with the given address and address type.
Notes: bluetoothAddress: A BluetoothAddress value containing the 64-bit address of the peer Bluetooth LE device.

bluetoothAddressType: A BluetoothAddressType value containing the address type of the peer Bluetooth LE device.

The returned BluetoothLEDevice is set to nil if FromBluetoothAddressAsync can't find the device identified by bluetoothAddress. Specifically, if the device isn't paired and it isn't found in the system cache. You can populate the cache for a non-paired device using either the LE advertisement watcher APIs (BluetoothLEAdvertisementWatcher) or the device enumeration APIs (GetDeviceSelectorFromPairingState) to scan for the Bluetooth devices before the FromBluetoothAddressAsync can be successfully used.

Calls delegate later when we have a result.

Creating a BluetoothLEDevice object by calling this method alone doesn't (necessarily) initiate a connection. To initiate a connection, set GattSession.MaintainConnection to true, or call an uncached service discovery method on BluetoothLEDevice, or perform a read/write operation against the device.
If GattSession.MaintainConnection is set to true, then the system waits indefinitely for a connection, and it will connect when the device is available. There's nothing for your application to wait on, since GattSession.MaintainConnection is a property.
For service discovery and read/write operations in GATT, the system waits a finite but variable time. Anything from instantaneous to a matter of minutes. Factors include the traffic on the stack, and how queued up the request is. If there are no other pending request, and the remote device is unreachable, then the system will wait for 7 seconds before it times out. If there are other pending requests, then each of the requests in the queue can take 7 seconds to process, so the further yours is toward the back of the queue, the longer you'll wait.
You can't cancel the connection process.

- 24.38.10 FromBluetoothAddressAsync(bluetoothAddress as UInt64, delegateHandler as DeviceFromBlue-

toothAddressAsyncCompletedMBS) 4426

24.38.10 FromBluetoothAddressAsync(bluetoothAddress as UInt64, delegateHandler as DeviceFromBluetoothAddressAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a BluetoothLEDevice object representing the peer Bluetooth LE device with the given address.
Notes: bluetoothAddress: A BluetoothAddress value containing the 64-bit address of the peer Bluetooth LE device.

The returned BluetoothLEDevice is set to nil if FromBluetoothAddressAsync can't find the device identified by bluetoothAddress. Specifically, if the device isn't paired and it isn't found in the system cache. You can populate the cache for a non-paired device using either the LE advertisement watcher APIs (BluetoothLEAdvertisementWatcher) or the device enumeration APIs (GetDeviceSelectorFromPairingState) to scan for the Bluetooth devices before the FromBluetoothAddressAsync can be successfully used.

Calls delegate later when we have a result.

Creating a BluetoothLEDevice object by calling this method alone doesn't (necessarily) initiate a connection. To initiate a connection, set GattSession.MaintainConnection to true, or call an uncached service discovery method on BluetoothLEDevice, or perform a read/write operation against the device.
If GattSession.MaintainConnection is set to true, then the system waits indefinitely for a connection, and it will connect when the device is available. There's nothing for your application to wait on, since GattSession.MaintainConnection is a property.

- 24.38.9 FromBluetoothAddressAsync(bluetoothAddress as UInt64, BluetoothAddressType as Integer, delegateHandler as DeviceFromBluetoothAddressAsyncCompletedMBS) 4425

24.38.11 FromId(Id as String) as WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries a BluetoothLEDeviceMBS object for the given Id.
Notes: Id: The Id of the Bluetooth LE device.

Synchronous version, which may blocks the application until the function finished.

24.38.12 FromIdAsync(Id as String, delegateHandler as DeviceFromIdAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries a BluetoothLEDeviceMBS object for the given Id.
Notes: Id: The Id of the Bluetooth LE device.
Calls delegate later when we have a result.

24.38.13 GetDeviceSelector as String

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets an Advanced Query Syntax (AQS) string for identifying all Bluetooth Low Energy (LE) devices.
Notes: This string is passed to the FindAllAsync or CreateWatcher method in order to get a list of Bluetooth LE devices.

24.38.14 GetDeviceSelectorFromAppearance(Appearance as WindowsBluetoothLEAppearanceMBS) as String

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an Advanced Query Syntax (AQS) filter string from a BluetoothLEAppearance object.
Notes: The AQS string is passed into the CreateWatcher method to return a collection of DeviceInformation objects with the specified appearance.

24.38.15 GetGattService(serviceUUID as String) as WindowsGattDeviceServiceMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the GATT service with the given service Id.
Notes: serviceUUID: The service Id of the GATT service.

24.38.16 GetGattServicesAsync

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries available GATT services for this device.
Notes: Calls GetGattServicesCompleted event later with results.
See also:

- 24.38.17 GetGattServicesAsync(BluetoothCacheMode as Integer) 4428

24.38.17 GetGattServicesAsync(BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries available GATT services for this device.
Notes: Calls GetGattServicesCompleted event later with results.

For cache mode, see CacheModeCached and CacheModeUncached constants in WindowsGattDeviceServiceMBS class.
See also:

- 24.38.16 GetGattServicesAsync 4428

24.38.18 GetGattServicesForUuidAsync(serviceUuid as String)

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries available GATT services for this device with given UUID.
Notes: Calls GetGattServicesCompleted event later with results.
See also:

- 24.38.19 GetGattServicesForUuidAsync(serviceUuid as String, BluetoothCacheMode as Integer) 4428

24.38.19 GetGattServicesForUuidAsync(serviceUuid as String, BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries available GATT services for this device with given UUID.
Notes: Calls GetGattServicesCompleted event later with results.

For cache mode, see CacheModeCached and CacheModeUncached constants in WindowsGattDeviceServiceMBS class.
See also:

• 24.38.18 GetGattServicesForUuidAsync(serviceUuid as String) 4428

24.38.20 RequestAccessAsync

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Requests access to the Bluetooth LowEnergy device.
Notes: Calls RequestAccessAsyncCompleted event later.

24.38.21 Properties

24.38.22 Appearance as WindowsBluetoothLEAppearanceMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the BluetoothLEAppearance object for the Bluetooth LE device.
Notes: (Read only property)

24.38.23 BluetoothAddress as UInt64

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the device address.
Notes: (Read only property)

24.38.24 BluetoothAddressType as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the address type for the Bluetooth LE device.
Notes: (Read only property)

24.38.25 BluetoothDeviceId as WindowsBluetoothDeviceIdMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the bluetooth device ID.
Notes: (Read only property)

24.38.26 ConnectionStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the connection status of the device.
Notes: Either ConnectionStatusConnected or ConnectionStatusDisconnected.
(Read only property)

24.38.27 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.38.28 Name as String

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the Bluetooth LE device.
Notes: (Read only property)

24.38.29 Pairing as WindowsDeviceInformationPairingMBS

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries pairing object for the bluetooth device.
Notes: (Read only property)

24.38.30 WasSecureConnectionUsedForPairing as Boolean

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a boolean indicating whether the BluetoothLEDevice was paired using a Secure Connection.
Notes: (Read only property)

24.38.31 Events

24.38.32 ConnectionStatusChanged

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The connection status changed.

24.38.33 GattServicesChanged

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The services changed.

24.38.34 GetGattServicesCompleted(asyncStatus as Integer, Result as WindowsGattDeviceServicesResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by GetGattServicesForUuidAsync or GetGattServicesAsync methods on completion.

24.38.35 NameChanged

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name changed.

24.38.36 PairAsyncCompleted(asyncStatus as Integer, PairingStatus as Integer, ProtectionLevelUsed as Integer)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when PairAsync method finishes.
Notes: ProtectionLevelUsed: Gets the level of protection used to pair the device.
Status: Gets the paired status of the device after the pairing action completed.

24.38.37 RequestAccessCompleted(asyncStatus as Integer, DeviceAccessStatus as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The request for access completed.

24.38.38 UnpairAsyncCompleted(asyncStatus as Integer, UnpairingStatus as Integer)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when the UnpairAsync method finished.
Notes: Status: Gets the paired status of the device after the unpairing action completed.

24.38.39 Constants

Address Type

Constant	Value	Description
AddressTypePublic	0	Public address.
AddressTypeRandom	1	Random address.
AddressTypeUnspecified	2	Unspecified address.

Asynchronous Status

Constant	Value	Description
AsyncStatusCanceled	2	The operation was canceled.
AsyncStatusCompleted	1	The operation has completed.
AsyncStatusError	3	The operation has encountered an error.
AsyncStatusStarted	0	The operation has started.

ConnectionStatus

Constant	Value	Description
ConnectionStatusConnected	1	The device is connected.
ConnectionStatusDisconnected	0	The device is disconnected.

Device Access Status

Constant	Value	Description
DeviceAccessStatusAllowed	1	Access to the device is allowed.
DeviceAccessStatusDeniedBySystem	3	Access to the device has been disallowed by the system.
DeviceAccessStatusDeniedByUser	2	Access to the device has been disallowed by the user.
DeviceAccessStatusUnspecified	0	The device access is not specified.

24.38.40 Delegates

24.38.41 DeviceFromBluetoothAddressAsyncCompletedMBS(AsyncStatus as Integer, Device as WindowsBluetoothLEDeviceMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate for FromBluetoothAddressAsync results.

24.38.42 DeviceFromIdAsyncCompletedMBS(AsyncStatus as Integer, Device as WindowsBluetoothLEDeviceMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate for FromIdAsync results.

24.39 class WindowsBluetoothLEExceptionMBS

24.39.1 class WindowsBluetoothLEExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop only.

Function: The exception for errors reported by WindowsBluetoothLE classes.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo Plugins, version 22.2pr6

24.40 class WindowsBluetoothLEManufacturerDataMBS

24.40.1 class WindowsBluetoothLEManufacturerDataMBS

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for manufacturer-specific data.
Notes: A Bluetooth LE manufacturer-specific data section (one particular type of LE advertisement section).
A Bluetooth LE advertisement packet can contain multiple instances of these BluetoothLEManufacturerData objects.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.40.2 Methods

24.40.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.40.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.40.5 Properties

24.40.6 CompanyId as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Bluetooth LE company identifier code.
Notes: The Bluetooth LE company identifier code as defined by the Bluetooth Special Interest Group (SIG).
(Read only property)

24.40.7 Data as MemoryBlock

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Bluetooth LE manufacturer-specific section data.
Notes: (Read only property)

24.40.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.41 class WindowsBlueToothLEMBS

24.41.1 class WindowsBlueToothLEMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The class for using Bluetooth LE functions on Windows 8 or newer.
Blog Entries

- MBS Xojo Plugins, version 22.1pr7
- MBS Xojo Plugins, version 18.3pr4
- Bluetooth for Xojo

24.41.2 Methods

24.41.3 AbortReliableWrite(ReliableWriteContextID as UInt64)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Specifies the end of reliable write procedures, and the writes should be aborted.
Notes: ReliableWriteContextID: The context describing the reliable write operation returned from a previous call to BeginReliableWrite.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450791(v=vs.85).aspx

24.41.4 Available as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Whether this classes are available.
Notes: Should return true on Windows 8 and later versions of Windows.

24.41.5 BeginReliableWrite as UInt64

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Specifies that reliable writes are about to begin.
Notes: Returns the ID for the context describing the reliable write operation.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450792(v=vs.85).aspx

24.41.6 Characteristics(ParentService as WindowsBlueToothLEServiceMBS, Flags as Integer = 0) as WindowsBlueToothLECharacteristicMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Gets all the characteristics available for the specified service.
Notes: Service: Address of a WindowsBlueToothLEServiceMBS containing the parent service of the included services to be retrieved. This parameter is optional if a service handle was passed to Device, in which case the service specified by the service handle will be treated as the parent.
Flags: Optional flags, currently non defined.

Returned characteristics are cached upon successful retrieval of characteristics from the device directly. Unless a service-change event is received, the list of returned characteristics is not expected to change.

The parent service must be present in the cache, otherwise the function will fail. The parent service must be a service returned by either Services or IncludedServices methods.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450795(v=vs.85).aspx

24.41.7 Constructor(DevicePath as String)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The constructor.
Notes: Takes path to device or service on device to connect.

24.41.8 Descriptors(Characteristic as WindowsBlueToothLECharacteristicMBS, Flags as Integer = 0) as WindowsBlueToothLEDescriptorMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Gets all the descriptors available for the specified characteristic.
Notes: Characteristic: The parent characteristic of the descriptors to be retrieved.

Returned characteristics are cached upon successful retrieval of characteristics from the device directly. Unless a service-change event is received, the list of returned characteristics is not expected to change.

The parent characteristic must be present in the cache, otherwise the function will fail. The parent service must be a service returned by either Services or IncludedServices.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450797(v=vs.85).aspx

24.41.9 DevicePathsForClassGUID(GUID as string) as String()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Queries installation database for devices.
Example:

```
Var paths() as String = WindowsBlueToothLEMBS.DevicePathsForClassGUID(" { 0000180D-0000-1000-8000-00805F9B34FB } ")

List.DeleteAllRows
if paths = nil then
list.AddRow "Failed."
else
for each path as string in paths
List.AddRow path
next
end if
```

Notes: This is a helper method in MBS Plugin to query setup database to find the paths to devices with a given GUID.

Pass in the GUID of the device, e.g. " { 0000180D-0000-1000-8000-00805F9B34FB } "

24.41.10 EndReliableWrite(ReliableWriteContextID as UInt64)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Specifies the end of reliable writes, and the writes should be committed.
Notes: ReliableWriteContextID: The context describing the reliable write operation returned from a previous call to BeginReliableWrite.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450794(v=vs.85).aspx

24.41.11 GetCharacteristicValue(Characteristic as WindowsBlueToothLECharacteristicMBS, Flags as Integer = 0) as MemoryBlock

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Gets the value of the specified characteristic.
Notes: Characteristic: the parent characteristic of the characteristic value to be retrieved.
Flags: Flags to modify the behavior of GetCharacteristicValue.

Flag	Description
kFlagNone	The client does not have specific GATT requirements (default).
kFlagConnectionEncrypted	The client requests the data to be transmitted over an encrypted channel.
kFlagConnectionAuthenticated	The client requests the data to be transmitted over an authenticated channel.
kFlagForceReadFromDevice	The characteristic value is to be read directly from the device. This overwrites the one in the cache if one is already present.
kFlagForceReadFromCache	The characteristic value is to be read from the cache (regardless of whether it is present in the cache or not).

The characteristic value is returned from the cache if one is already present. This would be the case most of the time, as all the device attributes are cached at the time of pairing or association. However, if it is not present, the characteristic value is read directly from the device, and will be cached upon successfully reading it from the device. If kFlagForceReadFromCache or kFlagForceReadFromDevice is present, the characteristic value is read using the specified method.
Returned characteristics are cached upon successful retrieval of characteristics from the device directly. Unless a service-change event is received, the list of returned characteristics is not expected to change.

The parent service must be present in the cache, otherwise the function will fail. The parent service must be a service returned by either Services or IncludedServices.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450795(v=vs.85).aspx

24.41.12 GetDescriptorValue(Descriptor as WindowsBlueToothLEDescriptorMBS, Flags as Integer = 0) as WindowsBlueToothLEDescriptorValueMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Gets the value of the specified descriptor.
Notes: Descriptor: The parent descriptor of the descriptor value to be retrieved.
Flags: Flags to modify the behavior of GetDescriptorValue.

Flag	Description
kFlagNone	The client does not have specific GATT requirements (default).
kFlagConnectionEncrypted	The client requests the data to be transmitted over an encrypted channel.
kFlagConnectionAuthenticated	The client requests the data to be transmitted over an authenticated channel.
kFlagForceReadFromDevice	The descriptor value is to be read directly from the device. This overwrites the one in the cache if one is already present.
kFlagForceReadFromCache	The descriptor value is to be read from the cache (regardless of whether it is present in the cache or not).

Lasterror and LastErrorMessage properties are set.

The descriptor value is returned from the cache if one is already present. This would be the case most of the time, as all the device attributes are cached at the time of pairing or association. However, if it is not present, the descriptor value is read directly from the device, and will be cached upon successfully reading it from the device. If kFlagForceReadFromCache or kFlagForceReadFromDevice is present, the descriptor value is read using the specified method.

Returned descriptor values are cached upon successful retrieval of descriptor values from the device directly. Unless a service-change event is received, the descriptor values is not expected to change.

The parent service must be present in the cache, otherwise the function will fail. The parent service must be a service returned by either Services or IncludedServices.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450798(v=vs.85).aspx

24.41.13 IncludedServices(ParentService as WindowsBlueToothLEServiceMBS, Flags as Integer = 0) as WindowsBlueToothLEServiceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Gets all the included services available for a given service.
Notes: ParentService: Address of a WindowsBlueToothLEServiceMBS object that contains the parent service of the included services to be retrieved. This parameter is optional if a service handle was passed to hDevice, in which case the service specified by the service handle will be treated as the parent.
Flags: Optional flags, currently none defined.

Returned services are cached upon successful retrieval of services from the device directly. Unless a service-change event is received, the list of returned services is not expected to change.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450800(v=vs.85).aspx

24.41.14 RegisterChangeEvent(Characteristics() as WindowsBlueToothLECharacteristicMBS)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Registers a ChangedEvent event to be called back during a characteristic value change event on the given characteristic identified by its characteristic handle.
Notes: Characteristics: List of characteristics to watch for changes.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450804(v=vs.85).aspx

24.41.15 Services(Flags as Integer = 0) as WindowsBlueToothLEServiceMBS()

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Gets all the primary services available for a server.
Notes: Flags: Currently not used.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450795(v=vs.85).aspx

24.41.16 SetCharacteristicValue(Characteristic as WindowsBlueToothLECharacteristicMBS, data as MemoryBlock, ReliableWriteContextID as UInt64, Flags as Integer = 0) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Writes the specified characteristic value to the Bluetooth device.
Notes: Characteristic: The object containing the parent characteristic.
CharacteristicValue: The object containing the characteristic value.
ReliableWriteContext: Optionally the context describing the reliable write operation returned from a previous call to BeginReliableWrite.
Flags: Flags to modify the behavior of SetCharacteristicValue.

Flag	Description
kFlagNone	The client does not have specific GATT requirements (default).
kFlagConnectionEncrypted	The client requests the data to be transmitted over an encrypted channel.
kFlagConnectionAuthenticated	The client requests the data to be transmitted over an authenticated channel.
kFlagWriteWithoutResponse	Write without response.
kFlagSignedWrite	Signed write. Profile drivers must use with BLUETOOTH_GATT_FLAG_WRITE_WITHOUT_RESPONSE in order to produce signed write without a response.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450806(v=vs.85).aspx

24.41.17 SetDescriptorValue(Descriptor as WindowsBlueToothLEDescriptorMBS, DescriptorValue as WindowsBlueToothLEDescriptorValueMBS, Flags as Integer = 0) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Writes the specified descriptor value to the Bluetooth device.
Notes: Descriptor: Tthe parent descriptor.
DescriptorValue: The descriptor's value.
Flags: Flags to modify the behavior of SetDescriptorValue:

Flag	Description
kFlagNone	The client does not have specific GATT requirements (default).
kFlagConnectionEncrypted	The client requests the data to be transmitted over an encrypted channel.
kFlagConnectionAuthenticated	The client requests the data to be transmitted over an authenticated channel.

Lasterror and LastErrorMessage properties are set.

see also:
https://msdn.microsoft.com/en-us/library/windows/hardware/hh450807(v=vs.85).aspx

24.41.18 Properties

24.41.19 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The internal object reference.
Notes: Either handle for device or service on a device.
(Read and Write property)

24.41.20 LastError as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

24.41.21 LastErrorMessage as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The text message for last error.
Notes: (Read and Write property)

24.41.22 Path as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The path used to open device.
Notes: (Read and Write property)

24.41.23 Events

24.41.24 ChangeEvent(ChangedAttributeHandle as Integer, CharacteristicValue as MemoryBlock)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The event called when a value changed.
Notes: Only called if you used RegisterChangeEvent before.

24.41.25 Constants

Flags

Constant	Value	Description
kFlagConnectionAuthenticated	&h00000002	The client requests the data to be transmitted over an authenticated cha
kFlagConnectionEncrypted	&h00000001	The client requests the data to be transmitted over an encrypted channe
kFlagForceReadFromCache	&h00000008	The descriptor value is to be read from the cache (regardless of whether present in the cache or not).
kFlagForceReadFromDevice	&h00000004	The descriptor value is to be read directly from the device. This overwrite one in the cache if one is already present.
kFlagNone	&h00000000	No flag.
kFlagReturnAll	&h00000040	
kFlagSignedWrite	&h00000010	Signed write. Profile drivers must use with kFlagWriteWithoutRespon order to produce signed write without a response.
kFlagWriteWithoutResponse	&h00000020	Write without response.

24.42 class WindowsBlueToothLEServiceMBS

24.42.1 class WindowsBlueToothLEServiceMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The WindowsBlueToothLEServiceMBS class describes a Bluetooth Low Energy (LE) generic attribute (GATT) profile service.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.42.2 Methods

24.42.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The private constructor.

24.42.4 Properties

24.42.5 AttributeHandle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The handle to the Bluetooth LE GATT profile attributes.
Notes: (Read and Write property)

24.42.6 ServiceUUID as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The Universally Unique ID (UUID) of the Bluetooth LE GATT profile service.
Notes: (Read and Write property)

24.43 class WindowsBlueToothRadioInfoMBS

24.43.1 class WindowsBlueToothRadioInfoMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: This class contains information about a Bluetooth radio.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 23.4pr1
- MBS Xojo Plugins, version 18.3pr4

24.43.2 Methods

24.43.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The private constructor.

24.43.4 Properties

24.43.5 Address as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Address of the local Bluetooth radio.
Notes: (Read only property)

24.43.6 ClassofDevice as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Device class for the local Bluetooth radio.
Notes: (Read only property)

24.43.7 Manufacturer as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Manufacturer of the Bluetooth radio, expressed as a BTH_MFG_Xxx value.
Notes: For more information about the Bluetooth assigned numbers document and a current list of values, see the Bluetooth specification at www.bluetooth.com.
(Read only property)

24.43.8 Name as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Name of the local Bluetooth radio.
Notes: (Read only property)

24.43.9 Subversion as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: This member contains data specific to individual Bluetooth device manufacturers.
Notes: (Read only property)

24.44 class WindowsBlueToothRadioMBS

24.44.1 class WindowsBlueToothRadioMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The class for a bluetooth radio.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.3pr4

24.44.2 Methods

24.44.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The private constructor.

24.44.4 DeviceInfo(Address as String) as WindowsBlueToothDeviceInfoMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Retrieves information about a remote Bluetooth device.
Notes: The Bluetooth device must have been previously identified through a successful device inquiry function call.
Lasterror is set.

24.44.5 EnableDiscovery(radio as WindowsBlueToothRadioMBS = nil, enable as boolean = true) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Changes the discovery state of a local Bluetooth radio or radios.
Notes: Enabled: Flag specifying whether discovery is to be enabled or disabled. Set to TRUE to enable discovery, set to FALSE to disable discovery.

Returns true if the discovery state was successfully changed.
Returns false if discovery state was not changed.

Use the IsDiscoverable function to determine the current state of a Bluetooth radio. Windows ensures that a discoverable system is connectable, and as such, the radio must allow incoming connections prior to making a radio discoverable. Failure to allow incoming connections results in the BluetoothEnableDiscovery function call failing.
When EnableDiscovery changes the discovery state, the new state is valid for the lifetime of the calling application. Additionally, if a Bluetooth radio previously made discoverable with this function is disabled and re-enabled via the application, discoverability will not persist. Once the calling application terminates, the discovery state of the specified Bluetooth radio reverts to the state it was in before EnableDiscovery was called.

24.44.6 EnableIncomingConnections(radio as WindowsBlueToothRadioMBS = nil, enable as boolean = true) as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Modifies whether a local Bluetooth radio accepts incoming connections.
Notes: Flag specifying whether incoming connection acceptance is to be enabled or disabled. Set to true to enable incoming connections, set to false to disable incoming connections.

Returns true if the incoming connection state was successfully changed.
Returns false if incoming connection state was not changed.

A radio that is non-connectable is non-discoverable. The radio must be made non-discoverable prior to making a radio non-connectable. Failure to make a radio non-discoverable prior to making it non-connectable will result in failure of the EnableIncomingConnections function call.

24.44.7 FirstRadio as WindowsBlueToothRadioMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Queries first radio.
Notes: Lasterror is set.

24.44.8 Radios as WindowsBlueToothRadioMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Queries radios.
Notes: Lasterror is set.

24.44.9 RemoveDevice(Address as string) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Removes authentication between a Bluetooth device and the computer and clears cached service information for the device.
Notes: Lasterror is set.

24.44.10 UpdateDeviceRecord(Address as string, Name as String) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Updates the local computer cache about a Bluetooth device.
Notes: Lasterror is set.

When updating a Bluetooth device record, please pass:

Address: Must be a previously found radio address.
Name: Must contain the new name to be stored.

24.44.11 Properties

24.44.12 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

24.44.13 Info as WindowsBlueToothRadioInfoMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Obtains information about a Bluetooth radio.
Notes: Lasterror is set.
(Read only property)

24.44.14 IsConnectable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Determines whether a Bluetooth radio or radios is connectable.
Notes: Returns true if at least one Bluetooth radio is accepting incoming connections. Returns false if no radios are accepting incoming connections.

If multiple Bluetooth radios exist, the first radio to return that it is connectable causes the IsConnectable function to succeed.
(Read only property)

24.44.15 IsDiscoverable as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Determines whether a Bluetooth radio or radios is discoverable.
Notes: Returns true if at least one Bluetooth radio is discoverable.
Returns false if no Bluetooth radios are discoverable.
(Read only property)

24.44.16 Lasterror as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

24.45 class WindowsBlueToothSelectDeviceDialogMBS

24.45.1 class WindowsBlueToothSelectDeviceDialogMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: This class facilitates and manages the visibility, authentication, and selection of Bluetooth devices and services.
Blog Entries

- MBS Xojo Plugins, version 21.6pr3
- MBS Xojo Plugins, version 18.3pr4
- Bluetooth for Xojo

24.45.2 Methods

24.45.3 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The constructor.

24.45.4 Devices as WindowsBlueToothDeviceInfoMBS()

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Queries list of devices.
Notes: The list of selected devices after calling ShowDialog method.

24.45.5 ShowDialog as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Enables Bluetooth device selection.
Notes: Sets Cancelled and Devices property.
Returns true if a user selected a device.

The ShowDialog function opens a common dialog box for selecting Bluetooth devices. The list of devices displayed to the user is determined by the flags and settings the caller specifies in the WindowsBlueTooth-SelectDeviceDialogMBS object.

If BluetoothSelectDevices returns true, the Devices member contains selected object. The caller should verify that the Authenticated and Remembered flags in the WindowsBlueToothDeviceInfoMBS objects to determine which devices were successfully authenticated, and which devices are valid selections for the user.

24.45.6 Properties

24.45.7 AddNewDeviceWizard as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: If true, starts the Add New Device wizard.
Notes: (Read and Write property)

24.45.8 Cancelled as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Set to true, if dialog was cancelled.
Notes: (Read and Write property)

24.45.9 ClassOfDevices as Dictionary

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The dictionary to select classes of devices.
Notes: Provided for specification and retrieval of Bluetooth Class Of Device (COD) information.

Key is COD mask and value is description text.

CODMask: A mask to compare to determine the class of device. The major and minor codes of ulCODMask are used to compare the class of device found. If a major code is provided it must match the major code returned by the remote device, such that GET_COD_MAJOR(ulCODMask) is equal to GET_COD_MAJOR([class of device of the remote device]).
(Read and Write property)

24.45.10 ForceAuthentication as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: If true, forces authentication before returning.
Notes: (Read and Write property)

24.45.11 Info as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Sets the information text when not "".
Notes: (Read and Write property)

24.45.12 Parent as Variant

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop only.

Function: Handle to the parent window.
Notes: Set to nil for no parent.
Can reference a Window or DesktopWindow object.
(Read and Write property)

24.45.13 ShowAuthenticated as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: If true, authenticated devices are shown in the picker.
Notes: (Read and Write property)

24.45.14 ShowRemembered as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: If true, remembered devices are shown in the picker.
Notes: (Read and Write property)

24.45.15 ShowUnknown as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: If true, unknown devices that are not authenticated or remembered are shown in the picker.
Notes: (Read and Write property)

24.45.16 SkipServicesPage as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: If true, skips the Services page in the Add New Device wizard.
Notes: (Read and Write property)

24.45.17 Events

24.45.18 DeviceFilter(device as WindowsBlueToothDeviceInfoMBS) as boolean

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: An event to filter devices.
Notes: Return true to skip device.

24.46 class WindowsBlueToothServiceMBS

24.46.1 class WindowsBlueToothServiceMBS

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The class for details on a bluetooth service.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.46.4 Properties

24.46.5 Comment as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The comment for the service.
Notes: (Read only property)

24.46.6 Name as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The name of the service.
Notes: (Read only property)

24.46.7 Port as Integer

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The network port.
Notes: e.g. 13
Range from 1 to 31.
(Read only property)

24.46.8 Properties as Dictionary

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Queries properties for the service.
Notes: (Read only property)

24.46.9 RemoteAddress as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The remote address.
Notes: e.g. "(44:00:10:12:56:78):13"
(Read only property)

24.47 class WindowsBlueToothSocketMBS

24.47.1 class WindowsBlueToothSocketMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The class for connecting via bluetooth to a device.
Blog Entries

- MBS Xojo Plugins 18.3
- MBS Xojo Plugins, version 18.3pr4
- Bluetooth for Xojo

24.47.2 Methods

24.47.3 Accept(byref RemoteAddress as String, byref RemotePort as Integer, NewSocket as WindowsBlueToothSocketMBS) as WindowsBlueToothSocketMBS

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Accepts a new incoming connection.
Notes: Bluetooth uses the accept function to enable incoming connection attempts on a socket.
RemoteAddress and RemotePort are set to address of remote peer.

If you like to pass in your own subclass object for NewSocket, we can use that socket object. Otherwise, we make a new WindowsBlueToothSocketMBS object.

Lasterror is set.

24.47.4 Bind(Port as Integer = -1, BluetoothAddress as string = "")

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Binds to a port and optional address.
Notes: Lasterror is set.
BindAddress and BindPort are set.
BluetoothAddress: When used with the bind function, must be "" or a valid local radio address.

Port: Must be -1 for automatic or valid port from 1 to 30.

On client applications, the port member must be zero to enable an appropriate local endpoint to be assigned. On server applications, the port member must be a valid port number or kPortAny; ports automatically assigned using kPortAny may be queried subsequently with a call to the getsockname function. The valid range for requesting a specific RFCOMM port is 1 through 30. Server channels are global resource, and only 30 server channels are available for RFCOMM on any Bluetooth device, which must be shared by all Windows Sockets that belong to the Bluetooth address family. If no server channel is available, or if the specified server channel is already reserved, the bind call fails.

Upon successful return from bind, the server channel is reserved until the socket is closed. Use the getsockname function to retrieve the channel number for SDP registration.

Applications should use auto-allocation for the server channel.
The bind function does not automatically advertise the server application using the Bluetooth SDP; applications must call the Publish function.

24.47.5 Close

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: Closes socket.
Notes: Called by destructor.
Does also UnpublishRecord if needed.

24.47.6 Connect(BluetoothAddress as string, Port as Integer, ServiceClassGUID as String = """, Blocking as boolean = true)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Connects to a bluetooth device.
Notes: Valid ports in range 1 to 31.
Lasterror is set.

BluetoothAddress: Address of the target Bluetooth device. If zero, a valid local Bluetooth device address is assigned when the connect or accept function is called. When used with the connect function, a valid remote radio address must be specified.
serviceClassId

Service Class Identifier of the socket. When used with the bind function, serviceClassId is ignored. Also ignored if the port is specified. For the connect function, specifies the unique Bluetooth service class ID of

the service to which it wants to connect. If the peer device has more than one port that corresponds to the service class identifier, the connect function attempts to connect to the first valid service; this mechanism can be used without prior SDP queries.
port: RFCOMM channel associated with the socket.

Added Blocking parameter in v23.4. If true, we block, so connect returns after connection is done. Pass false to return directly and check status later.

24.47.7 Constructor

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Creates a new socket.
Notes: Socket address type is always AF_BTH, type is SOCK_STREAM and protocol is BTHPROTO_RFCOMM.

24.47.8 Listen(BackLog as Integer = 2)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Listens for connections on this socket.
Notes: Lasterror is set.

24.47.9 Poll

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Polls for new events.
Notes: May call NewConnection or DataAvailable event if data is available.
Calls SendComplete when sending is done.
Calls Error event when an error occurred.

This is normally called automatically by a timer for you.
But if you are in a tight loop, you can call it manually.

24.47.10 PublishRecord(SDPRecord as MemoryBlock)

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Publish service record.

Notes: Lasterror is set.
Sets the SDPRecordID property.

24.47.11 Read(size as integer, peek as boolean = false) as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Reads data.
Notes: Please pass in size of desired data length to read.
Lasterror is set.
New data is returned (maybe shorter).
If peek is true, data is not removed from buffers.

24.47.12 ReadAll(peek as boolean = false) as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Reads all available data.
Notes: Lasterror is set.
New data is returned.
If peek is true, data is not removed from buffers.

24.47.13 RegisterService(ServiceClassGUID as String, InstanceName as String, Comment as String = "")

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Registers service.
Notes: Lasterror is set.

24.47.14 Send(data as MemoryBlock) as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Sends data.
Notes: Lasterror is set.
Returns number of bytes sent.
Later raises SendComplete event when sending is done.
See also:

- 24.47.15 Send(data as String) as Integer 4464

24.47.15 Send(data as String) as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Sends data.
Notes: Lasterror is set.
Returns number of bytes sent.
Later raises SendComplete event when sending is done.
See also:

- 24.47.14 Send(data as MemoryBlock) as Integer 4463

24.47.16 UnpublishRecord

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Unpublish service record.
Notes: Lasterror is set.
Clears SDPRecordID property.

24.47.17 Properties

24.47.18 Authenticate as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Whether to autheticate connection.
Notes: For disconnected sockets, the Authenticate options specifies whether authentication is required for a connect or accept operation to complete successfully. Setting this socket option actively initiates authentication during connection establishment, if the two Bluetooth devices were not previously authenticated. The user interface for passkey exchange, if necessary, is provided by the operating system outside the application context.

For outgoing connections that require authentication, the connect operation fails with WSAEACCES if authentication is not successful. In response, the application may prompt the user to authenticate the two Bluetooth devices before connection.
For incoming connections, the connection is rejected if authentication cannot be established and returns a WSAEHOSTDOWN error. For more information about authenticating Bluetooth devices, see BluetoothAuthenticateDevice function.

Lasterror is set.
(Read and Write property)

24.47.19 AvailableBytes as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Queries available bytes in input buffer.
Notes: Lasterror is set.
Returns -1 if unknown.
(Read only property)

24.47.20 BindAddress as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The address the socket is bound to.
Notes: (Read only property)

24.47.21 BindPort as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The port the socket is bound to.
Notes: (Read only property)

24.47.22 Encrypt as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Whether to encrypt connection.
Notes: On unconnected sockets, the Encrypt socket option enforces encryption to establish a connection. Encryption is only available for authenticated connections. For incoming connections, a connection for which encryption cannot be established is automatically rejected and returns WSAEHOSTDOWN as the error. For outgoing connections, the connect function fails with WSAEACCES if encryption cannot be established. In response, the application may prompt the user to authenticate the two Bluetooth devices before connection. For more information about authenticating Bluetooth devices, see BluetoothAuthenticateDevice.

Windows XP with SP2: For a socket that is connected and authenticated, SO_BTH_ENCRYPT starts encryption.
(Read and Write property)

24.47.23 Handle as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The internal socket reference number.
Notes: (Read only property)

24.47.24 Lasterror as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The last error code.
Notes: (Read only property)

24.47.25 LastErrorMessage as String

MBS Bluetooth Plugin, Plugin Version: 18.3, Platform: Windows, Targets: All.

Function: The last error message.
Notes: (Read only property)

24.47.26 Listening as Boolean

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Whether we are listening.
Notes: Set to true on success by Bind method.
(Read only property)

24.47.27 LocalAddress as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Queries local bluetooth address.
Notes: Lasterror is set.
Value is empty if not known.
(Read only property)

24.47.28 LocalPort as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Queries local port.
Notes: Value is -1 if not set.
Lasterror is set.
(Read only property)

24.47.29 MTU as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The MTU property.
Notes: The MTU socket option is an advanced option used primarily for validation. The MTU option obtains or sets default RFCOMM MTU (maximum transmission unit) for connection negotiation to a value different than the RFCOMM protocol-default value.
Because MTU is affected by the underlying L2CAP MTU, and protocol and application minimums and maximums, the default value for SO_BTH_MTU is only a starting point for negotiation with the remote peer, and the final negotiated MTU is likely to vary from the default. Setting the MTU value may negatively affect throughput, and as such, any modification should be performed with knowledge of the underlying Bluetooth protocol.

The MTU socket option can be performed on connected sockets, but has no effect if the negotiation has already completed. Setting it on the listening (server) socket has no effect.

The amount of data that an application can send or receive in a single socket call is not affected by the MTU; MTU only affects how the underlying Windows Sockets service provider segments packets for transport. Both the proposed MTU and the MTU ultimately negotiated must be between RFCOMM_MIN_MTU (&h17) and RFCOMM_MAX_MTU (&3F3), as defined in the Ws2bth.h header file.
(Read and Write property)

24.47.30 MTUMax as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The MTU max property.
Notes: The MTUMax socket option is an advanced option used primarily for validation. The MTUMax socket option sets the maximum RFCOMM MTU (maximum transmission unit) for connection negotiation. Connections with an RFCOMM MTU equal to or greater than this value fail during the connect/accept process. While setting this socket option is allowed for a connected socket, it has no effect if the negotiation has completed. Setting this socket option on a listening socket propagates the value for all incoming connections. The MAX MTU value must be between RFCOMM_MIN_MTU (&h17) and RFCOMM_MAX_MTU (&3F3), as defined in the Ws2bth.h header file.

(Read and Write property)

24.47.31 MTUMin as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The MTU min property.
Notes: The MTUMin socket option is an advanced option used primarily for validation. The MTUMin socket option sets the minimum RFCOMM MTU (maximum transmission unit) for connection negotiation. Connections with an RFCOMM MTU smaller than this value fail during the connect/accept process. While setting this socket option is allowed for a connected socket, it has no effect if the negotiation has completed. Setting this socket option on a listening socket propagates the value for all incoming connections.
Only a listening socket can revise the MTU downward, therefore if the value proposed by the connecting socket is less than the value set for MTUMin on the listening socket, the connection is refused. The minimum MTU must be between RFCOMM_MIN_MTU (&h17) and RFCOMM_MAX_MTU (&3F3), as defined in the Ws2bth.h header file.
(Read and Write property)

24.47.32 RemoteAddress as String

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Queries remote address.
Notes: Lasterror is set.
Value is empty if not known.
(Read only property)

24.47.33 RemotePort as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Queries remote port.
Notes: Lasterror is set.
Value is -1 if not set.
(Read only property)

24.47.34 SDPRecordID as Integer

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The SPF record ID for published service.

Notes: (Read only property)

24.47.35 Events

24.47.36 DataAvailable

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The data available event.
Notes: Called when data is coming in.

24.47.37 Error

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: The event called when an error occurred.

24.47.38 NewConnection

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: A new connection is needed.
Notes: Please call Accept method to accept the new connection and link it to a socket.

24.47.39 SendComplete

MBS Bluetooth Plugin, Plugin Version: 18.1, Platform: Windows, Targets: All.

Function: Sending data is complete.

24.47.40 Constants

Constants

Constant	Value	Description
kPortAny	-1	Any port.

24.48 class WindowsDeviceInformationCustomPairingMBS

24.48.1 class WindowsDeviceInformationCustomPairingMBS

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a custom pairing for a DeviceInformation object.
Blog Entries

- MBS Xojo Plugins, version 24.6pr3

24.48.2 Methods

24.48.3 Close

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the object.
Notes: Same as destructor.
Will clear internal reference and device property.

24.48.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 24.48.5 Constructor(other as WindowsDeviceInformationCustomPairingMBS) 4470

24.48.5 Constructor(other as WindowsDeviceInformationCustomPairingMBS)

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 24.48.4 Constructor 4470

24.48.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.48.7 PairAsync(DevicePairingKinds as Integer)

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attempts to pair the device.
Notes: DevicePairingKinds: The different pairing kinds supported by this DeviceInformation object.

Raises PairAsyncCompleted event later.
See also:

- 24.48.8 PairAsync(DevicePairingKinds as Integer, minProtectionLevel as Integer) 4471

24.48.8 PairAsync(DevicePairingKinds as Integer, minProtectionLevel as Integer)

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attempts to pair the device.
Notes: Raises PairAsyncCompleted event later.

DevicePairingKinds: The different pairing kinds supported by this DeviceInformation object.
minProtectionLevel: The minimum protection level this DeviceInformation object requires in order to pair.
See also:

- 24.48.7 PairAsync(DevicePairingKinds as Integer) 4471

24.48.9 Properties

24.48.10 Device as WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device to pair.
Notes: (Read and Write property)

24.48.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.48.12 Events

24.48.13 PairAsyncCompleted(asyncStatus as Integer, PairingStatus as Integer, ProtectionLevelUsed as Integer)

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when PairAsync method finishes.
Notes: ProtectionLevelUsed: Gets the level of protection used to pair the device.
Status: Gets the paired status of the device after the pairing action completed.

24.48.14 PairingRequested(Args as WindowsDevicePairingRequestedEventArgsMBS)

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Raised when a pairing action is requested.

24.48.15 Constants

Pairing Kinds

Constant	Value	Description
DevicePairingKindsConfirmOnly	1	The application must confirm they wish to perform the pairing You can present an optional confirmation dialog to the user. W ConfirmOnly, call Accept from the event args of the PairingRe handler if you want the pairing to complete.
DevicePairingKindsConfirmPinMatch	8	The application must display the given PIN to the user and a confirm that the PIN matches the one show on the target devic With a value of ConfirmPinMatch, call Accept from the eve PairingRequested event handler if you want the pairing to comp
DevicePairingKindsDisplayPin	2	The application must display the given PIN to the user. The user will then need to enter or confirm that PIN on the being paired. With a value of DisplayPin, call Accept from the the PairingRequested event handler if you want the pairing to co application cancels the pairing at this point, the device might This is because the system and the target device don't need an for this DevicePairingKinds value.
DevicePairingKindsNone	0	No pairing is supported.
DevicePairingKindsProvidePasswordCredential	16	The application must request a user name and password from t With a value of ProvidePasswordCredential, call AcceptWithPa tial from the event args of the PairingRequested event handler pairing. Pass in the PasswordCredential that encapsulates the password as a parameter.
DevicePairingKindsProvidePin	4	The application must request a PIN from the user. The PIN will typically be displayed on the target device. W ProvidePin, call Accept from the event args of the PairingRe handler if you want the pairing to complete. Pass in the PIN as

Protection Levels

Constant	Value	Description
DevicePairingProtectionLevelDefault	0	The default value. This should not be used.
DevicePairingProtectionLevelEncryption	2	Pair the device using encryption.
DevicePairingProtectionLevelEncryptionAndAuthentication	3	Pair the device using encryption and authenticatio
DevicePairingProtectionLevelNone	1	Pair the device using no levels of protection.

24.49 class WindowsDeviceInformationMBS

24.49.1 class WindowsDeviceInformationMBS

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a device.
Notes: This class allows access to well-known device properties as well as additional properties specified during device enumeration.

A DeviceInformation object is composed of an identity (DeviceInformation.Id), a kind (DeviceInformation.Kind), and a property bag (DeviceInformation.Properties). All of the other properties of a DeviceInformation object are derived from the Properties property bag. For example, Name is derived from System.ItemNameDisplay.

Successful completion of FindAllAsync results in a DeviceInformationCollection containing DeviceInformation objects.

If a call to CreateWatcher succeeds, a DeviceInformation object is passed to the added event for each device that is found.

The Name property should only be used for display purposes only and not for finding a device because the Name can change due to localization or a user assigning a name.
CreateFromIdAsync creates a DeviceInformation object if successful.

The DeviceInformation class provides device information, but more specifically, it provides properties of the device interface, the interface that represents functionality that the device exposes. Multi-function devices may have more than one device interface. The physical object that a user sees as a device, is known as the device container, and has properties such as Manufacturer and ModelID. For more information about enumerating devices and recovering properties, see Enumerate devices.

Function: The copy constructor.
See also:

- 24.49.4 Constructor 4475

24.49.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.49.7 Properties

24.49.8 Device as WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The reference to the device.
Notes: (Read and Write property)

24.49.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.49.10 Id as String

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string representing the identity of the device.
Notes: This ID can be used to activate device functionality using the CreateFromIdAsync methods on classes that implement device functionality.
By default, calling DeviceInformation.FindAllAsync returns a collection of DeviceInformation objects that describe device interfaces (rather than devices). Consequently, the value of DeviceInformation.Id for those objects is a device interface identifier (rather than a device identifier). There are overloads of DeviceInformation.FindAllAsync to which you can pass a DeviceInformationKind to control whether the returned DeviceInformation objects represent devices, device interfaces, or other kinds of information.
(Read only property)

24.49.11 IsDefault as Boolean

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether this device is the default device for the class.
Notes: (Read only property)

24.49.12 IsEnabled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether this device is enabled.
Notes: (Read only property)

24.49.13 Kind as Integer

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the type of DeviceInformation represented by this object.
Notes: (Read only property)

24.49.14 Name as String

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the device. This name is in the best available language for the app.
Notes: The Name property should only be used for display purposes only and not for finding a device because the Name can change due to localization or a user assigning a name.
(Read only property)

24.49.15 Pairing as WindowsDeviceInformationPairingMBS

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the information about the capabilities for this device to pair.
Notes: (Read only property)

24.49.16 Constants

Device Kind

Constant	Value	Description
KindAssociationEndpoint	5	The DeviceInformation object represents a device association endpoint (AE AEPs usually represent a device discovered over a wireless or network pro col. Some of these endpoints can be used without needing to first pair device. Use CanPair to determine if a device supports pairing and IsPaired determine if a device is already paired with the system. Only AssociationEn point objects have a non-NULL value for Pairing. For more information ab pairing over a network, see Enumerate devices over a network. An Associat nEndpoint object is a child of a single AssociationEndpointContainer obj and can contain 0 or more AssociationEndpointService objects. The Id for this object.
KindAssociationEndpointContainer	6	The DeviceInformation object represents an association endpoint (AEP) c tainer. An AssociationEndpointContainer object represents a single physi device that might have more than one AssociationEndpoint objects associa with it. For example, if a television supports two different network protoc the AssociationEndpointContainer would be the television. It would also h two AssociationEndpoint objects to represent each protocol. The Id for this object is the AEP container GUID as a string.
KindAssociationEndpointService	7	The DeviceInformation object represents an association endpoint (AEP) S vice. An AssociationEndpointService object represents a functional serv contract exposed by the device. Not all protocols support AEP services. AssociationEndpointService can have a single parent AssociationEndpointC tainer object. The Id for this object as a string.
KindDevice	3	The DeviceInformation object represents a device object. This could also referred to as a devnode. These devices are objects that represent a piece the device functionality and optionally have drivers loaded on them. Wh a physical device is paired with windows, multiple Device objects are crea for it. A device contains 0 or more DeviceInterface objects, is a child to DeviceContainer object, and is related to 0 or 1 AssociationEndpoint objec The Id for this object is the device instance id for this object.
KindDeviceContainer	2	The DeviceInformation object represents a device container. DeviceContai objects describe a collection of device objects that exist in the same physi device. For example, a multi-function printer may have several different devi included, but they would all exist as part of the parent DeviceContainer obje The Id for this object is the device container GUID as a string.
KindDeviceInterface	1	The DeviceInformation object represents a PnP device interface. These exposed by device drivers to enable an app to talk to the device, typica using device IOCTLS (input output controls). This type of DeviceInformation object contains all the properties of the P DeviceInterface object plus some properties from the parent PnP DeviceC tainer object. This combination of properties can be presented to the user wh the user needs to select a device to complete an app scenario. A DeviceInterf object can only be a child to one DeviceContainer object. This is the default DeviceInformationKind when enumerating devices witho specifying a specific kind. The Id for this object is the device interface id, or the device interface path
KindDeviceInterfaceClass	4	The DeviceInformation object represents a device interface class. Every I viceInterface object belongs to a certain DeviceInterfaceClass. This is simi to a contract definition. These contracts are represented with an id and pr erties, just like every other PnP object. DeviceInterfaceClass objects cont little more information than a unique identifier and possibly a name. The Id for this object is the device interface class GUID as a string.
KindDevicePanel	8	The DeviceInformation object represents a single physical face of a device closure. The Id for this object as a string.
KindUnknown	0	The object is of an unknown type. This value is not used.

24.50 class WindowsDeviceInformationPairingMBS

24.50.1 class WindowsDeviceInformationPairingMBS

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains information and enables pairing for a device.

24.50.2 Methods

24.50.3 Close

MBS WinFrameworks Plugin, Plugin Version: 24.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the object.
Notes: Same as destructor.
Will clear internal reference and device property.

24.50.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 24.50.5 Constructor(other as WindowsDeviceInformationPairingMBS) 4480

24.50.5 Constructor(other as WindowsDeviceInformationPairingMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 24.50.4 Constructor 4479

24.50.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.50.7 PairAsync

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attempts to pair the device.
Notes: Calls PairAsyncCompleted later.

You may need to first use RequestAccessAsync to request access, before pairing is allowed.
See also:

- 24.50.8 PairAsync(minProtectionLevel as Integer) 4480

24.50.8 PairAsync(minProtectionLevel as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attempts to pair the device using a provided level of protection.
Notes: minProtectionLevel: The required level of protection to use for the pairing action.

Calls PairAsyncCompleted later.
See also:

- 24.50.7 PairAsync 4480

24.50.9 TryRegisterForAllInboundPairingRequests(pairingKindsSupported as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers the application to handle all inbound pairing requests.
Notes: pairingKindsSupported: The pairing kinds your app supports.

Returns true whether or not the attempt was successful.

24.50.10 TryRegisterForAllInboundPairingRequestsWithProtectionLevel(pairingKindsSupported as Integer, minProtectionLevel as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers the application to handle all inbound pairing requests with the specified minimum level of protection.
Notes: pairingKindsSupported: The pairing kinds your app supports.
minProtectionLevel: The required minimum level of protection to accept for the pairing requests.

Returns true whether or not the attempt was successful.

24.50.11 UnpairAsync

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attempts to unpair the device.

24.50.12 Properties

24.50.13 CanPair as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value that indicates whether the device can be paired.
Notes: True if the device can be paired, otherwise false.
(Read only property)

24.50.14 CustomPairing as WindowsDeviceInformationCustomPairingMBS

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the DeviceInformationCustomPairing object necessary for custom pairing.
Notes: (Read only property)

24.50.15 Device as WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device to pair.
Notes: (Read and Write property)

24.50.16 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.50.17 IsPaired as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value that indicates whether the device is currently paired.
Notes: True if the device is currently paired, otherwise false.
(Read only property)

24.50.18 ProtectionLevel as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the level of protection used to pair the device.
Notes: The protection level, e.g. ProtectionLevelEncryptionAndAuthenticationRequired constant.
(Read only property)

24.50.19 Events

24.50.20 PairAsyncCompleted(asyncStatus as Integer, PairingStatus as Integer, ProtectionLevelUsed as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when PairAsync method finishes.
Notes: ProtectionLevelUsed: Gets the level of protection used to pair the device.
Status: Gets the paired status of the device after the pairing action completed.

24.50.21 UnpairAsyncCompleted(asyncStatus as Integer, UnpairingStatus as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when the UnpairAsync method finished.
Notes: Status: Gets the paired status of the device after the unpairing action completed.

24.50.22 Constants

Pairing Kinds

Constant	Value	Description
DevicePairingKindsConfirmOnly	1	The application must confirm they wish to perform the pairing You can present an optional confirmation dialog to the user. W ConfirmOnly, call Accept from the event args of the PairingRe handler if you want the pairing to complete.
DevicePairingKindsConfirmPinMatch	8	The application must display the given PIN to the user and a confirm that the PIN matches the one show on the target devic With a value of ConfirmPinMatch, call Accept from the eve PairingRequested event handler if you want the pairing to comp
DevicePairingKindsDisplayPin	2	The application must display the given PIN to the user. The user will then need to enter or confirm that PIN on the being paired. With a value of DisplayPin, call Accept from the the PairingRequested event handler if you want the pairing to co application cancels the pairing at this point, the device might This is because the system and the target device don't need an for this DevicePairingKinds value.
DevicePairingKindsNone	0	No pairing is supported.
DevicePairingKindsProvidePasswordCredential	16	The application must request a user name and password from t With a value of ProvidePasswordCredential, call AcceptWithPa tial from the event args of the PairingRequested event handler pairing. Pass in the PasswordCredential that encapsulates the password as a parameter.
DevicePairingKindsProvidePin	4	The application must request a PIN from the user. The PIN will typically be displayed on the target device. W ProvidePin, call Accept from the event args of the PairingRe handler if you want the pairing to complete. Pass in the PIN as

Protection Levels

Constant	Value	Description
DevicePairingProtectionLevelDefault	0	The default value. This should not be used.
DevicePairingProtectionLevelEncryption	2	Pair the device using encryption.
DevicePairingProtectionLevelEncryptionAndAuthentication	3	Pair the device using encryption and authenticatio
DevicePairingProtectionLevelNone	1	Pair the device using no levels of protection.
ProtectionLevelAuthenticationRequired	1	Require the link to be authenticated.
ProtectionLevelEncryptionAndAuthenticationRequired	3	Pair the device using encryption and authenticatio
ProtectionLevelEncryptionRequired	2	Require the link to be encrypted.
ProtectionLevelPlain	0	The default value. This should not be used.

Pairing Status

Constant	Value	Description
DevicePairingResultStatusAccessDenied	12	Your application does not have the appropriate per device object.
DevicePairingResultStatusAlreadyPaired	3	The device object has already been paired.
DevicePairingResultStatusAuthenticationFailure	9	Authentication failed, so the device is not paired. E the application rejected the authentication.
DevicePairingResultStatusAuthenticationNotAllowed	8	The authentication protocol is not supported, so the
DevicePairingResultStatusAuthenticationTimeout	7	The authentication process timed out before it coul
DevicePairingResultStatusConnectionRejected	4	The device object rejected the connection.
DevicePairingResultStatusFailed	19	An unknown failure occurred.
DevicePairingResultStatusHardwareFailure	6	The device object indicated there was a hardware fa
DevicePairingResultStatusInvalidCeremonyData	13	The ceremony data was incorrect.
DevicePairingResultStatusNoSupportedProfiles	10	There are no network profiles for this device object
DevicePairingResultStatusNotPaired	2	The device object is not currently paired.
DevicePairingResultStatusNotReadyToPair	1	The device object is not in a state where it can be p
DevicePairingResultStatusOperationAlreadyInProgress	15	The device object is already attempting to pair or u
DevicePairingResultStatusPaired	0	The device object is now paired.
DevicePairingResultStatusPairingCanceled	14	The pairing action was canceled before completion.
DevicePairingResultStatusProtectionLevelCouldNotBeMet	11	The minimum level of protection is not supported b application.
DevicePairingResultStatusRejectedByHandler	17	The application handler rejected the pairing.
DevicePairingResultStatusRemoteDeviceHasAssociation	18	The remove device already has an association.
DevicePairingResultStatusRequiredHandlerNotRegistered	16	Either the event handler wasn't registered or a req was not supported.
DevicePairingResultStatusTooManyConnections	5	The device object indicated it cannot accept any mo

Unpairing Status

Constant	Value	Description
DeviceUnpairingResultStatusAccessDenied	3	The caller does not have sufficient permissions to unp
DeviceUnpairingResultStatusAlreadyUnpaired	1	The device object was already unpaired.
DeviceUnpairingResultStatusFailed	4	An unknown failure occurred.
DeviceUnpairingResultStatusOperationAlreadyInProgress	2	The device object is currently in the middle of eith action.
DeviceUnpairingResultStatusUnpaired	0	The device object is successfully unpaired.

24.51 class WindowsDeviceInformationUpdateMBS

24.51.1 class WindowsDeviceInformationUpdateMBS

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains updated properties for a DeviceInformation object.
Notes: The Updated and Removed events of the WindowsDeviceWatcherMBS class receive a DeviceInformationUpdate object.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 24.3
- MBS Xojo Plugins, version 24.3pr4

24.51.2 Methods

24.51.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.51.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.51.5 Properties

24.51.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.51.7 Id as String

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DeviceInformation ID of the updated device.
Notes: (Read only property)

24.51.8 Kind as Integer

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the type of device for the updated device.
Notes: (Read only property)

24.51.9 Constants

Device Information

Constant	Value	Description
KindAssociationEndpoint	5	The DeviceInformation object represents a device association endpoint (AE AEPs usually represent a device discovered over a wireless or network pro col. Some of these endpoints can be used without needing to first pair device. Use CanPair to determine if a device supports pairing and IsPaired determine if a device is already paired with the system. Only AssociationEn point objects have a non-NULL value for Pairing. For more information ab pairing over a network, see Enumerate devices over a network. An Associat nEndpoint object is a child of a single AssociationEndpointContainer obj and can contain 0 or more AssociationEndpointService objects. The Id for this object.
KindAssociationEndpointContainer	6	The DeviceInformation object represents an association endpoint (AEP) c tainer. An AssociationEndpointContainer object represents a single physi device that might have more than one AssociationEndpoint objects associa with it. For example, if a television supports two different network protoc the AssociationEndpointContainer would be the television. It would also h two AssociationEndpoint objects to represent each protocol. The Id for this object is the AEP container GUID as a string.
KindAssociationEndpointService	7	The DeviceInformation object represents an association endpoint (AEP) S vice. An AssociationEndpointService object represents a functional serv contract exposed by the device. Not all protocols support AEP services. AssociationEndpointService can have a single parent AssociationEndpointC tainer object. The Id for this object as a string.
KindDevice	3	The DeviceInformation object represents a device object. This could also referred to as a devnode. These devices are objects that represent a piece the device functionality and optionally have drivers loaded on them. Wh a physical device is paired with windows, multiple Device objects are crea for it. A device contains 0 or more DeviceInterface objects, is a child to DeviceContainer object, and is related to 0 or 1 AssociationEndpoint objec The Id for this object is the device instance id for this object.
KindDeviceContainer	2	The DeviceInformation object represents a device container. DeviceContai objects describe a collection of device objects that exist in the same physi device. For example, a multi-function printer may have several different devi included, but they would all exist as part of the parent DeviceContainer obje The Id for this object is the device container GUID as a string.
KindDeviceInterface	1	The DeviceInformation object represents a PnP device interface. These exposed by device drivers to enable an app to talk to the device, typica using device IOCTLS (input output controls). This type of DeviceInformation object contains all the properties of the P DeviceInterface object plus some properties from the parent PnP DeviceC tainer object. This combination of properties can be presented to the user w the user needs to select a device to complete an app scenario. A DeviceInterf object can only be a child to one DeviceContainer object. This is the default DeviceInformationKind when enumerating devices witho specifying a specific kind. The Id for this object is the device interface id, or the device interface pat
KindDeviceInterfaceClass	4	The DeviceInformation object represents a device interface class. Every I viceInterface object belongs to a certain DeviceInterfaceClass. This is simi to a contract definition. These contracts are represented with an id and pr erties, just like every other PnP object. DeviceInterfaceClass objects cont little more information than a unique identifier and possibly a name. The Id for this object is the device interface class GUID as a string.
KindDevicePanel	8	The DeviceInformation object represents a single physical face of a device closure. The Id for this object as a string.
KindUnknown	0	The object is of an unknown type. This value is not used.

24.52 class WindowsDevicePairingRequestedEventArgsMBS

24.52.1 class WindowsDevicePairingRequestedEventArgsMBS

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data for the PairingRequested event.
Blog Entries

- News from the MBS Xojo Plugins Version 25.0

24.52.2 Methods

24.52.3 Accept

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Accepts a PairingRequested event and pairs the device with the application.

24.52.4 Close

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the object.
Notes: Same as destructor.

Sets Handle to zero.

24.52.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 24.52.6 Constructor(other as WindowsDevicePairingRequestedEventArgsMBS) 4488

24.52.6 Constructor(other as WindowsDevicePairingRequestedEventArgsMBS)

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

24.52.7 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.52.8 Properties

24.52.9 DeviceInformation as WindowsDeviceInformationMBS

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the DeviceInformation object associated with this pairing request.
Notes: (Read only property)

24.52.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.52.11 PairingKind as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the kind of pairing associated with this pairing event.
Notes: The kind of pairing used for this pairing request. Exactly one of the DevicePairingKinds bits will be set.
(Read only property)

24.52.12 Pin as String

MBS WinFrameworks Plugin, Plugin Version: 25.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the pin associated with a pairing request.
Notes: (Read only property)

24.52.13 Constants

Pairing Kinds

Constant	Value	Description
DevicePairingKindsConfirmOnly	1	The application must confirm they wish to perform the pairing You can present an optional confirmation dialog to the user. W ConfirmOnly, call Accept from the event args of the PairingRe handler if you want the pairing to complete.
DevicePairingKindsConfirmPinMatch	8	The application must display the given PIN to the user and a confirm that the PIN matches the one show on the target devic With a value of ConfirmPinMatch, call Accept from the eve PairingRequested event handler if you want the pairing to comp
DevicePairingKindsDisplayPin	2	The application must display the given PIN to the user. The user will then need to enter or confirm that PIN on the being paired. With a value of DisplayPin, call Accept from the the PairingRequested event handler if you want the pairing to co application cancels the pairing at this point, the device might This is because the system and the target device don't need an for this DevicePairingKinds value.
DevicePairingKindsNone	0	No pairing is supported.
DevicePairingKindsProvidePasswordCredential	16	The application must request a user name and password from t With a value of ProvidePasswordCredential, call AcceptWithPa tial from the event args of the PairingRequested event handler pairing. Pass in the PasswordCredential that encapsulates the password as a parameter.
DevicePairingKindsProvidePin	4	The application must request a PIN from the user. The PIN will typically be displayed on the target device. W ProvidePin, call Accept from the event args of the PairingRe handler if you want the pairing to complete. Pass in the PIN as

24.53 class WindowsDeviceWatcherMBS

24.53.1 class WindowsDeviceWatcherMBS

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enumerates devices dynamically, so that the app receives notifications if devices are added, removed, or changed after the initial enumeration is complete.
Notes: An app calls Start to begin the search for devices. During this initial enumeration, the DeviceWatcher raises an Added event for each device that's found, until all devices are found. The DeviceWatcher raises an EnumerationCompleted event when the initial enumeration is complete, and continues to raise events if a device is added, updated, or removed.
The following diagram shows how the DeviceWatcher transitions between the states represented by DeviceWatcherStatus enumeration.

The Start method can only be called when the DeviceWatcher is in the Created, Stopped or Aborted state. The Status property indicates the DeviceWatcher state. When re-starting the watcher, wait for the Stopped event before calling Start.
Stop transitions the DeviceWatcher to the Stopping state and completes immediately. The watcher will transition to the Stopped state once all events that are already in the process of being raised have completed. Apps may wait for the Stopped event if they need to know when the DeviceWatcher has stopped. Callers must wait for the Stopped event before they can call Start to restart the watcher. Callers may unsubscribe from events if they do not want to receive any additional events after Stop but do not want to wait for the Stopped event.

24.53.2 Methods

24.53.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a DeviceWatcher for all devices.
Notes: The DeviceWatcher first performs an initial enumeration of devices, raising an Added event for each device that it finds, and raising an EnumerationCompleted event when the initial enumeration is complete. After the initial enumeration is complete, it raises events when a device is added, deleted, or updated.
See also:

- 24.53.4 Constructor(aqsFilter as String) 4492

- 24.53.5 Constructor(DeviceClass as Integer) 4492

24.53.4 Constructor(aqsFilter as String)

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a DeviceWatcher for devices matching the specified Advanced Query Syntax (AQS) string.
Notes: aqsFilter: An AQS string that filters the DeviceInformation objects to enumerate. Typically this string is retrieved from the GetDeviceSelector method of a class that interacts with devices. For example, GetDeviceSelector retrieves the string for the StorageDevice class.

The DeviceWatcher first performs an initial enumeration of devices, raising an Added event for each device that it finds, and raising an EnumerationCompleted event when the initial enumeration is complete. After the initial enumeration is complete, it raises events when a device is added, deleted, or updated.
See also:

- 24.53.3 Constructor 4491
- 24.53.5 Constructor(DeviceClass as Integer) 4492

24.53.5 Constructor(DeviceClass as Integer)

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a DeviceWatcher for devices matching the specified Advanced Query Syntax (AQS) string.
Notes: aqsFilter: An AQS string that filters the DeviceInformation objects to enumerate. Typically this string is retrieved from the GetDeviceSelector method of a class that interacts with devices. For example, GetDeviceSelector retrieves the string for the StorageDevice class.

The DeviceWatcher first performs an initial enumeration of devices, raising an Added event for each device that it finds, and raising an EnumerationCompleted event when the initial enumeration is complete. After the initial enumeration is complete, it raises events when a device is added, deleted, or updated.
See also:

- 24.53.3 Constructor 4491
- 24.53.4 Constructor(aqsFilter as String) 4492

24.53.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.53.7 Start

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts a search for devices, and subscribes to device enumeration events.
Notes: An app calls Start to begin the search for devices. During this initial enumeration, the DeviceWatcher raises an Added event for each device that's found, until all devices are found. The DeviceWatcher raises an EnumerationCompleted event when the initial enumeration is complete, and continues to raise events if a device is added, updated, or removed.
The Start method can only be called when the DeviceWatcher is in the Created, Stopped or Aborted state. The Status property indicates the DeviceWatcher state. When re-starting the watcher, wait for the Stopped event before calling Start. The following diagram shows how the DeviceWatcher transitions between the states represented by DeviceWatcherStatus enumeration.

24.53.8 Stop

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stop raising the events that add, update and remove enumeration results.
Notes: To stop a search for devices, an app calls Stop and enters the Stopping state. The Stopped event is raised when the Stop operation completes and the DeviceWatcher enters the Stopped state.
The following diagram shows how the DeviceWatcher transitions between the states represented by DeviceWatcherStatus enumeration.

This call transitions the DeviceWatcher to the Stopping state and completes immediately. The watcher will transition to the Stopped state once all events that are already in the process of being raised have completed. Callers may wait for the Stopped event if they need to know when the DeviceWatcher has stopped. Callers must wait for the Stopped event before they can call Start to restart the watcher. Callers may unsubscribe from events if they do not want to receive any additional events after Stop but do not want to wait for the Stopped event.

24.53.9 Properties

24.53.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.53.11 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The status of the DeviceWatcher.
Notes: (Read only property)

24.53.12 Events

24.53.13 Added(Device as WindowsDeviceInformationMBS)

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Event that is raised when a device is added to the collection enumerated by the DeviceWatcher.

24.53.14 EnumerationCompleted()

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Event that is raised when the enumeration of devices completes.

24.53.15 Removed(Device as WindowsDeviceInformationUpdateMBS)

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Event that is raised when a device is removed from the collection of enumerated devices.

24.53.16 Stopped()

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Event that is raised when the enumeration operation has been stopped.

24.53.17 Updated(Device as WindowsDeviceInformationUpdateMBS)

MBS WinFrameworks Plugin, Plugin Version: 24.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Event that is raised when a device is updated in the collection of enumerated devices.

24.53.18 Constants

Device Class

Constant	Value	Description
DeviceClassAll	0	Indicates that the user wants to enumerate all devices.
DeviceClassAudioCapture	1	Indicates that the user wants to enumerate all audio capture devices.
DeviceClassAudioRender	2	Indicates that the user wants to enumerate all audio rendering devices.
DeviceClassImageScanner	5	Indicates that the user wants to enumerate all scanning devices.
DeviceClassLocation	6	Indicates that the user wants to enumerate all location aware devices.
DeviceClassPortableStorageDevice	3	Indicates that the user wants to enumerate all portable storage devices.
DeviceClassVideoCapture	4	Indicates that the user wants to enumerate all video capture devices.

Status

Constant	Value	Description
StatusStatusAborted	5	The watcher has aborted operation. No subsequent events will be raised.
StatusStatusCreated	0	This is the initial state of a Watcher object. During this state clients register event handlers.
StatusStatusEnumerationCompleted	2	The watcher has completed enumerating the initial collection. Items can be added, updated or removed from the collection.
StatusStatusStarted	1	The watcher transitions to the Started state once Start is called. The wat is enumerating the initial collection. Note that during this enumeration pl it is possible to receive Updated and Removed notifications but only to it that have already been Added.
StatusStatusStopped	4	The client has called Stop and the watcher has completed all outstan events. No further events will be raised.
StatusStatusStopping	3	The client has called Stop and the watcher is still in the process of stopp Events may still be raised.

24.54 class WindowsGattCharacteristicMBS

24.54.1 class WindowsGattCharacteristicMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a Characteristic of a GATT service.
Notes: The GattCharacteristic object represents a GATT Characteristic of a particular service, and is obtained from the Characteristics property of the GattDeviceService object.

24.54.2 Methods

24.54.3 AlertCategoryId as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined AlertCategoryId characteristic UUID.

24.54.4 AlertCategoryIdBitMask as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-Defined AlertCategoryIdBitMask characteristic UUID.

24.54.5 AlertLevel as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined AlertLevel characteristic UUID.

24.54.6 AlertNotificationControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined AlertNotificationControlPoint characteristic UUID.

24.54.7 AlertStatus as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined AlertStatus characteristic UUID.

24.54.8 AllDescriptors as WindowsGattDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of all descriptors belonging to this GattCharacteristic instance.

24.54.9 BatteryLevel as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Battery Level Characteristic UUID.

24.54.10 BloodPressureFeature as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Blood Pressure Feature Characteristic UUID.

24.54.11 BloodPressureMeasurement as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Blood Pressure Measurement Characteristic UUID.

24.54.12 BodySensorLocation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Body Sensor Location Characteristic UUID.

24.54.13 BootKeyboardInputReport as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined BootKeyboardInputReport characteristic UUID.

24.54.14 BootKeyboardOutputReport as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined BootKeyboardOutputReport characteristic UUID.

24.54.15 BootMouseInputReport as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined BootMouseInputReport characteristic UUID.

24.54.16 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 24.54.17 Constructor(other as WindowsGattCharacteristicMBS) 4499

24.54.17 Constructor(other as WindowsGattCharacteristicMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 24.54.16 Constructor 4498

24.54.18 ConvertShortIdToUuid(ID as UInt16) as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts a Bluetooth SIG defined short Id to a full GATT UUID.
Notes: ID: A 16-bit Bluetooth GATT Service UUID.

24.54.19 CscFeature as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Csc Feature Characteristic UUID.

24.54.20 CscMeasurement as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Csc Measurement Characteristic UUID.

24.54.21 CurrentTime as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined CurrentTime characteristic UUID.

24.54.22 CyclingPowerControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined CyclingPowerControlPoint characteristic UUID.

24.54.23 CyclingPowerFeature as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined CyclingPowerFeature characteristic UUID.

24.54.24 CyclingPowerMeasurement as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined CyclingPowerMeasurement characteristic UUID.

24.54.25 CyclingPowerVector as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined CyclingPowerVector characteristic UUID.

24.54.26 DateTime as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined DateTime characteristic UUID.

24.54.27 DayDateTime as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined DayDateTime characteristic UUID.

24.54.28 DayOfWeek as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined DayOfWeek characteristic UUID.

24.54.29 Descriptors(characteristicUUID as String) as WindowsGattDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns descriptors, that are identified by the specified UUID, and belong to this GattCharacteristic instance.

24.54.30 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.54.31 DstOffset as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined DstOffset characteristic UUID.

24.54.32 ExactTime256 as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ExactTime256 characteristic UUID.

24.54.33 FirmwareRevisionString as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined FirmwareRevisionString characteristic UUID.

24.54.34 GapAppearance as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined GapAppearance characteristic UUID.

24.54.35 GapDeviceName as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined GapDeviceName characteristic UUID.

24.54.36 GapPeripheralPreferredConnectionParameters as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined GapPeripheralPreferredConnectionParameters characteristic UUID.

24.54.37 GapPeripheralPrivacyFlag as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth GapPeripheralPrivacyFlag characterisitc UUID.

24.54.38 GapReconnectionAddress as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined GapReconnectionAddress characteristic UUID.

24.54.39 GattServiceChanged as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined GattServiceChanged characteristic UUID.

24.54.40 GetDescriptorsAsync

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the descriptors for this GattCharacteristic instance.
Notes: Calls DescriptorsCompleted event later when finished.
See also:

- 24.54.41 GetDescriptorsAsync(BluetoothCacheMode as Integer) 4503

24.54.41 GetDescriptorsAsync(BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the descriptors with the specified cache mode for this GattCharacteristic instance.
Notes: Calls DescriptorsCompleted event later when finished.
See also:

- 24.54.40 GetDescriptorsAsync 4502

24.54.42 GetDescriptorsForUuidAsync(characteristicUuid as String)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the descriptors whose UUIDs match descriptorUuid.
Notes: Calls DescriptorsCompleted event later when finished.
See also:

- 24.54.43 GetDescriptorsForUuidAsync(characteristicUuid as String, BluetoothCacheMode as Integer) 4503

24.54.43 GetDescriptorsForUuidAsync(characteristicUuid as String, BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the descriptors whose UUIDs match descriptorUuid with the specified cacheMode.
Notes: Calls DescriptorsCompleted event later when finished.
See also:

- 24.54.42 GetDescriptorsForUuidAsync(characteristicUuid as String) 4503

24.54.44 GlucoseFeature as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Glucose Feature Characteristic UUID.

24.54.45 GlucoseMeasurement as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Glucose Measurement Characteristic UUID.

24.54.46 GlucoseMeasurementContext as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Glucose Measurement Context Characteristic UUID.

24.54.47 HardwareRevisionString as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined HardwareRevisionString characterisitc UUID.

24.54.48 HeartRateControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Heart Rate Control Point Characteristic UUID.

24.54.49 HeartRateMeasurement as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Heart Rate Measurement Characteristic UUID.

24.54.50 HidControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined HidControlPoint characteristic UUID.

24.54.51 HidInformation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined HidInformation characteristic UUID.

24.54.52 Ieee1107320601RegulatoryCertificationDataList as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Ieee1107320601RegulatoryCertificationDataList characteristic UUID.

24.54.53 IntermediateCuffPressure as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Intermediate Cuff Pressure Characteristic UUID.

24.54.54 IntermediateTemperature as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Intermediate Temperature Characteristic UUID.

24.54.55 LnControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined LnControlPoint characteristic UUID.

24.54.56 LnFeature as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined LnFeature characteristic UUID.

24.54.57 LocalTimeInformation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined LocalTimeInformation characteristic UUID.

24.54.58 LocationAndSpeed as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined LocationAndSpeed characteristic UUID.

24.54.59 ManufacturerNameString as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ManufacturerNameString characteristic UUID.

24.54.60 MeasurementInterval as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Measurement Interval Characteristic UUID.

24.54.61 ModelNumberString as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ModelNumberString UUID.

24.54.62 Navigation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Navigation characteristic UUID.

24.54.63 NewAlert as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined NewAlert characteristic UUID.

24.54.64 PnpId as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined PnpId characteristic UUID.

24.54.65 PositionQuality as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined PositionQuality characteristic UUID.

24.54.66 ProtocolMode as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ProtocolMode characteristic UUID.

24.54.67 ReadClientCharacteristicConfigurationDescriptorAsync

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads the current value of the ClientCharacteristicConfigurationDescriptor.
Notes: Calls ReadClientCharacteristicConfigurationDescriptorAsyncCompleted event later.

24.54.68 ReadValueAsync

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Characteristic Value read from the value cache maintained by Windows.
Notes: Calls ReadValueAsyncCompleted event later.
See also:

- 24.54.69 ReadValueAsync(CacheMode as Integer) 4507

24.54.69 ReadValueAsync(CacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Characteristic Value read either from the value cache maintained by Windows, or directly from the device.

Notes: Calls ReadValueAsyncCompleted event later.
See also:

- 24.54.68 ReadValueAsync 4507

24.54.70 RecordAccessControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Record Access Control Point Characteristic UUID.

24.54.71 ReferenceTimeInformation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ReferenceTimeInformation characteristic UUID.

24.54.72 Report as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Report characteristic UUID.

24.54.73 ReportMap as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ReportMap characteristic UUID.

24.54.74 RingerControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined RingerControlPoint characteristic UUID.

24.54.75 RingerSetting as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined RingerSetting characteristic UUID.

24.54.76 RscFeature as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Rsc Feature Characteristic UUID.

24.54.77 RscMeasurement as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Rsc Measurement Characteristic UUID.

24.54.78 ScanIntervalWindow as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ScanIntervalWindow characteristic UUID.

24.54.79 ScanRefresh as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ScanRefresh characteristic UUID.

24.54.80 SCControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined SC Control Point Characteristic UUID.

24.54.81 SensorLocation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Sensor Location Characteristic UUID.

24.54.82 SerialNumberString as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined SerialNumberString characteristic UUID.

24.54.83 SoftwareRevisionString as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined SoftwareRevisionString characteristic UUID.

24.54.84 SupportedNewAlertCategory as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined SupportedNewAlertCategory characteristic UUID.

24.54.85 SupportUnreadAlertCategory as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined SupportUnreadAlertCategory characteristic UUID.

24.54.86 SystemId as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined SystemId characteristic UUID.

24.54.87 TemperatureMeasurement as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Temperature Measurement Characteristic UUID.

24.54.88 TemperatureType as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Temperature Type Characteristic UUID.

24.54.89 TimeAccuracy as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TimeAccuracy characteristic UUID.

24.54.90 TimeSource as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TimeSource characteristic UUID.

24.54.91 TimeUpdateControlPoint as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TimeUpdateControlPoint characteristic UUID.

24.54.92 TimeUpdateState as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TimeUpdateState characteristic UUID.

24.54.93 TimeWithDst as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TimeWithDst characteristic UUID.

24.54.94 TimeZone as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TimeZone characteristic UUID.

24.54.95 TxPowerLevel as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TxPowerLevel characteristic UUID.

24.54.96 UnreadAlertStatus as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined UnreadAlertStatus characteristic UUID.

24.54.97 WriteClientCharacteristicConfigurationDescriptorAsync(ClientCharacteristicConfigurationDescriptorValue as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes client characteristic configuration descriptor.
Example:

```
Var Characteristic As WindowsGattCharacteristicMBS // your characteristic

Var Mode as integer = _
WindowsGattReadClientCharacteristicConfigurationDescriptorResultMBS.ConfigurationDescriptorValueNotify + _
WindowsGattReadClientCharacteristicConfigurationDescriptorResultMBS.ConfigurationDescriptorValueIndicate
Characteristic.WriteClientCharacteristicConfigurationDescriptorAsync Mode
```

Notes: Writes the ClientCharacteristicConfigurationDescriptor to the Bluetooth LE device, and if the value to be written represents an indication or a notification and a ValueChanged event handler is registered, enables receiving ValueChanged events from the device.

Pass the new value for the ClientCharacteristicConfigurationDescriptor of this Characteristic object.

Calls WriteClientCharacteristicConfigurationDescriptorAsyncCompleted later.

24.54.98 WriteClientCharacteristicConfigurationDescriptorWithResultAsync(ClientCharacteristicConfigurationDescriptorValue as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes client characteristic configuration descriptor.
Example:

```
Var Characteristic as WindowsGattCharacteristicMBS
// your characteristic from e.g. CharacteristicsCompleted event

Characteristic.WriteClientCharacteristicConfigurationDescriptorAsync(1)
```

Notes: Writes the ClientCharacteristicConfigurationDescriptor to the Bluetooth LE device, and if the value to be written represents an indication or a notification and a ValueChanged event handler is registered, enables receiving ValueChanged events from the device.

Please pass the new value for the ClientCharacteristicConfigurationDescriptor of this WindowsGattCharacteristicMBS object.

Calls WriteClientCharacteristicConfigurationDescriptorWithResultAsyncCompleted event later.

24.54.99 WriteValueAsync(buffer as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Characteristic Value write to a Bluetooth LE device.
Notes: Calls WriteValueAsyncCompleted event later.
See also:

- 24.54.100 WriteValueAsync(buffer as MemoryBlock, WriteOption as Integer) 4513

24.54.100 WriteValueAsync(buffer as MemoryBlock, WriteOption as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Characteristic Value write to a Bluetooth LE device.
Example:

```
Var mb As New MemoryBlock(6)
mb.Byte(0) = &H01 // Data Byte
```

```
mb.Byte(1) = &HAA
mb.Byte(2) = &H55
mb.Byte(3) = &HAA
mb.Byte(4) = &H55
mb.Byte(5) = &HAA

Characteristics(0).WriteValueAsync(mb, GattCharacteristic.WriteWithResponse)
```

Notes: WriteOption is either WriteWithResponse or WriteWithoutResponse.
Calls WriteValueAsyncCompleted event later.
See also:

- 24.54.99 WriteValueAsync(buffer as MemoryBlock) 4513

24.54.101 WriteValueWithResultAsync(buffer as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Characteristic Value write to a Bluetooth LE device.
Notes: Calls WriteValueWithResultAsyncCompleted event later.
See also:

- 24.54.102 WriteValueWithResultAsync(buffer as MemoryBlock, WriteOption as Integer) 4514

24.54.102 WriteValueWithResultAsync(buffer as MemoryBlock, WriteOption as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Characteristic Value write to a Bluetooth LE device.
Notes: Calls WriteValueWithResultAsyncCompleted event later.
See also:

- 24.54.101 WriteValueWithResultAsync(buffer as MemoryBlock) 4514

24.54.103 Properties

24.54.104 AttributeHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the handle used to uniquely identify GATT-based characteristic attributes as declared on the Bluetooth LE device.
Notes: (Read only property)

24.54.105 CharacteristicProperties as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the GATT characteristic properties, as defined by the GATT profile.
Notes: If the ExtendedProperties flag is present it also represents the properties of the Extended Characteristic Properties Descriptor.
(Read only property)

24.54.106 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.54.107 ProtectionLevel as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the desired GATT security options for over the air communication with the device.
Notes: Windows will negotiate the maximum security possible with the device as part of the pairing process, and specifying a lower level of security won,Äôt degrade the existing security level.
(Read and Write property)

24.54.108 Service as WindowsGattDeviceServiceMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GattDeviceService of which this characteristic is a member.
Notes: (Read only property)

24.54.109 UserDescription as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get the user friendly description for this GattCharacteristic, if the User Description Descriptor is present, otherwise this will be an empty string.
Notes: (Read only property)

24.54.110 UUID as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the GATT Characteristic UUID for this GattCharacteristic.
Notes: (Read only property)

24.54.111 Events

24.54.112 DescriptorsCompleted(asyncStatus as Integer, Result as WindowsGattDescriptorsResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by GetDescriptorsForUuidAsync or GetDescriptorsAsync methods when completed.
Example:

```
Sub DescriptorsCompleted(asyncStatus as Integer, Result as WindowsGattDescriptorsResultMBS) Handles
DescriptorsCompleted
Log CurrentMethodName

If result <>Nil Then
Var Descriptors() As WindowsGattDescriptorMBS = result.Descriptors

For Each Descriptor As WindowsGattDescriptorMBS In Descriptors
Log "Descriptor for attribute "+Descriptor.AttributeHandle.ToString+" has "+Descriptor.UUID
Next

End If
End Sub
```

24.54.113 ReadClientCharacteristicConfigurationDescriptorAsyncCompleted(asyncStatus as Integer, Result as WindowsGattReadClientCharacteristicConfigurationDescriptorResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by ReadClientCharacteristicConfigurationDescriptorAsync method.

24.54.114 ReadValueAsyncCompleted(asyncStatus as Integer, Result as WindowsGattReadResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called when ReadValueAsync methods finished.

24.54.115 ValueChanged(args as WindowsGattValueChangedEventArgsMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called when value changed.
Notes: An App can register an event handler in order to receive events when notification or indications are received from a device, after setting the Client Characteristic Configuration Descriptor.

The WindowsGattValueChangedEventArgsMBS object represents the arguments received by a ValueChanged event handler used to process characteristic value change notification and indication events sent by a Bluetooth LE device.

To get this event working, you need to use the copy constructor to create a new instance of your WindowsGattCharacteristicMBS subclass.

24.54.116 WriteClientCharacteristicConfigurationDescriptorAsyncCompleted(asyncStatus as Integer, Status as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by WriteClientCharacteristicConfigurationDescriptorAsync method.

24.54.117 WriteClientCharacteristicConfigurationDescriptorWithResultAsyncCompleted(asyncStatus as Integer, Result as WindowsGattWriteResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by WriteClientCharacteristicConfigurationDescriptorWithResultAsync method.

24.54.118 WriteValueAsyncCompleted(asyncStatus as Integer, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by WriteValueAsync methods when completed.

24.54.119 WriteValueWithResultAsyncCompleted(asyncStatus as Integer, Result as WindowsGattWriteResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by WriteValueWithResultAsync methods when completed.

24.54.120 Constants

Cache Modes

Constant	Value	Description
CacheModeCached	0	Cached data.
CacheModeUncached	1	Uncached data.

GATT characteristic properties

Constant	Value	Description
PropertiesAuthenticatedSignedWrites	&h40	The characteristic supports signed writes.
PropertiesBroadcast	1	The characteristic supports broadcasting.
PropertiesExtendedProperties	&h80	The ExtendedProperties Descriptor is present.
PropertiesIndicate	&h20	The characteristic is indicatable.
PropertiesNone	0	The characteristic doesn,Äôt have any properties that apply.
PropertiesNotify	&h10	The characteristic is notifiable.
PropertiesRead	2	The characteristic is readable.
PropertiesReliableWrites	&h100	The characteristic supports reliable writes.
PropertiesWritableAuxiliaries	&h200	The characteristic has writable auxiliaries.
PropertiesWrite	8	The characteristic is writable.
PropertiesWriteWithoutResponse	4	The characteristic supports Write Without Response.

Protection Levels

Constant	Value	Description
ProtectionLevelAuthenticationRequired	1	Require the link to be authenticated.
ProtectionLevelEncryptionAndAuthenticationRequired	3	Require the link to be encrypted and authenticated.
ProtectionLevelEncryptionRequired	2	Require the link to be encrypted.
ProtectionLevelPlain	0	Uses the default protection level.

Status Values

Constant	Value	Description
StatusAccessDenied	3	Access is denied.
StatusProtocolError	2	There was a GATT communication protocol error.
StatusSuccess	0	The operation completed successfully.
StatusUnreachable	1	No communication can be performed with the device, at this time.

Write Options

Constant	Value	Description
WriteWithoutResponse	1	The Write Without Response procedure shall be used.
WriteWithResponse	0	The default GATT write procedure shall be used.

24.55 class WindowsGattCharacteristicsResultMBS

24.55.1 class WindowsGattCharacteristicsResultMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the result of GetCharacteristicsForUuidAsync and GetCharacteristicsAsync.
Notes: See WindowsGattDeviceServiceMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

24.55.2 Methods

24.55.3 Characteristics as WindowsGattCharacteristicMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the characterisitics.

24.55.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.55.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.55.6 Properties

24.55.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.55.8 ProtocolError as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the protocol error.
Notes: The plugin returns value if this property is not set.
(Read only property)

24.55.9 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the status of an asynchronous operation.
Notes: (Read only property)

24.55.10 Constants

Status Values

Constant	Value	Description
StatusAccessDenied	3	Access is denied.
StatusProtocolError	2	There was a GATT communication protocol error.
StatusSuccess	0	The operation completed successfully.
StatusUnreachable	1	No communication can be performed with the device, at this time.

24.56 class WindowsGattDescriptorMBS

24.56.1 class WindowsGattDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a Descriptor of a GATT Characteristic.
Notes: The GattDescriptor object represents a GATT Descriptor of a particular characteristic, and is obtained from the Descriptors property of the GattCharacteristic object.

24.56.5 ConvertShortIdToUuid(ID as UInt16) as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts a Bluetooth SIG defined short Id to a full GATT UUID.

24.56.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.56.7 ReadValueAsync

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Descriptor Value read from a value cache maintained by Windows.
Notes: Calls ReadValueAsyncCompleted event later when done.

24.56.8 WriteValueAsync(buffer as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Descriptor Value write to a Bluetooth LE device.
Notes: Buffer: the data to be written to the Bluetooth LE device.

Calls WriteValueAsyncCompleted event later.

24.56.9 WriteValueWithResultAsync(buffer as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a Descriptor Value write to a Bluetooth LE device.
Notes: Buffer: the data to be written to the Bluetooth LE device.

Calls WriteValueWithResultAsyncCompleted event later.

24.56.10 Properties

24.56.11 AttributeHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the GATT Attribute handle used to uniquely identify this attribute on the GATT Server Device.

Notes: (Read only property)

24.56.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.56.13 ProtectionLevel as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the desired GATT security options for over the air communication with the device.
Notes: Windows will negotiate the maximum security possible with the device as part of the pairing process, and specifying a lower level of security won,Äôt degrade the existing security level.
(Read only property)

24.56.14 UUID as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the GATT Descriptor UUID for this GattDescriptor.
Notes: (Read only property)

24.56.15 Events

24.56.16 ReadValueAsyncCompleted(asyncStatus as Integer, Result as WindowsGattReadResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by ReadValueAsync method when completed.

24.56.17 WriteValueAsyncCompleted(asyncStatus as Integer, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by WriteValueAsync method when completed.

24.56.18 WriteValueWithResultAsyncCompleted(asyncStatus as Integer, Result as WindowsGattWriteResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called by WriteValueWithResultAsync method when completed.

24.56.19 Constants

Protection Levels

Constant	Value	Description
ProtectionLevelAuthenticationRequired	1	Require the link to be authenticated.
ProtectionLevelEncryptionAndAuthenticationRequired	3	Require the link to be encrypted and authenticated.
ProtectionLevelEncryptionRequired	2	Require the link to be encrypted.
ProtectionLevelPlain	0	Uses the default protection level.

24.57 class WindowsGattDescriptorsResultMBS

24.57.1 class WindowsGattDescriptorsResultMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The status of GetDescriptorsForUuidAsync and GetDescriptorsAsync.
Notes: See WindowsGattCharacteristicMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.57.2 Methods

24.57.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.57.4 Descriptors as WindowsGattDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the descriptors.
Notes: See WindowsGattDescriptorMBS class.

24.57.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.57.6 Properties

24.57.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.57.8 ProtocolError as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the protocol error.
Notes: The plugin returns value if this property is not set.
(Read only property)

24.57.9 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the status of an asynchronous operation.
Notes: (Read only property)

24.57.10 Constants

Constants

Constant	Value	Description
StatusAccessDenied	3	One of the status values. Access is denied.
StatusProtocolError	2	One of the status values. There was a GATT communication protocol error.
StatusSuccess	0	One of the status values. The operation completed successfully.
StatusUnreachable	1	One of the status values. No communication can be performed with the device, at this time.

24.58 class WindowsGattDeviceServiceMBS

24.58.1 class WindowsGattDeviceServiceMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a GATT Primary Service on a Bluetooth device.
Notes: The GattDeviceService class represents a GATT service on a Bluetooth LE device. It is instantiated by using a device service instance path, obtained by finding a device using the Windows.Devices.Enumeration API.

24.58.2 Methods

24.58.3 AlertNotification as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined AlertNotification Service UUID.

24.58.4 Battery as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Battery Service UUID.

24.58.5 BloodPressure as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Blood Pressure Service UUID.

24.58.6 Characteristics(characteristicUUID as String) as WindowsGattDeviceServiceMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a vector of characteristics, that are identified by the specified UUID and belong to this GattDeviceService instance.

24.58.7 Close

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Releases the resources associated with the GattDeviceService class.
Notes: This allows other apps to access the resources of the GattDeviceService in question. A GattDeviceService object should not be used after Close is invoked, instead a new GattDeviceService object should be instantiated using the FromIdAsync method.

Sets handle to zero.

24.58.8 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 24.58.9 Constructor(other as WindowsGattDeviceServiceMBS) 4530

24.58.9 Constructor(other as WindowsGattDeviceServiceMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
Notes: Creates a new Xojo object pointing to same device service.
See also:

- 24.58.8 Constructor 4529

24.58.10 CurrentTime as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined CurrentTime service UUID.

24.58.11 CyclingPower as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined CyclingPower service UUID.

24.58.12 CyclingSpeedAndCadence as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Cycling Speed And Cadence Service UUID.

24.58.13 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.58.14 DeviceInformation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined DeviceInformation service UUID.

24.58.15 FromId(Id as String) as WindowsGattDeviceServiceMBS

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Instantiates a new GattDeviceService from the device ID.
Notes: Synchronous version, which may blocks the application until the function finished.
See also:

- 24.58.16 FromId(Id as String, sharingMode as Integer) as WindowsGattDeviceServiceMBS 4531

24.58.16 FromId(Id as String, sharingMode as Integer) as WindowsGattDeviceServiceMBS

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Instantiates a new GattDeviceService from the device ID.
Notes: Synchronous version, which may blocks the application until the function finished.
See also:

- 24.58.15 FromId(Id as String) as WindowsGattDeviceServiceMBS 4531

24.58.17 FromIdAsync(Id as String, delegateHandler as ServiceFromIdAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Instantiates a new GattDeviceService from the device ID.
Notes: Id: The GATT device ID.
See also:

- 24.58.18 FromIdAsync(Id as String, sharingMode as Integer, delegateHandler as ServiceFromIdAsyncCompletedMBS) 4531

24.58.18 FromIdAsync(Id as String, sharingMode as Integer, delegateHandler as ServiceFromIdAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Instantiates a new GattDeviceService object from the device ID.
Notes: deviceId: The GATT device ID.
sharingMode: The sharing mode of the GATT device.
See also:

- 24.58.17 FromIdAsync(Id as String, delegateHandler as ServiceFromIdAsyncCompletedMBS) 4531

24.58.19 GenericAccess as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined UUID for the Generic Access Service.

24.58.20 GenericAttribute as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined UUID for the Generic Attribute Service.

24.58.21 GetAllCharacteristics as WindowsGattCharacteristicMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of all characteristics belonging to this GattDeviceService instance.

24.58.22 GetAllIncludedServices as WindowsGattDeviceServiceMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of all included services belonging to this GattDeviceService instance.

24.58.23 GetCharacteristicsAsync

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the characteristics that are part of this GattDeviceService instance.
Notes: Creates an asynchronous operation that completes with a WindowsGattCharacteristicsResultMBS object and calls CharacteristicsCompleted event later.

An asynchronous operation that completes with a GattCharacteristicsResult object and calls CharacteristicsCompleted event later.
See also:

- 24.58.24 GetCharacteristicsAsync(BluetoothCacheMode as Integer) 4533

24.58.24 GetCharacteristicsAsync(BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the characteristics that are part of this GattDeviceService instance.
Notes: Creates an asynchronous operation that completes with a WindowsGattCharacteristicsResultMBS object and calls CharacteristicsCompleted event later.

For BluetoothCacheMode pass CacheModeUncached or CacheModeCached.
See also:

- 24.58.23 GetCharacteristicsAsync 4532

24.58.25 GetCharacteristicsForUuidAsync(characteristicUuid as String)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the characterisitics that are part of this GattDeviceService instance and associated with the characteristicUuid.
Notes: Creates an asynchronous operation that completes with a WindowsGattCharacteristicsResultMBS object and calls CharacteristicsCompleted event later.

For BluetoothCacheMode pass CacheModeUncached or CacheModeCached.
See also:

- 24.58.26 GetCharacteristicsForUuidAsync(characteristicUuid as String, BluetoothCacheMode as Integer) 4533

24.58.26 GetCharacteristicsForUuidAsync(characteristicUuid as String, BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the characterisitics that are part of this GattDeviceService instance and associated with the characteristicUuid.
Notes: Creates an asynchronous operation that completes with a WindowsGattCharacteristicsResultMBS object and calls CharacteristicsCompleted event later.

For BluetoothCacheMode pass CacheModeUncached or CacheModeCached.
See also:

- 24.58.25 GetCharacteristicsForUuidAsync(characteristicUuid as String) 4533

24.58.27 GetDeviceSelectorFromShortId(serviceShortId as UInt16) as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a suitable AQS Filter string for use with the CreateWatcher method, from a 16-bit Bluetooth GATT Service UUID.
Notes: serviceShortId: A 16-bit Bluetooth GATT Service UUID.

24.58.28 GetDeviceSelectorFromUuid(serviceUuid as String) as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a suitable AQS Filter string for use with the CreateWatcher method, from a Bluetooth service UUID.
Notes: serviceUuid: A 128-bit Bluetooth GATT Service UUID, represented as a standard GUID object.

24.58.29 GetIncludedServicesAsync

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the included services that are associated with this GattDeviceService instance.
Notes: Creates an asynchronous operation that completes with a WindowsGattDeviceServicesResultMBS object.
See also:

- 24.58.30 GetIncludedServicesAsync(BluetoothCacheMode as Integer) 4534

24.58.30 GetIncludedServicesAsync(BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the included services that are associated with this GattDeviceService instance.
Notes: Creates an asynchronous operation that completes with a WindowsGattDeviceServicesResultMBS object.

For BluetoothCacheMode pass CacheModeUncached or CacheModeCached.
See also:

- 24.58.29 GetIncludedServicesAsync 4534

24.58.31 GetIncludedServicesForUuidAsync(serviceUuid as String)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the included services from the serviceUuid that is associated with this GattDeviceService instance.
Notes: Creates an asynchronous operation that completes with a WindowsGattDeviceServicesResultMBS object.

serviceUuid: A 128-bit Bluetooth GATT Service UUID, represented as a standard GUID object.
See also:

- 24.58.32 GetIncludedServicesForUuidAsync(serviceUuid as String, BluetoothCacheMode as Integer) 4535

24.58.32 GetIncludedServicesForUuidAsync(serviceUuid as String, BluetoothCacheMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the included services from the serviceUuid that is associated with this GattDeviceService instance.
Notes: Creates an asynchronous operation that completes with a WindowsGattDeviceServicesResultMBS object.

serviceUuid: A 128-bit Bluetooth GATT Service UUID, represented as a standard GUID object.
See also:

- 24.58.31 GetIncludedServicesForUuidAsync(serviceUuid as String) 4534

24.58.33 Glucose as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Glucose Service UUID.

24.58.34 HealthThermometer as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Health Thermometer Service UUID.

24.58.35 HeartRate as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Heart Rate Service UUID.

24.58.36 HumanInterfaceDevice as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined HumanInterfaceDevice service UUID.

24.58.37 ImmediateAlert as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ImmediateAlert service UUID.

24.58.38 LinkLoss as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined LinkLoss service UUID.

24.58.39 LocationAndNavigation as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined LocationAndNavigation service UUID.

24.58.40 NextDstChange as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined NextDstChange service UUID.

24.58.41 OpenAsync(SharingMode as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the GATT device service with the specified sharingMode.
Notes: Calls OpenAsyncCompleted later with result.

24.58.42 ParentServices as WindowsGattDeviceServiceMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the read-only list of parent services for this service.
Notes: A read-only list of parent services from which this object is derived, if this GattDeviceService is an included service; Otherwise, nil.

24.58.43 PhoneAlertStatus as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined PhoneAlertStatus service UUID.

24.58.44 ReferenceTimeUpdate as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ReferenceTimeUpdate service UUID.

24.58.45 RequestAccessAsync

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Requests access to the GattDeviceService.
Notes: An asynchronous operation that completes with RequestAccessCompleted event.

24.58.46 RunningSpeedAndCadence as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined Running Speed And Cadence Service UUID.

24.58.47 ScanParameters as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined ScanParameters service UUID.

24.58.48 TxPower as String

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Bluetooth SIG-defined TxPower service UUID.

24.58.49 Properties

24.58.50 AttributeHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the handle used to uniquely identify GATT-based service attributes as declared on the Bluetooth LE device.
Notes: Handle to uniquely identify GATT-based service attributes.
(Read only property)

24.58.51 Device as WindowsBluetoothLEDeviceMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the BluetoothLEDevice object describing the device associated with the current GattDeviceService object.
Notes: (Read only property)

24.58.52 DeviceId as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get the string that represents the GATT service instance path used to instantiate the GattDeviceService.
Notes: (Read only property)

24.58.53 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.58.54 Session as WindowsGattSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the session for this GATT device service instance.
Notes: (Read only property)

24.58.55 SharingMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the sharing mode for this GATT device service instance.
Notes: (Read only property)

24.58.56 UUID as String

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the GATT Service UUID associated with this GattDeviceService.
Notes: A 128-bit Bluetooth GATT Service UUID, represented as a standard GUID object.
(Read only property)

24.58.57 Events

24.58.58 CharacteristicsCompleted(asyncStatus as Integer, Result as WindowsGattCharacteristicsResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetCharacteristicsAsync* functions completed.

24.58.59 IncludedServicesCompleted(asyncStatus as Integer, Result as WindowsGattDeviceServicesResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Event called when GetIncludedServices*Async method completes.
Example:

```
Sub IncludedServicesCompleted(asyncStatus as Integer, Result as WindowsGattDeviceServicesResultMBS)
Handles IncludedServicesCompleted
Log CurrentMethodName

if Result <>nil then
Var services() as WindowsGattDeviceServiceMBS = Result.Services

For Each Service As WindowsGattDeviceServiceMBS In Services
Log "Found service: "+Service.UUID+" Sharing Mode:"+Service.SharingMode.toText
next
end If
End Sub
```

24.58.60 OpenAsyncCompleted(asyncStatus as Integer, OpenStatus as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event for completed OpenAsync call.

24.58.61 RequestAccessCompleted(asyncStatus as Integer, DeviceAccessStatus as Integer)

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event for RequestAccessAsync method completion.

24.58.62 Constants

Cache Modes

Constant	Value	Description
CacheModeCached	0	Cached data.
CacheModeUncached	1	Uncached data.

Open Status Codes

Constant	Value	Description
OpenStatusAccessDenied	5	Access is denied.
OpenStatusAlreadyOpened	2	The GATT device service is already opened.
OpenStatusNotFound	3	The GATT device service was not found.
OpenStatusSharingViolation	4	There was a sharing violation.
OpenStatusSuccess	1	The GATT device service was successfully opened.
OpenStatusUnspecified	0	Unspecified error.

Sharing Modes

Constant	Value	Description
SharingModeExclusive	1	The sharing mode is exclusive.
SharingModeSharedReadAndWrite	3	The sharing mode is read and write.
SharingModeSharedReadOnly	2	The sharing mode is read only.
SharingModeUnspecified	0	The sharing mode is unspecified.

24.58.63 Delegates

24.58.64 ServiceFromIdAsyncCompletedMBS(AsyncStatus as Integer, Device as WindowsGattDeviceServiceMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate to be called by one of the FromIdAsync methods.

24.59 class WindowsGattDeviceServicesResultMBS

24.59.1 class WindowsGattDeviceServicesResultMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The status of GetIncludedServicesForUuidAsync and GetIncludedServicesForUuidAsync.
Notes: See WindowsGattDeviceServiceMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Function: The private constructor.

24.59.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.59.5 Services as WindowsGattDeviceServiceMBS()

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the services.
Notes: See WindowsGattDeviceServiceMBS class.

24.59.6 Properties

24.59.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.59.8 ProtocolError as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the protocol error.
Notes: The plugin returns value if this property is not set.
(Read only property)

24.59.9 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the status of an asynchronous operation.
Notes: (Read only property)

24.59.10 Constants

Status Values

Constant	Value	Description
StatusAccessDenied	3	Access is denied.
StatusProtocolError	2	There was a GATT communication protocol error.
StatusSuccess	0	The operation completed successfully.
StatusUnreachable	1	No communication can be performed with the device, at this time.

24.60 class WindowsGattReadClientCharacteristicConfigurationDescriptorResultMBS

24.60.1 class WindowsGattReadClientCharacteristicConfigurationDescriptorResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents the result of reading a GATT Client CharacteristicConfigurationClientDescriptor value.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.60.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.60.5 Properties

24.60.6 ClientCharacteristicConfigurationDescriptor as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents the value of the GATT ClientCharacteristicConfigurationDescriptor.
Notes: (Read only property)

24.60.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.60.8 ProtocolError as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the protocol error.
Notes: The plugin returns value if this property is not set.
(Read only property)

24.60.9 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the status of an asynchronous operation.
Notes: See Status* constants in WindowsGattCharacteristicMBS class.
(Read only property)

24.60.10 Constants

Client Characteristic Configuration descriptor

Constant	Value	Description
ConfigurationDescriptorValueIndicate	2	Characteristic indications are enabled.
ConfigurationDescriptorValueNone	0	Neither notification nor indications are enabled.
ConfigurationDescriptorValueNotify	1	Characteristic notifications are enabled.

Status Values

Constant	Value	Description
StatusAccessDenied	3	Access is denied.
StatusProtocolError	2	There was a GATT communication protocol error.
StatusSuccess	0	The operation completed successfully.
StatusUnreachable	1	No communication can be performed with the device, at this time.

24.61 class WindowsGattReadRequestMBS

24.61.1 class WindowsGattReadRequestMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class represents a Bluetooth GATT read request.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.61.2 Methods

24.61.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.61.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.61.5 Properties

24.61.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.61.7 Length as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the buffer length of the read request.
Notes: (Read only property)

24.61.8 Offset as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The read request offset.
Notes: (Read only property)

24.61.9 State as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The read request state.
Notes: (Read only property)

24.61.10 Constants

GATT request state

Constant	Value	Description
StateCanceled	2	The request is canceled.
StateCompleted	1	The request if completed.
StatePending	0	The request is pending.

24.62 class WindowsGattReadResultMBS

24.62.1 class WindowsGattReadResultMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents the result of an asynchronous read operation of a GATT Characteristic or Descriptor value.
Notes: One of the ReadValueAsync methods is used to retrieve a GattReadResult object.
The Status property on the GattReadResult returned indicates if the result of the operation was successful.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.62.2 Methods

24.62.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.62.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.62.5 Properties

24.62.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.62.7 ProtocolError as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the protocol error.
Notes: The plugin returns value if this property is not set.
(Read only property)

24.62.8 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the status of an asynchronous operation.
Notes: (Read only property)

24.62.9 Value as MemoryBlock

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the value read from the device.
Notes: (Read only property)

24.62.10 Constants

Status Values

Constant	Value	Description
StatusAccessDenied	3	Access is denied.
StatusProtocolError	2	There was a GATT communication protocol error.
StatusSuccess	0	The operation completed successfully.
StatusUnreachable	1	No communication can be performed with the device, at this time.

24.63 class WindowsGattSessionMBS

24.63.1 class WindowsGattSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a Generic Attribute Profile (GATT) session.

24.63.2 Methods

24.63.3 Close

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the GattSession.
Notes: Sets handle to zero.

24.63.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 24.63.5 Constructor(other as WindowsGattSessionMBS)

24.63.5 Constructor(other as WindowsGattSessionMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 24.63.4 Constructor 4550

24.63.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.63.7 FromDeviceId(deviceId as WindowsBluetoothDeviceIdMBS) as WindowsGattSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new GattSession object from the specified deviceId.
Notes: Synchronous version, which may blocks the application until the function finished.

24.63.8 FromDeviceIdAsync(deviceId as WindowsBluetoothDeviceIdMBS, delegateHandler as FromDeviceIdAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new GattSession object from the specified deviceId.
Example:

```
// you got a device ID as string
Var WinDeviceID As New WindowsBluetoothDeviceIdMBS(DeviceID)

// and now wait for callback
WindowsGattSessionMBS.FromDeviceIdAsync(WinDeviceID, AddressOf FromIDAsyncCompleted)
```

Notes: Later calls FromDeviceIdAsyncCompletedMBS event.

24.63.9 Properties

24.63.10 CanMaintainConnection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a Boolean value that indicates whether the connection can be maintained.
Notes: (Read only property)

24.63.11 DeviceId as WindowsBluetoothDeviceIdMBS

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the device ID.
Notes: (Read only property)

24.63.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.63.13 MaintainConnection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets a Boolean value that indicates whether the connection should be maintained.
Notes: Value is true if the connection should be maintained, otherwise false. false by default.

If GattSession.MaintainConnection is set to true, then the system waits indefinitely for a connection, and it will connect when the device is available. There's nothing for your application to wait on, since GattSession.MaintainConnection is a property.
(Read and Write property)

24.63.14 MaxPduSize as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum protocol data unit (PDU) size.
Notes: This metric is also known as the maximum transmission unit (MTU) size.

The Windows operating system automatically fragments down larger protocol data unit (PDU) sizes sent to a remote device (wherever supported by the Bluetooth GATT/ATT spec). So under normal circumstances, there's no need for you to know the maximum transmission unit (MTU) size at the application layer if your application's goal is just to send data efficiently.
You can send large amounts of data, and it will be fragmented automatically by the OS using the MTU. Your application is not limited by the MTU size as to the data transfer of each packet.
If you want your application to customize the data sent based on the MTU (for example, encoding/codec), or to communicate the MTU size information out-of-band, then you can access the the MTU value using MaxPduSize and GattSession.MaxPduSizeChanged.
(Read only property)

24.63.15 SessionStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the session status.
Notes: (Read only property)

24.63.16 Events

24.63.17 MaxPduSizeChanged

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An event that is raised when the maximum protocol data unit (PDU) size changes.
Notes: The PDU is also known as the maximum transmission unit (MTU).

MaxPduSizeChanged is raised whenever the negotiated MTU for the Attribute Protocol (ATT) is changed. And that can be changed or negotiated by a remote Bluetooth peripheral. As a developer, you can't change the value used by Windows itself, since that's fully managed by the operating system.
Also see the GattSession.MaxPduSize property which, as mentioned, is read-only.

24.63.18 SessionStatusChanged

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An event that is triggered when the GATT session status has changed.

24.63.19 Constants

Status

Constant	Value	Description
StatusActive	1	The GATT session is active.
StatusClosed	0	The GATT session is closed.

24.63.20 Delegates

24.63.21 FromDeviceIdAsyncCompletedMBS(AsyncStatus as Integer, session as WindowsGattSessionMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Event called when a session was created.

24.64 class WindowsGattValueChangedEventArgsMBS

24.64.1 class WindowsGattValueChangedEventArgsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The value changed event arguments.
Notes: Represents the arguments received by a WindowsGattCharacteristicMBS.ValueChanged event handler used to process characteristic value change notification and indication events sent by a Bluetooth LE device.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.64.2 Methods

24.64.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.64.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.64.5 Properties

24.64.6 CharacteristicValue as MemoryBlock

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the new Characteristic Value.
Notes: (Read only property)

24.64.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.64.8 Timestamp as UInt64

MBS WinFrameworks Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time at which the system was notified of the Characteristic Value change.
Example:

```
// convert value to time.
Var e as WindowsGattValueChangedEventArgsMBS // your object
Var value As Double = e.Timestamp / 10000000.0
Var d As New DateTime(1601, 1, 1, 0, 0, 0, 0)

d = New DateTime(d.SecondsFrom1970 + value)

MessageBox d.ToString
```

Notes: (Read only property)

24.65 class WindowsGattWriteRequestMBS

24.65.1 class WindowsGattWriteRequestMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class represents a GATT write request.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

24.65.2 Methods

24.65.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

24.65.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

24.65.5 Properties

24.65.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.65.7 Offset as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the offset.
Notes: (Read only property)

24.65.8 Option as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the write request option.
Notes: See OptionWriteWithResponse and OptionWriteWithoutResponse.
(Read only property)

24.65.9 State as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the state of the write request.
Notes: (Read only property)

24.65.10 Value as MemoryBlock

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the buffer value of the write request.
Notes: (Read only property)

24.65.11 Constants

Options

Constant	Value	Description
OptionWriteWithoutResponse	1	The Write Without Response procedure shall be used.
OptionWriteWithResponse	0	The default GATT write procedure shall be used.

GATT request state

Constant	Value	Description
StateCanceled	2	The request is canceled.
StateCompleted	1	The request if completed.
StatePending	0	The request is pending.

24.66 class WindowsGattWriteResultMBS

24.66.1 class WindowsGattWriteResultMBS

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the result of GATT write operations like WriteValueWithResultAsync.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

24.66.7 ProtocolError as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the protocol error.
Notes: The plugin returns value if this property is not set.
(Read only property)

24.66.8 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the status of an asynchronous operation.
Notes: (Read only property)

24.66.9 Constants

Status Values

Constant	Value	Description
StatusAccessDenied	3	Access is denied.
StatusProtocolError	2	There was a GATT communication protocol error.
StatusSuccess	0	The operation completed successfully.
StatusUnreachable	1	No communication can be performed with the device, at this time.

Chapter 25

Calendar

25.1 class CalAlarmMBS

25.1.1 class CalAlarmMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKAlarmMBS instead.
Function: The class for an Alarm in iCal.
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

// create a new calendar
Var c as new CalEventMBS

Var StartDate as date = new date
StartDate.day = StartDate.day +1 // start tomorrow

Var calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="new Event"
c.startDate=StartDate
c.calendar=calendars(0) // add to first calendar

Var EndDate as new date(StartDate) // one hour after start
EndDate.hour = EndDate.hour + 1
```

```
c.endDate=EndDate

Var a as new CalAlarmMBS // Send email one hour earlier
a.action = a.CalAlarmActionEmail
a.relativeTrigger = -3600
a.emailAddress="some@email.address"

c.addAlarm a // attach an alarm

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New event was created."
end if
```

Notes: Requires Mac OS X 10.5 to work.

25.1.2 Methods

25.1.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: This constructor creates a new empty alarm object.
Example:

```
Var a as new CalAlarmMBS // add alarm
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before
```

25.1.4 triggerDateRelativeTo(currentdate as date) as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the date of the trigger relative to the given date.

25.1.5 Properties

25.1.6 absoluteTrigger as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The absolute trigger value.
Notes: The time that an alarm goes off is referred to as the trigger. Alarms have either a relative trigger, which means the alarm fires a certain number of seconds before an alarm occurs, or an absolute trigger, which specifies the exact time the alarm will trigger off.

Setting an absoluteTrigger will also set the relativeTrigger to 0.
(Read and Write property)

25.1.7 acknowledged as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The acknowledged date for the alarm.
Notes: (Read and Write property)

25.1.8 action as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The action used for this alarm.
Notes: See the CalAlarmAction* constants.
(Read and Write property)

25.1.9 emailAddress as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The email address to notify.
Notes: Setting an emailAddress will also set the action to CalAlarmEmail as well as set the sound and URL to nil.
(Read and Write property)

25.1.10 relatedTo as String

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Related to text.
Notes: (Read and Write property)

25.1.11 relativeTrigger as Double

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The absolute relative value.
Notes: The time that an alarm goes off is referred to as the trigger. Alarms have either a relative trigger, which means the alarm fires a certain number of seconds before an alarm occurs, or an absolute trigger, which specifies the exact time the alarm will trigger off.

Setting a relativeTrigger will also set the absoluteTrigger to 0.
(Read and Write property)

25.1.12 sound as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The sound file to play.
Notes: Setting a sound will also set the action to CalAlarmSound as well as set the emailAddress and URL to nil. Expects the name of a system alert. See NSSound.
(Read and Write property)

25.1.13 url as string

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The URL to launch when the alarm comes.
Notes: Setting a URL will also set the action to CalAlarmProcedure as well as set the emailAddress and sound to nil. The URL must be a file URL.
(Read and Write property)

25.1.14 Constants

Alarm Action Constants

Constant	Value	Description
CalAlarmActionDisplay	"DISPLAY"	Display the event.
CalAlarmActionEmail	"EMAIL"	Send an email.
CalAlarmActionProcedure	"PROCEDURE"	
CalAlarmActionSound	"AUDIO"	Play a sound.

25.2 class CalAttendeeMBS

25.2.1 class CalAttendeeMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKParticipantMBS instead. **Function:** The class for an Attendee.
Notes: Requires Mac OS X 10.5 to work.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

25.2.2 Methods

25.2.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

25.2.4 Properties

25.2.5 address as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The address of this attendee.
Notes: (Read only property)

25.2.6 commonName as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The user-entered name of the attendee.
Notes: (Read only property)

25.2.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The internal used CalAttendee reference.
Notes: (Read and Write property)

25.2.8 status as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The attendee status.
Notes: Use the CalAttendeeStatus* constants.

For now (Mac OS X 10.5), it is not possible to modify an event's attendees or the attendees themselves.
(Read only property)

25.2.9 Constants

Constants

Constant	Value	Description
CalAttendeeStatusAccepted	"ACCEPTED"	These constants are used to describe the user's confirmation stat tendee.
CalAttendeeStatusDeclined	"DECLINED"	These constants are used to describe the user's confirmation stat tendee.
CalAttendeeStatusNeedsAction	"NEEDS-ACTION"	These constants are used to describe the user's confirmation stat tendee. This is the default status for an attendee.
CalAttendeeStatusTentative	"TENTATIVE"	These constants are used to describe the user's confirmation stat tendee.

25.3 class CalCalendarItemMBS

25.3.1 class CalCalendarItemMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKCalendarItemMBS instead. **Function:** The class for a calendar item in iCal.
Notes: This class and its subclasses should be used to get information about CalEvent and CalTasks. Accessors for properties common to both of these classes are included here.

Requires Mac OS X 10.5 to work.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.2pr2

25.3.2 Methods

25.3.3 addAlarm(alarm as CalAlarmMBS)

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Adds one alarm.

25.3.4 addAlarms(alarms() as CalAlarmMBS)

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Adds an array of alarms.

25.3.5 alarms as CalAlarmMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: An array of CalAlarms associated with the calendar item.

25.3.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

25.3.7 hasAlarm as Boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether this item has an alarm associated.

25.3.8 nextAlarmDate as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the next alaram date.

25.3.9 removeAlarm(alarm as CalAlarmMBS)

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Removes one alarm.

25.3.10 removeAlarms(alarms() as CalAlarmMBS)

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Removes the alarms.

25.3.11 setalarms(alarms() as CalAlarmMBS)

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Sets the alarms for this item.

25.3.12 Show

MBS MacFrameworks Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Shows the item in iCal.
Example:

```
Var c as new CalCalendarStoreMBS

// search for some events within last year
Var d as new date
Var e as new date

d.Year = d.Year -1

Var events() as CalEventMBS = c.events(d, e)

// pick one, show title and show in iCal
MsgBox Events(30).Title
events(30).show
```

25.3.13 Properties

25.3.14 calendar as CalCalendarMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The calendar of this item.
Notes: (Read and Write property)

25.3.15 dateStamp as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The datestamp of this calendar item.
Notes: This value is read only.
(Read only property)

25.3.16 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The internal used CalCalendarItem reference.
Notes: (Read and Write property)

25.3.17 notes as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The notes text for this item.
Example:

```
Var c as new CalCalendarStoreMBS

// set the date range where we look for event
Var sd as new date(2016,6,7,0,0,0)
Var ed as new date(2016,6,7,23,59,59)

// look for an event on that date
Var a() as CalEventMBS = c.events(sd,ed, c.calendars)
Var e as CalEventMBS = a(1)

// show notes
MsgBox e.notes

// change it
e.notes = "Just a test"

// check again
MsgBox e.notes

// Save
Var error as NSErrorMBS
Var ok as Boolean = c.saveEvent(e, c.CalSpanThisEvent, error)

if ok then
MsgBox "OK"
elseif error <>nil then
MsgBox error.LocalizedDescription
else
MsgBox "Failed."
end if
```

Notes: (Read and Write property)

25.3.18 title as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The title for this calendar item.
Example:

```
// init
Var s as new CalCalendarStoreMBS
```

```
// Get date range for today
Var Startdate as new date
Var Enddate as new date

Startdate.hour = 0
Startdate.Minute = 0
Startdate.Second = 0

Enddate.hour = 23
Enddate.minute = 59
Enddate.second = 59

// Query events on all calendars
Var events() as CalEventMBS = s.events(Startdate,Enddate)

// Display result
Var lines(-1) as string
for each e as CalEventMBS in events
lines.Append e.Title
next

MsgBox Join(lines,EndOfLine)
```

Notes: (Read and Write property)

25.3.19 uid as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The unique ID for this item.
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

// create a new calendar event
Var c as new CalEventMBS

Var calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="new Event"
c.startDate=new date
```

```
c.calendar=calendars(0) // add to first calendar

Var d as new date
d.hour=d.hour+1
c.endDate=d

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
// show the UID
MsgBox "New event was created with UID: "+c.uid
end if
```

Notes: This value is read only.
(Read only property)

25.3.20 URL as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The URL for this calendar item.
Notes: (Read and Write property)

25.4 class CalCalendarMBS

25.4.1 class CalCalendarMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKCalendarMBS instead.
Function: A class for the iCal calendars.
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

// create a new calendar
Var c as new CalCalendarMBS

// set properties
c.Title="New Calendar"
c.notes="Just a test"

// save calendar
call s.saveCalendar(c,e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New calendar was created."
end if
```

Notes: Requires Mac OS X 10.5 to work.
This class can be used to get attributes of a calendar, but cannot be used to get the list of events or tasks in a calendar.
Blog Entries

- MBS Xojo Plugins, version 17.3pr1

25.4.2 Methods

25.4.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The iCal class for a calendar.

Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

// create a new calendar
Var c as new CalCalendarMBS

// set properties
c.Title="New Calendar"
c.notes="Just a test"

// save calendar
call s.saveCalendar(c,e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New calendar was created."
end if
```

Notes: All calendars created with this API will be of type CalCalendarTypeLocal.

25.4.4 Properties

25.4.5 Color as NSColorMBS

MBS MacFrameworks Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The color for this calendar.
Notes: (Read and Write property)

25.4.6 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

25.4.7 isEditable as Boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether this calendar is editable.
Notes: This property is read only.
(Read only property)

25.4.8 notes as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The notes for this calendar.
Notes: (Read and Write property)

25.4.9 title as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The title of this calendar.
Example:

```
Var c as new CalCalendarStoreMBS
Var ca() as CalCalendarMBS = c.calendars
for each cc as CalCalendarMBS in ca
MsgBox cc.Title+EndOfLine+cc.type+EndOfLine+cc.notes
next
```

Notes: (Read and Write property)

25.4.10 type as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The type of this calendar.
Notes: This property is read only.

use the CalCalendarType* constants.
(Read only property)

25.4.11 uid as String

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The unique ID for this calendar.
Notes: This property is read only.
(Read only property)

25.4.12 Constants

Constants

Constant	Value	Description
CalCalendarTypeBirthday	"Birthday"	One of the calendar types.
CalCalendarTypeCalDAV	"CalDAV"	One of the calendar types.
CalCalendarTypeExchange	"Exchange"	One of the calendar types. New in Mac OS X 10.6.
CalCalendarTypeIMAP	"IMAP"	One of the calendar types.
CalCalendarTypeLocal	"Local"	One of the calendar types.
CalCalendarTypeSubscription	"Subscription"	One of the calendar types.

25.5 class CalCalendarStoreMBS

25.5.1 class CalCalendarStoreMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKEventStoreMBS instead. **Function:** The class for the calendar storage.
Example:

```
// init
Var s as new CalCalendarStoreMBS

// find calendar by name
Var myCalendar as CalCalendarMBS
Var calendars() as CalCalendarMBS = s.calendars

for each ca as CalCalendarMBS in calendars
if ca.Title = "Private Events" then
myCalendar=ca
exit
end if
next

// Get date range for today
Var Startdate as new date
Var Enddate as new date

Startdate.hour = 0
Startdate.Minute = 0
Startdate.Second = 0

Enddate.hour = 23
Enddate.minute = 59
Enddate.second = 59

// Query events on this calendar
Var events() as CalEventMBS = s.events(Startdate,Enddate, myCalendar)

// Display result
Var lines(-1) as string
for each e as CalEventMBS in events
lines.Append e.Title
next

MsgBox Join(lines,EndOfLine)
```

Notes: Requires Mac OS X 10.5 to work.

Calendar saving and modification errors:

CalCalendarNotEditableError	= 1025	Events and tasks cannot be added to an uneditable calendar
CalDateInvalidError	= 1026	The start date of an event must be earlier than its end date
CalCalendarNotInRepository	= 1027	Events' and tasks' calendar property must be a calendar in the user's calendar store
CalCalendarTitleNotUniqueError	= 1028	Calendar titles must be unique

And the domain for the errors is: CalCalendarStoreErrorDomain

25.5.2 Methods

25.5.3 calendars as CalCalendarMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: An array of all the user's calendars, represented as CalCalendars.
Example:

```
Var c as new CalCalendarStoreMBS
Var ca() as CalCalendarMBS

ca=c.calendars
for each cc as CalCalendarMBS in ca
MsgBox cc.Title+EndOfLine+cc.type+EndOfLine+cc.notes
next
```

Notes: If the user has iCal data from a previous version of Mac OS X, but has not launched iCal in 10.5, this will return an array of empty calendars. iCal needs to be launched at least once in order to migrate the user's calendar data.

If no calendar data from any version of Mac OS X exists, then this method will create and return two default calendars, named Home and Work.

25.5.4 calendarWithTitle(Title as string) as CalCalendarMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Queries all calendars and searches for one with the given title.
Example:

```
Var cs as new CalCalendarStoreMBS

// delete one
Var c as CalCalendarMBS = cs.calendarWithTitle("Just Testing")
Var e as NSErrorMBS
if cs.removeCalendar(c, e) then
MsgBox "deleted"
else
MsgBox "Failed to remove: "+e.LocalizedDescription
end if
```

Notes: Title comparison is case insensitive.
Returns nil on any error.

25.5.5 calendarWithUID(UID as string) as CalCalendarMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The calendar associated with the specific UID.
Notes: If no record with this UID exists, nil is returned.

25.5.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The class for the calendar storage.
Notes: This is the main class. Keep an object of it around as long as you use the calendar classes.

25.5.7 events(StartDate as date, EndDate as date) as CalEventMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalEvents which match the condition.
Example:

```
Var c as new CalCalendarStoreMBS
```

```
Var i,count as Integer
Var ta() as CalEventMBS
Var ct as CalEventMBS

Var sd as new date
Var ed as new date

ed.day=ed.day+1
// events within the next 24 hours

ta=c.events(sd,ed)
for each ct in ta
msgbox ct.Title+EndOfLine+ct.location+EndOfLine+ct.startDate.LongDate+" "+ct.startDate.LongTime
next
```

Notes: This is the function which uses all calendars.

For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.
See also:

- 25.5.8 events(StartDate as date, EndDate as date, calendar as CalCalendarMBS) as CalEventMBS() 4581
- 25.5.9 events(StartDate as date, EndDate as date, calendars() as CalCalendarMBS) as CalEventMBS() 4583
- 25.5.10 events(StartDate as date, EndDate as date, eventUID as string) as CalEventMBS() 4583
- 25.5.11 events(StartDate as date, EndDate as date, eventUID as string, calendar as CalCalendarMBS) as CalEventMBS() 4584
- 25.5.12 events(StartDate as date, EndDate as date, eventUID as string, calendars() as CalCalendarMBS) as CalEventMBS() 4584

25.5.8 events(StartDate as date, EndDate as date, calendar as CalCalendarMBS) as CalEventMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalEvents which match the condition.
Example:

```
// init
Var s as new CalCalendarStoreMBS
```

```
// find calendar by name
Var myCalendar as CalCalendarMBS
Var calendars() as CalCalendarMBS = s.calendars

for each ca as CalCalendarMBS in calendars
if ca.Title = "Private Events" then
myCalendar=ca
exit
end if
next

// Get date range for today
Var Startdate as new date
Var Enddate as new date

Startdate.hour = 0
Startdate.Minute = 0
Startdate.Second = 0

Enddate.hour = 23
Enddate.minute = 59
Enddate.second = 59

// Query events on this calendar
Var events() as CalEventMBS = s.events(Startdate,Enddate, myCalendar)

// Display result
Var lines(-1) as string
for each e as CalEventMBS in events
lines.Append e.Title
next

MsgBox Join(lines,EndOfLine)
```

Notes: For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.
See also:

- 25.5.11 events(StartDate as date, EndDate as date, eventUID as string, calendar as CalCalendarMBS) as CalEventMBS() 4584

- 25.5.12 events(StartDate as date, EndDate as date, eventUID as string, calendars() as CalCalendarMBS) as CalEventMBS() 4584

25.5.9 events(StartDate as date, EndDate as date, calendars() as CalCalendarMBS) as CalEventMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalEvents which match the condition.
Notes: For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.

- 25.5.9 events(StartDate as date, EndDate as date, calendars() as CalCalendarMBS) as CalEventMBS() 4583

- 25.5.10 events(StartDate as date, EndDate as date, eventUID as string) as CalEventMBS() 4583
- 25.5.11 events(StartDate as date, EndDate as date, eventUID as string, calendar as CalCalendarMBS) as CalEventMBS() 4584

25.5.13 eventsMT(StartDate as date, EndDate as date, calendars() as CalCalendarMBS = nil) as CalEventMBS()

MBS MacFrameworks Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalEvents which match the condition.
Notes: For performance reasons, this method will only return occurrences of repeating events that fall within a specific four year timespan. If the date range between the startDate and endDate is greater than four years, then the timespan containing recurrences is always the first four years of date range.

If calendars array is nil, we use all calendars.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

25.5.14 eventWithUID(UID as string, occurrence as date) as CalEventMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Searches the event with the given unique ID.
Example:

```
// connect to calendar storage
Var c as new CalCalendarStoreMBS

// find event with given UID
Var e as CalEventMBS = c.eventWithUID("M2CD-6-1-EEB42862-8BD6-4880-AF91-4AEEADD900B6", nil)

// and display title
MsgBox e.Title
```

Notes: Returns nil on any error.

uid: The unique identifier of an event.
date: The date of a recurring event. Pass nil if the event is not recurring.

Returns a CalEvent object that matches the specified unique identifier and date. Returns nil if the event is

not found, or the event is recurring and date is not specified.

Available in Mac OS X v10.5 and later.

25.5.15 removeCalendar(calendar as CalCalendarMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Deletes a calendar.
Example:

```
Var cs as new CalCalendarStoreMBS

// before

Var calendars1() as CalCalendarMBS = cs.calendars
Var list1() as string

for each c1 as CalCalendarMBS in calendars1
list1.Append c1.Title
next

MsgBox Join(list1, EndOfLine)

// delete one
Var c as CalCalendarMBS = cs.calendarWithTitle("Just Testing")
Var e as NSErrorMBS
if cs.removeCalendar(c, e) then
MsgBox "deleted"
else
MsgBox "Failed to remove: "+e.LocalizedDescription
end if

// after
Var calendars2() as CalCalendarMBS = cs.calendars
Var list2() as string

for each c2 as CalCalendarMBS in calendars2
list2.Append c2.Title
next

MsgBox Join(list2, EndOfLine)
```

Notes: Return

25.5.16 removeEvent(theEvent as CalEventMBS, span as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Removes the event from the calendar.
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

// create a new calendar event
Var c as new CalEventMBS

Var calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="new Event"
c.startDate=new date
c.calendar=calendars(0) // add to first calendar

Var d as new date
d.hour=d.hour+1
c.endDate=d

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New event was created with UID: "+c.uid

e = nil

// and delete it
if s.removeEvent(c, s.CalSpanAllEvents, e) then
MsgBox "Event deleted."
else
MsgBox e.localizedDescription
end if

end if
```

Notes: Returns true on success and false on failure.
Error is stored in the error object.

25.5.17 removeTask(task as CalTaskMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Removes the task from the calendar.
Notes: Returns true on success and false on failure.
Error is stored in the error object.

25.5.18 saveCalendar(calendar as CalCalendarMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Writes changes to calendar.
Example:

```
Var cs as new CalCalendarStoreMBS
Var c as new CalCalendarMBS

c.Title = "Just Testing"

Var e as NSErrorMBS
if cs.saveCalendar(c, e) then
MsgBox "OK"
else
MsgBox "Failed "+e.LocalizedDescription
end if
```

Notes: The saveCalendar and the removeCalendar calendars allow the client to add, modify, and remove calendars in the user's calendar store. saveCalendar should be used both to add a new calendar to the calendar store, and to modify a calendar already in the store.

The only calendars that can be added with this API are local calendars; it is not possible to add subscribed or CalDAV calendars, or the birthday calendar.

Changes made to a CalCalendar are not persisted until that calendar has been passed to saveCalendar. If saveCalendar is not called, the changes will be lost.

25.5.19 saveEvent(theEvent as CalEventMBS, span as Integer, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: This method allows the client to add or modify events in the user's calendar store.
Notes: This method should be used both to add a new event to the calendar store, and to modify an event already in the calendar store.
If the event being saved is a repeating event, the second argument is used to describe whether the change being made should apply to future occurrences of that event, all occurrences, or only this instance. This is analogous to options on the dialog iCal presents when a user modifies a recurring event (though iCal's UI does not provide a way to change all events, past and present).

Changes made to a CalEvent are not persisted until that event has been passed to saveEvent. If saveEvent is not called, the changes will be lost.

Applying changes to all events or all future events may cause the UID or the occurrence date of the event to change.

25.5.20 saveTask(task as CalTaskMBS, byref error as NSErrorMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Saves the specified task to the calendar store.
Example:

```
Var s as new CalCalendarStoreMBS
Var t as new CalTaskMBS
Var a() as CalCalendarMBS = s.calendars
Var d as new date

d.Month = d.Month + 1

t.calendar = a(0)
t.Title = "Test"
t.URL = "http://www.mbsplugins.de/"
t.priority = t.CalPriorityMedium
t.dueDate = d
t.notes = "just a test"
t.isCompleted = false

Var e as NSErrorMBS
if s.saveTask(t, e) then
MsgBox "saved"
else
MsgBox "failed to save"
```

end if

Notes: task: The task to save.
error: If this method returns false, an NSError object describing the error.

Returns true on success; otherwise, returns false and sets the error argument to an NSError object describing the error.

Use this method to save new task objects and modifications to existing task objects. Changes to task objects are not persistent until this method is invoked. The calendar property needs to be set before attempting to save a task.

Available in Mac OS X v10.5 and later.

25.5.21 tasks as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks.
Notes: This is the function which uses all calendars.
See also:

- 25.5.22 tasks(calendar as CalCalendarMBS) as CalTaskMBS() 4590
- 25.5.23 tasks(calendars() as CalCalendarMBS) as CalTaskMBS() 4590

25.5.22 tasks(calendar as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.21 tasks as CalTaskMBS() 4590
- 25.5.23 tasks(calendars() as CalCalendarMBS) as CalTaskMBS() 4590

25.5.23 tasks(calendars() as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.21 tasks as CalTaskMBS() 4590
- 25.5.22 tasks(calendar as CalCalendarMBS) as CalTaskMBS() 4590

25.5.24 TasksCompletedSince(completedSince as date) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
Notes: This is the function which uses all calendars.
See also:

- 25.5.25 TasksCompletedSince(completedSince as date, calendar as CalCalendarMBS) as CalTaskMBS() 4591
- 25.5.26 TasksCompletedSince(completedSince as date, calendars() as CalCalendarMBS) as CalTaskMBS() 4591

25.5.25 TasksCompletedSince(completedSince as date, calendar as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.24 TasksCompletedSince(completedSince as date) as CalTaskMBS() 4591
- 25.5.26 TasksCompletedSince(completedSince as date, calendars() as CalCalendarMBS) as CalTaskMBS() 4591

25.5.26 TasksCompletedSince(completedSince as date, calendars() as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.24 TasksCompletedSince(completedSince as date) as CalTaskMBS() 4591
- 25.5.25 TasksCompletedSince(completedSince as date, calendar as CalCalendarMBS) as CalTaskMBS() 4591

25.5.27 taskWithUID(UID as string) as CalTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Searches the task with the given unique ID.
Notes: Returns nil on any error.

25.5.28 UncompletedTasks as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
Example:

```
Var c as new CalCalendarStoreMBS

Var ta() as CalTaskMBS = c.UncompletedTasks

for each ct as CalTaskMBS in ta
msgbox ct.Title+EndOfLine+str(ct.priority)+EndOfLine+ct.dueDate.LongDate
next
```

Notes: This is the function which uses all calendars.
See also:

- 25.5.29 UncompletedTasks(calendar as CalCalendarMBS) as CalTaskMBS() 4592
- 25.5.30 UncompletedTasks(calendars() as CalCalendarMBS) as CalTaskMBS() 4592

25.5.29 UncompletedTasks(calendar as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.28 UncompletedTasks as CalTaskMBS() 4592
- 25.5.30 UncompletedTasks(calendars() as CalCalendarMBS) as CalTaskMBS() 4592

25.5.30 UncompletedTasks(calendars() as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.28 UncompletedTasks as CalTaskMBS() 4592
- 25.5.29 UncompletedTasks(calendar as CalCalendarMBS) as CalTaskMBS() 4592

25.5.31 UncompletedTasksDueBefore(dueDate as date) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
Notes: This is the function which uses all calendars.
See also:

- 25.5.32 UncompletedTasksDueBefore(dueDate as date, calendar as CalCalendarMBS) as CalTaskMBS() 4593
- 25.5.33 UncompletedTasksDueBefore(dueDate as date, calendars() as CalCalendarMBS) as CalTaskMBS() 4593

25.5.32 UncompletedTasksDueBefore(dueDate as date, calendar as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.31 UncompletedTasksDueBefore(dueDate as date) as CalTaskMBS() 4593
- 25.5.33 UncompletedTasksDueBefore(dueDate as date, calendars() as CalCalendarMBS) as CalTaskMBS() 4593

25.5.33 UncompletedTasksDueBefore(dueDate as date, calendars() as CalCalendarMBS) as CalTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of all the CalTasks which match the condition.
See also:

- 25.5.31 UncompletedTasksDueBefore(dueDate as date) as CalTaskMBS() 4593
- 25.5.32 UncompletedTasksDueBefore(dueDate as date, calendar as CalCalendarMBS) as CalTaskMBS() 4593

25.5.34 Properties

25.5.35 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The internal used CalCalendarStore reference.
Notes: (Read and Write property)

25.5.36 Events

25.5.37 CalendarsChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The event being called when some calendars changed.
Notes: The Calendar Store frameworks posts notifications when any application, including yours, makes changes to the user's calendar data.

Externally is true if this changes are not made by your application.

The three events give you the unique IDs of the calendars which have been inserted, updated or modified.

If all three arrays are nil/empty, that indicates everything has changed, and the client should refresh the calendar, event, and task information currently being used. Since this tends to be an expensive and inconvenient operation, it will only occur under unusual circumstances, such as when restoring from backup.

25.5.38 EventsChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The event being called when some events changed.
Notes: The Calendar Store frameworks posts notifications when any application, including yours, makes changes to the user's calendar data.

Externally is true if this changes are not made by your application.

The three events give you the unique IDs of the events which have been inserted, updated or modified.

If all three arrays are nil/empty, that indicates everything has changed, and the client should refresh the calendar, event, and task information currently being used. Since this tends to be an expensive and inconvenient operation, it will only occur under unusual circumstances, such as when restoring from backup.

25.5.39 TasksChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The event being called when some tasks changed.
Notes: The Calendar Store frameworks posts notifications when any application, including yours, makes changes to the user's calendar data.

Externally is true if this changes are not made by your application.

The three events give you the unique IDs of the tasks which have been inserted, updated or modified.

If all three arrays are nil/empty, that indicates everything has changed, and the client should refresh the calendar, event, and task information currently being used. Since this tends to be an expensive and inconvenient operation, it will only occur under unusual circumstances, such as when restoring from backup.

25.5.40 Constants

Constants

Constant	Value	Description
CalSpanAllEvents	2	One of the Calendar Span constants.
CalSpanFutureEvents	1	One of the Calendar Span constants.
CalSpanThisEvent	0	One of the Calendar Span constants.

25.6 class CalEventMBS

25.6.1 class CalEventMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKEventMBS instead.
Function: The class to handle events in iCal.
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

// create a new event
Var c as new CalEventMBS

// set properties
Var calendars() as CalCalendarMBS = s.calendars
c.Title="new Event"
c.startDate=new date
c.calendar=calendars(0) // add to first calendar

Var d as new date
d.hour=d.hour+1
c.endDate=d

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New event was created."
end if
```

Notes: Requires Mac OS X 10.5 to work.
Subclass of the CalCalendarItemMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.4pr7

25.6.2 Methods

25.6.3 attendees as CalAttendeeMBS()

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The attendees for this event.
Notes: It is not possible to modify an event's attendees in Mac OS X 10.5.

25.6.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The constructor to which creates a new event.
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

// create a new event
Var c as new CalEventMBS

// set properties
Var calendars() as CalCalendarMBS = s.calendars
c.Title="new Event"
c.startDate=new date
c.calendar=calendars(0) // add to first calendar

Var d as new date
d.hour=d.hour+1
c.endDate=d

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New event was created."
end if
```

Notes: The calendar property must be set before calling saveTask on a new task.

25.6.5 setEndDate(d as date, tz as NSTimeZoneMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: Sets the end date with given time zone.
Example:

```
Var d As new date
Var tz As NSTimeZoneMBS = NSTimeZoneMBS.localTimeZone
Var e As New CalEventMBS

e.setEndDate d, tz
```

Notes: The client is responsible for making sure they never attempt to save an event with a start date that occurs after the endDate, or an endDate that occurs before the startDate. Calling saveEvent: on an improperly configured event will fail.

25.6.6 setStartDate(d as date, tz as NSTimeZoneMBS)

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: Sets the start date with given time zone.
Example:

```
Var Today As New date

Var cal As New CalCalendarStoreMBS
Var e As New CalEventMBS
Var error As NSErrorMBS

Var sDate As New Date
Var eDate As New Date

sDate.Year=Today.Year
sDate.Month=Today.Month
sDate.Day=Today.Day
sDate.Hour=8
sDate.Minute=0
sDate.Second=0

eDate.Year=Today.Year
eDate.Month=Today.Month
eDate.Day=Today.Day
eDate.Hour=8
eDate.Minute=15
eDate.Second=0
```

```
Var tz As NSTimeZoneMBS = NSTimeZoneMBS.systemTimeZone
e.setStartDate(sDate, tz)
e.setEndDate(eDate, tz)
e.Title = "Hello World"
e.calendar = cal.calendarWithTitle("Private") // put valid calendar name here

If cal.saveEvent(e,cal.CalSpanAllEvents,error) Then
'MainWindow.NotePlayer1.Instrument=Globals.RDV_SOUND
'MainWindow.NotePlayer1.PlayNote(60,60)
MsgBox "OK"
Else
MsgBox "Failed: "+error.localizedDescription
End If
```

Notes: The client is responsible for making sure they never attempt to save an event with a start date that occurs after the endDate, or an endDate that occurs before the startDate. Calling saveEvent: on an improperly configured event will fail.

25.6.7 Properties

25.6.8 endDate as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The end date.
Example:

```
Var e as CalEventMBS
msgbox e.endDate.longdate+" "+e.endDate.longtime
```

Notes: The client is responsible for making sure they never attempt to save an event with a start date that occurs after the endDate, or an endDate that occurs before the startDate. Calling saveEvent: on an improperly configured event will fail.
(Read and Write property)

25.6.9 isAllDay as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether this event is all day.
Notes: True for all day events.
(Read and Write property)

25.6.10 isDetached as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether this event is detached.
Notes: These properties are only meaningful for CalEvents which are instances of a repeating event.

If this CalEvent is an instance of a repeating event, and an attribute of this CalEvent has been changed to from the default value generated by the repeating event, isDetached will return true. If the CalEvent is unchanged from its default state, or is not a repeating event, isDetached returns false.
(Read only property)

25.6.11 location as string

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The location of this event.
Example:

```
Var c as new CalCalendarStoreMBS

// set the date range where we look for event
Var sd as new date(2016,6,7,0,0,0)
Var ed as new date(2016,6,7,23,59,59)

// look for an event on that date
Var a() as CalEventMBS = c.events(sd,ed, c.calendars)
Var e as CalEventMBS = a(1)

// show location
MsgBox e.location

// change it
e.location = "Hamburg"

// check again
MsgBox e.location

// Save
Var error as NSErrorMBS
Var ok as Boolean = c.saveEvent(e, c.CalSpanThisEvent, error)

if ok then
MsgBox "OK"
elseif error <>nil then
MsgBox error.LocalizedDescription
```

```
else
MsgBox "Failed."
end if
```

Notes: (Read and Write property)

25.6.12 occurrence as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The ocurrences of this event.
Notes: These properties are only meaningful for CalEvents which are instances of a repeating event.

Returns the occurrence date of a CalEvent. Since all instances of a repeating event have the same UID, we need another way to differentiate between those CalEvents. This method returns the NSDate on which this event was originally scheduled to occur. This value will remain the same even if the event has been detached and its start date has changed. For CalEvents not part of a repeating pattern, this method will return the same value as startDate.
(Read only property)

25.6.13 recurrenceRule as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The recurrence rule for this event.
Example:

```
// create a recurrence event:

Var c as new CalCalendarStoreMBS
Var e as new CalEventMBS
Var error as NSErrorMBS
Var s as string
Var ed as new date
Var rule as CalRecurrenceRuleMBS
Var rend as CalRecurrenceEndMBS

ed.day=21
ed.Month=7
ed.Year=2008

e.endDate=ed

Var sd as new date
```

```
sd.day=18
sd.Month=7
sd.Year=2008

e.startDate=sd
e.isAllDay=true
e.location="Example Location"

rule=CalRecurrenceRuleMBS.initYearlyRecurrence(1,nil)

Var calendars() as CalCalendarMBS = c.calendars
e.Title="Example Title"
e.calendar=calendars(0) // pick first calendar
e.notes="Example Notes"
e.URL="http://www.monkeybreadsoftware.de"
e.recurrenceRule=rule

if c.saveEvent(e, c.CalSpanAllEvents, error) then
if error<>Nil then s=error.localizedDescription
MsgBox "OK"+EndOfLine+s
else
if error<>Nil then s=error.localizedDescription
MsgBox "Failed"+EndOfLine+s
end if
```

Notes: Set to nil to remove recurrence rule.
(Read and Write property)

25.6.14 startDate as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The start date.
Example:

```
Var e as CalEventMBS
msgbox e.startDate.longdate+" "+e.startDate.longtime
```

Notes: The client is responsible for making sure they never attempt to save an event with a start date that occurs after the endDate, or an endDate that occurs before the startDate. Calling saveEvent: on an improperly configured event will fail.
(Read and Write property)

25.7 class CalNthWeekDayMBS

25.7.1 class CalNthWeekDayMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKRecurrenceDayOfWeekMBS instead. **Function:** CalNthWeekDay specifies the nth instance of a particular day of the week, such as the third Tuesday of every month.
Notes: Requires Mac OS X 10.5 to work.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

25.7.2 Methods

25.7.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

25.7.4 Properties

25.7.5 dayOfTheWeek as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The day of the week.
Notes: Valid values for dayOfTheWeek are integers 1-7, which correspond to days of the week with Sunday = 1.
(Read only property)

25.7.6 weekNumber as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The week number.
Notes: Valid values for weekNumber portion are 1, 2, 3, 4, or -1, where a value of -1 indicates the last week.
(Read only property)

25.8 class CalRecurrenceEndMBS

25.8.1 class CalRecurrenceEndMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKRecurrenceEndMBS instead. **Function:** The class to specify the end of a recurring calendar event.
Notes: CalRecurrenceEnd is an attribute of CalRecurrenceRule that defines how long the recurrence is scheduled to repeat.

The recurrence can be defined either with an integer that indicates the total number times it repeats, or with a date, after which it no longer repeats. An event which is set to never end should have its CalRecurrenceEnd set to nil.

If the end of the pattern is defines with a date, the client must pass a valid date, nil cannot be passed. If the end of the pattern is defined as terms of a number of occurrences, the occurrenceCount passed to the initializer must be positive, it cannot be 0. If the client attempts to initialize a CalRecurrenceEnd with a nil date or OccurrenceCount of 0, an exception is raised.

A CalRecurrenceEnd initialized with an end date will return 0 for occurrenceCount. One initialized with a number of occurrences will return nil for its endDate.

Requires Mac OS X 10.5 to work.

25.8.2 Methods

25.8.3 Constructor(endDate as date)

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new recurrence end based on an end date.
See also:

- 25.8.4 Constructor(occurrenceCount as Integer) 4604

25.8.4 Constructor(occurrenceCount as Integer)

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new recurrence end based on an occurrence count.
See also:

• 25.8.3 Constructor(endDate as date) 4604

25.8.5 Properties

25.8.6 endDate as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The end date.
Notes: This property is read only.
(Read only property)

25.8.7 occurrenceCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The occurrence count.
Notes: This property is read only.
(Read only property)

25.8.8 usesEndDate as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether the end date is used.
Notes: This property is read only.
(Read only property)

25.9 class CalRecurrenceRuleMBS

25.9.1 class CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKRecurrenceRuleMBS instead. **Function:** The class for the recurrence rules.
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

Var r as CalRecurrenceRuleMBS = CalRecurrenceRuleMBS.initYearlyRecurrence(1, nil) // repeat every year without end

Var a as new CalAlarmMBS // add alarm
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before

// create a new calendar
Var c as new CalEventMBS

Var d as new date(2011, 04, 20) // the date

// set properties
Var calendars() as CalCalendarMBS = s.calendars
c.Title="Test Birthday"
c.startDate=d
c.recurrenceRule = r
c.calendar=calendars(1) // add to second calendar
c.addAlarm(a)
c.endDate = d
c.isAllDay = true

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New event was created."
end if
```

Notes: Requires Mac OS X 10.5 to work.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

25.9.2 Methods

25.9.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

25.9.4 daysOfTheMonth as Integer()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This property can be accessed as an array containing one or more integers corresponding to the days of the month the event recurs.
Notes: This property is valid for rules whose CalRecurrenceType is CalMonthlyRecurrence, and that were initialized with one or more specific days of the month (not with a day of the week and week of the month).

For all other CalRecurrenceRules, this property is empty.

25.9.5 daysOfTheWeek as Integer()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This property can be accessed as an array containing one or more integers corresponding to the days of the week the event recurs.
Notes: This property is valid for rules whose CalRecurrenceType is CalWeeklyRecurrence. For all other CalRecurrenceRules, this property is empty.

25.9.6 initDailyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Daily Recurrence initializer.
Notes: Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple

initializers for each CalRecurrenceType which take only these two parameters.

25.9.7 initMonthlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Monthly Recurrence initializer.
Notes: This initializer allows the client to specify a repeating monthly pattern in terms of a day of the week and a week of the month that the even repeats. An example is an event that recurs the first Monday of every month.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

Valid values for days of the week are integers 1-7, which correspond to days of the week with Sunday = 1.
Valid values for weeks of the month are integers 1-4 and -1, which is used to indicate the last week of the month.
See also:

- 25.9.8 initMonthlyRecurrence(interval as Integer, DaysOfTheMonth() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4608
- 25.9.9 initMonthlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4609

25.9.8 initMonthlyRecurrence(interval as Integer, DaysOfTheMonth() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Monthly Recurrence initializer.
Notes: This initializer allows the client to specify multiple days of the month that an event will recur. This method should be used to initialize events that occur more than once a month, in a set monthly pattern.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple

initializers for each CalRecurrenceType which take only these two parameters.

Valid values for days of the month are integers 1-31.
See also:

- 25.9.7 initMonthlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4608
- 25.9.9 initMonthlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4609

25.9.9 initMonthlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Monthly Recurrence initializer.
Notes: Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.
See also:

- 25.9.7 initMonthlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4608
- 25.9.8 initMonthlyRecurrence(interval as Integer, DaysOfTheMonth() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4608

25.9.10 initWeeklyRecurrence(interval as Integer, DaysOfTheWeek() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Weekly Recurrence initializers.
Notes: This initializer allows the client to specify multiple days of the week that an event will recur. This initializer should be used to initialize events that occur more than once a week, in a set weekly pattern.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

Valid values for days of the week are integers 1-7, which correspond to days of the week with Sunday = 1.
See also:

- 25.9.11 initWeeklyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4610

25.9.11 initWeeklyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Weekly Recurrence initializers.
Notes: Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.
See also:

- 25.9.10 initWeeklyRecurrence(interval as Integer, DaysOfTheWeek() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4609

25.9.12 initYearlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Yearly Recurrence initializer.
Notes: This initializer allows the client to specify multiple months of the year that an event will recur. This method should be used to initialize events that recur on the same day of the week, in the same week of a month, of possibly more than one month a year, in a set yearly pattern. An example is an event that occurs every year on the last Friday of sixth and twelfth months.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

Valid values for days of the week are integers 1-7, which correspond to days of the week with Sunday = 1.
Valid values for weeks of the month are integers 1-4 and -1, which is used to indicate the last week of the month.
Valid values for months of the year are integers 1-12, which correspond to months of the year with January

= 1.

- 25.9.13 initYearlyRecurrence(interval as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4611
- 25.9.14 initYearlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4611

25.9.13 initYearlyRecurrence(interval as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Yearly Recurrence initializer.
Notes: This initializer allows the client to specify multiple months of the year that an event will recur. This method should be used to initialize events that occur on the same date, in more than month a year, in a set monthly pattern. An example is an event that occurs every year on the first day of the first and seventh months.

Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecurrenceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.

Valid values for months of the year are integers 1-12, which correspond to months of the year with January = 1.
See also:

- 25.9.12 initYearlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4610
- 25.9.14 initYearlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4611

25.9.14 initYearlyRecurrence(interval as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Yearly Recurrence initializer.
Example:

```
// create a recurrence event:

Var c as new CalCalendarStoreMBS
Var e as new CalEventMBS
Var error as NSErrorMBS
Var s as string
Var ed as new date
Var rule as CalRecurrenceRuleMBS
Var rend as CalRecurrenceEndMBS

ed.day=21
ed.Month=7
ed.Year=2008

e.endDate=ed

Var sd as new date

sd.day=18
sd.Month=7
sd.Year=2008

e.startDate=sd
e.isAllDay=true
e.location="Example Location"

rule=CalRecurrenceRuleMBS.initYearlyRecurrence(1,nil)

Var calendars() as CalCalendarMBS = c.calendars
e.Title="Example Title"
e.calendar=calendars(0) // pick first calendar
e.notes="Example Notes"
e.URL="http://www.monkeybreadsoftware.de"
e.recurrenceRule=rule

if c.saveEvent(e, c.CalSpanAllEvents, error) then
if error<>Nil then s=error.localizedDescription
MsgBox "OK"+EndOfLine+s
else
if error<>Nil then s=error.localizedDescription
MsgBox "Failed"+EndOfLine+s
end if
```

Notes: Two parameters are included in every CalRecurrenceRule initializer. The first is the interval, which is described above and indicates how many CalRecurrenceTypes make up the period of the recurrence (every week, every other week, etc.). The second is a CalRecurrenceEnd, which describes when the CalRecur-

renceRule ends. If valid values for these two parameters are not included, nil is returned. There are simple initializers for each CalRecurrenceType which take only these two parameters.
See also:

- 25.9.12 initYearlyRecurrence(interval as Integer, DayOfTheWeek as Integer, WeekOfTheMonth as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4610
- 25.9.13 initYearlyRecurrence(interval as Integer, MonthsOfTheYear() as Integer, RecurrenceEnd as CalRecurrenceEndMBS) as CalRecurrenceRuleMBS 4611

25.9.15 monthsOfTheYear as Integer()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This property can be accessed as an array containing one or more integer corresponding to the months of the year the event recurs.
Notes: This property is valid for rules whose CalRecurrenceType is CalYearlyRecurrence. For all other CalRecurrenceRules, this property is empty.

25.9.16 nthWeekDaysOfTheMonth as CalNthWeekDayMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This property can be accessed as an array containing exactly one CalNthWeekDay corresponding to the week of the month the event recurs.
Notes: This property is valid for rules whose CalRecurrenceType is CalMonthlyRecurrence or CalYearlyRecurrence, and that were initialized with a day of the week and week of the month. For all other CalRecurrenceRules, this property is empty.

25.9.17 Properties

25.9.18 firstDayOfTheWeek as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The first day of the week.
Notes: Recurrence patterns can specify which day of the week should be treated as the first day. Possible values for this property are integers 0 and 1-7, which correspond to days of the week with Sunday = 1. Zero indicates that the property is not set for this recurrence. he first day of the week only affects the way the recurrence is expanded for weekly recurrence patterns with an interval greater than 1. For those types of recurrence patterns, the CalendarStore framework will set firstDayOfTheWeek to be 2 (Monday). In all other cases, this property will be set to zero. The iCalendar spec stipulates that the default value is Monday if this property is not set.

(Read only property)

25.9.19 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The internal used CalRecurrenceRule reference.
Notes: (Read and Write property)

25.9.20 recurrenceEnd as CalRecurrenceEndMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: This property defines when the the repeating event is scheduled to end.
Notes: The end date can be specified by a number of occurrences, or with an end date.
Value can be nil.
This is a read only property.
(Read only property)

25.9.21 recurrenceInterval as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Specifies how often the rule repeats over the given recurrence type.
Notes: An interval of 1 indicates that the event repeats every time unit, while an interval of 2 indicates that the repetition occurs in every other unit, etc.

This is a read only property.
(Read only property)

25.9.22 recurrenceType as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: This property designates the unit of time used to describe the recurrence pattern.
Notes: CalRecurrenceType designates the unit of time used to describe the recurrence. It has four possible values, which correspond to recurrence rules that are defined in terms of days, weeks, months, and years.

The interval of a CalRecurrenceRule is an Integer which specifies how often the recurrence rule repeats over the unit of time described by the CalRecurrenceType. For example, if the CalRecurrenceType is CalWeek-

lyRecurrence, then an interval of 1 means the pattern is repeated every week. A NSUInteger of 2 indicates it is repeated every other week, 3 means every third week, and so on. The Integer must be a positive integer; 0 is not a valid value, and nil will be returned if the client attempts to initialize a rule with a negative or zero interval.

Together, CalRecurrenceType and interval define how often the CalRecurrenceRule's pattern repeats.
This is a read only property.
(Read only property)

25.9.23 Constants

Constants

Constant	Value	Description
CalRecurrenceDaily	0	One of the recurrence type constants.
CalRecurrenceMonthly	2	One of the recurrence type constants.
CalRecurrenceWeekly	1	One of the recurrence type constants.
CalRecurrenceYearly	3	One of the recurrence type constants.

25.10 class CalTaskMBS

25.10.1 class CalTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use EKReminderMBS instead.
Function: The class for tasks in iCal.
Example:

```
Var calStore as new CalCalendarStoreMBS
Var err as NSErrorMBS ' needed for the error details
Var newTask as new CalTaskMBS ' create a new reminder

// find existign tasks
Var tasks() as CalTaskMBS = calStore.tasks

// set properties
newTask.Title="new reminder"
newTask.Priority=9
newTask.DueDate=new date
//

newTask.calendar = tasks(0).calendar ' add to first List of reminders

call calStore.saveTask(newTask,err) ' save reminder
if err<>nil then
MsgBox err.localizedDescription
else
MsgBox "New reminder was created."
end if
```

Notes: Requires Mac OS X 10.5 to work.
Subclass of the CalCalendarItemMBS class.

25.10.2 Methods

25.10.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The constructor to create a new empty task.
Example:

```
Var s as new CalCalendarStoreMBS
Var t as new CalTaskMBS
```

```
Var a() as CalCalendarMBS = s.calendars
Var d as new date

d.Month = d.Month + 1

t.calendar = a(0)
t.Title = "Test"
t.URL = "http://www.mbsplugins.de/"
t.priority = t.CalPriorityMedium
t.dueDate = d
t.notes = "just a test"
t.isCompleted = false

Var e as NSErrorMBS
if s.saveTask(t, e) then
MsgBox "saved"
else
MsgBox "failed to save"
end if
```

Notes: The calendar property must be set before calling saveTask on a new task.

25.10.4 Properties

25.10.5 completedDate as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The date the task was completed.
Notes: The properties isCompleted and CompletedDate are inextricably linked. Setting isCompleted to be true, will set the completedDate to be now, and setting any completedDate will change isCompleted to be true. Similarly, setting isCompleted to be false will set the completedDate to be nil, and setting the completedDate changes isCompleted to false.
(Read and Write property)

25.10.6 dueDate as date

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The date the task is due.
Example:

```
Var c as new CalCalendarStoreMBS
```

```
Var i,count as Integer
Var ta() as CalTaskMBS
Var ct as CalTaskMBS

ta=c.UncompletedTasks
for each ct in ta
msgbox ct.Title+EndOfLine+str(ct.priority)+EndOfLine+ct.dueDate.LongDate
next
```

Notes: (Read and Write property)

25.10.7 isCompleted as Boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether the task has been completed.
Notes: The properties isCompleted and CompletedDate are inextricably linked. Setting isCompleted to be true, will set the completedDate to be now, and setting any completedDate will change isCompleted to be true. Similarly, setting isCompleted to be false will set the completedDate to be nil, and setting the completedDate changes isCompleted to false.
(Read and Write property)

25.10.8 priority as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The priority of this task.
Notes: The iCalendar specification allows priority to be specified with an integer in the range of 0-9, with 0 representing an undefined priority, 1 the highest priority, and 9 the lowest priority. When a user sets the priority to high, medium or low in iCal saves the priority as 1, 5, or 9 respectively. Clients are encouraged to use these values when setting a task's priority, but is is possible to specify any integer value from 0 to 9. In iCal, a task with a priority in the range of 1-4 will show up as high priority, a task with a priority of 5 will be displayed as having medium priority, and 6-9 will be displayed as having a low priority.
(Read and Write property)

25.10.9 Constants

Constants

Constant	Value	Description
CalPriorityHigh	1	One of the constants for the priority property.
CalPriorityLow	9	One of the constants for the priority property.
CalPriorityMedium	5	One of the constants for the priority property.
CalPriorityNone	0	One of the constants for the priority property.

25.11 class EKAlarmMBS

25.11.1 class EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An EKAlarm object represents an alarm in Event Kit.
Notes: Use the alarmWithAbsoluteDate: and alarmWithRelativeOffset class methods to create an alarm and use the properties to set information about an alarm. In OS X Mountain Lion, you can specify an action to trigger when the alarm fires via the emailAddress, soundName, or url property.
Subclass of the EKObjectMBS class.
Blog Entries

- MBS Xojo Plugins, version 20.5pr6

25.11.2 Methods

25.11.3 alarmWithAbsoluteDate(d as date) as EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an alarm with an absolute date.

25.11.4 alarmWithAbsoluteDateTime(d as dateTime) as EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an alarm with an absolute date.

25.11.5 alarmWithRelativeOffset(offset as Double) as EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an alarm with a relative offset.
Notes: offset: The offset from the start of an event, at which the alarm fires.

Negative offset values fire before the start of the event, while positive values fire after the start.

25.11.6 Constructor(date as date)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an alarm with an absolute date.
See also:

- 25.11.7 Constructor(date as dateTime) 4621
- 25.11.8 Constructor(offset as Double) 4621

25.11.7 Constructor(date as dateTime)

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an alarm with an absolute date.
See also:

- 25.11.6 Constructor(date as date) 4620
- 25.11.8 Constructor(offset as Double) 4621

25.11.8 Constructor(offset as Double)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an alarm with a relative offset.
Notes: offset: The offset from the start of an event, at which the alarm fires.

Negative offset values fire before the start of the event, while positive values fire after the start.
See also:

- 25.11.6 Constructor(date as date) 4620
- 25.11.7 Constructor(date as dateTime) 4621

25.11.9 copy as EKAlarmMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of an alarm.

25.11.10 Properties

25.11.11 absoluteDate as date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The absolute date for the alarm.
Notes: If you set this property for a relative offset alarm, it loses the relative offset and becomes an absolute alarm.
(Read and Write property)

25.11.12 absoluteDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The absolute date for the alarm.
Notes: If you set this property for a relative offset alarm, it loses the relative offset and becomes an absolute alarm.
(Read and Write property)

25.11.13 emailAddress as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The recipient of an email to send when the alarm triggers.
Notes: Assigning this property a value will set the soundName and url properties to nil.
(Read and Write property)

25.11.14 proximity as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A value indicating how a location-based alarm is triggered.
Notes: Alarms can be set to trigger when entering or exiting a location specified by structuredLocation. By default, alarms are not affected by location.
(Read and Write property)

25.11.15 relativeOffset as Double

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The offset from the start of an event, at which the alarm fires.
Notes: If you set this value for an absolute alarm, it loses its absolute date and becomes a relative offset alarm.
(Read and Write property)

25.11.16 soundName as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The name of the sound to play when the alarm triggers.
Notes: The value of this property is the name of a system sound that can be used with the soundNamed class method to create an NSSound object. Assigning this property a value will set the emailAddress and url properties to nil.
(Read and Write property)

25.11.17 structuredLocation as EKStructuredLocationMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The location to trigger an alarm.
Notes: This property is used in conjunction with proximity to perform geofence-based triggering of reminders.
(Read and Write property)

25.11.18 type as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The type of action to trigger when the alarm fires.
Notes: To set the type of alarm, define one of emailAddress, soundName, or url.
(Read only property)

25.11.19 url as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The URL to open when the alarm triggers.
Notes: Assigning this property a value will set the emailAddress and soundName properties to nil.

Available in OS X v10.8 and later.
Deprecated in OS X v10.9.
(Read and Write property)

25.11.20 Constants

Proximity Values

Constant	Value	Description
kProximityEnter	1	The alarm is set to fire when entering a region.
kProximityLeave	2	The alarm is set to fire when leaving a region.
kProximityNone	0	The alarm has no proximity trigger.

Types

Constant	Value	Description
kTypeAudio	1	Play audio
kTypeDisplay	0	Display alert
kTypeEmail	3	Email
kTypeProcedure	2	Procedure

25.12 class EKCalendarItemMBS

25.12.1 class EKCalendarItemMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a calendar item.
Notes: The EKCalendarItem class is a an abstract superclass for calendar events and reminders. This class provides common properties and methods for accessing properties of calendar items such as the ability to set the calendar, title, and location as well as support for attaching notes, displaying attendees, setting multiple alarms, and specifying recurrence rules.
Subclass of the EKObjectMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

25.12.2 Methods

25.12.3 addAlarm(alarm as EKAlarmMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an alarm to the receiver.

25.12.4 addRecurrenceRule(rule as EKRecurrenceRuleMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a recurrence rule to the recurrence rule array.
Notes: The implementation only supports a single recurrence rule. Adding a recurrence rule replaces the single recurrence rule.

25.12.5 alarms as EKAlarmMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The alarms associated with the calendar item, as an array of EKAlarm objects.
Notes: This property is empty if the calendar item has no alarms.

25.12.6 attendees as EKParticipantMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The attendees associated with the calendar item, as an array of EKParticipant objects.
Notes: This property is read-only; it is not possible to add attendees with Event Kit. This property is nil if the calendar item has no attendees.

25.12.7 recurrenceRules as EKRecurrenceRuleMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The recurrence rules for the calendar item.
Notes: The implementation only supports a single recurrence rule.

25.12.8 removeAlarm(alarm as EKAlarmMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes an alarm from the calendar item.

25.12.9 removeRecurrenceRule(rule as EKRecurrenceRuleMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes a recurrence rule from the recurrence rule array.
Notes: The implementation only supports a single recurrence rule.

25.12.10 setAlarms(alarms() as EKAlarmMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the alarms array.

25.12.11 setRecurrenceRules(rules() as EKRecurrenceRuleMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the recurrences rules array.

25.12.12 Properties

25.12.13 calendar as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar for the calendar item.
Notes: (Read and Write property)

25.12.14 calendarItemExternalIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar item,Äôs external identifier as provided by the calendar server.
Notes: This identifier allows you to access the same event or reminder across multiple devices.

There are some cases where duplicate copies of a calendar item can exist in the same database:

- A calendar item was imported from an ICS file into multiple calendars
- An event was created in a calendar shared with the user and the user was also invited to the event
- The user is a delegate of a calendar that also has this event
- A subscribed calendar was added to multiple accounts

In such cases, you should choose between calendar items based on other factors, such as the calendar or source.

Recurring event identifiers are the same for all occurrences. If you wish to differentiate between occurrences, you may want to use the start date.

For Exchange servers, the identifier is different between iOS and OS X and different between devices for reminders.
(Read only property)

25.12.15 calendarItemIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar item,Äôs unique identifier.
Notes: This property is set when the calendar item is created and can be used as a local identifier. Use calendarItemWithIdentifier to look up the item by this value.

A full sync with the calendar will lose this identifier. You should have a plan for dealing with a calendar whose identifier is no longer fetch-able by caching its other properties.
(Read only property)

25.12.16 creationDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The date that this calendar item was created.
Notes: If nil, this property was not set or was synced in this state.
(Read only property)

25.12.17 creationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The date that this calendar item was created.
Notes: If nil, this property was not set or was synced in this state.
(Read only property)

25.12.18 hasAlarms as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the calendar item has alarms.
Notes: If true, the calendar item has alarms; otherwise it does not.
(Read only property)

25.12.19 hasAttendees as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the calendar item has attendees.
Notes: If true, the calendar item has attendees; otherwise it does not.
(Read only property)

25.12.20 hasNotes as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the calendar item has notes.
Notes: If true, the calendar item has notes; otherwise it does not.
(Read only property)

25.12.21 hasRecurrenceRules as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the calendar item has recurrence rules.
Notes: If true, the calendar item has recurrence rules; otherwise it does not.

The implementation only supports a single recurrence rule. Adding a recurrence rule replaces the single recurrence rule.
(Read only property)

25.12.22 lastModifiedDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The date that the calendar item was last modified.
Notes: (Read only property)

25.12.23 lastModifiedDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The date that the calendar item was last modified.
Notes: (Read only property)

25.12.24 location as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The location associated with the calendar item.
Notes: This property is "" if the calendar item has no location.
(Read and Write property)

25.12.25 notes as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The notes associated with the calendar item.
Notes: (Read and Write property)

25.12.26 timeZone as NSTimeZoneMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The time zone for the calendar item.
Notes: If nil, the calendar item is a floating event. A floating event is not tied to a particular time zone. It occurs at a given time regardless of the time zone —for example, ,Äúlunch at noon.,Äù The start and end times of a floating event should be set as if they were in the system time zone.
(Read and Write property)

25.12.27 title as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The title for the calendar item.
Notes: (Read and Write property)

25.12.28 URL as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The URL for the calendar item.
Notes: (Read and Write property)

25.13 class EKCalendarMBS

25.13.1 class EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An instance of the EKCalendar class represents a calendar in Event Kit.
Notes: Use the properties in this class to get attributes about a calendar, such as its title and type. Use the calendarForEntityType method to create a calendar object.
Subclass of the EKObjectMBS class.

25.13.2 Methods

25.13.3 calendarForEntityType(entityType as Integer, eventStore as EKEventStoreMBS) as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new calendar that can contain the given entity type.
Notes: entityType: The entity type that this calendar may support.
eventStore: The event store in which to create this calendar.

Returns the created calendar.

You can only create calendars that accept either reminders or events. Some servers might allow mixing the two, although it is not common.

25.13.4 Constructor(entityType as Integer, eventStore as EKEventStoreMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new calendar that can contain the given entity type.
Notes: entityType: The entity type that this calendar may support.
eventStore: The event store in which to create this calendar.

Returns the created calendar.

You can only create calendars that accept either reminders or events. Some servers might allow mixing the two, although it is not common.

25.13.5 Properties

25.13.6 allowedEntityTypes as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The entity types this calendar can contain.
Notes: While Event Kit only allows creation of single-entity calendars, other servers might allow mixed-entity calendars.
(Read only property)

25.13.7 allowsContentModifications as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether you can add, edit, and delete items in the calendar.
Notes: (Read only property)

25.13.8 calendarIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A unique identifier for the calendar.
Notes: This property is set when the calendar is created and can be used as a local identifier. Use calendarWithIdentifier to get a calendar with the specified identifier.

A full sync with the calendar will lose this identifier. You should have a plan for dealing with a calendar whose identifier is no longer fetch-able by caching its other properties.
(Read only property)

25.13.9 CGColor as Variant

MBS Mac64bit Plugin, Plugin Version: 21.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The calendar,Äôs color.
Notes: Value is a CGColorMBS. We use variant to reduce dependency to other plugins.

This property is the equivalent of the color property in macOS.
(Read and Write property)

25.13.10 color as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar,Äôs color.
Notes: (Read and Write property)

25.13.11 Immutable as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the calendar,Äôs properties can be edited or deleted.
Notes: If true, the calendar is immutable; otherwise it is not. Events and reminders can still be added to an immutable calendar.
(Read only property)

25.13.12 source as EKSourceMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The source object representing the account to which this calendar belongs.
Notes: This property can only be set for newly created calendar objects. This property is read-only after the first time it is set; setting a value to this property after the first time it is set will result in an error. Therefore, moving a calendar from one source to another is not supported.
(Read and Write property)

25.13.13 Subscribed as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the calendar is a subscribed calendar.
Notes: If true, the calendar is a subscribed calendar; otherwise it is not.
(Read only property)

25.13.14 supportedEventAvailabilities as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The event availability settings supported by this calendar, as indicated by a bitmask.
Notes: If the calendar doesn,Äôt support event availability settings, this value is EKCalendarEventAvailabilityNone.
(Read only property)

25.13.15 title as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar,Äôs title.
Notes: (Read and Write property)

25.13.16 type as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar,Äôs type.
Notes: CalDAV-subscribed calendars are of type EKCalendarTypeCalDAV with Subscribed set to true.
(Read only property)

25.13.17 Constants

Entity Mask

Constant	Value	Description
kEntityMaskEvent	1	Event
kEntityMaskReminder	2	Reminder

Types

Constant	Value	Description
kEntityTypeEvent	0	Entity Event
kEntityTypeReminder	1	Entity Reminder

Event Availabilities

Constant	Value	Description
kEventAvailabilityBusy	1	Busy
kEventAvailabilityFree	2	Free
kEventAvailabilityNone	0	Not available
kEventAvailabilityTentative	4	Tentative
kEventAvailabilityUnavailable	8	Unavailable

Calendar Types

Constant	Value	Description
kTypeBirthday	4	A birthday calendar.
kTypeCalDAV	1	A CalDAV or iCloud calendar.
kTypeExchange	2	An Exchange calendar.
kTypeLocal	0	A local calendar.
kTypeSubscription	3	A locally subscribed calendar.

25.14 class EKEventMBS

25.14.1 class EKEventMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An instance of the EKEvent class represents an event added to a calendar in the Event Kit framework.
Notes: Use the eventWithEventStore method to create a new event. Use the properties in the class to get and modify certain information about an event. Other properties, such as the event,Äôs title and calendar, are inherited from the parent class EKCalendarItem.
Subclass of the EKCalendarItemMBS class.

25.14.2 Methods

25.14.3 compareStartDateWithEvent(other as EKEventMBS) as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Compares the start date of the receiving event with the start date of another event.
Notes: other: The event to compare against.

NSOrderedAscending	-1	if the start date of the receiver precedes the start date of other.
NSOrderedSame	0	if the start dates of the two events are identical.
NSOrderedDescending	1	if the start date of the receiver comes after the start date of other.

25.14.4 Constructor(eventStore as EKEventStoreMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a new event belonging to a specified event store.
Notes: eventStore: The event store to which the event belongs.

25.14.5 eventWithEventStore(eventStore as EKEventStoreMBS) as EKEventMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a new event belonging to a specified event store.
Notes: eventStore: The event store to which the event belongs.

25.14.6 refresh as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Updates the event,Äôs data with the current information in the Calendar database.
Notes: If the event was successfully refreshed, true; otherwise, false.

You should call this method only on events that your application is editing, and only when your application receives the EKEventStoreChangedNotification notification. If this method returns false, the event has been deleted or otherwise invalidated, and you should not continue to use it.

This method does not replace the values of any properties that you have modified.

25.14.7 setEndDate(d as date, tz as NSTimeZoneMBS)

MBS Mac64bit Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: Sets the end date with given time zone.

25.14.8 setStartDate(d as date, tz as NSTimeZoneMBS)

MBS Mac64bit Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: Sets the start date with given time zone.
Example:

```
Var es As New EKEventStoreMBS
Var e As New EKEventMBS(es)

Var d As New date
```

```
d.day = 2
d.Month = d.Month + 6

// sets with time zone in the date object
e.startDate = d

Var d1 As date = e.startDate

// sets with the time zone local to that date for current user
e.setStartDate(d, NSTimeZoneMBS.localTimeZone)

Var d2 As date = e.startDate

MsgBox d1.SQLDateTime + EndOfLine + d2.SQLDateTime

Break // you may see a difference due to summer/winter time switching
```

25.14.9 Properties

25.14.10 AllDay as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the event is an all-day event.
Notes: (Read and Write property)

25.14.11 availability as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The availability setting for the event.
Notes: This setting is used by CalDAV and Exchange servers to indicate how the event should be treated for scheduling purposes.

If the event,Äôs calendar does not support availability settings, this property,Äôs value is EKEventAvailabilityNotSupported.
(Read and Write property)

25.14.12 birthdayContactIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: The contact identifier of the person for this birthday event.
Notes: This property only applies to events in the built-in Birthdays calendar. It specifies the contact identifier (for use with the Contacts classes) of the person for whom the system created this event. For any other type of event, this property returns nil.
Requires macOS 10.11 or newer.
(Read only property)

25.14.13 birthdayPersonUniqueID as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The Address Book framework record identifier of the person for this birthday event.
Notes: This property is only set if this is a birthday event; otherwise the property is "".
(Read only property)

25.14.14 endDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The end date for the event.
Notes: (Read and Write property)

25.14.15 endDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The end date for the event.
Notes: (Read and Write property)

25.14.16 eventIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A unique identifier for the event.
Notes: You can use this identifier to look up an event with the EKEventStore method eventWithIdentifier. If the calendar of an event changes, its identifier most likely changes as well.
(Read only property)

25.14.17 isDetached as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether an event is a detached instance of a repeating event.
Notes: This value is true if and only if the event is part of a repeating event and one or more of its attributes have been modified from the repeating event,Äôs default attributes.
(Read only property)

25.14.18 occurrenceDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The original occurrence date of an event if it is part of a recurring series.
Notes: This value will remain the same even if the event has been detached and its start date has changed. Floating events (such as all-day events) are returned in the default time zone.
(Read only property)

25.14.19 occurrenceDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The original occurrence date of an event if it is part of a recurring series.
Notes: This value will remain the same even if the event has been detached and its start date has changed. Floating events (such as all-day events) are returned in the default time zone.
(Read only property)

25.14.20 organizer as EKParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The organizer associated with the event.
Notes: This property is nil if the event has no organizer.
(Read only property)

25.14.21 startDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The start date of the event.
Notes: Floating events such as all-day events are returned in the default time zone.

(Read and Write property)

25.14.22 startDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The start date of the event.
Notes: Floating events such as all-day events are returned in the default time zone.
(Read and Write property)

25.14.23 status as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The status of the event.
Notes: You should act based on an event,Äôs status only if the status is EKEventStatusCanceled, which indicates that the event has been canceled. Other statuses should be considered informational.
(Read only property)

25.14.24 structuredLocation as EKStructuredLocationMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: The event's location with a potential geocoordinate.
Notes: (Read and Write property)

25.14.25 Constants

Events Availability

Constant	Value	Description
kAvailabilityBusy	0	The event has a busy availability setting.
kAvailabilityFree	1	The event has a free availability setting.
kAvailabilityNotSupported	-1	Availability settings are not supported by the event,Äôs calendar.
kAvailabilityTentative	2	The event has a tentative availability setting.
kAvailabilityUnavailable	3	The event has an unavailable availability setting.

Status Constants

Constant	Value	Description
kStatusCanceled	3	The event has no status.
kStatusConfirmed	1	The event has no status.
kStatusNone	0	The event has no status.
kStatusTentative	2	The event has no status.

25.15 class EKEventStoreMBS

25.15.1 class EKEventStoreMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An instance of the EKEventStore class represents the Calendar database.
Notes: It is an application,Äôs point of contact for accessing calendar and reminder data.

You must request access to an entity type after the event store is initialized with requestAccessToEntityType for data to return.

Acceptable entity types are EKEntityMaskEvent for events and EKEntityMaskReminder for reminders.
Create a predicate, or a search query for events, with the predicateForEventsWithStartDate method.
Fetch and process events that match a given predicate with the eventsMatchingPredicate: and enumerateEventsMatchingPredicate methods.
Save and delete events from the event store with the saveEvent and removeEvent methods.
Subclass of the EKObjectMBS class.

25.15.2 Methods

25.15.3 authorizationStatusForEntityType(entityType as Integer) as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the authorization status for the given entity type.
Notes: Available in OS X v10.9 and later.

25.15.4 Available as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.8 and newer with 64-bit.

25.15.5 calendarItemsWithExternalIdentifier(identifier as string) as EKCalendarItemMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns either the event,Äôs first occurrences or the reminders with the specified external identifier.
Notes: externalIdentifier: The calendar item,Äôs external identifier.

Returns an array of calendar items with the specified identifier.

The external identifier can be obtained from the calendarItemExternalIdentifier property. There may be more than one matching calendar item due to reasons discussed in calendarItemExternalIdentifier.

25.15.6 calendarItemWithIdentifier(identifier as string) as EKCalendarItemMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns either the event,Äôs first occurrence or the reminder with the specified identifier.
Notes: Returs the reminder or the first occurrence of an event with the specified identifier.

25.15.7 calendarsForEntityType(types as Integer) as EKCalendarMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns calendars that support a given entity type, such as reminders or events.

25.15.8 calendarWithIdentifier(identifier as string) as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the calendar with the specified identifier.

25.15.9 cancelFetchRequest(request as EKFetchRequestMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels the request to fetch reminders.
Notes: Pass the request you got from fetchRemindersMatchingPredicate method.

The fetchRemindersMatchingPredicateCompleted event will not fire.

25.15.10 commit(byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Commits all unsaved changes to the event store.
Notes: error: The error variable to be filled with an error object.

If the commit operation succeeded, true is returned; otherwise, false. Returns true even when there are no changes to commit.

This method allows you to save batched changes to the event store. For example, if you pass false as the commit parameter to the saveCalendar, removeCalendar, saveEvent, or removeEvent methods, the changes are not saved until this method is invoked. Likewise, if you pass true as the commit parameter to the aforementioned methods, there is no need to call this method.

25.15.11 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The default constructor.
See also:

- 25.15.12 Constructor(sources() as EKSourceMBS) 4645
- 25.15.13 Constructor(types as Integer) 4646

25.15.12 Constructor(sources() as EKSourceMBS)

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates an event store that contains data for the specified sources.
Notes: sources: An array of sources the event source should contain. This array may include delegate sources.

An event store that contains data for a specific collection of event sources.
See also:

- 25.15.11 Constructor 4645
- 25.15.13 Constructor(types as Integer) 4646

25.15.13 Constructor(types as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Initializes access to the event store with support for the given entity type.
Notes: Available in OS X v10.8 and later.
Deprecated in OS X v10.9.
See also:

- 25.15.11 Constructor 4645
- 25.15.12 Constructor(sources() as EKSourceMBS) 4645

25.15.14 delegateSources as EKSourceMBS()

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Deprecated: This item is deprecated and should no longer be used. You can use sources instead. **Function:** The event sources delegated to the user.
Notes: By default, delegate event sources aren,Äôt included in an event store,Äôs sources. To access events and reminders in a delegate source:

- Initialize an EKEventStore using init.
- Use requestAccessToEntityType:completion: to request access to the desired entity types.
- Get the delegate sources from the event store using delegateSources.
- After the request is granted, initialize another EKEventStoreMBS using Constructor, passing the delegate stores.

25.15.15 Destructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

25.15.16 EKErrorDomain as string

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The EventKit error domain.

25.15.17 EKEventStoreChangedNotification as string

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The changed notification name.
Notes: Posted whenever changes are made to the Calendar database, including adding, removing, and changing events or reminders. Individual changes are not described. When you receive this notification, you should refetch all EKEvent and EKReminder objects you have accessed, as they are considered stale. If you are actively editing an event and do not wish to refetch it unless it is absolutely necessary to do so, you can call the refresh method on it. If the method returns true, you do not need to refetch the event.

25.15.18 enumerateEventsMatchingPredicate(predicate as NSPredicateMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Finds all events that match a given predicate and calls enumerateEventsMatchingPredicateUpdate event for each event found.
Notes: predicate: The search predicate. Must be created with the predicateForEventsWithStartDate:endDate:calendars method.

Only events that have been committed are included in enumeration.
Events saved using saveEvent with the commit parameter set to NO must call commit beforehand to be included.

This method is synchronous.

25.15.19 eventsMatchingPredicate(predicate as NSPredicateMBS) as EKEventMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns all events that match a given predicate.
Notes: Returns all events that match predicate, as an array of EKEvent objects.

Only events that have been committed are included in the results. Events saved using saveEvent with the commit parameter set to false must call commit beforehand to be included.

This method is synchronous.

25.15.20 eventsMatchingPredicateAsync(predicate as NSPredicateMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns all events that match a given predicate.
Notes: Calls later eventsMatchingPredicateAsyncCompleted event with all events that match predicate, as an array of EKEvent objects.

Only events that have been committed are included in the results. Events saved using saveEvent with the commit parameter set to false must call commit beforehand to be included.

This method is asynchronous.

25.15.21 eventsWithExternalIdentifier(identifier as string) as EKCalendarItemMBS()

MBS Mac64bit Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns events with the specified external identifier.
Notes: Same as calendarItemsWithExternalIdentifier, but only returning events.

25.15.22 eventWithIdentifier(identifier as string) as EKEventMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the first occurrence of an event with a given identifier.
Notes: The event corresponding to identifier, or nil if no event is found.

25.15.23 fetchRemindersMatchingPredicate(predicate as NSPredicateMBS, tag as Variant = nil) as EKFetchRequestMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches reminders matching a given predicate asynchronously.
Notes: predicate: The search predicate.

Returns a value to be used in cancelFetchRequest to cancel the request later if desired.

Only reminders that have been committed are included in the results. Reminders saved using saveReminder with the commit parameter set to NO must call commit beforehand to be included.

This method fetches reminders asynchronously.
Calls FetchedReminders event later on success.

25.15.24 fetchRemindersMatchingPredicateSync(predicate as NSPredicateMBS) as EKReminderMBS()

MBS Mac64bit Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches reminders matching a given predicate synchronously.
Notes: Same as fetchRemindersMatchingPredicate, except that we wait for result and return it without calling an event.

Only reminders that have been committed are included in the results. Reminders saved using saveReminder with the commit parameter set to NO must call commit beforehand to be included.

25.15.25 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Fetches completed reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate methods.

Pass nil for startDate to find all reminders completed before endDate. Similarly, pass nil for both startDate and endDate to get all complete reminders in the specified calendars.
See also:

- 25.15.26 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4650
- 25.15.27 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4650
- 25.15.28 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4651

25.15.26 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Fetches completed reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate methods.

Pass nil for startDate to find all reminders completed before endDate. Similarly, pass nil for both startDate and endDate to get all complete reminders in the specified calendars.
See also:

- 25.15.25 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date) as NSPredicateMBS 4649
- 25.15.27 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4650
- 25.15.28 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4651

25.15.27 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches completed reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate methods.

Pass nil for startDate to find all reminders completed before endDate. Similarly, pass nil for both startDate and endDate to get all complete reminders in the specified calendars.
See also:

- 25.15.25 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date) as NSPredicateMBS 4649
- 25.15.26 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4650

- 25.15.28 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4651

25.15.28 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches completed reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate methods.

Pass nil for startDate to find all reminders completed before endDate. Similarly, pass nil for both startDate and endDate to get all complete reminders in the specified calendars.
See also:

- 25.15.25 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date) as NSPredicateMBS 4649
- 25.15.26 predicateForCompletedRemindersWithCompletionDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4650
- 25.15.27 predicateForCompletedRemindersWithCompletionDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4650

25.15.29 predicateForEvents(startDate as date, endDate as date) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a predicate for finding events in the event store that fall within a given date range.
Notes: startDate: The start date of the range of events fetched.
endDate: The end date of the range of events fetched.
calendars: Optional. The calendars to search, as an array of EKCalendarMBS objects. Passing nil indicates to search all calendars.
See also:

- 25.15.30 predicateForEvents(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4652
- 25.15.31 predicateForEvents(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4652

- 25.15.32 predicateForEvents(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4653

25.15.30 predicateForEvents(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a predicate for finding events in the event store that fall within a given date range.
Notes: startDate: The start date of the range of events fetched.
endDate: The end date of the range of events fetched.
calendars: Optional. The calendars to search, as an array of EKCalendarMBS objects. Passing nil indicates to search all calendars.
See also:

- 25.15.29 predicateForEvents(startDate as date, endDate as date) as NSPredicateMBS 4651
- 25.15.31 predicateForEvents(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4652
- 25.15.32 predicateForEvents(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4653

25.15.31 predicateForEvents(startDate as dateTime, endDate as dateTime) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a predicate for finding events in the event store that fall within a given date range.
Notes: startDate: The start date of the range of events fetched.
endDate: The end date of the range of events fetched.
calendars: Optional. The calendars to search, as an array of EKCalendarMBS objects. Passing nil indicates to search all calendars.
See also:

- 25.15.29 predicateForEvents(startDate as date, endDate as date) as NSPredicateMBS 4651
- 25.15.30 predicateForEvents(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4652
- 25.15.32 predicateForEvents(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4653

25.15.32 predicateForEvents(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a predicate for finding events in the event store that fall within a given date range.
Notes: startDate: The start date of the range of events fetched.
endDate: The end date of the range of events fetched.
calendars: Optional. The calendars to search, as an array of EKCalendarMBS objects. Passing nil indicates to search all calendars.
See also:

- 25.15.29 predicateForEvents(startDate as date, endDate as date) as NSPredicateMBS 4651
- 25.15.30 predicateForEvents(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4652
- 25.15.31 predicateForEvents(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4652

25.15.33 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Fetches incomplete reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate:completion:.

Pass nil for startDate to find all reminders due before endDate. Similarly, pass nil for both startDate and endDate to get all incomplete reminders in the specified calendars.
See also:

- 25.15.34 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4654
- 25.15.35 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4654
- 25.15.36 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4655

25.15.34 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Fetches incomplete reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate:completion:.

Pass nil for startDate to find all reminders due before endDate. Similarly, pass nil for both startDate and endDate to get all incomplete reminders in the specified calendars.
See also:

- 25.15.33 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date) as NSPredicateMBS 4653
- 25.15.35 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4654
- 25.15.36 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4655

25.15.35 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches incomplete reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate:completion:.

Pass nil for startDate to find all reminders due before endDate. Similarly, pass nil for both startDate and endDate to get all incomplete reminders in the specified calendars.
See also:

- 25.15.33 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date) as NSPredicateMBS 4653
- 25.15.34 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date, calendars() as EKCalendarMBS) as NSPredicateMBS 4654

- 25.15.36 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS 4655

25.15.36 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime, calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches incomplete reminders in a set of calendars within an optional range.
Notes: startDate: The starting bound of the range to search.
endDate: The ending bound of the range to search.
calendars: Optional. An array of calendars to search.

The created predicate to be used for fetchRemindersMatchingPredicate:completion:.

Pass nil for startDate to find all reminders due before endDate. Similarly, pass nil for both startDate and endDate to get all incomplete reminders in the specified calendars.
See also:

- 25.15.33 predicateForIncompleteRemindersWithDueDate(startDate as date, endDate as date) as NSPredicateMBS 4653

- 25.15.35 predicateForIncompleteRemindersWithDueDate(startDate as dateTime, endDate as dateTime) as NSPredicateMBS 4654

25.15.37 predicateForRemindersInCalendar(calendar as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches all reminders in a calendar.
Notes: The created predicate to be used for fetchRemindersMatchingPredicate methods.

25.15.38 predicateForRemindersInCalendars(calendars() as EKCalendarMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches all reminders in a set of calendars.
Notes: The created predicate to be used for fetchRemindersMatchingPredicate methods.

25.15.39 refreshSourcesIfNecessary

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Pulls new data from remote sources if necessary.
Notes: Use this method to pull new data from remote sources if the local data is out of date.

25.15.40 remindersWithExternalIdentifier(identifier as string) as EKCalendarItemMBS()

MBS Mac64bit Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns reminders with the specified external identifier.
Notes: Same as calendarItemsWithExternalIdentifier, but only returning reminders.

25.15.41 reminderWithIdentifier(identifier as string) as EKCalendarItemMBS

MBS Mac64bit Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the reminder with the specified identifier.
Notes: Same as calendarItemWithIdentifier, but for reminders only.

25.15.42 removeCalendar(calendar as EKCalendarMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes a calendar from the event store by either batching or committing the changes.
Notes: calendar: The calendar to be removed.
commit: True to remove the calendar immediately; otherwise, the change is batched until the commit: method is invoked.
error: The error that occurred, if any; otherwise, nil.

Returns ture if successful; otherwise, false.
This method raises an exception if calendar belongs to another event store.

25.15.43 removeEvent(event as EKEventMBS, span as integer, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: Removes an event from the event store.
Notes: event: The event to remove.
span: The span that indicates whether to remove a single event or all future instances of the event in the case of a recurring event.
error: A pointer to an error object. If an error occurs, this pointer provides access to the error. If you don,Äôt need the error information, pass nil.

Return true if the event store successfully removes the event; otherwise, NO. This method also returns false if event isn,Äôt in the event store.

This method raises an exception if the event belongs to another event store.

Same as other saveEvent, but with commit = false.
See also:

- 25.15.44 removeEvent(event as EKEventMBS, span as Integer, commit as boolean, byref error as NSErrorMBS) as boolean 4657

25.15.44 removeEvent(event as EKEventMBS, span as Integer, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes an event or recurring events from the event store by either batching or committing the changes.
Notes: event: The event to remove.
span: The span to use. Indicates whether the remove affects future instances of the event in the case of a recurring event.
commit: True to remove the event immediately; otherwise, the change is batched until the commit: method is invoked.
error: The error that occurred, if any did. Otherwise, nil.

If the event has successfully removed, true; otherwise, false. Also returns false if event cannot be removed because it is not in the event store.

This method raises an exception if it is passed an event from another event store.
See also:

- 25.15.43 removeEvent(event as EKEventMBS, span as integer, byref error as NSErrorMBS) as boolean

4657

25.15.45 removeReminder(reminder as EKReminderMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes a reminder from the event store by either committing or batching the changes.
Notes: reminder: The reminder to be removed.
commit: A Boolean value indicating whether to remove the reminder immediately or to batch the removals; passing NO will not commit the removal from the event store until the commit: method is invoked.
error: The error that occurred, if any; otherwise, nil.

If successful, true; otherwise, false.
This method raises an exception if reminder belongs to another event store.

25.15.46 requestAccessToEntityType(entityType as Integer, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Prompts the user to grant or deny access to event or reminder data.
Notes: entityType: The event or reminder entity type.

Requesting access to an event store asynchronously prompts your users for permission to use their data. The user is only prompted the first time your app requests access to an entity type; any subsequent instantiations of EKEventStore uses existing permissions. When the user taps to grant or deny access, the requestAccessToEntityTypeCompleted event will be called on an arbitrary queue. Your app is not blocked while the user decides to grant or deny permission.

After users choose their permission level, the event store either calls the event.
Available in OS X v10.9 and later.

25.15.47 requestFullAccessToEvents(tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop & iOS.

Function: Prompts people to grant or deny read and write access to event data.
Notes: Requesting access to an event store asynchronously prompts people for permission to use their data. The operating system only prompts them the first time your app requests full access to events; any subsequent instantiations of EKEventStore uses existing permissions. When they grant or deny access, EventKit

calls the requestAccessToEntityTypeCompleted event.

Your app isn,Äôt blocked while the person decides to grant or deny permission. Because they may deny permission, your app should handle cases where it doesn,Äôt receive access to the event store.

25.15.48 requestFullAccessToReminders(tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop & iOS.

Function: Prompts people to grant or deny read and write access to reminders.
Notes: Requesting access to an event store asynchronously prompts people for permission to use their data. The operating system only prompts them the first time your app requests access to reminders; any subsequent instantiations of EKEventStore uses existing permissions. When they grant or deny access, EventKit calls the requestAccessToEntityTypeCompleted event.

Your app isn,Äôt blocked while the person decides to grant or deny permission. Because they may deny permission, your app should handle cases where it doesn,Äôt receive access to the event store.

25.15.49 requestWriteOnlyAccessToEvents(tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop & iOS.

Function: Prompts the person using your app to grant or deny write access to event data.
Notes: Requesting access to an event store asynchronously prompts people for permission to use their data. The operating system only prompts them the first time your app requests write-only event access; any subsequent instantiations of EKEventStore uses existing permissions. When they grant or deny access, EventKit calls the requestAccessToEntityTypeCompleted event.

Your app isn,Äôt blocked while the person decides to grant or deny permission. Because they may deny permission, your app should handle cases where it doesn,Äôt receive access to the event store.

25.15.50 reset

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the event store to its saved state.
Notes: This method updates all the properties of all the objects with their corresponding values in the event store. Any local changes that were not saved before invoking this method will be lost. All objects that were created or retrieved using this store are disassociated from it and should be considered invalid.

25.15.51 saveCalendar(calendar as EKCalendarMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Saves a calendar to the event store by either committing or batching the changes.
Notes: calendar: The calendar to be saved.
commit: True to save the calendar immediately; otherwise, the change is batched until the commit method is invoked.
error: The error that occurred, if any; otherwise, nil.

Returns true if successful; otherwise, false.

This method raises an exception if calendar belongs to another event store.

25.15.52 saveEvent(event as EKEventMBS, span as integer, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: Saves changes to an event permanently.
Notes: event: The event to save.
span: The span that indicates whether to remove a single event or all future instances of the event in the case of a recurring event.
error: A pointer to an error object. If an error occurs, this pointer provides access to the error. If you don,Äôt need the error information, pass nil.

Returns true if the event store saves the event successfully; otherwise, NO. This method also returns false if event wasn,Äôt modified.

This method raises an exception if it,Äôs passed an event from another event store.
When an event is saved, it,Äôs updated in the Calendar database. Any fields you didn,Äôt modify are updated to reflect the most recent value in the database. If the event has been deleted from the database, it,Äôs recreated as a new event.

Same as other saveEvent, but with commit = false.
See also:

- 25.15.53 saveEvent(event as EKEventMBS, span as Integer, commit as boolean, byref error as NSErrorMBS) as boolean

25.15.53 saveEvent(event as EKEventMBS, span as Integer, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Saves an event or recurring events to the event store by either batching or committing the changes.
Notes: event: The event to be saved.
span: The span to use. Indicates whether the save affects future instances of the event in the case of a recurring event.
commit: To save the event immediately, pass true; otherwise, the change is batched until the commit: method is invoked.
error: The error that occurred, if any; otherwise, nil.

Returns if successful, true; otherwise, false. Also returns false if event does not need to be saved because it has not been modified.

This method raises an exception if it is passed an event from another event store.

When an event is saved, it is updated in the Calendar database. Any fields you did not modify are updated to reflect the most recent value in the database. If the event has been deleted from the database, it is re-created as a new event.
See also:

- 25.15.52 saveEvent(event as EKEventMBS, span as integer, byref error as NSErrorMBS) as boolean 4660

25.15.54 saveReminder(reminder as EKReminderMBS, commit as boolean, byref error as NSErrorMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Saves changes to a reminder by either committing or batching the changes.
Notes: reminder: The reminder to be saved.
commit: A Boolean value indicating whether to save the reminder immediately or to batch the changes; passing NO will not commit changes to the event store until the commit: method is invoked.
error: The error that occurred, if any; otherwise, nil.

If successful, true; otherwise, false.
This method raises an exception if reminder belongs to another event store.

25.15.55 sources as EKSourceMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an unordered array of source objects.
Notes: An EKSource object represents an account that contains calendars.

25.15.56 sourceWithIdentifier(identifier as string) as EKSourceMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a source with the specified identifier.

25.15.57 Properties

25.15.58 defaultCalendarForNewEvents as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar that events are added to by default, as specified by user settings.
Notes: (Read only property)

25.15.59 defaultCalendarForNewReminders as EKCalendarMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The calendar that events are added to by default, as specified by user settings.
Notes: (Read only property)

25.15.60 eventStoreIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The unique identifier for the event store.
Notes: If the store is damaged, it is re-created and given a new identifier. If this value is different from a fetched value, you should take the appropriate action.
(Read only property)

25.15.61 Events

25.15.62 Changed

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The changed event.
Notes: Posted whenever changes are made to the Calendar database, including adding, removing, and changing events or reminders. Individual changes are not described. When you receive this notification, you should refetch all EKEvent and EKReminder objects you have accessed, as they are considered stale. If you are actively editing an event and do not wish to refetch it unless it is absolutely necessary to do so, you can call the refresh method on it. If the method returns true, you do not need to refetch the event.

25.15.63 enumerateEventsMatchingPredicateUpdate(e as EKEventMBS, byref stop as boolean, predicate as NSPredicateMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The method enumerateEventsMatchingPredicate found another event.

25.15.64 eventsMatchingPredicateAsyncCompleted(events() as EKEventMBS, predicate as NSPredicateMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The async call to eventsMatchingPredicate completed.

25.15.65 fetchRemindersMatchingPredicateCompleted(reminders() as EKReminderMBS, predicate as NSPredicateMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The call to fetchRemindersMatchingPredicate completed.

25.15.66 requestAccessToEntityTypeCompleted(entityType as Integer, granted as Boolean, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The event called by requestAccessToEntityType once decision is made.

25.15.67 Constants

Authorization Status

Constant	Value	Description
kAuthorizationStatusAuthorized	3	The app is authorized to access the service.
kAuthorizationStatusDenied	2	The user explicitly denied access to the service for the app.
kAuthorizationStatusNotDetermined	0	The user has not yet made a choice regarding whether the app may access service.
kAuthorizationStatusRestricted	1	The app is not authorized to access the service. The user cannot cha this app,Äôs authorization status, possibly due to active restrictions suc parental controls being in place.

Entity Mask

Constant	Value	Description
kEntityMaskEvent	1	Event
kEntityMaskReminder	2	Reminder

Types

Constant	Value	Description
kEntityTypeEvent	0	Entity Event
kEntityTypeReminder	1	Entity Reminder

Errors

Constant	Value	Description
kErrorAlarmGreaterThanRecurrence	8	The alarm interval is greater than the recurrence interval.
kErrorAlarmProximityNotSupported	21	The source does not allow geofences on alarms.
kErrorCalendarDoesNotAllowEvents	22	The calendar does not allow events to be added.
kErrorCalendarDoesNotAllowReminders	23	The calendar does not allow reminders to be added.
kErrorCalendarHasNoSource	14	The calendar cannot be saved with no source set.
kErrorCalendarIsImmutable	16	The calendar is immutable and cannot be modified or deleted.
kErrorCalendarReadOnly	6	The calendar is read-only and cannot have events added to it.
kErrorCalendarSourceCannotBeModified	15	The calendar cannot be moved to another source.
kErrorDatesInverted	4	The event,Äôs end date occurs before its start date.
kErrorDurationGreaterThanRecurrence	7	The duration of an event is greater than its recurrence interval.
kErrorEventNotMutable	0	The event is not mutable and cannot be saved or deleted.
kErrorInternalFailure	5	An internal error occurred.
kErrorInvalidSpan	13	An invalid span was passed when saving or deleting.
kErrorInvitesCannotBeMoved	12	The event cannot be moved because it is an invite.
kErrorNoCalendar	1	The event is not associated with a calendar.
kErrorNoEndDate	3	The event has no end date set.
kErrorNoStartDate	2	The event has no start date set.
kErrorObjectBelongsToDifferentStore	11	The object belongs to a different calendar store.
kErrorRecurringReminderRequiresDueDate	18	The recurring reminder requires a due date.
kErrorReminderLocationsNotSupported	20	The source doesn't support locations on reminders.
kErrorSourceDoesNotAllowCalendarAddDelete	17	The source doesn,Äôt allow calendars to be added or deleted.
kErrorSourceDoesNotAllowEvents	25	The source does not allow calendars supporting event entity typ
kErrorSourceDoesNotAllowReminders	24	The source does not allow calendars supporting reminder entity
kErrorStartDateCollidesWithOtherOccurrence	10	The event,Äôs start date collides with another occurrence of the
kErrorStartDateTooFarInFuture	9	The start date is further into the future than the calendar can
kErrorStructuredLocationsNotSupported	19	The source to which this calendar belongs does not support st tions.

Event Span

Constant	Value	Description
kSpanFutureEvents	1	Modifications to this event instance should also affect future instances of this event.
kSpanThisEvent	0	Modifications to this event instance should affect only this instance.

Week Days

Constant	Value	Description
kWeekDayFriday	6	Friday
kWeekDayMonday	2	Monday
kWeekDaySaturday	7	Saturday
kWeekDaySunday	1	Sunday
kWeekDayThursday	5	Thursday
kWeekDayTuesday	3	Tuesday
kWeekDayWednesday	4	Wednesday

25.16 class EKFetchRequestMBS

25.16.1 class EKFetchRequestMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The class for an ongoing fetch report.
Notes: If request object is destroyed, the request is cancelled, if it is not yet finished.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

25.16.2 Methods

25.16.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

25.16.4 Properties

25.16.5 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

25.17 class EKObjectMBS

25.17.1 class EKObjectMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The EKObject class is an abstract superclass for all Event Kit classes whose instances are persistent.
Notes: It provides fine control when saving and restoring property settings. For example, you can find out if a persistent object was modified locally and whether it needs to be saved. If the object has changed in the event store since it was fetched, you can refresh the local copy by keeping local changes or by removing local changes. You can also roll back the object to the state when it was first fetched.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

25.17.2 Methods

25.17.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

25.17.4 hasChanges as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns whether this object or any of the objects it contains has uncommitted changes.
Notes: Returns true if there are uncommitted changes; otherwise, false.

25.17.5 isNew as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns whether this object has ever been saved.
Notes: Returns true if the object has not been saved; otherwise, false.

25.17.6 refresh as boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Merges changes to this object with the latest saved values.
Notes: If the operation is successful, YES; if the object was deleted in the event store, false. If this method returns false, the object should be released.

This method merges the local changes to properties of this object with the latest values in the event store. This method updates only properties that have not been modified locally, so you do not lose any changes by invoking this method. You can also use this method to see whether an object was deleted from the event store.

25.17.7 reset

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns this object to its saved state.
Notes: This method updates all the properties of this object with the corresponding values in the event store. Any local changes that were not saved before invoking this method are lost. This method does nothing if the object was never saved.

25.17.8 rollback

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Rolls back the property values of this object to its original state when it was first fetched.
Notes: Any local changes to this object are lost when invoking this method. This method does not refetch property values from the event store. This method does nothing if the object was never changed.

25.17.9 Properties

25.17.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

25.18 class EKParticipantMBS

25.18.1 class EKParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An EKParticipant object represents a participant in a calendar event.
Notes: A participant can be a person, group, room, or other resource.

Do not create EKParticipant objects directly. Instead, use the property attendees on EKCalendarItem to return an array of EKParticipant objects.

Event Kit cannot add participants to an event nor change participant information. Use the properties in this class to get information about a participant.
Subclass of the EKObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 22.0pr7

25.18.2 Methods

25.18.3 ABPersonInAddressBook(addressBook as Variant) as Variant

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Returns the address book record that represents the participant.
Notes: Please pass a ABAddressbookMBS object for the addressBook parameter. You get back a ABPersonMBS object.
The address book record for the participant, or nil if the record is not found.
This method searches for a record match based on the participant,Äôs email address.

25.18.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

25.18.5 copy as EKParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the participant.

25.18.6 Properties

25.18.7 contactPredicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: A predicate to use with the Contacts framework to retrieve the corresponding contact instance.
Notes: Use this property to get a predicate that you can use with a CNContactStoreMBS to fetch a CNContactMBS instance for this participant, if one exists.
(Read only property)

25.18.8 isCurrentUser as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether this participant represents the owner of this account.
Notes: (Read only property)

25.18.9 name as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The participant,Äôs name.
Notes: (Read only property)

25.18.10 participantRole as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The participant,Äôs role in the event.
Notes: (Read only property)

25.18.11 participantStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The participant,Äôs attendance status.
Notes: (Read only property)

25.18.12 participantType as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The participant,Äôs type.
Notes: (Read only property)

25.18.13 person as Variant

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The person in the shared addressbook instance.
Notes: Value is a ABPersonMBS. We use variant to reduce dependency to other plugins.
(Read only property)

25.18.14 URL as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The URL representing this participant.
Notes: (Read only property)

25.18.15 Constants

Roles

Constant	Value	Description
kRoleChair	3	The participant is the chair of the event.
kRoleNonParticipant	4	The participant does not have an active role in the event.
kRoleOptional	2	The participant,Äôs attendance is optional.
kRoleRequired	1	The participant,Äôs attendance is required.
kRoleUnknown	0	The participant,Äôs role is unknown.

Status Constants

Constant	Value	Description
kStatusAccepted	2	The participant has accepted the event.
kStatusCompleted	6	The participant,Äôs event has completed.
kStatusDeclined	3	The participant has declined the event.
kStatusDelegated	5	The participant has delegated attendance to another participant.
kStatusInProcess	7	The participant,Äôs event is currently in process.
kStatusPending	1	The participant has yet to respond to the event.
kStatusTentative	4	The participant,Äôs attendance status is tentative.
kStatusUnknown	0	The participant,Äôs attendance status is unknown.

Participant Types

Constant	Value	Description
kTypeGroup	4	The participant is a group.
kTypePerson	1	The participant is a person.
kTypeResource	3	The participant is a resource.
kTypeRoom	2	The participant is a room.
kTypeUnknown	0	The participant,Äôs type is unknown.

25.19 class EKRecurrenceDayOfWeekMBS

25.19.1 class EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The EKRecurrenceDayOfWeek class represents a day of the week for use with an EKRecurrenceRule object.
Notes: A day of the week can optionally have a week number, indicating a specific day in the recurrence rule,Äôs frequency. For example, a day of the week with a day value of Tuesday and a week number of 2 would represent the second Tuesday of every month in a monthly recurrence rule, and the second Tuesday of every year in a yearly recurrence rule. A day of the week with a week number of 0 ignores its week number.

25.19.2 Methods

25.19.3 Constructor(dayOfTheWeek as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a day of the week with a given day and week number.
Notes: dayOfTheWeek: The day of the week. Values range from 1 to 7, with Sunday being 1.
weekNumber: Optional, the week number.
See also:

- 25.19.4 Constructor(dayOfTheWeek as Integer, weekNumber as Integer) 4673

25.19.4 Constructor(dayOfTheWeek as Integer, weekNumber as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a day of the week with a given day and week number.
Notes: dayOfTheWeek: The day of the week. Values range from 1 to 7, with Sunday being 1.
weekNumber: Optional, the week number.
See also:

- 25.19.3 Constructor(dayOfTheWeek as Integer) 4673

25.19.5 copy as EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of this object.

25.19.6 dayOfWeek(dayOfTheWeek as Integer) as EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a day of the week with a given day.
Notes: The week number of the returned day of the week is 0.
Values range from 1 to 7, with Sunday being 1.
See also:

- 25.19.7 dayOfWeek(dayOfTheWeek as Integer, weekNumber as Integer) as EKRecurrenceDayOfWeekMBS 4674

25.19.7 dayOfWeek(dayOfTheWeek as Integer, weekNumber as Integer) as EKRecurrenceDayOfWeekMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an autoreleased day of the week with a given day and week number.
Notes: dayOfTheWeek: The day of the week. Values range from 1 to 7, with Sunday being 1.
weekNumber: The week number.
See also:

- 25.19.6 dayOfWeek(dayOfTheWeek as Integer) as EKRecurrenceDayOfWeekMBS 4674

25.19.8 Properties

25.19.9 dayOfTheWeek as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The day of the week.
Notes: Values are from 1 to 7, with Sunday being 1.
(Read only property)

25.19.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

25.19.11 weekNumber as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The week number of the day of the week.
Notes: Values range from –53 to 53. A negative value indicates a value from the end of the range. 0 indicates the week number is irrelevant.
(Read only property)

25.19.12 Constants

Days

Constant	Value	Description
kFriday	6	Friday
kMonday	2	Monday
kSaturday	7	Saturday
kSunday	1	Sunday
kThursday	5	Thursday
kTuesday	3	Tuesday
kWednesday	4	Wednesday

25.20 class EKRecurrenceEndMBS

25.20.1 class EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The EKRecurrenceEnd class defines the end of a recurrence rule defined by an EKRecurrenceRule object.
Notes: The recurrence end can be specified by a date (date-based) or by a maximum count of occurrences (count-based). An event which is set to never end should have its EKRecurrenceEnd set to nil.

25.20.2 Methods

25.20.3 Constructor(endDate as date)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Initializes and returns a date-based recurrence end with a given end date.
Notes: The end date argument must be a valid NSDate and not nil; otherwise an exception will be raised.
See also:

- 25.20.4 Constructor(endDate as dateTime) 4676
- 25.20.5 Constructor(occurrenceCount as Integer) 4676

25.20.4 Constructor(endDate as dateTime)

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a date-based recurrence end with a given end date.
Notes: The end date argument must be a valid NSDate and not nil; otherwise an exception will be raised.
See also:

- 25.20.3 Constructor(endDate as date) 4676
- 25.20.5 Constructor(occurrenceCount as Integer) 4676

25.20.5 Constructor(occurrenceCount as Integer)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a count-based recurrence end with a given maximum occurrence count.
Notes: The maximum occurrence count argument must be a positive integer and not 0; otherwise an exception will be raised.
See also:

- 25.20.3 Constructor(endDate as date) 4676
- 25.20.4 Constructor(endDate as dateTime) 4676

25.20.6 copy as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

25.20.7 recurrenceEndWithEndDate(endDate as date) as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Initializes and returns a date-based recurrence end with a given end date.
Notes: The end date argument must be a valid NSDate and not nil; otherwise an exception will be raised.

25.20.8 recurrenceEndWithOccurrenceCount(occurrenceCount as Integer) as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Initializes and returns a count-based recurrence end with a given maximum occurrence count.
Notes: The maximum occurrence count argument must be a positive integer and not 0; otherwise an exception will be raised.

25.20.9 Properties

25.20.10 endDate as Date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The end date of the recurrence end, or nil if the recurrence end is count-based.
Notes: (Read only property)

25.20.11 endDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The end date of the recurrence end, or nil if the recurrence end is count-based.
Notes: (Read only property)

25.20.12 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

25.20.13 occurrenceCount as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The occurrence count of the recurrence end, or 0 if the recurrence end is date-based.
Notes: (Read only property)

25.21 class EKRecurrenceRuleMBS

25.21.1 class EKRecurrenceRuleMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The EKRecurrenceRule class is used to describe the recurrence pattern for a recurring event.
Notes: After you create a recurrence rule, assign it to an event with the recurrenceRule method of EKEvent.

Recurrence rules can have an end, represented by an EKRecurrenceEnd object. The end can be based on a specific date or a maximum number of occurrences.
Subclass of the EKObjectMBS class.
Blog Entries

- MBS Xojo Plugins, version 20.6pr1

25.21.2 Methods

25.21.3 Constructor(type as Integer, interval as Integer, days() as EKRecurrenceDayOfWeekMBS, monthDays() as Integer, months() as Integer, weeksOfTheYear() as Integer, daysOfTheYear() as Integer, setPositions() as Integer, end as EKRecurrenceEndMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a recurrence rule with a given frequency and additional scheduling information.
Notes: type: The frequency of the recurrence rule. Can be daily, weekly, monthly, or yearly.
interval: The interval between instances of this recurrence. For example, a weekly recurrence rule with an interval of 2 occurs every other week. Must be greater than 0.
days: The days of the week that the event occurs, as an array of EKRecurrenceDayOfWeek objects.
monthDays: The days of the month that the event occurs, as an array of integers. Values can be from 1 to 31 and from -1 to -31. This parameter is only valid for recurrence rules of type EKRecurrenceFrequencyMonthly.
months: the months of the year that the event occurs, as an array of integers. Values can be from 1 to 12. This parameter is only valid for recurrence rules of type EKRecurrenceFrequencyYearly.
weeksOfTheYear: The weeks of the year that the event occurs, as an array of integers. Values can be from 1 to 53 and from -1 to -53. This parameter is only valid for recurrence rules of type EKRecurrenceFrequencyYearly.
daysOfTheYear: The days of the year that the event occurs, as an array of integers. Values can be from 1 to 366 and from -1 to -366. This parameter is only valid for recurrence rules of type EKRecurrenceFrequencyYearly.
setPositions: An array of ordinal numbers that filters which recurrences to include in the recurrence rule,Äôs frequency. See setPositions for more information.
end: The end of the recurrence rule.

Handle is zero if invalid values are provided.

Negative values indicate counting backwards from the end of the recurrence rule,Äôs frequency.
See also:

- 25.21.4 Constructor(type as Integer, interval as Integer, end as EKRecurrenceEndMBS = nil) 4680

25.21.4 Constructor(type as Integer, interval as Integer, end as EKRecurrenceEndMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a simple recurrence rule with a given frequency, interval, and end.
Notes: type: The frequency of the recurrence rule. Can be daily, weekly, monthly, or yearly.
interval: The interval between instances of this recurrence. For example, a weekly recurrence rule with an interval of 2 occurs every other week. Must be greater than 0.
end: The end of the recurrence rule.

Handle is zero if invalid values are provided.
See also:

- 25.21.3 Constructor(type as Integer, interval as Integer, days() as EKRecurrenceDayOfWeekMBS, monthDays() as Integer, months() as Integer, weeksOfTheYear() as Integer, daysOfTheYear() as Integer, setPositions() as Integer, end as EKRecurrenceEndMBS = nil) 4679

25.21.5 copy as EKRecurrenceRuleMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the recurrence rule.

25.21.6 daysOfTheMonth as Integer()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The days of the month associated with the recurrence rule, as an array of integers.
Notes: Values can be from 1 to 31 and from -1 to -31.This property value is valid only for recurrence rules that were initialized with specific days of the month and a frequency type of EKRecurrenceFrequency-Monthly.
Negative values indicate counting backwards from the end of the month.

25.21.7 daysOfTheWeek as EKRecurrenceDayOfWeekMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The days of the week associated with the recurrence rule, as an array of EKRecurrenceDayOfWeek objects.
Notes: This property value is valid only for recurrence rules that were initialized with specific days of the week and a frequency type of EKRecurrenceFrequencyWeekly, EKRecurrenceFrequencyMonthly, or EKRecurrenceFrequencyYearly.

25.21.8 daysOfTheYear as Integer()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The days of the year associated with the recurrence rule, as an array of integers.
Notes: Values can be from 1 to 366 and from -1 to -366. This property value is valid only for recurrence rules initialized with a frequency type of EKRecurrenceFrequencyYearly.

Negative values indicate counting backwards from the end of the year.

25.21.9 monthsOfTheYear as Integer()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The months of the year associated with the recurrence rule, as an array of integers.
Notes: Values can be from 1 to 12. This property value is valid only for recurrence rules initialized with specific months of the year and a frequency type of EKRecurrenceFrequencyYearly.

25.21.10 setPositions as Integer()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of ordinal numbers that filters which recurrences to include in the recurrence rule,Äôs frequency.
Notes: For example, a yearly recurrence rule that has a daysOfTheWeek value that specifies Monday through Friday, and a setPositions array containing 2 and -1, occurs only on the second weekday and last weekday of every year.

Values can be from 1 to 366 and from -1 to -366.

Negative values indicate counting backwards from the end of the recurrence rule,Äôs frequency (week, month,

or year).

25.21.11 weeksOfTheYear as Integer()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The weeks of the year associated with the recurrence rule, as an array of integers.
Notes: Values can be from 1 to 53 and from -1 to -53. This property value is valid only for recurrence rules initialized with specific weeks of the year and a frequency type of EKRecurrenceFrequencyYearly.
Negative values indicate counting backwards from the end of the year.

25.21.12 Properties

25.21.13 calendarIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The identifier for the recurrence rule,Äôs calendar.
Notes: (Read only property)

25.21.14 firstDayOfTheWeek as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates which day of the week the recurrence rule treats as the first day of the week.
Notes: Values of 1 to 7 correspond to Sunday through Saturday. A value of 0 indicates that this property is not set for the recurrence rule.
(Read only property)

25.21.15 frequency as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The frequency of the recurrence rule.
Notes: (Read only property)

25.21.16 interval as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies how often the recurrence rule repeats over the unit of time indicated by its frequency.
Notes: For example, a recurrence rule with a frequency type of EKRecurrenceFrequencyWeekly and an interval of 2 repeats every two weeks.
(Read only property)

25.21.17 recurrenceEnd as EKRecurrenceEndMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates when the recurrence rule ends.
Notes: This can be represented by an end date or a number of occurrences.
(Read and Write property)

25.21.18 Constants

Frequencies for recurrence rules.

Constant	Value	Description
kRecurrenceFrequencyDaily	0	Indicates a daily recurrence rule.
kRecurrenceFrequencyMonthly	2	Indicates a monthly recurrence rule.
kRecurrenceFrequencyWeekly	1	Indicates a weekly recurrence rule.
kRecurrenceFrequencyYearly	3	Indicates a yearly recurrence rule.

25.22 class EKReminderMBS

25.22.1 class EKReminderMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An instance of the EKReminder class represents a reminder added to a calendar in the Event Kit framework.
Notes: Use the reminderWithEventStore: method to create a new reminder. Use the properties in the class to get and modify certain information about a reminder.
Subclass of the EKCalendarItemMBS class.

25.22.2 Methods

25.22.3 Constructor(eventStore as EKEventStoreMBS)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a new reminder in the given event store.

25.22.4 reminderWithEventStore(eventStore as EKEventStoreMBS) as EKReminderMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new reminder in the given event store.

25.22.5 Properties

25.22.6 completed as Boolean

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value determining whether or not the reminder is marked completed.
Notes: Setting this property to true will set completionDate to the current date; setting this property to false will set completionDate to nil.

If the reminder was completed using a different client, you may encounter the case where this property is true, but completionDate is nil.
(Read and Write property)

25.22.7 completionDate as date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The completion date as a date.
Notes: (Read and Write property)

25.22.8 completionDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The completion date as a date.
Notes: (Read and Write property)

25.22.9 dueDate as date

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The due date.
Notes: (Read only property)

25.22.10 dueDateComponents as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The date by which the reminder should be completed.
Notes: The use of date components allows the due date and its time zone to be represented in a single property. A nil time zone represents a floating date. Setting a date component without an hour, minute and second component will set the reminder to be an all-day reminder. If this property is set, the calendar must be set to NSGregorianCalendar; otherwise an exception is raised.

This components,Äôs timeZone property is independent of time zone properties on startDateComponents and its super EKCalendarItem object. By default, the due date is set to the system time zone.

On iOS, Event Kit requires that a start date is set if the due date is set, however this is not a requirement on OS X.
(Read and Write property)

25.22.11 dueDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The due date.
Notes: (Read only property)

25.22.12 priority as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The priority of the reminder.
Notes: Priorities run from 1 (highest) to 9 (lowest). A priority of 0 means no priority.
Saving a reminder with any other priority will fail.
Per RFC 5545, priorities of 1-4 are considered "high," a priority of 5 is "medium," and priorities of 6-9 are "low."
(Read and Write property)

25.22.13 startDateComponents as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The start date of the task.
Notes: The use of date components allows the start date and its time zone to be represented in a single property. A nil time zone represents a floating date. Setting a date component without an hour, minute and second component will set the reminder to be an all-day reminder. If this property is set, the calendar must be set to NSGregorianCalendar; otherwise an exception is raised.

The start date components,Äôs timeZone property corresponds to the timeZone property on EKCalendarItem. A change in one value will cause a change in the other. Setting the time zone directly on the components does not guarantee that your changes will be saved; instead, pull this property from the reminder, set the time zone on it, and assign it back to the reminder:
(Read and Write property)

25.22.14 Constants

Priorities

Constant	Value	Description
kPriorityHigh	1	High
kPriorityLow	9	Low
kPriorityMedium	5	Medium
kPriorityNone	0	No priority

25.23 class EKSourceMBS

25.23.1 class EKSourceMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: An instance of the EKSource class represents the account that a calendar belongs to.
Notes: You do not create instances of this class. You retrieve EKSource objects from an EKEventStore object. Use the sources property to get all the EKSource objects for an event store, and use the methods in this class to access properties of the source object.
Subclass of the EKObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

25.23.2 Methods

25.23.3 calendarsForEntityType(types as Integer) as EKCalendarMBS()

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the calendars that belong to this source object that support a particular entity type.
Notes: entityType: The entity type of either an event or a reminder.

25.23.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

25.23.5 Properties

25.23.6 sourceIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A unique identifier for the source object.
Notes: (Read only property)

25.23.7 sourceType as Integer

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The type of this source object.
Notes: (Read only property)

25.23.8 title as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of this source object.
Notes: (Read only property)

25.23.9 Constants

Types

Constant	Value	Description
kTypeBirthdays	5	Represents a birthday source.
kTypeCalDAV	2	Represents a CalDAV or iCloud source.
kTypeExchange	1	Represents an Exchange source.
kTypeLocal	0	Represents a local source.
kTypeMobileMe	3	Represents a MobileMe source.
kTypeSubscribed	4	Represents a subscribed source.

25.24 class EKStructuredLocationMBS

25.24.1 class EKStructuredLocationMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The EKStructuredLocation class specifies a geofence that can be used to trigger the alarm of a calendar item.
Notes: Use locationWithTitle to create a new structured location, then set it to the structuredLocation property of an EKAlarm object.
Subclass of the EKObjectMBS class.

- MBS Xojo Plugins, version 22.0pr7

Xojo Developer Magazine

- 21.1, page 29: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

25.24.2 Methods

25.24.3 Constructor(title as string)

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new structured location.
Notes: title: The title of the location.

25.24.4 copy as EKObjectMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the location.

25.24.5 locationWithMapItem(MapItem as Variant) as EKStructuredLocationMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new structured location with the specified map item.
Notes: mapItem: The MKMapItemMBS object that represents the location.

25.24.6 locationWithTitle(title as string) as EKStructuredLocationMBS

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new structured location.
Notes: title: The title of the location.

25.24.7 Properties

25.24.8 geoLocation as Variant

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The core location.
Notes: Value is a CLLocationMBS object. We use variant to reduce dependency to other plugins.
(Read and Write property)

25.24.9 radius as Double

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: A minimum distance from the core location that would trigger the alarm or reminder.
Notes: To use the default radius, set this property to 0.
(Read and Write property)

25.24.10 title as String

MBS Mac64bit Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the location.
Notes: (Read and Write property)

Chapter 26

CallKit

26.1 class CXCallDirectoryManagerMBS

26.1.1 class CXCallDirectoryManagerMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: The programmatic interface to an object that manages a Call Directory app extension.
Notes: You may need to write your call extension in Xcode.

Xojo Developer Magazine

- 21.1, page 34: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

26.1.2 Methods

26.1.3 available as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on iOS 10.0 or newer.

26.1.4 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: The constructor.

26.1.5 getEnabledStatusForExtension(Identifier as String)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: Asynchronously returns the enabled status of the extension with the specified identifier.
Notes: identifier: The identifier for the call extension.

Calls getEnabledStatusForExtensionCompleted event later.

26.1.6 openSettings

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: Opens the iOS Settings app and shows the Call Blocking & Identification settings.
Notes: Before a Call Directory extension can operate on incoming calls, the user must explicitly enable the extension in the iOS Settings app.
Use this method to open the Settings app and show the Call Blocking & Identification settings directly.

Calls openSettingsCompleted event later.

26.1.7 reloadExtension(Identifier as String)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: Asynchronously reloads the extension with the specified identifier.
Notes: identifier: The identifier for the call extension.

Calls reloadExtensionCompleted event later.

26.1.8 sharedInstance as CXCallDirectoryManagerMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: Returns the shared call directory manager instance for the app.
Notes: You may prefer to subclass this class to fill events and then keep an instance of your own class around. But at any point you can use this method to get the instance you created or if needed the plugin creates one.

26.1.9 Properties

26.1.10 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

26.1.11 Events

26.1.12 getEnabledStatusForExtensionCompleted(identifier as string, enabledStatus as Integer, error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: An event to be executed when the manager is finished determining the enabled status of the specified extension.
Notes: enabledStatus: The enabled status of the extension. For possible values, see status constants.
error: If an error occurred, an error object indicating how the check failed, otherwise nil.

26.1.13 openSettingsCompleted(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: An event executed when the manager finishes opening the Call Directory panel.
Notes: error: If an error occurred, an error object indicating how the operation failed; otherwise, nil.

26.1.14 reloadExtensionCompleted(identifier as string, error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: All.

Function: An event to be executed when the manager is finished reloading the specified extension.
Notes: error: If an error occurred, an error object indicating how reloading failed, otherwise nil.

26.1.15 Constants

Status

Constant	Value	Description
EnabledStatusDisabled	1	Indicates that the extension is disabled.
EnabledStatusEnabled	2	Indicates that the extension is enabled.
EnabledStatusUnknown	0	Indicates that the enabled status for the extension is unknown.

Chapter 27

Canon EOS Digital

27.1 class EdsBaseMBS

27.1.1 class EdsBaseMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The base object class.

27.1.2 Methods

27.1.3 ChildCount as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the number of child objects of the designated object.
Notes: Example: Number of files in a directory.
Lasterror is set.

27.1.4 GetPropertyData(PropertyID as UInt32, Param as Int32 = 0) as Memoryblock

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.

Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.5 GetPropertyDataBool(PropertyID as UInt32, Param as Int32 = 0) as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.6 GetPropertyDataInt32(PropertyID as UInt32, Param as Int32 = 0) as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.7 GetPropertyDataInt32Array(PropertyID as UInt32, Param as Int32 = 0) as Integer()

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.8 GetPropertyDataPoint(PropertyID as UInt32, Param as Int32 = 0) as EdsPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.9 GetPropertyDataRational(PropertyID as UInt32, Param as Int32 = 0) as EdsRationalMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.10 GetPropertyDataRationalArray(PropertyID as UInt32, Param as Int32 = 0) as EdsRationalMBS()

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.11 GetPropertyDataRect(PropertyID as UInt32, Param as Int32 = 0) as EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.12 GetPropertyDataSize(PropertyID as UInt32, Param as Int32 = 0) as EdsSizeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.13 GetPropertyDataString(PropertyID as UInt32, Param as Int32 = 0) as String

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.14 GetPropertyDataType(PropertyID as UInt32, Param as Int32 = 0) as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So

please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.15 GetPropertyDataUInt32(PropertyID as UInt32, Param as Int32 = 0) as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Example:

```
// we set bit for redirecting output to PC, leave other bits as they are.
Var device as UInt32 = camera.GetPropertyDataUInt32(camera.kEdsPropID_Evf_OutputDevice)
if camera.lasterror = EDSModuleMBS.EDS_ERR_OK then

device = Bitwise.BitOr(device, EDSModuleMBS.kEdsEvfOutputDevice_PC)
camera.SetPropertyDataUInt32 camera.kEdsPropID_Evf_OutputDevice, 0, device
end if
```

Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.16 GetPropertyDataUInt32Array(PropertyID as UInt32, Param as Int32 = 0) as UInt32()

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.

Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.17 GetPropertyDataUInt8(PropertyID as UInt32, Param as Int32 = 0) as UInt8

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets property information from the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property.
Values that can be designated for each property are as follows.

Lasterror is set.

The plugin queries size first, allocates storage and queries value and returns it to you as function result. So please check Lasterror after calling so you know whether an error occurred.
Returns EDS_ERR_OK on normal completion. Otherwise, see the EDS Error Lists for error codes. See Also

Regarding retrieval of the camera property data in particular, the conditions that can be retrieved vary depending on the values of other property data. For further information, see Properties in SDK Manual.

27.1.18 GetPropertyDesc(PropertyID as UInt32) as Memoryblock

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets a list of property data that can be set for the object, as well as maximum and minimum values.
Notes: PropertyID: Designate a property ID.

Lasterror is set.
Returns a memoryblock with EdsPropertyDesc structure data.
This structure has:

form	Int32(0)	Reserved (currently, always 0)
access	Int32(4)	Reserved (currently, always 0)
numElements	Int32(8)	Indicates the number of property data list elements stored in the PropDesc array.
propDesc	Int32(12+n*4)	A property data array. The meaning of PropDesc array elements varies depending on the property type.

For details on properties and the meaning of array elements that can be set in the data list, see the Properties section in SDK manual.

27.1.19 GetPropertyElementCount(PropertyID as UInt32) as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries property description and returns the number of items for a property.

27.1.20 GetPropertySize(PropertyID as UInt32, Param as Int32 = 0) as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the byte size and data type of a designated property from a camera object or image object.
Notes: PropertyID: Designate the property ID.
Param: Additional information of the property. Used to designate multiple additional items of information, if the property has such information that can be set or retrieved. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData.

Returns the property size. The data type and value returned varies depending on the property ID. See "Property Details" for further information in the SDK manual.
Lasterror is set.

27.1.21 SetProgress(progress as EdsProgressMBS, options as Integer)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets progress events.
Notes: An event is received as notification of progress during processing that takes a relatively long time,

such as downloading files from a remote camera. If you register the callback function, the EDSDK calls the callback function during execution or on completion of the following APIs. This timing can be used in updating on-screen progress bars, for example.

27.1.22 SetPropertyData(PropertyID as UInt32, Param as Int32, data as Memoryblock)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically taken from data.size by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.23 SetPropertyDataBool(PropertyID as UInt32, Param as Int32, data as Boolean)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.24 SetPropertyDataInt32(PropertyID as UInt32, Param as Int32, data as Int32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.25 SetPropertyDataInt32Array(PropertyID as UInt32, Param as Int32, data() as Integer)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.26 SetPropertyDataPoint(PropertyID as UInt32, Param as Int32, data as EdsPointMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.27 SetPropertyDataRational(PropertyID as UInt32, Param as Int32, data as EdsRationalMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.28 SetPropertyDataRationalArray(PropertyID as UInt32, Param as Int32, data() as EdsRationalMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.29 SetPropertyDataRect(PropertyID as UInt32, Param as Int32, data as EdsRectMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.

Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.30 SetPropertyDataSize(PropertyID as UInt32, Param as Int32, data as EdsSizeMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.31 SetPropertyDataString(PropertyID as UInt32, Param as Int32, data as String)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.32 SetPropertyDataUInt32(PropertyID as UInt32, Param as Int32, data as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Example:

```
// we set bit for redirecting output to PC, leave other bits as they are.
Var device as UInt32 = camera.GetPropertyDataUInt32(camera.kEdsPropID_Evf_OutputDevice)
if camera.lasterror = EDSModuleMBS.EDS_ERR_OK then

device = Bitwise.BitOr(device, EDSModuleMBS.kEdsEvfOutputDevice_PC)
camera.SetPropertyDataUInt32 camera.kEdsPropID_Evf_OutputDevice, 0, device
end if
```

Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.33 SetPropertyDataUInt32Array(PropertyID as UInt32, Param as Int32, data() as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.34 SetPropertyDataUInt8(PropertyID as UInt32, Param as Int32, data as UInt8)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets property data for the object.
Notes: PropertyID: Designate the property ID.
Param: Designate additional property information. Use additional property information if multiple items of information such as picture styles can be set or retrieved for a property. For descriptions of values that can be designated for each property, see the description of Param for GetPropertyData in the manual SDK.

Property size is automatically calculated by plugin and passed for you.
Lasterror is set.

Note: When you set properties of an image object (EdsImageRef), this API maintains the change internally.

27.1.35 Properties

27.1.36 DataRef as String

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The reference to stream data.
Notes: (Read only property)

27.1.37 Handle as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

27.1.38 Lasterror as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The last error code of last command.
Notes: See EDS_ERR_* constants in EDSModuleMBS.

(Read and Write property)

27.1.39 MemoryRef as Memoryblock

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The reference to stream data.
Notes: (Read only property)

27.1.40 Progress as EdsProgressMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Register a progress event.
Notes: (Read only property)

27.1.41 Constants

Constants

Constant	Value	Description
kEdsPropID_AEBracket	&h0000040e	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_AEMode	&h00000400	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_AEModeSelect	&h00000436	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta New in 2.11 SDK.
kEdsPropID_AFMode	&h00000404	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_Artist	&h00000418	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_AtCapture_Flag	&h80000000	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_Av	&h00000405	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_AvailableShots	&h0000040a	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_BatteryLevel	&h00000008	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_BatteryQuality	&h00000010	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_BodyIDEx	&h00000015	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_Bracket	&h0000040b	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_CFn	&h00000009	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_ClickWBPoint	&h00000301	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_ColorMatrix	&h00000113	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_ColorSaturation	&h0000010a	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_ColorSpace	&h0000010d	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta

kEdsPropID_DriveMode	&h00000401	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_EFCompensation	&h0000041e	One of the proeperty constants. Please check the EDSDK API Programming Reference for deta
kEdsPropID_Evf_AFMode	&h0000050E	One of the proeperty constants.

Data Type Constants

Constant	Value	Description
kEdsDataType_Bool	1	Boolean
kEdsDataType_Bool_Array	30	Array of Boolean
kEdsDataType_ByteBlock	14	Bytes (use memoryblock)
kEdsDataType_Double	13	Double
kEdsDataType_Float	12	Float
kEdsDataType_FocusInfo	101	Focus info. Use EdsFocusInfoMBS.
kEdsDataType_Int16	4	Int16
kEdsDataType_Int16_Array	32	Array of Int16
kEdsDataType_Int32	8	Int32
kEdsDataType_Int32_Array	33	Array of Int32
kEdsDataType_Int64	10	Int64
kEdsDataType_Int8	3	Int8
kEdsDataType_Int8_Array	31	Array of Int8
kEdsDataType_PictureStyleDesc	102	A Picture style description. Use EdsPictureStyleDescMBS.
kEdsDataType_Point	21	Point (use EdsPointMBS)
kEdsDataType_Rational	20	Rational value
kEdsDataType_Rational_Array	37	Array of rational numbers (Use EdsRationalMBS)
kEdsDataType_Rect	22	Rectangle (use EdsRectMBS)
kEdsDataType_String	2	String value
kEdsDataType_Time	23	Time (use EdsTimeMBS)
kEdsDataType_UInt16	7	UInt16
kEdsDataType_UInt16_Array	35	Array of UInt16
kEdsDataType_UInt32	9	UInt32
kEdsDataType_UInt32_Array	36	Array of UInt32
kEdsDataType_UInt64	11	UInt64
kEdsDataType_UInt8	6	UInt8
kEdsDataType_UInt8_Array	34	Array of UInt8
kEdsDataType_Unknown	0	Unknown

Progress Option Constants

Constant	Value	Description
kEdsProgressOption_Done	1	Call a progress callback function when the progress reaches 100%.
kEdsProgressOption_NoReport	0	Do not call a progress callback function.
kEdsProgressOption_Periodically	2	Call a progress callback function periodically.

27.2 class EdsCameraAddedHandlerMBS

27.2.1 class EdsCameraAddedHandlerMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class is to monitor for cameras being added.
Notes: Constructor registers callback for event and sets lasterror code.

27.2.2 Events

27.2.3 CameraAdded as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This event is called when a new camera is added.
Notes: Returns EDS_ERR_OK if successful. Otherwise, ensure the implementation returns an appropriate error code.

27.3 class EdsCameraListMBS

27.3.1 class EdsCameraListMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The object for a list of cameras.
Notes: This object represents an enumeration of the cameras remotely connected to the host PC by USB interface. This object can be used to select the camera to be controlled from among the cameras currently connected with EDSDK client application. This object can also be used when getting an EdsCameraMBS child object.
Subclass of the EdsBaseMBS class.

27.3.2 Methods

27.3.3 Child(index as UInt32) as EdsCameraMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets an indexed child object of the designated object.
Notes: Index is 0 based and range from 0 to ChildCount-1.
Lasterror is set.

27.4 class EdsCameraMBS

27.4.1 class EdsCameraMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This object represents a remotely connected camera.
Notes: This object is used to control the camera or to get an EdsVolumeMBS object when accessing the memory card, which is a child object of the camera.
Subclass of the EdsBaseMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr5

27.4.2 Methods

27.4.3 Child(index as UInt32) as EdsVolumeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets an indexed child object of the designated object.
Notes: Index is 0 based and range from 0 to ChildCount-1.
Lasterror is set.

27.4.4 CloseSession

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Closes a logical connection with a remote camera.
Notes: Lasterror is set.

27.4.5 DateTime as EdsTimeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Convenience function to query date and time values.
Notes: Calls GetPropertyData for you with kEdsPropID_DateTime.
Lasterror is set.

27.4.6 DeviceInfo as EdsDeviceInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets device information, such as the device name.
Notes: Because device information of remote cameras is stored on the host computer, you can use this API before the camera object initiates communication (that is, before a session is opened).
Lasterror is set.
Returns nil on any error.

27.4.7 DownloadEvfImage(image as EdsEvfImageMBS, OldSDK as boolean)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Downloads the live view image data set for a camera currently in live view mode.
Notes: Live view can be started by using the property ID:kEdsPropertyID_Evf_OutputDevice and data:EdsOutputDevice_PC to call SetPropertyData.
In addition to image data, information such as zoom, focus position, and histogram data is included in the image data set. Image data is saved in a stream maintained by EdsEvfImageMBS. GetPropertyData can be used to get information such as the zoom, focus position, etc.
Although the information of the zoom and focus position can be obtained from EdsEvfImageMBS, settings are applied to EdsCameraMBS.
Lasterror is set.

If you use 2.11 SDK, please pass OldSDK=false. If you use 2.10 SDK, please pass OldSDK=true. The two SDKs handle this function differently, so you need to tell the plugin which SDK you use. Using wrong value will liekly lead to a crash.

27.4.8 FocusInfo as EdsFocusInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Convenience function to query focus information.
Notes: Lasterror is set.
This queries kEdsPropID_FocusInfo with GetPropertyData for you and returns an EdsFocusInfoMBS object.

27.4.9 OpenSession

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Establishes a logical connection with a remote camera.
Notes: Use this API after getting the camera's EdsCamera object.

Lasterror is set.

27.4.10 Parent as EdsCameraListMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the parent object of the designated object.
Notes: Lasterror is set.

27.4.11 PictureStyleDesc as EdsPictureStyleDescMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Convenience function to query Picture Style Description information.
Notes: Calls GetPropertyData for you with kEdsPropID_PictureStyleDesc and returns object with values.
Lasterror is set.

27.4.12 SendCommand(command as Integer, param as Integer = 0)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sends a command such as "Shoot" to a remote camera.
Example:

```
Var camera as EdsCameraMBS // your camera object

camera.SendCommand camera.kEdsCameraCommand_TakePicture
```

Notes: Command: The command ID to send to the object. See kEdsCameraCommand* constants.
Param: Specify the x-coordinate in the upper 16 bit and the y-coordinate in the lower 16 bit for kEdsCameraCommand_DoClickWBEvf only.
Lasterror is set.

Please check SDK manual for details.

27.4.13 SendStatusCommand(command as Integer, param as Integer = 0)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the remote camera state or mode.
Notes: command: Designate the particular mode ID to set the camera to. See kEdsCameraStatusCom-

mand* constants.
Param: Currently unused. Designate 0.
Lasterror is set.

Please check SDK manual for details.

27.4.14 SetCapacity(numberOfFreeClusters as Integer, bytesPerSector as Integer, reset as boolean)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the remaining HDD capacity on the host computer(excluding the portion from image transfer),as calculated by subtracting the portion from the previous time.
Notes: Set a reset flag initially and designate the cluster length and number of free clusters.
Some cameras can display the number of shots left on the camera based on the available disk capacity of the host computer.
For these cameras, after the storage destination is set to the computer,use this API to notify the camera of the available disk capacity of the host computer.

Lasterror is set.

27.4.15 Constants

Camera Command Constants

Constant	Value	Description
kEdsCameraCommand_BulbEnd	3	Lock the UI before bulb shooting. An exposure time event is generated at th teEvent_BulbExposureTime)
kEdsCameraCommand_BulbStart	2	Starts bulb shooting/ Ends bulb shooting
kEdsCameraCommand_DoClickWBEvf	&h00000104	Adjusts the white balance of the live view This command is supported only in live vi
kEdsCameraCommand_DoEvfAf	&h00000102	Controls auto focus in live view mode. This command is supported by the EOS cameras, and only in live view mode.
kEdsCameraCommand_DriveLensEvf	&h00000103	Drives the lens and adjusts focus This command is supported only in live vi
kEdsCameraCommand_EvfAf_OFF	0	
kEdsCameraCommand_EvfAf_ON	1	
kEdsCameraCommand_ExtendShutDownTimer	1	Requests to extend the time for the auto s
kEdsCameraCommand_PressShutterButton	4	Controls shutter button operations. This command is supproted by the EOS cameras.
kEdsCameraCommand_ShutterButton_Completely	3	
kEdsCameraCommand_ShutterButton_Completely_NonAF	&h00010003	
kEdsCameraCommand_ShutterButton_Halfway	1	
kEdsCameraCommand_ShutterButton_Halfway_NonAF	&h00010001	
kEdsCameraCommand_ShutterButton_OFF	0	
kEdsCameraCommand_TakePicture	0	Requests the camera to shoot.

Camera Status Command Constants

Constant	Value	Description
kEdsCameraStatusCommand_EnterDirectTransfer	2	
kEdsCameraStatusCommand_ExitDirectTransfer	3	
kEdsCameraStatusCommand_UILock	0	
kEdsCameraStatusCommand_UIUnLock	1	

Progress Option Constants

Constant	Value	Description
kEdsProgressOption_Done	1	Call a progress callback function when the progress reaches 100%.
kEdsProgressOption_NoReport	0	Do not call a progress callback function.
kEdsProgressOption_Periodically	2	Call a progress callback function periodically.

27.5 class EdsCameraStateEventHandlerMBS

27.5.1 class EdsCameraStateEventHandlerMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class to receive camera state events.

27.5.2 Methods

27.5.3 Add(camera as EdsCameraMBS, CameraStateEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Designate event for receiving events related to camera object states.
Notes: Lasterror is set.

27.5.4 Constructor

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates an event handler object.
Notes: You can later add objects to it.
See also:

- 27.5.5 Constructor(camera as EdsCameraMBS, CameraStateEvent as UInt32) 4722

27.5.5 Constructor(camera as EdsCameraMBS, CameraStateEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Designate event for receiving events related to camera object states.
Notes: Lasterror is set.
See also:

- 27.5.4 Constructor 4722

27.5.6 Events

27.5.7 StateChanged(StateEvent as UInt32, EventData as UInt32) as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Called when the state changed.
Notes: StateEvent: Indicate the event type supplemented. Designate one of the event types subject to supplementation, as designated by Constructor/Add. Events that occur can be determined based on the event type.

Returns EDS_ERR_OK if successful. In other cases, see the EDS Error Lists.

27.6 class EdsDeviceInfoMBS

27.6.1 class EdsDeviceInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for device information.

27.6.2 Properties

27.6.3 DeviceDescription as String

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The device name.
Notes: (Read and Write property)

27.6.4 deviceSubType as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The device subtype.
Notes: Canon PTP cameras: 1
Canon PTP-IP cameras: 2

If the camera involved in PTP communication is connected to a Windows computer on which WIA is installed, 0 is specified in DeviceSubType, representing standard Windows PTP.
(Read and Write property)

27.6.5 PortName as String

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The port name.
Notes: (Read and Write property)

27.6.6 reserved as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reserved for the future.
Notes: (Read and Write property)

27.7 class EdsDirectoryItemInfoMBS

27.7.1 class EdsDirectoryItemInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class represents directory item information for the memory card in the camera.

27.7.2 Properties

27.7.3 DateTime as UInt32

MBS Cameras Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The date and time value.
Notes: New in 2.11 SDK.
(Read and Write property)

27.7.4 FileName as String

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the directory name or file name if successful.
Notes: Example: "_MG_0060.JPG"
(Read and Write property)

27.7.5 Format as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the directory item type.
Notes: See kEdsImageType* constants.
(Read and Write property)

27.7.6 GroupID as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The group ID for this file.
Notes: A non-zero integer. The same group ID is assigned to files that belong to the same group, such as RAW+JPEG images or RAW+AVI images.

(Read and Write property)

27.7.7 IsFolder as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether this is a folder.
Notes: If a folder: True
If not a folder: False
(Read and Write property)

27.7.8 Option as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The option property.
Notes: An option when a direct transfer request is received (a kEdsObjectEvent_DirItemRequestTransferDT event). kEdsTransferOptionToDesktop is set when [Wallpaper] in the direct transfer is executed by means of camera operations.
Prohibit it under other timing conditions.
(Read and Write property)

27.7.9 Size as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The file size.
Notes: For folders, the file size is indicated as 0.
(Read and Write property)

27.7.10 Constants

Image Type constants.

Constant	Value	Description
kEdsImageType_CR2	6	CR2
kEdsImageType_CRW	2	CRW
kEdsImageType_Jpeg	1	JPEG
kEdsImageType_RAW	4	RAW
kEdsImageType_Unknown	0	Unknown

27.8 class EdsDirectoryItemMBS

27.8.1 class EdsDirectoryItemMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This object represents a file or folder on the camera.
Notes: When files are downloaded from the camera, each file to be downloaded is treated as one of these objects.
Subclass of the EdsBaseMBS class.

27.8.2 Methods

27.8.3 Child(index as UInt32) as EdsDirectoryItemMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets an indexed child object of the designated object.
Notes: Index is 0 based and range from 0 to ChildCount-1.
Lasterror is set.

27.8.4 DeleteDirectoryItem

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Deletes a camera folder or file.
Notes: If folders with subdirectories are designated, all files are deleted except protected files.

Don't use the object after you deleted it.
Lasterror is set.

27.8.5 DirectoryItemInfo as EdsDirectoryItemInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets information about the directory or file objects on the memory card (volume) in a remote camera.
Notes: Lasterror is set.
Returns nil on any error.

27.8.6 Download(ReadSize as UInt64, stream as EdsStreamMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Downloads a file on a remote camera (in the camera memory or on a memory card) to the host computer.
Notes: The downloaded file is sent directly to a file stream created in advance.
When dividing the file being retrieved, call this API repeatedly. Also in this case, make the data block size a multiple of 512 (bytes), excluding the final block.

ReadSize: Designate the size in bytes to download.
stream: Specifies the destination stream.

Lasterror is set.

27.8.7 DownloadCancel

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Must be executed when downloading of a directory item is canceled.
Notes: Calling this API makes the camera cancel file transmission. It also releases resources.
This operation need not be executed when using DownloadThumbnail.
Lasterror is set.
In applications that take locally released images on the camera and load them on host computer, if the application receives a file transfer request from the camera when the file is not needed (by means of kEdsObjectEvent_DirItemRequestTransfer or kEdsObjectEvent_DirItemRequestTransferDT), this API must be called to notify the camera that transmission has been canceled.
Normally, delete callback function registration at the moment an event is not needed.

27.8.8 DownloadComplete

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Must be called when downloading of directory items is complete.
Notes: Executing this API makes the camera recognize that file transmission is complete.
This operation need not be executed when using DownloadThumbnail.
Lasterror is set.

If transfer of a file that was divided is canceled, call DownloadCancel instead of this API to notify the camera that downloading of the directory item has been canceled.

27.8.9 DownloadThumbnail(stream as EdsStreamMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extracts and downloads thumbnail information from image files in a camera.
Notes: Thumbnail information in the camera's image files is downloaded to the host computer. Downloaded thumbnails are sent directly to a file stream created in advance.

stream: Designate the stream for saving extracted thumbnails.
Lasterror is set.

27.8.10 Parent as EdsDirectoryItemMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the parent object of the designated object.
Notes: Lasterror is set.

27.8.11 Properties

27.8.12 FileAttributes as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets attributes of files on a camera.
Example:

```
Var d as EdsDirectoryItemMBS // your directory item
Var a as Integer = d.FileAttributes
if bitwiseAnd(a, d.kEdsFileAttribute_ReadOnly)<>0 then
msgbox "Readonly."
end if
```

Notes: Returns the file attributes.
As for the file attributes, OR values of the value defined by kEdsFileAttribute* constants can be retrieved. Thus, when determining the file attributes, you must check if an attribute flag is set for target attributes. Use BitwiseAnd to check for different flags.
Lasterror is set.

If you assign value, this property changes attributes of files on a camera.
(Read and Write computed property)

27.8.13 Constants

File Attribute Constants

Constant	Value	Description
kEdsFileAttribute_Archive	&h20	Archive attribute
kEdsFileAttribute_Hidden	2	Hidden attribute
kEdsFileAttribute_Normal	0	A standard file
kEdsFileAttribute_ReadOnly	1	Read-only
kEdsFileAttribute_System	4	System attribute

27.9 class EdsEvfImageMBS

27.9.1 class EdsEvfImageMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This object represents PC live view image data.
Notes: When using a camera model that supports live view, live view image data set can be downloaded from the camera. Information such as zoom and histogram data is included with image data.
Subclass of the EdsBaseMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr5

27.9.2 Methods

27.9.3 Constructor(stream as EdsStreamMBS, OldSDK as boolean = false)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates an object used to get the live view image data set.
Notes: Lasterror is set.
See EdsCreateEvfImageRef in the SDK documentation.

If you use 2.11 SDK, please pass OldSDK=false. If you use 2.10 SDK, please pass OldSDK=true. The two SDKs handle this function differently, so you need to tell the plugin which SDK you use. Using wrong value will liekly lead to a crash.

27.10 class EdsFocusInfoMBS

27.10.1 class EdsFocusInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class represents focus information.
Notes: It stores kEdsPropID_FocusInfo property data.
Blog Entries

- MBS Xojo Plugins, version 18.3pr1

27.10.2 Methods

27.10.3 FocusPoint(index as Integer) as EdsFocusPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The array of focus points.
Notes: Index from 0 to 127, but of course lower than PointNumber.

27.10.4 Properties

27.10.5 ExecuteMode as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The execute mode.
Notes: (Read and Write property)

27.10.6 ImageRect as EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The rectangle of the image.
Notes: (Read and Write property)

27.10.7 PointNumber as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Number of frames.
Notes: (Read and Write property)

27.11 class EdsFocusPointMBS

27.11.1 class EdsFocusPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class represents the AF frame information of focus information.
Notes: It stores AF frame information of the kEdsPropID_FocusInfo property.

27.11.2 Properties

27.11.3 JustFocus as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the frame is just focus.
Notes: (Read and Write property)

27.11.4 Rect as EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The rectangle of the frame.
Notes: (Read and Write property)

27.11.5 Reserved as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reserved.
Notes: (Read and Write property)

27.11.6 Selected as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the point is selected.
Notes: (Read and Write property)

27.11.7 Valid as Boolean

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: True if the frame is valid.
Notes: (Read and Write property)

27.12 class EdsImageInfoMBS

27.12.1 class EdsImageInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class represents various information found in image data.

27.12.2 Properties

27.12.3 componentDepth as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Bits per sample.
Notes: Either 8 or 16.
Note: Image files may contain image data of mixed resolutions.
(Read and Write property)

27.12.4 effectiveRect as EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The effective image rectangle.
Notes: This means the area excluding the black bands on the top and bottom of the thumbnail image.
(Read and Write property)

27.12.5 height as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image height in pixels.
Notes: (Read and Write property)

27.12.6 numOfComponents as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Number of color components in image.
Notes: (Read and Write property)

27.12.7 reserved1 as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reserved.
Notes: (Read and Write property)

27.12.8 reserved2 as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reserved.
Notes: (Read and Write property)

27.12.9 width as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image width in pixels.
Notes: (Read and Write property)

27.13 class EdsImageMBS

27.13.1 class EdsImageMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This object represents image data.
Notes: This data is obtained from image files. This object is used to retrieve and control information included with an image such as thumbnails and parameters.
Subclass of the EdsBaseMBS class.

27.13.2 Methods

27.13.3 CacheImage(UseCache as boolean)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Switches a setting on and off for creation of an image cache in the SDK for a designated image object during extraction (processing) of the image data.
Notes: Creating the cache increases the processing speed, starting from the second time.
UseCache: Image Cache on/off.
Lasterror is set.

27.13.4 Constructor(stream as EdsImageMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates an image object from an image file.
Notes: Without modification, stream objects cannot be worked with as images. Thus, when extracting images from image files, you must use this API to create image objects.
The image object created this way can be used to get image information (such as the height and width, number of color components, and resolution), thumbnail image data, and the image data itself.
Lasterror is set.

27.13.5 DateTime as EdsTimeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Convenience function to query date and time values.
Notes: Calls GetPropertyData for you with kEdsPropID_DateTime.
Lasterror is set.

27.13.6 FocusInfo as EdsFocusInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Convenience function to query focus information.
Notes: Lasterror is set.
This queries kEdsPropID_FocusInfo with GetPropertyData for you and returns an EdsFocusInfoMBS object.

27.13.7 Image(ImageSource as Integer, TargetImageType as Integer, Source as EdsRectMBS, Dest as EdsSizeMBS, DestStream as EdsStreamMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets designated image data from an image file, in the form of a designated rectangle.
Notes: Returns uncompressed results for JPEG compressed images and processed results in the designated pixel order (RGB, Top-down BGR, and so on) for RAW images. Additionally, by designating the input/output rectangle, it is possible to get reduced, enlarged, or partial images. However, because images corresponding to the designated output rectangle are always returned by the SDK, the SDK does not take the aspect ratio into account. To maintain the aspect ratio, you must keep the aspect ratio in mind when designating the rectangle.
Lasterror is set.

ImageSource: Designate the type of image data to get from the image file (thumbnail, preview, and so on). Designate values as defined in kEdsImageSrc* constants.
TargetImageType: Designate the output image type. Because the output format of EdsGetImage may only be RGB, only kEdsTargetImageType_RGB or kEdsTargetImageType_RGB16 can be designated.

However, image types exceeding the resolution of ImageSource cannot be designated.
Example: Suppose the source image resolution (componentDepth) retrieved by means of ImageInfo() is 8 bits
->The resolution that can be retrieved by means of Image () is also 8 bits
->Thus, only kEdsTargetImageType_RGB is available.
Source: Designate the coordinates and size of the rectangle to be retrieved (processed) from the source image.
Dest: Designate the rectangle size for output.
DestStream: Designate the memory or file stream for output of the image.

Lasterror is set.

- To maintain the aspect ratio, you must keep the aspect ratio in mind when designating a rectangle.
- In calculating the data size of the output file, the original image data resolution is not used.

Instead, the resolution of the image type designated by inImageType is used. For example, the calculation

for kEdsTargetImageType_RGB is 3 (R, G, and B) x 8 (resolution) x width x height √ 8 (bytes). Similarly, kEdsTargetImageType_RGB16 is calculated by 3 x 16 x width x height √ 8 (bytes).

27.13.8 ImageInfo(ImageSource as Integer) as EdsImageInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets image information from a designated image object.
Notes: Here, image information means the image width and height, number of color components, resolution, and effective image area.
Lasterror is set.

27.13.9 PictureStyleDesc as EdsPictureStyleDescMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Convenience function to query Picture Style Description information.
Notes: Calls GetPropertyData for you with kEdsPropID_PictureStyleDesc and returns object with values.
Lasterror is set.

27.13.10 ReflectImageProperty

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Incorporates image object property changes (effected by means of EdsSetPropertyData) in the stream.
Notes: Lasterror is set.

27.13.11 SaveImage(TargetImageType as Integer, DestStream as EdsStreamMBS, JPEGQuality as Integer = 0, iccProfileStream as EdsStreamMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Saves as a designated image type after RAW processing.
Notes: TargetImageType: Designate the image type to produce. Designate the following image types. See kEdsTargetImageType* constants.
JPEGQuality: Image quality for JPEG compression
iccProfileStream: ICC profile stream.

Lasterror is set.

27.13.12 Constants

Image Source Constants

Constant	Value	Description
kEdsImageSrc_FullView	0	The image itself (a full-sized image)
kEdsImageSrc_Preview	2	A preview image
kEdsImageSrc_RAWFullView	4	A RAW full-sized image
kEdsImageSrc_RAWThumbnail	3	A RAW thumbnail image
kEdsImageSrc_Thumbnail	1	A thumbnail image

Image Target Type Constants

Constant	Value	Description
kEdsTargetImageType_DIB	11	Device Independent Bitmap
kEdsTargetImageType_JPEG	1	JPEG
kEdsTargetImageType_RGB	9	8-bit RGB, chunky format
kEdsTargetImageType_RGB16	10	16-bit RGB, chunky format
kEdsTargetImageType_TIFF	7	8-bit TIFF
kEdsTargetImageType_TIFF16	8	16-bit TIFF
kEdsTargetImageType_Unknown	0	Folder, or unknown image type

27.14 module EDSModuleMBS

27.14.1 module EDSModuleMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The main module for the EDS SDK.
Notes: Please get a copy of the SDK with the manual, so you can lookup some details.
The documentation coming with the plugin shows the classes and some specifics for Xojo, but not all the details.

Typically SDK functions return a EdsError value. The plugin gives you that value by lasterror properties.

27.14.2 Methods

27.14.3 GetCameraList as EdsCameraListMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets camera list objects.
Notes: Lasterror is set.
Returns the camera list object or nil.

27.14.4 GetEvent

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This function acquires an event.
Notes: In console application, please call this function regularly to acquire the event from a camera.
Lasterror is set.

27.14.5 Initialize

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Initializes the libraries.
Notes: When using the EDSDK libraries, you must call this API once before using EDSDK APIs.
Lasterror is set.

27.14.6 Lasterror as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The last error code of any EDS function in all the classes.

27.14.7 LoadLibrary(file as folderitem, IsVersion2 as Boolean) as boolean

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Loads the SDK.
Example:

```
Var file as FolderItem

// find DLL in application folder
if TargetWin32 then
file = GetFolderItem("EDSDK.dll")
elseif TargetMacOS then
// find Framework in inside frameworks folder in app bundle
Var frameworks as FolderItem = app.ExecutableFile.Parent.parent.Child("Frameworks")

file = frameworks.Child("EDSDK.framework")
else
MsgBox "not supported."
end if

// load framework or DLL
if EDSModuleMBS.LoadLibrary(file) then
// continue
end if
```

Notes: Pass folderitem for framework on Mac or DLL on Windows.
Returns true on success.
After loading, you need to call Initialize method.

If you use 2.x SDK, please set IsVersion2 to true.
For 3.x SDK, please set IsVersion2 to false.
The 3.x SDK uses 64-bit integer, while the older one uses 32-bit integers.
Using wrong switch, you get wrong numbers.
See also:

- 27.14.8 LoadLibrary(path as string, IsVersion2 as Boolean) as boolean

27.14.8 LoadLibrary(path as string, IsVersion2 as Boolean) as boolean

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Loads the SDK.
Notes: Pass path for framework on Mac or DLL on Windows.
Returns true on success.
After loading, you need to call Initialize method.

If you use 2.x SDK, please set IsVersion2 to true.
For 3.x SDK, please set IsVersion2 to false.
The 3.x SDK uses 64-bit integer, while the older one uses 32-bit integers.
Using wrong switch, you get wrong numbers.
See also:

- 27.14.7 LoadLibrary(file as folderitem, IsVersion2 as Boolean) as boolean 4744

27.14.9 Terminate

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Terminates use of the libraries.
Notes: Calling this function releases all resources allocated by the libraries.
Lasterror is set.

27.14.10 Constants

Constants

Constant	Value	Description
EDS_CMP_ID_CLIENT_COMPONENTID	&h01000000	One of the ED-SDK Base Component IDs.
EDS_CMP_ID_HLSDK_COMPONENTID	&h03000000	One of the ED-SDK Base Component IDs.
EDS_CMP_ID_LLSDK_COMPONENTID	&h02000000	One of the ED-SDK Base Component IDs.
EDS_MAX_NAME	256	The maximum file name length is limited to EDS_MAX_
EDS_TRANSFER_BLOCK_SIZE	512	The transfer block size.
kEdsETTL2ModeAverage	1	One of the ETTL2 Mode evaluative constants. Average
kEdsETTL2ModeEvaluative	0	One of the ETTL2 Mode evaluative constants. Evaluative
kEdsPropertyEvent_All	&h00000100	One of the property event constants. One of the state events for EdsPropertyEventHandlerMBS EDSDK API Programming Reference for details.
kEdsPropertyEvent_PropertyChanged	&h00000101	One of the property event constants. One of the state events for EdsPropertyEventHandlerMBS EDSDK API Programming Reference for details.
kEdsPropertyEvent_PropertyDescChanged	&h00000102	One of the property event constants. One of the state events for EdsPropertyEventHandlerMBS EDSDK API Programming Reference for details.
kEdsStateEvent_AfResult	&h00000309	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_All	&h00000300	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_BulbExposureTime	&h00000310	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_CaptureError	&h00000305	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_InternalError	&h00000306	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_JobStatusChanged	&h00000302	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_Shutdown	&h00000301	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_ShutDownTimerUpdate	&h00000304	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.
kEdsStateEvent_WillSoonShutDown	&h00000303	One of the state event constants. One of the state events for EdsCameraStateEventHandle check EDSDK API Programming Reference for details.

Image Quality Constants

Constant	Value	Description
EdsImageQuality_CR	&h0063ff0f	CRAW
EdsImageQuality_CRLJ	&h00630010	CRAW + Jpeg Large
EdsImageQuality_CRLJF	&h00630013	CRAW + Jpeg Large Fine
EdsImageQuality_CRLJN	&h00630012	CRAW + Jpeg Large Normal
EdsImageQuality_CRM1J	&h00630510	CRAW + Jpeg Middle1
EdsImageQuality_CRM1JF	&h00630513	CRAW + Jpeg Middle1 Fine
EdsImageQuality_CRM1JN	&h00630512	CRAW + Jpeg Middle1 Normal
EdsImageQuality_CRM2J	&h00630610	CRAW + Jpeg Middle2
EdsImageQuality_CRM2JF	&h00630613	CRAW + Jpeg Middle2 Fine
EdsImageQuality_CRM2JN	&h00630612	CRAW + Jpeg Middle2 Normal

EDS_ERR_INVALID_HANDLE	&h00000061	
EDS_ERR_INVALID_ID	&h000000F3	
EDS_ERR_INVALID_INDEX	&h00000063	
EDS_ERR_INVALID_LENGTH	&h00000064	
EDS_ERR_INVALID_OBJECTFORMATCODE	&h0000200B	

AF Mode Constants

Constant	Value	Description
Evf_AFMode_Live	1	Live Mode
Evf_AFMode_LiveFace	2	Live Face Mode
Evf_AFMode_Quick	0	Quick Mode

Shooting mode Constants

Constant	Value	Description
kEdsAEMode_Av	2	Aperture Priority AE
kEdsAEMode_A_DEP	5	Auto Depth-of-Field AE
kEdsAEMode_BacklitScenes	24	Backlit Scenes
kEdsAEMode_Bulb	4	Bulb
kEdsAEMode_CandlelightPortraits	28	Candlelight Portraits
kEdsAEMode_Children	26	Children
kEdsAEMode_Closeup	14	Close-Up
kEdsAEMode_CreativeAuto	19	Creative Auto
kEdsAEMode_CreativeFilter	29	Creative Filter
kEdsAEMode_Custom	7	Camera settings registered
kEdsAEMode_DEP	6	Depth-of-Field AE
kEdsAEMode_Fisheye	33	Fisheye
kEdsAEMode_FlashOff	15	Flash Off
kEdsAEMode_Food	27	Food
kEdsAEMode_Green	9	Auto
kEdsAEMode_GroupPhoto	46	Group Photo
kEdsAEMode_Hdr_Bold	38	HDR Bold
kEdsAEMode_Hdr_Embossed	39	HDR Embossed
kEdsAEMode_Hdr_Standard	36	HDR Standard
kEdsAEMode_Hdr_Vivid	37	HDR Vivid
kEdsAEMode_Landscape	13	Landscape
kEdsAEMode_Lock	8	Lock
kEdsAEMode_Manual	3	Manual Exposure
kEdsAEMode_Miniature	35	Miniature
kEdsAEMode_Movie	20	Not documented.
kEdsAEMode_Movie_DirectMono	43	Movie Direct Mono
kEdsAEMode_Movie_Fantasy	40	Movie Fantasy
kEdsAEMode_Movie_Memory	42	Movie Memory
kEdsAEMode_Movie_Mini	44	Movie Mini
kEdsAEMode_Movie_Old	41	Movie Old
kEdsAEMode_Myself	50	Myself
kEdsAEMode_NightPortrait	10	Night Scene Portrait
kEdsAEMode_NightScenes	23	NightScenes
kEdsAEMode_PanningAssist	45	PanningAssist
kEdsAEMode_PhotoInMovie	21	Photo In Movie (This value is valid for only Image.)
kEdsAEMode_Portrait	12	Portrait
kEdsAEMode_Program	0	Program AE
kEdsAEMode_RoughMonoChrome	30	RoughMonoChrome
kEdsAEMode_SceneIntelligentAuto	22	Auto New in 2.11 SDK.
kEdsAEMode_SCN	25	SCN
kEdsAEMode_SmoothSkin	52	SmoothSkin
kEdsAEMode_SoftFocus	31	Soft Focus
kEdsAEMode_Sports	11	Sports
kEdsAEMode_ToyCamera	32	Toy Camera
kEdsAEMode_Tv	1	Shutter-Speed Priority AE
kEdsAEMode_Unknown	&hffffffff	Not valid/no settings changes
kEdsAEMode_WaterColor	34	Water Color

Battery level Constants

Constant	Value	Description
kEdsBatteryLevel2_AC	&hFFFFFFFF	AC
kEdsBatteryLevel2_BCLevel	0	BCLevel
kEdsBatteryLevel2_Empty	0	Empty
kEdsBatteryLevel2_Error	0	Error
kEdsBatteryLevel2_Half	49	Half
kEdsBatteryLevel2_Hi	69	Hi
kEdsBatteryLevel2_Low	9	Low
kEdsBatteryLevel2_Normal	80	Normal
kEdsBatteryLevel2_Quarter	19	Quarter
kEdsBatteryLevel2_Unknown	&hFFFFFFFE	Unknown

Bracket Constants

Constant	Value	Description
kEdsBracket_AEB	&h01	AE bracket
kEdsBracket_FEB	&h08	FE bracket
kEdsBracket_ISOB	&h02	ISO bracket
kEdsBracket_Unknown	&hffffffff	Bracket off
kEdsBracket_WBB	&h04	WB bracket

Color Matrix Constants

Constant	Value	Description
kEdsColorMatrix_1	1	
kEdsColorMatrix_2	2	
kEdsColorMatrix_3	3	
kEdsColorMatrix_4	4	
kEdsColorMatrix_5	5	
kEdsColorMatrix_6	6	
kEdsColorMatrix_7	7	
kEdsColorMatrix_Custom	0	

Colorspace Constants

Constant	Value	Description
kEdsColorSpace_AdobeRGB	2	
kEdsColorSpace_sRGB	1	
kEdsColorSpace_Unknown	&hffffffff	

Depth of Field Preview Constants

Constant	Value	Description
kEdsEvfDepthOfFieldPreview_OFF	&h00000000	Off
kEdsEvfDepthOfFieldPreview_ON	&h00000001	On

Drive Lens Constants

Constant	Value	Description
kEdsEvfDriveLens_Far1	&h00008001	
kEdsEvfDriveLens_Far2	&h00008002	
kEdsEvfDriveLens_Far3	&h00008003	
kEdsEvfDriveLens_Near1	&h00000001	
kEdsEvfDriveLens_Near2	&h00000002	
kEdsEvfDriveLens_Near3	&h00000003	

Output Device Constants

Constant	Value	Description
kEdsEvfOutputDevice_PC	2	The live view image can be transferred to the PC.ÔøºÔøºÔøº
kEdsEvfOutputDevice_TFT	1	Live view is displayed on the camera's TFT.

Zoom Constants

Constant	Value	Description
kEdsEvfZoom_Fit	1	Entire screen
kEdsEvfZoom_x10	10	10 times.
kEdsEvfZoom_x5	5	5 times

Filter Effect Constants

Constant	Value	Description
kEdsFilterEffect_Green	4	Green
kEdsFilterEffect_None	0	No effect
kEdsFilterEffect_Orange	2	Orange
kEdsFilterEffect_Red	3	Red
kEdsFilterEffect_Yellow	1	Yellow

Legacy Image Quality Constants

Constant	Value	Description
kEdsImageQualityForLegacy_LJ	&h001f000f	Jpeg Large
kEdsImageQualityForLegacy_LJF	&h00130000	Jpeg Large Fine
kEdsImageQualityForLegacy_LJN	&h00120000	Jpeg Large Normal
kEdsImageQualityForLegacy_LR	&h00240000	RAW
kEdsImageQualityForLegacy_LR2	&h002f000f	RAW
kEdsImageQualityForLegacy_LR2LJ	&h002f001f	RAW + Jpeg Large
kEdsImageQualityForLegacy_LR2M1J	&h002f051f	RAW + Jpeg Middle1
kEdsImageQualityForLegacy_LR2M2J	&h002f061f	RAW + Jpeg Middle2
kEdsImageQualityForLegacy_LR2SJ	&h002f021f	RAW + Jpeg Small
kEdsImageQualityForLegacy_LRLJF	&h00240013	RAW + Jpeg Large Fine
kEdsImageQualityForLegacy_LRLJN	&h00240012	RAW + Jpeg Large Normal
kEdsImageQualityForLegacy_LRMJF	&h00240113	RAW + Jpeg Middle Fine
kEdsImageQualityForLegacy_LRMJN	&h00240112	RAW + Jpeg Middle Normal
kEdsImageQualityForLegacy_LRSJF	&h00240213	RAW + Jpeg Small Fine
kEdsImageQualityForLegacy_LRSJN	&h00240212	RAW + Jpeg Small Normal
kEdsImageQualityForLegacy_M1J	&h051f000f	Jpeg Middle1
kEdsImageQualityForLegacy_M2J	&h061f000f	Jpeg Middle2
kEdsImageQualityForLegacy_MJF	&h01130000	Jpeg Middle Fine
kEdsImageQualityForLegacy_MJN	&h01120000	Jpeg Middle Normal
kEdsImageQualityForLegacy_SJ	&h021f000f	Jpeg Small
kEdsImageQualityForLegacy_SJF	&h02130000	Jpeg Small Fine
kEdsImageQualityForLegacy_SJN	&h02120000	Jpeg Small Normal
kEdsImageQualityForLegacy_Unknown	&hffffffff	Unknown

Image Size Constants

Constant	Value	Description
kEdsImageSize_Large	0	Large
kEdsImageSize_Middle	1	Middle
kEdsImageSize_Middle1	5	Middle
kEdsImageSize_Middle2	6	Middle
kEdsImageSize_Small	2	Small
kEdsImageSize_Small1	14	Small
kEdsImageSize_Small2	15	Small
kEdsImageSize_Small3	16	Small
kEdsImageSize_Unknown	&hffffffff	Unknown

Object event Constants

Constant	Value	Description
kEdsObjectEvent_All	&h00000200	
kEdsObjectEvent_DirItemCancelTransferDT	&h0000020a	
kEdsObjectEvent_DirItemContentChanged	&h00000207	
kEdsObjectEvent_DirItemCreated	&h00000204	
kEdsObjectEvent_DirItemInfoChanged	&h00000206	
kEdsObjectEvent_DirItemRemoved	&h00000205	
kEdsObjectEvent_DirItemRequestTransfer	&h00000208	
kEdsObjectEvent_DirItemRequestTransferDT	&h00000209	
kEdsObjectEvent_FolderUpdateItems	&h00000203	
kEdsObjectEvent_VolumeAdded	&h0000020c	
kEdsObjectEvent_VolumeInfoChanged	&h00000201	
kEdsObjectEvent_VolumeRemoved	&h0000020d	
kEdsObjectEvent_VolumeUpdateItems	&h00000202	

Photo Effect Constants

Constant	Value	Description
kEdsPhotoEffect_Monochrome	5	Black and white
kEdsPhotoEffect_Off	0	Off (Color Effect deactivated. Normal shooting.)

Picture Style Constants

Constant	Value	Description
kEdsPictureStyle_Auto	&h0087	Auto
kEdsPictureStyle_Faithful	&h0085	Faithful
kEdsPictureStyle_Landscape	&h0083	Landscape
kEdsPictureStyle_Monochrome	&h0086	Monochrome
kEdsPictureStyle_Neutral	&h0084	Neutral
kEdsPictureStyle_PC1	&h0041	PC1
kEdsPictureStyle_PC2	&h0042	PC2
kEdsPictureStyle_PC3	&h0043	PC3
kEdsPictureStyle_Portrait	&h0082	Portrait
kEdsPictureStyle_Standard	&h0081	Standard
kEdsPictureStyle_User1	&h0021	User defined
kEdsPictureStyle_User2	&h0022	User defined
kEdsPictureStyle_User3	&h0023	User defined

SaveTo Constants

Constant	Value	Description
kEdsSaveTo_Both	3	Save both ways (memory card of a remote camera and by downloading to a host computer)
kEdsSaveTo_Camera	1	Save on a memory card of a remote camera.
kEdsSaveTo_Host	2	Save by downloading to a host computer.

Strobo Mode Constants

Constant	Value	Description
kEdsStroboModeExternalATTL	2	
kEdsStroboModeExternalAuto	4	
kEdsStroboModeExternalETTL	1	
kEdsStroboModeExternalManual	5	
kEdsStroboModeExternalTTL	3	
kEdsStroboModeInternal	0	
kEdsStroboModeManual	6	

Toning Effect Constants

Constant	Value	Description
kEdsToningEffect_Blue	2	
kEdsToningEffect_Green	4	
kEdsToningEffect_None	0	
kEdsToningEffect_Purple	3	
kEdsToningEffect_Sepia	1	

Transfer Option Constants

Constant	Value	Description
kEdsTransferOption_ByDirectTransfer	1	
kEdsTransferOption_ByRelease	2	
kEdsTransferOption_ToDesktop	&h00000100	

White Balance Constants

Constant	Value	Description
kEdsWhiteBalance_Auto	0	Auto
kEdsWhiteBalance_Click	-1	Setting the white balance by clicking image coordinates.
kEdsWhiteBalance_Cloudy	2	Cloudy
kEdsWhiteBalance_ColorTemp	9	Color temperature
kEdsWhiteBalance_Daylight	1	Daylight
kEdsWhiteBalance_Fluorescent	4	Fluorescent
kEdsWhiteBalance_Pasted	-2	White balance copied from another image.
kEdsWhiteBalance_PCSet1	10	Custom white balance: PC-1
kEdsWhiteBalance_PCSet2	11	Custom white balance: PC-2
kEdsWhiteBalance_PCSet3	12	Custom white balance: PC-3
kEdsWhiteBalance_PCSet4	20	Custom white balance: PC-4
kEdsWhiteBalance_PCSet5	21	Custom white balance: PC-5
kEdsWhiteBalance_Shade	8	Shade
kEdsWhiteBalance_Strobe	5	Flash
kEdsWhiteBalance_Tangsten	3	Tungsten
kEdsWhiteBalance_WhitePaper	6	Manual (set by shooting a white card or paper)
kEdsWhiteBalance_WhitePaper2	15	Manual 2
kEdsWhiteBalance_WhitePaper3	16	Manual 3
kEdsWhiteBalance_WhitePaper4	18	Manual 4
kEdsWhiteBalance_WhitePaper5	19	Manual 5

27.15 class EdsObjectEventHandlerMBS

27.15.1 class EdsObjectEventHandlerMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class to watch for object events.
Blog Entries

- MBS Real Studio Plugins, version 12.2pr7

27.15.2 Methods

27.15.3 Add(camera as EdsBaseMBS, ObjectEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Registers event handler to listen for object events.
Notes: Lasterror is set.

27.15.4 Constructor

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Constructor to create object event handler.
Notes: You can add objects to watch for events later.
See also:

- 27.15.5 Constructor(camera as EdsBaseMBS, ObjectEvent as UInt32) 4759

27.15.5 Constructor(camera as EdsBaseMBS, ObjectEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates object event handler and registers it to listen object events.
Notes: Lasterror is set.
See also:

- 27.15.4 Constructor 4759

27.15.6 Events

27.15.7 ObjectChanged(EventCode as Integer, obj as EdsBaseMBS) as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when an object changed.
Notes: obj: The target object.

Return EDS_ERR_OK if successful. In other cases, see the EDS Error Lists.

27.16 class EdsPictureStyleDescMBS

27.16.1 class EdsPictureStyleDescMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Use this class when retrieving picture styles.

27.16.2 Properties

27.16.3 ColorTone as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Color tone.
Notes: An integer from –4 to 4
(Read and Write property)

27.16.4 Contrast as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Contrast setting.
Notes: An integer from –4 to 4.
(Read and Write property)

27.16.5 FilterEffect as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Monochrome filter effect
Notes: 0: None
1: Yellow
2: Orange
3: Red
4: Green
&hFFFFFFFF: Unknown
(Read and Write property)

27.16.6 Saturation as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The saturation value.
Notes: An integer from –4 to 4
(Read and Write property)

27.16.7 sharpFineness as UInt32

MBS Cameras Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The sharp fineness value.
Notes: Only for 3.x SDK.
(Read and Write property)

27.16.8 Sharpness as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Sharpness value.
Notes: An integer from 0 to 7.
(Read and Write property)

27.16.9 sharpThreshold as UInt32

MBS Cameras Plugin, Plugin Version: 16.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The sharp threshold value.
Notes: Only for 3.x SDK.
(Read and Write property)

27.16.10 ToningEffect as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Monochrome tone.
Notes: 0: None
1: Sepia
2: Blue
3: Violet

(Read and Write property)

27.17 class EdsPointMBS

27.17.1 class EdsPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class is generally used to represent a set of coordinates.

27.17.2 Properties

27.17.3 X as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The x value.
Notes: (Read and Write property)

27.17.4 Y as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The y value.
Notes: (Read and Write property)

27.18 class EdsProgressMBS

27.18.1 class EdsProgressMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for progress event.
Notes: Please make subclass or put it on a window to receive events.

27.18.2 Events

27.18.3 Progress(Percent as UInt32, byref Cancel as boolean) as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The progress event.
Notes: Percent: Indicates the progress in a range of 0 - 100%.
Cancel: To cancel processing in progress, set this variable to true.

For example, if this argument is set to true during file transfer from the camera, the EDSDK notifies the camera that file transfer has been canceled, and transfer of those files is canceled.

Return EDS_ERR_OK (0) if everything is okay.

27.18.4 Constants

Progress Option Constants

Constant	Value	Description
kEdsProgressOption_Done	1	Call a progress callback function when the progress reaches 100%.
kEdsProgressOption_NoReport	0	Do not call a progress callback function.
kEdsProgressOption_Periodically	2	Call a progress callback function periodically.

27.19 class EdsPropertyEventHandlerMBS

27.19.1 class EdsPropertyEventHandlerMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for a property event handler.

27.19.2 Methods

27.19.3 Add(camera as EdsCameraMBS, PropertyEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Registers this event handler to report property events for the given camera.
Notes: Lasterror is set.

27.19.4 Constructor

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Constructor to create property event handler.
Notes: You can add cameras to watch for properties later.
See also:

- 27.19.5 Constructor(camera as EdsCameraMBS, PropertyEvent as UInt32) 4766

27.19.5 Constructor(camera as EdsCameraMBS, PropertyEvent as UInt32)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Constructor to create property event handler and registers this event handler to report property events for the given camera.
Notes: Lasterror is set.
See also:

- 27.19.4 Constructor 4766

27.19.6 Events

27.19.7 PropertyChanged(PropertyEvent as UInt32, PropertyID as UInt32, Param as UInt32) as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Event for receiving property-related camera events.
Notes: PropertyEvent: Indicate the event type supplemented. Designate one of the event types subject to supplementation, as designated by EdsSetPropertyEventHandler. Events that occur can be determined based on the event type.
PropertyID: Returns the property ID created by the event.
Param: Used to identify information created by the event for custom function (CF) properties or other properties that have multiple items of information.

Returns EDS_ERR_OK if successful. In other cases, see the EDS Error Lists.

27.20 class EdsRationalMBS

27.20.1 class EdsRationalMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class is generally used to represent fractions.
Notes: It is used with many properties such as kEdsPropID_Av and kEdsPropID_Tv.

27.20.2 Properties

27.20.3 denominator as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The denominator part of the fraction.
Notes: (Read and Write property)

27.20.4 numerator as Int32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The numerator part of the fraction.
Notes: (Read and Write property)

27.21 class EdsRectMBS

27.21.1 class EdsRectMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class is generally used to indicate the coordinates of a rectangle.

27.21.2 Properties

27.21.3 Height as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The height of the rectangle.
Notes: (Read and Write property)

27.21.4 Point as EdsPointMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the location of the rectangle.
Notes: (Read and Write property)

27.21.5 Size as EdsSizeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the size of the rectangle.
Notes: (Read and Write property)

27.21.6 Width as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the rectangle.
Notes: (Read and Write property)

27.21.7 X as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The x position.
Notes: (Read and Write property)

27.21.8 Y as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The y position.
Notes: (Read and Write property)

27.22 class EdsSizeMBS

27.22.1 class EdsSizeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class generally represents the width and height of a rectangle.

27.22.2 Properties

27.22.3 Height as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The height value.
Notes: (Read and Write property)

27.22.4 Width as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width value.
Notes: (Read and Write property)

27.23 class EdsStreamMBS

27.23.1 class EdsStreamMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for a file/data stream.
Notes: Use it to specify a destination for downloading image data or as source for reading data.
Subclass of the EdsBaseMBS class.

27.23.2 Methods

27.23.3 Constructor(data as string)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a stream from the memory buffer you prepared.
Notes: Unlike the buffer size of streams created by means of EdsCreateMemoryStream, the buffer size you prepare for streams created this way does not expand.
Lasterror is set.
See also:

- 27.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0) 4772
- 27.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) 4773
- 27.23.6 Constructor(path as string, CreateDisposition as Integer, DesiredAccess as Integer) 4773
- 27.23.7 Constructor(size as UInt64) 4774

27.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a stream from the memory buffer you prepare.
Notes: Unlike the buffer size of streams created by means of CreateMemoryStream, the buffer size you prepare for streams created this way does not expand.
Lasterror is set.
See also:

- 27.23.3 Constructor(data as string) 4772
- 27.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) 4773
- 27.23.6 Constructor(path as string, CreateDisposition as Integer, DesiredAccess as Integer) 4773
- 27.23.7 Constructor(size as UInt64) 4774

27.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a new file on a host computer (or opens an existing file) and creates a file stream for access to the file.
Notes: If a new file is designated before executing this API, the file is actually created following the timing of writing by means of EdsWrite or the like with respect to an open stream.

path: Designate the file name of a new file or a file to open.
CreateDisposition: Designate how the file is handled (that is, its disposition) if it exists or does not exist. Designate a value defined in kEdsFileCreateDisposition*.
DesiredAccess: Pass kEdsAccess_Read, kEdsAccess_Write or kEdsAccess_ReadWrite.
Lasterror is set.
See also:

- 27.23.3 Constructor(data as string) 4772
- 27.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0) 4772

- 27.23.7 Constructor(size as UInt64) 4774

27.23.6 Constructor(path as string, CreateDisposition as Integer, DesiredAccess as Integer)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a new file on a host computer (or opens an existing file) and creates a file stream for access to the file.
Notes: If a new file is designated before executing this API, the file is actually created following the timing of writing by means of EdsWrite or the like with respect to an open stream.

path: Designate the file name of a new file or a file to open.
CreateDisposition: Designate how the file is handled (that is, its disposition) if it exists or does not exist. Designate a value defined in kEdsFileCreateDisposition*.
DesiredAccess: Pass kEdsAccess_Read, kEdsAccess_Write or kEdsAccess_ReadWrite.
Lasterror is set.

- 27.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0) 4772
- 27.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) 4773
- 27.23.7 Constructor(size as UInt64) 4774

27.23.7 Constructor(size as UInt64)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a stream in the memory of a host computer.
Notes: In the case of writing in excess of the allocated buffer size, the memory is automatically extended.
Lasterror is set.
See also:

- 27.23.3 Constructor(data as string) 4772
- 27.23.4 Constructor(Memory as Memoryblock, size as Int64 = -1, offset as Integer = 0) 4772
- 27.23.5 Constructor(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) 4773
- 27.23.6 Constructor(path as string, CreateDisposition as Integer, DesiredAccess as Integer) 4773

27.23.8 CopyData(WriteSize as UInt64, outStream as EdsStreamMBS)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copies data from the copy source stream to the copy destination stream.
Notes: The read or write position of the data to copy is determined from the current file read or write position of the respective stream.
After this API is executed, the read or write positions of the copy source and copy destination streams are moved an amount corresponding to WriteSize in the positive direction.
Lasterror is set.

27.23.9 CreateEvfImageRef as EdsEvfImageMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates an object used to get the live view image data set.
Notes: Lasterror is set.
See EdsCreateEvfImageRef in the SDK documentation.

27.23.10 CreateFileStream(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a new file on a host computer (or opens an existing file) and creates a file stream for access to the file.
Notes: If a new file is designated before executing this API, the file is actually created following the timing

of writing by means of EdsWrite or the like with respect to an open stream.

path: Designate the file name of a new file or a file to open.
CreateDisposition: Designate how the file is handled (that is, its disposition) if it exists or does not exist. Designate a value defined in kEdsFileCreateDisposition*.
DesiredAccess: Pass kEdsAccess_Read, kEdsAccess_Write or kEdsAccess_ReadWrite.
Lasterror is set.
See also:

- 27.23.11 CreateFileStream(path as string, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS 4775

27.23.11 CreateFileStream(path as string, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a new file on a host computer (or opens an existing file) and creates a file stream for access to the file.
Notes: If a new file is designated before executing this API, the file is actually created following the timing of writing by means of EdsWrite or the like with respect to an open stream.

path: Designate the file name of a new file or a file to open.
CreateDisposition: Designate how the file is handled (that is, its disposition) if it exists or does not exist. Designate a value defined in kEdsFileCreateDisposition*.
DesiredAccess: Pass kEdsAccess_Read, kEdsAccess_Write or kEdsAccess_ReadWrite.
Lasterror is set.
See also:

- 27.23.10 CreateFileStream(path as folderitem, CreateDisposition as Integer, DesiredAccess as Integer) as EdsStreamMBS 4774

27.23.12 CreateImage as EdsImageMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates an image object from an image file.
Notes: Without modification, stream objects cannot be worked with as images. Thus, when extracting images from image files, you must use this API to create image objects.
The image object created this way can be used to get image information (such as the height and width, number of color components, and resolution), thumbnail image data, and the image data itself.
Lasterror is set.

27.23.13 CreateMemoryStream(size as UInt32) as EdsStreamMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a stream in the memory of a host computer.
Notes: In the case of writing in excess of the allocated buffer size, the memory is automatically extended.
Lasterror is set.

27.23.14 CreateMemoryStreamFromMemoryblock(Memory as Memoryblock, size as Integer = -1, offset as Integer = 0) as EdsStreamMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a stream from the memory buffer you prepare.
Notes: Unlike the buffer size of streams created by means of CreateMemoryStream, the buffer size you prepare for streams created this way does not expand.
Lasterror is set.

27.23.15 CreateMemoryStreamFromstring(data as string) as EdsStreamMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a stream from the memory buffer you prepared.
Notes: Unlike the buffer size of streams created by means of CreateMemoryStream, the buffer size you prepare for streams created this way does not expand.
Lasterror is set.

27.23.16 Length as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the stream size.
Notes: Returns the number of bytes of the stream.
Lasterror is set.

27.23.17 Pointer as Ptr

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the pointer to the start address of memory managed by the memory stream.
Notes: As the EDSDK automatically resizes the buffer, the memory stream provides you with the same

access methods as for the file stream. If access is attempted that is excessive with regard to the buffer size for the stream, data before the required buffer size is allocated is copied internally, and new writing occurs. Thus, the buffer pointer might be switched on an unknown timing. Caution in use is therefore advised.

Lasterror is set.

27.23.18 Position as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the current read or write position of the stream (that is, the file position indicator).
Notes: Returns the current read or write position of the stream (that is, to the offset position from the beginning of the stream). (The beginning of the stream is 0.)
Lasterror is set.

The stream's initial read or write position is 0. If Write or Read is used to write or read from the stream, the indicator is moved an amount corresponding to that size in the positive direction.
When intentionally changing the read or write position of the stream, use Seek.

27.23.19 Read(size as UInt64) as string

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reads data with given maximum lenegth into the buffer, starting at the current read or write position of the stream.
Notes: The size of data actually read can be slower.
Lasterror is set.

27.23.20 Seek(Offset as Int64, origin as Integer)

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Moves the read or write position of the stream (that is, the file position indicator).
Notes: Offset: Designate the number of bytes to move the file position indicator.
Origin: Designate the origin for moving from the read or write position. Designate any of the following, as defined in constant kEdsSeek*.
Lasterror is set.

27.23.21 Write(Data as string) as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Writes data of a designated buffer to the current read or write position of the stream.
Notes: Lasterror is set.
Returns number of bytes written.

27.23.22 Constants

File Access Constants

Constant	Value	Description
kEdsAccess_Error	-1	Error
kEdsAccess_Read	0	Open a read-only stream.
kEdsAccess_ReadWrite	2	Allow reading and writing.
kEdsAccess_Write	1	Open a write-only stream.

File Create Disposition Constants

Constant	Value	Description
kEdsFileCreateDisposition_CreateAlways	1	Creates a new file. If the designated file already exists, that file and existing attributes is erased.
kEdsFileCreateDisposition_CreateNew	0	Creates a new file. An error occurs if the designated file already
kEdsFileCreateDisposition_OpenAlways	3	If the file exists, it is opened. If the designated file does not exist created.
kEdsFileCreateDisposition_OpenExisting	2	Opens a file. An error occurs if the designated file does not exist
kEdsFileCreateDisposition_TruncateExsisting	4	Opens a file and sets the file size to 0 bytes.

Seek Origin Constants

Constant	Value	Description
kEdsSeek_Begin	1	Moves the file position indicator from the beginning of the stream forward by inOffset bytes.
kEdsSeek_Cur	0	Moves the file position indicator from the current position in the stream forward by inOffset bytes.
kEdsSeek_End	2	Moves the file position indicator from the end of the stream by offset bytes. To move toward the beginning, designate a negative value. Positive values will move the indicator beyond the end of the file.

27.24 class EdsTimeMBS

27.24.1 class EdsTimeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This class represents the camera time or the shooting date of an image.
Notes: It is used to store kEdsPropID_DateTime property data.

27.24.2 Methods

27.24.3 Date as Date

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Convenience function to return the same date as a Xojo date object.

27.24.4 Properties

27.24.5 Day as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The day value.
Notes: Value from 1 to 31.
(Read and Write property)

27.24.6 Hour as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The hour value.
Notes: Value from 0 to 23.
(Read and Write property)

27.24.7 Milliseconds as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The millisecond value.
Notes: (Read and Write property)

27.24.8 Minute as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The minute value.
Notes: Value from 0 to 59.
(Read and Write property)

27.24.9 Month as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The month value.
Notes: 1=January, 2=February, ...
Value from 1 to 12.
(Read and Write property)

27.24.10 Second as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The second value.
Notes: Value from 0 to 59.
(Read and Write property)

27.24.11 Year as UInt32

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The year value.
Notes: This is a 4 digit year number.
(Read and Write property)

27.25 class EdsVolumeInfoMBS

27.25.1 class EdsVolumeInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for volume information.

27.25.2 Properties

27.25.3 Access as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The access rights.
Notes: See kEdsAccess* constants.
(Read and Write property)

27.25.4 FreeSpaceInBytes as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Available capacity (in bytes)
Notes: (Read and Write property)

27.25.5 MaxCapacity as UInt64

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Maximum size (in bytes)
Notes: (Read and Write property)

27.25.6 StorageType as Integer

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The storage type.
Notes: See kEdsStorage* constants.
(Read and Write property)

27.25.7 VolumeLabel as String

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Volume name.
Notes: (Read and Write property)

27.25.8 Constants

Access Mode

Constant	Value	Description
kEdsAccess_Error	-1	
kEdsAccess_Read	0	
kEdsAccess_ReadWrite	2	
kEdsAccess_Write	1	

Storage Type Constants

Constant	Value	Description
kEdsStorageType_CF	1	Compact flash
kEdsStorageType_HD	4	HD card
kEdsStorageType_Non	0	No memory card inserted
kEdsStorageType_SD	2	SD card

27.26 class EdsVolumeMBS

27.26.1 class EdsVolumeMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The class for a volume on the camera's recording media
Notes: This object represents the memory card inside the camera. If the camera model allows two memory cards to be installed at once, the EdsVolumeRef object represents one memory card each. This object is used to get an EdsDirectoryItemRef object, which is a child object, when performing operations on a file or folder on the memory card.
Subclass of the EdsBaseMBS class.

27.26.2 Methods

27.26.3 Child(index as UInt32) as EdsDirectoryItemMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets an indexed child object of the designated object.
Notes: Index is 0 based and range from 0 to ChildCount-1.
Lasterror is set.

27.26.4 FormatVolume

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Formats volumes of memory cards in a camera.
Notes: Lasterror is set.
Be careful to avoid doing this when the camera is not in the right mode. Lock the UI, for example.

27.26.5 Parent as EdsCameraMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the parent object of the designated object.
Notes: Lasterror is set.

27.26.6 VolumeInfo as EdsVolumeInfoMBS

MBS Cameras Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets volume information for a memory card in the camera.
Notes: Lasterror is set.
Returns nil on any error.

Chapter 28

Carbon Events

28.1 class CarbonApplicationEventsMBS

28.1.1 class CarbonApplicationEventsMBS

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSApplicationDelegateMBS for Cocoa instead. **Function:** A class for receiving events sent to the application.
Notes: Even if the name of the class includes Carbon, it works fine with Cocoa applications for most events.

Apple deprecated the carbon framework, but still in a Cocoa application, some features are only available through this class due to missing replacements. So we use CarbonApplicationEventsMBS class until a future MacOS update breaks it.

28.1.2 Methods

28.1.3 CreateTypeStringWithOSType(ostype as string) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Creates a type string object for the use in the ServiceGetTypes event.

28.1.4 Listen

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Starts listening for events send to your application.

28.1.5 Properties

28.1.6 Available as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Whether this events are fireing.
Notes: Still each event may have it's own requirement.
(Read only property)

28.1.7 EventCount as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse event counter.
Notes: Increases whenever one of the following events occurs:
MouseUp, MouseMoved, MouseDragged and MouseDown.
(Read and Write property)

28.1.8 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The last reported Mac OS error code.
Notes: 0 if successfull, -1 if function is not available.
(Read and Write property)

28.1.9 MouseButton as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse buttons used at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.1.10 MouseChord as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse chord state at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.1.11 MouseClickCount as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse click count at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.1.12 MouseDeltaX as Single

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse movement at the time of the last mouse event.
Notes: Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

28.1.13 MouseDeltaY as Single

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse movement at the time of the last mouse event.
Notes: Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

28.1.14 MouseModifierKeys as Integer

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The modifier key state at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.

The modifiers field contains information about the state of the modifier keys and the mouse button at the time the event was posted.

Each of the modifier keys is represented by a specific bit in the modifiers field. You can use these constants as masks to test the setting of various bits in the modifiers field:

activeFlag	1	set if window being activated or if mouse-down event caused foreground switch
btnState	128	set if mouse button up
cmdKey	256	set if Command key down
shiftKey	512	set if Shift key down
alphaLock	1024	set if Caps Lock key down
optionKey	2048	set if Option key down
controlKey	4096	set if Control key down
rightshiftKey	8192	set if right Shift key down
rightoptionKey	16384	set if right Option key down
rightcontrolKey	32768	set if right Control key down

If your application attaches special meaning to any of these keys in combination with other keys or when the mouse button is down, you can test the state of the modifiers field to determine the action your application should take. For example, you can use this information to determine whether the user pressed the Command key and another key to make a menu choice.

Some keyboards do not distinguish between the right or left Control, Shift, and Option keys; for example, the virtual key code for the right Shift key and left Shift key might be the same. For these keyboards, if the user presses the Control, Shift, or Option key, the Event Manager sets only the bits corresponding to the shiftKey, optionKey, and controlKey constants. For keyboards that do distinguish between these keys, the Event Manager sets the bits in the modifiers field to indicate whether the right or left Control, Shift, or Option keys were pressed. For example, the Event Manager sets bit 13 in the modifiers field if the user presses the right Shift key and sets bit 9 if the user presses the left Shift key. In most cases your application should not need to distinguish between the left and right Control, Shift, and Option keys.
(Read and Write property)

28.1.15 MouseX as Single

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse position at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.1.16 MouseY as Single

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: The mouse position at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.1.17 Tablet as Boolean

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: Whether you want to get the tablet event data.
Notes: As not every application needs tablet event information, this is optional.
Set to true to get the TabletPoint and TabletProximity parameters filled in the events.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.1.18 TabletPoint as CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: Saves the current tablet point object.
Notes: Whenever an event is received and the tablet property is true and there is point information available, a reference to the CarbonEventsTabletPointMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.1.19 TabletProximity as CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: Saves the current tablet proximity object.
Notes: Whenever an event is received and the tablet property is true and there is proximity information available, a reference to the CarbonEventsTabletProximityMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.1.20 Events

28.1.21 ApplicationActivated

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever your application is activated.
Notes: In older versions this event was misspelled: ApplicationActived

28.1.22 ApplicationDeactivated

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever your application is deactivated.
Notes: In older versions this event was misspelled: ApplicationDeactived

28.1.23 ApplicationGetDockTileMenu as Integer

MBS MacCF Plugin, Plugin Version: 3.0, Platform: macOS, Targets: Desktop only.

Function: Called whenever the system likes to know which menu to display in the dock tile.
Notes: Create a menu using the MenuMBS class and return the handle property to this event as the result.

28.1.24 ApplicationHidden

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The application was hidden.
Notes: Only used on Mac OS X 10.2 and newer.

28.1.25 ApplicationLaunched(ProcessSerial as memoryblock)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever an application is launched.
Notes: ProcessSerial is a memoryblock to 8 bytes defining the process serial number.
ProcessSerial may be nil on very low memory.

28.1.26 ApplicationQuit

MBS MacCF Plugin, Plugin Version: 5.3, Platform: macOS, Targets: Desktop only.

Function: The application is requested to quit.
Notes: Current Xojo versions seems to handle this event before the plugin can get it, so currently this event does not fire. (tested with RB 5.5 and 2005r2)

28.1.27 ApplicationShown

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The application was shown.
Notes: Only used on Mac OS X 10.2 and newer.

28.1.28 ApplicationSwitched(ProcessSerial as memoryblock)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the frontmost application is changed.
Example:

```
sub ApplicationSwitched(ProcessSerial as memoryblock)
' This even works in built applications.
Var s as String
Var p as ProcessMBS
```

```
if ProcessSerial<>nil then
p=new ProcessMBS

p.GetProcess(ProcessSerial)
p.Update
s=p.Name
end if
List.InsertRow 0,"Application switched to "+s+"."
end sub
```

Notes: ProcessSerial is a memoryblock to 8 bytes defining the process serial number.
ProcessSerial may be nil on very low memory.

28.1.29 ApplicationSystemUIModeChanged(SystemUIMode as Integer)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The system UI mode changed.
Notes: Only used on Mac OS X 10.2 and newer.

28.1.30 ApplicationTerminated(ProcessSerial as memoryblock)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever an application quits.
Notes: ProcessSerial is a memoryblock to 8 bytes defining the process serial number.
ProcessSerial may be nil on very low memory.

Note that the process serial number may no longer be valid when this event is called.

28.1.31 GestureEnded(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the gesture ends.
Notes: GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See Window-

PartCode definition in Apple documentation.)

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

28.1.32 GestureMagnify(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, MagnificationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called several times while the magnify gesture is performed.
Notes: MagnificationAmount the magnification amount.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

Return true if you handled the event.

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

28.1.33 GestureRotate(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, RotationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called several times while the rotation gesture is performed.
Notes: The RotationAmount in polar coordinates.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

28.1.34 GestureStarted(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when a gesture starts.
Notes: GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.

If not supported with the current hardware, this event is never called.

28.1.35 GestureSwipe(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, SwipeDirectionX as Double, SwipeDirectionY as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called for a swipe gesture.
Notes: SwipeDirectionX and SwipeDirectionY specify the swipe direction.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

28.1.36 HotKeyPressed(signature as Integer, id as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The hotkey was pressed.

28.1.37 HotKeyReleased(signature as Integer, id as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The hotkey was released.
Notes: Works not on Carbon inside Mac OS 9!

28.1.38 KeyboardRawKeyDown(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: A key was pressed.
Notes: Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead.
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

28.1.39 KeyboardRawKeyModifiersChanged(modifierkeys as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: The state of the modifier keys changed.
Notes: Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead.
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

28.1.40 KeyboardRawKeyRepeat(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: A key is still down.
Notes: Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead.
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

28.1.41 KeyboardRawKeyUp(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: A key was released.
Notes: Does only work in Carbon target, not in Cocoa. Please use NSEventMonitorMBS class instead.
If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

28.1.42 MenuPopulate(MenuHandle as Integer)

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: The system asks the application to update the menu bar.
Notes: The application can change the menubar just a second before the user sees it.
This event is also sent whenever a command key is searched.
Works on CarbonLib 1.6 or newer.
Added MenuHandle parameter in v5.2.

28.1.43 MouseDown(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: An event which fires when a mousebuton is down.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.1.44 MouseDragged(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: An event which fires when the mouse is dragged.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.1.45 MouseMoved(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: An event which fires when the mouse is moved.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.1.46 MouseUp(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop only.

Function: An event which fires when a mousebutton is released.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.1.47 MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the mouse wheel is moved.
Example:

```
function MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean
Var d as Integer

const cmdKey=256
const shiftKey=512
const alphaLock=1024
const optionKey=2048
const controlKey=4096
const rightShiftKey=8192
const rightOptionKey=16384
const rightControlKey=32768

const kEventMouseWheelAxisY=1
const kEventMouseWheelAxisX=0

if axis=kEventMouseWheelAxisY then
d=delta

if BitwiseAnd(modifierKeys,optionkey)<>0 then
d=d*4 // scroll faster with option
end if

List.ScrollPosition=List.ScrollPosition-d
end if

List.InsertRow 0,"MouseWheelMoved "+str(delta)
end function
```

Notes: Currently axis is only 0 or 1, but in future new input devices may have up to 32 axises.

Added a boolean function result in version 3.2. If you return true the event is handled by you. Else it's passed to the next receiver of events.

28.1.48 ProcessCommand(AttributeFlags as Integer, CommandId as Integer, Handle as Integer, Index as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.0, Platform: macOS, Targets: Desktop only.

Function: Called whenever a command is to process.
Notes: Called for example when the DockTileMenu is used.
It seems like handle and index are optional.

Renamed Attributes parameter to AttributeFlags in plugin version 8.2.

28.1.49 ServiceCopy(Scrap as CarbonEventsScrapMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever a service needs something from you.
Notes: You have to fill the scrap.
Return true if you handled the event.

28.1.50 ServiceGetTypes(copytypes as CFMutableArrayMBS, pastetypes as CFMutableArrayMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the Mac OS needs to know what types you can process.
Example:

```
function ServiceGetTypes(copytypes as CFMutableArrayMBS, pastetypes as CFMutableArrayMBS) as boolean
pastetypes.Append me.CreateTypeStringWithOSType("TEXT") // Speak text
pastetypes.Append me.CreateTypeStringWithOSType("TIFF") // for Grab

copytypes.Append me.CreateTypeStringWithOSType("TEXT")
end function
```

Notes: Fill the arrays with your content type codes.
Use the CreateTypeStringWithOSType function to make strings with the type codes.
Return true if you handled the event.

28.1.51 ServicePaste(Scrap as CarbonEventsScrapMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever a service gives something to you.
Notes: You have to do something with the content of the scrap.
Return true if you handled the event.

28.1.52 ServicePerform(Scrap as CarbonEventsScrapMBS, MessageName as CFStringMBS, UserData as CFStringMBS) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever you should perform a service.
Notes: You have to do something with the content of the scrap.
Return true if you handled the event.

28.1.53 VolumeMounted(VolumeRefNum as Integer, VolumeRoot as FolderItem)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever a volume is mounted.
Example:

```
sub VolumeMounted(VolumeRefNum as Integer)
Var s as String
Var f as FolderItem

f=NewVolumeFolderitemMBS(VolumeRefNum)
if f<>nil then
s=f.DisplayName
end if

List.InsertRow 0,"A volume was mounted: "+s
end sub
```

Notes: VolumeRefNum is the number of the mounted volume. You may keep a list of mounted volumes if you need to know which was is unmounted later.

28.1.54 VolumeUnmounted(VolumeRefNum as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever a volume is unmounted.
Example:

```
sub VolumeUnmounted(VolumeRefNum as Integer)
// If you keep a list you can identify the volume...
List.InsertRow 0,"A volume was unmounted."
end sub
```

Notes: VolumeRefNum is the number of the mounted volume. You may keep a list of mounted volumes if

you need to know which was is unmounted later.

28.2 class CarbonEventsIdleTimerMBS

28.2.1 class CarbonEventsIdleTimerMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** A class for an idle timer.
Notes: An idle timer is called whenever the user didn't use the mouse or the keyboard for a given time period.
Blog Entries

- MBS Xojo Plugins, version 23.3pr7
- MBS Xojo Plugins, version 19.1pr2

28.2.2 Methods

28.2.3 Constructor(delay as Double, interval as Double)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Installs an idle timer.
Notes: Idle timers are only called when there is no user activity occuring in the application. This means that the user is not actively clicking/typing, and is also not in the middle of tracking a control, menu, or window. TrackMouseLocation actually disables all idle timers automatically for you.

Parameters:

delay:
The delay before firing this timer after a user input event has come in. For example, if you want to start your timer 2 seconds after the user stops typing, etc. you would pass 2.0 into this parameter. Each time the user types a key (or whatever), this timer is reset. If we are considered to be idle when an idle timer is installed, the first time it fires will be inDelay seconds from the time it is installed. So if you installed it in the middle of control tracking, say, it wouldn't fire until the user stopped tracking. But if you installed it at app startup and the user hasn't typed/clicked, it would fire in delay seconds.

interval:
The timer interval (pass 0 for a one-shot timer, which executes once but does not repeat). You may also pass kEventDurationForever (-1) to create a one-shot timer.

In older plugins this was called Create, but later changed to Constructor to make usage easier.

28.2.4 Properties

28.2.5 Available as Boolean

MBS MacCF Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: True if this timer can work.
Notes: Should always be true on Mac OS X and false on Windows or Mac OS Classic.
Changed in 19.1 from regular to shared property.
(Read only property)

28.2.6 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The last error code reported.
Notes: 0 for successfull.
-1 for function not available.
else a Mac OS error code.
(Read and Write property)

28.2.7 Events

28.2.8 Action(state as Integer)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Called when an idle timer fires.
Notes: Constants for state:

The user has gone idle (not touched an input device) for the duration specified in your idle timer. This is the first message you will receive. Start your engines!

kEventLoopIdleTimerStarted = 1

If you specified an interval on your idle timer, your idle timer proc will be called with this message, letting you know it is merely firing at the interval specified. If you did not specify an interval, this message is not sent.

kEventLoopIdleTimerIdling = 2

The user is back! Stop everything! This is your cue to stop any processing if you need to.

kEventLoopIdleTimerStopped = 3

28.3 class CarbonEventsScrapMBS

28.3.1 class CarbonEventsScrapMBS

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSPasteboardMBS for Cocoa instead. **Function:** A class for a clipboard used for the carbon service events.
Notes: This is Carbon API. You may want to prefer NSPasteboardMBS class for new projects.

28.3.2 Methods

28.3.3 AddData(FlavorType as string,data as string)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Adds data to the scrap.

28.3.4 AddText(Text as string)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Adds plain text to the scrap.

28.3.5 AddUnicodeText(Text as string)

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Adds 16bit unicode text to the scrap.
Notes: Your string must be in 16 bit unicode. Else you may run into crashes.

28.3.6 clear

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Clears the scrap.

28.3.7 DataAvailable(FlavorType as string) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Looks whether data is available or not for this type.
Notes: This function is much faster then if you use datasize.
Returns false on any error.

28.3.8 DataSize(FlavorType as string) as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Returns the data size of an item in the scrap.
Notes: Some data provider generate the data for the scrap only if you read it, so this function may be slower than just DataAvailable.
Returns 0 on any error.

28.3.9 FlavorCount as Integer

MBS MacCF Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The number of flavor in the clipboard.
Notes: Calling this function recreates the internal flavor list.

28.3.10 FlavorFlags(index as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns the flags of the given flavor.
Notes: Index goes from 0 to count-1.
Returns 0 on any error.

Flags are a combination of type values:
1 - private data (Sender only)
2 - translated data

28.3.11 FlavorType(index as Integer) as string

MBS MacCF Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns the type of the given flavor.
Notes: Index goes from 0 to count-1.
Returns "" on any error.

28.3.12 GetData(FlavorType as string) as string

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Returns the data of an item in the scrap.
Notes: Some data provider generate the data for the scrap only if you read it, so this function may be slower than just DataAvailable.
Returns "" on any error.

28.3.13 GetFile(byref file as folderitem) as boolean

MBS MacCF Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Trys to get a file reference from the scrap.
Notes: Returns true on success and false on failure.
On newer Mac OS X versions with 12.4 plugin, we fixed this function. But there we can't provide type, creator and flags.
See also:

- 28.3.14 GetFile(byref file as folderitem, byref type as string, byref creator as string, byref flags as Integer) as boolean 4810

28.3.14 GetFile(byref file as folderitem, byref type as string, byref creator as string, byref flags as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Trys to get a file reference from the scrap.
Notes: Returns true on success and false on failure.
Type and Creator are the Mac OS 9 file types.
flags are the normal Finderflags as you get them if using GetFileFlagsMBS(file).

On newer Mac OS X versions with 12.4 plugin, we fixed this function. But there we can't provide type, creator and flags.
See also:

• 28.3.13 GetFile(byref file as folderitem) as boolean 4810

28.3.15 GetText as string

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Returns the plain text from the scrap.
Notes: Some data provider generate the data for the scrap only if you read it, so this function may be slower than just TextAvailable.
Returns "" on any error.

28.3.16 GetUnicodeText as string

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Returns the unicode text from the scrap.
Notes: Some data provider generate the data for the scrap only if you read it, so this function may be slower than just TextAvailable.
Returns "" on any error.

28.3.17 PictAvailable as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Looks whether Mac PICT data is available.
Notes: Returns false on any error.

28.3.18 TextAvailable as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Like Dataavailable, but just for text.
Notes: This function is much faster then if you use Textsize.
Checks only for plain TEXT, not for unicode or styled text.
Returns false on any error.

28.3.19 TextSize as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Like DataSize, but just for text.
Notes: Checks only for plain TEXT, not for unicode or styled text.
Returns 0 on any error.

28.3.20 UnicodeTextAvailable as boolean

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: True if unicode text is available.
Notes: This function is much faster then if you use UnicodeTextsize.
Returns false on any error.

28.3.21 UnicodeTextSize as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Returns the number of available characters in the unicode string part of the scrap.
Notes: Returns 0 on any error.

28.3.22 Properties

28.3.23 Handle as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The handle to the scrap.
Notes: (Read and Write property)

28.3.24 Release as Boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Whether the destructor should destroy the handle later.
Notes: (Read and Write property)

28.4 class CarbonEventsTabletPointMBS

28.4.1 class CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** A class for details about the current point information.
Blog Entries

- MBS Xojo Plugins, version 23.3pr7

28.4.2 Properties

28.4.3 AbsX as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Absolute x coordinate in tablet space at full tablet resolution.
Notes: (Read and Write property)

28.4.4 AbsY as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Absolute y coordinate in tablet space at full tablet resolution.
Notes: (Read and Write property)

28.4.5 AbsZ as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Absolute z coordinate in tablet space at full tablet resolution.
Notes: (Read and Write property)

28.4.6 Buttons as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Which buttons are pressed.
Notes: One bit per button - bit 0 is first button - 1 = closed.

(Read and Write property)

28.4.7 DeviceID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: System-assigned unique device ID - matches to deviceID field in proximity event.
Notes: (Read and Write property)

28.4.8 Pressure as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Scaled pressure value.
Notes: MAXPRESSURE=(2^16)-1, MINPRESSURE=0.
(Read and Write property)

28.4.9 Rotation as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Fixed-point representation of device rotation in a 10.6 format.
Notes: (Read and Write property)

28.4.10 TangentialPressure as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Tangential pressure on the device; range same as tilt.
Notes: (Read and Write property)

28.4.11 TiltX as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Scaled tilt x value.
Notes: range is -((2^15)-1) to (2^15)-1 (-32767 to 32767)
(Read and Write property)

28.4.12 TiltY as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Scaled tilt y value.
Notes: range is -((2^15)-1) to (2^15)-1 (-32767 to 32767).
(Read and Write property)

28.4.13 Vendor1 as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined signed 16-bit integer.
Notes: (Read and Write property)

28.4.14 Vendor2 as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined signed 16-bit integer.
Notes: (Read and Write property)

28.4.15 Vendor3 as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined signed 16-bit integer.
Notes: (Read and Write property)

28.5 class CarbonEventsTabletProximityMBS

28.5.1 class CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** A class for the tablet proximity details.
Blog Entries

- MBS Xojo Plugins, version 23.3pr7

28.5.2 Properties

28.5.3 CapabilityMask as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Mask representing the capabilities of the device.
Notes: Unsigned 32 bit integer.
(Read and Write property)

28.5.4 DeviceID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: System-assigned unique device ID - matches to deviceID field in tablet event.
Notes: Unsigned 16 bit integer.
(Read and Write property)

28.5.5 EnterProximity as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Whether the pen entered or was leaving.
Notes: non-zero = entering; zero = leaving
(Read and Write property)

28.5.6 PointerID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined ID of the specific pointing device.
Notes: Unsigned 16 bit integer.
(Read and Write property)

28.5.7 PointerSerialNumber as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined serial number of the specific pointing device.
Notes: Unsigned 32 bit integer.
(Read and Write property)

28.5.8 PointerType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Type of pointing device.
Notes: No values defined for this function by Apple.
Unsigned 8 bit integer.
(Read and Write property)

28.5.9 SystemTabletID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: System-assigned unique tablet ID.
Notes: Unsigned 16 bit integer.
(Read and Write property)

28.5.10 TabletID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined tablet ID - typically will be USB product ID for the tablet.
Notes: Unsigned 16 bit integer.
(Read and Write property)

28.5.11 UniqueID as Memoryblock

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined unique ID for this pointer.
Notes: A 64bit integer value stored in an eight byte memoryblock.
(Read and Write property)

28.5.12 VendorID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined ID - typically will be USB vendor ID.
Notes: Unsigned 16 bit integer.
(Read and Write property)

28.5.13 VendorPointerType as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Vendor-defined pointer type.
Notes: Unsigned 16 bit integer.
(Read and Write property)

28.6 class CarbonEventsTimerMBS

28.6.1 class CarbonEventsTimerMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** A class for a Carbon timer. **Notes:** Compare to a Xojo timer, the CarbonEventsTimerMBS will fire more often, for example if a menu is open.

28.6.2 Methods

28.6.3 Constructor

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new timer.
Notes: Lasterror is set.
In older plugins this was called Create, but later changed to Constructor to make usage easier.

28.6.4 Properties

28.6.5 Available as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Whether the time can fire.
Notes: Should be true in Carbon applications.
(Read only property)

28.6.6 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The last error code reported.
Notes: 0 for successfull.
-1 for function not available.
else a Mac OS error code.
(Read and Write property)

28.6.7 Mode as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The timer mode.
Notes: Like a RB timer: 0 - off, 1 - single, 2 - multiple.
The timer may fire directly when set.
(Read and Write property)

28.6.8 Period as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The period of the timer in milliseconds.
Notes: Added to make it compatible to normal RB code.
(Read and Write property)

28.6.9 PeriodSeconds as Double

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The period of the timer in seconds.
Notes: Set to 1 to fire the timer every second.
If you set this to 0.000001, you can get something like 13500 events per second. See Timer Benchmark example project.
(Read and Write property)

28.6.10 Events

28.6.11 Action

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Called whenever the timer fires.
Notes: There seems to be a bug in some RB versions:
If you draw into a window in this timer's action event, you may draw not in the window graphics port, but in the current graphics port. If you click on the menubar to open a menu, you draw over this menu.
To work around this you can add a line before drawing: TheWindow.Show

28.7 class CarbonHotKeyMBS

28.7.1 class CarbonHotKeyMBS

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use HotKeyMBS instead.
Function: A class for creating hot keys.
Example:

```
const activeFlag = 1
const btnState = 128
const cmdKey = 256
const shiftKey = 512
const alphaLock = 1024
const optionKey = 2048
const controlKey = 4096
const rightShiftKey = 8192
const rightOptionKey = 16384
const rightControlKey = 32768

Var MyEvents1 as CarbonApplicationEventsMBS
// use a global property to store your instance of your subclass
Var p as CarbonHotKeyMBS // this should also be global

MyEvents1.Listen

p=new CarbonHotKeyMBS
p.AddKey(&h24, optionKey, OSTypeFromStringMBS("MBSG"), 5)

if p.LastError<>0 then
MsgBox "The Hotkey could not be registered!"
end if

// key will be released when p is destroyed on closing the window.
```

Notes: The CarbonHotKeyMBS has carbon in the name, but works fine with Cocoa, too. The Cocoa event handling system is based internally on the Carbon event handling. If you need to catch NSEvents, please use NSEventMonitorMBS class.

- 13.5, page 8: News

28.7.2 Methods

28.7.3 AddKey(keycode as Integer, keymodifier as Integer, hotkeysignature as Integer, hotkeyid as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Creates a hot key binding.
Notes: Please use only one CarbonHotKeyMBS object for each hotkey you want to use.

Keycode is the same keycode as for the sprite surface.

Possible values for the key modifier:
activeFlag = 1
btnState = 128
cmdKey = 256
shiftKey = 512
alphaLock = 1024
optionKey = 2048
controlKey = 4096
rightShiftKey = 8192
rightOptionKey = 16384
rightControlKey = 32768

The Signature should be unique. Best if you use your application's creator code.
The ID is for your application to check which hot key was pressed in the HotKey events of the CarbonApplicationEventsMBS class.

Some keycode values:

28.7.4 RemoveKey

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Removes the hot key binding.
Notes: Called by the destructor if you don't call it.

28.7.5 Properties

28.7.6 HotKeyID as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The ID used for this hotkey.
Notes: (Read only property)

28.7.7 HotKeyRef as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The handle for this hotkey.
Notes: Used internally for releasing it later.
(Read only property)

28.7.8 HotKeySignature as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The Signature used for this hotkey.
Notes: The signature should be the creator code of your application to make it unique.
(Read only property)

28.7.9 KeyCode as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The keycode used for this hotkey.
Notes: (Read only property)

28.7.10 KeyModifier as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The KeyModifier used for this hotkey.
Notes: (Read only property)

28.7.11 LastError as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The last Mac OS error code reported from one of the functions.
Notes: (Read only property)

```
kVK_A                = &h00
kVK_S                = &h01

kVK_Keypad3          = &h55
```

28.8 class CarbonMonitorEventsMBS

28.8.1 class CarbonMonitorEventsMBS

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** A class for receiving events sent to the application while monitoring events.
Notes: The CarbonMonitorEventsMBS class is a special class used to monitor user input events across all processes. When such a class is listening, the Carbon Event Manager examines the event type for user input event types, such as mouse-down, mouse-up, key-down, and so forth. It then requests that the WindowServer make copies of any of these events that are sent to any process, and deliver them to the current process also. These events are queued into the main thread's event queue, and during normal event dispatching are sent directly to the event handlers installed on the event monitor class. Monitored events are not sent through the normal event dispatching path for the current process; they will pass through the event dispatcher target, and will then be sent directly to the event monitor target.

Handlers installed on the event monitor class will only receive events when the current application is inactive. When the current application is active, all event flow occurs through the event dispatcher target, and no events are sent to the event monitor target.

Currently, the event monitor supports the following event kinds: kEventRawKeyDown, kEventRawKeyUp, kEventRawKeyRepeat, kEventRawKeyModifiersChanged, kEventMouseDown, kEventMouseUp, kEventMouseMoved, kEventMouseDragged, kEventMouseWheelMoved, kEventTabletPoint, and kEventTabletProximity.

Note that both Carbon and Cocoa password edit text controls enable a secure input mode while the focus is on the control, which prevents keyboard events from being passed to other applications. This prevents the monitoring event target from being used to sniff password keystrokes.

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

Accessibility made need to be turned on. On Mac OS X 10.9 this may not work in debug apps, but only in build apps after second launch.
Blog Entries

- MBS Xojo Plugins, version 23.3pr7

28.8.2 Methods

28.8.3 Listen

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Starts listening for events send to your application.

28.8.4 Properties

28.8.5 Available as Boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Whether this events are fireing.
Notes: Still each event may have it's own requirement.
(Read only property)

28.8.6 EventCount as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse event counter.
Notes: Increases whenever one of the following events occurs:
MouseUp, MouseMoved, MouseDragged and MouseDown.
(Read and Write property)

28.8.7 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The last reported Mac OS error code.
Notes: 0 if successfull, -1 if function is not available.
(Read and Write property)

28.8.8 MouseButton as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse buttons used at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.

(Read and Write property)

28.8.9 MouseChord as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse chord state at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.8.10 MouseClickCount as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse click count at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.8.11 MouseDeltaX as Single

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse movement at the time of the last mouse event.
Notes: Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

28.8.12 MouseDeltaY as Single

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse movement at the time of the last mouse event.
Notes: Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

28.8.13 MouseModifierKeys as Integer

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The modifier key state at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.

The modifiers field contains information about the state of the modifier keys and the mouse button at the time the event was posted.

Each of the modifier keys is represented by a specific bit in the modifiers field. You can use these constants as masks to test the setting of various bits in the modifiers field:

activeFlag	1	set if window being activated or if mouse-down event caused foreground switch
btnState	128	set if mouse button up
cmdKey	256	set if Command key down
shiftKey	512	set if Shift key down
alphaLock	1024	set if Caps Lock key down
optionKey	2048	set if Option key down
controlKey	4096	set if Control key down
rightshiftKey	8192	set if right Shift key down
rightoptionKey	16384	set if right Option key down
rightcontrolKey	32768	set if right Control key down

If your application attaches special meaning to any of these keys in combination with other keys or when the mouse button is down, you can test the state of the modifiers field to determine the action your application should take. For example, you can use this information to determine whether the user pressed the Command key and another key to make a menu choice.

Some keyboards do not distinguish between the right or left Control, Shift, and Option keys; for example, the virtual key code for the right Shift key and left Shift key might be the same. For these keyboards, if the user presses the Control, Shift, or Option key, the Event Manager sets only the bits corresponding to the shiftKey, optionKey, and controlKey constants. For keyboards that do distinguish between these keys, the Event Manager sets the bits in the modifiers field to indicate whether the right or left Control, Shift, or Option keys were pressed. For example, the Event Manager sets bit 13 in the modifiers field if the user presses the right Shift key and sets bit 9 if the user presses the left Shift key. In most cases your application should not need to distinguish between the left and right Control, Shift, and Option keys.
(Read and Write property)

28.8.14 MouseX as Single

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse position at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.8.15 MouseY as Single

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The mouse position at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.8.16 Tablet as Boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Whether you want to get the tablet event data.
Notes: As not every application needs tablet event information, this is optional.
Set to true to get the TabletPoint and TabletProximity parameters filled in the events.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.8.17 TabletPoint as CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Saves the current tablet point object.
Notes: Whenever an event is received and the tablet property is true and there is point information available, a reference to the CarbonEventsTabletPointMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.8.18 TabletProximity as CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Saves the current tablet proximity object.
Notes: Whenever an event is received and the tablet property is true and there is proximity information available, a reference to the CarbonEventsTabletProximityMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.8.19 Events

28.8.20 KeyboardRawKeyDown(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: A key was pressed.
Notes: If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

28.8.21 KeyboardRawKeyModifiersChanged(modifierkeys as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: The state of the modifier keys changed.
Notes: If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

28.8.22 KeyboardRawKeyRepeat(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: A key is still down.
Notes: If you return true you tell the system that you handled the event.

Possible values for the key modifier:

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

activeFlag	= 1	= &h000001

28.8.23 KeyboardRawKeyUp(maccharcode as Integer, keycode as Integer, modifiers as Integer, keyboardtype as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: A key was released.
Notes: If you return true you tell the system that you handled the event.

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

For added security, GetEventMonitorTarget requires that "Enable access for assistive devices" be checked in the Universal Access preference pane in order to monitor RawKeyDown, RawKeyUp, and RawKeyRepeat events. If this control is not checked, you can still install handlers for these events on the event monitor class, but no events of these types will be sent to your handler. Administrator privileges are required to enable this feature.

28.8.24 MouseDown(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when a mousebuton is down.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.8.25 MouseDragged(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when the mouse is dragged.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.8.26 MouseMoved(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when the mouse is moved.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.8.27 MouseUp(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when a mousebutton is released.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with

an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.8.28 MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Called whenever the mouse wheel is moved.
Example:

```
function MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean
Var d as Integer

const cmdKey=256
const shiftKey=512
const alphaLock=1024
const optionKey=2048
const controlKey=4096
const rightShiftKey=8192
const rightOptionKey=16384
const rightControlKey=32768

const kEventMouseWheelAxisY=1
const kEventMouseWheelAxisX=0

if axis=kEventMouseWheelAxisY then
d=delta

if BitwiseAnd(modifierKeys,optionkey)<>0 then
d=d*4 // scroll faster with option
end if

List.ScrollPosition=List.ScrollPosition-d
end if

List.InsertRow 0,"MouseWheelMoved "+str(delta)
end function
```

Notes: Currently axis is only 0 or 1, but in future new input devices may have up to 32 axises.

Added a boolean function result in version 3.2. If you return true the event is handled by you. Else it's passed to the next receiver of events.

28.9 class CarbonSystemEventsMBS

28.9.1 class CarbonSystemEventsMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** A class for receiving system events sent to the application.
Blog Entries

- MBS Xojo Plugins, version 23.3pr7
- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

28.9.2 Methods

28.9.3 Listen

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: Starts listening for events send to your application.

28.9.4 Properties

28.9.5 Available as Boolean

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: Whether this events are fireing.
Notes: Still each event may have it's own requirement.
(Read only property)

28.9.6 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: The last reported Mac OS error code.
Notes: 0 if successfull, -1 if function is not available.
(Read and Write property)

28.9.7 Events

28.9.8 DisplayReconfigured

MBS MacCF Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Notification that the Display configuration has changed.
Notes: This event is sent to all handlers registered for it on the application event target. When this event is received, applications may wish to update geometry and color depth usage or perform a redraw based on the new configuration.

Sent in Mac OS X 10.5 and newer.

28.9.9 DisplaysAsleep

MBS MacCF Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: All connected displays have gone to sleep.
Notes: Sent in Mac OS X 10.4 and newer.

28.9.10 DisplaysAwake

MBS MacCF Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: All connected displays have awoken.
Notes: Sent in Mac OS X 10.4 and newer.

28.9.11 TimeDateChanged

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: The system time and/or date has changed via the preferences panel.
Notes: Requires Mac OS X 10.3 or newer.
The RB date class may not recognize the case when just the time zone changed.

28.9.12 UserSessionActivated

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: The current user login session has been activated.
Notes: Requires Mac OS X 10.3 or newer.

From Apple's documentation:

When a user switch occurs, Mac OS X generates events for all interested applications. Events are sent to applications in a login session whenever the login session is activated or deactivated. If a login session is not being activated or deactivated, it receives no events. You can use the activation events to perform the following kinds of tasks:

- Halt or restart sound playback
- Halt or restart animations
- Give up or acquire shared resources
- Put your application into a quiescent state to improve overall system performance

Event Timing

User switch notifications are sent to applications at the same time the switch occurs. Because the switch occurs relatively quickly, this is normally not a problem. However, it is possible for an application to receive its activation event before other applications have received their deactivation events. This could lead to potential race conditions between applications releasing and acquiring shared resources.
To avoid race conditions, applications in the session being deactivated should continue to release any shared resources as soon as possible. Applications in the session being activated should delay the acquisition of any shared resources until those resources are actually used. Not only can this help avoid potential race conditions, it can also improve overall system performance. If your application needs a particular resource right away but encounters errors while trying to acquire it, set a timer and try to acquire the resource again a short time later.

28.9.13 UserSessionDeactivated

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: The current user login session has been deactivated.
Notes: Requires Mac OS X 10.3 or newer.

From Apple's documentation:

When a user switch occurs, Mac OS X generates events for all interested applications. Events are sent to applications in a login session whenever the login session is activated or deactivated. If a login session is not being activated or deactivated, it receives no events. You can use the activation events to perform the following kinds of tasks:

- Halt or restart sound playback
- Halt or restart animations
- Give up or acquire shared resources
- Put your application into a quiescent state to improve overall system performance

Event Timing

User switch notifications are sent to applications at the same time the switch occurs. Because the switch occurs relatively quickly, this is normally not a problem. However, it is possible for an application to receive its activation event before other applications have received their deactivation events. This could lead to potential race conditions between applications releasing and acquiring shared resources.
To avoid race conditions, applications in the session being deactivated should continue to release any shared resources as soon as possible. Applications in the session being activated should delay the acquisition of any shared resources until those resources are actually used. Not only can this help avoid potential race conditions, it can also improve overall system performance. If your application needs a particular resource right away but encounters errors while trying to acquire it, set a timer and try to acquire the resource again a short time later.

28.10 class CarbonWindowsEventsMBS

28.10.1 class CarbonWindowsEventsMBS

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSWindowDelegateMBS for Cocoa instead. **Function:** A class for receiving events sent to a window.
Notes: Only for Carbon target. Will not work with Cocoa windows.

28.10.2 Methods

28.10.3 Listen(win as window)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Starts listening for events send to the given window.

28.10.4 ListenOnWindowsHandle(windowHandle as Integer)

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Starts listening for events send to the given window.
Notes: You can use the WindowHandle from the CocoaColorPanel class.

28.10.5 Properties

28.10.6 Available as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: whether this events are fireing.
Notes: (Read only property)

28.10.7 EventCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse event counter.
Notes: Increases whenever one of the following events occurs:
MouseUp, MouseMoved, MouseDragged and MouseDown.
(Read and Write property)

28.10.8 Lasterror as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The last reported Mac OS error code.
Notes: 0 if successfull, -1 if function is not available.
(Read and Write property)

28.10.9 MouseButton as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse buttons used at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.10.10 MouseChord as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse chord state at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.10.11 MouseClickCount as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse click count at the time of the last mouse event.
Notes: Set by the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.10.12 MouseDeltaX as Single

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse movement at the time of the last mouse event.
Notes: Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

28.10.13 MouseDeltaY as Single

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse movement at the time of the last mouse event.
Notes: Set by the MouseMoved and the MouseDragged event.
(Read and Write property)

28.10.14 MouseModifierKeys as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The modifier key state at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.

The modifiers field contains information about the state of the modifier keys and the mouse button at the time the event was posted.

Each of the modifier keys is represented by a specific bit in the modifiers field. You can use these constants as masks to test the setting of various bits in the modifiers field:

If your application attaches special meaning to any of these keys in combination with other keys or when the mouse button is down, you can test the state of the modifiers field to determine the action your application should take. For example, you can use this information to determine whether the user pressed the Command key and another key to make a menu choice.

Some keyboards do not distinguish between the right or left Control, Shift, and Option keys; for example, the virtual key code for the right Shift key and left Shift key might be the same. For these keyboards, if the user presses the Control, Shift, or Option key, the Event Manager sets only the bits corresponding to

activeFlag	1	set if window being activated or if mouse-down event caused foreground switch
btnState	128	set if mouse button up
cmdKey	256	set if Command key down
shiftKey	512	set if Shift key down
alphaLock	1024	set if Caps Lock key down
optionKey	2048	set if Option key down
controlKey	4096	set if Control key down
rightshiftKey	8192	set if right Shift key down
rightoptionKey	16384	set if right Option key down
rightcontrolKey	32768	set if right Control key down

the shiftKey, optionKey, and controlKey constants. For keyboards that do distinguish between these keys, the Event Manager sets the bits in the modifiers field to indicate whether the right or left Control, Shift, or Option keys were pressed. For example, the Event Manager sets bit 13 in the modifiers field if the user presses the right Shift key and sets bit 9 if the user presses the left Shift key. In most cases your application should not need to distinguish between the left and right Control, Shift, and Option keys.
(Read and Write property)

28.10.15 MouseX as Single

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse position at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.10.16 MouseY as Single

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The mouse position at the time of the last mouse event.
Notes: Set by the MouseMoved, the MouseDragged, the MouseDown and the MouseUp event.
(Read and Write property)

28.10.17 Tablet as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Whether you want to get the tablet event data.
Notes: As not every application needs tablet event information, this is optional.
Set to true to get the TabletPoint and TabletProximity parameters filled in the events.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.10.18 TabletPoint as CarbonEventsTabletPointMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Saves the current tablet point object.
Notes: Whenever an event is received and the tablet property is true and there is point information available, a reference to the CarbonEventsTabletPointMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.10.19 TabletProximity as CarbonEventsTabletProximityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Saves the current tablet proximity object.
Notes: Whenever an event is received and the tablet property is true and there is proximity information available, a reference to the CarbonEventsTabletProximityMBS object (from the event) is stored in this property.

So this property enables you to access the current state information of the tablet by just looking on the last state reported.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).
(Read and Write property)

28.10.20 Events

28.10.21 GestureEnded(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the gesture ends.
Notes: GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

28.10.22 GestureMagnify(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, MagnificationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called several times while the magnify gesture is performed.

Notes: MagnificationAmount the magnification amount.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

28.10.23 GestureRotate(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, RotationAmount as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called several times while the rotation gesture is performed.
Notes: The RotationAmount in polar coordinates.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

28.10.24 GestureStarted(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when a gesture starts.
Notes: GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

28.10.25 GestureSwipe(GlobalMouseX as Double, GlobalMouseY as Double, WindowHandle as Integer, WindowMouseX as Double, WindowMouseY as Double, WindowPartCode as Integer, KeyModifiers as Integer, SwipeDirectionX as Double, SwipeDirectionY as Double) as boolean

MBS MacCF Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: This event is called for a swipe gesture.
Notes: SwipeDirectionX and SwipeDirectionY specify the swipe direction.

GlobalMouseX and GlobalMouseY specify the mouse position. If WindowHandle is not 0, it contains the handle for the current window on that mouse position and WindowMouseX/WindowMouseY specify the window relative position. The WindowPartCode specifies which part of the window was hit. (See WindowPartCode definition in Apple documentation.)

Possible values for the key modifier:

activeFlag	= 1	= &h000001
btnState	= 128	= &h000080
cmdKey	= 256	= &h000100
shiftKey	= 512	= &h000200
alphaLock	= 1024	= &h000400
optionKey	= 2048	= &h000800
controlKey	= 4096	= &h001000
rightShiftKey	= 8192	= &h002000
rightOptionKey	= 16384	= &h004000
rightControlKey	= 32768	= &h008000
NumLock	= 65536	= &h010000
Fn	= 131072	= &h020000

Return true if you handled the event.

Supported on Mac OS X 10.5.5 and newer.
If not supported with the current hardware, this event is never called.

28.10.26 MouseDown(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when a mousebuton is down.

28.10.27 MouseDragged(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when the mouse is dragged.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.10.28 MouseMoved(x as single, y as single, modifierKeys as Integer, deltax as single, deltay as single) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when the mouse is moved.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.10.29 MouseUp(x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: An event which fires when a mousebutton is released.
Notes: In case the tablet property is true, the TabletPoint or the TabletProximity property is filled with an object.

Tablet functions may or may not work in Xojo's debug mode (some RB versions work and some not).

28.10.30 MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the mouse wheel is moved with the mouse cursor within your window.
Example:

```
function MouseWheelMoved(modifierKeys as Integer, axis as Integer, delta as Integer) as boolean
Var d as Integer

const cmdKey=256
const shiftKey=512
const alphaLock=1024
const optionKey=2048
const controlKey=4096
const rightShiftKey=8192
const rightOptionKey=16384
const rightControlKey=32768

const kEventMouseWheelAxisY=1
const kEventMouseWheelAxisX=0

if axis=kEventMouseWheelAxisY then
d=delta

if BitwiseAnd(modifierKeys,optionkey)<>0 then
d=d*4 // scroll faster with option
end if

List.ScrollPosition=List.ScrollPosition-d
end if

List.InsertRow 0,"MouseWheelMoved "+str(delta)
end function
```

Notes: Currently axis is only 0 or 1, but in future new input devices may have up to 32 axises.

28.10.31 WindowBoundsChanging(original as object, previous as object, current as object, flags as Integer)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window changes its bounds.
Notes: You may need to cast the objects to IntegerRectMBS objects.

28.10.32 WindowClickCloseRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the close button area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.33 WindowClickCollapseRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the collapse button area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.34 WindowClickContentRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the content area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.35 WindowClickDragRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the drag area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.36 WindowClickProxyIconRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the proxy icon area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.37 WindowClickResizeRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the resize widget area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.38 WindowClickStructureRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the window structure area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.39 WindowClickToolbarButtonRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the toolbar button area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.40 WindowClickZoomRgn(ClickedWindowHandle as Integer, UnderMouseWindowHandle as Integer, globalX as single, globalY as single, x as single, y as single, modifierKeys as Integer, button as Integer, clickcount as Integer, MouseChord as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when the zoom button area of the window was clicked.
Notes: ClickedWindowHandle: The handle of the window that was clicked. 0 if not available.
UnderMouseWindowHandle: The handle of the window under the mouse. 0 if not available.
globalX and globalY: global mouse coordinates.
X and Y: mouse coordinates relative to window.
modifierkeys: which keys are pressed. (see CarbonWindowsEventsMBS.MouseModifierKeys for details)
button: Which mouse button was pressed.
clickcount: Whether this is a single click, double click, etc.
MouseChord: Which other mouse buttons were pressed when the event was generated.

Return true if you handled the event and false if not.

28.10.41 WindowClose as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window should close.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.42 WindowCloseAll as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever all windows should close.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.43 WindowCollapse as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called when the window is going to collapse.
Notes: Return false to run the default handler.

Return true to tell the system that you handled this event.

28.10.44 WindowCollapseAll as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called when all windows are going to collapse.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.45 WindowCollapsed as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window is collapsed.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.46 WindowCollapsing as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called while the window is collapsing.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.47 WindowExpand as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window should expand.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.48 WindowExpandAll as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever all windows should expand.
Notes: Return false to run the default handler.

Return true to tell the system that you handled this event.

28.10.49 WindowExpanded as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window is expanded.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.50 WindowExpanding as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called while the window is expanding.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.51 WindowHidden as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window is hidden.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.52 WindowHiding as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called while the window is hiding.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.53 WindowRestoreFromDock as boolean

MBS MacCF Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Function: Called when the minimized window is clicked to be restored.
Notes: Return true to block this or return false to allow the restore to go on.

28.10.54 WindowShowing as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called while the window is showing.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.55 WindowShown as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window is shown.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.56 WindowToolbarButtonClicked as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the toolbar button is pressed.
Notes: Return true to tell the system that you handled this event. Else you may get this event two tims on a metal window. (Boolean result added in plugin version 4.1)

28.10.57 WindowTransitionCompleted(TransitionAction as Integer, TransactionEffect as Integer)

MBS MacCF Plugin, Plugin Version: 6.5, Platform: macOS, Targets: Desktop only.

Function: Called when a window transition completed.

28.10.58 WindowTransitionStarted(TransitionAction as Integer, TransactionEffect as Integer)

MBS MacCF Plugin, Plugin Version: 6.5, Platform: macOS, Targets: Desktop only.

Function: Called when a window transition started.

28.10.59 WindowZoom as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window should zoom.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.60 WindowZoomAll as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever all windows should zoom.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

28.10.61 WindowZoomed as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Called whenever the window was zoomed.
Notes: Return false to run the default handler.
Return true to tell the system that you handled this event.

Chapter 29

Catalog Search

29.1 class CatSearchMBS

29.1.1 class CatSearchMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Allows you to search fast on your harddisk.
Example:

```
Var cs as new CatSearchMBS

if cs.Search(volume(0), true) then

// set search params

cs.Name = "Xojo"
cs.PartialName = true

Var response as Integer
do
response = cs.SearchNext
if response = 0 then // still searching

if cs.Result<>nil then // did we find something?
Listbox1.AddRow cs.Result.Name

if Listbox1.ListCount = 100 then
Return // stop after 100 entries
end if
end if
```

```
end
loop until response <0
end if
```

Notes: Depending on what and how you want to search, you can decide whether MDQueryMBS or CatSearchMBS is the better choice.

This class implements the PBCatSearch function of the Mac OS File Manager. This is a very fast routine to find specific types of files on a volume. The MacOS tool Sherlock (aka Find File) uses this function to its quick search on local volumes.

There are some restrictions to CatSearchMBS: Is it not supported on every volume! Whether it is supported or not depents on the File System format used on the Volume: HFS, HFS+ and most File Servers support it, while Floppy Disks, ISO 9660 and UDF formatted disks, used on some CDs and on most DVD-ROMs, might not support it.

This version of this plugin can now handle those cases where CatSearchMBS is not supported, too: If a volume does not support CatSearchMBS, you can choose to fall back to the classic recursive directory search, which is much slower, but gives you the same results.

(This new feature is achieved by using a C library called "MoreFiles", written by Jim Luther, one of Apple's File System "gurus".)
Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MBS Xojo / Real Studio Plugins, version 14.4pr3

29.1.2 Methods

29.1.3 close

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

29.1.4 Search(volume as FolderItem, allowRecursiveSearch as Boolean) as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the Search engine.
Notes: Call this to initiate a search a volume. If the returned value is false, then an error has occured (either there is not enough free memory or the volume wasn't valid). If the returned value is true, everything is okay.

The volume parameter can be anything that identifies the volume, including any file or folder on it.

If allowRecursiveSearch is true and the volume is a folder you search only the folder on this volume, but using recursive directory search.

The allowRecursiveSearch parameter determines whether the search shall use the slower recursive directory scan method if the volume does not support CatSearchMBS. If you pass false for a volume that does not support CatSearchMBS, this method will fail, and return false.

Update: Newer plugin versions (4.x?) allow to search folders if allowRecursiveSearch=true.

29.1.5 SearchNext as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Searches for the next machting file
Example:

```
// Here's an example of a proper search loop:

Var cs as CatSearchMBS
// ....

Var response as Integer
do
If UserCancelled then
exit
end
response = cs.SearchNext
if response = 0 then
// ... read cs.result and process the found item
end
loop until response <0
```

Notes: Once the search criteria has been set, call this function repeatedly as long as it returns non-negative values.
Once the result is negative, the search is finished and CatSearchClose should be called.

These are the possible non-negative return values:

0	a match has been found, and the found item can be inquired by calling Result.
1	a certain amount of time has passed (see ResponseTimeout). You can ignore this result and continue to search.
2	files or folders were added or removed to the volume. You may ignore this error by simply continuing the search.
-39 (eofErr)	end of search, no more matches

29.1.6 Properties

29.1.7 BackupDateEnd as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The end of the backup date search range.
Notes: This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

29.1.8 BackupDateStart as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The start of the backup date search range.
Notes: This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

29.1.9 CreationDateEnd as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The end of the creation date search range.
Notes: This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

29.1.10 CreationDateStart as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The start of the creation date search range.
Notes: This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

29.1.11 creator as String

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function:

Var c as CatSearchMBS
c.Creator="ttxt"
' will look for files created by the SimpleText application.
Notes:

The above Creator property allows you to specifiy the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.
(Read and Write property)

29.1.12 FileFlags as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file flags to search for.
Example:

```
Var c as CatSearchMBS
c.FileFlags=&H4000 // Invisible
c.FileFlagsMask=&H4000 // only look on the invisible flag
```

Notes: The above FileFlags property allows you to specifiy the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.

There is a FileFlags and a FileFlagsMask property which must be used together: bits set in FileFlagsMask specifiy which bits of FileFlags shall be tested. Those bits will then be compared to the corresponding bits

of the files' (and folders') flags on the searched volume. If they are identical, you have a match.

The meaning of the flags are as follows (you can use BitwiseOr or + to combine them):

bit 15,	value &H8000:	isAlias
bit 14	value &H4000:	isInvisible
bit 13,	value &H2000:	hasBundle (has a BNDL resource)
bit 12,	value &H1000:	nameLocked
bit 11,	value &H0800:	isStationary
bit 10,	value &H0400:	hasCustomIcon
bit 8,	value &H0100:	hasBeenInited (Finder has seen the file since it has been created)
bit 7,	value &H0080:	hasNoINITs (there is no INIT rsrc in the Extension file)
bit 6,	value &H0040:	isShared
bits 1-3,	value &H000E:	color (as a 3-bit value from 0-7)

For example, to find only invisible files, use &H4000 for the FileFlagsMask and the same value for the FileFlags, or to find only visible files, use the same FileFlagsMask, but 0 for the FileFlags. To find stationaries that do not have a custom icon, use &H0C00 (=&H0800+&H0400) for the FileFlagsMask and &H0800 for the FileFlags.
(Read and Write property)

29.1.13 FileFlagsMask as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file flags mask to search for.
Example:

```
Var c as CatSearchMBS
c.FileFlags=&H4000 // Invisible
c.FileFlagsMask=&H4000 // only look on the invisible flag
```

Notes: The above FileFlagsMask property allows you to specifiy the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.

There is a FileFlags and a FileFlagsMask property which must be used together: bits set in FileFlagsMask specifiy which bits of FileFlags shall be tested. Those bits will then be compared to the corresponding bits of the files' (and folders') flags on the searched volume. If they are identical, you have a match.

The meaning of the flags are as follows (you can use BitwiseOr or + to combine them):

bit 15,	value &H8000:	isAlias
bit 14	value &H4000:	isInvisible
bit 13,	value &H2000:	hasBundle (has a BNDL resource)
bit 12,	value &H1000:	nameLocked
bit 11,	value &H0800:	isStationary
bit 10,	value &H0400:	hasCustomIcon
bit 8,	value &H0100:	hasBeenInited (Finder has seen the file since it has been created)
bit 7,	value &H0080:	hasNoINITs (there is no INIT rsrc in the Extension file)
bit 6,	value &H0040:	isShared
bits 1-3,	value &H000E:	color (as a 3-bit value from 0-7)

For example, to find only invisible files, use &H4000 for the FileFlagsMask and the same value for the FileFlags, or to find only visible files, use the same FileFlagsMask, but 0 for the FileFlags. To find stationaries that do not have a custom icon, use &H0C00 (=&H0800+&H0400) for the FileFlagsMask and &H0800 for the FileFlags.
(Read and Write property)

29.1.14 FileType as String

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file type to look for.
Example:

```
Var c as CatSearchMBS
c.FileType="TEXT"
' will look for plain Text files.
```

Notes: The above Creator property allows you to specifiy the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.
(Read and Write property)

29.1.15 LogicalDataForkSizeEnd as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum logical data fork file size.
Example:

```
Var c as CatSearchMBS
```

```
c.LogicalDataForkSizeStart=0
c.LogicalDataForkSizeEnd=102400 // search for files <= 100 KB.
```

Notes: You can assign -1 to have no upper limit.
(Read and Write property)

29.1.16 LogicalDataForkSizeStart as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The minimum logical data fork file size.
Example:

```
Var c as CatSearchMBS
c.LogicalDataForkSizeStart=0
c.LogicalDataForkSizeEnd=102400 // search for files <= 100 KB.
```

Notes: (Read and Write property)

29.1.17 LogicalResForkSizeEnd as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum logical resource fork file size.
Example:

```
Var c as CatSearchMBS
c.LogicalResForkSizeStart=0
c.LogicalResForkSizeEnd=102400 // search for files <= 100 KB.
```

Notes: You can assign -1 to have no upper limit.
(Read and Write property)

29.1.18 LogicalResForkSizeStart as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The minimum logical resource fork file size.
Example:

```
Var c as CatSearchMBS
c.LogicalResForkSizeStart=0
```

```
c.LogicalResForkSizeEnd=102400 // search for files <= 100 KB.
```

Notes: (Read and Write property)

29.1.19 ModificationDateEnd as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The end of the modification date search range.
Notes: This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

29.1.20 ModificationDateStart as Integer

MBS MacClassic Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The start of the modification date search range.
Notes: This value is an unsigned integer. If you assign a double from a date totalseconds property, please move it to the matching range like in the example project "Find stuff from today".
(Read and Write property)

29.1.21 name as String

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Set's the name for the search.
Example:

```
Var c as CatSearchMBS
c.Name="Apple"
c.partialname=true
```

Notes: The above name property allows you to specifiy the search criteria. Without setting any property from this class, a search will find nothing.

Note: If you set one of this properties, all criterias must match to get a match back from a call to SearchNext.

If you pass true to the partialname property, you'll get a match any time the item's name contains the searched name. Otherwise, the intire name must match.

This property is encoded with system encoding. You need to convert strings from an editfield in RB 5 to match the system encoding which is not UTF8.
(Read and Write property)

29.1.22 PartialName as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: whether or not the name property contains only a partial file name.
Example:

```
Var c as CatSearchMBS
c.Name="Apple"
c.partialname=true
```

Notes: If you pass true to the partialname property, you'll get a match any time the item's name contains the searched name. Otherwise, the intire name must match.
(Read and Write property)

29.1.23 PhysicalDataForkSizeEnd as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum physical data fork file size.
Example:

```
Var c as CatSearchMBS
c.PhysicalDataForkSizeStart=0
c.PhysicalDataForkSizeEnd=102400 // search for files <= 100 KB.
```

Notes: You can assign -1 to have no upper limit.
(Read and Write property)

29.1.24 PhysicalDataForkSizeStart as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The minimum physical data fork file size.
Example:

```
Var c as CatSearchMBS
c.PhysicalDataForkSizeStart=0
```

c.PhysicalDataForkSizeEnd=102400 // search for files <= 100 KB.

Notes: (Read and Write property)

29.1.25 PhysicalResForkSizeEnd as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum physical resource fork file size.
Example:

Var c as CatSearchMBS
c.PhysicalResForkSizeStart=0
c.PhysicalResForkSizeEnd=102400 // search for files <= 100 KB.

Notes: You can assign -1 to have no upper limit.
(Read and Write property)

29.1.26 PhysicalResForkSizeStart as UInt64

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: The minimum physical resource fork file size.
Example:

Var c as CatSearchMBS
c.PhysicalResForkSizeStart=0
c.PhysicalResForkSizeEnd=102400 // search for files <= 100 KB.

Notes: (Read and Write property)

29.1.27 ResponseTimeout as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the timeout for the search.
Example:

Var c as CatSearchMBS
c.ResponseTimeout=1000 // one second

Notes: Sets the maximum time that may pass before SearchNext shall return even if no item has been

found yet. The default is 15ms.

If you set the timeout to 0, then SearchNext will only return if an item has been found or if the search is finished.

Background:

Searching for a file or folder, especially if the volume does not support CatSearchMBS, can take a lot of time. While the search is in progress, you might want the user to give still access to your app's user interface. If SearchNext would only return once an item is found, the user interface might not be responsive for several seconds, up to minutes. RB's threads would not help here. To solve this, SearchNext returns in timely intervals even when it has nothing found yet. At that time, RB can respond to any user interaction, if necessary. This happens then automatically. All you have to do is to call SearchNext again.
(Read and Write property)

29.1.28 Result as folderitem

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current file and returns nil if none was found.
Notes: After CatSearchNext has returned zero, this functions returns the found item else nil.
(Read and Write property)

29.1.29 UsedCatSearchForLastSearch as Boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: whether the last search used the fast catalog search or the slow directory search.
Notes: (Read and Write property)

29.1.30 UseIndexedSearch as Boolean

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Forces the class to use indexed search.
Notes: (Read and Write property)

Chapter 30

ChartDirector

30.1 class CDAngularAxisMBS

30.1.1 class CDAngularAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The AngularAxis class represents angular axes in polar charts. The angular axis is the axis representing the angular component of a polar coordinate.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.1.2 Methods

30.1.3 addLabel(pos as Double, label as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an extra label on the axis.
Notes:

Parameter	Default	Description
pos	(Mandatory)	The position on the axis to add the label.
label	(Mandatory)	The text label to add.

30.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.
See also:

- 30.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1) 4874
- 30.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color) 4875
- 30.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer) 4875

30.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an angular zone to the polar chart.
Notes: This method is just a short cut to AngularAxis.addZone, in which the starting radius is always 0, and ending radius is the radius of the polar plot region. In other words, the angular zone is a sector on the polar chart.

Parameters:

startValue	(Mandatory)	The data value that marks the start angular position of the zone.
endValue	(Mandatory)	The data value that marks the end angular position of the zone.
fillColor	(Mandatory)	The fill color of the zone.
edgeColor	-1	The edge color of the zone. The default is the same as the fill color.

See also:

- 30.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color) 4874
- 30.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color) 4875
- 30.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer) 4875

30.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.
See also:

- 30.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color) 4874
- 30.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1) 4874
- 30.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer) 4875

30.1.7 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as Integer, edgeColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an angular zone to the polar chart.
Notes: An angular zone marks an angular region that spans from a start angle to an end angle, where the angles are specified as data values on the angular axis scale. The addZone method allows you to specify a starting and ending radius in pixels for drawing the zone.

Parameter	Default	Description
startValue	(Mandatory)	The data value that marks the start angular position of the zone.
endValue	(Mandatory)	The data value that marks the end angular position of the zone.
startRadius	(Mandatory)	The starting radius of the zone in pixels.
endRadius	(Mandatory)	The ending radius of the zone in pixels.
fillColor	(Mandatory)	The fill color of the zone.
edgeColor	-1	The edge color of the zone. The default is the same as the fill color.

See also:

- 30.1.4 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color) 4874
- 30.1.5 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1) 4874
- 30.1.6 addZone(startValue as Double, endValue as Double, startRadius as Double, endRadius as Double, fillColor as color, edgeColor as color) 4875

30.1.8 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.1.9 getAxisImageMap(noOfSegments as Integer, mapWidth as Integer, url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for the axis itself.
Notes: This method is similar to AngularAxis.getHTMLImageMap. The difference is instead of generating an image map for the labels, it generates an image map for the axis itself. The axis will be divided into a number of segments, with an image map entry created for each segment.

noOfSegments	(Mandatory)	The number of segments to divide the axis into.
mapWidth	(Mandatory)	The width of the axis used for the purpose of generating the image map.
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported. The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.
extraAttr	""	A text string to specify additional attributes to add to the <area>tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string containing the image map generated.

30.1.10 getHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for the axis labels.
Notes: This method should be called only after creating the chart image (eg. using BaseChart.makeChart). The image map cannot be determined without creating the chart image first.
This method accepts a URL as its argument. When generating an image map, it appends query parameters to the URL to indicate which legend entry the user has clicked.

The following is an example image map generated for an axis with 3 labels.

<area shape="rect" coords="30,220,70,239" href="handler.asp?value=0&label=John">
<area shape="rect" coords="70,220,110,239" href="handler.asp?value=1&label=Mary">
<area shape="rect" coords="110,220,150,239" href="handler.asp?value=2&label=Peter">

The image map consists of multiple <area>tags, one for each label. In the "href" attributes, query parameters are appended to the URL to provide information on the label clicked.
The image map produces by ChartDirector does not include the <map>and </map>tag. This is intentional so that you can add additional custom <area>tags to the image map, or append multiple image maps together.
The format of the appended URL parameters is determined using the queryFormat argument, which by default is:

value= { value } &label= { label }

The texts in curly brackets (i.e. { value } , { label }) will be replaced by the actual values when generating the image map. For example, { label } will be replaced by the label text.
Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.
In addition to customizing the query parameters, ChartDirector supports additional HTML attributes in the <area>tags using the extraAttr argument.
For example, the following extraAttr will add a "title" HTML attribute to every <area>tag. The "title" attribute will be displayed as "tool tip" when the mouse moves over the image map.

title='Click me for details on { label } '

Another common usage of the extraAttr argument is to add "onmouseover" and "onmouseout" HTML attributes to handle user interaction using Javascript on the browser.

Return Value
A text string containing the image map generated.

url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported. The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.
extraAttr	""	A text string to specify additional attributes to add to the <area>tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

30.1.11 setLabelGap(d as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the distance between the axis labels and the axis.
Notes: Parameters:

d	(Mandatory)	The distance between the axis label and axis in pixels.

30.1.12 setLabels(labels() as Double, formatString as string = "") as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the numeric labels to be used on the axis.
Notes: This method is typically used to set the angular axis to enumerated scale. For more details on what is enumerated axis scale, please refer to AngularAxis.setLabels. In some cases, it may be desirable to skip some labels. If you want to leave a label position empty, use kNoValue as the axis label.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
See also:

- 30.1.13 setLabels(labels() as string) as CDTextBoxMBS

Parameter	Default	Description
labels	(Mandatory)	An array of numbers to be used as the axis labels.
formatString	""	A format string to specified how to format the labels into human readable form. Please refer to Axis.setLabelFormatfor the syntax of the format string. An empty string means the format will be automatically determined.

30.1.13 setLabels(labels() as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the text labels to be used on the axis.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis.
upperLimit	(Mandatory)	The upper bound of the axis.
labels	(Mandatory)	An array of text strings to be used as the labels on the axis. ChartDirector will distribute the labels evenly on the axis.

This method is typically used in radar charts to set the angular axis to enumerated scale.
In enumerated scale, the labels are laid out evenly on the perimeter of the polar plot area. It is like the labels are at on the vertices of an n-side polygon, where n is the number of labels. Radial grid lines are drawn from the center to the vertices.
The angular coordinates of the data points are determined based on their position in the data array. The first data point will be at the same angular coordinate as the first vertex, the second data point at the second vertex, and so on.
Internally, ChartDirector will assign a value of 0 to the first axis label, 1 to the second axis label, and so on. These values are not visible. Only the axis labels are visible. However, these values may be useful for some ChartDirector features that need to reference the axis position by value, such as adding extra labels using AngularAxis.addLabel.

Parameter	Default	Description
text	(Mandatory)	An array of strings containing the text of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
See also:

- 30.1.12 setLabels(labels() as Double, formatString as string = "") as CDTextBoxMBS 4878

30.1.14 setLabelStyle(font as string = "bold", fontsize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font style used to for the axis labels.
Notes: See Font Specification for details on various font attributes.

Parameter	Default	Description
font	"bold"	The font used to draw the labels.
fontSize	10	The font size used to draw the labels in points.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.1.15 setLinearScale(lowerLimit as Double, upperLimit as Double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given linear scale and the given labels.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis.
upperLimit	(Mandatory)	The upper bound of the axis.
labels	(Mandatory)	An array of text strings to be used as the labels on the axis. ChartDirector will distribute the labels evenly on the axis.

See also:

- 30.1.16 setLinearScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

30.1.16 setLinearScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given linear scale.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis.
upperLimit	(Mandatory)	The upper bound of the axis.
majorTickInc	0	Adds major ticks to the axis, where the major ticks are separated by majorTickInc in value. Each major tick will have an associated text label for the value if the axis at the tick. The default value of 0 means no major tick is used.
minorTickInc	0	Adds minor ticks to the axis, where the minor ticks are separated by minorTickInc in value. The default value of 0 means no minor tick is used.

See also:

- 30.1.15 setLinearScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4880

30.2 class CDAngularMeterMBS

30.2.1 class CDAngularMeterMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The AngularMeter class represents angular meters.
Example:

```
// The value to display on the meter
const value = 27.48

// Create an AngularMeter object of size 200 x 115 pixels, with silver background
// color, black border, 2 pixel 3D border border and rounded corners
Var m as new CDAngularMeterMBS(200, 115, CDBaseChartMBS.silverColor, &h000000, 2)
m.setRoundedFrame

// Set the meter center at (100, 100), with radius 85 pixels, and span from -90
// to +90 degress (semi-circle)
m.setMeter(100, 100, 85, -90, 90)

// Meter scale is 0 - 100, with major tick every 20 units, minor tick every 10
// units, and micro tick every 5 units
m.setScale(0, 100, 20, 10, 5)

// Set 0 - 60 as green (66FF66) zone
m.addZone(0, 60, 0, 85, &h66ff66)

// Set 60 - 80 as yellow (FFFF33) zone
m.addZone(60, 80, 0, 85, &hffff33)

// Set 80 - 100 as red (FF6666) zone
m.addZone(80, 100, 0, 85, &hff6666)

// Add a text label centered at (100, 60) with 12 pts Arial Bold font
call m.addText(100, 60, "PSI", "arialbd.ttf", 12, CDBaseChartMBS.kTextColor, CDBaseChartMBS.kCen-
ter)

// Add a text box at the top right corner of the meter showing the value
// formatted to 2 decimal places, using white text on a black background, and
// with 1 pixel 3D depressed border
m.addText(156, 8, m.formatValue(value, "2"), "arial.ttf", 8, &hffffff).setBackground(&h000000, 0, -1)

// Add a semi-transparent blue (40666699) pointer with black border at the
// specified value
call m.addPointer(value, &h40666699, &h000000)

// Output the chart
```

Backdrop=m.makeChartPicture

Notes: Subclass of the CDBaseMeterMBS class.

30.2.2 Methods

30.2.3 addGlare

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds glare effect to the meter.
Notes: The glare effect is created by brightening part of the meter face.
The face is divided by an arc, of which one part is brightened. The glare effect works best for meters with dark background.
All parameters are optional.

See also:

- 30.2.4 addGlare(radius as Double, span as Double = 135, rotate as Double = 0.0) 4883
- 30.2.5 addGlare(radius as Double, span as Double, rotate as Double, glareRadius as Double, intensity as Double = 0.13) 4885

30.2.4 addGlare(radius as Double, span as Double = 135, rotate as Double = 0.0)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds glare effect to the meter.
Notes: The glare effect is created by brightening part of the meter face.

Argument	Default	Description
radius	NoValue	The radius of the face of the meter. The default is the meter scale radius as set by AngularMeter.setMeter.
span	135	The angular span of the arc that divides the face into two parts. The dividing arc intersects with the face border at two points. The angular span is defined as center angle of these two points (that is, the angle subtended at the meter center by these two points).
rotate	0	By default, the glare will be symmetrically with respect to the vertical axis. This argument can be used to rotate the glare clockwise in degrees.
glareRadius	NoValue	The radius of the arc that divides the face into two parts. A positive value means the arc will result in a convex glare, while a negative means concave glare. The default is equal to 1.5 times of the face radius.
intensity	0.13	The intensity of the glare, which must be from 0 to 1. A value of 0 means no glare, while a value of 1 means the glare will be 100% white.

The face is divided by an arc, of which one part is brightened. The glare effect works best for meters with dark background.
All parameters are optional.

Argument	Default	Description
radius	NoValue	The radius of the face of the meter. The default is the meter scale radius as set by AngularMeter.setMeter.
span	135	The angular span of the arc that divides the face into two parts. The dividing arc intersects with the face border at two points. The angular span is defined as center angle of these two points (that is, the angle subtended at the meter center by these two points).
rotate	0	By default, the glare will be symmetrically with respect to the vertical axis. This argument can be used to rotate the glare clockwise in degrees.
glareRadius	NoValue	The radius of the arc that divides the face into two parts. A positive value means the arc will result in a convex glare, while a negative means concave glare. The default is equal to 1.5 times of the face radius.
intensity	0.13	The intensity of the glare, which must be from 0 to 1. A value of 0 means no glare, while a value of 1 means the glare will be 100% white.

30.2.5 addGlare(radius as Double, span as Double, rotate as Double, glareRadius as Double, intensity as Double = 0.13)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds glare effect to the meter.
Notes: The glare effect is created by brightening part of the meter face.
The face is divided by an arc, of which one part is brightened. The glare effect works best for meters with dark background.
All parameters are optional.

Argument	Default	Description
radius	NoValue	The radius of the face of the meter. The default is the meter scale radius as set by AngularMeter.setMeter.
span	135	The angular span of the arc that divides the face into two parts. The dividing arc intersects with the face border at two points. The angular span is defined as center angle of these two points (that is, the angle subtended at the meter center by these two points).
rotate	0	By default, the glare will be symmetrically with respect to the vertical axis. This argument can be used to rotate the glare clockwise in degrees.
glareRadius	NoValue	The radius of the arc that divides the face into two parts. A positive value means the arc will result in a convex glare, while a negative means concave glare. The default is equal to 1.5 times of the face radius.
intensity	0.13	The intensity of the glare, which must be from 0 to 1. A value of 0 means no glare, while a value of 1 means the glare will be 100% white.

30.2.6 addPointer(value as Double, fillColor as color, edgeColor as color = &cFFFFFFFF, pointerType as Integer = 6) as CDMeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new style pointer to the meter.
Notes: When compared to classical pointers (added by CDBaseMeterMBS.addPointer), new style pointers are thinner. They are designed to be used with the new style meter cap (see CDAngularMeterMBS.setCap2). They are also designed to have their base and tip movable in the radial direction, which means they can be detached from the center, and can even points from the outside inwards.
Parameters are optional and colors can be passed as Integer or color values.

Return a MeterPointer object representing the pointer. You may use this object to fine-tune the appearance

Argument	Default	Description
value	(Mandatory)	The value that the pointer points to.
fillColor	(Mandatory)	The fill color of the pointer.
edgeColor	-1	The edge color of the pointer. -1 means the edge color is the same as the fill color.
pointerType	TriangularPointer2	The pointer shape. Please refer to MeterPointer.setShapeAndOffset for the available shapes.
startOffset	NoValue	The distance between the starting point of the pointer with the meter center, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined. Please refer to MeterPointer.setShapeAndOffset for more information about this argument.
endOffset	NoValue	The distance between the ending point of the pointer with the meter center, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined. Please refer to MeterPointer.setShapeAndOffset for more information about this argument.
widthRatio	NoValue	The width of the pointer relative to the default width. NoValue means the width is automatically determined.

of the pointer.

30.2.14 addRing(startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addRing method, but uses color instead of integer data type for passing color values.
See also:

- 30.2.15 addRing(startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1) 4895

30.2.15 addRing(startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a circular ring or a circle to the meter.
Notes: A ring is the region between two concentric circles. This method is most often used for adding circular borders and backgrounds for the meter, and for some other decorative purposes. For example, one can add a circle with a metallic background color as the 'face' of the meter meter using this method.

Parameter	Default	Description
startRadius	(Mandatory)	The starting radius of the ring in pixels. To add a circle, set the start radius to 0.
endRadius	(Mandatory)	The ending radius of the ring in pixels.
fillColor	(Mandatory)	The fill color of the ring.
edgeColor	-1	The edge color of the ring. The default is the same as the fill color.

See also:

- 30.2.14 addRing(startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color) 4894

30.2.16 addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addRingSector method, but uses color instead of integer data type for passing color values.
See also:

- 30.2.17 addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as Integer, edgeColor as Integer = -1) 4896

30.2.17 addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a ring sector or a sector to the meter.
Notes: This method is similar to the AngularMeter.addRing method, except that the ring it adds does not span the complete circle, but just part of the circle.

Parameter	Default	Description
startRadius	(Mandatory)	The starting radius of the ring sector in pixels. To add a sector, set the starting radius to 0.
endRadius	(Mandatory)	The ending radius of the ring sector in pixels.
a1	(Mandatory)	The starting angle of the ring sector in degrees. The angle is measured in degrees clockwise, with 0 being the upward pointing direction.
a2	(Mandatory)	The ending angle of the ring sector in degrees. The angle is measured in degrees clockwise, with 0 being the upward pointing direction.
fillColor	(Mandatory)	The fill color of the ring sector.
edgeColor	-1	The edge color of the ring sector. The default is the same as the fill color.

See also:

- 30.2.16 addRingSector(startRadius as Integer, endRadius as Integer, a1 as Double, a2 as Double, fillColor as color, edgeColor as color) 4895

30.2.18 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer = 0, edgeColor as color = &cFFFFFFFF, scaleRadius as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a background to the meter scale.
Notes: The scale background is a circle segment (a circle with a part cut-off by a chord). Its radius is usually configured as larger than that of the meter scale. In this case, its angular span will also be larger than that of the meter scale. In the above sample, the meter scale spans 180 degrees. The scale background spans more than 180 degrees so that it can maintain a margin at the bottom side (the chord side).
Most arguments are optional and colors can be passed as Integer or color value.

See also:

- 30.2.19 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer, edgeColor as color, scaleRadius as Integer, startAngle as Double, endAngle as Double) 4897
- 30.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647) 4898

Argument	Default	Description
bgRadius	(Mandatory)	The radius of the circle segment to be used as the scale background.
fillColor	(Mandatory)	The fill color of the circle segment (the background color).
edgeWidth	0	The edge width of the circle segment. A positive width means the edge is internal to the circle segment. A negative width means the edge is external to the circle segment.
edgeColor	-1	The edge color. The default value of -1 means the edge color is the same as the fill color.
scaleRadius	-0x7fffffff	The radius of the meter scale. ChartDirector uses this value to compute the extra angular span the circle segment must have in order to maintain proper margin at the chord side. This argument is usually not necessary as ChartDirector already know the scale radius from the meter configuration. This argument can be used if you would like to use a "fake" scale radius to draw the scale background for special effects.
startAngle	NoValue	The start angle of the meter scale. ChartDirector uses this value to compute start angle of the circle segment. This argument is usually not necessary as ChartDirector already know the start angle from the meter configuration. This argument can be used if you would like to use a "fake" angle to draw the scale background for special effects.
endAngle	NoValue	The end angle of the meter scale. ChartDirector uses this value to compute end angle of the circle segment. This argument is usually not necessary as ChartDirector already know the end angle from the meter configuration. This argument can be used if you would like to use a "fake" angle to draw the scale background for special effects.

- 30.2.21 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer, edgeColor as Integer, scaleRadius as Integer, startAngle as Double, endAngle as Double) 4899

30.2.19 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer, edgeColor as color, scaleRadius as Integer, startAngle as Double, endAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a background to the meter scale.
Notes: The scale background is a circle segment (a circle with a part cut-off by a chord). Its radius is usually configured as larger than that of the meter scale. In this case, its angular span will also be larger than that of the meter scale. In the above sample, the meter scale spans 180 degrees. The scale background spans more than 180 degrees so that it can maintain a margin at the bottom side (the chord side).
Most arguments are optional and colors can be passed as Integer or color value.

- 30.2.18 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer = 0, edgeColor as color = &cFFFFFFFF, scaleRadius as Integer = -2147483647) 4896

Argument	Default	Description
bgRadius	(Mandatory)	The radius of the circle segment to be used as the scale background.
fillColor	(Mandatory)	The fill color of the circle segment (the background color).
edgeWidth	0	The edge width of the circle segment. A positive width means the edge is internal to the circle segment. A negative width means the edge is external to the circle segment.
edgeColor	-1	The edge color. The default value of -1 means the edge color is the same as the fill color.
scaleRadius	-0x7fffffff	The radius of the meter scale. ChartDirector uses this value to compute the extra angular span the circle segment must have in order to maintain proper margin at the chord side. This argument is usually not necessary as ChartDirector already know the scale radius from the meter configuration. This argument can be used if you would like to use a "fake" scale radius to draw the scale background for special effects.
startAngle	NoValue	The start angle of the meter scale. ChartDirector uses this value to compute start angle of the circle segment. This argument is usually not necessary as ChartDirector already know the start angle from the meter configuration. This argument can be used if you would like to use a "fake" angle to draw the scale background for special effects.
endAngle	NoValue	The end angle of the meter scale. ChartDirector uses this value to compute end angle of the circle segment. This argument is usually not necessary as ChartDirector already know the end angle from the meter configuration. This argument can be used if you would like to use a "fake" angle to draw the scale background for special effects.

- 30.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647) 4898
- 30.2.21 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer, edgeColor as Integer, scaleRadius as Integer, startAngle as Double, endAngle as Double) 4899

30.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a background to the meter scale.
Notes: The scale background is a circle segment (a circle with a part cut-off by a chord). Its radius is usually configured as larger than that of the meter scale. In this case, its angular span will also be larger than that of the meter scale. In the above sample, the meter scale spans 180 degrees. The scale background spans more than 180 degrees so that it can maintain a margin at the bottom side (the chord side).
Most arguments are optional and colors can be passed as Integer or color value.

30.2.21 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer, edgeColor as Integer, scaleRadius as Integer, startAngle as Double, endAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a background to the meter scale.
Notes: The scale background is a circle segment (a circle with a part cut-off by a chord). Its radius is usually configured as larger than that of the meter scale. In this case, its angular span will also be larger than that of the meter scale. In the above sample, the meter scale spans 180 degrees. The scale background spans more than 180 degrees so that it can maintain a margin at the bottom side (the chord side).
Most arguments are optional and colors can be passed as Integer or color value.

Argument	Default	Description
bgRadius	(Mandatory)	The radius of the circle segment to be used as the scale background.
fillColor	(Mandatory)	The fill color of the circle segment (the background color).
edgeWidth	0	The edge width of the circle segment. A positive width means the edge is internal to the circle segment. A negative width means the edge is external to the circle segment.
edgeColor	-1	The edge color. The default value of -1 means the edge color is the same as the fill color.
scaleRadius	-0x7fffffff	The radius of the meter scale. ChartDirector uses this value to compute the extra angular span the circle segment must have in order to maintain proper margin at the chord side. This argument is usually not necessary as ChartDirector already know the scale radius from the meter configuration. This argument can be used if you would like to use a "fake" scale radius to draw the scale background for special effects.
startAngle	NoValue	The start angle of the meter scale. ChartDirector uses this value to compute start angle of the circle segment. This argument is usually not necessary as ChartDirector already know the start angle from the meter configuration. This argument can be used if you would like to use a "fake" angle to draw the scale background for special effects.
endAngle	NoValue	The end angle of the meter scale. ChartDirector uses this value to compute end angle of the circle segment. This argument is usually not necessary as ChartDirector already know the end angle from the meter configuration. This argument can be used if you would like to use a "fake" angle to draw the scale background for special effects.

- 30.2.19 addScaleBackground(bgRadius as Integer, fillColor as color, edgeWidth as Integer, edgeColor as color, scaleRadius as Integer, startAngle as Double, endAngle as Double) 4897
- 30.2.20 addScaleBackground(bgRadius as Integer, fillColor as Integer, edgeWidth as Integer = 0, edgeColor as Integer = -1, scaleRadius as Integer = -2147483647) 4898

30.2.22 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.
See also:

- 30.2.23 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1) 4901

- 30.2.24 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color) 4901
- 30.2.25 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1) 4902

30.2.23 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a colored zone to the meter.
Notes: This method is just a short cut to AngularMeter.addZone, in which the starting radius is always 0, and ending radius is the radius of the meter scale. In other words, the zone is a sector on the meter.

Parameter	Default	Description
startValue	(Mandatory)	The data value that marks the start position of the zone.
endValue	(Mandatory)	The data value that marks the end position of the zone.
fillColor	(Mandatory)	The fill color of the zone.
edgeColor	-1	The edge color of the zone. The default is the same as the fill color.

See also:

- 30.2.22 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color) 4900
- 30.2.24 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color) 4901
- 30.2.25 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1) 4902

30.2.24 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.
See also:

- 30.2.22 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color) 4900

- 30.2.25 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1) 4902

30.2.25 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a colored zone to the meter.
Notes:

Parameter	Default	Description
startValue	(Mandatory)	The data value that marks the start position of the zone.
endValue	(Mandatory)	The data value that marks the end position of the zone.
startRadius	(Mandatory)	The starting radius of the zone in pixels.
endRadius	(Mandatory)	The ending radius of the zone in pixels.
fillColor	(Mandatory)	The fill color of the zone.
edgeColor	-1	The edge color of the zone. The default is the same as the fill color.

See also:

- 30.2.22 addZone(startValue as Double, endValue as Double, fillColor as color, edgeColor as color) 4900
- 30.2.23 addZone(startValue as Double, endValue as Double, fillColor as Integer, edgeColor as Integer = -1) 4901
- 30.2.24 addZone(startValue as Double, endValue as Double, startRadius as Integer, endRadius as Integer, fillColor as color, edgeColor as color) 4901

30.2.26 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.2.27 Constructor(width as Integer, height as Integer, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 4902

30.2.27 Constructor(width as Integer, height as Integer, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Parameter	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

Function: Creates a new AngularMeter object.
Notes:

See also:

- 30.2.26 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 4902

30.2.28 relativeLinearGradient(gradient() as Double, angle as Double = 0.0, radius as Double = -1.0) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a linear gradient color relative to the meter center and radius.
Notes: A general linear gradient color can be created by CDBaseChartMBS.linearGradientColor, which involves specifying the x and y coordinates of the starting and ending points and the color stops. The relativeLinearGradient simplifies creating a linear gradient by assuming the gradient line passes through the meter center at an configurable angle.

The linear gradient is defined using an array of numbers, in which each pair of numbers represents the relative distance and its associated color. The relative distance is the ratio of the absolute distance to the reference radius, which defaults to the meter scale radius (set by AngularMeter.setMeter).

For example, to define a linear gradient with blue (0000FF) at the bottom-left of reference radius, green (00FF00) at the center, and red (FF0000) at the top-right of the reference radius, the angle should be set to 45 degrees, and the array of numbers should be:

-1.0, &H0000ff, 0.0, &H00ff00, 1.0, &Hff0000

The relative distances in the array should be arranged in increasing order. It is possible to define a relative linear gradient shorter or longer than the reference radius by using a relative distance of magnitude smaller or greater than 1. A negative relative distance means the distance is measured at the opposite side of center.

Returns a 32-bit integer representing the linear gradient color.

Argument	Default	Description
gradient	(Mandatory)	An numeric array defining the color stops. Please refer to the description above for details.
angle	0	The direction of the linear gradient line. It is specified as a clockwise angle in degrees, with 0 being the upward pointing direction.
radius	-1	The reference radius to define the relative distance. The default is the meter scale radius (set by CDAngularMeterMBS.setMeter).

30.2.29 relativeRadialGradient(gradient() as Double, radius as Double = -1.0) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a radial gradient color relative to the meter center and radius.
Notes: A general radial gradient color can be created by CDBaseChartMBS.radialGradientColor, which involves specifying the center x and y coordinates, horizontal and vertical radii, and the color stops. The relativeRadialGradient simplifies creating a radial gradient by assuming the center of the radial gradient to be the meter center, and the radial pattern is circular (so that the vertical and horizontal radii are the same), and default to using the meter scale radius (set by AngularMeter.setMeter) as the reference radius.

The radial gradient is defined using an array of numbers, in which each pair of numbers represents the relative radius and its associated color. The relative radius is the ratio of the absolute radius to the reference radius.

For example, to define a radial gradient with blue (0000FF) at the center, green (00FF00) at the mid-point between the center and the reference radius, and red at the reference radius, the numbers should be:

0.0, &H0000ff, 0.5, &H00ff00, 1.0, &Hff0000

The relative radii in the array must be arranged in increasing order. It is possible to define a relative radial gradient smaller or larger than the reference radius by using a relative radius smaller or greater than 1.

Argument	Default	Description
gradient	(Mandatory)	An numeric array defining the color stops. Please refer to the description above for details.
radius	-1	The reference radius of the radial gradient. The default is the meter scale radius (set by CDAngularMeterMBS.setMeter).

Returns a 32-bit integer representing the radial gradient color.

30.2.30 setCap(radius as Integer, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the radius and color of the pointer cap.
Notes: The pointer cap is a circle at the center of the meter above the meter pointer. By default, it is a small circle 3 pixels in radius, so it looks like a "pivot" for the pointer for it to rotate about the center.

You may change the radius and colors of this circle using this method to achieve other visual effects.

Parameter	Default	Description
radius	(Mandatory)	The radius of pointer cap circle in pixels.
fillColor	(Mandatory)	The fill color of the pointer cap circle.
edgeColor	LineColor	The edge color of the pointer cap circle.

See also:

- 30.2.31 setCap(radius as Integer, fillColor as Integer, edgeColor as Integer = &hffff0001) 4905

30.2.31 setCap(radius as Integer, fillColor as Integer, edgeColor as Integer = &hffff0001)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the radius and color of the pointer cap.
Notes: The pointer cap is a circle at the center of the meter above the meter pointer. By default, it is a small circle 3 pixels in radius, so it looks like a "pivot" for the pointer for it to rotate about the center.

You may change the radius and colors of this circle using this method to achieve other visual effects.

Parameter	Default	Description
radius	(Mandatory)	The radius of pointer cap circle in pixels.
fillColor	(Mandatory)	The fill color of the pointer cap circle.
edgeColor	LineColor	The edge color of the pointer cap circle.

See also:

- 30.2.30 setCap(radius as Integer, fillColor as color, edgeColor as color) 4905

30.2.32 setCap2(backcolor as Color = &c888888, frontColor as Color = &c000000, frontEdgeColor as Color = &c888888)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures the meter to use new style pointer cap.
Notes: The new style pointer cap is a circular object covering the the center of the meter. If is designed to be used with new style pointers (added with AngularMeter.addPointer2). The cap consists of two circles, one at the background below the pointer, and one covering the pointer. The pointer will appear to be sandwiched between these two circles.
Arguments are optional and colors can be passed as Integer or color value.

Argument	Default	Description
backColor	0x888888	The fill color of the back circle.
frontColor	0x000000	The fill color of the front circle.
frontEdgeColor	0x888888	The edge color of the front circle.
lightingRatio	NoValue	By default, lighting effect is applied to the back circle and the edge of the front circle, such that the bottom-right side will appear to be darkened. This argument configures how bright the bottom-right side is. The default value is 0.2, which means the bottom-right side is 20% as bright as the top-left side. Setting this argument to 1 disables the lighting effect.
backRadiusRatio	NoValue	The radius of the back circle, expressed as a ratio to the meter scale radius (set with AngularMeter.setMeter). The default is 0.15.
frontRadiusRatio	NoValue	The radius of the front circle, expressed as a ratio to the meter scale radius (set with AngularMeter.setMeter). The default is 0.11.
frontEdgeWidthRatio	NoValue	The edge width of the front circle, expressed as a ratio to the meter scale radius (set with AngularMeter.setMeter). The default is 0.01.

30.2.35 setCap2(backcolor as Color, frontColor as Color, frontEdgeColor as Color, lightingRatio as Double, backRadiusRatio as Double, frontRadiusRatio as Double)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures the meter to use new style pointer cap.
Notes: The new style pointer cap is a circular object covering the the center of the meter. If is designed to be used with new style pointers (added with AngularMeter.addPointer2). The cap consists of two circles, one at the background below the pointer, and one covering the pointer. The pointer will appear to be sandwiched between these two circles.
Arguments are optional and colors can be passed as Integer or color value.

- 30.2.33 setCap2(backcolor as Color, frontColor as Color, frontEdgeColor as Color, lightingRatio as Double) 4907

Argument	Default	Description
backColor	0x888888	The fill color of the back circle.
frontColor	0x000000	The fill color of the front circle.
frontEdgeColor	0x888888	The edge color of the front circle.
lightingRatio	NoValue	By default, lighting effect is applied to the back circle and the edge of the front circle, such that the bottom-right side will appear to be darkened. This argument configures how bright the bottom-right side is. The default value is 0.2, which means the bottom-right side is 20% as bright as the top-left side. Setting this argument to 1 disables the lighting effect.
backRadiusRatio	NoValue	The radius of the back circle, expressed as a ratio to the meter scale radius (set with AngularMeter.setMeter). The default is 0.15.
frontRadiusRatio	NoValue	The radius of the front circle, expressed as a ratio to the meter scale radius (set with AngularMeter.setMeter). The default is 0.11.
frontEdgeWidthRatio	NoValue	The edge width of the front circle, expressed as a ratio to the meter scale radius (set with AngularMeter.setMeter). The default is 0.01.

30.2.42 setMeter(cx as Integer, cy as Integer, radius as Integer, startAngle as Double, endAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position and angle range of the meter.
Notes:

Parameter	Default	Description
cx	(Mandatory)	The x-coordinate of the center of the meter.
cy	(Mandatory)	The y-coordinate of the center of the meter.
radius	(Mandatory)	The radius of the meter.
startAngle	(Mandatory)	The start angle of the meter. The angle is measured in degrees clockwise, with 0 being the upward pointing direction.
endAngle	(Mandatory)	The end angle of the meter. The angle is measured in degrees clockwise, with 0 being the upward pointing direction.

30.2.43 Screenshots

30.2.44 squareameter.jpg

Function: A meter created using ChartDirector with the CDAngularMeterMBS class.

30.3 class CDAreaLayerMBS

30.3.1 class CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The AreaLayer class represents area layers.
Example:

```
// The data for the area chart
Var data0(-1) as Double = array(42, 49, 33, 38, 51, 46, 29, 41, 44, 57, 59, 52, 37, 34, 51, 56, 56, 60, 70, 76,
63, 67, 75, 64, 51.0)
Var data1(-1) as Double = array(50, 45, 47, 34, 42, 49, 63, 62, 73, 59, 56, 50, 64, 60, 67, 67, 58, 59, 73, 77,
84, 82, 80, 84, 89.0)
Var data2(-1) as Double = array(61, 79, 85, 66, 53, 39, 24, 21, 37, 56, 37, 22, 21, 33, 13, 17, 4, 23, 16, 25, 9,
10, 5, 7, 16.0)
Var labels(-1) as string = array("0", "1", "2", "3", "4", "5", "6", "7", "8", "9", "10", "11", "12", "13", "14",
"15", "16", "17", "18", "19", "20", "21", "22", "23", "24")

// Create a XYChart object of size 500 x 300 pixels
Var c as new CDXYChartMBS(500, 300)

// Set the plotarea at (90, 30) and of size 300 x 240 pixels.
call c.setPlotArea(90, 30, 300, 240)

// Add a legend box at (405, 100)
call c.addLegend(405, 100)

// Add a title to the chart
call c.addTitle("Daily System Load")

// Add a title to the y axis. Draw the title upright (font angle = 0)
c.yAxis.setTitle("Database"+endofline.unix+"Queries"+endofline.unix+"(per sec)").setFontAngle(0)

// Set the labels on the x axis.
call c.xAxis.setLabels(labels)

// Display 1 out of 2 labels on the x-axis. Show minor ticks for remaining
// labels.
c.xAxis.setLabelStep(2, 1)

// Add an area layer
Var layer as CDAreaLayerMBS
layer = c.addAreaLayer

// Draw the area layer in 3D
layer.set3D
```

```
// Add the three data sets to the area layer
call layer.addDataSet(data0, -1, "Server # 1")
call layer.addDataSet(data1, -1, "Server # 2")
call layer.addDataSet(data2, -1, "Server # 3")

// Output the chart
Backdrop=c.makeChartPicture
```

Notes: Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.3.2 Methods

30.3.3 setGapColor(fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.3.4 setGapColor(fillColor as Integer) 4921

30.3.4 setGapColor(fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color used to fill the area under kNoValue data points.
Notes: By default, if there are kNoValue data points, ChartDirector will interpolate using the remaining data points. The area will remain continuous.

This method can be used to set up an alternative color to represent the area at kNoValue data point positions. In particular, if the fillColor argument is set to Transparent, the kNoValue data points will result in gaps in the area.

Parameter	Default	Description
fillColor	(Mandatory)	The color used to fill the area region at kNoValue data point positions.

See also:

- 30.3.3 setGapColor(fillColor as color) 4921

30.3.5 setMinLabelSize(s as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum height (or width if x and y axes are swapped) of an area below which data labels will be hidden.
Notes: In ChartDirector, for an area layer, data labels (Layer.setDataLabelStyle) are drawn internal to the area, while the aggregate labels (Layer.setAggregateLabelStyle) are drawn external to the area.

ChartDirector will disable data labels if the area height (or width if x and y axes are swapped) is too small to contain the data label.

By default, ChartDirector will automatically determine what is meant by "too small". The setMinLabelSize method can be used to manually defined the threshold for "too small".

Sometimes it may be desirable to display the data label even though it cannot be contained within the area. In this case, the setMinLabelSize can be used to set the threshold to 0.

Parameter	Default	Description
s	(Mandatory)	The minimum height (or width if x and y axes are swapped) of an area below which data labels will be hidden.

30.4 class CDArrayMBS

30.4.1 class CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CDArrayMBS class is a utility class used to perform array computations.
Blog Entries

- MBS Xojo Plugins, version 19.4pr5
- MBS Real Studio Plugins, version 13.1pr16

30.4.2 Methods

30.4.3 abs

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its absolute value.

30.4.4 acc

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by the accumulated total of its previous element (including itself).

30.4.5 addArray(value as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The array will be added by adding the each array element to the corresponding element of the CDArrayMBS object.
Notes:

Parameter	Default	Description
Values	(Mandatory)	A CDArrayMBS with numbers to be added to the CDArrayMBS object.

This method does not append a new value to the array.
See also:

- 30.4.6 addArray(value() as Double) 4924

30.4.6 addArray(value() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The array will be added by adding the each array element to the corresponding element of the CDArrayMBS object.
Example:

```
Var src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
Var data As New CDArrayMBS(array(1.0, 1.0, 1.0, 1.0))

data.addArray( src )

Var lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes:

Parameter	Default	Description
b	(Mandatory)	An array of numbers to be added to the CDArrayMBS object.

This method does not append a new value to the array.
See also:

- 30.4.5 addArray(value as CDArrayMBS) 4923

30.4.7 addValue(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a number to every element of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))

data.addValue(5)

Var lines(-1) as string
```

```
lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes:

Parameter	Default	Description
b	(Mandatory)	A number to be added to every element of the CDArrayMBS object.

This method does not append a new value to the array.

30.4.8 aggregate(srcArray() as Double, aggregateMethod as Integer, param as Double = 50.0) as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Aggregates a data array by merging groups of elements, similar to the GROUP BY clause in SQL statements.
Notes: This primary usage of this method is for changing data resolution, such as to convert a daily data into weekly data.

If the data is from a database, aggregation can often be more efficiently and conveniently performed by using the GROUP BY clause of SQL. This method should only be used when the data are not coming from a database, or the aggregation method are not supported by the database used.

In this method, the CDArrayMBS object represents the delimiters used to group elements in the srcArray. The positions of all non-kNoValue elements in the CDArrayMBS object will be used as delimiters positions.

For example, if the CDArrayMBS object consists of an array of 50 elements, and only the elements at 0, 10, 20, 30, 40 are not NoValue, then the groups will be defined as positions 0 - 9, 10 - 19, 20 - 29, 30 - 39 and 40 - 49.

Note that a group includes the starting delimiter position but excludes the ending delimiter position.

The CDArrayMBS object is typically created by applying CDArrayMBS.selectStartOfHour, CDArrayMBS.selectStartOfDay, CDArrayMBS.selectStartOfWeek, CDArrayMBS.selectStartOfMonth, CDArrayMBS.selectStartOfYear or CDArrayMBS.selectRegularSpacing to a data array.

For example, to group daily data into weekly data, one may create an CDArrayMBS object with the dates of the daily data, then CDArrayMBS.selectStartOfWeek to select only the elements representing the start of a week. The resulting CDArrayMBS object can then be used to aggregate daily data into weekly data.

Due to aggregation, the length of the output array will usually be shorter than, and never be longer than, the length of the input array.

Parameter	Default	Description
srcArray	(Mandatory)	The array to be aggregated.
aggregateMethod	(Mandatory)	The method to aggregate the data, which must be one of AggregateSum, AggregateAvg, AggregateStdDev, AggregateMin, AggregateMed, AggregateMax, AggregatePercentile, AggregateFirst, AggregateLast, AggregateCount.
param	50	The aggregation parameter, if needed. Currently, only AggregatePercentile needs a parameter to specify the percentile used.

30.4.9 aggregateValues(srcArray() as Double, aggregateMethod as Integer, param as Double = 50.0) as Double()

MBS ChartDirector Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Aggregates a data array by merging groups of elements, similar to the GROUP BY clause in SQL statements.
Notes: This primary usage of this method is for changing data resolution, such as to convert a daily data into weekly data.

If the data is from a database, aggregation can often be more efficiently and conveniently performed by using the GROUP BY clause of SQL. This method should only be used when the data are not coming from a database, or the aggregation method are not supported by the database used.

In this method, the CDArrayMBS object represents the delimiters used to group elements in the srcArray. The positions of all non-kNoValue elements in the CDArrayMBS object will be used as delimiters positions.

For example, if the CDArrayMBS object consists of an array of 50 elements, and only the elements at 0, 10, 20, 30, 40 are not NoValue, then the groups will be defined as positions 0 - 9, 10 - 19, 20 - 29, 30 - 39 and 40 - 49.

Note that a group includes the starting delimiter position but excludes the ending delimiter position.

The CDArrayMBS object is typically created by applying CDArrayMBS.selectStartOfHour, CDArrayMBS.selectStartOfDay, CDArrayMBS.selectStartOfWeek, CDArrayMBS.selectStartOfMonth, CDArrayMBS.select-

StartOfYear or CDArrayMBS.selectRegularSpacing to a data array.

For example, to group daily data into weekly data, one may create an CDArrayMBS object with the dates of the daily data, then CDArrayMBS.selectStartOfWeek to select only the elements representing the start of a week. The resulting CDArrayMBS object can then be used to aggregate daily data into weekly data.

Due to aggregation, the length of the output array will usually be shorter than, and never be longer than, the length of the input array.

Parameter	Default	Description
srcArray	(Mandatory)	The array to be aggregated.
aggregateMethod	(Mandatory)	The method to aggregate the data, which must be one of AggregateSum, AggregateAvg, AggregateStdDev, AggregateMin, AggregateMed, AggregateMax, AggregatePercentile, AggregateFirst, AggregateLast, AggregateCount.
param	50	The aggregation parameter, if needed. Currently, only AggregatePercentile needs a parameter to specify the percentile used.

30.4.10 avg as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the avg value of the elements of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.avg) // shows 2.5
```

30.4.11 Constructor

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The dummy constructor doing nothing.
See also:

- 30.4.12 Constructor(a as CDArrayMBS) 4927
- 30.4.13 Constructor(data() as Double) 4928

30.4.12 Constructor(a as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an CDArrayMBS object and initialize it with the given array.
See also:

- 30.4.11 Constructor 4927
- 30.4.13 Constructor(data() as Double) 4928

30.4.13 Constructor(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an CDArrayMBS object and initialize it with the given array.
See also:

- 30.4.11 Constructor 4927
- 30.4.12 Constructor(a as CDArrayMBS) 4927

30.4.14 count as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of elements in this array object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.count) // shows 4
```

30.4.15 delta(offset as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts each element of the CDArrayMBS object by an earlier element in the same CDArrayMBS object.
Notes:

Parameter	Default	Description
offset	1	The difference in position between an element and the earlier element to be subtracted from it.

30.4.16 divArray(value as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides the CDArrayMBS object by the given array.
Notes: The CDArrayMBS object will be divided by dividing each of its elements by the corresponding element in the given array.

Parameter	Default	Description
Values	(Mandatory)	A CDArrayMBS with numbers used as divisors to divide the CDArrayMBS object.

See also:

- 30.4.17 divArray(value() as Double) 4929

30.4.17 divArray(value() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides the CDArrayMBS object by the given array.
Example:

```
Var src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
Var data As New CDArrayMBS(array(2.0, 2.0, 2.0, 2.0))

data.divArray( src )

Var lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes: The CDArrayMBS object will be divided by dividing each of its elements by the corresponding element in the given array.

Parameter	Default	Description
b	(Mandatory)	An array of numbers used as divisors to divide the CDArrayMBS object.

See also:

- 30.4.16 divArray(value as CDArrayMBS) 4928

30.4.18 divValue(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides every element of the CDArrayMBS object by the given number.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))

data.divValue(5)

Var lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes:

Parameter	Default	Description
b	(Mandatory)	A number to be used as divisor to divide every element of the CDArrayMBS object.

30.4.19 expAvg(smoothingFactor as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its exponential average.
Notes: The exponential average is computed by :

avg(n) = value(n) * smoothingFactor + avg(n - 1) * (1 - smoothingFactor)

where avg(n) is the exponential average of the nth element, and value(n) is the value of the nth element.

For the first element (n = 0), its exponential average is assumed to be equal to its original value.

Parameter	Default	Description
smoothingFactor	(Mandatory)	The smoothing factor used for computing exponential average. It should be between 0 - 1.

30.4.20 financeDiv(values() as Double, zeroByZeroValue as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides the CDArrayMBS object by the given array, with special handling of the case of zero divided by zero.
Notes: In many financial formulas, it is possible to have cases of zero divided by zero. For example, the Relative Strength Index is defined as the ratio between positive price changes and absolute value of all price changes over a period of time. In case the price does not change at all during that period, and the RSI will become zero divided by zero.

Traditionally, under the above case, the RSI will be consider as 50%.

To handle these special cases, the financeDiv method has an argument specifying what value to assume in case the division is zero divided by zero.

Parameter	Default	Description
b	(Mandatory)	An array of numbers used as divisors to divide the CDArrayMBS object.
zeroByZeroValue	(Mandatory)	The value to use if the division is zero divided by zero.

30.4.21 getvalue(index as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the vaue with the given index.
Notes: Returns zero if the value does not exist.

30.4.22 insert(value as Double, len as Integer, insertPoint as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts some constant elements to the CDArrayMBS object.
Notes:

See also:

- 30.4.23 insert(value() as Double, insertPoint as Integer = -1) 4932

Parameter	Default	Description
c	(Mandatory)	The value of the constant element.
len	(Mandatory)	The number of elements to insert.
insertPoint	-1	The position of the insertion point. The new elements will be inserted just before the insertion point. -1 means inserting elements at the end of the array.

30.4.23 insert(value() as Double, insertPoint as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts the elements of an array to the CDArrayMBS object.
Notes:

Parameter	Default	Description
a	(Mandatory)	An array to be inserted to the CDArrayMBS object.
insertPoint	-1	The position of the insertion point. The new elements will be inserted just before the insertion point. -1 means inserting elements at the end of the array.

See also:

- 30.4.22 insert(value as Double, len as Integer, insertPoint as Integer = -1) 4931

30.4.24 lowess(smoothness as Double = 0.25, iteration as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fits a curve through the data points in the CDArrayMBS object using the LOWESS algorithm.
Example:

```
// generate some values
Var values() as Double
Var x as Double

for i as Integer = 1 to 10
x = x + rnd - 0.5
values.Append x
next

// make array
Var c as new CDArrayMBS(values)
Var oldValues() as Double = c.Values

// now run Algorithm
c.lowess(1.0) // 1.0 so we see it

// now get new values
```

```
Var newValues() as Double = c.Values

// the rest is for displaying in MsgBox:
Var oldValueStrings() as string
Var newValueStrings() as string

for each v as Double in oldValues
oldValueStrings.Append str(v)
next

for each v as Double in newValues
newValueStrings.Append str(v)
next

MsgBox join(oldValueStrings, " ")+EndOfLine+EndOfLine+join(newValueStrings, " ")
```

Notes: The full name of LOWESS is "Robust locally weighted regression and smoothing scatterplots". It is a commonly used algorithm for drawing a smooth curve through a number of points.

LOWESS works by assuming a small segment of any curve can be approximated by a straight line. For each data point, LOWESS finds the n nearest points to that data point (n is configurable), and performs weighted linear regression using a tricube weighting function. It then adjust the coordinates of the data point based on the result of the weighted linear regression.

LOWESS can run in multiple iterations, in which case it should converge to a stable curve - thus it is called "robust".

In most cases, LOWESS behaves better than many other smoothing algorithms, such as moving average, moving median, exponential average. Curves draw using LOWESS look smoother, yet they track the data points better. Also, LOWESS behaves well at the end points. On the other hand, methods based on moving windows (e.g. moving averages) do not work on the first few data points, because they need sufficient data points to fill the moving window first.

In this method, each element of the CDArrayMBS object will be replaced by the corresponding value computed using the LOWESS algorithm.

Parameter	Default	Description
smoothness	0.25	The smoothness factor. It must be between 0 - 1. It is the portion of points used in finding the n nearest points. In other words, n = smoothness * no_of_points. A larger value will result in a smoother the curve. A smaller value will result in the curve tracking the data points better.

For LOWESS to have any smoothing effect at all, n must be at least 3. You may need to use a large

smoothness factor if you only have a few data points.

iteration	0	The number of additional iteration used in the LOWESS algorithm. Unless your data is extremely noisy, in most case no additional iteration is necessary.

See also:

- 30.4.25 lowess(values() as Double, smoothness as Double = 0.25, iteration as Integer = 0) 4934

30.4.25 lowess(values() as Double, smoothness as Double = 0.25, iteration as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fits a curve through the data points in the CDArrayMBS object using the LOWESS algorithm, where the spacing of the data points is supplied by the given array.
Notes: Please refer to CDArrayMBS.lowess for a brief description of the LOWESS algorithm.

In this method, each element of the CDArrayMBS object will be replaced by the corresponding value computed using the LOWESS algorithm.

Parameter	Default	Description
b	(Mandatory)	An array of numbers providing the x coordinates of the data points in the CDArrayMBS object.
smoothness	0.25	The smoothness factor. It must be between 0 - 1. It is the portion of points used in finding the n nearest points. In other words, n = smoothness * no_of_points. A larger value will result in a smoother the curve. A smaller value will result in the curve tracking the data points better.

For LOWESS to have any smoothing effect at all, n must be at least 3. You may need to use a large smoothness factor if you only have a few data points.

iteration	0	The number of additional iteration used in the LOWESS algorithm. Unless your data is extremely noisy, in most case no additional iteration is necessary.

See also:

- 30.4.24 lowess(smoothness as Double = 0.25, iteration as Integer = 0) 4932

30.4.26 max as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the maximum value of the elements of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.max) // shows 4.0
```

30.4.27 maxIndex as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the index of the maximum value element of the CDArrayMBS object.

30.4.28 med as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the med value of the elements of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0, 1.0))
MsgBox str(data.med) // shows 2.0
MsgBox str(data.avg) // shows 2.2
```

30.4.29 min as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the minimum value of the elements of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.min) // shows 1.0
```

30.4.30 minIndex as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the index of the minimum value element of the CDArrayMBS object.

30.4.31 movAvg(interval as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its moving average.
Notes: The interval parameter specifies the window size for computing moving average. The moving average is computed as the average of the current element with the previous (interval - 1) elements. No moving average can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

Parameter	Default	Description
interval	(Mandatory)	The window size.

30.4.32 movCorr(interval as Integer, value() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by the moving correlation with another array or with itself.
Notes: The interval parameter specifies the window size for computing moving correlation. The moving correlation is computed as the correlation coefficient between the CDArrayMBS object and the other array, where only the current element and the previous (interval - 1) elements are considered in the computation.

If the other array is not provided, it is assumed to be the sequence of numbers 0, 1, 2, 3, 4.... This is equivalent to checking if the elements of the CDArrayMBS object is linear.

No moving correlation can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

interval	(Mandatory)	The window size.b	[Empty_Array]	The array to be correlated with the CDArrayMBS object. If this argument is an empty array, the sequence of numbers 0, 1, 2, 3, 4 .... will be used instead.

30.4.33 movMax(interval as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its moving maximum.
Notes: The interval parameter specifies the window size for computing moving average. The moving average is computed as the maximum of the current element with the previous (interval - 1) elements. No moving maximum can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

Parameter	Default	Description
interval	(Mandatory)	The window size.

30.4.34 movMed(interval as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its moving median.
Notes: The interval parameter specifies the window size for computing moving average. The moving average is computed as the median of the current element with the previous (interval - 1) elements. No moving median can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

Parameter	Default	Description
interval	(Mandatory)	The window size.

30.4.35 movMin(interval as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its moving minimum.
Notes: The interval parameter specifies the window size for computing moving average. The moving average is computed as the minimum of the current element with the previous (interval - 1) elements. No moving minimum can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

Parameter	Default	Description
interval	(Mandatory)	The window size.

30.4.36 movPercentile(interval as Integer, percentile as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its moving percentile.
Notes: The interval parameter specifies the window size for computing moving average. The moving average is computed as the percentile of the current element with the previous (interval - 1) elements. No moving percentile can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

Parameter	Default	Description
interval	(Mandatory)	The window size.
percentile	(Mandatory)	The percentile to be computed. It should be between 0 - 100.

30.4.37 movStdDev(interval as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each element of the CDArrayMBS object by its moving standard deviation.
Notes: The interval parameter specifies the window size for computing moving average. The moving average is computed as the standard deviation of the current element with the previous (interval - 1) elements. No moving standard deviation can be computed for the first (interval - 1) elements, because there are insufficient previous elements. So the first (interval - 1) elements will be replaced with kNoValue.

Parameter	Default	Description
interval	(Mandatory)	The window size.

30.4.38 mulArray(value as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies an array to the CDArrayMBS object.
Notes: The array will be multiplied by multiplying each array element with the corresponding element of the CDArrayMBS object.

Parameter	Default	Description
Values	(Mandatory)	A CDArrayMBS with numbers to be multiplied to the CDArrayMBS object.

See also:

- 30.4.39 mulArray(value() as Double) 4938

30.4.39 mulArray(value() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies an array to the CDArrayMBS object.
Example:

```
Var src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
Var data As New CDArrayMBS(array(2.0, 2.0, 2.0, 2.0))
```

```
data.mulArray( src )

Var lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes: The array will be multiplied by multiplying each array element with the corresponding element of the CDArrayMBS object.

Parameter	Default	Description
b	(Mandatory)	An array of numbers to be multiplied to the CDArrayMBS object.

See also:

- 30.4.38 mulArray(value as CDArrayMBS) 4938

30.4.40 mulValue(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies a number to every element of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))

data.mulValue(5)

Var lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes:

Parameter	Default	Description
b	(Mandatory)	A number to be multiplied to every element of the CDArrayMBS object.

30.4.41 percentile(p as Double) as double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the required percentile value of the elements of the CDArrayMBS object.
Notes:

Parameter	Default	Description
p	(Mandatory)	The percentile to get. It should be between 0 - 100.

30.4.42 rate(offset as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides each element of the CDArrayMBS object by an earlier element in the same CDArrayMBS object.
Notes:

Parameter	Default	Description
offset	1	The difference in position between an element and the earlier element to divide it.

30.4.43 replace(a as Double, b as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds elements that are equal to a given value and replace it with another value.
Notes:

30.4.44 result as memoryblock

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the content of the CDArrayMBS object as a memoryblock.

Parameter	Default	Description
a	(Mandatory)	The value to be replaced.
b	(Mandatory)	The replacing value.

30.4.45 selectEQZ

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is equal to zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.46 selectEQZ(decisionArray() as Double, fillValue as Double = 0) 4941

30.4.46 selectEQZ(decisionArray() as Double, fillValue as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is equal to zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

• 30.4.45 selectEQZ 4941

30.4.47 selectGEZ

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is greater than or equal to zero.
Notes: If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

• 30.4.48 selectGEZ(decisionArray() as Double, fillValue as Double = 0) 4942

30.4.48 selectGEZ(decisionArray() as Double, fillValue as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is greater than or equal to zero.
Notes: If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

• 30.4.47 selectGEZ 4942

30.4.49 selectGTZ

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is greater than zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given

fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.50 selectGTZ(decisionArray() as Double, fillValue as Double = 0) 4943

30.4.50 selectGTZ(decisionArray() as Double, fillValue as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is greater than zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.49 selectGTZ 4942

30.4.51 selectLEZ

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is less than or equal to zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.52 selectLEZ(decisionArray() as Double, fillValue as Double = 0) 4944

30.4.52 selectLEZ(decisionArray() as Double, fillValue as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is less than or equal to zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.51 selectLEZ 4943

30.4.53 selectLTZ

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is less than zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.54 selectLTZ(decisionArray() as Double, fillValue as Double = 0) 4945

30.4.54 selectLTZ(decisionArray() as Double, fillValue as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object by checking if the elements of the given decisionArray is less than zero.
Notes: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.

If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.53 selectLTZ 4944

30.4.55 selectNEZ

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.
Notes: If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.56 selectNEZ(decisionArray() as Double, fillValue as Double = 0) 4946

30.4.56 selectNEZ(decisionArray() as Double, fillValue as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The selected elements will be left unchanged. The remaining elements will be replaced by the given fillValue.
Notes: If the decisionArray is empty, the CDArrayMBS object itself will function as the decision array.

Parameter	Default	Description
decisionArray	[Empty_Array]	An array of numbers used to decide whether the corresponding elements in the CDArrayMBS object is selected or not.
fillValue	0	The value used to replace the elements that are not selected.

See also:

- 30.4.55 selectNEZ 4945

30.4.57 selectRegularSpacing(majorTickStep as Integer, minorTickStep as Integer = 0, initialMargin as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects an evenly spaced subset of elements of the CDArrayMBS object.
Notes: The primary purpose of this method is to select the regularly spaced elements as ticks on an enumerated axis.

For example, if the majorTickStep is 10, and minorTickStep is 5, this method will select one out of 10 elements as major tick elements, and one of out of 5 elements as minor tick elements.

Major tick elements will remain intact. The remaining minor ticks elements will have their values replaced with MinorTickOnly. Non-selected elements will have their values replaced with kNoValue, so they will not appear on the axis. The resulting array can be used directly in Axis.setLabels.

30.4.58 selectStartOfDay(majorTickStep as Integer = 1, initialMargin as Double = 10800.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Parameter	Default	Description
majorTickStep	(Mandatory)	The spacing between major ticks.
minorTickStep	0	The spacing between minor ticks. The default value of 0 means no minor tick will be used.
initialMargin	0	The position of the first tick.

Function: Selects the elements of the CDArrayMBS object that represents a different day from the previous element.
Notes: This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see
Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per day (or one tick per multiple days). This is by selecting the dates/times in the data array only if it is not the same day as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the day it represents. By default, near means within 3 hours (10800 seconds). This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

Parameter	Default	Description
majorTickStep	1	The tick step. The default value of 1 means one tick per day. A value of n means one tick per n days.
initialMargin	10800	The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the day it represents. The default is 3 hours (10800 seconds).

30.4.59 selectStartOfHour(majorTickStep as Integer = 1, initialMargin as Double = 300.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object that represents a different hour from the previous element.
Notes: This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see
Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per hour (or one tick per multiple hours). This is by selecting the dates/times in the data array only if it is not the same hour as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels2.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the hour it represents. By default, near means within 300 seconds. This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

Parameter	Default	Description
majorTickStep	1	The tick step. The default value of 1 means one tick per hour. A value of n means one tick per n hours.
initialMargin	300	The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the hour it represents. The default is 300 seconds.

30.4.60 selectStartOfMinute(majorTickStep as Integer = 1, initialMargin as Double = 5.0)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the array that represents a different minute from the previous element.
Notes: This method assumes the elements of the ArrayMath object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see CDAxisMBS.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per minute (or one tick per multiple minutes). This is by selecting the dates/times in the data array only if it is not the same minute as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in CDAxisMBS.setLabels2.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the minute it represents. By default, near means within 5 seconds. This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using CDLayerMBS.setXData and CDAxisMBS.setDateScale3 (or CDAxisMBS.setDateScale or CDAxisMBS.setDateScale2).

Argument	Default	Description
majorTickStep	1	The tick step. A value of n means one tick per n minutes.
initialMargin	5	The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the minute it represents. The default is 5 seconds.

30.4.61 selectStartOfMonth(majorTickStep as Integer = 1, initialMargin as Double = 432000.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object that represents a different month from the previous element.
Notes: This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see
Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per month (or one tick per multiple months). This is by selecting the dates/times in the data array only if it is not the same month as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in
Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the month it represents. By default, near means within 5 days (432000 seconds). This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

Parameter	Default	Description
majorTickStep	1	The tick step. The default value of 1 means one tick per month. A value of n means one tick per n months.
initialMargin	432000	The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the month it represents. The default is 5 days (432000 seconds).

30.4.62 selectStartOfSecond(majorTickStep as Integer = 1, initialMargin as Double = 0.1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the ArrayMath object that represents a different second from the previous element.

Notes: This method assumes the elements of the ArrayMath object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see CDAxisMBS.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per second (or one tick per multiple seconds). This is by selecting the dates/times in the data array only if it is not the same second as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by NoValue. The resulting array can be used directly in CDAxisMBS.setLabels2.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the second it represents. By default, near means within 0.1 second. This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using CDLayerMBS.setXData and CDAxisMBS.setDateScale3 (or CDAxisMBS.setDateScale or CDAxisMBS.setDateScale2).

Argument	Default	Description
majorTickStep	1	The tick step. A value of n means one tick per n seconds.
initialMargin	0.1	The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the second it represents. The default is 0.1 second.

30.4.63 selectStartOfWeek(majorTickStep as Integer = 1, initialMargin as Double = 172800.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object that represents a different week from the previous element.
Notes: This method assumes the elements of the CDArrayMBS object are dates/times.

The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see
Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per week (or one tick per multiple weeks). This is by selecting the dates/times in the data array only if it is not the same week as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the week it represents. By default, near means within 2 days (172800 seconds). This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

Parameter	Default	Description
majorTickStep	1	The tick step. The default value of 1 means one tick per week. A value of n means one tick per n weeks.
initialMargin	172800	The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the week it represents. The default is 2 days (172800 seconds).

30.4.64 selectStartOfYear(majorTickStep as Integer = 1, initialMargin as Double = 5184000.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the elements of the CDArrayMBS object that represents a different year from the previous element.
Notes: This method assumes the elements of the CDArrayMBS object are
dates/times. The primary purpose of this method is to select the appropriate elements as ticks on an enumerated axis.

Suppose you want to plot a variable against time. The x-values of the data points will be an array of dates/times. If an enumerated x-axis is used (see

Axis.setLabels), there will be a tick at every data point, which may be too dense if there are too many data points.

This method can be used to reduce the ticks to one tick per year (or one tick per multiple years). This is by selecting the dates/times in the data array only if it is not the same year as the previous element in the array. The selected elements will be left unchanged, while the elements not select will be replaced by kNoValue. The resulting array can be used directly in Axis.setLabels.

For the first data point, there is no previous data point to compare, so it is handled differently. The first data point will be selected if it is near the beginning of the year it represents. By default, near means within 60 days (5184000 seconds). This is configurable using the initialMargin argument.

Note that if the data points does not have data in a certain time range, no element can be selected in that time range, and so there will be no tick for that time range. This is appropriate for many chart types, such as finance charts, in which missing time ranges (non-trading hours, holidays, etc) are traditionally skipped.

However, if the data points may contain missing time ranges, but the ticks cannot be skipped, it may be more appropriate to use a non-enumerated x-axis by using Layer.setXData and Axis.setDateScale.

Parameter	Default	Description
majorTickStep	1	The tick step. The default value of 1 means one tick per year. A value of n means one tick per n years.
initialMargin	5184000	The margin for the first data point. The first data point will be selected if it is within initialMargin number of seconds from beginning of the year it represents. The default is 60 days (5184000 seconds).

30.4.65 shift(offset as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts the array "rightwards".
Notes: If the array does not have any kNoValue data points, this method will shift the point at position "n" to "n + offset". On the "right" side of the array (the side with the largest index), points that are shifted outside the array will be discarded. On the "left" side of the array, fillValue data points will be shifted in.

If the array contains kNoValue data points, these points are not shifted. Conceptually, one can imagine the non-NoValue points being shifted to the next non-NoValue positions, and the process repeats offset number of times.

See also:

- 30.4.66 shift(offset as Integer, fillValue as Double)

Parameter	Default	Description
offset	1	The number of positions to shift the array "rightwards."
fillValue	kNoValue	The new value to be shifted into the array.

30.4.66 shift(offset as Integer, fillValue as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts the array "rightwards".
Notes: If the array does not have any kNoValue data points, this method will shift the point at position "n" to "n + offset". On the "right" side of the array (the side with the largest index), points that are shifted outside the array will be discarded. On the "left" side of the array, fillValue data points will be shifted in.

If the array contains kNoValue data points, these points are not shifted. Conceptually, one can imagine the non-NoValue points being shifted to the next non-NoValue positions, and the process repeats offset number of times.

Parameter	Default	Description
offset	1	The number of positions to shift the array "rightwards."
fillValue	kNoValue	The new value to be shifted into the array.

See also:

- 30.4.65 shift(offset as Integer = 1) 4953

30.4.67 stdDev as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the stdDev value of the elements of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.stdDev) // shows 1.118034
```

30.4.68 subArray(value as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts an array from the CDArrayMBS object.
Notes: The array will be subtracted by subtracting each array element from the corresponding element of

the CDArrayMBS object.

Parameter	Default	Description
Values	(Mandatory)	A CDArrayMBS with numbers to be subtracted from the CDArrayMBS object.

See also:

- 30.4.69 subArray(value() as Double) 4955

30.4.69 subArray(value() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts an array from the CDArrayMBS object.
Example:

```
Var src(-1) as Double = Array( 63.1, 10.15, 6.15, 2.88 )
Var data As New CDArrayMBS(array(1.0, 1.0, 1.0, 1.0))

data.subArray( src )

Var lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes: The array will be subtracted by subtracting each array element from the corresponding element of the CDArrayMBS object.

Parameter	Default	Description
b	(Mandatory)	An array of numbers to be subtracted from the CDArrayMBS object.

See also:

- 30.4.68 subArray(value as CDArrayMBS) 4954

30.4.70 subValue(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts a number from every element of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))

data.subValue(5)

Var lines(-1) as string

lines.Append str(data.count)+" values:"
lines.Append ""
lines.Append str(Data.getvalue(0))
lines.Append str(Data.getvalue(1))
lines.Append str(Data.getvalue(2))
lines.Append str(Data.getvalue(3))

MsgBox Join(lines,EndOfLine)
```

Notes:

Parameter	Default	Description
b	(Mandatory)	A number to be subtracted from every element of the CDArrayMBS object.

30.4.71 sum as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the sum value of the elements of the CDArrayMBS object.
Example:

```
Var data As New CDArrayMBS(array(1.0, 2.0, 3.0, 4.0))
MsgBox str(data.sum) // shows 10.0
```

30.4.72 trim(startIndex as Integer = 0, len as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trims the CDArrayMBS object by keeping only some elements in the middle.
Notes:

startIndex to the end of the array.

Parameter	Default	Description
startIndex	0	The index for the first element to keep.
len	-1	The number of elements to keep. -1 means keeping all elements from the

30.4.73 Values as Double()

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies all the values of this array object into a Xojo array.
Notes: On error the array returned is empty.

30.5 class CDAxisMBS

30.5.1 class CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Axis class represents x and y axes in XY charts.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.5.2 Methods

30.5.3 addLabel(pos as Double, label as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an extra label on the axis.
Notes:

Parameter	Default	Description
pos	(Mandatory)	The position on the axis to add the label.
label	(Mandatory)	The text label to add.

30.5.4 addMark(value as Double, lineColor as color, text as string = "", font as string = "", fontsize as Double = 8) as CDMarkMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addMark method, but uses color instead of integer data type for passing color values.
See also:

- 30.5.5 addMark(value as Double, lineColor as Integer, text as string = "", font as string = "", fontsize as Double = 8) as CDMarkMBS

30.5.5 addMark(value as Double, lineColor as Integer, text as string = """, font as string = """, fontsize as Double = 8) as CDMarkMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a mark line to the chart.
Notes: A mark line is a line drawn on the plot area. This line is usually used to indicate some special values, such as a "target value", "threshold value", "target date", etc.

A mark line attached to the horizontal axis will be vertical across the plot area. A mark line drawn using the vertical axis will be horizontal across the plot area. In either case, the mark line label will be added to the axis at the mark line position.

The location of the mark line label can be changed by using
TextBox.setAlignment. For example, by setting the alignment to TopCenter, the mark line label will be drawn on the top center of the mark line.

By default, the mark line is drawn at the front of the chart layers. You may change it to draw at the back of the plot area (that is, like grid lines) using
Mark.setDrawOnTop.

Parameter	Default	Description
value	(Mandatory)	The value on the axis to draw the mark line.
lineColor	(Mandatory)	The color of the mark line.
text	""	The text label for the mark line. An empty string means there is no text label. By default, the text label and the tick on the axis will be drawn using the same color as the mark line. You can modify the colors by using the Mark.setMarkColor method.
font	""	The font used to draw the text label.
fontSize	8	The font size used to draw the text label in points.

See also:

- 30.5.4 addMark(value as Double, lineColor as color, text as string = "", font as string = "", fontsize as Double = 8) as CDMarkMBS 4958

30.5.6 addZone(startValue as Double, endValue as Double, colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.
See also:

• 30.5.7 addZone(startValue as Double, endValue as Double, colorvalue as Integer) 4960

30.5.7 addZone(startValue as Double, endValue as Double, colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a zone to the chart.
Notes: A zone is a range of values. For example, "10 to 20" is a zone. Typically, a zones are used to classify data ranges. For example, you may classify 0 - 60 as the normal zone, 60 - 90 as the warning zone, and 90 - 100 as the critical zone.

A zone based on a horizontal axis will be drawn as a vertical band. A zone based on a vertical axis will be drawn as a horizontal band. Zones are always drawn at the back of the plot area.

Parameter	Default	Description
startValue	(Mandatory)	The start value (the lower bound) for the zone.
endValue	(Mandatory)	The end value (the upper bound) for the zone.
color	(Mandatory)	The color of the zone.

See also:

• 30.5.6 addZone(startValue as Double, endValue as Double, colorvalue as color) 4959

30.5.8 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.5.9 copyAxis(axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the scale and labels from another axis.
Notes: This method is typically used to ensure the axes on different charts are identical. For example, if multiple charts are draw and are stacked up, and you want the x-axes of the charts to be the same for easy comparison, you may copy the x-axis from one chart to the other charts.

The differences between copyAxis and Axis.syncAxis are:

Axis.syncAxis relates the axes with a linear relationship, so the axes may not be exact copies of one another.

Axis.syncAxis synchronizes axis scale and copies only scale related labels, such as the labels generated by auto-scaling, Axis.setLinearScale, Axis.setLogScale or Axis.setDateScale.

copyAxis copies all labels, including labels created using
Axis.setLabels, which may be arbitrary text.

Parameter	Default	Description
axis	(Mandatory)	The axis to copy from.

30.5.10 getAlignment as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the side of the plot area that the axis is associated with.
Notes: This method is only applicable to XYChart objects.

30.5.11 getAxisImageMap(noOfSegments as Integer, mapWidth as Integer, url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for the axis itself.
Notes: This method is similar to Axis.getHTMLImageMap. The difference is instead of generating an image map for the labels, it generates an image map for the axis itself. The axis will be divided into a number of segments, with an image map entry created for each segment.

30.5.12 getCoor(value as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the geometric coordinates given the data value.

30.5.13 getFormattedLabel(v as Double, options as string = """) as string

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Parameter	Default	Description
noOfSegments	(Mandatory)	The number of segments to divide the axis into.
mapWidth	(Mandatory)	The width of the axis used for the purpose of generating the image map.
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.
extraAttr	""	A text string to specify additional attributes to add to the <area>tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Function: Gets the label at the specified position on the axis, formatting one if necessary.
Notes:

Argument	Default	Description
v	(Mandatory)	The position specified as a value on the axis scale.
formatString	""	The format string used to format a label if necessary. Please refer to Axis.setLabelFormat for the syntax of the format string. An empty string means the format will be automatically determined.

30.5.14 getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for the axis labels.
Notes: This method should be called only after creating the chart image (eg. using BaseChart.makeChart). The image map cannot be determined without creating the chart image first.

This method accepts a URL as its argument. When generating an image map, it appends query parameters to the URL to indicate which legend entry the user has clicked.

The following is an example image map generated for an axis with 3 labels.

<area shape="rect" coords="30,220,70,239" href="handler.asp?value=0&label=John">
<area shape="rect" coords="70,220,110,239" href="handler.asp?value=1&label=Mary">
<area shape="rect" coords="110,220,150,239" href="handler.asp?value=2&label=Peter">

The image map consists of multiple <area>tags, one for each label. In the "href" attributes, query parameters are appended to the URL to provide information on the label clicked.

The image map produces by ChartDirector does not include the <map>and </map>tag. This is intentional so that you can add additional custom <area>tags to the image map, or append multiple image maps together.

The format of the appended URL parameters is determined using the queryFormat argument, which by default is:

value= { value } &label= { label }

The texts in curly brackets (i.e. { value } , { label }) will be replaced by the actual values when generating the image map. For example, { label } will be replaced by the label text.

Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.

In addition to customizing the query parameters, ChartDirector supports additional HTML attributes in the <area>tags using the extraAttr argument.

For example, the following extraAttr will add a "title" HTML attribute to every <area>tag. The "title" attribute will be displayed as "tool tip" when the mouse moves over the image map.

title='Click me for details on { label } '

Another common usage of the extraAttr argument is to add "onmouseover" and "onmouseout" HTML attributes to handle user interaction using Javascript on the browser.

Parameter	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map.

Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.

queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported. The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default. Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.
extraAttr	""	A text string to specify additional attributes to add to the <area>tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

30.5.15 getLabel(i as Double) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the label at the specified position on the axis.
Notes:

Parameter	Default	Description
i	(Mandatory)	The position specified as a value on the axis scale.

Return Value
Returns the label at the specified position, or a "" string if there is no label at that position.

30.5.16 getLabelTable as CDMLTableMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the CDML table created by CDAxisMBS.makeLabelTable.

30.5.17 getMaxValue as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the upper bound of the axis.
Notes: The upper bound of an axis is known only after auto-scaling. So this method should be called only after ChartDirector has finished auto-scaling (e.g. after calling BaseChart.layout to explicitly auto-scale the axis).

30.5.18 getMinValue as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the lower bound of the axis.
Notes: The lower bound of an axis is known only after auto-scaling. So this method should be called only after ChartDirector has finished auto-scaling (e.g. after calling BaseChart.layout to explicitly auto-scale the axis).

30.5.19 getThickness as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the thickness of the axis.
Notes: The axis can be considered as a line, with one side facing the internal of the plot area, and the other side not facing the plot area. By default, the latter side includes the axis labels and axis title (although ChartDirector allows the axis to be configured so that the labels and titles are internal to the plot area).

The thickness of an axis only refers to the thickness of the side not facing the plot area. For a vertical axis, it is the width of the bounding box of that side, including the axis ticks, labels and title if they are on that side. For a horizontal axis, it is the height of the bounding box.

The intention of this method is to allow the chart to be adjusted to leave enough space for the axis labels and title.

This method should be called only after axis layout (after calling CDXYChartMBS.layoutAxes, CDBaseChartMBS.layout or CDXYChartMBS.packPlotArea).

Arguments:
None

Return Value
The thickness of the axis in pixels.

30.5.20 getTicks as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the values of the ticks.
Notes: Return Value
An array of numbers representing the values of the ticks.

30.5.21 getX as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x-coordinate of starting point of the axis.
Notes: For an XYChart object, the starting point of a horizontal axis is its left end point, and the starting point of a vertical axis is its bottom end point. For a PolarChart object, the starting point of a radial axis is the origin. For other types of charts, the starting point of an axis is undefined.

30.5.22 getY as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y-coordinate of starting point of the axis.
Notes: For an XYChart object, the starting point of a horizontal axis is its left end point, and the starting point of a vertical axis is its bottom end point. For a PolarChart object, the starting point of a radial axis is the origin. For other types of charts, the starting point of an axis is undefined.

30.5.23 makeLabelTable as CDMLTableMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a CDML table and docks it to the axis, with one row (for horizontal axis) or column (for vertical axis) containing the axis labels.
Notes: Before calling this method, it is necessarily to set the labels on the axis first using CDAxisMBS.setLabels. You should only use this method on a label based axis with no label stepping.

This method will automatically indent the axis (see CDAxisMBS.setIndent), and set the tick offset to 0.5 (see CDAxisMBS.setTickOffset). This is to ensure the plot area grid lines align with the table grid lines (instead of align with the labels).

You may use the returned CDMLTableMBS object to insert additional rows and/or columns to the table. A common application of this method is to insert the data values to the table, so the chart will have a data table docked to the axis, aligned with the chart contents.

Arguments:
None

Return Value
A CDMLTable object containing the axis labels.

30.5.24 setAngle(angle as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the angular coordinates of the data points.

30.5.25 setAutoScale(topExtension as Double = 0.1, bottomExtension as Double = 0.1, zeroAffinity as Double = 0.8)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the margins at the two ends of the axis during auto-scaling, and whether to start the axis from zero.
Notes: During auto-scaling, it is often desirable to leave some margins at the ends of the axis. For example, suppose in a bar chart, the longest bar is 10 units. If auto-scaling chooses 0 - 10 as the scale, the longest bar will touch the top edge of the plot area. In many cases, the chart will look better if there is some margin so that the longest bar does not touch the top edge.

The setAutoScale can be used to reserve some margins at the ends of the axis by using a scale that is larger than necessary. For example, in the above case, if a scale of 0 - 12 is used, then the longest bar will not touch the top edge.

Other common reasons for reserving margins at the ends of the axis include making sure the data labels (which may be drawn on top of the data points) will not go outside the plot area, and that objects put at the top or bottom of the plot area (such as legend box and custom text box) will not overlap with the data points.

Note that there is an alternative way to reserve space at the ends of the axis - the Axis.setMargin method.

In the setAutoScale method, the amount of margins reserved is controlled by the topExtension and bottomExtension arguments. These arguments determine the portion of the axis where no data point can reach. For example, a topExtension of 0.2 will ensure no data point can fall within the top 20% of the axis.

Note that ChartDirector will not extend the scale across the 0 point.

For example, suppose the data range is 0.1 - 9.9. If 10% margin is added to the bottom end of the axis, the bottom end may become negative. In this case, ChartDirector will extend the bottom end to 0 at most.

In other words, if the data range is completely positive, ChartDirector will not extend the axis to negative, as it would be undesirable in most applications. The same applies if the data range is completely negative.

For a purely positive axis, the bottom end has "zero affinity". That means ChartDirector will tend to choose 0 as the bottom end because zero is a natural starting point for the axis. However, if the data range is too

extreme (e.g. the data is in the range 10000 - 10005), it may be "unreasonable" to choose 0 as the axis starting point. In this case, ChartDirector will not use 0 as the axis starting point.

ChartDirector will determine that it is "unreasonable" to use 0 as the axis starting point if the data fluctuation (the difference between the maximum and minimum data values) is too small compare with the data value. ChartDirector test the "too small" condition using the formula:

maxDataValue * zeroAffinity <minDataValue

where zeroAffinity by default is 0.8.

Similar "zero affinity" mechanism applies to the top end of the axis for a purely negative axis. If the data range contains both positive and negative values, the zero point is always included.

The zeroAffinity argument of the setAutoScale method allows you to modify the zero affinity when performing auto-scaling. Zero affinity should be between 0 and 1. A large value encourages ChartDirector to start the axis from zero.

A zero affinity of 1 means the axis always includes the zero point. A zero affinity of 0 means that the axis is scaled purely according to the data range, without any preference for the zero point.

Note that zero affinity is ignored for log scale axis as log scale axis cannot contain 0.

Parameter	Default	Description
topExtension	0.1	The top portion of the axis that no data point should fall into. For example, a value of 0.2 means no data value will fall within the top 20% of the axis. The topExtension must be between 0 to 1.
bottomExtension	0.1	The bottom portion of the axis that no data point should fall into. For example, a value of 0.2 means no data value will fall within the bottom 20% of the axis. The bottomExtension must be between 0 to 1.
zeroAffinity	0.8	The tendency of ChartDirector to include zero in the axis during auto-scaling. The value must be between 0 and 1. A large value encourages ChartDirector to start the axis from zero. A value of 1 means the axis always includes the zero point. A value of 0 means there is no preference for the zero point during auto-scaling.

30.5.26 setColors(axisColor as color, labelColor as color, titleColor as color, tickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.5.27 setColors(axisColor as Integer, labelColor as Integer = &hffff0002, titleColor as Integer = -1, tickColor as Integer = -1) 4969

30.5.27 setColors(axisColor as Integer, labelColor as Integer = &hffff0002, titleColor as Integer = -1, tickColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the axis itself, axis label, axis title and axis ticks.
Notes: By default, the axis and axis ticks are drawn using the LineColor, while the axis label and axis title are drawn using the TextColor. You may use this method to change their colors.

Parameter	Default	Description
axisColor	(Mandatory)	The color of the axis itself.
labelColor	TextColor	The color of the axis labels.
titleColor	-1	The color of the axis title. -1 means the axis title color is the same as the axis label color.
tickColor	-1	The color of the axis ticks. -1 means the axis ticks color is the same as the axis color.

See also:

- 30.5.26 setColors(axisColor as color, labelColor as color, titleColor as color, tickColor as color) 4968

30.5.28 setDateScale(formatString as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use date auto-scale.
Notes:

Parameter	Default	Description
formatString	""	The format used for the labels on the axis. Please refer to Axis.setLabelFormat for the syntax of the format string. An empty string means the format will be automatically determined.

See also:

- 30.5.29 setDateScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4970

- 30.5.30 setDateScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0) 4970

30.5.29 setDateScale(lowerLimit as Double, upperLimit as Double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given date scale and the given labels.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis, representing using one of the ChartDirector supported date format.
upperLimit	(Mandatory)	The upper bound of the axis, representing using one of the ChartDirector supported date format.
labels	(Mandatory)	An array of text strings to be used as the labels on the axis. ChartDirector will distribute the labels evenly on the axis. By default, all labels are associated with major ticks. These can be modified by using '-' or '

textasciitilde ' as the first character. Please refer to Axis.setLabels for details.

See also:

- 30.5.28 setDateScale(formatString as string = "") 4969
- 30.5.30 setDateScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0) 4970

30.5.30 setDateScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given date scale.
Notes:

The value 30 * 86400 will be assume to mean one month (which actually contains a variable number of seconds), and 60 * 86400 will be assumed to mean 2 months and so on. The value 360 * 86400 therefore means 12 months, or 1 year.

The default value of 0 means no minor tick is used.
See also:

- 30.5.28 setDateScale(formatString as string = "") 4969
- 30.5.29 setDateScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4970

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis, representing using one of the ChartDirector supported date format.
upperLimit	(Mandatory)	The upper bound of the axis, representing using one of the ChartDirector supported date format.
majorTickInc	0	Adds major ticks to the axis, where the major ticks are separated by majorTickInc seconds. Each major tick will have an associated text label for the value if the axis at the tick. The value 30 * 86400 will be assume to mean one month (which actually contains a variable number of seconds), and 60 * 86400 will be assumed to mean 2 months and so on. The value 360 * 86400 therefore means 12 months, or 1 year. The default value of 0 means the major ticks will be automatically determined. In this case, the lowerLimit and upperLimit may be automatically adjusted to align with the ticks. Use kNoValue to disable major ticks.
minorTickInc	0	Adds minor ticks to the x-axis, where the minor ticks are separated by minorTickInc seconds.

30.5.31 setFormatCondition(condition as string, operand as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the condition that subsequent Axis.setLabelFormat and Axis.setMultiFormat will become applicable.
Notes: In some applications, the axis range can vary greatly. For example, for a date/time axis, the ticks on the axis can be hourly ticks if the duration is short, or daily ticks (or even monthly or yearly) if the duration is long. One can always use a universal axis format that is applicable in all cases (such as "mmm dd, yyyy<*br*>hh:nn:ss"), or one can leave ChartDirector to automatically come up with a suitable axis format.

Sometimes it may be desirable to explicitly specify different axis formats depending on tick types. For example, one may want to specify a certain format if the ticks are hourly, and another format if the ticks are daily.

If it is possible to predict which kind of ticks will be on the axis, one can always use "if" statements to specify different axis formats for various cases.

The setFormatCondition method is for cases in which it is difficult to predict which type of ticks would appear on the axis. For example, in an auto-scaled axis in which the duration can vary continuously, in some marginal cases, it is difficult to predict if auto-scaling will choose hourly or daily ticks.

The setFormatCondition method allows you to specify a condition to be tested against the auto-scaling result, so that subsequent
Axis.setLabelFormat or Axis.setMultiFormat will be applicable only if the condition is true.

The types of condition supported are:

Condition	Description
"align"	Test if all the ticks are aligned to the operand. Use 3600 for testing hourly alignment, 86400 (1 day = 86400) for daily alignment, 30 * 86400 for monthly alignment and 360 * 86400 for yearly alignment. (Note: The values for monthly and yearly alignments are special values recognized by ChartDirector. They works even if a month or year is not exactly 30 or 360 days.)
">"	Test if the maximum absolute value of the ticks are larger than the operand. This is useful when one needs to apply different formats to large numbers (eg. use scientific formats if the axis range exceed certain values).
">="	Test if the maximum absolute value of the ticks is larger than or equal to the operand.
"<"	Test if the maximum absolute value of the ticks is less than the operand.
"<="	Test if the maximum absolute value of the ticks is less than or equal to the operand.
"=="	Test if the maximum absolute value of the ticks is equal to the operand.
"="	Same as "==" above.
"!="	Test if the maximum absolute value of the ticks is not equal to the operand.
"<>"	Same as "!=" above.
"else"	This condition is true if and only if the previous condition is false.
"true"	This condition is always true. It is useful as a "catch all" condition.
"false"	This condition is always false.

Parameter	Default	Description
condition	(Mandatory)	The type of condition to test. Must be one of the condition types in the above table. This text string is case sensitive.
operand	0	The operand for condition types that need an operand.

30.5.32 setIndent(indent as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies if the axis should be "indented" or not.
Notes: Normally, the x-axis is automatically scaled so that x coordinate of first data point is at the beginning of the x-axis, and the x coordinate last data point is at the end of the axis. If a line layer is drawn, the line will span from the left border of the plot area to the right border of the plot area.

However, for bar layer, if the x-axis is scaled as above, half of the first bar and half of the last bar will be outside the plot area. The same applies to HLOC layers, candlestick layers and box-whisker layers.

When the axis ”indented”, some margins will be reserved at the ends of the axis, so that all data representation are within the plot area.

By default, ”indented” mode is automatically used in x-axis for charts that contain bar, HLOC, candlestick or box-whisker layers.

The setIndent method allows you to manually configure whether ”indented” mode is used or not. One common usage is to align the x-axes in different charts.

For example, suppose a web page contains a bar chart and a line chart. The bar chart will be using ”indented” mode x-axis, while the line chart will be using ”non-indented” mode. If the two charts are on top of one another for ease of comparison (common for finance style charts), it is desirable that their x-axes should align. In this case, the setIndent method can be used to force the line chart to use indented mode x-axis.

Parameter	Default	Description
indent	(Mandatory)	A true value sets the axis to indented mode. A false value sets the axis to non-indented mode.

30.5.33 setLabelAlignment(alignment as Integer, minLabelSpace as Integer = 3)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the label alignment.

30.5.34 setLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the format for numeric or date/time axis labels.
Example:

```
Var c as CDAxisMBS

// you can use label formats like this:

c.setLabelFormat("<*block,halign=left*><*font=timesbi.ttf,size=12,underline=1*>{ label } <*/font*><*br*>US$
{ value } K ( { percent } %)")
```

```
// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } %")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } %")

// and

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } %")

// uses dot for thousands and comma for decimal separator.
```

Notes: By default, ChartDirector will try to guess if the axis represents numbers or dates. If the axis represents numbers, it will use " { value } " as the default format. If the axis represents dates, it will guess the format based on resolution of the dates (e.g. whether the dates contain hourly data or monthly data, etc). It may use formats such as { value | mm/dd/yy<*br*>hh:nn:ss } , { value | mm/dd/yy hh:nn:ss } , { value | mm/dd/yyyy } , { value | mm/yyyy } or { value | yyyy } .

Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.

Parameter	Default	Description
formatString	(Mandatory)	The format string.

30.5.35 setLabelGap(d as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the distance between the axis labels and the ticks on the axis.
Notes:

Parameter	Default	Description
d	(Mandatory)	The distance between the axis label and the tick in pixels.

30.5.36 setLabelOffset(offset as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts the axis labels from its default position along the axis.
Notes: This method expects the offset along the axis being a value on the axis scale. The Box.setPos

method of the axis label prototype (obtained using Axis.setLabelStyle) can also be used to shift the labels, with the offsets specified in pixel units.

Parameter	Default	Description
offset	(Mandatory)	The distance to shift the labels along the axis as a value on the axis scale.

30.5.37 setLabels(labels() as Double, formatString as string = "") as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the numeric/date/time labels to be used on the axis.
Notes: This method is typically used to set the x-axis to enumerated scale. For more details on what is enumerated axis scale, please refer to
Axis.setLabels.

This method assumes the labels are in their "native" form (that is, not formatted). Please refer to Date Representation for the native date/time formats supported in ChartDirector.

If the labels are already formatted into human readable form (that is, they are text strings), use Axis.setLabels instead.

One common issue is that there may be too many labels on the axis. In this case, the Axis.setLabelStep method may be used show only a regularly spaced subset of labels on the axis.

For date/time labels, another alternative is to use Axis.setMultiFormat, which uses filters to select important dates/times (such as dates/times representing the start of a month) for display as labels.

A third method to avoid too many labels is to remove some labels by replacing them with kNoValue before passing them to ChartDirector. If you want to remove the label text but leave a minor tick, use MinorTickOnly as the label value.

labels	(Mandatory)	An array of numbers/dates to be used as the axis labels.
formatString	""	A format string to specified how to format the labels into human readable form. Please refer to Axis.setLabelFormat for the syntax of the format string. An empty string means the format will be automatically determined.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
See also:

• 30.5.38 setLabels(labels() as string) as CDTextBoxMBS 4976

30.5.38 setLabels(labels() as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the text labels to be used on the axis.
Notes: This method is typically used to set the x-axis to enumerated scale. In enumerated scale, the data points are associated with the x-axis by position. The first data point will be plotted at the first label position on the x-axis, the second data point at the second label position, and so on.

Enumerated axis is a very flexible axis type. It is most suitable for chart types where the data points are evenly spaced on the x-axis. The axis labels can be any text. They do not need to be numbers or dates. If they are numbers or dates, you can format them in any way you like before calling this method.

Internally, ChartDirector will assign a value of 0 to the first axis label, 1 to the second axis label, and so on. These values are not visible. Only the axis labels are visible. However, these values may be useful for some ChartDirector features that need to reference the axis position by value, such as adding mark lines using Axis.addMark.

By default, all axis labels will be associated major ticks. To associate a label with a minor tick, use '-' as the first character of the label. To draw a label without any tick at all, use '
textasciitilde ' as the first character of the label.

Leading '-' or '
textasciitilde ' characters are tick specification characters and will not appear on the labels. They just specify the the tick style to be associated with the labels. If you want have a label that actually begins these characters, add '\' as the first character as the escape character.

One common issue is that there may be too many labels on the axis. In this case, the Axis.setLabelStep method may be used show only a regularly spaced subset of labels on the axis.

Another method is to remove some labels is to replace them with empty strings before passing them to ChartDirector. If you want to remove the label text but leave a major tick, use a space character " " as the label text. If you want to remove the label text but leave a major tick, use "-" as the label text.

Parameter	Default	Description
text	(Mandatory)	An array of strings containing the text of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See also:

- 30.5.37 setLabels(labels() as Double, formatString as string = "") as CDTextBoxMBS 4975

30.5.39 setLabelStep(majorTickStep as Integer, minorTickStep as Integer = 0, majorTickOffset as Integer = 0, minorTickOffset as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shows a regularly spaced subset of the axis labels on the axis.
Notes: This method is typically used in conjunction with
Axis.setLabels. These two methods define the full set of labels on the axis, one for each data point in a data set. In many cases, there may be too many labels and the axis may become overcrowded with labels. The setLabelStep method will cause the axis to show a regularly spaced subset of labels instead all labels.

Parameter	Default	Description
majorTickStep	(Mandatory)	The spacing between visible labels (major ticks). For example, a value of 10 means displaying 1 label for every 10 labels.
minorTickStep	0	For labels that are not displayed, ChartDirector can optionally put a minor tick in its place. The argument specifies the spacing between minor ticks. For example, a value of 5 means displaying 1 minor tick for every 5 labels. The default value of 0 means no minor tick is used.
majorTickOffset	0	The offset used for selecting the labels. For example, if majorTickStep is set to 10, by default, ChartDirector will select the labels with index 0, 10, 20, 30 and so on. If the majorTickOffset argument is set to 3, then ChartDirector will select labels with index 3, 13, 23, 33 and so on.
minorTickOffset	-7fffffff	The offset used for selecting minor tick points. The usage is the same as the majorTickOffset argument, except it applies to minor tick points. The default is to use the same value as majorTickOffset.

30.5.40 setLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font style used to for the axis labels.
Notes: See Font Specification for details on various font attributes.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

Parameter	Default	Description
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels in points.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.5.41 setLabelStyle(font as string, fontsize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS 4978

30.5.41 setLabelStyle(font as string, fontsize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.5.40 setLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 4977

30.5.42 setLength(length as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the length of the axis.

30.5.43 setLinearScale(formatString as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use linear auto-scale.
Notes:

See also:

- 30.5.44 setLinearScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4979
- 30.5.45 setLinearScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0) 4979

Parameter	Default	Description
formatString	""	The format used for the labels on the axis. Please refer to Axis.setLabelFormat for the syntax of the format string. An empty string means the format will be automatically determined.

30.5.44 setLinearScale(lowerLimit as Double, upperLimit as Double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given linear scale and the given labels.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis.
upperLimit	(Mandatory)	The upper bound of the axis.
labels	(Mandatory)	An array of text strings to be used as the labels on the axis. ChartDirector will distribute the labels evenly on the axis. By default, all labels are associated with major ticks. These can be modified by using '-' or ' textasciitilde ' as the first character. Please refer to Axis.setLabels for details.

See also:

- 30.5.43 setLinearScale(formatString as string = "") 4978
- 30.5.45 setLinearScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0) 4979

30.5.45 setLinearScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given linear scale.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis.
upperLimit	(Mandatory)	The upper bound of the axis.
majorTickInc	0	Adds major ticks to the axis, where the major ticks are separated by majorTickInc in value. Each major tick will have an associated text label for the value if the axis at the tick. The default value of 0 means the major ticks will be automatically determined. In this case, the lowerLimit and upperLimit may be automatically adjusted to align with the ticks. Use kNoValue to disable major ticks.
minorTickInc	0	Adds minor ticks to the axis, where the minor ticks are separated by minorTickInc in value. The default value of 0 means no minor tick is used.

See also:

- 30.5.43 setLinearScale(formatString as string = "") 4978
- 30.5.44 setLinearScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4979

30.5.46 setLogScale(formatString as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use logarithmic auto-scale.
Notes:

Parameter	Default	Description
formatString	""	The format used for the labels on the axis. Please refer to Axis.setLabelFormat for the syntax of the format string. An empty string means the format will be automatically determined.

See also:

- 30.5.47 setLogScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4980
- 30.5.48 setLogScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0) 4981

30.5.47 setLogScale(lowerLimit as Double, upperLimit as Double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given logarithmic scale and the given labels.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis.
upperLimit	(Mandatory)	The upper bound of the axis.
labels	(Mandatory)	An array of text strings to be used as the labels on the axis. ChartDirector will distribute the labels evenly on the axis. By default, all labels are associated with major ticks. These can be modified by using '-' or ' textasciitilde ' as the first character. Please refer to Axis.setLabels for details.

See also:

- 30.5.46 setLogScale(formatString as string = "") 4980
- 30.5.48 setLogScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0) 4981

30.5.48 setLogScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis to use the given logarithmic scale.
Notes:

Parameter	Default	Description
lowerLimit	(Mandatory)	The lower bound of the axis.
upperLimit	(Mandatory)	The upper bound of the axis.
majorTickInc	0	Adds major ticks to the axis, where the major ticks are separated by majorTickInc in ratio. For example, a value of 10 means each tick will be 10 times the value of the previous tick. Each major tick will have an associated text label for the value if the axis at the tick. The special predefined constant LogTick (= 1.6e308) means the tick increment will be using the non-regular ratio 1, 2, 5, 10, 20, 50, 100, ... The default value of 0 means the major ticks will be automatically determined. In this case, the lowerLimit and upperLimit may be automatically adjusted to align with the ticks. Use kNoValue to disable major ticks.
minorTickInc	0	Adds minor ticks to the axis, where the minor ticks are separated by minorTickInc in ratio.

The special constant LogTick means the tick increment will be using the non- regular ratio 1, 2, 5, 10, 20, 50, 100, ...

The default value of 0 means no minor tick is used.
See also:

- 30.5.46 setLogScale(formatString as string = "") 4980
- 30.5.47 setLogScale(lowerLimit as Double, upperLimit as Double, labels() as string) 4980

30.5.49 setMargin(topMargin as Integer, bottomMargin as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reserve margins at the ends of the axis.
Notes: This method is usually used to reserve space in the plot area. For example, if some margin is reserved at the top of the vertical y-axis, the top of the plot area will contain no data points. It is because this region would be outside the active range of the y-axis. If anything is put at the top of the plot area (such as a legend box or custom text), it will not overlap with the data points.

Note if auto-scaling is used, there is an alternative way to reserve space at the top and/or bottom of the plot area - the Axis.setAutoScale method.

Parameter	Default	Description
topMargin	(Mandatory)	The margin reserved at the top end (or right end for horizontal axis) of the axis in pixels.
bottomMargin	0	The margin reserved at the bottom end (or left end for horizontal axis) of the axis in pixels.

30.5.50 setMinTickInc(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum distance between two ticks on the axis for auto-scaled axis.
Notes: The most common use of this method is to ensure the ticks are of integer values (the minimum distance set to 1).

ChartDirector auto-scaling will automatically determine the optimal number of ticks and labels on the axis. However, in some cases, the nature of the data may be such that the ticks should assume only certain discrete values (such as must be integers). This method will inform ChartDirector for this constraint when performing auto-scaling.

For a log scale axis, because the axis ticks are unevenly spaced, the minimum distance will be handled as the minimum value allowed for the axis scale.

Parameter	Default	Description
inc	(Mandatory)	The minimum distance between two ticks on the axis as a data value.

30.5.51 setMultiFormat(filter as Integer, format as string, labelSpan as Integer = 1, promoteFirst as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds one filter and format string to the multi-format lists.
Notes: Please refer to Axis.setMultiFormat on how to use this method.

Parameter	Default	Description
filterId	(Mandatory)	The filter that defines a subset of labels.
formatString	(Mandatory)	The format string for formatting the subset defined by the above filter.
labelSpan	1	The number of label positions that are claimed by one label. If a label occupies more than 1 position, ChartDirector will not put labels on nearby positions, even if they meet the filter criteria.
promoteFirst	true	If set to true, the first label will be promoted to a higher filter category in the multi-format list.

See also:

- 30.5.52 setMultiFormat(filter1 as Integer, format1 as string, filter2 as Integer, format2 as string, labelSpan as Integer = 1, promoteFirst as boolean=true) 4983

30.5.52 setMultiFormat(filter1 as Integer, format1 as string, filter2 as Integer, format2 as string, labelSpan as Integer = 1, promoteFirst as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets multiple formats for numeric or date/time axis labels.
Notes: This method is typically used to format date/time labels. For example, for an axis that spans 90 days, this method can be used to format the first labels of each month in bold as "mmm-dd", while other labels are shown in normal font as "dd".

The multiple formats are defined as a list of filters and format strings. If the label value satisfies the first filter, it will be formatted using the first format string. Otherwise if the label value satisfies the second filter, it will be formatted using the second format string, and so on. If a label value does not satisfy any filter, it will be discarded.

In the above example, the first filter can be a "start of month" filter (created using Chart::StartOfMonthFilter), and the first format string can be " { value | mmm-dd } ". The second filter can be the "all pass" filter (created using Chart::AllPassFilter), and the format string can be " { value | dd } ".

Supported filters in ChartDirector include:

Filter	Description
Chart::StartOfHourFilter	Creates a data filter that matches date/times that represent the start of a new hour in a date/time series.
Chart::StartOfDayFilter	Creates a data filter that matches date/times that represent the start of a new day in a date/time series.
Chart::StartOfWeekFilter	Creates a data filter that matches date/times that represent the start of a new week in a date/time series.
Chart::StartOfMonthFilter	Creates a data filter that matches date/times that represent the start of a new month in a date/time series.
Chart::StartOfYearFilter	Creates a data filter that matches date/times that represent the start of a new year in a date/time series.
Chart::RegularSpacingFilter	Creates a data filter that matches 1 out of every N elements.
Chart::AllPassFilter	Creates a data filter that matches every element.
Chart::NonePassFilter	Creates a data filter that matches no element.
Chart::SelectItemFilter	Creates a data filter that matches one specified item.

For the format strings, please refer to Parameter Substitution and Formatting on their syntax.

A single setMultiFormat method supports two filters and two format strings. You can use multiple setMultiFormat methods to add more filters and format strings.

One common issue in putting labels on the axis is that there may be too many labels on the axis. The setMultiFormat method supports a labelSpan argument that specifies how many label positions a single label will occupy. If a label occupies more than 1 position, ChartDirector will not put labels on nearby positions, even if they meet the filter criteria.

The setMultiFormat method supports special handling of the first label on the axis. For example, in the above example, we may want to show the the first label as "mmm-dd", even if it is not actually the "start of month". The promoteFirst argument, if set to true, will cause the first label to be promoted to a higher filter category in the multi-format list. For example, if the first label satisfies only the second filter, it will be formatted as if it satisfies the first filter.

Parameter	Default	Description
filter1	(Mandatory)	The filter that defines the first kind of labels.
format1	(Mandatory)	The format string for the first kind of labels.
filter2	(Mandatory)	The filter that defines the second kind of labels.
format2	(Mandatory)	The format string for the second kind of labels.
labelSpan	1	The number of label positions that are claimed by one label. If a label occupies more than 1 position, ChartDirector will not put labels on nearby positions, even if they meet the filter criteria.
promoteFirst	true	If set to true, the first label will be promoted to a higher filter category in the multi-format list.

See also:

- 30.5.51 setMultiFormat(filter as Integer, format as string, labelSpan as Integer = 1, promoteFirst as boolean=true) 4982

30.5.53 setOffset(x as Integer, y as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the positional offset of the axis.
Notes: By default, ChartDirector draws horizontal axes at the top/bottom borders of the plot area, and vertical axes at the left/right borders of the plot area.

This method can be used to shift an axis from its standard position.

Arguments:

Argument	Default	Description
x	(Mandatory)	The x offset in pixels.
y	(Mandatory)	The y offset in pixels.

30.5.54 setReverse(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverse the axis.
Notes: For a normal vertical axis, the axis starts from the bottom and increase its value towards the top. For a normal horizontal axis, the axis starts from the left and increase its value towards the right. The setReverse method can be used to reverse the direction of the axis.

Parameter	Default	Description
b	true	A true value means the axis is reversed. A false value means the axis is not reversed.

30.5.55 setRounding(roundMin as boolean, roundMax as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Controls whether to round the ends of the axis to align with tick positions.
Notes: For example, if the axis is from 0.33 - 9.7, ChartDirector may round it to 0 - 10 so that the ends 0 and 10 are properly aligned with the ticks.

By default, ChartDirector will round the axis ends for the y-axis, but not for the x-axis. An exception is a chart containing a scatter layer, where both x and y axes will be rounded.

Parameter	Default	Description
roundMin	(Mandatory)	A true value means the lesser end of the axis should be rounded to align with tick positions. A false value means no rounding.
roundMax	(Mandatory)	A true value means the greater end of the axis should be rounded to align with tick positions. A false value means no rounding.

30.5.56 setTickColor(majorTickColor as color, minorTickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setTickColor method, but uses color instead of integer data type for passing color values.
See also:

• 30.5.57 setTickColor(majorTickColor as Integer, minorTickColor as Integer = -1) 4986

30.5.57 setTickColor(majorTickColor as Integer, minorTickColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the axis ticks.
Notes:

Parameter	Default	Description
majorTickColor	(Mandatory)	The color of the major ticks.
minorTickColor	-1	The color of the major ticks. -1 means the color is the same as majorTickColor

See also:

• 30.5.56 setTickColor(majorTickColor as color, minorTickColor as color) 4985

30.5.58 setTickDensity(majorTickSpacing as Integer, minorTickSpacing as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the density of the axis ticks.
Notes: Tick density is the desired distance between two ticks in pixels. When ChartDirector performs auto-scaling, it will decide how many ticks to put on the axis based on tick density.

Note that the actual tick density chosen in auto-scaling may not be exactly the same as the desired tick density. It is because ChartDirector may have other constraints in choosing the ticks, such as the ticks and axis range should be neat numbers, and the axis must contain an integral number of ticks, etc. ChartDirector may use a tick distance that is larger than suggested, but never smaller.

Parameter	Default	Description
majorTickSpacing	(Mandatory)	Specify the desired distance between two major ticks in pixels.
minorTickSpacing	-1	Specify the desired distance between two minor ticks in pixels. -1 means minor ticks are not used.

30.5.59 setTickLength(majorTickLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the length of the axis ticks.
Notes: A positive tick length means the ticks are drawn outside the plot area. A negative tick length means

the ticks are drawn inside the plot area.

Parameter	Default	Description
majorTickLen	(Mandatory)	The length of the major ticks in pixels. The length of the minor ticks will automatically be set to half the length of the major ticks.

See also:

- 30.5.60 setTickLength(majorTickLen as Integer, minorTickLen as Integer) 4987

30.5.60 setTickLength(majorTickLen as Integer, minorTickLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the length of the major and minor axis ticks.
Notes: A positive tick length means the ticks are drawn outside the plot area. A negative tick length means the ticks are drawn inside the plot area.

Parameter	Default	Description
majorTickLen	(Mandatory)	The length of the major ticks in pixels.
minorTickLen	(Mandatory)	The length of the minor ticks in pixels.

See also:

- 30.5.59 setTickLength(majorTickLen as Integer) 4986

30.5.61 setTickOffset(offset as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts the position of the ticks along the axis.
Notes: By default, ChartDirector draws the ticks at the label position. This method is typically used to shift the ticks so that the ticks are between two labels, rather than aligned with the label.

The offset is specified as a value on the axis scale. For a label based axis (configured using Axis.setLabels), shifting with an offset of 0.5 means shifting half the label interval. This will achieve the effect of putting the ticks in between the labels.

Parameter	Default	Description
offset	(Mandatory)	The distance to shift the ticks along the axis as a value on the axis scale.

30.5.62 setTickWidth(majorTickWidth as Integer, minorTickWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width of the axis ticks.
Notes:

Parameter	Default	Description
majorTickWidth	(Mandatory)	The width of the major ticks in pixels.
minorTickWidth	-1	The width of the minor ticks in pixels. -1 means the width is the same as majorTickWidth.

30.5.63 setTitle(text as string, font as string = """, fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a title to the axis.
Notes: See Font Specification for details on various font attributes.

Parameter	Default	Description
text	(Mandatory)	The title text.
font	""	The font used to draw the title. If no font is specified, the default is "bold".
fontSize	8	The size of the font in points.
fontColor	TextColor	The color used to draw the title text.

Return Value
A TextBox object representing the axis title. This may be used to fine-tune the appearance of the axis title.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.5.64 setTitle(text as string, font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS 4988

30.5.64 setTitle(text as string, font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setTitle method, but uses color instead of integer data type for passing color values.
See also:

- 30.5.63 setTitle(text as string, font as string = """, fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS 4988

30.5.65 setTitlePos(alignment as Integer, titleGap as Integer = 3)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position of the axis title relative to the axis.
Notes: By default, the axis title will be drawn at the middle of the axis outside the plot area. You may change the location of the title. For example, instead of drawing the y-axis title at the middle of the axis, you may want draw it at the top of the axis.

Parameter	Default	Description
alignment	(Mandatory)	The position of the title relative to the axis.
titleGap	3	The distance between the axis title and the axis in pixels.

30.5.66 setWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the line width of the axis.
Notes:

Parameter	Default	Description
width	(Mandatory)	The line width of the axis in pixels.

30.5.67 syncAxis(axis as CDAxisMBS, slope as Double = 1.0, intercept as Double = 0.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes this axis with another axis using a linear formula.
Notes: This method is typically used if the two axes represent the same quantity but in different units. For example, one axis may represent temperature in Celsius, and the other in Fahrenheit, or they may represent lengths in meters and feet.

The scale of this axis (value) will be related to the scale of the another axis (value2) using the following formula:

value = value2 * slope + intercept

Typically, one of the axis will be for actual charting, and its scale will be determined in the standard way using auto or manual scaling. Then the second axis is set to synchronize with the first axis.

Parameter	Default	Description
axis	(Mandatory)	The axis to synchronize to.
slope	1	The slope for synchronizing this axis to the other axis.
intercept	0	The intercept parameter for synchronizing this axis to the other axis.

30.5.68 syncScale(axis as CDAxisMBS = nil, slope as double = 1.0, intercept as double = 0.0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes the scale of this axis with another axis using a linear formula.
Notes: The scale of this axis (value) will be related to the scale of the source axis (value2) using the following formula:

value = value2 * slope + intercept

The differences between syncScale and Axis.syncAxis are:

- Axis.syncAxis assumes the two axes are of the same length. In addition to the scale, it will also synchronize the ticks and labels, and configurations that may affect the positions of ticks and labels, such as axis margins and axis indentation. This ensures the two axes scale align properly.
- syncScale does not assume the two axes are of the same length. For example, the y-axis of one chart can be synchronized with the CDColorAxisMBS of a different chart. The two axes can have different labels to fit their different lengths.

Argument	Default	Description
axis	(Mandatory)	The axis to synchronize to. A value of null means not to synchronize to any axis.
slope	1	The slope for synchronizing this axis to the other axis.
intercept	0	The intercept parameter for synchronizing this axis to the other axis.

30.6 class CDBarLayerMBS

30.6.1 class CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The BarLayer class represents bar layers. BarLayer is a subclass of Layer.
Notes: Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.6.2 Methods

30.6.3 setBarGap(barGap as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gap between the bars in a bar chart layer.
Notes: In the setBarGap method, the gap between the bars is expressed as the portion of the space between the bars. For example, a bar gap of 0.2 means 20% of the distance between two adjacent bars is the gap between the bars.

A bar gap of 0 means there is no gap in between the bars. The bar gap can be negative. In this case, the bars will overlap. The predefined constant TouchBar (= -1.7E-100) means the bars will "touch", that is, the bar borders overlap, so two adjacent bars will share the same border.

For multi-bar layers (bar layers using the Side data combine method, or for stacked bar layers with multiple data groups), barGap refers to the portion of the space between bar groups, while subBarGap refers to the portion of the space between bars within the bar group.

Parameter	Default	Description
barGap	(Mandatory)	The portion of the space between the bars (or between bar groups for multi-bar layers).
subBarGap	0.2	This argument only applies to multi-bar charts. It is the portion of the space between the bars in a bar group.

See also:

- 30.6.4 setBarGap(barGap as Double, subBarGap as Double) 4992

30.6.4 setBarGap(barGap as Double, subBarGap as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gap between the bars in a bar chart layer.
Notes: In the setBarGap method, the gap between the bars is expressed as the portion of the space between the bars. For example, a bar gap of 0.2 means 20% of the distance between two adjacent bars is the gap between the bars.

A bar gap of 0 means there is no gap in between the bars. The bar gap can be negative. In this case, the bars will overlap. The predefined constant TouchBar (= -1.7E-100) means the bars will "touch", that is, the bar borders overlap, so two adjacent bars will share the same border.

For multi-bar layers (bar layers using the Side data combine method, or for stacked bar layers with multiple data groups), barGap refers to the portion of the space between bar groups, while subBarGap refers to the portion of the space between bars within the bar group.

Parameter	Default	Description
barGap	(Mandatory)	The portion of the space between the bars (or between bar groups for multi-bar layers).
subBarGap	0.2	This argument only applies to multi-bar charts. It is the portion of the space between the bars in a bar group.

See also:

- 30.6.3 setBarGap(barGap as Double) 4991

30.6.5 setBarShape(shape as Integer, dataGroup as Integer = -1, dataItem as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the bar(s) using built-in shapes.
Notes:

Parameter	Default	Description
shape	(Mandatory)	The bar shape to use. Please refer to Shape Specification on how shapes are specified.
dataGroup	-1	The index of the data group that the shape applies to. In a multi-stacked bar, the data sets that are stacked up into a single bar forms a data group. In a multi-bar chart, each data set is a data group by itself. The default value of -1 means the shape applies to all data groups.
dataItem	-1	The index of the data points that the shape applies to. For example, if set to 3, the shape will only apply to the 4th bar (index starts from 0) in each data series. The default value of -1 means the shape applies to all data points.

See also:

- 30.6.6 setBarShape(shape() as Integer, dataGroup as Integer = -1, dataItem as Integer = -1) 4993

30.6.6 setBarShape(shape() as Integer, dataGroup as Integer = -1, dataItem as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the bar(s) to a custom shape defined using an array of (x, y) coordinates.
Notes:

Parameter	Default	Description
shape	(Mandatory)	The bar shape to use. Please refer to Shape Specification on how shapes are specified.
dataGroup	-1	The index of the data group that the shape applies to. In a multi-stacked bar, the data sets that are stacked up into a single bar forms a data group. In a multi-bar chart, each data set is a data group by itself. The default value of -1 means the shape applies to all data groups.
dataItem	-1	The index of the data points that the shape applies to. For example, if set to 3, the shape will only apply to the 4th bar (index starts from 0) in each data series. The default value of -1 means the shape applies to all data points.

See also:

- 30.6.5 setBarShape(shape as Integer, dataGroup as Integer = -1, dataItem as Integer = -1) 4993

30.6.7 setBarWidth(barWidth as Integer, subBarWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width of the bars.
Notes:

Parameter	Default	Description
barWidth	(Mandatory)	The width of the bars (or bar groups for multi-bar layers) in pixels.
subBarWidth	-1	This argument only applies to multi-bar charts. It is the width of the bars in a bar group in pixels.

30.6.8 setIconSize(height as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the icon(s) to be used in legend box.
Notes: By default, if a legend box is available on the chart, ChartDirector will insert an legend entry for any named data sets in the legend box. The icons for the data sets will be the shape of the bars. The size of the icons will be determined using the key size settings of the legend box (see LegendBox.setKeySize).

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current BarLayer.

If the icon size is set to 0, a square color box will be used as the icon without regarding the shape of the bar.

Parameter	Default	Description
height	(Mandatory)	The height of the icon in pixels.
width	-1	The width of the icon in pixels. The default value of -1 means the width is the same as the height.

30.6.9 setMinImageMapSize(s as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.
Notes: By default, the hot spots defined by image map exactly cover the bars. For very short bars, the hot spots may be very small, and it may become difficult to move the mouse over the hot spots.
This method ensures the hot spots are at least of certain size, even if the bars are shorter. The default is 5 pixels.

Arguments:

Argument	Default	Description
size	(Mandatory)	The minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.

30.6.10 setMinLabelSize(s as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum height (or width for horizontal bars) of the bar segments below which data labels will be hidden.
Notes: In ChartDirector, for a bar layer, data labels (Layer.setDataLabelStyle) are drawn internal to the bar segment, while the aggregate labels (Layer.setAggregateLabelStyle) are drawn external to the bar.

ChartDirector will disable data labels for a bar segment if the bar segment is too short to contain the data label.

By default, ChartDirector will automatically determine what is meant by "too short". The setMinLabelSize method can be used to manually defined the threshold for "too short".

Sometimes it may be desirable to display the data label even though it cannot be contained within the bar segment. In this case, the setMinLabelSize can be used to set the threshold to 0.

Parameter	Default	Description
s	(Mandatory)	The minimum length of the bar segments in pixels, below which data labels will be hidden.

30.6.11 setOverlapRatio(overlapRatio as Double, firstOnTop as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets overlapping among bars in within a bar group in a multi-bar chart.
Notes: By default, in a multi-bar chart, the bars are not overlapped, but are separated with a gap in between. This method can be used to set an alternative style, where the bars partially overlap.

30.6.12 setRoundedCorners

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Parameter	Default	Description
overlapRatio	(Mandatory)	The overlapping ratio between adjacent bars in a bar group. Should be between 0 to 1.
firstOnTop	true	If this value is true, the first data set will be on top of the second data during overlapping, and the second data set will be on top of the third data set, and so on. If this value is false, then the overlapping order will be reversed.

Function: Configures rounded corners for rectangular bars.
Notes: A rectangular bar has 4 corners. Two of them are at the base of the bar, while the other two are at the "data end" of the bar. Note that the base of the bar can be any side of the bar, depending on whether the bar is positive or negative, vertical or horizontal.

For the 2 base corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the two data end corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

Values Provided	Description
0	The radii of the data end corners are automatically determined. The radii of the base corners are set to 0.
1	The radii of the data end corners are set to the specified value. The radii of the base corners are set to 0.
2	The radii of the data end corners are set to the first value. The radii of the base corners are set to the second value.
4	The radius of the data end corner at the negative x direction is set to the first value. The radius of the data end corner at the positive x direction is set to the second value. The radius of the base corner at the negative x direction is set to the third value. The radius of the base corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-&h7fffffff	The first radius. See description above on how this radius value is used.
r2	-&h7fffffff	The second radius. See description above on how this radius value is used.
r3	-&h7fffffff	The third radius. See description above on how this radius value is used.
r4	-&h7fffffff	The fourth radius. See description above on how this radius value is used.

See also:

- 30.6.13 setRoundedCorners(r1 as Integer, r2 as Integer = -2147483647, r3 as Integer = -2147483647, r4 as Integer = -2147483647)

30.6.13 setRoundedCorners(r1 as Integer, r2 as Integer = -2147483647, r3 as Integer = -2147483647, r4 as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures rounded corners for rectangular bars.
Notes: A rectangular bar has 4 corners. Two of them are at the base of the bar, while the other two are at the "data end" of the bar. Note that the base of the bar can be any side of the bar, depending on whether the bar is positive or negative, vertical or horizontal.

For the 2 base corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the two data end corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

Values Provided	Description
0	The radii of the data end corners are automatically determined. The radii of the base corners are set to 0.
1	The radii of the data end corners are set to the specified value. The radii of the base corners are set to 0.
2	The radii of the data end corners are set to the first value. The radii of the base corners are set to the second value.
4	The radius of the data end corner at the negative x direction is set to the first value. The radius of the data end corner at the positive x direction is set to the second value. The radius of the base corner at the negative x direction is set to the third value. The radius of the base corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-&h7fffffff	The first radius. See description above on how this radius value is used.
r2	-&h7fffffff	The second radius. See description above on how this radius value is used.
r3	-&h7fffffff	The third radius. See description above on how this radius value is used.
r4	-&h7fffffff	The fourth radius. See description above on how this radius value is used.

See also:

- 30.6.12 setRoundedCorners 4995

30.7 class CDBaseBoxLayerMBS

30.7.1 class CDBaseBoxLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function:

The BaseBoxLayer class is the base class for layers that uses isolated symbols to represent multiple data sets. These include BoxWhiskerLayer, HLOCLayer and
CandleStickLayer.
Notes:

Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.7.2 Methods

30.7.3 setDataGap(gap as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the symbol width by specifying the gap ratio between adjacent symbols.
Notes:

Parameter	Default	Description
gap	(Mandatory)	The gap between two adjacent symbols as the portion of the space between the midpoints of the elements. The gap must be in the range 0 - 1. A value of 0 (the default) means there is no gap between two adjacent symbols.

30.7.4 setDataWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the symbol width by specifying the pixel width of the symbols.
Notes:

Parameter	Default	Description
width	(Mandatory)	The width of the symbols in pixels.

30.7.5 setMinImageMapSize(size as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.
Notes: By default, the hot spots defined by image map exactly cover the bars. For very short bars, the hot spots may be very small, and it may become difficult to move the mouse over the hot spots.
This method ensures the hot spots are at least of certain size, even if the bars are shorter. The default is 5 pixels.

Arguments:

Argument	Default	Description
size	(Mandatory)	The minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.

30.7.6 setRoundedCorners(r1 as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures rounded corners for the boxes.
Notes: This method currently is only supported by the BoxWhiskerLayer.

A box has 4 corners, two of them are at "box-top", and two of them are at "box-bottom". Note that "box-top" and "bottom-bottom" refer to the sides of the box representing the boxTop and boxBottom parameters in CDXYChartMBS.addBoxWhiskerLayer or CDXYChartMBS.addBoxLayer. Note that they are not necessarily the geometric top or bottom of the box. For example, if the y-axis is reversed (such as configured using CDAxisMBS.setReverse), the top and bottom side may be reversed. For horizontal boxes (with CDXYChartMBS.swapXY in effect), the box-top and box-bottom sides may actually be the right and left sides.

Of the 2 box-top corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the box-bottom corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

See also:

- 30.7.7 setRoundedCorners(r1 as Integer, r2 as Integer, r3 as Integer = -2147483647, r4 as Integer = -2147483647) 5000

Values Provided	Description
0	The radii of all the box corners are automatically determined.
1	The radii of all the box corners are set to the specified value.
2	The radii of the box-top corners are set to the first value. The radii of the box-bottom corners are set to the second value.
4	The radius of the box-top corner at the negative x direction is set to the first value. The radius of the box-top corner at the positive x direction is set to the second value. The radius of the box-bottom corner at the negative x direction is set to the third value. The radius of the box-bottom corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-0x7fffffff	The first radius. See description above on how this radius value is used.
r2	-0x7fffffff	The second radius. See description above on how this radius value is used.
r3	-0x7fffffff	The third radius. See description above on how this radius value is used.
r4	-0x7fffffff	The fourth radius. See description above on how this radius value is used.

30.7.7 setRoundedCorners(r1 as Integer, r2 as Integer, r3 as Integer = -2147483647, r4 as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures rounded corners for the boxes.
Notes: This method currently is only supported by the BoxWhiskerLayer.

A box has 4 corners, two of them are at "box-top", and two of them are at "box-bottom". Note that "box-top" and "bottom-bottom" refer to the sides of the box representing the boxTop and boxBottom parameters in CDXYChartMBS.addBoxWhiskerLayer or CDXYChartMBS.addBoxLayer. Note that they are not necessarily the geometric top or bottom of the box. For example, if the y-axis is reversed (such as configured using CDAxisMBS.setReverse), the top and bottom side may be reversed. For horizontal boxes (with CDXYChartMBS.swapXY in effect), the box-top and box-bottom sides may actually be the right and left sides.

Of the 2 box-top corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the box-bottom corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

See also:

- 30.7.6 setRoundedCorners(r1 as Integer) 4999

Values Provided	Description
0	The radii of all the box corners are automatically determined.
1	The radii of all the box corners are set to the specified value.
2	The radii of the box-top corners are set to the first value. The radii of the box-bottom corners are set to the second value.
4	The radius of the box-top corner at the negative x direction is set to the first value. The radius of the box-top corner at the positive x direction is set to the second value. The radius of the box-bottom corner at the negative x direction is set to the third value. The radius of the box-bottom corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-0x7fffffff	The first radius. See description above on how this radius value is used.
r2	-0x7fffffff	The second radius. See description above on how this radius value is used.
r3	-0x7fffffff	The third radius. See description above on how this radius value is used.
r4	-0x7fffffff	The fourth radius. See description above on how this radius value is used.

30.8 class CDBaseChartMBS

30.8.1 class CDBaseChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The BaseChart class is an abstract class containing methods that are common to all chart types.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.8.2 Methods

30.8.3 addExtraField(numbers() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of numbers/dates to be used as an extra field in various places.
Notes: This method merely stores the data inside the chart object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
numbers	(Mandatory)	An array of numbers/dates to be stored inside the chart object.

See also:

- 30.8.4 addExtraField(paths() as folderitem) 5003
- 30.8.5 addExtraField(texts() as string) 5004

30.8.4 addExtraField(paths() as folderitem)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of file paths to be used as an extra field in various places.
Notes: This method merely stores the data inside the chart object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
texts	(Mandatory)	An array of text to be stored inside the chart object.

See also:

- 30.8.3 addExtraField(numbers() as Double) 5003

• 30.8.5 addExtraField(texts() as string) 5004

30.8.5 addExtraField(texts() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of text to be used as an extra field in various places.
Notes: This method merely stores the data inside the chart object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
texts	(Mandatory)	An array of text to be stored inside the chart object.

Great to add point labels to the chart.
See also:

• 30.8.3 addExtraField(numbers() as Double) 5003

• 30.8.4 addExtraField(paths() as folderitem) 5003

30.8.6 addLegend(x as Integer, y as Integer, noOfCols as Integer, font as string = ””, fontsize as Double = 10) as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a legend box to the chart with grid layout.
Notes: In grid layout, the legend box will be divided into a table in which all cells are of of same width. The legend entries will fill the cells from left to right, top to bottom.

The number of columns can be specified using the noOfCols argument. If this argument is set to the special constant AutoGrid (= -2), the number of columns will be automatically determined based on the longest legend entry. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).

In any case, the number of rows in the table is automatically determined so as to have enough cells for all legend entries.

Argument	Default	Description
x	(Mandatory)	The x coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
y	(Mandatory)	The y coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
noOfCols	(Mandatory)	The number of columns in the legend box. The special value AutoGrid (= -2) means the number of columns is automatically determined. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).
font	""	The font name of the font for drawing the legend text. The default is "normal". See Font Specification for details on various font attributes.
fontSize	10	The font size of the legend text.

Return Value
A LegendBox object representing the legend box. You may use this object to fine-tune the appearance of the legend box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.7 addLegend(x as Integer, y as Integer, vertical as boolean=true, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS 5005

30.8.7 addLegend(x as Integer, y as Integer, vertical as boolean=true, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a legend box to the chart.
Notes: The entries in the legend box will flow from top to bottom (one line per entry), or from left to right and then top to bottom (like flowing text), depending on the vertical argument. For grid layout, use BaseChart.addLegend2.

Return Value
A LegendBox object representing the legend box. You may use this object to fine-tune the appearance of the legend box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
y	(Mandatory)	The y coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
vertical	true	A true value means the legend keys are laid out vertically (one line per entry). A false value means the legend keys are laid out horizontal and flow like text (from left to right, top to bottom).
font	""	The font name of the font for drawing the legend text. The default is "normal". See Font Specification for details on various font attributes.
fontSize	10	The font size of the legend text.

- 30.8.6 addLegend(x as Integer, y as Integer, noOfCols as Integer, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS 5004

30.8.8 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as color, lineWidth as Integer = 1) as CDLineMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addLine method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.9 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as Integer = &hffff0001, lineWidth as Integer = 1) as CDLineMBS 5006

30.8.9 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as Integer = &hffff0001, lineWidth as Integer = 1) as CDLineMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a line to the chart.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first endpoint of the line.
y1	(Mandatory)	The y coordinate of the first endpoint of the line.
x2	(Mandatory)	The x coordinate of the second endpoint of the line.
y2	(Mandatory)	The y coordinate of the second endpoint of the line.
color	LineColor	The color of the line.
lineWidth	1	The width of the line.

Return Value
A Line object representing the line added. You may use this object to fine- tune the appearance of the line.
See also:

- 30.8.8 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as color, lineWidth as Integer = 1) as CDLineMBS 5006

30.8.10 addTable(x as Integer, y as Integer, alignment as Integer, col as Integer, row as Integer) as CDMLTableMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a CDML table to the chart.
Notes: Arguments:

Argument	Default	Description
x	(Mandatory)	The x-coordinate of the reference point used to position the table.
y	(Mandatory)	The y-coordinate of the reference point used to position the table.
alignment	(Mandatory)	The alignment of the table with respect to the reference point. For example, a value of kTopLeft means the reference point is the top- left corner of the table. See Alignment Specification for supported alignment types..
col	(Mandatory)	The number of columns in the table.
row	(Mandatory)	The number of rows in the table.

Returns a CDMLTableMBS object representing the CDML table added.

30.8.11 addText(x as Integer, y as Integer, text as string, font as string = "", fontsize as Double = 8, fontcolor as Integer = &hffff0002, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a text box to the chart.
Notes: By default, only the text is visible, the box is transparent. This method returns a TextBox object that can be used to change the appearance of the text box.

Return Value
A TextBox object representing the text box. This may be used to fine-tune the appearance of the text box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

Argument	Default	Description
x	(Mandatory)	The x coordinate of the left of the text box.
y	(Mandatory)	The y coordinate of the top of the text box.
text	(Mandatory)	The text to shown in the text box. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	""	The font used to draw the text. See Font Specification for details on various font attributes.
fontSize	8	The font size used to draw the text.
fontColor	TextColor	The color used to draw the text.
alignment	TopLeft	The alignment of the text within the text box. See Alignment Specification for supported alignment types.
angle	0	The rotation angle of the text within the text box.
vertical	false	Indicate whether the text should be laid out vertically (from top to bottom) or horizontally (from left to right).

See also:

- 30.8.12 addText(x as Integer, y as Integer, text as string, font as string, fontsize as Double, fontcolor as color, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS 5008

30.8.12 addText(x as Integer, y as Integer, text as string, font as string, fontsize as Double, fontcolor as color, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addText method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.11 addText(x as Integer, y as Integer, text as string, font as string = "", fontsize as Double = 8, fontcolor as Integer = &hffff0002, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS 5007

30.8.13 addTitle(alignment as Integer, text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a title to the chart.
Notes:

Argument	Default	Description
alignment	(Mandatory)	The position on the title on the chart. See Alignment Specification for supported alignment types.
text	(Mandatory)	The text for the title. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	""	The font used to draw the title text. The default is "bold". See Font Specification for details on various font attributes.
fontSize	12	The font size in points for the title text.
fontColor	TextColor	The color of the title text.
bgColor	Transparent	The background color of the title box.
edgeColor	Transparent	The border color of the title box.

Return Value
A TextBox object representing the title box. This may be used to fine-tune the appearance of the title box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5009
- 30.8.15 addTitle(text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5010
- 30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5010

30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addTitle method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.13 addTitle(alignment as Integer, text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5008
- 30.8.15 addTitle(text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5010

- 30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5010

30.8.15 addTitle(text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a title at the top center of the chart.
Notes: The title is contained within a box, of which the width is the same as the width of the chart, and the height is automatically adjusted to fit the text. The box is initially invisible, but can be made visible by setting the bgColor and edgeColor.

Argument	Default	Description
text	(Mandatory)	The text for the title. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	""	The font used to draw the title text. The default is "bold". See Font Specification for details on various font attributes.
fontSize	12	The font size in points for the title text.
fontColor	TextColor	The color of the title text.
bgColor	Transparent	The background color of the title box.
edgeColor	Transparent	The border color of the title box.

Return Value
A TextBox object representing the title box. This may be used to fine-tune the appearance of the title box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.13 addTitle(alignment as Integer, text as string, font as string = "", fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5008
- 30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5009
- 30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5010

30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addTitle method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.13 addTitle(alignment as Integer, text as string, font as string = ""), fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5008
- 30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5009
- 30.8.15 addTitle(text as string, font as string = ""), fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5010

30.8.17 adjustBrightness(ColorValue as color, brightness as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other adjustBrightness method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.18 adjustBrightness(ColorValue as Integer, brightness as Double) as Integer 5011

30.8.18 adjustBrightness(ColorValue as Integer, brightness as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color that is a darkened or brightened version of the given color.
Notes: A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

Arguments:

Argument	Default	Description
c	(Mandatory)	The given color.
brightness	(Mandatory)	A non-negative number represent the factor to darken or brighten the color.

Return Value
A 32-bit integer representing the darkened or brightened color.
See also:

• 30.8.17 adjustBrightness(ColorValue as color, brightness as Double) as Integer 5011

30.8.19 AllPassFilter as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches every element.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 as a "catch all" filter.
Return Value
An integer filter id representing the filter.

30.8.20 ArrowShape(angle as Double = 0.0, widthRatio as Double = 1, stemWidthRatio as Double = 0.5, stemLengthRatio as Double = 0.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents an arrow shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
angle	0	The clockwise angle of the arrow relative to the upward pointing position.
widthRatio	1	The width of the base of the arrow head as a ratio to the height of the entire arrow. Must be between 0 and 1.
stemWidthRatio	0.5	The width of the arrow stem as a ratio to the width of the base of the arrow head. Must be between 0 and 1.
stemLengthRatio	0.5	The length of the arrow stem as a ratio to the height of the entire arrow. Must be between 0 and 1.

Returns an integer shape id representing the arrow shape.

30.8.21 barLighting(startBrightness as Double = 0.75, endBrightness as Double = 1.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A special shading effect for rectangular and polygonal bars on a CDBarLayerMBS.
Notes: It shades all surfaces of a 2D or 3D bar with gradient colors.

For the front surface of a bar, the gradient is from base line of the bar to the end of the bar. For example, for a vertical bar pointing upwards, the gradient is from bottom to the top. Similarly, for a horizontal bar

pointing rightwards, the gradient is from left to right.

For a 3D bar, the gradient for the top surface of a vertical bar or the right surface of a horizontal bar is from front to back. The gradients for the side surfaces are the same as for the front surface.

The gradient is specified with two brightness values at the gradient end points. A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

The followings are some examples demonstrating this effect.

The barLighting method returns an integer representing this effect. The integer can be used as the second argument to CDLayerMBS.setBorderColor for CDBarLayerMBS objects to apply the effect to bars.

Arguments:

Argument	Default	Description
startBrightness	0.75	The brightness at the starting point.
endBrightness	1.5	The brightness at the ending point.

Return Value
An integer representing the bar lighting effect.

30.8.22 blueMetalGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a blue metallic color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 9898E0 60 F0F0FF B0 D8D8F0 100 9898E0
See Color Specification on how colors are represented in ChartDirector.

30.8.23 brushedGoldColor(texture as Integer = 2, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a brushed golden color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.brushedMetalColor method, using yellow (FFEE44 in hex) as the base color.

Arguments:

Argument	Default	Description
texture	2	The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value:
A 32-bit integer representing the brushed golden color.

30.8.24 brushedMetalColor(c as Integer, texture as Integer = 2, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color by modulates the brightness of another color to create brushed metallic shiny effects.
Notes: The brightness of the color will vary smoothly across the image in a given a direction, so as to produce a shiny effect. The color will then be modulated with a horizontal texture to create the brushed effect. The modulation period will be the same as the size of the image, so this method is best use to create background colors.

Arguments:

Argument	Default	Description
c	(Mandatory)	The color to be modulated.
texture	2	The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value:
A 32-bit integer representing the brushed metallic color.

30.8.25 brushedSilverColor(texture as Integer = 2, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a brushed silver color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.brushedMetalColor method, using grey (DDDDDD in hex) as the base color.

Arguments:

Argument	Default	Description
texture	2	The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the brushed silver color.

30.8.26 bSearch(values() as Double, value as Double) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses binary search to search for a value in an array.
Notes: This method returns the array index of the value in the array, which must be sorted in ascending order.

If the value is in between two elements of the array, this method returns a non-integer that interpolates the indexes of the two elements. For example, suppose the array consists of 3 elements [4, 6, 10] . If this method is used to search for the value 7, it will return 1.25.

If the value is smaller or larger than all the elements in the array, this method returns the nearest index, which must be either 0 or the index of the last element of the array.

Returns the index of the value within the array. If the value is in between two elements of the array, this method returns a non-integer that interpolates the indexes of the two elements. If the value is smaller or

Argument	Default	Description
a	(Mandatory)	The array to be searched.
v	(Mandatory)	The value to search for.

larger than all the elements in the array, thie method returns the nearest index.

30.8.27 chartTime(t as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a UNIX time (seconds elapsed since 01-01-1970 00:00:00 GMT) to the date/time format used by ChartDirector.
Notes: The UNIX time will be converted assuming based on local time zone (the time zone settings of the operating system).

Argument	Default	Description
t	(Mandatory)	A time represented as seconds elapsed since 01-01-1970 00:00:00 GMT.

Return Value
The second elapsed since 01-01-0001 00:00:00 to the given time.
See also:

- 30.8.28 chartTime(year as Integer, month as Integer, day as Integer, hour as Integer = 0, minute as Integer = 0, second as Integer = 0) as Double 5016

30.8.28 chartTime(year as Integer, month as Integer, day as Integer, hour as Integer = 0, minute as Integer = 0, second as Integer = 0) as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the second elapsed since 01-01-0001 00:00:00 to the given time, which is the date/time format used by ChartDirector.
Notes:

Argument	Default	Description
y	(Mandatory)	The year component of the given time.
m	(Mandatory)	The month component of the given time
d	(Mandatory)	The day of month component of the given time.
h	0	The hour component of the given time.
n	0	The minute component of the given time.
s	0	The second component of the given time.

Return Value
The second elapsed since 01-01-0001 00:00:00 to the given time.
See also:

- 30.8.27 chartTime(t as Integer) as Double 5016

30.8.29 ClearTypeColor(gamma as Double = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a value to represent that standard ClearType or a similar technology be used for font rendering.
Notes: This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

ClearType is a Microsoft font rendering technology that renders text more accurately with subpixel rendering. Similar technologies include Quartz in Mac OS X, Adobe CoolType and other unnamed algorithms. Although this API uses ClearType in its name, ChartDirector may use ClearType or a similar technology depending on the operating system and programming language.

In most modern flat panel displays, a pixel is consisted of 3 sub-pixels R, G and B for the red, green and blue colors, typically arranged horizontally. So a row of pixels is actually a sequence of subpixels like RGBRGBRGBRGB... To display a white pixel, the display hardware turns on the RGB subpixels.

It happens a white dot can also be made by turning on the GB subpixels of one pixel, and the R subpixel of the next pixel to the right. This will result in 3 consecutive subpixels GBR, which is also white. This white dot will be in between the two pixels, with 2/3 on the left pixel, and 1/3 on the right pixel. In other words, it is possible to position a white dot in between two pixels without blurring it. ClearType uses this effect to render text with subpixel accuracy.

Apart from subpixel rendering, ClearType may adjust the glyph shapes to fit the pixel grid (technically called hinting) differently from classical rendering. As a result, the glyph shapes and sizes in ClearType may be different from classical rendering.

One issue with ClearType is that it is hardware dependent. To work perfectly, it needs to know the subpixels ordering of the display. In many applications, the charts are rendered on one computer, but viewed using another computer. For example, in a web application, the charts can be rendered on the server but displayed on the browser computer. The chart generating computer may not know the subpixel configuration of the viewing computer. If ClearType is used, there is a risk that the text may look suboptimal on the viewing computer.

To address the above issues, ChartDirector supports a hardware independent ClearType method, represented by ClearTypeMono. This is basically ClearType with subpixel rendering disabled. The resulting text has no color distortion. Black and white text will not be as sharp as standard ClearType, but is still better than classical anti-alias. The charts rendered can be viewed equally well with different types of displays. This is

especially useful for applications in which the charts are rendered and viewed by different computers.

Argument	Default	Description
gamma	0	Specifies the level of gamma correction used for ClearType font rendering. This is usually a number between 1 to 2.5. A value of 0 means the default gamma level.

30.8.30 ClearTypeMono(gamma as Double = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a value to represent that hardware independent ClearType or a similar technology be used for font rendering.
Notes: This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

Please refer to ClearTypeColor on the detail explanation of what is standard ClearType and hardware independent ClearType.

Argument	Default	Description
gamma	0	Specifies the level of gamma correction used for ClearType font rendering. This is usually a number between 1 to 2.5. A value of 0 means the default gamma level.

30.8.31 ColorToInteger(c as color, alpha as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a Xojo color object to an integer for ChartDirector.

30.8.32 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.8.33 Cross2Shape(width as Double = 0.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a 'X' shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
width	(Mandatory)	The percentage width of the arms of the a 'X' relative to the entire shape. Must be between 0 and 1.

Return Value
An integer shape id representing the a 'X' shape.

30.8.34 CrossShape(width as Double = 0.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a '+' shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
width	(Mandatory)	The percentage width of the arms of the a '+' relative to the entire shape. Must be between 0 and 1.

Return Value
An integer shape id representing the a '+' shape.

30.8.35 cylinderEffect(orientation as Integer = 5, ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5, specularIntensity as Double = 0.75, shininess as Integer = 8) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A special shading effect that emulates the lighting of a cylinder surface.
Notes: This effect adjusts the brightness of the color of a rectangular box to make it look like cylindrical. The brightness is adjusted as according to the Phong lighting model, in which the light source is from the viewer direction and is far away.

The cylinderEffect method returns an integer representing this effect. The integer can be used as the third argument to CDBoxMBS.setBackground to apply the effect to Box objects (including derived objects such

as CDTextBoxMBS objects).

This effect is automatically used for cylindrical bars in a CDBarLayerMBS. You may use this method to adjust the lighting parameters by using its return value as the second argument to CDLayerMBS.setBorderColor.

Arguments:

Argument	Default	Description
orientation	kCenter	The orientation of the cylinder. A value of kTop or kBottom means the cylinder is vertical. A value of kLeft or kRight means the cylinder is horizontal. A value of kCenter means the orientation is automatically determined. For a CDBarLayerMBS, the orientation will be the same as the orientation of the bars. For other objects (eg. CDTextBoxMBS objects), if the object height is bigger than its width, the cylinder will be treated as vertical, otherwise it will be treated as horizontal.
ambientIntensity	0.5	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	0.5	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	0.75	The specular reflection coefficient of the Phong lighting model.
shininess	8	The shininess coefficient of the Phong lighting model.

Return Value
An integer representing the cylinder effect.

30.8.36 dashLineColor(colorvalue as color, patternCode as Integer = &h0505) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other dashLineColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.37 dashLineColor(colorvalue as Integer, patternCode as Integer = &h0505) as Integer 5020

30.8.37 dashLineColor(colorvalue as Integer, patternCode as Integer = &h0505) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant equals to 0505 (in hex) to represent a dash line pattern for use in dash colors.
Notes: See Color Specification on how colors are represented in ChartDirector.
See also:

• 30.8.36 dashLineColor(colorvalue as color, patternCode as Integer = &h0505) as Integer 5020

30.8.38 defaultPalette as Integer()

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default palette.

30.8.39 Destructor

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor for the base chart.

30.8.40 enableVectorOutput

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Enables true vector graphics output.
Notes: By default, when creating the output image, ChartDirector draws directly onto an output buffer representing the bitmap of the image. For example, for a chart 800 x 600 pixels in size, the output buffer may represent a 800 x 600 bitmap. The output buffer size is unchanged no matter how many items are drawn onto it. Even if the output contains 1 million elements (eg. 1 million symbols), the size of the output buffer is still the same.

On the other hand, a true vector output is indefinitely scalable and can be considered as having infinite resolution. To produce a true vector output, it is necessary to remember the graphics operations for every element in the output buffer. The output buffer size is therefore proportional to the number of elements to draw.

This method tells ChartDirector that it needs to remember the graphics operations to prepare for true vector output. If true vector output is needed, this method should be called immediately after creating the BaseChart object.

If this method is not called, and a vector graphics output format is used (such as SVG), instead of a true vector output, ChartDirector will output a raster image using the vector graphics format. (Most vector graphics formats support embedded raster images.)

30.8.41 flatBorder(thickness as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a flat border of a given width.
Example:

```
// set edge to be 2 pixel wide line
Var table As CDMLTableMBS
Var t As CDTextBoxMBS = table.getStyle
Var x As Integer = c.flatBorder(2)
t.setBackground(&heeeeee, CDXYChartMBS.kLineColor, x)
```

Notes: The flatBorder method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect to Box objects (including derived objects such as TextBox objects). It may also be used as the second argument to Layer.setBorderColor for BarLayer or BoxWhiskerLayer objects to apply the effect to bars or boxes.

Argument	Default	Description
width	(Mandatory)	The border width. A positive value means the border is drawn inside the box or bar. A negative value means the border is outside the box or bar.

Returns an integer representing using flat border of the specified width.

30.8.42 formatValue(value as Double, formatstring as string) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Formats a number/date using the ChartDirector formatting syntax as is in Parameter Substitution and Formatting.
Notes:

Argument	Default	Description
value	(Mandatory)	The value to be formatted.
formatString	(Mandatory)	The format string, using { value } to denote the value. For example, $ { value | 2, } can be used to format the value to 2 decimal points, using "," as the thousand separator, and with a '$ ' sign in front.

30.8.43 getAbsOffsetX as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x offset of the chart relative to the outermost MultiChart container.
Notes: Returns an integer representing the x offset in pixels relative to the outermost MultiChart container, or 0 if the chart is not within a MultiChart container.

30.8.44 getAbsOffsetY as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y offset of the chart relative to the outermost MultiChart container.
Notes: Returns an integer representing the y offset in pixels relative to the outermost MultiChart container, or 0 if the chart is not within a MultiChart container.

30.8.45 getChartMetrics as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the chart metrics for passing to CChartViewer to support view ports.
Notes: The format of the chart metrics is not published.
Return Value
A text string representing the chart metrics.

30.8.46 getChartWeekDay(t as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the weekday represented by a ChartDirector date/time.
Notes:

Argument	Default	Description
t	(Mandatory)	A ChartDirector date/time, that is, a number representing seconds elapsed since 01-01-0001 00:00:00.

Return Value
An integer from 0 - 6 representing Sun - Sat.

30.8.47 getChartYMD(t as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the year, month and day represented by a ChartDirector date/time.
Notes:

Argument	Default	Description
t	(Mandatory)	A ChartDirector date/time, that is, a number representing seconds elapsed since 01-01-0001 00:00:00.

Return Value
An integer which when represented in decimal notation is yyyymmdd, where yyyy is the year, mm is the month (1 - 12), and dd is the day (1 - 31).

30.8.48 getColor(index as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the color at the specified position of the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
paletteEntry	(Mandatory)	An index to the palette.

Return Value
The requested color.

30.8.49 getCopyright as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the copyright string of the ChartDirector library.
Example:

```
MsgBox CDBaseChartMBS.getCopyright
// displays "Copyright (c) 2006 Advanced Software Engineering Limited"
```

30.8.50 getDescription as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the library description.
Example:

```
MsgBox CDBaseChartMBS.getDescription // displays "ChartDirector"
```

30.8.51 getDrawArea as CDDrawAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the internal DrawArea object that is used to draw the chart.
Notes: The most common reason of accessing the internal DrawArea object is to add custom drawings (lines, texts, shapes, etc) to the chart.

If the custom drawings are drawn before drawing the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3), the custom drawings will be at the background of the chart.
Return Value
A DrawArea object that can be used to add custom text and shapes to the chart.

30.8.52 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the chart.

30.8.53 getHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "", offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for the chart.
Notes: This method generates an image map to represent all data points on the chart. It does not include legend box, title box or custom text box. Please use LegendBox.getHTMLImageMap or Box.getImageCoor to produce image maps for these objects.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

This method accepts a URL as its argument. When generating an image map, it appends query parameters to the URL to indicate which data point the user has clicked.

The following is an example image map generated for a bar chart with 3 bars.

<area shape="rect" coords="34,219,63,139" href="myurl.cpp?x=0&xLabel=Mon&dataSet=0&dataSetName=Revenue&value=100">
<area shape="rect" coords="74,219,103,119" href="myurl.cpp?x=1&xLabel=Tue&dataSet=0&dataSetName=Revenue&value=125">

<area shape="rect" coords="114,219,143,22" href="myurl.cpp?x=2&xLabel=Wed&dataSet=0&dataSetName=Revenue&value=245.78">

The image map consists of multiple <area>tags, one for each bar in the chart. In the "href" attributes, query parameters are appended to the URL to provide information on the bar clicked.

The image map produces by ChartDirector does not include the <map>and </map>tag. This is intentional so that you can add additional custom <area>tags to the image map, or append multiple image maps together.

The type of query parameters to append to the URL depends on the chart type and layer type. The default query parameters are as follows.

Chart/Layer Type	Default Query Format
Pie chart	sector= { sector } &label= { label } &value= { value } &percent= { percent }
Bar, Line, Spline, Step Line, Area and Scatter layers	x= { x } &xLabel= { xLabel } &dataSet= { dataSet } &dataSetName= { dataSetName } &value= { value }
Percentage Bar and Percentage Area layers	x= { x } &xLabel= { xLabel } &dataSet= { dataSet } &dataSetName= { dataSetName } &value= { value } &percent= { percent }
HLOC and CandleStick layers	x= { x } &xLabel= { xLabel } &high= { high } &low= { low } &open= { open } &close= { close }
Box-Whisker layer	x= { x } &xLabel= { xLabel } &top= { top } &bottom= { bottom } &max= { max } &min= { min } &med= { med }
Trend layer	dataSetName= { dataSetName }
Vector layer and Polar Vector layer	x= { x } &xLabel= { xLabel } &dataSetName= { dataSetName } &value= { value } &dir= { dir } &len= { len }
Polar Line, Area, Spline Line and Spline Area layers	"x= { x } &label= { label } &name= { name } &value= { value } "

The texts in curly brackets (e.g. { sector } , { dataSet } , etc.) will be replaced by the actual values when generating the image map. For example, { sector } will be replaced by the sector number of the sector.

ChartDirector allows developers to modify the query parameters by using the queryFormat argument. For example, if "x= { x } &v= { value } " is used as the queryFormat for a XYChart, only the x position and the value of the data point will be included in query parameters.

Please refer to Parameter Substitution and Formatting on all available parameters and their meanings.

In addition to customizing the query parameters, ChartDirector supports additional HTML attributes in the <area>tags by using the extraAttr argument.

For example, the following extraAttr will add an "title" HTML attribute to every <area>tag. The attribute which will contain the x-axis label and the value of the data point. The "title" attribute will be displayed as "tool tip" when the mouse moves over the image map.

title=' { xlabel } : { value } '
Another common usage of the extraAttr argument is to add "onmouseover" and "onmouseout" HTML attributes to handle user interaction using Javascript on the browser.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.

extraAttr	""	A text string to specify additional attributes to add to the <area>tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string containing the image map generated.

30.8.54 getLegend as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the LegendBox object representing the legend box in the chart.
Notes: The LegendBox obtains using this method is not fixed. This allows you to add more keys to the legend box, and change the legend box fonts, etc. However, this also means that the legend box size (Box.getWidth and Box.getHeight) is undefined.

To obtain the width and height of the legend box, use BaseChart.layoutLegend.
Return Value

The LegendBox object representing the legend box in the chart.

30.8.55 GetPath(path as folderitem) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a path string for a folderitem.
Notes: Returns the path in the UTF8 format as ChartDirector needs them.

30.8.56 getVersion as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets ChartDirector version information.
Example:

```
Var v as Integer = CDBaseChartMBS.getVersion

Var v1 as Integer = Bitwise.BitAnd( Bitwise.ShiftRight(v, 24), 255)
Var v2 as Integer = Bitwise.BitAnd( Bitwise.ShiftRight(v, 16), 255)
Var v3 as Integer = Bitwise.BitAnd( v, 65535)

MsgBox str(v1)+"."+str(V2)+"."+str(V3)
```

Notes: The version number is encoded as a 32-bit integer. The most significant 8 bits is the major version number. The next 8 bits are the minor version number. The least significant 16 bits are the build number.
Return Value
The version information encoded in a 32-bit integer.

30.8.57 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the chart.

30.8.58 glassEffect(glareSize as Integer = 3, glareDirection as Integer = 8, raisedEffect as Integer = 5) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A complex shading effect that emulates tinted glass or semi-transparent plastic material.
Notes: This effect involves glare and variation of lighting caused by reflection and refraction inside the material. It is best explained by viewing the examples.

ExampleLocation of lighting effect

Error Line Chart	The title is shaded using glass effect, with NormalGlare, lighting from Top, and raised effect of 5 pixels.
Donut Chart	Both the title and the sector labels are shaded using glass effect with ReducedGlare, lighting from Top, and raised effect of 5 pixels.
Glass Multi-Bar Chart	The bars are shaded using glass effect, with NormalGlare, lighting from Left, and raised effect of 5 pixels.

Currently, this effect only works well for long, thin objects, such as title bars, text boxes and bars in bar charts.

The glassEffect method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect it objects derived from Box (such as labels and titles represented by TextBox). It may also be used as the second argument to Layer.setBorderColor for BarLayer objects to apply the effect to bars.

Argument	Default	Description
glareSize	NormalGlare	The amount of glare. Must be one of the predefined constants NormalGlare, ReducedGlare or NoGlare. With NormalGlare and ReducedGlare, the glare will cover around 50% and 35% of the object. If NoGlare is used, there will be no glare and the effect will not look like glass at all, but is equivalent to the CDBaseChartMBS.softLighting effect.

Usually, NormalGlare is best for thin objects with lightly colored background, while ReducedGlare is best for dark background objects or not-so-thin objects (eg. text boxes using white text on a dark background, or with more than 1 line of text).

glareDirection	Top	The direction of the glare, which must be one of the predefined constants Top, Right, Bottom, Left.
raisedEffect	5	With glass shading effect, the object will appear to have some 3D depth. The raisedEffect argument controls the amount of 3D depth in pixels.

Return Value
An integer representing the glass effect.

30.8.59 goldColor(angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a golden color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.metalColor method, using yellow (FFEE44 in hex) as the base color.

Argument	Default	Description
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the golden color.

30.8.60 goldGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a golden color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor and DrawArea.gradientColor. Its contents (in hex) is:

00 FFE743 60 FFFFE0 B0 FFF0B0 100 FFE743
See Color Specification on how colors are represented in ChartDirector.

30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other gradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5031
- 30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5031
- 30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5032

30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point linear gradient color.
Notes: This method is for backward compatibility. Use BaseChart.linearGradientColor2 instead.

Argument	Default	Description
colorArray	(Mandatory)	An array defining the positions and colors of the pixels along the reference gradient line segment.
angle	90	The direction of the reference gradient line segment in degrees, measured clockwise, with 0 degree as the upward pointing direction. The default direction is horizontal from left to right (90 degrees).
scale	1.0	The scaling factor for the reference gradient line segment. By default, the reference gradient line segment is 256 pixels in length. The scaling factor can be use to stretch or compress the gradient line segment.
startX	0	The x coordinate of the starting point of the reference gradient line segment.
startY	0	The y coordinate of the starting point of the reference gradient line segment.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5030
- 30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5031
- 30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5032

30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other gradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5030
- 30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5031

- 30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5032

30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point linear gradient color.
Notes: This method is for backward compatibility. Use BaseChart.linearGradientColor instead.

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
startColor	(Mandatory)	The color at the starting point of the reference gradient line segment.
endColor	(Mandatory)	The color at the ending point of the reference gradient line segment.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5030
- 30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5031
- 30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5031

30.8.65 greenMetalGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a green metallic color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 98E098 60 F0FFF0 B0 D8F0D8 100 98E098
See Color Specification on how colors are represented in ChartDirector.

30.8.66 halfColor(c as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color that is half the intensity of the given color.
Notes:

Argument	Default	Description
c	(Mandatory)	The given color.

Return Value
A 32-bit integer representing the half intensity color.

30.8.67 initDynamicLayer as CDDrawAreaMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a dynamic layer for drawing text and shapes.
Notes: This method clears the existing dynamic layer, or creates a new one if there is no existing dynamic layer. This method returned a DrawArea object that can be used to draw on the dynamic layer. The dynamic layer can later be removed using BaseChart.removeDynamicLayer.

The design of the dynamic layer is for drawing small, rapidly updatable contents for desktop applications. For example, the dynamic layer can be used to implement a cross-hair mouse cursor, with text showing the location of the mouse cursor. To do this, in the mouse move event handler, BaseChart.initDynamicLayer can be used to create or clear the dynamic layer. The returned DrawArea object can then be used to draw the cross hair cursor (as two straight lines) and the text. When the mouse cursor leaves the chart, BaseChart.removeDynamicLayer can be used in the mouse out event handler to remove the cross-hair cursor and the text.

Note that as long as the dynamic layer is not removed with BaseChart.removeDynamicLayer, only the returned DrawArea object should be used to draw things on the dynamic layer. No other objects should be used to draw on the chart.

Returns a DrawArea object that can be used to add text and shapes to the dynamic layer.

30.8.68 kDataBound as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.7E-100 to represent that the interpolated z values should not exceed the minimum or maximum values of the original data.

This constant is used in ContourLayer.setZBounds.

30.8.69 kLinearTick as Double

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to +1.5E+308 to represent that the ticks in a log scale axis should be 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 - 10 style increments.

30.8.70 kLogTick as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to +1.6e308 to represent that the ticks in a log scale axis should be 1 - 2 - 5 - 10 style increments.
This constant is used in Axis.setLogScale.

30.8.71 kMicroTickOnly as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.6e308 to represent that the label position should contain a micro tick only.
This constant is used in Axis.setLabels and BaseMeter.setScale.

30.8.72 kMinorTickOnly as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.7e308 to represent that the label position should contain a minor tick only.
This constant is used in Axis.setLabels.

30.8.73 kNoValue as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to 1.7E+308 to represent missing values in ChartDirector.
Please refer to No Value Specification for more details.

30.8.74 kTickInc as Double

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to +1E+200 to represent the distance between major ticks.
This constant is used in CDAxisMBS.setLogScale.

30.8.75 kTouchBar as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.7e-100 to represent that the bars in a bar layer should touch each others with no gap in between.
This constant is used in BarLayer.setBarGap.

30.8.76 layout

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform auto-scaling of the axis and compute the positions of the various objects in the chart.
Notes: BaseChart.layout is automatically called when drawing the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3). There is usually no need to call BaseChart.layout explicitly.

However, if you would like to add custom objects to the chart whose positions depend on the axis scales or position of other objects, you may need to call BaseChart.layout explicit to auto-scaling the axis. An example is to draw a custom label at the maximum value point of a data line.

30.8.77 layoutLegend as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Lays out and gets the LegendBox object representing the legend box in the chart.
Notes: Once the legend box has been laid out, the width and height is known and can be obtained using Box.getWidth and Box.getHeight. However, you may not perform actions that may affect the legend box

sizes, such as changing the fonts or adding more data. You may still move the legend box around by using Box.setPos.

The most common use of this method is to position the legend box based on its actual size.
Return Value
The LegendBox object representing the legend box in the chart.

30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5036
- 30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5037
- 30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5038

30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point linear gradient color.
Notes: In this method, the color points are defined as an array of positions and colors along a reference line segment, in the following format:

position0, color0, position1, color1, ... positionN, colorN
The positions are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the starting point of the reference line segment, and 256 (100 in hex) represents the ending point of the reference line segment.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00
means the starting point (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and

the ending point (000100 in hex) is green (00FF00).

One common usage of multi-point gradient colors is to define colors that have metallic look and feel. ChartDirector comes from several predefined gradient color arrays as follows.

NameValue (in Hex)

goldGradient	000000, FFE743, 000060, FFFFE0, 0000B0, FFF0B0, 000100, FFE743
silverGradient	000000, C8C8C8, 000060, F8F8F8, 0000B0, E0E0E0, 000100, C8C8C8
redMetalGradient	000000, E09898, 000060, FFF0F0, 0000B0, F0D8D8, 000100, E09898
greenMetalGradient	000000, 98E098, 000060, F0FFF0, 0000B0, D8F0D8, 000100, 98E098
blueMetalGradient	000000, 9898E0, 000060, F0F0FF, 0000B0, D8D8F0, 000100, 9898E0

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
colorArray	(Mandatory)	An array defining the positions and colors of the pixels along the reference gradient line segment.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5036
- 30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5037
- 30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5038

30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5036
- 30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5036
- 30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5038

30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point linear gradient color.
Notes:

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
startColor	(Mandatory)	The color at the starting point of the reference gradient line segment.
endColor	(Mandatory)	The color at the ending point of the reference gradient line segment.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5036
- 30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5036
- 30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5037

30.8.82 makeChart as CDDrawAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart in internal format and return a DrawArea object to allow adding custom drawings on top of the chart.
Notes: If you want to add custom drawings at the background of the chart, use the BaseChart.getDrawArea method to obtain the DrawArea instead.

After finish adding custom drawings, the resulting chart can then be output using other chart output methods.
Return Value
A DrawArea object that can be used to add custom text and shapes to the chart.
See also:

- 30.8.83 makeChart(format as Integer) as string 5039
- 30.8.84 makeChart(path as folderitem) as boolean 5040

30.8.83 makeChart(format as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart as an image in memory.
Notes: This method is most often used to output the chart directly to an HTTP stream.

ChartDirector supports PNG, JPG, GIF, WBMP and BMP formats, denoted by the following predefined constants:

Constant	Value	Description
kPNG	0	The PNG format.
kGIF	1	The GIF format.
kJPG	2	The JPEG format.
kWMP	3	The WAP bitmap format.
kBMP	4	The BMP format.
kSVG	5	Normal SVG.
kSVGZ	6	Compressed SVG
kPDF	7	PDF format

For vector output (SVG), please call enableVectorOutput early.

Argument	Default	Description
format	(Mandatory)	A constant representing the format of the image.

Return Value
A memory block containing the binary image of the chart in the requested format.
See also:

- 30.8.82 makeChart as CDDrawAreaMBS 5039
- 30.8.84 makeChart(path as folderitem) as boolean 5040

30.8.84 makeChart(path as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart image and save it into a file.
Notes: ChartDirector supports PNG, JPG, GIF, WBMP, SVG, PDF and BMP. The format used are selected based on file extension, which should be png, jpg, jpeg, gif, wbmp, wmp, pdf, svg or bmp.

Argument	Default	Description
filename	(Mandatory)	The name of the file to save the image.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 30.8.82 makeChart as CDDrawAreaMBS 5039
- 30.8.83 makeChart(format as Integer) as string 5039

30.8.85 makeChartPicture as picture

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart as a picture.
Notes: Returns nil on any error.

30.8.86 metalColor(c as Integer, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color by modulates the brightness of another color to create metallic shiny effects.
Notes: The brightness of the color will vary smoothly across the image in a given a direction, so as to produce a shiny effect. The modulation period will be the same as the size of the image, so this method is best use to create background colors.

Argument	Default	Description
c	(Mandatory)	The color to be modulated.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the metallic color.

30.8.87 NonePassFilter as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches no element.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 as a "deny all" filter.
Return Value
An integer filter id representing the filter.

30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other patternColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5043
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5043

30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color using an array of colors as the bitmap pattern.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Argument	Default	Description
colorArray	(Mandatory)	An array of colors representing the colors of the bitmap pixels. The color of the pixel at (x, y) should correspond to index (x + y * width - 1) of the array.
height	(Mandatory)	The height of the bitmap in pixels. (The width is automatically computed as the size of the color array divided by the height.)
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5041
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5043
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5043

30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color by loading the pattern from an image file.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
filename	(Mandatory)	An image file providing the pattern.
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5041
- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5043
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5043

30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates pattern color with named item.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5041
- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5043

30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color using a picture.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used

Argument	Default	Description
pic	(Mandatory)	A picture. The color of the pixel at (x, y) should correspond to index (x + y * width - 1) of the array.
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

to fill an area, the area will look like being tiled with a wallpaper pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5041
- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5042
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5043

30.8.93 phongLighting(ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5, specularIntensity as Double = 0.75, shininess as Integer = 8) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the parameters for the phong lighting effect.
Notes: The return value of this method can be used as the second argument to Layer.setBorderColor to configure phong lighting effect for the layer.

Argument	Default	Description
ambientIntensity	0.5	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	0.5	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	0.75	The specular reflection coefficient of the Phong lighting model.
shininess	8	The shininess coefficient of the Phong lighting model.

30.8.94 Polygon2Shape(slide as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a polygon in an alternative orientation.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
side	(Mandatory)	The number of sides the polygon has.

Return Value
An integer shape id representing the polygon in an alternative orientation.

30.8.95 PolygonShape(slide as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a polygon.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
side	(Mandatory)	The number of sides the polygon has.

Return Value
An integer shape id representing the polygon.

30.8.96 PolynomialRegression(n as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the degree of the polynomial regression to be used in a trend layer.
Notes: This method is used to specify the polynomial regression type in CDTrendLayerMBS.setRegressionType.

Arguments:

Argument	Default	Description
n	(Mandatory)	The degree of the polynomial.

Return Value
An integer representing a polynomial regression of degree n to be used as an argument to CDTrendLay-

erMBS.setRegressionType.

30.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point radial gradient color.
Notes: In this method, the color points are defined as an array of radial distances and colors, in the following format:

distance0, color0, distance1, color1, ... distanceN, colorN
The distances are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the center of the gradient defining ellipse, and 256 (100 in hex) represents the perimeter of the gradient defining ellipse.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00
means the center (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the perimeter (000100 in hex) is green (00FF00).

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the radial gradient.
cy	(Mandatory)	The y coordinate of the center of the radial gradient.
rx	(Mandatory)	The horizontal radius of the radial gradient defining ellipse.
ry	(Mandatory)	The vertical radius of the radial gradient defining ellipse.
colorArray	(Mandatory)	An array defining the radial distances and colors.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.

Return Value
A 32-bit integer representing the radial gradient color.
See also:

- 30.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5047
- 30.8.99 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5047

30.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other radialGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer 5046
- 30.8.99 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5047

30.8.99 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point radial gradient color.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the radial gradient.
cy	(Mandatory)	The y coordinate of the center of the radial gradient.
rx	(Mandatory)	The horizontal radius of the radial gradient defining ellipse.
ry	(Mandatory)	The vertical radius of the radial gradient defining ellipse.
startColor	(Mandatory)	The color at the center of the gradient defining ellipse.
endColor	(Mandatory)	The color at the perimeter of the gradient defining ellipse.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.

Return Value
A 32-bit integer representing the radial gradient color.
See also:

- 30.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer 5046
- 30.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5047

30.8.100 redMetalGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a red metallic color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor and DrawArea.gradientColor. Its contents (in hex) is:

00 E09898 60 FFF0F0 B0 F0D8D8 100 E09898
See Color Specification on how colors are represented in ChartDirector.

30.8.101 RegularSpacingFilter(labelStep as Integer = 1, initialMargin as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches 1 out of every N elements.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific elements for formatting as axis labels.

Argument	Default	Description
labelStep	1	Picks 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements will be selected.
initialMargin	0	Adds an offset when determining the elements to be selected. For example, if the labelStep is 3, the selected indexes should be 0, 3, 6, 9, ... If initialMargin is set to 1, the indexes becomes 1, 4, 7, 10, ...

Return Value
An integer filter id representing the filter.

30.8.102 removeDynamicLayer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the dynamic layer if any.

30.8.103 RGB(r as Integer, g as Integer, b as Integer, a as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a RGB color.

30.8.104 SelectItemFilter(item as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches the specified item.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select a specific element for special formatting.

Argument	Default	Description
item	(Mandatory)	The index of the specified item.

Return Value
An integer filter id representing the filter.

30.8.105 setAMPM(am as string, pm as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the names to be used to denote morning and afternoon.
Notes: The default is to use "am" and "pm".

Argument	Default	Description
am	(Mandatory)	The name used to denote morning.
pm	(Mandatory)	The name used to denote afternoon.

30.8.106 setAntiAlias(shapeAntiAlias as Boolean, textAntiAlias as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Controls whether anti-alias is used when drawing lines, shapes and text.
Notes: For anti-aliasing text, ChartDirector supports the following modes.

ConstantValueDescription

NoAntiAlias	0	Disable anti-alias when drawing text
AntiAlias	1	Always use anti-alias when drawing text
AutoAntiAlias	2	Automatically determine if anti-alias should be used for the text. This is the default.

Currently, ChartDirector will anti-alias only large or bold fonts. For small fonts, assuming it is of high quality, anti-alias is unnecessary. It is because high quality fonts are normally designed to be sharp and clear at low resolution. Anti-aliasing will blur the fonts and make them look worse.

However, for complicated fonts (e.g. some fonts with oriental characters), or for lower quality fonts (e.g. some freeware fonts), anti-alias may be necessary. In this case, it may be needed to force anti-aliasing of all fonts using AntiAlias mode.

Argument	Default	Description
shapeAntiAlias	true	A true value enables anti-alias when drawing lines and shapes. A false value disables anti-alias when drawing lines and shapes
textAntiAlias	AutoAntiAlias	The text anti-alias mode, which must be one of AutoAntiAlias, AntiAlias or NoAntiAlias.

30.8.107 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBackground method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.108 setBackground(colorvalue as Integer, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5050

30.8.108 setBackground(colorvalue as Integer, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the background color, border color and 3D border effect of the chart.
Notes:

See also:

Argument	Default	Description
color	(Mandatory)	The background color of the chart.
edgeColor	Transparent	The border color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

- 30.8.107 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0) 5050

30.8.109 setBgImage(img as string, align as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses the image from the specified file as the background image of the chart.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
img	(Mandatory)	The image file that is used as the background image of the chart.
align	Center	The alignment of the background image relative to the chart. See Alignment Specification for supported alignment types.

30.8.110 setBorder(colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBorder method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.111 setBorder(colorvalue as Integer) 5051

30.8.111 setBorder(colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deprecated. Use SetBackground instead.
See also:

- 30.8.110 setBorder(colorvalue as color) 5051

30.8.112 setColor(paletteEntry as Integer, colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.113 setColor(paletteEntry as Integer, colorvalue as Integer) 5052

30.8.113 setColor(paletteEntry as Integer, colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the color at the specified position in the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
paletteEntry	(Mandatory)	An index to the palette.
color	(Mandatory)	The color to change to.

See also:

- 30.8.112 setColor(paletteEntry as Integer, colorvalue as color) 5052

30.8.114 setColors(numbers() as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.115 setColors(numbers() as Integer) 5052
- 30.8.116 setColors(paletteEntry as Integer, numbers() as color) 5053
- 30.8.117 setColors(paletteEntry as Integer, numbers() as Integer) 5053

30.8.115 setColors(numbers() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the colors in the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
colors	(Mandatory)	An array of colors to change to.

See also:

- 30.8.114 setColors(numbers() as color) 5052
- 30.8.116 setColors(paletteEntry as Integer, numbers() as color) 5053
- 30.8.117 setColors(paletteEntry as Integer, numbers() as Integer) 5053

30.8.116 setColors(paletteEntry as Integer, numbers() as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.114 setColors(numbers() as color) 5052
- 30.8.115 setColors(numbers() as Integer) 5052
- 30.8.117 setColors(paletteEntry as Integer, numbers() as Integer) 5053

30.8.117 setColors(paletteEntry as Integer, numbers() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the colors in the palette, starting from the specified position in the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
paletteEntry	(Mandatory)	An index to the palette to start changing the colors.
colors	(Mandatory)	An array of colors to change to.

See also:

- 30.8.114 setColors(numbers() as color) 5052
- 30.8.115 setColors(numbers() as Integer) 5052
- 30.8.116 setColors(paletteEntry as Integer, numbers() as color) 5053

30.8.118 setDefaultColors(paletteEntry as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the default colors.

30.8.119 setDefaultFonts(normal as string, bold as string, italic as string, boldItalic as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the defaults for normal, bold, italic and bold-italic fonts.
Example:

```
Var Chart as CDBaseChartMBS // your chart

#If TargetARM And TargetLinux Then
// use specific fonts on Linux on Raspberry Pi
Call Chart.setDefaultFonts("/usr/share/fonts/truetype/piboto/PibotoLt-Regular.ttf","/usr/share/fonts/truetype/piboto/Pi
#EndIf
```

Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
normal	(Mandatory)	The default normal font. This is the same as the first font in the font table.
bold	""	The default bold font. This is the same as the second font in the font table. An empty string means the default is unchanged.
italic	""	The default italic font. This is the same as the third font in the font table. An empty string means the default is unchanged.
boldItalic	""	The default bold-italic font. This is the same as the fourth font in the font table. An empty string means the default is unchanged.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.8.120 setDropShadow(ColorValue as color, OffsetX as Integer = 5, OffsetY as Integer = &h7ffffff, blurRadius as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDropShadow method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.121 setDropShadow(ColorValue as Integer = &hAAAAAA, OffsetX as Integer = 5, OffsetY as Integer = &h7fffffff, blurRadius as Integer = 5) 5055

30.8.121 setDropShadow(ColorValue as Integer = &hAAAAAA, OffsetX as Integer = 5, OffsetY as Integer = &h7fffffff, blurRadius as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a drop shadow to the chart.
Notes: The drop shadow effect is created using a single color representation of the non-transparent part of the chart, offsetted by an amount, and put under the chart. The drop shadow can be blurred to create a soft drop shadow effect.

Note that adding a drop shadow will increase the width and height of the chart image so as to accommodate the drop shadow.

Because the drop shadow is located exterior to the original chart, it uses an exterior background color different from the background color of the original chart. The exterior background color is by default white, and can be configured with CDBaseChartMBS.setRoundedFrame.

Arguments:

Argument	Default	Description
color	AAAAAA	The color of the drop shadow.
offsetX	5	The x offset of the drop shadow.
offsetY	7fffffff	The y offset of the drop shadow. 7fffffff means it is the same as the x offset.
blurRadius	5	The blur radius of the drop shadow.

See also:

- 30.8.120 setDropShadow(ColorValue as color, OffsetX as Integer = 5, OffsetY as Integer = &h7fffffff, blurRadius as Integer = 5) 5054

30.8.122 SetFontSearchPath(path as folderitem)

MBS ChartDirector Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font search path.
Example:

```
Var FontFolder as folderitem = SpecialFolder.Desktop.Child("fonts")
CDBaseChartMBS.SetFontSearchPath FontFolder
```

Notes: This method can be used to configure the font search path. You may set your own font search path, or add additional search path before or after the default search path. The usage us like:

CDBaseChartMBS.setFontSearchPath("myPath1;myPath2;%PATH%;myPath3;myPath4");

In the above %PATH% (case sensitive) represents the default search path. This method must be called before the ChartDirector font system is used. It is suggested it be called before any ChartDirector methods. Once ChartDirector tries to look for the fonts (eg. to get font metrics so as to layout a chart), the search path cannot be changed without restarting the process.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.
See also:

- 30.8.123 SetFontSearchPath(path as string) 5056

30.8.123 SetFontSearchPath(path as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font search path.
Example:

```
if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype;/usr/share/fonts/truetype/msttcorefonts"
else
// on Mac and Windows we use system fonts.
end if
```

Notes: This method can be used to configure the font search path. You may set your own font search path, or add additional search path before or after the default search path. The usage us like:

CDBaseChartMBS.setFontSearchPath("myPath1;myPath2;%PATH%;myPath3;myPath4");

In the above %PATH% (case sensitive) represents the default search path. This method must be called before the ChartDirector font system is used. It is suggested it be called before any ChartDirector methods. Once ChartDirector tries to look for the fonts (eg. to get font metrics so as to layout a chart), the search path cannot be changed without restarting the process.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.
See also:

- 30.8.122 SetFontSearchPath(path as folderitem) 5055

30.8.124 setFontTable(index as Integer, font as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an entry in the font table to the specified font name.
Notes: The first 4 fonts in the font table have special significance. They are the defaults for normal, bold, italic and bold-italic fonts.

See Font Specification for details on various font attributes.

Argument	Default	Description
index	(Mandatory)	An index to the font table, starting from 0.
font	(Mandatory)	The font name to be put into the font table.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.8.125 setLicenseCode(n as string, enddate as Integer, v1 as Integer, v2 as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Registeres the chartdirector plugin and library.

30.8.126 setMonthNames(names() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the names of the months for date/time formatting purposes.
Notes: The default is to use the first 3 characters of the English month names (Jan, Feb, Mar ...).

Argument	Default	Description
names	(Mandatory)	An array of 12 text strings to be used as the month names.

30.8.127 setNumberFormat(thousandSeparator as string = " textasciitilde ", decimalPointChar as string = ".", signChar as string = "-")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the characters used for thousand separator, decimal point, and negative sign.
Notes:

Argument	Default	Description
thousandSeparator	'	
textasciitilde '	The thousand separator. Use '	
textasciitilde ' to mean no thousand separator.		
decimalPointChar	'.'	The decimal point character.
signChar	'-'	The negative sign character.

30.8.128 setOutputOptions(options as string)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets output format options for the next chart output. Currently, only SVG, SVGZ and PDF output formats support output options.
Example:

```
Var c as CDBaseChartMBS // your chart object

// 2x for higher DPI displays
c.setOutputOptions("bmpscale=2")
```

Notes: An output option can be a flag (such as "compress") or an attribute-value pair (such as "width=800"). Multiple output options can be joined using semicolons as delimiters.

Raster Image Options (PNG, JPG, GIF, BMP or desktop display output)

Raster Image Option	Type	Description
bmpScale	Attribute	Render the chart with a scale factor. For example, "bmpScale=1.5" means the chart size will be 1.5 times of the original. The supported bmpScale is 0.1 to 4.
dpi	Attribute	Specify the factor for conversion from pixel to physical unit. e.g. 196 for double size.

SVG Options

PDF Options

30.8.129 setResource(id as string, data as MemoryBlock)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.

SVG Option	Type	Description
compress	Flag	Compressed the SVG, that is, output SVGZ.
bitmap	Flag	Render the chart as a bitmap and output the bitmap as SVG.
noxmldecl	Flag	Do not include the xml declaration line "<?xml version="1.0" .... >" in the SVG.
nodoctype	Flag	Do not include the document type declaration line "<!DOCTYPE svg PUBLIC .... >" in the SVG.
width	Flag / Attribute	Specifies the width attribute of the SVG. By default, ChartDirector will not include the width or height attribute in the SVG output. In this case, the SVG is variable in size and would assume the size of its container. For example, if the SVG is inside a <DIV>block in a web page, it will assume the size of the DIV block. If the "width" option is used as a flag, ChartDirector will include the width attribute in the SVG and set it to the chart width. If the "width" option is used as an attribute (such as "width=800"), ChartDirector will include the width attribute in the SVG and set it to the specified value. The specified value should be some text that is valid as SVG width. Examples are "100" and "75%".
height	Flag / Attribute	Specifies the height attribute of the SVG. See the description on "width" above on how to use it.

Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 30.8.130 setResource(id as string, data as string) 5059
- 30.8.131 setResource(id as string, DataArea as CDDrawAreaMBS) 5061

30.8.130 setResource(id as string, data as string)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image

PDF Option	Type	Description
bitmap	Flag	Render the chart as a bitmap and output the bitmap as PDF.
width	Attribute	The width of the chart in the PDF in pixel unit. By default, ChartDirector will use the pixel width of the chart as the width of the chart in PDF. The "width" attribute can be used to specify an alternative value. The value must be a number.
height	Attribute	The width of the chart in the PDF in pixel unit. See the description on "width" above for how to use it.
pagewidth	Attribute	The page width in pixel unit. By default, ChartDirector will set the page width to the same width as the chart. The "pagewidth" attribute can be used to specify an alternative value. The value must be a number.
pageheight	Attribute	The page height in pixel unit. By default, ChartDirector will set the page height to the same height as the chart. The "pageheight" attribute can be used to specify an alternative value. The value must be a number.
leftx	Attribute	The x coordinate of the left side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "leftx" attribute can be used to specify an alternative horizontal position. The coordinate must be a number.
topy	Attribute	The y coordinate of the top side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "topy" attribute can be used to specify an alternative vertical position. The coordinate must be a number.
dpi	Attribute	Specify the factor for conversion from pixel to physical unit. The PDF viewer will convert the pixel unit into physical unit (eg. inches) so that it can be layout on paper or other physical media. The default conversion factor for the chart is 96 pixels per inch. The "dpi" attribute can be used to specify an alternative value. The value must be a number.

Argument	Default	Description
options	(Mandatory)	A list of options delimited by semicolons.

is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

- 30.8.129 setResource(id as string, data as MemoryBlock) 5058
- 30.8.131 setResource(id as string, DataArea as CDDrawAreaMBS) 5061

30.8.131 setResource(id as string, DataArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a DrawArea object to allow it to be referenced using a resource path.
Notes: This method is the same DrawArea.setResource, except that it assigns the resource ID to a CDBaseChartMBS object instead of a memory image. This allows the CDBaseChartMBS object to be reference as an image resource using "@/res_id".

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the DrawArea object.
drawArea	(Mandatory)	The CDDrawAreaMBS object to be used as a resource.

While ChartDirector does not copy the draw area, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 30.8.129 setResource(id as string, data as MemoryBlock) 5058
- 30.8.130 setResource(id as string, data as string) 5059

30.8.132 setResourceGlobal(id as string, data as MemoryBlock)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.

- 30.8.133 setResourceGlobal(id as string, data as string) 5062
- 30.8.134 setResourceGlobal(id as string, DrawArea as CDDrawAreaMBS) 5062

30.8.133 setResourceGlobal(id as string, data as string)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 30.8.132 setResourceGlobal(id as string, data as MemoryBlock) 5061
- 30.8.134 setResourceGlobal(id as string, DrawArea as CDDrawAreaMBS) 5062

30.8.134 setResourceGlobal(id as string, DrawArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a DrawArea object to allow it to be referenced using a resource path.
Notes: This method is the same DrawArea.setResource, except that it assigns the resource ID to a CDBaseChartMBS object instead of a memory image. This allows the CDBaseChartMBS object to be reference as an image resource using "@/res_id".

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the DrawArea object.
drawArea	(Mandatory)	The CDDrawAreaMBS object to be used as a resource.

While ChartDirector does not copy the draw area, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.

30.8.135 setRoundedFrame(extColor as color, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setRoundedFrame method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.136 setRoundedFrame(extColor as Integer = &hFFFFFF, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1) 5063

30.8.136 setRoundedFrame(extColor as Integer = &hFFFFFF, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border style of the chart to rounded corners.
Notes: The underlying drawing surface for a chart is always rectangular. When rounded corners are used, part of the drawing surface (the regions external to the rounded corners) will be outside the chart border. The extColor argument specifies the color to be used for the external regions. Typically, it is set to the same color as the background the container that will be hosting the chart.

For example, in a web page, the extColor may be set to the same color as the web page background.

See also:

Argument	Default	Description
extColor	FFFFFF	The exterior background color.
r1	10	The radius of the top-left rounded corner in pixels.
r2	-1	The radius of the top-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.
r3	-1	The radius of the bottom-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.
r4	-1	The radius of the bottom-left rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.

- 30.8.135 setRoundedFrame(extColor as color, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1) 5063

30.8.137 setSearchPath(path as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the file system search path for loading image files.
Notes: The plugin uses folderitems for most file operations, so this method is not needed for most operations.

Several ChartDirector operations involve loading image files. Examples are wallpapers (BaseChart.setWallpaper), background images (BaseChart.setBgImage and PlotArea.setBackground2), user-defined symbols (DataSet.setDataSymbol2) or for embedding images in text using ChartDirector Mark Up Language.

Argument	Default	Description
path	(Mandatory)	A list of directories, separated with the path separator of your operating system (";" for Windows, ":" for Linux/UNIX).

30.8.138 setSize(width as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the chart.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.

30.8.139 setThickFrame(thickness as Integer, frameColor as Integer = -1, outerEdgeColor as Integer = -1, innerEdgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a thick frame around the chart.
Notes: The thick frame can have 3 colors for the frame itself, the outer edge and the inner edge.

In some applications, the frame color may be similar to the external background color. An common example is a "silver" frame (which is actually a light grey gradient) against a white background. In this case, the frame effect may look less than optimal. An outer edge of different color (such as darker grey) can often help to highlight the frame. Similarly, if the frame color is similar to the chart background, an inner edge of different color may help to improve the frame effect.

Argument	Default	Description
thickness	(Mandatory)	The frame thickness.
frameColor	-1	The frame color. The default value of -1 means the frame color is the same as the outer edge color.
outerEdgeColor	-1	The outer edge color. The default value of -1 means the outer edge color is the same as the current edge color, which can be set in the chart constructor or in BaseChart.setBackground.
innerEdgeColor	-1	The inner edge color. The default value of -1 means the inner edge color is the same as the frame color.

30.8.140 setTransparentColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setTransparentColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.141 setTransparentColor(c as Integer) 5065

30.8.141 setTransparentColor(c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a certain color to mean transparent when creating the image output, or to include alpha transparency channel in the output.
Notes: Alpha transparency: In addition to red, green and blue levels, there is a transparency level associated with each pixel, which can range from completely transparent to completely opaque. The data associated with the transparency information is called the alpha channel.

Single color transparency: The image itself has no alpha channel, but a certain color is used to mean completely transparent. For internal drawing, ChartDirector always use alpha transparency. However, when outputting the image as an image file, ChartDirector by default will remove the alpha channel to reduce image size. It is because many image displaying software do not support alpha transparency. For example, the IE browser only supports single color transparency but not alpha transparency.

If you want to use single color transparency in the output, you may specify the transparent color as the argument to the setTransparentColor method. Note that only GIF and PNG can support single color transparency. JPEG, BMP and WBMP cannot support transparency at all.

If you do want to keep the alpha channel in final output, you may pass -1 as the argument to setTransparentColor. Note that the only image format that can support alpha transparency is PNG.

One important thing to note is that the IE browser (and possibly many image displaying software) only supports single color transparency for palette based images with up to 256 colors, but not for true color images. For this reason, if single color transparency is used, ChartDirector will automatically reduce the image to 256 colors if it has more than 256 colors. This may result in lost of image quality, especially if the image contains gradient colors.

Therefore, due to the limitations of the current generations of image displaying software, for highest image quality, sometimes it may be beneficial to not using transparency in image output, but to set the image background color to the same color as the container background.

Argument	Default	Description
c	(Mandatory)	The color that is designated as the transparent color. If -1 is used, the full alpha transparency channel will be included in the final output.

See also:

- 30.8.140 setTransparentColor(c as color) 5065

30.8.142 setTransparentColors(paletteEntry as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color palette to transparent colors.

30.8.143 setWallpaper(img as folderitem)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses the image from the specified file as the wallpaper to repetitively fill the background of the chart.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
img	(Mandatory)	The image file that is used as the background wallpaper of the chart.

30.8.144 setWeekDayNames(names() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the names of the week days for date/time formatting purposes.
Notes: The default is to use the first 3 characters of the English week day names (Sun, Mon, Tue, ...).

Argument	Default	Description
names	(Mandatory)	An array of 7 text strings to be used as the week day names.

30.8.145 setWhiteOnBlackColors(paletteEntry as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color palette to white on black colors.

30.8.146 silverColor(angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a silver color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.metalColor method, using grey (CCCCCC in hex) as the base color.

Argument	Default	Description
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the silver color.

30.8.147 silverGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a silver color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 C8C8C8 60 F8F8F8 B0 E0E0E0 100 C8C8C8
See Color Specification on how colors are represented in ChartDirector.

30.8.148 softLighting(direction as Integer = 8, raisedEffect as Integer = 4) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A special shading effect that looks like gradient coloring.
Notes: This effect is best explained by viewing the examples.

ExampleLocation of lighting effect

Soft Multi-Bar Chart	The bars are shaded using soft lighting effect, with light direction from Top, and raised effect of 4 pixels.
Soft Bar Shading	The bars are shaded using soft lighting effect, with light direction from Left, and raised effect of 4 pixels.
Spline Line Chart	The title is shaded using soft lighting effect, with light direction from Right, and raised effect of 4 pixels.

The softLighting method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect it objects derived from Box (such as labels and titles represented by TextBox). It may also be used as the second argument to Layer.setBorderColor for BarLayer objects to apply the effect to bars.

Return Value
An integer representing the soft lighting effect.

Argument	Default	Description
direction	Top	The direction of the lighting, which must be one of the predefined constants Top, Bottom, Right or Left.
raisedEffect	4	With soft lighting effect, the object will appear to have some 3D depth. The raisedEffect argument controls the amount of 3D depth in pixels.

30.8.149 StarShape(slide as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a star shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
side	(Mandatory)	The number of points the polygon has.

Return Value
An integer shape id representing the star shape.

30.8.150 StartOfDayFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new day in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new day if it is of a different day than the previous element. It does not need to be at exactly the starting instance of the day.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new day if it is "near" the exact starting instance of the current day, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the day duration.

Return Value
An integer filter id representing the filter.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of day criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of day will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current day to within the ratio specified in the initial margin, it will be considered to have matched the start of day criteria.

30.8.151 StartOfHourFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new hour in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new hour if it is of a different hour than the previous element. It does not need to be at exactly the starting instance of the hour.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new hour if it is "near" the exact starting instance of the current hour, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the hour duration.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of hour criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of hour will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current hour to within the ratio specified in the initial margin, it will be considered to have matched the start of hour criteria.

Return Value
An integer filter id representing the filter.

30.8.152 StartOfMinuteFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new minute in a

date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new minute if it is of a different minute than the previous element. It does not need to be at exactly the starting instance of the minute.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new minute if it is "near" the exact starting instance of the current minute, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the minute duration.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of minute criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of minute will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current minute to within the ratio specified in the initial margin, it will be considered to have matched the start of minute criteria.

Returns an integer filter id representing the filter.

30.8.153 StartOfMonthFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new month in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new month if it is of a different month than the previous element. It does not need to be at exactly the starting instance of the month.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new month if it is "near" the exact starting instance of the current month, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the month duration.

Return Value
An integer filter id representing the filter.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of month criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of month will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current month to within the ratio specified in the initial margin, it will be considered to have matched the start of month criteria.

30.8.154 StartOfSecondFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new second in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new second if it is of a different second than the previous element. It does not need to be at exactly the starting instance of the second.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new second if it is "near" the exact starting instance of the current second, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the second duration.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of second criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of second will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current second to within the ratio specified in the initial margin, it will be considered to have matched the start of second criteria.

Returns an integer filter id representing the filter.

30.8.155 StartOfWeekFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new week in a date/time series.

Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new week if it is of a different week than the previous element. It does not need to be at exactly the starting instance of the week.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new week if it is "near" the exact starting instance of the current week, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the week duration.

Argument	Default	Description
