This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.
See also:

- 37.128.16 insertText(text as string) 7578

37.128.16 insertText(text as string)

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Inserts text into the receiver's text at the insertion point if there is one, otherwise replacing the selection.
Notes: text: The string to insert. Can be either an string or an NSAttributedStringMBS object.

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the NSInputManager class and NSTextInput protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.
See also:

- 37.128.15 insertText(attributedString as NSAttributedStringMBS) 7577

37.128.17 invalidateTextContainerOrigin

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Invalidates the calculated origin of the text container.
Notes: This method is invoked automatically; you should never need to invoke it directly. Usually called because the text view has been resized or the contents of the text container have changed.

37.128.18 loosenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Increases the space between glyphs in the receiver's selection, or in all text if the receiver is a plain text view.
Notes: Kerning values are determined by the point size of the fonts in the selection.

37.128.19 lowerBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Lowers the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
Notes: As such, this method defines a more primitive operation than subscripting.

37.128.20 orderFrontLinkPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate links in the text view.
Notes: Available in Mac OS X v10.4 and later.

37.128.21 orderFrontListPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate text lists in the text view.
Notes: Available in Mac OS X v10.4 and later.

37.128.22 orderFrontSpacingPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate text line heights, interline spacing, and paragraph spacing, in the text view.
Notes: Available in Mac OS X v10.4 and later.

37.128.23 orderFrontSubstitutionsPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Orders the substitution panel to the front.
Notes: Available on Mac OS X 10.6 or newer.

37.128.24 orderFrontTablePanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate text tables in the text view.

37.128.25 outline

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Adds the outline attribute to the selected text attributes if absent; removes the attribute if present.
Notes: If there is a selection and the first character of the selected range has a non-zero stroke width, or if there is no selection and the typing attributes have a non-zero stroke width, then the stroke width is removed; otherwise the value of NSStrokeWidthAttributeName is set to the default value for outline (3.0).

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

37.128.26 pasteAsPlainText

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Inserts the contents of the pasteboard into the receiver's text as plain text.
Notes: This method behaves analogously to insertText.

37.128.27 pasteAsRichText

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: This action method inserts the contents of the pasteboard into the receiver's text as rich text, maintaining its attributes.
Notes: The text is inserted at the insertion point if there is one, otherwise replacing the selection.

37.128.28 performFindPanelAction(FindAction as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Performs a find panel action specified by the sender's tag.
Example:

```
const NSFindPanelActionShowFindPanel = 1

Var n as NSTextViewMBS = TextArea1.NSTextViewMBS
n.usesFindPanel = true
n.performFindPanelAction(NSFindPanelActionShowFindPanel)
```

Notes: This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.

Possible values:
NSFindPanelActionShowFindPanel = 1

NSFindPanelActionNext = 2
NSFindPanelActionPrevious = 3
NSFindPanelActionReplaceAll = 4
NSFindPanelActionReplace = 5
NSFindPanelActionReplaceAndFind = 6
NSFindPanelActionSetFindString = 7
NSFindPanelActionReplaceAllInSelection = 8
NSFindPanelActionSelectAll = 9
NSFindPanelActionSelectAllInSelection = 10
See also:

- 37.128.29 performFindPanelAction(sender as object) 7582

37.128.29 performFindPanelAction(sender as object)

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Performs a find panel action specified by the sender.
Notes: This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.
Sender could be a NSMenuItem or maybe also a NSView.
See also:

- 37.128.28 performFindPanelAction(FindAction as Integer) 7581

37.128.30 raiseBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Raises the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
Notes: As such, this method defines a more primitive operation than superscripting.

37.128.31 replaceTextContainer(textContainer as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Replaces the text container for the group of text system objects containing the receiver, keeping the association between the receiver and its layout manager intact.
Notes: textContainer: The new text container. This method raises NSInvalidArgumentException if TextContainer is nil.

37.128.32 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Initiates a series of delegate messages (and general notifications) to determine whether modifications can be made to the characters and attributes of the receiver,Äôs text.
Notes: affectedCharRange: The range of characters affected by the proposed change.
replacementString: The characters that will replace those in affectedCharRange. If only text attributes are being changed, replacementString is "".

Returns true to allow the change, false to prohibit it.

This method checks with the delegate as needed using textShouldBeginEditing and shouldChangeTextInRange.
This method must be invoked at the start of any sequence of user-initiated editing changes. If your subclass of NSTextView implements methods that modify the text, make sure to invoke this method to determine whether the change should be made. If the change is allowed, complete the change by invoking the didChangeText method.

If the receiver is not editable, this method automatically returns false. This result prevents instances in which a text view could be changed by user actions even though it had been set to be non-editable.
In macOS 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.
See also:

- 37.128.102 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean 7602

37.128.33 showFindIndicatorForRange(charRange as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Causes a temporary highlighting effect to appear around the visible portion (or portions) of the specified range.
Notes: charRange: The character range around which indicators appear.

This method supports lozenge-style indication of find results. The indicators automatically disappear after a certain period of time, or when the method is called again, or when any of a number of changes occur to the view (such as changes to text, view size, or view position).

This method does not itself scroll the specified range to be visible; any desired scrolling should be done before this method is called, first, because the method acts only on the visible portion of the specified range, and, second, because scrolling causes the indicators to disappear. Calling this method with a zero-length range always removes any existing indicators.

Available in OS X v10.5 and later.

37.128.34 startSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Speaks the selected text, or all text if no selection.

37.128.35 stopSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Stops the speaking of text.

37.128.36 tightenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Decreases the space between glyphs in the receiver's selection, or for all glyphs if the receiver is a plain text view.
Notes: Kerning values are determined by the point size of the fonts in the selection.

37.128.37 toggleAutomaticDashSubstitution

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic dash substitution.
Notes: Available on Mac OS X 10.6 or newer.

37.128.38 toggleAutomaticDataDetection

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic data detection.
Notes: Available on Mac OS X 10.6 or newer.

37.128.39 toggleAutomaticLinkDetection

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Changes the state of automatic link detection from enabled to disabled and vice versa.
Notes: Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Available in Mac OS X v10.5 and later.

37.128.40 toggleAutomaticQuoteSubstitution

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Changes the state of automatic quotation mark substitution from enabled to disabled and vice versa.
Notes: Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Available in Mac OS X v10.5 and later.

37.128.41 toggleAutomaticSpellingCorrection

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic spelling correction.
Notes: Available on Mac OS X 10.6 or newer.

37.128.42 toggleAutomaticTextReplacement

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic text replacements.
Notes: Available on Mac OS X 10.6 or newer.

37.128.43 toggleBold

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Toggles the use of a bold/non-bold font.
Example:

```
// some textview
Var textview as NSTextView = TextArea1.NSTextViewMBS

// switch between bold and non bold
textview.toggleBold
```

Notes: You can set this to continue typing with/without bold or change current selection.
Can only provide bold if the font supports it.

37.128.44 toggleContinuousSpellChecking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Toggles whether continuous spell checking is enabled for the receiver.

37.128.45 toggleGrammarChecking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Changes the state of grammar checking from enabled to disabled and vice versa.
Notes: Available in Mac OS X v10.5 and later.

37.128.46 toggleItalic

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Toggles the use of an italic/non-italic font.
Example:

```
// some textview
Var textview as NSTextView = TextArea1.NSTextViewMBS

// switch between italic and non italic
textview.toggleItalic
```

Notes: You can set this to continue typing with/without bold or change current selection.
Can only provide italic if the font supports it.

37.128.47 toggleSmartInsertDelete

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Changes the state of smart insert and delete from enabled to disabled and vice versa.
Notes: Controls whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.

Available in Mac OS X v10.5 and later.

37.128.48 toggleTraditionalCharacterShape

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Toggles the NSCharacterShapeAttributeName attribute at the current selection.

37.128.49 turnOffKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use nominal glyph spacing for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

37.128.50 turnOffLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use only required ligatures when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

37.128.51 updateDragTypeRegistration

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Updates the acceptable drag types of all text views associated with the receiver's layout manager.
Notes: If the receiver is editable and is a rich text view, causes all text views associated with the receiver's layout manager to register their acceptable drag types. If the text view isn't editable or isn't rich text, causes those text views to unregister their dragged types.

Subclasses can override this method to change the conditions for registering and unregistering drag types,

whether as a group or individually based on the current state of the text view. They should invoke this method when that state changes to perform the necessary update.

37.128.52 updateFontPanel

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Updates the Font panel to contain the font attributes of the selection.
Notes: Does nothing if the receiver doesn't use the Font panel. You should never need to invoke this method directly, but you can override it if needed to handle additional font attributes.

37.128.53 updateRuler

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Updates the ruler view in the receiver's enclosing scroll view to reflect the selection's paragraph and marker attributes.
Notes: Does nothing if the ruler isn't visible or if the receiver doesn't use the ruler. You should never need to invoke this method directly, but you can override this method if needed to handle additional ruler attributes.

37.128.54 useAllLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use all ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

37.128.55 useStandardKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Set the receiver to use pair kerning data for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

37.128.56 useStandardLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use the standard ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

37.128.57 Properties

37.128.58 acceptsGlyphInfo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver accepts the glyph info attribute.
Notes: True if the receiver should accept the NSGlyphInfoAttributeName attribute from text input sources such as input methods and the pasteboard, false otherwise.
(Read and Write property)

37.128.59 allowedWritingToolsResultOptions as Integer

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: What types of results are allowed for writing tools.
Example:

```
Var n As NSTextViewMBS = TextArea1.NSTextViewMBS

n.allowedWritingToolsResultOptions = n.NSWritingToolsResultPlainText
n.writingToolsBehavior = n.NSWritingToolsBehaviorComplete
```

Notes: This is whether Apple Intelligence may add text, rich text, lists or tables to the text content.
Requires macOS 15.0 or iOS 18.0 or newer.
(Read and Write property)

37.128.60 allowsDocumentBackgroundColorChange as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Sets whether the receiver allows its background color to change.
Notes: This corresponds to the background color of the entirety of the text view, not just to a selected range of text.
(Read and Write property)

37.128.61 allowsImageEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether image attachments should permit editing of their images.
Notes: True if image editing is allowed; otherwise, false.

For image editing to be allowed, the text view must be editable and the text attachment cell must support image editing.

Available in Mac OS X v10.5 and later.
(Read and Write property)

37.128.62 allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether undo support is enabled.
Notes: (Read and Write property)

37.128.63 AutomaticDashSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic dash substitution is enabled.
Example:

```
Sub CellGotFocus(row as Integer, column as Integer) Handles CellGotFocus
// disable dash subsitution for current cell
Var v As Variant = Me.ActiveCell
if v isa TextArea then
Var t As TextArea = v
Var n As NSTextViewMBS = t.NSTextViewMBS
n.AutomaticDashSubstitutionEnabled = False
End If
End
```

Notes: Turning on automatic dash substitution enables automatic conversion of sequences of ASCII hyphen (-) characters to typographic dashes.
Available in Mac OS X v10.6 and later.
(Read and Write property)

37.128.64 AutomaticDataDetectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic data detection is enabled.
Notes: Automatic data detection enables detection of dates, addresses, and phone numbers.
Available in Mac OS X v10.6 and later.
(Read and Write property)

37.128.65 AutomaticLinkDetectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Enables or disables automatic link detection.
Notes: If true, automatic link detection is enabled; if false, it is disabled.

Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Available in Mac OS X v10.5 and later.
(Read and Write property)

37.128.66 AutomaticQuoteSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether automatic quotation mark substitution is enabled.
Notes: True if automatic quotation mark substitution is enabled; otherwise, false.

Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Available in Mac OS X v10.5 and later.
(Read and Write property)

37.128.67 AutomaticSpellingCorrectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic spelling correction is enabled.
Notes: Available in Mac OS X v10.6 and later.

(Read and Write property)

37.128.68 AutomaticTextReplacementEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic text replacement is enabled.
Notes: Turning on automatic text replacement enables automatic substitution of a variety of static text items based on user preferences.
Available in Mac OS X v10.6 and later.
(Read and Write property)

37.128.69 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: (Read and Write property)

37.128.70 Bold as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether the current typing uses a bold font.
Example:

```
// some textview
Var textview as NSTextView = TextArea1.NSTextViewMBS

// switch to bold font
textview.Bold = true
```

Notes: You can set this to continue typing with/without bold or change current selection.
Can only provide bold if the font supports it.
(Read and Write property)

37.128.71 ContinuousSpellCheckingEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver has continuous spell checking enabled.

Notes: True if the receiver has continuous spell checking enabled, otherwise, false.

See Textarea.WinSpellcheckingMBS property for Windows.

See also enabledTextCheckingTypes property.
(Read and Write property)

37.128.72 defaultParagraphStyle as Variant

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets or sets the receiver's default paragraph style.
Example:

```
Var n As NSTextViewMBS = TextArea1.NSTextViewMBS
Var a As NSTextStorageMBS = n.textStorage

// get first paragraph style
Var m As New NSMutableParagraphStyleMBS

// get old tab stops
Var tabs() As NSTextTabMBS

For i As Integer = 0 To 11
Var options As New Dictionary
Var neu As New NSTextTabMBS(n.NSLeftTextAlignment, i * 50.0, options)
tabs.append neu
next

m.setTabStops tabs

// change for current text
a.addAttribute(a.NSParagraphStyleAttributeName, m, New NSRangeMBS(0, a.Length))

// and for future text
n.defaultParagraphStyle = m
```

Notes: Use with NSParagraphStyleMBS class.
(Read and Write property)

37.128.73 displaysLinkToolTips as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the text view automatically supplies the destination of a link as a tooltip for text that has a link attribute.
Notes: True if link tooltips are automatically displayed; otherwise, false.

The default value for this feature is true; clients who do not wish tooltips to be displayed automatically must explicitly disable it.

Available in Mac OS X v10.5 and later.
(Read and Write property)

37.128.74 enabledTextCheckingTypes as Int64

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The default text checking types.
Notes: Available in Mac OS X v10.6 and later.

Can be NSTextCheckingAllSystemTypes (&hffffffff) or NSTextCheckingAllCustomTypes (&hffffffff00000000) or NSTextCheckingAllTypes (&hffffffffffffffff).

Setting this property also changes continuousSpellCheckingEnabled and GrammarCheckingEnabled.
(Read and Write property)

37.128.75 GrammarCheckingEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether or not grammar checking is enabled.
Notes: Available on Mac OS X 10.5 or newer.
If grammar checking is enabled, then it is performed alongside spell checking, whenever the text view checks spelling, whether continuously or manually.

See also enabledTextCheckingTypes property.
(Read and Write property)

37.128.76 insertionPointColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The color used to draw the insertion point.

Notes: (Read and Write property)

37.128.77 isCoalescingUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns whether undo coalescing is in progress.
Notes: True if undo coalescing is in progress, otherwise false.
Available in OS X v10.6 and later.
(Read only property)

37.128.78 isWritingToolsActive as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Whether writing tools are currently active.
Example:

```
Var n As NSTextViewMBS = TextArea1.NSTextViewMBS

If n.isWritingToolsActive Then
MessageBox "Tools active!"
End If
```

Notes: Requires macOS 15.0 or iOS 18.0 or newer.
(Read only property)

37.128.79 Italic as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether the current typing uses a italic font.
Example:

```
// some textview
Var textview as NSTextView = TextArea1.NSTextViewMBS

// switch to italic font
textview.Italic = true
```

Notes: You can set this to continue typing with/without italic or change current selection.
Can only provide italic if the font supports it.

(Read and Write property)

37.128.80 layoutManager as NSLayoutManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the layout manager that lays out text for the receiver's text container.
Notes: The layout manager that lays out text for the receiver's text container, or nil if there's no such object, such as when a text view isn't linked into a group of text objects.
(Read only property)

37.128.81 linkTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets and sets the attributes used to draw the onscreen presentation of link text.
Notes: A dictionary of attributes corresponding to the onscreen presentation of link text.

Link text attributes are applied as temporary attributes to any text with a link attribute. Candidates include those attributes that do not affect layout.

In applications created prior to OS X v10.3, the default value is an empty dictionary. In applications created with OS X v10.3 or greater, the default attributes specify blue text with a single underline and the pointing hand cursor.
(Read and Write property)

37.128.82 markedTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets or sets the attributes used to draw marked text.
Notes: A dictionary of attributes used to draw marked text. Text color, background color, and underline are the only supported attributes for marked text.
(Read and Write property)

37.128.83 RTFData as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Get or set the textview content as RTF data.

Notes: Works only for Cocoa and uses RTF parser/generator from Apple.

See also RTFDataMBS in StyledText, RTFDataMBS and WinRTFDataMBS in TextArea and Desktop-TextArea controls.
(Read and Write property)

37.128.84 RulerVisible as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler.
Notes: True if the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler, false otherwise. The default is false.
(Read and Write property)

37.128.85 selectedTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets or sets the attributes used to indicate the selection.
Example:

```
// underline selected text in TextArea1

Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
Var s as NSTextStorageMBS = t.textStorage

Var d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = s.NSUnderlineStyleSingle
t.selectedTextAttributes = d
```

Notes: A dictionary of attributes used to indicate the selection. Text color, background color, and underline are the only supported attributes for selected text.
(Read and Write property)

37.128.86 smartInsertDeleteEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Whether the view inserts or deletes space around selected words so as to preserve proper spacing and punctuation.

Notes: (Read and Write property)

37.128.87 spellCheckerDocumentTag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a tag identifying the text view's text as a document for the spell checker server.
Notes: The document tag is obtained by sending a uniqueSpellDocumentTag message to the spell server the first time this method is invoked for a particular group of text views. See the NSSpellChecker and NSSpellServer class specifications for more information on how this tag is used.
(Read only property)

37.128.88 supportsAdaptiveImageGlyph as Boolean

MBS MacCocoa Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the document supports adaptive images in the input.
Example:

```
Var n As NSTextViewMBS = TextArea1.NSTextViewMBS

// allow graphics in text
n.importsGraphics = True

// allow to edit images
n.allowsImageEditing = True

// supports adaptive images
n.supportsAdaptiveImageGlyph = True
```

Notes: When this property is false, the input system doesn,Äôt allow the text input to contain adaptive images. Set the value of this property to true only if your document supports adaptive images and handles them properly. For more information, see NSAdaptiveImageGlyphMBS class.
(Read only property)

37.128.89 textContainer as NSTextContainerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The text container.
Notes: The receiver uses the layout manager and text storage of aTextContainer.

Special Considerations
This method is invoked automatically when you create a text view; you should never invoke it directly, but might want to override it. To change the text view for an established group of text system objects, use TextView setter on the text container. To replace the text container for a text view and maintain the view's association with the existing layout manager and text storage, use replaceTextContainer.
(Read and Write property)

37.128.90 textContainerInset as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The empty space the receiver leaves around its text container.
Example:

```
Var n as NSTextViewMBS = TextArea1.NSTextViewMBS

n.textContainerInset = NSMakeSizeMBS(-3,0)
```

Notes: It is possible to set the text container and view sizes and resizing behavior so that the inset cannot be maintained exactly, although the text system tries to maintain the inset wherever possible. In any case, the textContainerOrigin and size of the text container are authoritative as to the location of the text container within the view.

The text itself can have an additional inset, inside the text container, specified by the setLineFragmentPadding method of NSTextContainer.
(Read and Write property)

37.128.91 textContainerOrigin as NSPointMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the origin of the receiver's text container.
Notes: The origin of the receiver's text container, which is calculated from the receiver's bounds rectangle, container inset, and the container's used rect.
(Read only property)

37.128.92 textStorage as NSTextStorageMBS

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's text storage object.
Example:

```
// load rtfd file into textarea
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
Var n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: (Read only property)

37.128.93 typingAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Get or set typing attributes.
Notes: Typing attributes are reset automatically whenever the selection changes. However, if you add any user actions that change text attributes, the action should use this method to apply those attributes afterwards. User actions that change attributes should always set the typing attributes because there might not be a subsequent change in selection before the next typing.
(Read and Write property)

37.128.94 usesAdaptiveColorMappingForDarkAppearance as Boolean

MBS MacCocoa Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the framework should use adaptive color mapping for dark appearance.
Notes: (Read and Write property)

37.128.95 usesFindBar as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether to use the find bar for this text view.
Notes: The value of this property is true if the find bar is used for this text view; otherwise false.
See NSTextFinderMBS class for information about the find bar.
A text view can use either a find panel or a find bar. If usesFindBar is set to true, usesFindPanel is set to false and vice versa.
(Read and Write property)

37.128.96 usesFindPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows for a find panel.
Notes: (Read and Write property)

37.128.97 usesFontPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the text views sharing the receiver's layout manager use the Font panel and Font menu.
Notes: (Read and Write property)

37.128.98 usesInspectorBar as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Whether this text view uses the inspector bar.
Example:

```
Var t as NSTextViewMBS = textarea1.NSTextViewMBS
t.usesInspectorBar = true
```

Notes: Available in OS X v10.7 and later.
(Read and Write property)

37.128.99 usesRuler as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the text views sharing the receiver's layout manager use a ruler.
Notes: True to cause text views sharing the receiver's layout manager to respond to NSRulerView client messages and to paragraph-related menu actions, and update the ruler (when visible) as the selection changes with its paragraph and tab attributes, otherwise false.

Text views must use a ruler to respond to Format menu commands. If a set of text views don't use the ruler, the ruler is hidden, and the text views disallow paragraph attribute changes. By default, text view objects use the ruler.
(Read and Write property)

37.128.100 writingToolsBehavior as Integer

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Whether writing tools are allowed.
Example:

Var n As NSTextViewMBS = TextArea1.NSTextViewMBS

n.allowedWritingToolsResultOptions = n.NSWritingToolsResultPlainText
n.writingToolsBehavior = n.NSWritingToolsBehaviorComplete

Notes: Allows you to control whether Apple Intelligence may be allowed to improve text.
Requires macOS 15.0 or iOS 18.0 or newer.
(Read and Write property)

37.128.101 Events

37.128.102 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Sent when a text view needs to determine if text in a specified range should be changed.
Notes: affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.
See also:

- 37.128.32 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean 7583

37.128.103 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Sent when the selection changes in the text view.

37.128.104 Constants

Constants

Constant	Value	Description
NSFindPanelSubstringMatchTypeContains	0	One of the constants to specify the type of substring matching Find panel. Finds a word containing the search string. Available in Mac OS X v10.5 and later.
NSFindPanelSubstringMatchTypeEndsWith	3	One of the constants to specify the type of substring matching Find panel. Finds a word ending with the search string. Available in Mac OS X v10.5 and later.
NSFindPanelSubstringMatchTypeFullWord	2	One of the constants to specify the type of substring matching Find panel. Finds a word exactly matching the search string. Available in Mac OS X v10.5 and later.
NSFindPanelSubstringMatchTypeStartsWith	1	One of the constants to specify the type of substring matching Find panel. Finds a word starting with the search string. Available in Mac OS X v10.5 and later.
NSSelectByCharacter	0	One of the constants to specify how much the text view extends when the user drags the mouse. Extends the selection character by character.
NSSelectByParagraph	2	One of the constants to specify how much the text view extends when the user drags the mouse. Extends the selection paragraph by paragraph.
NSSelectByWord	1	One of the constants to specify how much the text view extends when the user drags the mouse. Extends the selection word by word.
NSSelectionAffinityDownstream	1	One of the constants to specify the preferred direction of selectio The selection is moving toward the bottom of the document.
NSSelectionAffinityUpstream	0	One of the constants to specify the preferred direction of selectio The selection is moving toward the top of the document.

Writing Tools Behavior

Constant	Value	Description
NSWritingToolsBehaviorComplete	1	The complete inline-editing experience will be provided if possible.
NSWritingToolsBehaviorDefault	0	System-defined behavior, may resolve to ‘None‘, ‘Complete‘, or ‘Limited‘
NSWritingToolsBehaviorLimited	2	The limited, overlay-panel experience will be provided if possible.
NSWritingToolsBehaviorNone	-1	Writing Tools will ignore this view

Writing Tools Result

Constant	Value	Description
NSWritingToolsResultDefault	0	System—defined behavior
NSWritingToolsResultList	4	Lists. implies ‘RichText‘, and Writing Tools may provide attributes layout
NSWritingToolsResultPlainText	1	Writing Tools will provide plain text in proofreading suggestions or re
NSWritingToolsResultPresentationIntent	16	Implies ‘RichText‘, ‘List‘, and ‘Table‘, and Writing Tools may provide t presentation intent attributes. Writing Tools will use ‘NSPresentatio instead of ‘NSTextList‘ and ‘NSTextTable‘ to represent lists and table For macOS 26 or newer.
NSWritingToolsResultRichText	2	as well as plain text, Writing Tools will provide text attributes in pr ing suggestions or rewrites that are natively supported or known to b adopted (such as lists)
NSWritingToolsResultTable	8	Tables. implies ‘RichText‘, and Writing Tools may provide attributes ular layout

37.129 control NSTokenFieldControlMBS

37.129.1 control NSTokenFieldControlMBS

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSTokenField.
Blog Entries

- MBS Xojo Plugins, version 24.1pr5
- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo Plugins, version 21.4pr1
- MBS Xojo Plugins, version 21.1pr2

37.129.2 Properties

37.129.3 View as NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The view used for the control.
Notes: (Read only property)

37.129.4 Events

37.129.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.129.6 Close

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.129.7 Closing

Plugin Version: 15.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.129.8 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes: substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.

If the delegate does not implement this method, no completions are provided.
Available in OS X v10.4 and later.

37.129.9 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.129.10 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.129.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.129.12 displayStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented object.
Notes: representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

37.129.13 editingStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes: representedObject: A represented object of the token field.

Returns a string that's an editable proxy of the represented object, or nil if the token should not be editable.

37.129.14 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.129.15 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.129.16 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.129.17 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.129.18 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.129.19 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes: representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

37.129.20 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.129.21 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.129.22 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a menu for the specified represented object.
Notes: representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.

37.129.23 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.129.24 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.129.25 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.129.26 Open

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.129.27 Opening

Plugin Version: 15.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.129.28 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes: pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

37.129.29 representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a represented object for the given editing string.
Notes: editingString: The edited string representation of a represented object.

Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

37.129.30 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.129.31 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows to validate the tokens to be added to the receiver at a particular location.
Notes: tokens: An array of tokens to be inserted in the receiver at index.
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

37.129.32 styleForRepresentedObject(representedObject as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to return the token style for editing the specified represented object.
Notes: representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don't implement this method, the token field's tokenStyle is used.

37.129.33 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

37.129.34 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.129.35 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

37.129.36 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.

Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.129.37 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.129.38 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The control's action was triggered.
Notes: For a button if it was pressed.

37.129.39 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing.

37.129.40 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow text editing.

37.129.41 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.129.42 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
Notes: objects: An array of represented objects associated with the token field.
pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

37.130 control NSViewControlMBS

37.130.1 control NSViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control to host a generic NSView.

37.130.2 Properties

37.130.3 View as NSViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.130.4 Events

37.130.5 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.130.6 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

37.130.7 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

37.130.8 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.130.9 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

37.130.10 Close

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control is about to close.

37.130.11 Closed

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom view is destroyed.
Notes: Renamed to Closed in plugin version 20.5. Used to be named Close.

37.130.12 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.130.13 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.130.14 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.130.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.130.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.130.17 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

37.130.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

37.130.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

37.130.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.

context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

37.130.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

37.130.22 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examina-

tion is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

37.130.23 drawFocusRingMask(g as NSGraphicsMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Draw the focus ring mask for the view.
Notes: If false is returned, the default method from NSView class runs.

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView default implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

Please use NSGraphicsMBS class for drawing.

37.130.24 DrawRect(g as NSGraphicsMBS, left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The paint event with the rectangle which needs to be redrawn.

37.130.25 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event where you can enable menu items.

37.130.26 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.130.27 focusRingMaskBounds as NSRectMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns the focus ring mask bounds.
Notes: Return nil to run default NSView method.

Return a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring's overall size and position to be determined before it is drawn.
Subclasses must override this method if they require the display of a focus ring.
The NSView default implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box and that noteFocusRingMaskChanged is invoked as described.

37.130.28 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

37.130.29 isFlipped as Boolean

MBS MacControls Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The event to return a boolean value indicating whether the view uses a flipped coordinate system.
Notes: The default value of this property is false, which results in a non-flipped coordinate system. In a non-flipped coordinate system, the origin is in the lower-left corner of the view and positive y-values extend upward. In a flipped coordinate system, the origin is in the upper-left corner of the view and y-values extend downward. X-values always extend to the right.

If you want your view to use a flipped coordinate system, override this property and return true.

37.130.30 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

37.130.31 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.130.32 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.130.33 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

Return true if you handled this event.

37.130.34 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

37.130.35 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.36 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

37.130.37 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.38 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.39 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.40 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.41 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.42 Open

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control is about to was created and you can initialize it.

37.130.43 Opened

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSView is created.
Notes: Renamed to Opened in plugin version 20.5. Used to be named Open.

37.130.44 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.130.45 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.130.46 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.130.47 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

37.130.48 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

37.130.49 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

37.130.50 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

37.130.51 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.52 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.53 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.130.54 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.130.55 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.130.56 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

37.130.57 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.130.58 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

37.130.59 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

37.130.60 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

37.131 class PopupMenu

37.131.1 class PopupMenu

Platform: macOS, Targets: Desktop only.

Function: Gives access to the NSMenuMBS of the PopupMenu.

37.131.2 Methods

37.131.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox PopupMenu1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

37.131.4 NSPopUpButtonMBS as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSPopUpButtonMBS object for the given control.
Example:

```
// get cocoa view for the popupmenu
Var p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
Var it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
Var pic as Picture = LogoMBS(500)
Var img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes: This way you can manipulate Cocoa controls directly.

37.132 class ProgressWheel

37.132.1 class ProgressWheel

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in ProgressWheel class in Xojo.

37.132.2 Methods

37.132.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSProgressIndicatorMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.133 class PushButton

37.133.1 class PushButton

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in Button class in Xojo.

37.133.2 Methods

37.133.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox PushButton1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

37.134 class Radiobutton

37.134.1 class Radiobutton

Plugin Version: 2.9, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

37.134.2 Methods

37.134.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox RadioButton1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

37.135 class ScrollBar

37.135.1 class ScrollBar

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in Scrollbar class in Xojo.

37.135.2 Methods

37.135.3 NSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollerMBS object for the given control.
Example:

MsgBox ScrollBar1.NSScrollerMBS.className

Notes: This way you can manipulate Cocoa controls directly.

37.136 class SearchField

37.136.1 class SearchField

Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built-in search field control in Xojo.
Notes: Only for Xojo 2020r2 or newer.

37.136.2 Methods

37.136.3 NSSearchFieldMBS as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Queries search field object for the control.
Notes: Only for Xojo 2020r2 or newer.

37.137 class SegmentedControl

37.137.1 class SegmentedControl

Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Build in Segmented Control class in Xojo.

37.137.2 Methods

37.137.3 NSSegmentedControlMBS as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSegmentedControlMBS object for the given control.
Example:

SegmentedControl1.NSSegmentedControlMBS.selectedSegment = 0

Notes: This way you can manipulate Cocoa controls directly.

37.138 class Separator

37.138.1 class Separator

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in Separator class in Xojo.

37.138.2 Methods

37.138.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.139 class Slider

37.139.1 class Slider

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in slider class in Xojo.

37.139.2 Methods

37.139.3 NSSliderMBS as NSSliderMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSliderMBS object for the given control.
Example:

MsgBox Slider1.NSSliderMBS.className

Notes: This way you can manipulate Cocoa controls directly.

37.140 class SpinningProgressIndicatorMBS

37.140.1 class SpinningProgressIndicatorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: A resizable, recolorable clone of the spinning NSProgressIndicator.
Notes: Based on YRKSpinningProgressIndicator from Kelan Champagne.
See also https://github.com/kelan/yrk-spinning-progress-indicator
Subclass of the NSViewMBS class.

37.140.2 Methods

37.140.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with size 100/100 and position 0/0
Example:

```
Var t as new SpinningProgressIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.140.4 Constructor(Handle as Integer) 7641

37.140.4 Constructor(Handle as Integer)

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given SpinningProgressIndicator handle.
Example:

```
Var t as new SpinningProgressIndicatorMBS(0, 0, 100, 100)
Var v as new SpinningProgressIndicatorMBS(t.handle)
```

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)

Notes: The handle is casted to a SpinningProgressIndicator and the plugin retains this handle.

- 37.140.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7642

37.140.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with the given size and position.
Example:

Var x as new SpinningProgressIndicatorMBS(0, 0, 100, 100)

Notes: On success the handle property is not zero.
See also:

- 37.140.3 Constructor 7641
- 37.140.4 Constructor(Handle as Integer) 7641

37.140.6 startAnimation

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Starts animation.
Notes: If you see no animation, you can maybe add a timer with short period (50ms) and set needsDisplay to true.

37.140.7 stopAnimation

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Stops the animation.

37.140.8 Properties

37.140.9 backgroundColor as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: Default color is NSColorMBS.clearColor.
(Read and Write computed property)

37.140.10 colorValue as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The color for drawing.
Notes: Default color is NSColorMBS.blackColor.
(Read and Write computed property)

37.140.11 doubleValue as Double

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The current value.
Notes: Default is 0.0.
(Read and Write computed property)

37.140.12 drawsBackground as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether to draw background.
Notes: Default is false.
(Read and Write computed property)

37.140.13 isDisplayedWhenStopped as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether this control is visible without animation turned on.
Notes: Default is true.

(Read and Write computed property)

37.140.14 isIndeterminate as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether progress is indeterminated.
Notes: Default is true.
(Read and Write computed property)

37.140.15 maxValue as Double

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The maximum value.
Notes: Default is 100.0.
(Read and Write computed property)

37.140.16 usesThreadedAnimation as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether to use a thread for the animation.
Notes: Default is true.
(Read and Write computed property)

37.141 class Statictext

37.141.1 class Statictext

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in Statictext class in Xojo.

37.141.2 Methods

37.141.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.142 class TextArea

37.142.1 class TextArea

Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in textarea class in Xojo.
Example:

```
// make a PDF from a textarea in Cocoa Xojo target:

// find view
Var n as NSViewMBS = TextArea1.NSViewMBS
if n = nil then
MsgBox "Only in Cocoa!"
Return
end if

// make pdf data
Var s as string = n.dataWithPDFInsideRect(0,0,n.frame.Width, n.frame.Height)

// save
Var f as FolderItem = GetSaveFolderItem("", "test.pdf")

if f<>Nil then

Var b as BinaryStream = BinaryStream.Create(f, true)

b.Write s

end if
```

Notes: Requires RB 2009r4 or newer.

37.142.2 Methods

37.142.3 NSScrollViewMBS as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollViewMBS object for the given control.
Example:

```
MsgBox TextArea1.NSScrollViewMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.142.4 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

37.142.5 NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextViewMBS object for the given control.
Example:

```
// load rtfd file into textarea
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
Var n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

37.142.6 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Example:

```
// called im a thread:
TextArea1.SetTextThreadSafeMBS "Hello World"
```

Notes: This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

37.142.7 WinInsertImageMBS(data as string, Width as Integer, Height as Integer)

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop only.

Function: Inserts image to file.
Example:

```
Var pic As Picture = LogoMBS(500)
Var data As String = pic.GetData(pic.SaveAsJPEG)

call TextArea1.WinInsertImageMBS(data, 500, 500)
```

Notes: Specify size in pixels and image data.
Image data works with JPEG and other data types.
Requires Windows 8 or newer.

37.142.8 WinShowFontPanelMBS as Boolean

MBS Win Plugin, Plugin Version: 19.2, Platform: Windows, Targets: Desktop only.

Function: Shows font dialog.
Example:

```
If TextArea1.WinShowFontPanelMBS Then
// update controls as font may have been changed?

End If
```

Notes: You can make changes and apply them with OK button.
Returns true when OK is selected.

37.142.9 Properties

37.142.10 RTFDataMBS as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Get or set the textview content as RTF data.
Example:

```
Var rtf as MemoryBlock = TextArea1.RTFDataMBS
TextArea2.RTFDataMBS = rtf
```

Notes: Works only for Cocoa and uses RTF parser/generator from Apple.

See also RTFDataMBS in StyledText, WinRTFDataMBS in TextArea and DesktopTextArea controls and RTFData in NSTextViewMBS class.
(Read and Write computed property)

37.142.11 WinAutoCorrectionMBS as Boolean

MBS Win Plugin, Plugin Version: 19.2, Platform: Windows, Targets: Desktop only.

Function: Enables auto correction for Textarea.
Example:

```
#If TargetWindows Then
TextArea1.WinAutoCorrectionMBS = True
#ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.AutomaticSpellingCorrectionEnabled = True
#EndIf
```

Notes: Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS for MacOS.
(Read and Write computed property)

37.142.12 WinAutoHorizontalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll horizontally.
Notes: Automatically scrolls text to the right by 10 characters when the user types a character at the end of the line. When the user presses the ENTER key, the control scrolls all text back to position zero.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

37.142.13 WinAutoVerticalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll vertically.
Notes: Automatically scrolls text up one page when the user presses the ENTER key on the last line.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

37.142.14 WinRTFDataMBS(SelectionOnly as boolean = false) as string

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop only.

Function: Get or set the RTF data for the text area.
Example:

```
Var rtfData As String

#If TargetWindows Then
rtfData = TextArea1.WinRTFDataMBS
#ElseIf TargetMacOS Then
rtfData = TextArea1.RTFDataMBS
```

#EndIf

Notes: Including images and probably faster as StyledText.RTFData.

See also RTFDataMBS in StyledText, RTFDataMBS in TextArea and DesktopTextArea controls and RTF-Data in NSTextViewMBS class.
(Read and Write computed property)

37.142.15 WinSelHasTextBackColorMBS as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: Whether a custom background color is in used for the selection.
Example:

textArea1.WinSelHasTextBackColorMBS = false

Notes: If false, standard background color is used.
(Read and Write computed property)

37.142.16 WinSelHasTextColorMBS as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: Whether a custom text color is in used for the selection.
Example:

textArea1.WinSelHasTextColorMBS = false

Notes: If false, standard text color is used.
(Read and Write computed property)

37.142.17 WinSelStrikeThroughMBS as Boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop only.

Function: Get or set StrikeThrough text style.
Example:

TextArea1.WinSelStrikeThroughMBS = True

Notes: See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

37.142.18 WinSelSubScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Get or set subscript text style.
Example:

TextArea1.WinSelSubScriptMBS = True

Notes: Subscript text has a lower base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

37.142.19 WinSelSuperScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Get or set superscript text style.
Example:

TextArea1.WinSelSuperScriptMBS = True

Notes: Superscript text has a higher base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

37.142.20 WinSelTextBackColorMBS as Color

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: The current background text color.
Example:

textArea1.WinSelTextBackColorMBS = &cFF0000

Notes: If set also sets WinSelHasTextBackColorMBS to true internally.
(Read and Write computed property)

37.142.21 WinSelTextColorMBS as Color

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: The current foreground text color.
Example:

textArea1.WinSelTextColorMBS = &cFF0000

Notes: If set also sets WinSelHasTextColorMBS to true internally.
(Read and Write computed property)

37.142.22 WinSpellcheckingMBS as Boolean

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop only.

Function: Enables spellchecking for Textarea.
Example:

```
#If TargetWindows Then
TextArea1.WinSpellcheckingMBS = True
#ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.continuousSpellCheckingEnabled = True
#EndIf
```

Notes: Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS for MacOS.
(Read and Write computed property)

37.143 class UpDownArrows

37.143.1 class UpDownArrows

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The build in control class in Xojo.

37.143.2 Methods

37.143.3 NSStepperMBS as NSStepperMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSStepperMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

Chapter 38

Cocoa Drawing

38.1 class NSBezierPathMBS

38.1.1 class NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The plugin class for a Cocoa NSBezierPath.
Notes: An NSBezierPath object allows you to create paths using PostScript-style commands. Paths consist of straight and curved line segments joined together. Paths can form recognizable shapes such as rectangles, ovals, arcs, and glyphs; they can also form complex polygons using either straight or curved line segments. A single path can be closed by connecting its two endpoints, or it can be left open.

An NSBezierPath object can contain multiple disconnected paths, whether they are closed or open. Each of these paths is referred to as a subpath. The subpaths of an NSBezierPath object must be manipulated as a group. The only way to manipulate subpaths individually is to create separate NSBezierPath objects for each.

For a given NSBezierPath object, you can stroke the path's outline or fill the region occupied by the path. You can also use the path as a clipping region for views or other regions. Using methods of NSBezierPath, you can also perform hit detection on the filled or stroked path. Hit detection is needed to implement interactive graphics, as in rubberbanding and dragging operations.

The current graphics context is automatically saved and restored for all drawing operations involving NSBezierPath objects, so your application does not need to worry about the graphics settings changing across invocations.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr4

38.1.2 Methods

38.1.3 appendBezierPath(path as NSBezierPathMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends the contents of the specified path object to the receiver's path.
Notes: Path: The path to add to the receiver.

This method adds the commands used to create aPath to the end of the receiver's path. This method does not explicitly try to connect the subpaths in the two objects, although the operations in Path may still cause that effect.

38.1.4 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an arc of a circle to the receiver's path.
Notes: center: Specifies the center point of the circle used to define the arc.
radius: Specifies the radius of the circle used to define the arc.
startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in a counterclockwise direction. If the receiver's path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver's path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 38.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean) 7656
- 38.1.6 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double) 7657

38.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an arc of a circle to the receiver's path.
Notes: center: Specifies the center point of the circle used to define the arc.
radius: Specifies the radius of the circle used to define the arc.
startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.
clockwise: true if you want the arc to be drawn in a clockwise direction; otherwise false to draw the arc in a counterclockwise direction.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in the direction indicated by the clockwise parameter. If the receiver's path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver's path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 38.1.4 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double) 7656
- 38.1.6 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double) 7657

38.1.6 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an arc to the receiver's path.
Notes: point1: The middle point of the angle.
point2: The end point of the angle.
radius: The radius of the circle inscribed in the angle.

The created arc is defined by a circle inscribed inside the angle specified by three points: the current point, the fromPoint parameter, and the toPoint parameter (in that order). The arc itself lies on the perimeter of the circle, whose radius is specified by the radius parameter. The arc is drawn between the two points of the circle that are tangent to the two legs of the angle.

The arc usually does not contain the points in the fromPoint and toPoint parameters. If the starting point of the arc does not coincide with the current point, a line is drawn between the two points. The starting point of the arc lies on the line defined by the current point and the fromPoint parameter.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 38.1.4 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double) 7656
- 38.1.5 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean) 7656

38.1.7 appendBezierPathWithGlyph(glyph as Integer, font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an outline of the specified glyph to the receiver's path.
Notes: Glyph: The glyph to add to the path.
font: The font in which the glyph is encoded.

If the glyph is not encoded in the font specified by the font parameter—that is, the font does not have an entry for the specified glyph—then no path is appended to the receiver.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

38.1.8 appendBezierPathWithGlyphs(glyphs() as Integer, font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends the outlines of the specified glyphs to the receiver's path.
Notes: glyphs: An array of glpyhs to add to the path.
count: The number of glyphs in the glyphs parameter.
font: The font in which the glyphs are encoded.

If the glyphs are not encoded in the font specified by the font parameter—that is, the font does not have an entry for one of the specified glyphs—then no path is appended to the receiver.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

38.1.9 appendBezierPathWithOvalInRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an oval path to the receiver, inscribing the oval in the specified rectangle.
Notes: rect: The rectangle in which to inscribe the oval.

Before adding the oval, this method moves the current point, which implicitly closes the current subpath. If the aRect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

38.1.10 appendBezierPathWithPoints(points() as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a series of line segments to the receiver's path.
Notes: points: An array of NSPoint data types, each of which contains the end point of the next line segment.
count :The number of points in the points parameter.

This method interprets the points as a set of connected line segments. If the current path contains an open subpath, a line is created from the last point in that subpath to the first point in the points array. If the current path is empty, the first point in the points array is used to set the starting point of the line segments. Subsequent line segments are added using the remaining points in the array.

This method does not close the path that is created. If you wish to create a closed path, you must do so by explicitly invoking the receiver's closePath method.

38.1.11 appendBezierPathWithRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a rectangular path to the receiver's path.
Notes: rect: The rectangle describing the path to create.

Before adding the rectangle, this method moves the current point to the origin of the rectangle, which implicitly closes the current subpath (if any). The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction. The final segment is added using a closePath message.

38.1.12 appendBezierPathWithRoundedRect(rect as NSRectMBS, xRadius as Double, yRadius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a rounded rectangular path to the receiver's path.
Notes: rect: The rectangle that defines the basic shape of the path.
xRadius: The radius of each corner oval along the x-axis. Values larger than half the rectangle's width are clamped to half the width.
yRadius: The radius of each corner oval along the y-axis. Values larger than half the rectangle's height are clamped to half the height.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

38.1.13 bezierPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object.

38.1.14 bezierPathByFlatteningPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a "flattened" copy of the receiver.
Notes: Returns a new path object whose contents are a flattened version of the receiver's path.

Flattening a path converts all curved line segments into straight line approximations. The granularity of the approximations is controlled by the path's current flatness value, which is set using the DefaultFlatness property.

38.1.15 bezierPathByReversingPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object with the reversed contents of the receiver's path.
Notes: Returns a new path object whose contents are a reversed version of the receiver's path.

Reversing a path does not necessarily change the appearance of the path when rendered. Instead, it changes

the direction in which path segments are drawn. For example, reversing the path of a rectangle (whose line segments are normally drawn starting at the origin and proceeding in a counterclockwise direction) causes its line segments to be drawn in a clockwise direction instead. Drawing a reversed path could affect the appearance of a filled pattern, depending on the pattern and the fill rule in use.

This method reverses each whole or partial subpath in the path object individually.

38.1.16 bezierPathWithOvalInRect(r as NSRectMBS) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object initialized with an oval path inscribed in the specified rectangle.
Notes: r: The rectangle in which to inscribe an oval.

Returns an NSBezierPath new path object with the oval path.

If the rect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

38.1.17 bezierPathWithRect(r as NSRectMBS) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object initialized with a rectangular path.
Notes: r: The rectangle describing the path to create.

Returns a new path object with the rectangular path.
The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction.

38.1.18 bezierPathWithRoundedRect(r as NSRectMBS, xRadius as Double, yRadius as Double) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a new NSBezierPath object initialized with a rounded rectangular path.
Notes: r: The rectangle that defines the basic shape of the path.
xRadius: The radius of each corner oval along the x-axis. Values larger than half the rectangle's width are clamped to half the width.

yRadius: The radius of each corner oval along the y-axis. Values larger than half the rectangle's height are clamped to half the height.

Returns a new path object with the rounded rectangular path.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

38.1.19 closePath

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Closes the most recently added subpath.
Notes: This method closes the current subpath by creating a line segment between the first and last points in the subpath. This method subsequently updates the current point to the end of the newly created line segment, which is also the first point in the now closed subpath.

38.1.20 Constructor

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Initializes a new empty NSBezierPath object.

38.1.21 containsPoint(p as NSPointMBS) as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the receiver contains the specified point.
Example:

```
Var r as new NSRectMBS(10, 10, 50, 50)
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
Var p as new NSPointMBS(20,20)

MsgBox str(b.containsPoint(p))
```

Notes: p: The point to test against the path, specified in the path object's coordinate system.

Returns true if the path's enclosed area contains the specified point; otherwise, false.

This method checks the point against the path itself and the area it encloses. When determining hits in the enclosed area, this method uses the non-zero winding rule (NSNonZeroWindingRule). It does not take into account the line width used to stroke the path.

38.1.22 copy as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates a copy of the bezier path.

38.1.23 curveToPoint(endPoint as NSPointMBS, controlPoint1 as NSPointMBS, controlPoint2 as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a Bezier cubic curve to the receiver's path.
Notes: endPoint: The destination point of the curve segment, specified in the current coordinate system
controlPoint1: The point that determines the shape of the curve near the current point.
controlPoint2: The point that determines the shape of the curve near the destination point.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

38.1.24 elementAtIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the type of path element at the specified index.
Notes: index: The index of the desired path element.

Returns the type of the path element.
Path elements describe the commands used to define a path and include basic commands such as moving to a specific point, creating a line segment, creating a curve, or closing the path. The elements are stored in the order of their execution.
See also:

- 38.1.25 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer 7664

38.1.25 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the element type and (and optionally) the associated points for the path element at the specified index.
Notes: index: The index of the desired path element.
associatedPoints: On output, the data points associated with the specified path element.

Returns the type of the path element.

For curve operations, the order of the points is controlPoint1 (associatedPoints(0)), controlPoint2 (associatedPoints(1)), endPoint (associatedPoints(2)).
See also:

- 38.1.24 elementAtIndex(index as Integer) as Integer 7663

38.1.26 elementCount as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the total number of path elements in the receiver's path.
Example:

```
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2

b.removeAllPoints
MsgBox str(b.elementCount) // 0
```

Notes: Each element type corresponds to one of the operations described in constants.

38.1.27 getLineDash(byref pattern() as Double, byref count as Integer, byref phase as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns the line-stroking pattern for the receiver.
Notes: pattern: On output, this array contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed

by the first gap length, followed by the second line segment length, and so on.
count: On output, the number of entries written to pattern.
phase: On output, this value contains the offset at which to start drawing the pattern, measured in points along the dashed-line pattern. For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

38.1.28 isEmpty as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the receiver is empty.
Example:

```
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
MsgBox "isEmpty: "+str(b.isEmpty)
```

Notes: True if the receiver contains no path elements; otherwise, false.

38.1.29 lineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a straight line to the receiver's path.
Notes: p: The destination point of the line segment, specified in the current coordinate system.

This method creates a straight line segment starting at the current point and ending at the point specified by the aPoint parameter. The current point is the last point in the receiver's most recently added segment.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

38.1.30 moveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Moves the receiver's current point to the specified location.
Notes: p: A point in the current coordinate system.

This method implicitly closes the current subpath (if any) and sets the current point to the value in p. When closing the previous subpath, this method does not cause a line to be created from the first and last points

in the subpath.

For many path operations, you must invoke this method before issuing any commands that cause a line or curve segment to be drawn.

38.1.31 relativeCurveToPoint(endPoint as NSPointMBS, controlPoint1 as NSPointMBS, controlPoint2 as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a Bezier cubic curve to the receiver's path from the current point to a new location, which is specified as a relative distance from the current point.
Notes: endPoint: The destination point of the curve segment, interpreted as a relative offset from the current point.
controlPoint1: The point that determines the shape of the curve near the current point, interpreted as a relative offset from the current point.
controlPoint2: The point that determines the shape of the curve near the destination point, interpreted as a relative offset from the current point.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

38.1.32 relativeLineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a straight line segment to the receiver's path starting at the current point and moving towards the specified point, relative to the current location.
Notes: p: A point whose coordinates are interpreted as a relative offset from the current point.

The destination point is relative to the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), a line segment is created between the points (1, 1) and (2, 3).

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

38.1.33 relativeMoveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the receiver's current point to a new point whose location is the specified distance from the current point.
Notes: p: A point whose coordinates are interpreted as a relative offset from the current point.

This method implicitly closes the current subpath (if any) and updates the location of the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), the previous subpath would be closed and the current point would become (2, 3). When closing the previous subpath, this method does not cause a line to be created from the first and last points in the subpath.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

38.1.34 removeAllPoints

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Removes all path elements from the receiver, effectively clearing the path.
Example:

```
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2

b.removeAllPoints
MsgBox str(b.elementCount) // 0
```

38.1.35 setAssociatedPoints(points() as NSPointMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the points associated with the specified path element.
Notes: points: An array containing up to three NSPointMBS data types. This parameter must contain the correct number of points for the path element at the specified index. Move, close path, and line segment commands require one point. Curve operations require three points.
index: The index of the path element you want to modify.

You can use this method to change the points associated with a path quickly and without recreating the path. You cannot use this method to change the type of the path element.

The following example shows you how you would modify the point associated with a line path element. The path created by this example results in a path with two elements. The first path element specifies a move to point (0, 0) while the second creates a line to point (100, 100). It then changes the line to go only to the point (50,50) using this method:

Note: If you specify too few points for a path element of type NSCurveToBezierPathElement, the behavior of this method is undefined.

38.1.36 setLineDash(pattern() as Double, phase as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Sets the line-stroking pattern for the receiver.
Example:

```
Var n as new NSImageMBS(300, 300)
Var g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

Var r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)

Var pattern() as Double
pattern.Append 5
pattern.Append 2
b.setLineDash pattern, 6

g.stroke(b)

g = nil

window1.Backdrop = n.CopyPicture // red line with dash pattern
```

Notes: pattern: An array of floating point values that contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on
count: The number of values in pattern.
phase: The offset at which to start drawing the pattern, measured in points along the dashed-line pattern.

For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

38.1.37 transformUsingAffineTransform(transform as Variant)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Transforms all points in the receiver using the specified transform.
Example:

```
Var bezierPath as NSBezierPathMBS = NSBezierPathMBS.bezierPath
Var transform as NSAffineTransformMBS = NSAffineTransformMBS.transform

bezierPath.moveToPoint NSMakePointMBS(0.0, 0.0)
bezierPath.lineToPoint NSMakePointMBS(100.0, 100.0)

transform.translate(10,10)
bezierPath.transformUsingAffineTransform(transform)

Break // bezierPath.bounds starts now at 10/10
```

Notes: Transform: The transform to apply to the path.

This method applies the transform to the path's points immediately. The following code translates a line from 0,0 to 100,100 to a line from 10,10 to 110,110.

transform must be a NSAffineTransformMBS object.

38.1.38 Properties

38.1.39 Bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns the bounding box of the receiver's path.
Example:

```
Var r as new NSRectMBS(10, 10, 50, 50)
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
Var rr as NSRectMBS = b.Bounds
MsgBox rr.String
```

Notes: The rectangle that encloses the path of the receiver. If the path contains curve segments, the bounding box encloses the curve but may not enclose the control points used to calculate the curve.

(Read only property)

38.1.40 ControlPointBounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bounding box of the receiver's path, including any control points.
Notes: The rectangle that encloses the receiver's path. If the path contains curve segments, the bounding box encloses the control points of the curves as well as the curves themselves.
(Read only property)

38.1.41 CurrentPoint as NSPointMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns the receiver's current point (the trailing point or ending point in the most recently added segment).
Example:

```
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
b.moveToPoint NSMakePointMBS(10,10)

MsgBox b.CurrentPoint.String
```

Notes: The point from which the next drawn line or curve segment begins.
If the receiver is empty, this method raises NSGenericException.
(Read only property)

38.1.42 defaultFlatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The default flatness value for all paths.
Notes: The flatness value specifies the accuracy (or smoothness) with which curves are rendered. It is also the maximum error tolerance (measured in pixels) for rendering curves, where smaller numbers give smoother curves at the expense of more computation. The exact interpretation may vary slightly on different rendering devices.

The default flatness value is 0.6, which yields smooth curves.
(Read and Write property)

38.1.43 defaultLineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The default line cap style for all paths.
Notes: The default line cap style or NSButtLineCapStyle if no other style has been set. For a list of values, see Constants.

The default line cap style can be overridden for individual paths by setting a custom style for that path using the LineCapStyle property.
(Read and Write property)

38.1.44 defaultLineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The default line join style for all paths.
Notes: The default line join style or NSMiterLineJoinStyle if no other value has been set. For a list of values, see Constants.
(Read and Write property)

38.1.45 defaultLineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default line width for the all paths.
Notes: The line width defines the thickness of stroked paths. A width of 0 is interpreted as the thinnest line that can be rendered on a particular device. The actual rendered line width may vary from the specified width by as much as 2 device pixels, depending on the position of the line with respect to the pixel grid and the current anti-aliasing settings. The width of the line may also be affected by scaling factors specified in the current transformation matrix of the active graphics context.
(Read and Write property)

38.1.46 defaultMiterLimit as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default miter limit for all paths.
Notes: The miter limit helps you avoid spikes at the junction of two line segments connected by a miter join (NSMiterLineJoinStyle). If the ratio of the miter length—the diagonal length of the miter join—to the line thickness exceeds the miter limit, the joint is converted to a bevel join. The default miter limit value is 10, which converts miters whose angle at the joint is less than 11 degrees.

(Read and Write property)

38.1.47 defaultWindingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default winding rule used to fill all paths.
Notes: The current default winding rule or NSNonZeroWindingRule if no default rule has been set. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.

Winding rules determine how to paint (or fill) the region enclosed by a path. You use this method to set the default rule that is applied to paths that do not have a custom winding rule assigned.
(Read and Write property)

38.1.48 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.1.49 flatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The flatness value of the path.
Notes: If no value is set, this method returns the default flatness value.
(Read and Write computed property)

38.1.50 lineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The line cap style for the receiver's path.
Notes: If this value is not set for the receiver, the default line cap style is returned.
(Read and Write computed property)

38.1.51 lineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The receiver's line join style.
Notes: If this value is not set for the receiver, the default line join style is returned.
(Read and Write computed property)

38.1.52 lineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The line width of the receiver's path.
Example:

```
Var n as new NSImageMBS(300, 300)
Var g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

Var r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)

Var pattern() as Double
pattern.Append 10
pattern.Append 4

b.lineWidth = 5
b.setLineDash pattern, 12

g.stroke(b)

g = nil

window1.Backdrop = n.CopyPicture // red line with dash pattern
```

Notes: The line width of the receiver, measured in points in the user coordinate space.
If no value was set explicitly for the receiver, this method returns the default line width.
(Read and Write computed property)

38.1.53 miterLimit as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The miter limit of the receiver's path.
Notes: If no value is set, this method returns the default miter limit.
(Read and Write computed property)

38.1.54 windingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the winding rule used to fill the receiver's path.
Notes: Returns the winding rule for the path. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.

This value overrides the default value returned by defaultWindingRule.
For more information on how winding rules affect the appearance of filled paths, see Constants.
(Read and Write computed property)

38.1.55 Constants

Line Joint Style Constants

Constant	Value	Description
NSBevelLineJoinStyle	2	Specifies a bevel line shape of the joints between connected segments of a stroked path. See the setDefaultLineJoinStyle method for an example of the appearance.
NSMiterLineJoinStyle	0	Specifies a miter line shape of the joints between connected segments of a stroked path. See the setDefaultLineJoinStyle method for an example of the appearance.
NSRoundLineJoinStyle	1	Specifies a round line shape of the joints between connected segments of a stroked path. See the setDefaultLineJoinStyle method for an example of the appearance.

Line Cap Style Constants

Constant	Value	Description
NSButtLineCapStyle	0	Specifies a butt line cap style for endpoints for an open path when stroked. See the setDefaultLineCapStyle method for an example of the appearance.
NSRoundLineCapStyle	1	Specifies a round line cap style for endpoints for an open path when stroked. See the setDefaultLineCapStyle method for an example of the appearance.
NSSquareLineCapStyle	2	Specifies a square line cap style for endpoints for an open path when stroked. See the setDefaultLineCapStyle method for an example of the appearance.

Path Element Command Constants

Constant	Value	Description
NSClosePathBezierPathElement	3	Marks the end of the current subpath at the specified point. Note that the point specified for the Close Path element is essentially the same as the current point.
NSCurveToBezierPathElement	2	Creates a curved line segment from the current point to the specified endpoint using two control points to define the curve. The points are stored in the following order: controlPoint1, controlPoint2, endPoint. Ovals, arcs, and Bezier curves all use curve elements to specify their geometry. Contains 3 points.
NSLineToBezierPathElement	1	Creates a straight line from the current drawing point to the specified point. Lines and rectangles are specified using this path element. Contains 1 point.
NSMoveToBezierPathElement	0	Moves the path object's current drawing point to the specified point. This path element does not result in any drawing. Using this command in the middle of a path results in a disconnected line segment. Contains 1 point.

Window Rule Constants

Constant	Value	Description
NSEvenOddWindingRule	1	Specifies the even-odd winding rule. Count the total number of path crossings. If the number of crossings is even, the point is outside the path. If the number of crossings is odd, the point is inside the path and the region containing it should be filled.
NSNonZeroWindingRule	0	Specifies the non-zero winding rule. Count each left-to-right path as +1 and each right-to-left path as -1. If the sum of all crossings is 0, the point is outside the path. If the sum is nonzero, the point is inside the path and the region containing it is filled. This is the default winding rule.

38.2 class NSBitmapImageRepMBS

38.2.1 class NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSBitmapImageRep class renders an image from bitmap data.
Notes: Bitmap data formats supported include GIF, JPEG, TIFF, PNG, and various permutations of raw bitmap data.

Alpha Premultiplication

If a coverage (alpha) plane exists, a bitmap's color components are premultiplied with it. If you modify the contents of the bitmap, you are therefore responsible for premultiplying the data. For this reason, though, if you want to manipulate the actual data, an NSBitmapImageRep object is not recommended for storage. If you need to work with data that is not premultiplied, you should use Quartz, specifically CGImageCreate with kCGImageAlphaLast.

Note that premultiplying does not affect the output quality. Given source bitmap pixel s, destination pixel d, and alpha value a, a blend is basically

d' = a * s + (1 - a) * d

All premultiplication does is precalculate a * s.
Subclass of the NSImageRepMBS class.

38.2.2 Methods

38.2.3 bitmapImageRepByConvertingToColorSpace(colorSpace as NSColorSpaceMBS, renderingIntent as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: Converts the image rep to the specified colorspace.
Notes: targetSpace: The new colorSpace
renderingIntent: The rendering intent specifies how to handle colors that are not located within the target color space. The supported values are NSColorRenderingIntent.

Constant	Value
Default	0
AbsoluteColorimetric	1
RelativeColorimetric	2
Perceptual	3
Saturation	4

An NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.

38.2.4 bitmapImageRepByRetaggingWithColorSpace(newSpace as NSColorSpaceMBS) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the colorSpace tag of the receiver.
Notes: newSpace: The desired colorSpace.

Returns an NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.

This method will definitely fail if you pass a colorSpace that has a different color space model than the receiver. That is, if your original image is sRGB, you can only retag with some other RGB colorspace.
Available in Mac OS X v10.6 and later.

38.2.5 BMPRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as bmp data.

38.2.6 canBeCompressedUsing(compression as Integer) as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tests whether the receiver can be compressed by the specified compression scheme.
Notes: Returns ture if the receiver's data matches compression with this type, false if the data doesn't match compression or if compression is unsupported..

Legal values for compression can be found in NSBitmapImageRep.h and are described in TIFF Compression in NSBitmapImageReps. This method returns true if the receiver's data matches compression; for example, if compression is NSTIFFCompressionCCITTFAX3, then the data must be 1 bit per sample and 1 sample per pixel.

38.2.7 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated NSBitmapImageRep from the provided data.
Notes: data: A data object containing image data. The contents of bitmapData can be any supported bitmap format. For TIFF data, the NSBitmapImageRep is initialized from the first header and image data found in bitmapData.

On success the handle property is not zero.
See also:

- 38.2.8 Constructor(pic as Picture) 7678
- 38.2.9 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer) 7679

38.2.8 Constructor(pic as Picture)

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Creates an NSBitmapImageRep object created from a Core Graphics image object.
Notes: pic: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.
See also:

- 38.2.7 Constructor(data as Memoryblock) 7678
- 38.2.9 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer) 7679

38.2.9 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer)

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated NSBitmapImageRep object, so it can render the specified image.
Example:

```
Var n as new NSImageMBS(300,300)
Var r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

Var g as new NSGraphicsMBS(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes: The image bitmap data is allocated for you.

pixelsWide: The width of the image in pixels. This value must be greater than 0.
pixelsHigh: The height of the image in pixels. This value must be greater than 0.
bitsPerSample: The number of bits used to specify one pixel in a single component of the data. All components are assumed to have the same bits per sample. bps should be one of these values: 1, 2, 4, 8, 12, or 16.
samplesPerPixel: The number of data components, or samples per pixel. This value includes both color components and the coverage component (alpha), if present. Meaningful values range from 1 through 5. An image with cyan, magenta, yellow, and black (CMYK) color components plus a coverage component would have an spp of 5; a grayscale image that lacks a coverage component would have an spp of 1.
hasAlpha: True if one of the components counted in the number of samples per pixel (spp) is a coverage (alpha) component, and false if there is no coverage component. If true, the color components in the bitmap data must be premultiplied with their coverage component.
colorSpaceName: A string constant that indicates how data values are to be interpreted. It should be one of the following values: NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, NSNamedColorSpace or NSCustomColorSpace. (see NSColorSpaceMBS)

If bps is 12, you cannot specify the monochrome color space.
bytesPerRow: The number of bytes that are allocated for each scan line in each plane of data. A scan line is a single row of pixels spanning the width of the image.
Normally, rowBytes can be figured from the width of the image, the number of bits per pixel in each sample (bps), and, if the data is in a meshed configuration, the number of samples per pixel (spp). However, if the data for each row is aligned on word or other boundaries, it may have been necessary to allocate more memory for each row than there is data to fill it. rowBytes lets the object know whether that's the case.
If you pass in a rowBytes value of 0, the bitmap data allocated may be padded to fall on long word or larger boundaries for performance. If your code wants to advance row by row, use bytesPerRow and do not assume the data is packed. Passing in a non-zero value allows you to specify exact row advances.
bitsPerPixel: This integer value informs NSBitmapImageRep how many bits are actually allocated per pixel in each plane of data. If the data is in planar configuration, this normally equals bps (bits per sample). If the data is in meshed configuration, it normally equals bps times spp (samples per pixel). However, it's possible for a pixel specification to be followed by some meaningless bits (empty space), as may happen, for example, if pixel data is aligned on byte boundaries. NSBitmapImageRep supports only a limited number of pixelBits values (other than the default): for RGB images with 4 bps, pixelBits may be 16; for RGB images with 8 bps, pixelBits may be 32. The legal values for pixelBits are system dependent.
If you specify 0 for this parameter, the object interprets the number of bits per pixel using the values in the bps and spp parameters, as described in the preceding paragraph, without any meaningless bits.

On success the handle property is not zero.

You can add several NSBitmapImageRepMBS to NSImage to make a multi page tiff file.
To make a 300 dpi image, the size of the NSImage must be smaller than the size of the bitmap inside by factor 72/300.
See also:

- 38.2.7 Constructor(data as Memoryblock) 7678
- 38.2.8 Constructor(pic as Picture) 7678

38.2.10 GIFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as gif data.

38.2.11 imageRepWithCGImage(CGImage as Variant) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a Core Graphics image object.
Notes: cgimage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

38.2.12 imageRepWithCGImageRef(CGImageHandle as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a Core Graphics image reference.
Notes: CGImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

38.2.13 imageRepWithCIImage(CIImage as variant) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a CoreImage object.
Notes: CIImage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

38.2.14 imageRepWithCIImageRef(CIImageHandle as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a CoreImage reference.
Notes: CIImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

38.2.15 imageRepWithData(data as Memoryblock) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSBitmapImageRep object initialized with the first image in the supplied data.
Notes: data: A data object containing one or more bitmapped images. The bitmapData parameter can contain data in any supported bitmap format.

Returns an NSBitmapImageRep instance or nil if the class is unable to create an image representation.

38.2.16 JPEGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as jpeg data.

38.2.17 NSImageColorSyncProfileData as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a memoryblock containing the ColorSync profile data.
It can be used for TIFF, JPEG, GIF, and PNG files. This value is set when reading in and used when writing out image data. You can get the profile data for a particular color space from the corresponding NSColorSpace object or from the ColorSync Manager.

38.2.18 NSImageCompressionFactor as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing the compression factor of the image.
Used only for JPEG files. JPEG compression in TIFF files is not supported, and the factor is ignored. The value is a float between 0.0 and 1.0, with 1.0 resulting in no compression and 0.0 resulting in the maximum compression possible. It's set when reading in and used when writing out the image.

38.2.19 NSImageCompressionMethod as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number identifying the compression method of the image.
Used only for TIFF files. The value corresponds to one of the NSTIFFCompression constants, described below. It's set when reading in and used when writing out.

38.2.20 NSImageCurrentFrame as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing the current frame for an animated GIF file.

The first frame is 0.

38.2.21 NSImageCurrentFrameDuration as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing the duration (in seconds) of the current frame for an animated GIF image.
The frame duration can be a floating-point value. It is used when reading in, but not when writing out.

38.2.22 NSImageDitherTransparency as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing a boolean that indicates whether the image is dithered.
Used only when writing GIF files.

38.2.23 NSImageEXIFData as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies an dictionary containing the EXIF data for the image.
This property is used only when reading or writing JPEG files. The dictionary contains the EXIF keys and values. Th standard dictionary keys (that is, those that are not specific to camera vendors) are identical to those for kCGImagePropertyExifDictionary declared in the CGImageSource API. See kCGImagePropertyExifDictionary Keys for details.

38.2.24 NSImageFallbackBackgroundColor as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Specifies the background color to use when writing to an image format (such as JPEG) that doesn't support alpha. The color's alpha value is ignored. The default background color, when this property is not specified, is white. The value of the property should be an NSColorMBS object. This constant corresponds to the kCGImageDestinationBackgroundColor constant in Quartz.
Available in Mac OS X v10.5 and later.

38.2.25 NSImageFrameCount as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing the number of frames in an animated GIF file.
This value is used when reading in data.

38.2.26 NSImageGamma as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing the gamma value for the image.
Used only for PNG files. The gamma values is a floating-point number between 0.0 and 1.0, with 0.0 being black and 1.0 being the maximum color. It's set when reading in and used when writing out.

38.2.27 NSImageInterlaced as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing a Boolean value that indicates whether the image is interlaced.
Used only when writing out PNG files.

38.2.28 NSImageLoopCount as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing the number of loops to make when animating a GIF image.
A value of 0 indicates the animation should loop indefinitely. Values should be specified as Integer numbers.
It is used when reading in but not when writing out the image.

38.2.29 NSImageProgressive as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies a number containing a boolean that indicates whether the image uses progressive encoding.
Used only for JPEG files. It's set when reading in and used when writing out.

38.2.30 NSImageRGBColorTable as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes: Identifies an Memoryblock containing the RGB color table.
Used only for GIF files. It's stored as packed RGB. It's set when reading in and used when writing out.

38.2.31 PNGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as PNG data.

38.2.32 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a TIFF representation of the receiver.
Notes: This method invokes TIFFRepresentationUsingCompression using the stored compression type and factor retrieved from the initial image data or changed using setCompression. If the stored compression type isn't supported for writing TIFF data (for example, NSTIFFCompressionNEXT), the stored compression is changed to NSTIFFCompressionNone before invoking TIFFRepresentationUsingCompression. receiver, using the compression that's returned by getCompression (if applicable).

If a problem is encountered during generation of the TIFF, TIFFRepresentation raises an NSTIFFException or an NSBadBitmapParametersException.
See also:

- 38.2.33 TIFFRepresentation(properties as dictionary = nil) as Memoryblock 7686

38.2.33 TIFFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as tiff data.
See also:

- 38.2.32 TIFFRepresentation as Memoryblock 7686

38.2.34 Properties

38.2.35 bitmapData as Ptr

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a pointer to the bitmap data.
Notes: If the data is planar, returns a pointer to the first plane.
(Read only property)

38.2.36 bitmapFormat as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap format of the receiver.
Notes: Returns 0 by default. The return value can indicate several different attributes, which are described in Constants.
(Read only property)

38.2.37 bitsPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of bits allocated for each pixel in each plane of data.
Notes: This number is normally equal to the number of bits per sample or, if the data is in meshed configuration, the number of bits per sample times the number of samples per pixel. It can be explicitly set to another value (in initWithBitmapDataPlanes) in case extra memory is allocated for each pixel. This may be the case, for example, if pixel data is aligned on byte boundaries.
(Read only property)

38.2.38 bytesPerPlane as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of bytes in each plane or channel of data.
Notes: This number is calculated from the number of bytes per row and the height of the image.
(Read only property)

38.2.39 bytesPerRow as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the minimum number of bytes required to specify a scan line (a single row of pixels spanning the width of the image) in each data plane.
Notes: If not explicitly set to another value (in initWithBitmapDataPlanes), this number will be figured from the width of the image, the number of bits per sample, and, if the data is in a meshed configuration, the number of samples per pixel. It can be set to another value to indicate that each row of data is aligned on word or other boundaries.
(Read only property)

38.2.40 CGImage as Variant

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the CGImageMBS for this image representation.
Notes: If the image was created using a CGImage, you can get it back.
Else a new CGImage may be created for you.
(Read only property)

38.2.41 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the image rep's colorSpace
Notes: Available in Mac OS X v10.6 and later.
(Read only property)

38.2.42 isPlanar as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if image data is a planar configuration and false if its in a meshed configuration.
Notes: In a planar configuration, the image data is segregated into a separate plane for each color and coverage component. In a meshed configuration, the data is integrated into a single plane.
(Read only property)

38.2.43 numberOfPlanes as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of separate planes image data is organized into.
Notes: This number is the number of samples per pixel if the data has a separate plane for each component (isPlanar returns true) and 1 if the data is meshed (isPlanar returns false).

(Read only property)

38.2.44 samplesPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of components in the data.
Notes: The returned value includes both color components and the coverage component, if present.
(Read only property)

38.2.45 valueForProperty(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value for the specified property.
Notes: Value can be nil.
(Read and Write computed property)

38.2.46 Constants

Bitmap Format Constants

Constant	Value	Description
NSAlphaFirstBitmapFormat	1	If 0, alpha values are the last component. For example, CMYKA and RGBA. Available in Mac OS X v10.4 and later.
NSAlphaNonpremultipliedBitmapFormat	2	If 0, alpha values are premultiplied. Available in Mac OS X v10.4 and later.
NSFloatingPointSamplesBitmapFormat	4	If 0, samples are integer values. Available in Mac OS X v10.4 and later.

Image format file type constants

Constant	Value	Description
NSBMPFileType	1	Windows bitmap image (BMP) format
NSGIFFileType	2	Graphics Image Format (GIF), originally created by CompuServe for online downloads
NSJPEG2000FileType	5	JPEG 2000 file format.
NSJPEGFileType	3	JPEG format.
NSPNGFileType	4	Portable Network Graphics (PNG) format.
NSTIFFFileType	0	Tagged Image File Format (TIFF)

Image Loading State Constants

Constant	Value	Description
NSImageRepLoadStatusCompleted	-6	Enough data has been provided to successfully decompress the image less of the complete: flag).
NSImageRepLoadStatusInvalidData	-4	An error occurred during image decompression. The image contains tions of the data that have already been successfully decompressed, i
NSImageRepLoadStatusReadingHeader	-2	The image format is known, but not enough data has been read to d the size, depth, etc., of the image. You should continue to provide m
NSImageRepLoadStatusUnexpectedEOF	-5	incrementalLoadFromData was called with true, but not enough data able for decompression. The image contains the portions of the data already been successfully decompressed, if any.
NSImageRepLoadStatusUnknownType	-1	Not enough data to determine image format. You should continue t more data.
NSImageRepLoadStatusWillNeedAllData	-3	Incremental loading cannot be supported. Until you call incremen FromData with true, this status will be returned. You can continue t method but no decompression will take place. Once you do call the with true, then the image will be decompressed and one of the final thr messages will be returned.

Tiff Compression Constants

Constant	Value	Description
NSTIFFCompressionCCITTFAX3	3	CCITT Fax Group 3 compression. Used for 1-bit fax images sent over telephone lines.
NSTIFFCompressionCCITTFAX4	4	CCITT Fax Group 4 compression. Used for 1-bit fax images sent over ISDN lines.
NSTIFFCompressionJPEG	6	JPEG compression. No longer supported for input or output.
NSTIFFCompressionLZW	5	LZW compression.
NSTIFFCompressionNEXT	32766	NeXT compressed. Supported for input only.
NSTIFFCompressionNone	1	No compression.
NSTIFFCompressionOldJPEG	32865	Old JPEG compression. No longer supported for input or output.
NSTIFFCompressionPackBits	32773	PackBits compression.

38.3 class NSColorListMBS

38.3.1 class NSColorListMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a Cocoa ColorList.

38.3.2 Methods

38.3.3 colorWithKey(key as string) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color with the given key.
Notes: Returns nil if key doesn't exist.

38.3.4 Create(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a color list; specify "" if you don't want a name.
Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user's path with writeToFile("").
See also:

- 38.3.5 Create(name as string, path as string) as boolean 7691

38.3.5 Create(name as string, path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a color list; specify "" if you don't want a name.
Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user's path with writeToFile("").
See also:

- 38.3.4 Create(name as string) as boolean 7691

38.3.6 insertColor(theColor as NSColorMBS, key as string, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Inserts color at the specified location.
Notes: If a color by the same key is already in the list but at a different location it is removed from there.

38.3.7 isEditable as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this color list is editable.
Notes: True if it is editable.

38.3.8 Load(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Loads the named color list from availableColorLists.
Notes: Returns true on success.

38.3.9 name as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Name of the color list.

38.3.10 removeColorWithKey(key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the color with the given key.
Notes: Does nothing if the key does not exist.

38.3.11 removeFile

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the color list is in the user's path, removes the corresponding file in user's colorlists directory.
Notes: Also removes the color list from availableColorLists. If there are no outstanding references to the color list this might deallocate the object as well.

38.3.12 setColor(theColor as NSColorMBS, key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: If key already exists, sets the corresponding color; otherwise inserts the color at the end.

38.3.13 writeToFile(path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes the color list to the given path.
Notes: Use "" to save to the user's private colorlists directory. If the color list is named, this method will also insert the color list into availableColorLists.
Returns true for success.

38.4 class NSColorMBS

38.4.1 class NSColorMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The class for a Cocoa color.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)
```

38.4.2 Methods

38.4.3 alternateSelectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the face of a selected control.
Example:

```
Var c as NSColorMBS = NSColorMBS.alternateSelectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the face of a selected control—a control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

38.4.4 alternateSelectedControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text in a selected control.
Example:

```
Var c as NSColorMBS = NSColorMBS.alternateSelectedControlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text in a selected control—a control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

38.4.5 alternatingContentBackgroundColors as NSColorMBS()

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background colors for alternating content items: such as table view rows, collection view items.
Notes: Available on MacOS 10.14 or newer.
This function calls controlAlternatingRowBackgroundColors when alternatingContentBackgroundColors is not available.

38.4.6 blackColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 0.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.blackColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.7 blendedColorWithFraction(alpha as Double, c as NSColorMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object whose component values are a weighted sum of the receiver's and the specified color object's.
Example:

```
Var b as NSColorMBS = NSColorMBS.blueColor
Var r as NSColorMBS = NSColorMBS.redColor
Var c as NSColorMBS = b.blendedColorWithFraction(0.5, r)

MsgBox c.description
```

Notes: fraction: The amount of the color to blend with the receiver's color. The method converts color and a copy of the receiver to RGB, and then sets each component of the returned color to fraction of color's value plus 1 –fraction of the receiver's.
color: The color to blend with the receiver's color.

The resulting color object or nil if the colors can't be converted.

38.4.8 blueColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.0, 0.0, 1.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.9 brownColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.6, 0.4, 0.2 and whose alpha value is 1.0.
Notes: Var c as NSColorMBS = NSColorMBS.brownColor

```
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.10 CGColorHandle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Converts NSColor to CGColor.
Notes: Return value may be an approximation in some cases, so there isn't guaranteed round-trip fidelity. Available on Mac OS X 10.8.

38.4.11 clearColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale and alpha values are both 0.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.clearColor
```

```
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.12 colorFromPasteboard as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the NSColor currently on the given pasteboard.
Notes: The color currently on the pasteboard or nil if pasteBoard doesn't contain color data.

38.4.13 colorNamed(colorName as String) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create catalog colors from values stored with the given name in the Asset Catalog of the main app bundle.

38.4.14 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an object representing the color space of the receiver.
Example:

```
Var b as NSColorMBS = NSColorMBS.blueColor

MsgBox b.colorSpace.localizedName
```

Notes: An object representing a color space. The returned NSColorSpace object may represent a custom color space.

Calling this method raises an exception if the receiver is not based on a color space represented by an NSColorSpace object—specifically, colors designated by NSNamedColorSpace and NSPatternColorSpace. If you are unsure about a color object, convert it to an equivalent NSColorSpace-based object before calling this method. Color objects created with color-space names NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, or NSCustomColorSpace—or with the NSColorSpace class methods corresponding to these names—are safe to use with this method. See "About Color Spaces" in Color Programming Topics for Cocoa for a list of these corresponding methods.

38.4.15 colorUsingColorSpace(colorSpace as NSColorSpaceMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a new color object representing the color of the receiver in the specified color space.
Example:

```
Var b as NSColorMBS = NSColorMBS.blueColor
Var c as NSColorMBS = b.colorUsingColorSpace(NSColorSpaceMBS.deviceRGBColorSpace)

MsgBox b.description
```

Notes: space: The color space of the new NSColor object.

Returns the new NSColor object. This method converts the receiver's color to an equivalent one in the new color space. Although the new color might have different component values, it looks the same as the original. Returns nil if conversion is not possible.

If the receiver's color space is the same as that specified in space, this method returns the same NSColor object.

38.4.16 colorUsingColorSpaceName(colorSpace as string) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor whose color is the same as the receiver's, except that the new NSColor is in the specified color space.
Notes: colorSpace: The name of the color space containing the new NSColor object. If colorSpace is "", the most appropriate color space is used.

The new NSColor object or nil if the specified conversion cannot be done.

38.4.17 colorUsingType(type as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convert the color to a color of different type.
Notes: Return nil if conversion is not possible.

38.4.18 colorWithAlphaComponent(alpha as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object that has the same color space and component values as the receiver, but the specified alpha component.
Example:

```
Var b as NSColorMBS = NSColorMBS.blueColor.colorWithAlphaComponent(0.5)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 0 0 1 0.5"
```

Notes: alpha: The opacity value of the new NSColor object.

Returns a new NSColor object. If the receiver's color space doesn't include an alpha component, the receiver is returned.

A subclass with explicit opacity components should override this method to return a color with the specified alpha.

38.4.19 colorWithCalibratedHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object using the given opacity and HSB color space components.
Example:

```
Var b as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 0.2 0.1 0.1 1"
```

Notes: hue: The hue component of the color object in the HSB color space.
saturation: The saturation component of the color object in the HSB color space.
brightness: The brightness (or value) component of the color object in the HSB color space.
alpha: The opacity value of the color object,

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

38.4.20 colorWithCalibratedRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity and RGB components.
Example:

```
Var b as NSColorMBS = NSColorMBS.colorWithCalibratedRGB(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 1 0.5 0.2 1"
```

Notes: red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

38.4.21 colorWithCalibratedWhite(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity and grayscale value.
Example:

```
Var b as NSColorMBS = NSColorMBS.colorWithCalibratedWhite(1.0, 1.0)
MsgBox b.description // shows "NSCalibratedWhiteColorSpace 1 1"
```

Notes: white: The grayscale value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

38.4.22 colorWithCatalogName(listName as String, colorName as String) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Look up and return catalog colors from standard color catalogs, or from NSColorList whose name matches the specified catalog name.

38.4.23 colorWithCGColor(CGColorHandle as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Converts CGColor to NSColor.
Notes: Return value may be an approximation in some cases, so there isn't guaranteed round-trip fidelity.
Available on Mac OS X 10.8.

38.4.24 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object created from the specified components of the given color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName

Var co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
MsgBox co.description
```

Notes: space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object. The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil.
Raises an NSExceptionMBS if the number of components does not match.
See also:

- 38.4.25 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double) as NSColorMBS 7702

38.4.25 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object created from the specified components of the given color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName

Var co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
```

MsgBox co.description

Notes: space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object. The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil.
Raises an NSExceptionMBS if the number of components does not match.
See also:

- 38.4.24 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS 7702

38.4.26 colorWithColorSpaceHSV(ColorSpace as NSColorSpaceMBS, hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object with the specified color space, hue, saturation, brightness, and alpha channel values.
Notes: ColorSpace: An NSColorSpace object representing a color space. An exception is raised if the color model of the provided color space is not RGB.
hue: The hue (color) component, expressed as a floating-point value in the range 0–1.0.
saturation: The color saturation component, expressed as a floating-point value in the range 0–1.0.
brightness: The brightness component, expressed as a floating-point value in the range 0–1.0.
alpha: The alpha (opacity), expressed as a floating-point value in the range 0 (transparent) to 1.0 (opaque).

Returns the color object.

38.4.27 colorWithDeviceCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object using the given opacity value and CMYK components.
Example:

```
Var b as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.5, 1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceCMYKColorSpace 0.5 1 0.5 0.2 1"
```

Notes: cyan: The cyan component of the color object.
magenta: The magenta component of the color object.
yellow: The yellow component of the color object.
black: The black component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setcmykcolor.

38.4.28 colorWithDeviceHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object using the given opacity value and HSB color space components.
Example:

```
Var b as NSColorMBS = NSColorMBS.colorWithDeviceHSV(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 0.2 0.1 0.1 1"
```

Notes: hue: The hue component of the color object.
saturation: The saturation component of the color object.
brightness: The brightness component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.

38.4.29 colorWithDeviceRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity value and RGB components.
Example:

```
Var b as NSColorMBS = NSColorMBS.colorWithDeviceRGB(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 1 0.5 0.2 1"
```

Notes: red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.

alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.

38.4.30 colorWithDeviceWhite(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity and grayscale values.
Example:

```
Var b as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
MsgBox b.description // shows "NSDeviceWhiteColorSpace 1 1"
```

Notes: white: The grayscale value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setgray.

38.4.31 colorWithDisplayP3(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns a color created from the specified components in the Display P3 colorspace.
Notes: red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

38.4.32 colorWithGenericGamma22White(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns an color created with the specified white and alpha values in the GenericGamma22 colorspace.
Notes: white: The white value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.
Available in OS X v10.7 and later.

38.4.33 colorWithHSV(hue as double, saturation as double, brightness as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

38.4.34 colorWithPatternImage(image as Variant) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object that uses the specified image pattern.
Example:

```
Var p as Picture = LogoMBS(100)
Var n as new NSImageMBS(p)
Var c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
Var x as NSImageMBS = c.patternImage

Backdrop=x.CopyPictureWithMask
```

Notes: The image is tiled starting at the bottom of the window. The image is not scaled.

Parameter is a NSImageMBS object. We declare it as a variant to reduce plugin dependencies.

38.4.35 colorWithRGB(red as double, green as double, blue as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

38.4.36 colorWithSRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a color created from the specified components in the sRGB colorspace.
Notes: red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.
Available in OS X v10.7 and later.

38.4.37 colorWithSystemEffect(systemEffect as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a color representing the base color with a system defined effect applied to it.
Notes: This color is safe to create before draw time, as the resolution of the final color only happens when being set, retrieving its CGColor, resolving with colorWithType, etc. The return color type is named.
Available on MacOS 10.14 or newer.

38.4.38 colorWithWhite(white as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

38.4.39 Components as Double()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the components of the receiver as an array.
Example:

```
Var b as NSColorMBS = NSColorMBS.blueColor
Var c(-1) as Double = b.Components
Var lines(-1) as string

for each d as Double in c
lines.Append str(d)
next

MsgBox Join(lines) // shows 0 0 1 1
```

Notes: You can invoke this method on NSColor objects created from custom color spaces to get the individual floating point components, including alpha. Raises an exception if the receiver doesn't have floating-point components. To find out how many components are in the components array, send the receiver a numberOfComponents message.

38.4.40 Constructor(c as color)

MBS MacBase Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Initializes the color with generic colorspace.
Example:

```
Var r as NSColorMBS = NSColorMBS.redColor
Var c as color = &cFF0000
Var n as new NSColorMBS(c)

Break // check debugger
```

See also:

- 38.4.41 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0) 7708

38.4.41 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

MBS MacBase Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Initializes the color with generic colorspace.

Notes: Pass values in range from 0.0 to 1.0.
See also:

- 38.4.40 Constructor(c as color) 7708

38.4.42 controlAccentColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: A dynamic color that reflects the user's current preferred accent color.
Notes: This color automatically updates when the accent color preference changes. Do not make assumptions about the color space of this color, which may change across releases.
Available on MacOS 10.14 or newer.

38.4.43 controlAlternatingRowBackgroundColors as NSColorMBS()

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background colors for alternating content items: such as table view rows, collection view items.
Notes: Available on MacOS 10.3 or newer.

38.4.44 controlBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the background of large controls.
Example:

```
Var c as NSColorMBS = NSColorMBS.controlBackgroundColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the background of large controls such as browsers, table views, and clip views.

38.4.45 controlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the flat surfaces of a control.
Example:

```
Var c as NSColorMBS = NSColorMBS.controlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the flat surfaces of a control. By default, the control color is a pattern color that will draw the ruled lines for the window background, which is the same as returned by windowBackgroundColor.

If you use controlColor assuming that it is a solid, you may have an incorrect appearance. You should use lightGrayColor in its place.

38.4.46 controlDarkShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the dark edge of the shadow dropped from controls.
Example:

```
Var c as NSColorMBS = NSColorMBS.controlDarkShadowColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the outer, darker border.

38.4.47 controlHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the highlighted bezels of controls.
Example:

```
Var c as NSColorMBS = NSColorMBS.controlHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the inner, duller border.

38.4.48 controlLightHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for light highlights in controls.
Example:

```
Var c as NSColorMBS = NSColorMBS.controlLightHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the outer, brighter border.

38.4.49 controlShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the shadows dropped from controls.
Example:

```
Var c as NSColorMBS = NSColorMBS.controlShadowColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the inner, lighter border.

38.4.50 controlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text on controls that aren't disabled.
Example:

```
Var c as NSColorMBS = NSColorMBS.controlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.51 currentControlTint as Integer

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns current system control tint.

38.4.52 cyanColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.0, 1.0, 1.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.cyanColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.53 darkGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 1/3 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.darkGrayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.54 disabledControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text on disabled controls.
Example:

```
Var c as NSColorMBS = NSColorMBS.disabledControlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.55 findHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Background color of find indicators: the bubbles that show inline search result hits.
Notes: Requires MacOS 10.13 or newer.

38.4.56 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's CMYK and opacity values.
Example:

```
Var co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8)
Var c,m,y,k as Double

co.getCMYK(c,m,y,k)

MsgBox str(c)+" "+str(m)+" "+str(y)+" "+str(k)
```

Notes: cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

- 38.4.57 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double) 7714

38.4.57 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's CMYK and opacity values.
Example:

```
Var co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8, 0.4)
Var c,m,y,k,a as Double

co.getCMYK(c,m,y,k,a)

MsgBox str(c)+" "+str(m)+" "+str(y)+" "+str(k)+" "+str(a)
```

Notes: cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

- 38.4.56 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double) 7713

38.4.58 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's HSB component and opacity values in the respective arguments.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 1.0, 0.4)
Var h,s,v,a as Double

c.getHSV(h,s,v,a)

MsgBox str(h)+" "+str(s)+" "+str(v)+" "+str(a)
```

Notes: hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.

alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.
See also:

- 38.4.59 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref alpha as Double) 7715

38.4.59 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's HSB component and opacity values in the respective arguments.
Notes: hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.
See also:

- 38.4.58 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double) 7714

38.4.60 getRGB(byref red as Double, byref green as Double, byref blue as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's RGB component and opacity values in the respective arguments.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
Var r,g,b as Double

c.getRGB(r,g,b)

MsgBox str(r)+" "+str(g)+" "+str(b) // shows "0 0 1"
```

Notes: red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.

alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.
See also:

- 38.4.61 getRGB(byref red as Double, byref green as Double, byref blue as Double, byref alpha as Double) 7716

38.4.61 getRGB(byref red as Double, byref green as Double, byref blue as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's RGB component and opacity values in the respective arguments.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
Var r,g,b,a as Double

c.getRGB(r,g,b,a)

MsgBox str(r)+" "+str(g)+" "+str(b)+" "+str(a) // shows "0 0 1 1"
```

Notes: red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.
See also:

- 38.4.60 getRGB(byref red as Double, byref green as Double, byref blue as Double) 7715

38.4.62 getWhite(byref white as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's grayscale value and alpha values.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
Var w as Double

c.getWhite(w)

MsgBox str(w)
```

Notes: white: Upon return, contains the grayscale value of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.
See also:

- 38.4.63 getWhite(byref white as Double, byref alpha as Double) 7717

38.4.63 getWhite(byref white as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's grayscale value and alpha values.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
Var w,a as Double

c.getWhite(w,a)

MsgBox str(w)+" "+str(a)
```

Notes: white: Upon return, contains the grayscale value of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.
See also:

- 38.4.62 getWhite(byref white as Double) 7716

38.4.64 grayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 0.5 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.grayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.65 greenColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.0, 1.0, 0.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.greenColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.66 gridColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the optional gridlines in, for example, a table view.
Example:

```
Var c as NSColorMBS = NSColorMBS.gridColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.67 headerColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used as the background color for header cells in table views and outline

views.
Example:

```
Var c as NSColorMBS = NSColorMBS.headerColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used as the background for header cells in table and outline views.

38.4.68 headerTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text in header cells in table views and outline views.
Example:

```
Var c as NSColorMBS = NSColorMBS.headerTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.69 highlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color that represents the virtual light source on the screen.
Example:

```
Var c as NSColorMBS = NSColorMBS.highlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.70 highlightWithLevel(level as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object that represents a blend between the receiver and the highlight color returned by highlightColor.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
Var h as NSColorMBS = c.highlightWithLevel(0.5)
MsgBox h.description
```

Notes: level: The amount of the highlight color that is blended with the receiver's color. This should be a number from 0.0 through 1.0. A highlightLevel below 0.0 is interpreted as 0.0; a highlightLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can't be converted.

Invoke this method when you want to brighten the receiving NSColor for use in highlights.

38.4.71 keyboardFocusIndicatorColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color that represents the keyboard focus ring around controls.
Example:

```
Var c as NSColorMBS = NSColorMBS.keyboardFocusIndicatorColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.72 knobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the flat surface of a slider knob that hasn't been selected.
Example:

```
Var c as NSColorMBS = NSColorMBS.knobColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The knob's beveled edges, which set it in relief, are drawn in highlighted and shadowed versions of the face color. When a knob is selected, its color changes to selectedKnobColor.

38.4.73 labelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for static text and related elements.
Notes: Requires MacOS 10.10 or newer.

38.4.74 lightGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 2/3 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.lightGrayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.75 linkColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for standard system links
Notes: Requires MacOS 10.10 or newer.

38.4.76 magentaColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 0.0, 1.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.magentaColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.77 orangeColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 0.5, 0.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.orangeColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.78 patternImage as Variant

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the image that the receiver is using as a pattern.
Example:

```
Var p as Picture = LogoMBS(100)
Var n as new NSImageMBS(p)
Var c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
Var x as NSImageMBS = c.patternImage

Backdrop=x.CopyPictureWithMask
```

Notes: The image used by the color object. If the receiver doesn't have an image, this method raises an exception.

Declared a variant instead of NSImageMBS to reduce plugin dependencies.

38.4.79 placeholderTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for placeholder text in controls or text views.
Notes: Requires MacOS 10.10 or newer.

38.4.80 purpleColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.5, 0.0, 0.5 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.purpleColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.81 quaternaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for large secondary or disabled static text, separators, large glyphs/icons, etc.
Notes: Requires MacOS 10.10 or newer.

38.4.82 redColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 0.0, 0.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.redColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.83 scrollBarColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for scroll "bars"—that is, for the groove in which a scroller's knob moves.
Example:

```
Var c as NSColorMBS = NSColorMBS.scrollBarColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for scroll bars.

38.4.84 scrubberTexturedBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The scrubber texture background color.

38.4.85 secondaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for secondary static text and related elements.
Notes: Requires MacOS 10.10 or newer.

38.4.86 secondarySelectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used in non-key views.
Example:

```
Var c as NSColorMBS = NSColorMBS.secondarySelectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.87 selectedContentBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background color of selected and emphasized (focused) content: table views rows, collection views, etc.
Notes: Alias for alternateSelectedControlColor
Requires MacOS 10.14 or newer.

38.4.88 selectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the face of a selected control.
Example:

```
Var c as NSColorMBS = NSColorMBS.selectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the face of a selected control—a control being dragged or clicked.

38.4.89 selectedControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text in a selected control—a control being clicked or dragged.
Example:

```
Var c as NSColorMBS = NSColorMBS.selectedControlTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.90 selectedKnobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the slider knob when it is selected.
Example:

```
Var c as NSColorMBS = NSColorMBS.selectedKnobColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for a slider knob that is selected—that is, dragged.

38.4.91 selectedMenuItemColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the face of selected menu items.
Example:

```
Var c as NSColorMBS = NSColorMBS.selectedMenuItemColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for selected menu items.

38.4.92 selectedMenuItemTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the text in menu items.
Example:

```
Var c as NSColorMBS = NSColorMBS.selectedMenuItemTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text in selected menu items.

38.4.93 selectedTextBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the background of selected text.
Example:

```
Var c as NSColorMBS = NSColorMBS.selectedTextBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.94 selectedTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for selected text.
Example:

```
Var c as NSColorMBS = NSColorMBS.selectedTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.95 separatorColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground used for separators between sections of content.
Notes: Not appropriate for use as split view or window chrome dividers.
Requires MacOS 10.14 or newer.

38.4.96 shadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color that represents the virtual shadows cast by raised objects on the screen.
Example:

```
Var c as NSColorMBS = NSColorMBS.shadowColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.97 shadowWithLevel(level as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object that represents a blend between the receiver and the shadow color

returned by shadowColor.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
Var h as NSColorMBS = c.shadowWithLevel(0.5)
MsgBox h.description
```

Notes: level: The amount of the shadow color used for the blend. This should be a number from 0.0 through 1.0. A shadowLevel below 0.0 is interpreted as 0.0; a shadowLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can't be converted.

Invoke this method when you want to darken the receiving NSColor for use in shadows.

38.4.98 systemBlueColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system blue color.
Notes: Requires MacOS 10.10 or newer.

38.4.99 systemBrownColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system brown color.
Notes: Requires MacOS 10.10 or newer.

38.4.100 systemGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system gray color.
Notes: Requires MacOS 10.10 or newer.

38.4.101 systemGreenColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system green color.
Notes: Requires MacOS 10.10 or newer.

38.4.102 systemIndigoColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system indigo color.
Notes: Available in MacOS 10.15 or later.

38.4.103 systemOrangeColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system orange color.
Notes: Requires MacOS 10.10 or newer.

38.4.104 systemPinkColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system pink color.
Notes: Requires MacOS 10.10 or newer.

38.4.105 systemPurpleColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system purple color.
Notes: Requires MacOS 10.10 or newer.

38.4.106 systemRedColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system red color.
Notes: Requires MacOS 10.10 or newer.

38.4.107 systemTealColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system teal color.
Notes: Available in MacOS 10.12 or later.

38.4.108 systemYellowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system yellow color.
Notes: Requires MacOS 10.10 or newer.

38.4.109 tertiaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for disabled static text and related elements.
Notes: Requires MacOS 10.10 or newer.

38.4.110 textBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the text background.
Example:

```
Var c as NSColorMBS = NSColorMBS.textBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the background of text. When text is selected, its background color changes to the return value of selectedTextBackgroundColor.

38.4.111 textColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text.
Example:

```
Var c as NSColorMBS = NSColorMBS.textColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text. When text is selected, its color changes to the return value of selectedTextColor.

38.4.112 underPageBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Background areas revealed behind documents. This should not be used for drawing, and NSVisualEffectMaterialUnderPageBackground should be used instead.
Notes: Requires MacOS 10.8 or newer.

38.4.113 unemphasizedSelectedContentBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background color of selected and unemphasized content: table views rows, collection views, etc.
Notes: Requires MacOS 10.14 or newer.
Alias for secondarySelectedControlColor

38.4.114 unemphasizedSelectedTextBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background for unemphasized text selection (e.g. when the associated control/view/window is not key)
Notes: Requires MacOS 10.14 or newer.

38.4.115 unemphasizedSelectedTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The foreground for unemphasized text selection (e.g. when the associated control/view/window is not key)
Notes: Requires MacOS 10.14 or newer.

38.4.116 whiteColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale and alpha values are both 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.whiteColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.117 windowBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a pattern color that will draw the ruled lines for the window background.
Example:

```
Var c as NSColorMBS = NSColorMBS.windowBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.118 windowFrameColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for window frames, except for their text.
Example:

```
Var c as NSColorMBS = NSColorMBS.windowFrameColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.119 windowFrameTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the text in window frames.
Example:

```
Var c as NSColorMBS = NSColorMBS.windowFrameTextColor
```

```
// convert to Calibrated RGB ColorSpace
c=c.colorUsingColorSpaceName("NSCalibratedRGBColorSpace")

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.120 writeToPasteboard

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes the receiver's data to the specified pasteboard.

38.4.121 yellowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 1.0, 0.0 and whose alpha value is 1.0.
Example:

```
Var c as NSColorMBS = NSColorMBS.yellowColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

38.4.122 Properties

38.4.123 alphaComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The alpha value of the color.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.alphaComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.124 blackComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.blackComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.125 blueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a RGB color.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.126 brightnessComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a HSV color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.brightnessComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.127 catalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the catalog containing the receiver's name.
Notes: This method raises an exception if the receiver's color space isn't NSNamedColorSpace.
(Read only property)

38.4.128 colorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's name.
Notes: This method raises an exception if the receiver's color space isn't NSNamedColorSpace.
(Read only property)

38.4.129 colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Get the color space of the color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)

MsgBox c.colorSpaceName
```

Notes: (Read only property)

38.4.130 colorValue as color

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Returns the color value of this color (ignoring color space).
Notes: The alphaComponent is ignored.
Returns RGB(RedComponent*255, GreenComponent*255, BlueComponent*255).

Plugin converts color to calibrated RGB if needed.
The color is converted to generic RGB Colorspace if needed as that is the one Xojo uses for pictures.
(Read only property)

38.4.131 cyanComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.cyanComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.132 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: The description of the color object.
Example:

```
Var n as NSColorMBS = NSColorMBS.blueColor

MsgBox n.description // shows "NSCalibratedRGBColorSpace 0 0 1 1"
```

Notes: (Read only property)

38.4.133 greenComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a RGB color.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.greenComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.134 Handle as Integer

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: Useful for declares. Value is a NSColor pointer.
(Read and Write property)

38.4.135 hueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a HSV color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.hueComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.136 localizedCatalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the catalog containing the receiver's name as a localized string.
Notes: This string may be displayed in user interface items like color pickers.
(Read only property)

38.4.137 localizedColorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the receiver as a localized string.
Notes: The name of color object as a localized string. This string may be displayed in user interface items like color pickers.
(Read only property)

38.4.138 magentaComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.magentaComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.139 numberOfComponents as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the number of components in the receiver.
Example:

```
Var n as NSColorMBS = NSColorMBS.blueColor

MsgBox str(n.numberOfComponents) // shows 4
```

Notes: The number of components in the color object. The floating-point components counted include alpha. This method raises an exception if the receiver doesn't have floating-point components.

Available in Mac OS X v10.4 and later.
(Read only property)

38.4.140 redComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a RGB color.
Example:

```
Var c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.redComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.141 saturationComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a HSV color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.saturationComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.142 Type as Integer

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Return the type of the color, which in turn determines which accessors are valid for this color.
Notes: It's an exception-raising error to use properties that are not valid for a color; so, before using a given accessor on a color, call colorUsingType to convert the color to the appropriate type. Or, if wanting to use colorSpace-specific accessors such as redComponent, convert to the desired colorSpace with colorUsingColorSpace.

Note that as of macOS 10.13, the new APIs type and colorUsingType replace colorSpaceName and colorUsingColorSpaceName as the funnel APIs for determining the type of color. In code destined to run on 10.13 and newer systems, subclassers are encouraged to implement these two rather than the older colorSpaceName based methods.

Requires MacOS 10.13 or newer.
(Read only property)

38.4.143 whiteComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a Gray color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(0.1)
MsgBox str(c.whiteComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.144 yellowComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
Var c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.yellowComponent)
```

Notes: Value is from 0.0 to 1.0.
(Read only property)

38.4.145 Constants

System Effect

Constant	Value	Description
SystemEffectDeepPressed	2	Deep Pressed
SystemEffectDisabled	3	Disabled
SystemEffectNone	0	No
SystemEffectPressed	1	Pressed
SystemEffectRollover	4	Rollover

Color Types

Constant	Value	Description
TypeCatalog	2	nColor with a catalog name and a color name. These colors can be dynamic and have multiple underlying color values.one
TypeComponentBased	0	Colors which have a color space (specified as NSColorSpace) and appropriate number of CGFloat components.
TypePattern	1	Colors that draw a pattern, specified as an NSImage.

38.5 class NSColorPanelMBS

38.5.1 class NSColorPanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to control a Color Panel (floating window).
Notes: If you use SelectColor in your application, this color panel will be converted in a dialog which makes this class useless.

You should only have one instance of this class in your application.

If you compile for Cocoa, a TextField/TextArea automatically registers for color panel. So in order to avoid them updating text color with color panel selection, clear the focus by calling window.clearfocus method.

This class does only work on desktop computers, not in a webbrowser.

See WinColorPickerMBS class for Windows.
Subclass of the NSPanelMBS class.

38.5.2 Methods

38.5.3 attachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Attaches the given color list to the panel.
Notes: An application should use this method to add an NSColorList saved with a document in its file package or in a directory other than NSColorList's standard search directories.

38.5.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The constructor to create a new color panel.

38.5.5 detachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Detaches the color list from the panel.

38.5.6 GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color in the RGB color model.
Notes: Values from 0.0 to 1.0.
Returns true if the values are valid.
See also:

- 38.5.21 getColor as NSColorMBS 7746

38.5.7 GetColorFromDrag as color

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns color values from the drag.
Notes: If you receive a drag flavor which can't be handled, it may be a NSColor.
In this case only this method will be successfull.
See also:

- 38.5.8 GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean 7743

38.5.8 GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns color values from the drag.
Notes: If you receive a drag flavor which can't be handled, it may be a NSColor.

In this case only this method will be successfull.
See also:

- 38.5.7 GetColorFromDrag as color 7743

38.5.9 orderFrontColorPanel

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Brings up the color panel, an instance of NSColorPanel.
Notes: If the NSColorPanel object does not exist yet, this method creates one. This method is typically invoked when the user chooses Colors from a menu.

38.5.10 SetColor(red as single, green as single, blue as single, alpha as single)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Sets the color.
Notes: Values from 0.0 to 1.0.
See also:

- 38.5.11 setColor(value as NSColorMBS) 7744

38.5.11 setColor(value as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Sets the color.
See also:

- 38.5.10 SetColor(red as single, green as single, blue as single, alpha as single) 7744

38.5.12 setContinuous(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether you want to receive Changed events while the user chooses the color.
Notes: Set value to true to have the receiver calls the Changed event continuously as the color of the NSColorPanel is set by the user; otherwise false.

38.5.13 setMode(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Sets the mode of the panel the mode is one of the modes allowed by the color mask.
Notes: Constants:

```
const NSGrayModeColorPanel              = 0
const NSRGBModeColorPanel               = 1
const NSCMYKModeColorPanel              = 2
const NSHSBModeColorPanel               = 3
const NSCustomPaletteModeColorPanel     = 4
const NSColorListModeColorPanel         = 5
const NSWheelModeColorPanel             = 6
const NSCrayonModeColorPanel            = 7
```

38.5.14 SetPickerMode(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Specifies the color panel's initial picker.
Notes: Constants:

```
NSColorPanelGrayModeMask            = &h00000001
NSColorPanelRGBModeMask             = &h00000002
NSColorPanelCMYKModeMask            = &h00000004
NSColorPanelHSBModeMask             = &h00000008
NSColorPanelCustomPaletteModeMask   = &h00000010
NSColorPanelColorListModeMask       = &h00000020
NSColorPanelWheelModeMask           = &h00000040
NSColorPanelCrayonModeMask          = &h00000080
NSColorPanelAllModesMask            = &h0000ffff
```

38.5.15 setShowsAlpha(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Tells the panel whether or not to show alpha values and an opacity slider.
Notes: Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set with this method.

38.5.16 SharedColorPanelExists as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the NSColorPanel has been created already.
Notes: True if the NSColorPanel has been created already; otherwise false.

38.5.17 Properties

38.5.18 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The accessory view displayed in the panel.
Notes: The accessory view can be any custom view you want to display with NSColorPanel, such as a view offering color blends in a drawing program. The accessory view is displayed below the color picker and above the color swatches in the NSColorPanel. The NSColorPanel automatically resizes to accommodate the accessory view.
(Read and Write property)

38.5.19 alpha as Double

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's current alpha value based on its opacity slider.
Notes: Value is in the range between 0.0 and 1.0.
This is 1.0 (opaque) if the panel has no opacity slider.
(Read only property)

38.5.20 ColorValue as Color

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color as a Xojo color in the RGB model.
Notes: (Read and Write property)

38.5.21 getColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color.
Notes: The color returned can be RGB or something else.
(Read and Write property)
See also:

- 38.5.6 GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean 7743

38.5.22 getColorAsRGB as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color.
Notes: Returned NSColorMBS object is in RGB color mode.
(Read only property)

38.5.23 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the class continuously calls the Changed event.
Notes: Returns true if the receiver continuouslycalls the Changed event as the user manipulates the color picker; otherwise false.
(Read and Write property)

38.5.24 mode as Integer

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns the color picker mode.
Notes: Constants:

```
const NSGrayModeColorPanel              = 0
const NSRGBModeColorPanel               = 1
const NSCMYKModeColorPanel              = 2
const NSHSBModeColorPanel               = 3
const NSCustomPaletteModeColorPanel     = 4
const NSColorListModeColorPanel         = 5
const NSWheelModeColorPanel             = 6
const NSCrayonModeColorPanel            = 7
```

(Read and Write property)

38.5.25 showsAlpha as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether or not the panel shows alpha values and an opacity slider.
Notes: Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set with setShowsAlpha.

(Read and Write property)

38.5.26 Events

38.5.27 Changed

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The color changed.
Notes: May not fire in the RB IDE.

38.5.28 DidMove

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The color panel did move.

38.5.29 GotFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The color panel got focus.

38.5.30 Hidden

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The color panel is hidden.

38.5.31 LostFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The color panel lost focus.

38.5.32 Shown

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The color panel shows.

38.5.33 WillClose

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The color panel will close.

38.5.34 Constants

Modes

Constant	Value	Description
NSCMYKModeColorPanel	2	Cyan-yellow-magenta-black
NSColorListModeColorPanel	5	Custom color list
NSCrayonModeColorPanel	7	Crayons.
NSCustomPaletteModeColorPanel	4	Custom palette
NSGrayModeColorPanel	0	Grayscale-alpha
NSHSBModeColorPanel	3	Hue-saturation-brightness
NSNoModeColorPanel	-1	Indicates no color panel mode. Available in OS X version 10.5 and later.
NSRGBModeColorPanel	1	Red-green-blue
NSWheelModeColorPanel	6	Color wheel

Masks

Constant	Value	Description
NSColorPanelAllModesMask	&h0000ffff	All of the above.
NSColorPanelCMYKModeMask	&h00000004	Cyan-yellow-magenta-black.
NSColorPanelColorListModeMask	&h00000020	Custom color list.
NSColorPanelCrayonModeMask	&h00000080	Crayons.
NSColorPanelCustomPaletteModeMask	&h00000010	Custom palette.
NSColorPanelGrayModeMask	&h00000001	Grayscale-alpha.
NSColorPanelHSBModeMask	&h00000008	Hue-saturation-brightness.
NSColorPanelRGBModeMask	&h00000002	Red-green-blue.
NSColorPanelWheelModeMask	&h00000040	Color wheel.

38.5.35 Screenshots

38.5.36 NSColorPanel.jpg

Function: The NSColorPanel running in a Xojo application.

38.6 class NSColorSamplerMBS

38.6.1 class NSColorSamplerMBS

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for color sampler.
Blog Entries

38.6.2 Methods

38.6.3 Available as Boolean

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether NSColorSampler is available.
Notes: Returns true on MacOS 10.15 or newer.

38.6.4 Constructor

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: May raise PlatformNotSupportedException if not available.

38.6.5 Show

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Shows the color sampler.
Notes: Begins or attaches to an existing color sampling session which presents UI to the user for selecting a color from their screen. The handler will be called on the main thread when the user completes the session (either by selection, or cancelation). In the event of user-cancellation, the color passed with be nil.

Calls Completed event later.

38.6.6 Properties

38.6.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

38.6.8 Events

38.6.9 Completed(selectedColor as NSColorMBS)

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when color sampler finished.
Notes: selectedColor is selected color or nil in case of cancel.

38.7 class NSColorSpaceMBS

38.7.1 class NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSColorSpace class enables the creation of objects representing custom color spaces.
Notes: You can make custom color spaces from ColorSync profiles or from ICC profiles. NSColorSpace also has factory methods that return objects representing the system color spaces.

38.7.2 Methods

38.7.3 adobeRGB1998ColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing an Adobe RGB (1998) color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.adobeRGB1998ColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The Adobe RGB (1998) color space was designed to encompass most of the colors achievable on CMYK color printers, but by using RGB primary colors on a device such as the computer display. For more information on this color space, go to this website:

http://www.adobe.com/digitalimag/adobergb.html

38.7.4 availableColorSpacesWithModel(Model as Integer) as NSColorSpaceMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of color spaces available on the system that are displayed in the color panel, in the order they are displayed in the color panel.
Example:

```
Var a(-1) as NSColorSpaceMBS
Var m as Integer = NSColorSpaceMBS.NSRGBColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

Var names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: This method doesn't return color spaces created on the fly or spaces without user-displayable names. Pass NSUnknownColorSpaceModel as model to get all available color spaces.

Available in Mac OS X v10.6 and later.

38.7.5 CGColorSpaceHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Core Graphics color-space object that represents a color space equivalent to the receiver's.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.CGColorSpaceHandle)
```

Notes: A reference to an Core Graphics color-space object (CGColorSpaceRef) or 0if the type of color space represented by the receiver cannot be represented by a CGColorSpace object.

Available in Mac OS X version 10.5.

38.7.6 colorSpaceForColorSpaceName(name as string) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The colorspace for this color space name.
Example:

Var n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSDeviceWhiteColorSpace)
MsgBox n.localizedName

Notes: This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.

Works well on Mac OS X 10.6.

38.7.7 ColorSpaceWithCGColorSpace(CGColorSpaceHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object.
Notes: The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.

38.7.8 ColorSpaceWithColorSyncProfile(ColorSyncProfileHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given a ColorSync profile.
Notes: The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

38.7.9 ColorSpaceWithICCProfileData(File as FolderItem) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given an ICC profile.
Notes: file: The path to the ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 38.7.10 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS 7757

38.7.10 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given an ICC profile.
Notes: ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 38.7.9 ColorSpaceWithICCProfileData(File as FolderItem) as NSColorSpaceMBS 7757

38.7.11 colorSyncProfileHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the ColorSync profile from which the receiver was created.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.colorSyncProfileHandle)
```

Notes: The ColorSync profile on which the receiver is based. You need to cast this value to an object of opaque type CMProfileRef. Returns NULL if the receiver was created from a ICC-profile data instead. See ColorSync Manager Reference for further information on CMProfileRef.

Available in Mac OS X v10.4 and later.

38.7.12 Constructor(ICCProfileData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given an ICC profile.
Notes: ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

38.7.13 deviceCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a calibrated or device-dependent CMYK color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.deviceCMYKColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color space has cyan, magenta, yellow, black, and alpha components. Typical devices that use the color-subtractive CMYK color space are color printers. This object corresponds to the Cocoa color space name NSDeviceCMYKColorSpace.

Available in Mac OS X v10.4 and later.

38.7.14 deviceGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a calibrated or device-dependent gray color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.deviceGrayColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. The color space also includes an alpha component. Typical devices that use this color space are grayscale printers and displays. This object corresponds to the Cocoa color space name NSDeviceWhiteColorSpace.

Available in Mac OS X v10.4 and later.

38.7.15 deviceRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a calibrated or device-dependent RGB color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.deviceRGBColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color space has red, green, blue, and alpha components. Typical devices that use the color-additive RGB color space are displays and scanners. This object corresponds to the Cocoa color space name NSDeviceRGBColorSpace.

38.7.16 genericCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a device-independent CMYK color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.genericCMYKColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color space has cyan, magenta, yellow, black and alpha component.

Available in Mac OS X v10.4 and later.

38.7.17 genericGamma22GrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a gray color space with a gamma value of 2.2.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.genericGamma22GrayColorSpace
MsgBox n.localizedName
```

Notes: Available in Mac OS X v10.6 and later.

38.7.18 genericGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a device-independent gray color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.genericGrayColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. The color space also includes an alpha component. This object corresponds to the Cocoa color space name NSCalibratedWhiteColorSpace.

Available in Mac OS X v10.4 and later.

38.7.19 genericRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a device-independent RGB color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components. This object corresponds to the Cocoa color space name NSCalibratedRGBColorSpace.

Available in Mac OS X v10.4 and later.

38.7.20 ICCProfileData as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the ICC profile data from which the receiver was created.
Notes: The ICC profile from which the receiver was created. This method attempts to compute the profile data from a CMProfileRef object and returns nil if it is unable to.

For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Available in Mac OS X v10.4 and later.

38.7.21 initWithCGColorSpace(CGColorSpaceHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object.
Notes: The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.

38.7.22 initWithColorSyncProfile(ColorSyncProfileHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given a ColorSync profile.
Notes: The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

38.7.23 sRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing an sRGB color space.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The sRGB color space is a standard color space for use on monitors, printers, and the Internet. For further information on sRGB, see this website:

http://www.color.org/srgb.html

Available in Mac OS X version 10.5.

38.7.24 Properties

38.7.25 colorSpaceModel as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the model on which the color space of the receiver is based.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox str(n.colorSpaceModel)
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

38.7.26 colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the colorspace.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
```

MsgBox n.colorSpaceName

Notes: This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.

Works well on Mac OS X 10.6.
Returns an empty string for some color spaces.
(Read only property)

38.7.27 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the description of the color space.
Notes: (Read only property)

38.7.28 File as FolderItem

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The reference to file if available.
Notes: Will be nil for profiles created from string/MemoryBlock.
(Read only property)

38.7.29 Handle as Integer

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

38.7.30 localizedName as string

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the localized name of the receiver.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedName
```

Notes: The name of the color space as a localized string or nil if no localized name exists.

Available in Mac OS X v10.4 and later.
(Read only property)

38.7.31 numberOfColorComponents as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of components supported by the receiver.
Example:

```
Var n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox str(n.numberOfColorComponents) // shows 3
```

Notes: The number of components (excluding alpha) the receiver supports or zero if the receiver is not based on float components.

Available in Mac OS X v10.4 and later.
(Read only property)

38.7.32 Constants

Constants

Constant	Value	Description
NSCalibratedBlackColorSpace	"NSCalibratedBlackColorSpace"	Calibrated color space with black and alpha compon Deprecated in Mac OS X v10.6.
NSCalibratedRGBColorSpace	"NSCalibratedRGBColorSpace"	Calibrated color space with red, green, blue, and alp You can also create a color with HSB (hue, saturati components and can extract these components.
NSCalibratedWhiteColorSpace	"NSCalibratedWhiteColorSpace"	Calibrated color space with white and alpha compor
NSCMYKColorSpaceModel	2	The CYMK (cyan, yellow, magenta, black) color-spa Can refer to both device-dependent and generic colo Available in Mac OS X v10.4 and later.
NSCustomColorSpace	"NSCustomColorSpace"	Custom NSColorSpace object and floating-point com in that space. A custom color-space object represents a color spa predefined by the Application Kit. See "Working W formation on creating custom color-space objects.
NSDeviceBlackColorSpace	"NSDeviceBlackColorSpace"	Device-dependent color space with black and alpha c 1.0)
NSDeviceCMYKColorSpace	"NSDeviceCMYKColorSpace"	Device-dependent color space with cyan, magenta, components.
NSDeviceNColorSpaceModel	4	DeviceN is a color-space model from Adobe System and PDF color specification. Available in Mac OS X v10.4 and later.
NSDeviceRGBColorSpace	"NSDeviceRGBColorSpace"	Device-dependent color space with red, green, blue, You can also create a color with HSB (hue, saturati components and can extract these components.
NSDeviceWhiteColorSpace	"NSDeviceWhiteColorSpace"	Device-dependent color space with white and alpha c 1.0)
NSGrayColorSpaceModel	0	The grayscale color-space model. Can refer to bo generic color space variants. Available in Mac OS X v10.4 and later.
NSIndexedColorSpaceModel	5	An indexed color space, which identifies specified dis by index number. An indexed color value (a color specification in index an index value that refers to a color in a color list. Available in Mac OS X version 10.5 and later.
NSLABColorSpaceModel	3	The L*a*b* device-independent color-space model, w ative to a reference white point. Available in Mac OS X v10.4 and later.
NSNamedColorSpace	"NSNamedColorSpace"	Catalog name and color name components. The components of this color space are indexes into li colors. The catalogs of named colors come with look generate the correct color on a given device.
NSPatternColorSpace	"NSPatternColorSpace"	Pattern image (tiled) Identifies a pattern color space, which is simply an in and over again in a tiled pattern.
NSPatternColorSpaceModel	6	Identifies a pattern color space, which is simply an in and over again in a tiled pattern. Available in Mac OS X version 10.5 and later.
NSRGBColorSpaceModel	1	The RGB (red green blue) color-space model. Can refer to both device-dependent and generic colo Available in Mac OS X v10.4 and later.
NSUnknownColorSpaceModel	-1	This model is not known to NSColorSpace. Available in Mac OS X v10.4 and later.

38.8 class NSEPSImageRepMBS

38.8.1 class NSEPSImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** An NSEPSImageRep object can render an image from encapsulated PostScript (EPS) code.
Notes: Won't work in macOS Sonoma since Apple removed the feature from the OS.
Subclass of the NSImageRepMBS class.
Blog Entries

- MBS Xojo Plugins, version 23.3pr2
- EPS support deprecated in macOS Sonoma
- MBS Xojo Plugins, version 18.1pr2
- MBS Real Studio Plugins, version 12.0pr5

38.8.2 Methods

38.8.3 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the rectangle that bounds the receiver.
Notes: This rectangle is obtained from the "%%BoundingBox:" comment in the EPS header when the NSEPSImageRep object is initialized.

38.8.4 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an NSEPSImageRep object initialized with the specified EPS data.
Notes: The size of the receiver is set using the bounding box information specified in the EPS header comments.
On success the handle property is not zero.

38.8.5 EPSRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the EPS representation of the receiver.

38.8.6 imageRepWithData(data as Memoryblock) as NSEPSImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSEPSImageRep object initialized with the specified EPS data.
Notes: Returns a new, initialized NSEPSImageRep object or nil if the object could not be initialized.
The size of the receiver is set using the bounding box information specified in the EPS header comments.

38.8.7 prepareGState

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Implemented by subclasses to configure the graphics state prior to drawing.
Notes: The draw method of NSEPSImageRep sends this message to itself just before rendering the EPS code. The default implementation of this method does nothing. You can override it in your subclass to prepare the graphics state as needed.

38.8.8 Properties

38.8.9 pdfImage as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDF representation of the image.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("logo_new.eps")

// read in as image
Var image as new nsimageMBS(f)

// get represenations
Var reps() as NSImageRepMBS = image.representations

// get EPS representation
Var rep as NSEPSImageRepMBS = NSEPSImageRepMBS(Reps(0))

// get PDF representation
Var pdf as NSPDFImageRepMBS = rep.pdfImage

Break
```

Notes: When you load an EPS file, a PDF file is automatically created.
(Read only property)

38.9 class NSGraphicsMBS

38.9.1 class NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: The Cocoa class for drawing.
Example:

```
// make new image
Var myImage as new NSImageMBS(500,500)
Var myGraphics as new NSGraphicsMBS(myImage)

// make logo image
Var myPicture as Picture = LogoMBS(500)
Var anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes: The plugin often provides in events such objects for drawing. In that case please only use the object in the event and don't store it for later use. It is only valid with in a draw event.

Internally this is a NSGraphicsContext object.

If you create objects on your own, make sure you only use the methods while the object is valid.

38.9.2 Methods

38.9.3 addClip(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Intersects the area enclosed by the receiver's path with the clipping path of the current graphics context and makes the resulting shape the current clipping path.
Notes: This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver's path.

38.9.4 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Calculates and returns bounding rectangle for the receiver drawn using the options specified, within the given rectangle in the current graphics context.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// query size
Var g as new NSGraphicsMBS(Canvas1.NSViewMBS)
Var r as NSRectMBS = g.boundingRectWithSize(m, new NSSizeMBS(canvas1.Width, canvas1.Height),
g.NSStringDrawingUsesLineFragmentOrigin)

MsgBox r.String
```

Notes: size: The size of the rectangle to draw in.
options: The string drawing options.

Returns the bounding rectangle in the current graphics context.
The origin of the rectangle returned from this method is the first glyph origin.
See also:

- 38.9.5 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DicAttributes as dictionary = nil) as NSRectMBS 7771

38.9.5 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DicAttributes as dictionary = nil) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Calculates and returns the bounding rect for the text drawn using the given options and display characteristics, within the specified rectangle in the current graphics context.
Example:

```
Var NSGraphics as New NSGraphicsMBS()
Var size as NSSizeMBS = new NSSizeMBS(100,100)
Var text as string = "Hello World. How are you? I'm fine. This is just a test string."
Var options as Integer = NSGraphics.NSStringDrawingUsesLineFragmentOrigin
Var rect as NSRectMBS = NSGraphics.boundingRectWithSize(text, size, options)

MsgBox str(Rect.Width)+" "+str(Rect.Height)
```

Notes: text: the text to use for calculation.
size: The size of the rectangle to draw in.
options: String drawing options.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of Strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding rect for the receiver drawn using the given options and display characteristics. The rect origin returned from this method is the first glyph origin.

Available in Mac OS X v10.4 and later.

See NSStringDrawing* constants. Use NSStringDrawingUsesLineFragmentOrigin to switch to multiline mode.
See also:

- 38.9.4 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS 7770

38.9.6 clipRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Intersects the specified rectangle with the clipping path of the current graphics context and makes the resulting shape the current clipping path
Notes: r: The rectangle to intersect with the current clipping path.

38.9.7 concat(transform as NSAffineTransformMBS)

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Concats this transform to the current transform of the graphics environment.

38.9.8 ConcatTransform(NSAffineTransform as Variant)

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: Appends the receiver's matrix to the current transformation matrix stored in the current graphics context, replacing the current transformation matrix with the result.
Notes: Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

Concatenation is performed by matrix multiplication.

If this method is invoked from within an NSView drawRect method, then the current transformation matrix is an accumulation of the screen, window, and any superview's transformation matrices. Invoking this method defines a new user coordinate system whose coordinates are mapped into the former coordinate system according to the receiver's transformation matrix. To undo the concatenation, you must invert the receiver's matrix and invoke this method again.

NSAffineTransform must be a NSAffineTransformMBS object.

38.9.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Initializes the current graphics context of the current thread.
See also:

- 38.9.10 Constructor(targetImage as NSBitmapImageRepMBS) 7773
- 38.9.11 Constructor(targetImage as NSImageMBS) 7773

- 38.9.12 Constructor(targetView as NSViewMBS) 7774
- 38.9.13 Constructor(targetWindow as DesktopWindow) 7775
- 38.9.14 Constructor(targetWindow as NSWindowMBS) 7775
- 38.9.15 Constructor(targetWindow as window) 7775

38.9.10 Constructor(targetImage as NSBitmapImageRepMBS)

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new graphics context for drawing into a bitmap image representation.
Example:

```
Var n as new NSImageMBS(300,300)
Var r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

Var g as new NSGraphicsMBS(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.
See also:

- 38.9.9 Constructor 7772
- 38.9.11 Constructor(targetImage as NSImageMBS) 7773
- 38.9.12 Constructor(targetView as NSViewMBS) 7774
- 38.9.13 Constructor(targetWindow as DesktopWindow) 7775
- 38.9.14 Constructor(targetWindow as NSWindowMBS) 7775
- 38.9.15 Constructor(targetWindow as window) 7775

38.9.11 Constructor(targetImage as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a new graphics context for drawing into an image.
Example:

```
// make new image
Var myImage as new NSImageMBS(500,500)
Var myGraphics as new NSGraphicsMBS(myImage)

// make logo image
Var myPicture as Picture = LogoMBS(500)
Var anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.

38.9.12 Constructor(targetView as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a Cocoa view.
Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the window.

38.9.16 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Draws all or part of the image at the specified point in the current coordinate system.
Notes: x/y: The location in the current coordinate system at which to draw the image.
sx/sy/sw/sh: The source rectangle specifying the portion of the image you want to draw. The coordinates of this rectangle are specified in the image's own coordinate system. If you pass in zeros, the entire image is drawn.
operation: The compositing operation to use when drawing the image. See the NSCompositingOperation constants.
fraction: The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted as 1.0.

The image content is drawn at its current resolution and is not scaled unless the CTM of the current coordinate system itself contains a scaling factor. The image is otherwise positioned and oriented using the current coordinate system.

For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 38.9.17 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 7776
- 38.9.18 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 7777

38.9.17 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Draws the receiver with its font and other display attributes at the given point in the currently focused view.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
Var g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawAtPoint m, new NSPointMBS(20,20)
```

Notes: point: The point in the current view to draw the text.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

Don't invoke this method when no NSView is focused.
See also:

- 38.9.16 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7776
- 38.9.18 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 7777

38.9.18 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Draws the text with the font and other display characteristics of the given attributes, at the specified point in the currently focused view.
Notes: Point: The origin for the bounding box for drawing the string. If the focused view is flipped, the origin is the upper-left corner of the drawing bounding box; otherwise, the origin is the lower-left corner.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

You should only invoke this method when an NSView object has focus.
See also:

- 38.9.16 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7776
- 38.9.17 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 7776

38.9.19 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: draws the image into the given rectangle with the given source rectangle and the given mode.
Example:

```
// make new image
Var myImage as new NSImageMBS(500,500)
Var myGraphics as new NSGraphicsMBS(myImage)

// make logo image
Var myPicture as Picture = LogoMBS(500)
Var anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush

// save to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes: For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 38.9.20 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 7778
- 38.9.21 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 7779

38.9.20 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Draws the attributed string within the given rectangle in the currently view, clipping the text layout to this rectangle.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
Var g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawInRect m, new NSRectMBS(20,20, 100, 100)
```

Notes: rect: The rectangle in which to draw.

Text is drawn within rect according to its line sweep direction; for example, Arabic text will begin at the right edge and potentially be clipped on the left.

The rect parameter determines how many glyphs are typeset within the width of a line, but it's possible for a portion of a glyph to appear outside the area of rect if the image bounding box of the particular glyph exceeds its typographic bounding box.

If the focus view is flipped, the text origin is set at the upper-left corner of the drawing bounding box; otherwise the origin is set at the lower-left corner. For text rendering, whether the view coordinates are flipped or not doesn't affect the flow of line layout, which goes from top to bottom. However, it affects the interpretation of the text origin. So, for example, if the rect argument is { 0.0, 0.0, 100.0, 100.0 } , the text origin is { 0.0, 0.0 } when the view coordinates are flipped and { 0.0, 100.0 } when not.

Don't invoke this method when no NSView is focused.
See also:

- 38.9.19 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7778
- 38.9.21 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 7779

38.9.21 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Draws the text with the font and other display characteristics of the given attributes, within the specified rectangle in the currently focused NSView.
Notes: text: The text to draw.
Rect: The rectangle in which to draw the string.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

The rendering area is bounded by rect, unlike drawAtPoint, which has an unlimited width. As a result, this method renders the text in multiple lines.

You should only invoke this method when an NSView has focus.
See also:

- 38.9.19 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 7778
- 38.9.20 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 7778

38.9.22 drawPicture(image as Picture, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Draws a picture.
Notes: Same as drawInRect with NSImageMBS, but using picture.

38.9.23 drawRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Draws a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

38.9.24 DrawWindowBackground(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Draws the window's default background pattern into the specified rectangle of the currently focused view.

Notes: Pass the rectangle (in the current coordinate system) in which to draw the window's background pattern.

38.9.25 drawWithRect(text as NSAttributedStringMBS, rect as NSRectMBS, options as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Draws the receiver with the specified options, within the given rectangle in the current graphics context.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
Var g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawWithRect m, new NSRectMBS(20,20, 100, 100), g.NSStringDrawingUsesLineFragmentOrigin
```

Notes: rect: The rectangle specifies the rendering origin in the current graphics context.
options: The string drawing options. See NSStringDrawingOptions for the available options..

The rect argument's origin field specifies the rendering origin. The point is interpreted as the baseline origin by default. With NSStringDrawingUsesLineFragmentOrigin, it is interpreted as the upper left corner of the line fragment rect. The size field specifies the text container size. The width part of the size field specifies the maximum line fragment width if larger than 0.0. The height defines the maximum size that can be occupied with text if larger than 0.0 and NSStringDrawingUsesLineFragmentOrigin is specified. If NSStringDrawingUsesLineFragmentOrigin is not specified, height is ignored and considered to be single-line rendering (NSLineBreakByWordWrapping and NSLineBreakByCharWrapping are treated as NSLineBreakByClipping).

You should only invoke this method when there is a current graphics context.
Available in OS X v10.4 and later.

38.9.26 eraseRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Erases a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

38.9.27 fill(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Paints the region enclosed by the receiver's path.
Example:

```
Var n as new NSImageMBS(300, 300)
Var g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

Var r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
g.fill(b)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes: This method fills the path using the current fill color and the receiver's current winding rule. If the path contains any open subpaths, this method implicitly closes them before painting the fill region.

The painted region includes the pixels right up to, but not including, the path line itself. For paths with large line widths, this can result in overlap between the fill region and the stroked path (which is itself centered on the path line).

38.9.28 fillRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Fills the specified rectangular path with the current fill color.
Example:

```
Var n as new NSImageMBS(300, 300)
Var g as new NSGraphicsMBS(n)
```

```
g.setFillColor NSColorMBS.redColor

Var r as new NSRectMBS(10,10,200,200)
g.fillRect(r)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rectangle
```

Notes: r: A rectangle in the current coordinate system.

This method fills the specified region immediately. This method uses the compositing operation returned by the compositingOperation method of NSGraphicsContext.
See also:

- 38.9.29 fillRect(x as Double, y as Double, w as Double, h as Double) 7783
- 38.9.30 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer) 7783

38.9.29 fillRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Fills a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 38.9.28 fillRect(r as NSRectMBS) 7782
- 38.9.30 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer) 7783

38.9.30 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Fills a rectangle using the current fill color and the specified compositing operation.
Notes: See NSComposite* constants.
See also:

- 38.9.28 fillRect(r as NSRectMBS) 7782
- 38.9.29 fillRect(x as Double, y as Double, w as Double, h as Double) 7783

38.9.31 flushGraphics

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Forces any buffered operations or data to be sent to the receiver's destination.
Notes: Graphics contexts use buffers to queue pending operations but for efficiency reasons may not always empty those buffers immediately. This method forces the buffers to be emptied.

38.9.32 graphicsContext as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a NSGraphicsMBS object with the current graphics context of the current thread.
Example:

```
Sub Paint(g As Graphics)
// Canvas Paint event in a Mac Cocoa application

Var ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContext
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)

End Sub
```

Notes: Returns nil on any error.

38.9.33 graphicsContextWithCGContext(targetCGContext as Variant, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a new graphics context pointing to the given CGContextMBS object.
Example:

```
Sub Paint(g As Graphics)
// get current context
Var cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
Var ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContext(cg)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.

38.9.34 graphicsContextWithCGContextHandle(targetCGContextRef as Integer, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Creates a new graphics context pointing to the given CGContext reference.
Example:

```
Sub Paint(g As Graphics)
// get current context
Var cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
Var ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContextHandle(cg.Handle)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.
See also:

- 38.9.35 graphicsContextWithCGContextHandle(targetCGContextRef as Ptr, initialFlippedState as boolean = false) as NSGraphicsMBS 7785

38.9.35 graphicsContextWithCGContextHandle(targetCGContextRef as Ptr, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a new graphics context pointing to the given CGContext reference.
Example:

```
Sub Paint(g As Graphics)
// get current context
Var cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
Var ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContextHandle(cg.Handle)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.
See also:

- 38.9.34 graphicsContextWithCGContextHandle(targetCGContextRef as Integer, initialFlippedState as boolean = false) as NSGraphicsMBS 7785

38.9.36 graphicsContextWithNSBitmapImageRep(targetImage as NSBitmapImageRepMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new graphics context for drawing into a bitmap image representation.
Example:

```
Var n as new NSImageMBS(300,300)
Var r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

Var g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSBitmapImageRep(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.

38.9.37 graphicsContextWithNSImage(targetImage as NSImageMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a new graphics context for drawing into an image.
Example:

```
// make new image
Var myImage as new NSImageMBS(500,500)
Var myGraphics as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSImage(myImage)

// make logo image
Var myPicture as Picture = LogoMBS(500)
Var anotherImage as new NSImageMBS(myPicture)
```

```
// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image. Returns nil on any error.

38.9.38 graphicsContextWithNSView(targetView as NSViewMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a Cocoa view.
Example:

```
// draws in a Cocoa view
Var gg as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSView(canvas1.NSViewMBS)
gg.SetColorRGB 1.0,0,0,0.5
gg.fillRect 0, 0, 100, 100
gg = nil // flush
```

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the window. Returns nil on any error.

38.9.39 graphicsContextWithNSWindow(targetNSWindow as NSWindowMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a window.
Example:

```
// draw in a Cocoa window
Var g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSWindow(window1.NSWindowMBS)
g.SetColorRGB 1.0,0,0,0.5
```

```
g.fillRect 0, 0, 100, 100
g = nil // flush
```

Notes: Returns nil on any error.

38.9.40 graphicsContextWithWindow(targetWindow as DesktopWindow) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a window.
Notes: Returns nil on any error.
See also:

- 38.9.41 graphicsContextWithWindow(targetWindow as window) as NSGraphicsMBS 7788

38.9.41 graphicsContextWithWindow(targetWindow as window) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a window.
Example:

```
// draws in a Cocoa window
Var g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithWindow(window1)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
```

Notes: Returns nil on any error.
See also:

- 38.9.40 graphicsContextWithWindow(targetWindow as DesktopWindow) as NSGraphicsMBS 7788

38.9.42 graphicsPort as Variant

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the low-level, platform-specific graphics context represented by the receiver.
Notes: In Mac OS X, this is the Core Graphics context, a CGContextMBS object.

38.9.43 highlightRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Highlights the rectangle.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

38.9.44 invalidate

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Invalides the graphics object.

38.9.45 isDrawingToScreen as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the drawing destination is the screen.
Notes: True if the drawing destination is the screen, otherwise false.

A return value of false may mean that the drawing destination is a printer, but the destination may also be a PDF or EPS file. If this method returns false, you can call attributes to see if additional information is available about the drawing destination.

38.9.46 isFlipped as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates the receiver's flipped state.
Notes: True if the receiver is flipped, otherwise false.

The state is determined by sending isFlipped to the receiver's view that has focus. If no view has focus, returns false unless the receiver is instantiated using graphicsContextWithGraphicsPort:flipped: specifying true as the flipped parameter.

Available in Mac OS X v10.4 and later.

38.9.47 restoreGraphicsState

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Removes the receiver's graphics state from the top of the graphics state stack and makes the next graphics state the current graphics state.
Notes: This method must have been preceded with a saveGraphicsState message to add the graphics state to the stack. Invocations of saveGraphicsState and restoreGraphicsState methods may be nested.

Restoring the graphics state restores such attributes as the current drawing style, transformation matrix, color, and font of the original graphics state.

38.9.48 saveGraphicsState

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Saves the graphics state of the current graphics context.
Notes: This method pushes the context onto the per-thread stack.

38.9.49 ScaleCoordinates(x as Double, y as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Scales coordinate system so the next drawing commands will use different scaling.
Notes: Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

38.9.50 set(transform as NSAffineTransformMBS)

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Sets the current transform of the graphics environment.

38.9.51 setClip(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Replaces the clipping path of the current graphics context with the area inside the receiver's path.
Notes: You should avoid using this method as a way of adjusting the clipping path, as it may expand the clipping path beyond the bounds set by the enclosing view. If you do use this method, be sure to save the

graphics state prior to modifying the clipping path and restore the graphics state when you are done.

This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver's path.

38.9.52 setColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Sets the color of subsequent drawing to the color that the receiver represents.

38.9.53 SetColorBW(white as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to a BW color.
Notes: Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

38.9.54 SetColorCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to a CMYK color.
Notes: Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

38.9.55 SetColorHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to an HSV color.
Notes: Values range is from 0.0 to 1.0.

38.9.56 SetColorRGB(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to a RGB color.
Notes: Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

38.9.57 setCurrentContext

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Sets this context to be the current.

38.9.58 setFillColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Sets the fill color of subsequent drawing to the receiver's color.

38.9.59 setStrokeColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Sets the stroke color of subsequent drawing to the receiver's color.

38.9.60 SetTransform(NSAffineTransform as Variant)

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: Sets the current transformation matrix to the receiver's transformation matrix.
Notes: Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

The current transformation is stored in the current graphics context and is applied to subsequent drawing operations. You should use this method sparingly because it removes the existing transformation matrix, which is an accumulation of transformation matrices for the screen, window, and any superviews. Instead use the concat method to add this transformation matrix to the current transformation matrix.

NSAffineTransform must be a NSAffineTransformMBS object.

38.9.61 sizeWithAttributes(text as string, DicAttributes as dictionary = nil) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the bounding box size the text occupies when drawn with the given attributes.
Example:

```
Var NSGraphics as New NSGraphicsMBS()
Var NSStringWidth as Double = NSGraphics.sizeWithAttributes("Hello World").Width

MsgBox("StringWidth from NSGraphicsMBS: " + Str(NSStringWidth))

Var REALGraphics as Graphics = window1.Graphics
Var REALStringWidth as Double = REALGraphics.StringWidth("Hello World")

MsgBox("StringWidth from REAL Graphics: " + Str(REALStringWidth))
```

Notes: attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding box size the receiver occupies when drawn with attributes.

38.9.62 stroke(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Draws a line along the receiver's path using the current stroke color and drawing attributes.
Example:

```
Var n as new NSImageMBS(300, 300)
Var g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

Var r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
Var b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
b.lineWidth = 5
g.stroke(b)

g = nil
```

```
window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes: The drawn line is centered on the path with its sides parallel to the path segment. This method uses the current drawing attributes associated with the receiver. If a particular attribute is not set for the receiver, this method uses the corresponding default attribute.

38.9.63 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Strokes a line between two points using the current stroke color and the default drawing attributes.
Example:

```
Var n as new NSImageMBS(300, 300)
Var g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

Var p1 as new NSPointMBS(10,10)
Var p2 as new NSPointMBS(50,50)
g.strokeLine(p1,p2)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color line
```

Notes: point1: The starting point of the line.
point2: The ending point of the line.

This method strokes the specified path immediately.
See also:

- 38.9.64 strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double) 7794

38.9.64 strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Strokes a line.
See also:

- 38.9.63 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS) 7794

38.9.65 strokeRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Strokes the path of the specified rectangle using the current stroke color and the default drawing attributes.
Example:

```
Var n as new NSImageMBS(300, 300)
Var g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

Var r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
g.strokeRect(r)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes: r: A rectangle in the current coordinate system.

The path is drawn beginning at the rectangle's origin and proceeding in a counterclockwise direction. This method strokes the specified path immediately.

38.9.66 TranslateCoordinates(x as Double, y as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Moves coordinate system so the next drawing commands will use different starting point.
Notes: Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

38.9.67 Properties

38.9.68 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The internal handle to the Graphics Context.
Notes: Reference to NSGraphicsContext object.
(Read and Write property)

38.9.69 Owner as Variant

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The owner object.
Notes: When you have a graphics object based on a window, view or image, this property points to the original object to keep it alive while drawing.
(Read and Write property)

38.9.70 Valid as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Wheter this graphics object is still valid.
Notes: Set to true when the plugin creates an object and false when the object is no longer needed.
(Read and Write property)

38.9.71 imageInterpolation as Integer

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The interpolation behavior.
Notes: Note that this value is not part of the graphics state, so it cannot be reset using restoreGraphicsState.
(Read and Write computed property)

38.9.72 shouldAntialias as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Whether the receiver should use antialiasing.
Notes: This value is part of the graphics state and is restored by restoreGraphicsState.
(Read and Write computed property)

38.9.73 Constants

Constants

Constant	Value	Description
NSCompositeClear	0	Transparent. (R = 0)
NSCompositeCopy	1	Source image. (R = S)
NSCompositeDestinationAtop	9	Destination image wherever both images are opaque, source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. (R = S*(1 - Da) + D*Sa)
NSCompositeDestinationIn	7	Destination image wherever both images are opaque, and transparent elsewhere. (R = D*Sa)
NSCompositeDestinationOut	8	Destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. (R = D*(1 - Sa))
NSCompositeDestinationOver	6	Destination image wherever destination image is opaque, and source image elsewhere. (R = S*(1 - Da) + D)
NSCompositeHighlight	12	Source image wherever source image is opaque, and destination image elsewhere. (Deprecated. Mapped to NSCompositeSourceOver.)
NSCompositePlusDarker	11	Sum of source and destination images, with color values approaching 0 as a limit. (R = MAX(0, (1 - D) + (1 - S)))
NSCompositePlusLighter	13	Sum of source and destination images, with color values approaching 1 as a limit. (R = MIN(1, S + D))
NSCompositeSourceAtop	5	Source image wherever both images are opaque, destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. (R = S*Da + D*(1 - Sa))
NSCompositeSourceIn	3	Source image wherever both images are opaque, and transparent elsewhere. (R = S*Da)
NSCompositeSourceOut	4	Source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. (R = S*(1 - Da))
NSCompositeSourceOver	2	Source image wherever source image is opaque, and destination image elsewhere. (R = S + D*(1 - Sa))
NSCompositeXOR	10	Exclusive OR of source and destination images. (R = S*(1 - Da) + D*(1 - Sa)) Works only with black and white images and is not recommended for color contexts.
NSImageInterpolationDefault	0	One of the interpolation contants. Use the context's default interpolation.
NSImageInterpolationHigh	3	One of the interpolation contants. Slower, higher-quality interpolation.
NSImageInterpolationLow	2	One of the interpolation contants. Fast, low-quality interpolation.
NSImageInterpolationMedium	4	One of the interpolation contants. Medium quality, slower than NSImageInterpolationLow. Available in Mac OS X v10.6 and later.
NSImageInterpolationNone	1	One of the interpolation contants. No interpolation.

Drawing Option Constants

Constant	Value	Description
NSStringDrawingDisableScreenFontSubstitution	4	Disable screen font substitution (equivalent to NSLayoutMa creenFonts(false)).
NSStringDrawingOneShot	16	Suppresses caching layout information.
NSStringDrawingTruncatesLastVisibleLine	32	Truncates and adds the ellipsis character to the last visible doesn't fit into the bounds specified. This option is ignored if NSStringDrawingUsesLineFragmentO set. In addition, the line break mode must be either NSLine Wrapping or NSLineBreakByCharWrapping for this option to line break mode can be specified in a paragraph style passed i dictionary argument of the drawing methods. Available in Mac OS X v10.5 and later.
NSStringDrawingUsesDeviceMetrics	8	Uses image glyph bounds instead of typographic bounds.
NSStringDrawingUsesFontLeading	2	Uses the font leading for calculating line heights.
NSStringDrawingUsesLineFragmentOrigin	1	The specified origin is the line fragment origin, not the baselin

38.10 class NSImageMBS

38.10.1 class NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: An NSImage object is a high-level class for manipulating image data.
Notes: You use this class to load existing images or create new ones and composite them into a view or other image. This class works in conjunction with one or more image representation objects (subclasses of NSImageRep), which manage the actual image data.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

38.10.2 Methods

38.10.3 addRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds the specified image representation object to to the receiver.
Notes: After invoking this method, you may need to explicitly set features of the new image representation, such as the size, number of colors, and so on. This is true particularly when the NSImage object has multiple image representations to choose from. See NSImageRep and its subclasses for the methods you use to complete initialization.

Any representation added by this method is retained by the receiver. Image representations cannot be shared among multiple NSImage objects.

38.10.4 BMPRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a BMP file.
Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream
```

```
p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.bmp")
b=f.CreateBinaryFile("")
b.Write img.BMPRepresentation
b.Close

f.Launch
```

Notes: BMP does not support masks.

38.10.5 BMPRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a BMP file.
Notes: BMP does not support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.6 cancelIncrementalLoad

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels the current download operation immediately, if the image is being incrementally loaded.
Notes: This call has no effect if the image is not loading.

38.10.7 canInitWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Tests whether the receiver can create an instance of itself using pasteboard data.
Notes: This method uses the NSImageRep class method imageUnfilteredPasteboardTypes to find a class that can handle the data in the specified pasteboard. If you create your own NSImageRep subclasses, override

the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.

38.10.8 Constructor

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The default constructor creating a dummy NSImage object.
See also:

- 38.10.9 Constructor(data as Memoryblock) 7802
- 38.10.10 Constructor(file as folderitem) 7802
- 38.10.11 Constructor(image as Picture, mask as picture = nil) 7803
- 38.10.12 Constructor(width as Double, height as Double) 7803

38.10.9 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The data constructor calling initWithData internally.
Notes: Calls initWithData.
On success the image is valid and the handle is not zero.
See also:

- 38.10.8 Constructor 7802
- 38.10.10 Constructor(file as folderitem) 7802
- 38.10.11 Constructor(image as Picture, mask as picture = nil) 7803
- 38.10.12 Constructor(width as Double, height as Double) 7803

38.10.10 Constructor(file as folderitem)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The file constructor calling initWithContentsOfURL(file) internally.
Notes: Calls initWithContentsOfURL.
On success the image is valid and the handle is not zero.
See also:

- 38.10.8 Constructor 7802
- 38.10.9 Constructor(data as Memoryblock) 7802
- 38.10.11 Constructor(image as Picture, mask as picture = nil) 7803
- 38.10.12 Constructor(width as Double, height as Double) 7803

38.10.11 Constructor(image as Picture, mask as picture = nil)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates a new NSImageMBS object based on the image data in a Xojo picture.
Example:

```
Var img as new NSImageMBS(pict)
```

Notes: Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.
Calls initWithPicture.
See also:

- 38.10.8 Constructor 7802
- 38.10.9 Constructor(data as Memoryblock) 7802
- 38.10.10 Constructor(file as folderitem) 7802
- 38.10.12 Constructor(width as Double, height as Double) 7803

38.10.12 Constructor(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The size constructor calling initWithSize internally.
Notes: Calls initWithSize.
On success the image is valid and the handle is not zero.
See also:

- 38.10.8 Constructor 7802
- 38.10.9 Constructor(data as Memoryblock) 7802
- 38.10.10 Constructor(file as folderitem) 7802
- 38.10.11 Constructor(image as Picture, mask as picture = nil) 7803

38.10.13 CopyMask as picture

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Example:

```
Var f as FolderItem
Var n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyMask
```

Notes: Copies only the alpha channel as mask.
Returns nil on any error.

Not implemented for iOS.

38.10.14 CopyPicture(CGColorSpace as Variant = nil, BackgroundColor as NSColorMBS = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Example:

```
Var f as FolderItem
Var n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

Notes: A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

Implemented for iOS in v22.4 to return underlaying UIImage as Xojo picture. Colorspace and background are ignored as picture is passed directly.

38.10.15 CopyPictureRect(x as Integer, y as Integer, w as Integer, h as Integer, CGColorSpace as Variant = nil, BackgroundColor as NSColorMBS = nil) as picture

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage from the given rectangle.
Example:

```
Var f as FolderItem
Var n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

Notes: A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

Not implemented for iOS.

38.10.16 CopyPictureWithAlpha as picture

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Example:

```
Var nsImage As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("pencil")
Var pic As Picture = nsImage.CopyPictureWithAlpha

Break // check picture in debugger
```

Notes: This is a function for Cocoa target which returns picture with alpha channel.
Returns nil on any error.

Not implemented for iOS.

38.10.17 CopyPictureWithAlphaRect(x as Integer, y as Integer, w as Integer, h as Integer) as picture

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in given rectangle.
Notes: This is a function for Cocoa target which returns picture with alpha channel.
Returns nil on any error.

Not implemented for iOS.

38.10.18 CopyPictureWithMask(CGColorSpace as Variant = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Example:

```
Var f as FolderItem
Var n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPictureWithMask
```

Notes: Copies the picture and its mask.
This function is faster than CopyPicture and CopyMask combined as the picture is only copied one time to an internal buffer.

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

Not implemented for iOS.

38.10.19 DrawIntoCGContextAtPoint(cgcontext as Integer, x as Double, y as Double, sx as Double, sy as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Draws the image.
Notes: Same as DrawIntoCGContextAtRect, but with a point instead of a rectangle.

38.10.20 DrawIntoCGContextAtRect(cgcontext as Integer, x as Double, y as Double, w as Double, h as Double, SourceX as Double, SourceY as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Draws the image.
Example:

```
Function OpenAsNSimage(extends file as folderitem) As picture
Var width as Integer
Var height as Integer
Var c as NSImageMBS
Var g as CGPictureContextMBS

// load image from file
c=new NSImageMBS

// is that image valid?
if c.initWithContentsOfURL(file) then
Width=c.Width
height=c.Height

// create a drawing buffer to draw inside
g=new CGPictureContextMBS(width,height)

if g.Handle<>0 then // valid?

// now draw the image inside.
// you could scale or even apply transparency...
if c.DrawIntoCGContextAtRect(g.Handle, 0, 0, width, height, 0,0,width,height,2,1.0) then
// make a RB Picture from it
Return g.CopyPicture
end if
end if
end if
```

End Function

Notes: Draws the image into a CGContext. You need to specify first the destination rectangle followed by the source rectangle.

fraction:
The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted as 1.0.

operation codes:

NSCompositeClear	= 0	Transparent.
NSCompositeCopy	= 1	Source image.
NSCompositeSourceOver	= 2	Source image wherever source image is opaque, and destination image elsewhere.
NSCompositeSourceIn	= 3	Source image wherever both images are opaque, and transparent elsewhere.
NSCompositeSourceOut	= 4	Source image wherever source image is opaque but destination image is transparent, and transparent elsewhere.
NSCompositeSourceAtop	= 5	Source image wherever both images are opaque, destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere.
NSCompositeDestinationOver	= 6	Destination image wherever destination image is opaque, and source image elsewhere.
NSCompositeDestinationIn	= 7	Destination image wherever both images are opaque, and transparent elsewhere.
NSCompositeDestinationOut	= 8	Destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere.
NSCompositeDestinationAtop	= 9	Destination image wherever both images are opaque, source image wherever source image is opaque but destination image is transparent, and transparent elsewhere.
NSCompositeXOR	= 10	Exclusive OR of source and destination images.
NSCompositePlusDarker	= 11	Sum of source and destination images, with color values approaching 0 as a limit.
NSCompositeHighlight	= 12	Source image wherever source image is opaque, and destination image elsewhere.
NSCompositePlusLighter	= 13	Sum of source and destination images, with color values approaching 1 as a limit.

Returns true on success and false on failure.

38.10.21 GIFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a GIF file.

Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.gif")
b=f.CreateBinaryFile("")
b.Write img.GIFRepresentation
b.Close

f.Launch
```

Notes: GIF does support masks in a limited way.

38.10.22 GIFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a GIF file.
Notes: GIF does support masks in a limited way.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.23 imageByFadingToFraction(fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns an image with a mask faded to the given percentage
Example:

```
Var img as NSImageMBS
Var p as Picture
```

```
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByFadingToFraction(0.1)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: Returns nil on failure.

38.10.24 imageByScalingToSize(width as Double, height as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Scales image to the new size.
Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close
```

f.Launch

Notes: Returns nil on failure.
Internally creates a copy of the image.
See also:

- 38.10.25 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS 7811
- 38.10.26 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS 7812

38.10.25 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Scales image to the new size with given fading.
Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200,0.5)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: Returns nil on failure.
Internally creates a copy of the image.
See also:

- 38.10.24 imageByScalingToSize(width as Double, height as Double) as NSImageMBS 7810

- 38.10.26 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS 7812

38.10.26 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Scales image to the new size with given fading fraction.
Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: Returns nil on failure.
The image can be flipped vertically with the flip property.
Internally creates a copy of the image.
See also:

- 38.10.24 imageByScalingToSize(width as Double, height as Double) as NSImageMBS 7810
- 38.10.25 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS 7811

38.10.27 imageFileTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the image types supported by the registered NSImageRep objects.

Example:

```
Var types() as string = NSImageMBS.imageFileTypes
MsgBox Join(types, EndOfLine)
```

Notes: An array of strings, each of which identifies a single supported file type. The array can include encoded HFS file types as well as filename extensions.

This list includes all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can pass the array returned by this method directly to NSOpenPanelMBS.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredFileTypes method to notify NSImage of the file types your class supports directly.

38.10.28 imageNamed(name as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the NSImage instance associated with the specified name.
Notes: This method searches for named images in several places, returning the first image it finds matching the given name. The order of the search is as follows:

1. Search for an object whose name was set explicitly using the setName: method and currently resides in the image cache.
2. Search the application's main bundle for a file whose name matches the pecified string. (For information on how the bundle is searched, see "Searching for Bundle Resources" in Bundle Programming Guide.)
3. Search the Application Kit framework for a shared image with the specified name.

When looking for files in the application bundle, it is better (but not required) to include the filename extension in the name parameter. When naming an image with the setName method, it is also convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application's bundle.

One particularly useful image you can retrieve is your application's icon. This image is set by Cocoa automatically and referenced by the string "NSApplicationIcon". Icons for other applications can be obtained through the use of methods declared in the NSWorkspace class. You can also retrieve some standard system images using Cocoa defined constants; for more information, see the Constants section of this class.

If an application is linked in Mac OS X v10.5 or later, images requested using this method and whose name ends in the word "Template" are automatically marked as template images.

The NSImage class keeps a reference to any named images in a table until the image name is cleared. Consequently you do not need to retain the returned image object unless its name could be cleared. You can clear an image object from the table by passing nil to the setName: method of the corresponding NSImage object.

Here is a good list of identifiers you can use:
http://hetima.github.io/fucking_nsimage_syntax/

38.10.29 imagePasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.
Example:

```
Var types() as string = NSImageMBS.imagePasteboardTypes
MsgBox Join(types, EndOfLine)
```

Notes: Returns an array of strings, each of which identifies a single supported pasteboard type. By default, this list contains the NSPDFPboardType, NSPICTPboardType, NSPostScriptPboardType, and NSTIFFPboardType types.

This list includes all pasteboard types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.

38.10.30 imageTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of UTI strings identifying the image types supported by the registered NSImageRep objects, either directly or through a user-installed filter service.
Example:

```
Var types() as string = NSImageMBS.imageTypes
MsgBox Join(types, EndOfLine)
```

Notes: Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of

supported types, see UTCoreTypes.h.

The returned list includes UTIs all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageTypes method of NSImageRep.

Available in Mac OS X v10.5 and later.

38.10.31 imageUnfilteredFileTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the file types supported directly by the registered NSImageRep objects.
Example:

```
Var types() as string = NSImageMBS.imageUnfilteredFileTypes
MsgBox Join(types, EndOfLine)
```

Notes: An array of strings, each of which identifies a single supported file type. File types are identified by file extension and HFS file types.
The returned list does not contain pasteboard types that are available only through a user-installed filter service.

38.10.32 imageUnfilteredPasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.
Example:

```
Var types() as string = NSImageMBS.imageUnfilteredPasteboardTypes
MsgBox Join(types, EndOfLine)
```

Notes: An array of strings, each of which identifies a single supported pasteboard type.
The returned list does not contain pasteboard types that are supported only through a user-installed filter service.

38.10.33 imageUnfilteredTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of UTI strings identifying the image types supported directly by the registered NSImageRep objects.
Example:

```
Var types() as string = NSImageMBS.imageUnfilteredTypes
MsgBox Join(types, EndOfLine)
```

Notes: Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of supported types, see UTCoreTypes.h.

The returned list includes UTI strings only for those file types that are supported directly by registered subclasses of NSImageRep. It does not include types that are supported through user-installed filter services. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageUnfilteredTypes method of NSImageRep.

38.10.34 imageWithCGImage(CGImage as Variant, width as Double = 0, height as Double = 0) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the CGImage.
Example:

```
Var logo as Picture = LogoMBS(500)
Var cgimage as CGImageMBS = CGCreateImageMBS(logo)
Var nsimage as NSImageMBS = NSImageMBS.imageWithCGImage(cgimage)
Var pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: If width is zero, we take the width from the CGImage.
If height is zero, we take the height from the CGImage.

cgImage: The source CGImageMBS object.
width & height: The size of the new image.

Returns an initialized NSImage instance, or nil if the new instance cannot be initialized.

You should not assume anything about the image, other than that drawing it is equivalent to drawing the CGImage.
Available in OS X v10.6 and later.

38.10.35 imageWithContentsOfFile(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
Var image as NSImageMBS = NSImageMBS.imageWithContentsOfFile(file)
Backdrop = image.CopyPictureWithMask
```

Notes: File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

38.10.36 imageWithContentsOfFileMT(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
Var image as NSImageMBS = NSImageMBS.imageWithContentsOfFileMT(file)
Backdrop = image.CopyPictureWithMask
```

Notes: File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.37 imageWithContentsOfPath(path as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
Var path as string = file.NativePath
Var image as NSImageMBS = NSImageMBS.imageWithContentsOfPath(path)
Backdrop = image.CopyPictureWithMask
```

Notes: path: A full or relative path name specifying the file with the desired image data. Relative paths must be relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

38.10.38 imageWithContentsOfPathMT(path as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
Var path as string = file.NativePath
Var image as NSImageMBS = NSImageMBS.imageWithContentsOfPathMT(path)
Backdrop = image.CopyPictureWithMask
```

Notes: path: A full or relative path name specifying the file with the desired image data. Relative paths must be relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.39 imageWithContentsOfURL(URL as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified URL.
Example:

```
Var url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
Var img as NSImageMBS = NSImageMBS.imageWithContentsOfURL(url)
Backdrop = img.CopyPictureWithMask
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.

38.10.40 imageWithContentsOfURLMT(URL as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified URL.
Example:

```
Var url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
Var img as NSImageMBS = NSImageMBS.imageWithContentsOfURLMT(url)
Backdrop = img.CopyPictureWithMask
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

38.10.41 imageWithData(data as memoryblock) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified memoryblock.
Example:

```
Var logo as Picture = LogoMBS(500)
Var jpeg as string = PictureToJPEGStringMBS(logo, 75)
Var nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
Var pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
See also:

- 38.10.42 imageWithData(data as string) as NSImageMBS 7820

38.10.42 imageWithData(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified string.
Example:

```
Var logo as Picture = LogoMBS(500)
Var jpeg as string = PictureToJPEGStringMBS(logo, 75)
Var nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
Var pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
See also:

- 38.10.41 imageWithData(data as memoryblock) as NSImageMBS 7819

38.10.43 imageWithDataMT(data as memoryblock) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified memoryblock.
Example:

```
Var logo as Picture = LogoMBS(500)
Var jpeg as string = PictureToJPEGStringMBS(logo, 75)
Var nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
Var pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 38.10.44 imageWithDataMT(data as string) as NSImageMBS 7821

38.10.44 imageWithDataMT(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified string.
Example:

```
Var logo as Picture = LogoMBS(500)
Var jpeg as string = PictureToJPEGStringMBS(logo, 75)
Var nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
Var pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 38.10.43 imageWithDataMT(data as memoryblock) as NSImageMBS 7820

38.10.45 imageWithHandle(Handle as Integer) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Creates a new picture for a NSImage handle.

38.10.46 imageWithSymbolConfiguration(configuration as NSImageSymbolConfigurationMBS) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new symbol image with the specified configuration.
Example:

```
Var config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithPointSize(40, 0)
Var n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Var o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

38.10.47 imageWithSystemSymbolName(name as string, accessibilityDescription as string = "") as NSImageMBS

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns an image for a given symbol name.
Example:

```
Var n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
If n <>Nil Then

n.setSize(300,300)
Backdrop = n.CopyPictureWithAlpha

End If
```

Notes: For macOS 11.0 or newer.

See list of symbols in SF Symbol font, see SF Symbols app or the list here:
https://developer.apple.com/design/human-interface-guidelines/sf-symbols/overview/

38.10.48 imageWithTintColor(tintColor as NSColorMBS) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the image colored with the given tint.
Notes: Input image should be grayscale.

38.10.49 initWithContentsOfURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified folderitem.
Notes: Returns true on success and false on failure.
See also:

- 38.10.50 initWithContentsOfURL(url as string) as boolean 7823

38.10.50 initWithContentsOfURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified URL.
Notes: Returns true on success and false on failure.
See also:

- 38.10.49 initWithContentsOfURL(file as folderitem) as boolean 7823

38.10.51 initWithData(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes and with the contents of the specified data in the string.
Notes: Returns true on success and false on failure.

38.10.52 initWithDataIgnoringOrientation(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSImage instance with the contents of the specified memoryblock, ignoring the EXIF orientation tags.
Notes: An initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
Available in Mac OS X v10.6 and later.

38.10.53 initWithIconRef(IconHandle as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the image object with a Carbon-style icon resource.
Notes: IconHandle: A reference to a Carbon icon resource (IconRef).

Creates one or more bitmap image representations, one for each size icon contained in the IconRef data structure. This initialization method automatically retains the data in the iconRef parameter and loads the bitmaps from that data file lazily.
Available in Mac OS X v10.5 and later.

38.10.54 initWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes an NSImage instance with data from the pasteboard.
Notes: The specified pasteboard should contain a type supported by one of the registered NSImageRep subclasses. Table 1 lists the default pasteboard types and file extensions for several NSImageRep subclasses.

38.10.55 initWithPicture(img as picture, mask as picture = nil) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes the image object with image data from the Xojo pictures.
Example:

```
Var img as new NSImageMBS
if img.initWithPicture(pict, pict.mask) then
MsgBox "OK"
end if
```

Notes: Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.

38.10.56 initWithSize(width as Double, height as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an empty image object with the given size.
Notes: Returns true on success and false on failure.

38.10.57 JPEGRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
b=f.CreateBinaryFile("")
b.Write img.JPEGRepresentation
b.Close

f.Launch
```

Notes: JPEG does not support masks. Uses 80% for the quality.

38.10.58 JPEGRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
// take some Picture
Var logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
Var nsimage as new NSImageMBS(logo)

// use thread friendly compress function
Var jpeg as MemoryBlock = nsimage.JPEGRepresentationMT

// decode to see if it worked
Var test as Picture = JPEGStringToPictureMBS(jpeg)

// and display
```

Backdrop = test

Notes: JPEG does not support masks. Uses 80% for the quality.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.59 JPEGRepresentationWithCompressionFactor(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
b=f.CreateBinaryFile("")
b.Write img.JPEGRepresentationWithCompressionFactor(0.01)
b.Close

f.Launch
```

Notes: Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.

38.10.60 JPEGRepresentationWithCompressionFactorMT(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
// take some Picture
Var logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
Var nsimage as new NSImageMBS(logo)

// use thread friendly compress function
Var jpeg as MemoryBlock = nsimage.JPEGRepresentationWithCompressionFactorMT(1.0)

// decode to see if it worked
Var test as Picture = JPEGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes: Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.61 NSImageHintUserInterfaceLayoutDirection as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the dictionary keys used in the hints dictionary.
Notes: value is a number with NSUserInterfaceLayoutDirection enum value

38.10.62 NSImageNameActionTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.

Notes: To access this image, pass the specified constant to the imageNamed method.
An action menu template image.
Available in Mac OS X v10.5 and later.

38.10.63 NSImageNameAddTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Example:

```
Var n As NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameAddTemplate)

canvas1.backdrop = n.CopyPictureWithAlpha
```

Notes: An add item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.64 NSImageNameAdvanced as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Example:

```
Var n As NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameAdvanced)

canvas1.backdrop = n.CopyPictureWithAlpha
```

Notes: To access this image, pass the specified constant to the imageNamed method.
Advanced preferences toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

38.10.65 NSImageNameApplicationIcon as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
The application's icon.
On versions of Mac OS X prior to v10.6, you can use the string "NSApplicationIcon".

Available in Mac OS X v10.6 and later.

38.10.66 NSImageNameBluetoothTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A Bluetooth template image.
Available in Mac OS X v10.5 and later.

38.10.67 NSImageNameBonjour as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes: To access this image, pass the specified constant to the imageNamed method.
A Bonjour icon.
Available in Mac OS X v10.5 and later.

38.10.68 NSImageNameBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
Bookmarks image suitable for a template.
Available in Mac OS X v10.6 and later.

38.10.69 NSImageNameCaution as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
Caution Image.
Available in Mac OS X v10.6 and later.

38.10.70 NSImageNameColorPanel as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
A color panel toolbar icon.
Available in Mac OS X v10.5 and later.

38.10.71 NSImageNameColumnViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes: To access this image, pass the specified constant to the imageNamed method.
A column view mode template image.
Available in Mac OS X v10.5 and later.

38.10.72 NSImageNameComputer as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Example:

```
Var n as NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameComputer)

// set to size you need
n.size = NSMakeSizeMBS(512,512)

// and make picture
Backdrop = n.CopyPictureWithMask
```

Notes: To access this image, pass the specified constant to the imageNamed method.
A computer icon.
Available in Mac OS X v10.5 and later.

38.10.73 NSImageNameDotMac as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes: To access this image, pass the specified constant to the imageNamed method.

A Dot Mac icon.
Available in Mac OS X v10.5 and later.

38.10.74 NSImageNameEnterFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: An enter full-screen mode template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.75 NSImageNameEveryone as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing sharing permission icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
Permissions for all users.
Available in Mac OS X v10.5 and later.

38.10.76 NSImageNameExitFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: An exit full-screen mode template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.77 NSImageNameFlowViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes: To access this image, pass the specified constant to the imageNamed method.
A cover flow view mode template image.
Available in Mac OS X v10.5 and later.

38.10.78 NSImageNameFolder as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
A folder image.
Available in Mac OS X v10.6 and later.

38.10.79 NSImageNameFolderBurnable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes: To access this image, pass the specified constant to the imageNamed method.
A burnable folder icon.
Available in Mac OS X v10.5 and later.

38.10.80 NSImageNameFolderSmart as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes: A smart folder icon.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.81 NSImageNameFollowLinkFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: A link template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.82 NSImageNameFontPanel as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.

A font panel toolbar icon.
Available in Mac OS X v10.5 and later.

38.10.83 NSImageNameGoBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The template name for the go back image.
Notes: Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.
Available in macOS 10.12 and newer.

38.10.84 NSImageNameGoForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The template name for the go forward image.
Notes: Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.
Available in macOS 10.12 and newer.

38.10.85 NSImageNameGoLeftTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A "go back" template image.
Available in Mac OS X v10.5 and later.

38.10.86 NSImageNameGoRightTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A "go forward" template image.
Available in Mac OS X v10.5 and later.

38.10.87 NSImageNameHomeTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
Home image suitable for a template.
Available in Mac OS X v10.6 and later.

38.10.88 NSImageNameIChatTheaterTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
An iChat Theater template image.
Available in Mac OS X v10.5 and later.

38.10.89 NSImageNameIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes: To access this image, pass the specified constant to the imageNamed method.
An icon view mode template image.
Available in Mac OS X v10.5 and later.

38.10.90 NSImageNameInfo as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
An information toolbar icon.
Available in Mac OS X v10.5 and later.

38.10.91 NSImageNameInvalidDataFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.

An invalid data template image. Place this icon to the right of any fields containing invalid data. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

38.10.92 NSImageNameLeftFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A generic left-facing triangle template image.
Available in Mac OS X v10.5 and later.

38.10.93 NSImageNameListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes: To access this image, pass the specified constant to the imageNamed method.
A list view mode template image.
Available in Mac OS X v10.5 and later.

38.10.94 NSImageNameLockLockedTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A locked lock template image. Use to indicate locked content.
Available in Mac OS X v10.5 and later.

38.10.95 NSImageNameLockUnlockedTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
An unlocked lock template image. Use to indicate modifiable content that can be locked.
Available in Mac OS X v10.5 and later.

38.10.96 NSImageNameMenuMixedStateTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
A horizontal dash. Drawing these outside of menus is discouraged.
Available in Mac OS X v10.6 and later.

38.10.97 NSImageNameMenuOnStateTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
A check mark. Drawing these outside of menus is discouraged.
Available in Mac OS X v10.6 and later.

38.10.98 NSImageNameMobileMe as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
MobileMe logo. Note that this is preferred to using the NSImageNameDotMac image, although that image is not expected to be deprecated.
Available in Mac OS X v10.6 and later.

38.10.99 NSImageNameMultipleDocuments as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: Drag image you can use in your applications.
Notes: A drag image for multiple items.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.100 NSImageNameNetwork as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes: A network icon.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.101 NSImageNamePathTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A path button template image.
Available in Mac OS X v10.5 and later.

38.10.102 NSImageNamePreferencesGeneral as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
General preferences toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

38.10.103 NSImageNameQuickLookTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A Quick Look template image.
Available in Mac OS X v10.5 and later.

38.10.104 NSImageNameRefreshFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: A refresh template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.105 NSImageNameRefreshTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: A refresh template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.106 NSImageNameRemoveTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Example:

```
Var n As NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameRemoveTemplate)

canvas1.backdrop = n.CopyPictureWithAlpha
```

Notes: A remove item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.107 NSImageNameRevealFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: A reveal contents template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.108 NSImageNameRightFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A generic right-facing triangle template image.
Available in Mac OS X v10.5 and later.

38.10.109 NSImageNameShareTemplate as string

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes: A share view template image.
Available in OS X v10.8 and later.

38.10.110 NSImageNameSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A slideshow template image.
Available in Mac OS X v10.5 and later.

38.10.111 NSImageNameSmartBadgeTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: A badge for a ”smart” item.
Available in Mac OS X v10.5 and later.

To access this image, pass the specified constant to the imageNamed method.

38.10.112 NSImageNameStatusAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
Small green indicator, similar to iChat's available image.
Available in Mac OS X v10.6 and later.

38.10.113 NSImageNameStatusNone as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
Small clear indicator.
Available in Mac OS X v10.6 and later.

38.10.114 NSImageNameStatusPartiallyAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
Small yellow indicator, similar to iChat's idle image.
Available in Mac OS X v10.6 and later.

38.10.115 NSImageNameStatusUnavailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
Small red indicator, similar to iChat's unavailable image.
Available in Mac OS X v10.6 and later.

38.10.116 NSImageNameStopProgressFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
A stop progress template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

38.10.117 NSImageNameStopProgressTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes: A stop progress button template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

38.10.118 NSImageNameTouchBarAddDetailTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddDetailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.119 NSImageNameTouchBarAddTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
```

```
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.120 NSImageNameTouchBarAlarmTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAlarmTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.121 NSImageNameTouchBarAudioInputMuteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.122 NSImageNameTouchBarAudioInputTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.123 NSImageNameTouchBarAudioOutputMuteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.124 NSImageNameTouchBarAudioOutputVolumeHighTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeHighTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.125 NSImageNameTouchBarAudioOutputVolumeLowTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeLowTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.126 NSImageNameTouchBarAudioOutputVolumeMediumTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeMediumTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.127 NSImageNameTouchBarAudioOutputVolumeOffTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeOffTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.128 NSImageNameTouchBarBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarBookmarksTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.129 NSImageNameTouchBarColorPickerFill as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFill

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.130 NSImageNameTouchBarColorPickerFont as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFont
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.131 NSImageNameTouchBarColorPickerStroke as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerStroke
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.132 NSImageNameTouchBarCommunicationAudioTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationAudioTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.133 NSImageNameTouchBarCommunicationVideoTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationVideoTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.134 NSImageNameTouchBarComposeTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarComposeTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.135 NSImageNameTouchBarDeleteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarDeleteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.136 NSImageNameTouchBarDownloadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarDownloadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.137 NSImageNameTouchBarEnterFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarEnterFullScreenTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.138 NSImageNameTouchBarExitFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarExitFullScreenTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.139 NSImageNameTouchBarFastForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFastForwardTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.140 NSImageNameTouchBarFolderCopyToTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderCopyToTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.141 NSImageNameTouchBarFolderMoveToTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderMoveToTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.142 NSImageNameTouchBarFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.143 NSImageNameTouchBarGetInfoTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGetInfoTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.144 NSImageNameTouchBarGoBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoBackTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.145 NSImageNameTouchBarGoDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoDownTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.146 NSImageNameTouchBarGoForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoForwardTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.147 NSImageNameTouchBarGoUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoUpTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.148 NSImageNameTouchBarHistoryTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarHistoryTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.149 NSImageNameTouchBarIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarIconViewTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.150 NSImageNameTouchBarListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarListViewTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.151 NSImageNameTouchBarMailTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarMailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.152 NSImageNameTouchBarNewFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewFolderTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.153 NSImageNameTouchBarNewMessageTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewMessageTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.154 NSImageNameTouchBarOpenInBrowserTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarOpenInBrowserTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.155 NSImageNameTouchBarPauseTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPauseTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.156 NSImageNameTouchBarPlayheadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayheadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.157 NSImageNameTouchBarPlayPauseTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayPauseTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.158 NSImageNameTouchBarPlayTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.159 NSImageNameTouchBarQuickLookTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarQuickLookTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.160 NSImageNameTouchBarRecordStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRecordStartTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.161 NSImageNameTouchBarRecordStopTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRecordStopTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.162 NSImageNameTouchBarRefreshTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRefreshTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.163 NSImageNameTouchBarRewindTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRewindTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.164 NSImageNameTouchBarRotateLeftTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRotateLeftTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.165 NSImageNameTouchBarRotateRightTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRotateRightTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.166 NSImageNameTouchBarSearchTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSearchTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.167 NSImageNameTouchBarShareTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarShareTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.168 NSImageNameTouchBarSidebarTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSidebarTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.169 NSImageNameTouchBarSkipAhead15SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead15SecondsTemplate

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.170 NSImageNameTouchBarSkipAhead30SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead30SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.171 NSImageNameTouchBarSkipAheadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAheadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.172 NSImageNameTouchBarSkipBack15SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack15SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.173 NSImageNameTouchBarSkipBack30SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack30SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.174 NSImageNameTouchBarSkipBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBackTemplate

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.175 NSImageNameTouchBarSkipToEndTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipToEndTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.176 NSImageNameTouchBarSkipToStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipToStartTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.177 NSImageNameTouchBarSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSlideshowTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.178 NSImageNameTouchBarTagIconTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTagIconTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.179 NSImageNameTouchBarTextBoldTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoldTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.180 NSImageNameTouchBarTextBoxTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoxTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.181 NSImageNameTouchBarTextCenterAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextCenterAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.182 NSImageNameTouchBarTextItalicTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextItalicTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.183 NSImageNameTouchBarTextJustifiedAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextJustifiedAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.184 NSImageNameTouchBarTextLeftAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextLeftAlignTemplate
```

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.185 NSImageNameTouchBarTextListTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextListTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.186 NSImageNameTouchBarTextRightAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextRightAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.187 NSImageNameTouchBarTextStrikethroughTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextStrikethroughTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.188 NSImageNameTouchBarTextUnderlineTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextUnderlineTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.189 NSImageNameTouchBarUserAddTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserAddTemplate

img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.190 NSImageNameTouchBarUserGroupTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserGroupTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.191 NSImageNameTouchBarUserTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

38.10.192 NSImageNameTouchBarVolumeDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarVolumeDownTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.193 NSImageNameTouchBarVolumeUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
Var name as string
Var img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarVolumeUpTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

38.10.194 NSImageNameTrashEmpty as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
An image of the empty trash can.
Available in Mac OS X v10.6 and later.

38.10.195 NSImageNameTrashFull as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
An image of the full trash can.
Available in Mac OS X v10.6 and later.

38.10.196 NSImageNameUser as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing sharing permission icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
Permissions for a single user.
Available in Mac OS X v10.5 and later.

38.10.197 NSImageNameUserAccounts as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.
User account toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

38.10.198 NSImageNameUserGroup as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing sharing permission icons that you can use in your applications.
Notes: To access this image, pass the specified constant to the imageNamed method.
Permissions for a group of users.
Available in Mac OS X v10.5 and later.

38.10.199 NSImageNameUserGuest as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes: To access this image, pass the specified constant to the imageNamed method.

Shaded user figure.
Available in Mac OS X v10.6 and later.

38.10.200 PNGRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a PNG file.
Example:

```
Var img as NSImageMBS
Var p as Picture
Var f as FolderItem
Var b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=&cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: PNG does support masks.

38.10.201 PNGRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a PNG file.
Example:

```
// take some Picture
Var logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
Var nsimage as new NSImageMBS(logo)

// use thread friendly compress function
Var jpeg as MemoryBlock = nsimage.PNGRepresentationMT
```

```
// decode to see if it worked
Var test as Picture = PNGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes: PNG does support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.202 recache

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Invalidates and frees the offscreen caches of all image representations.
Notes: If you modify an image representation, you must send a recache message to the corresponding image object to force the changes to be recached. The next time any image representation is drawn, it is asked to recreate its cached image. If you do not send this message, the image representation may use the old cache data. This method simply clears the cached image data; it does not delete the NSCachedImageRep objects associated with any image representations.
If you do not plan to use an image again right away, you can free its caches to reduce the amount of memory consumed by your program.

38.10.203 removeRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the specified image representation from the receiver and releases it.

38.10.204 RepresentationHeight(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Height of the representation with the given index in pixel.
Notes: Index from 0 to RepresetationCount-1.
Returns 0 on invalid index.

38.10.205 representations as NSImageRepMBS()

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array containing all of the receiver's image representations.
Notes: An array containing zero or more NSImageRep objects.
Returns nil on any error.

38.10.206 RepresentationWidth(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Width of the representation with the given index in pixel.
Notes: Index from 0 to RepresetationCount-1.
Returns 0 on invalid index.

38.10.207 setName(value as String) as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Registers the image under the specified name.
Notes: Returns true if the receiver was successfully registered with the given name; otherwise, false.

Discussion
If the receiver is already registered under a different name, this method unregisters the other name. If a different image is registered under the name specified in aString, this method does nothing and returns false.

When naming an image using this method, it is convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application's bundle. For information about the rules used to search for images, see the imageNamed method.

38.10.208 setSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the width and height of the image.
Notes: Pass the new size of the image, measured in points.

Discussion:
The size of an NSImage object must be set before it can be used. If the size of the image hasn't already been set when an image representation is added, the size is taken from the image representation's data. For EPS images, the size is taken from the image's bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation will draw itself in an offscreen window to recreate the cache.

38.10.209 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Example:

```
Var p As Picture = LogoMBS(500)

// save as tiff

Var n As New NSImageMBS(p)
Var tiff As String = n.TIFFRepresentation
Var file1 As FolderItem = SpecialFolder.Desktop.Child("test1.tif")
Var b As BinaryStream = BinaryStream.Create(file1)
b.Write tiff
b.Close
```

Notes: A string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:

You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

38.10.210 TIFFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Example:

```
// take some Picture
Var logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
Var nsimage as new NSImageMBS(logo)

// use thread friendly compress function
Var data as MemoryBlock = nsimage.TIFFRepresentationMT

// decode to see if it worked
Var test as Picture = TIFFStringToPictureMBS(data)

// and display
Backdrop = test
```

Notes: A string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.211 TIFFRepresentationUsingCompression(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Notes: comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn't applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

38.10.212 TIFFRepresentationUsingCompressionMT(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Notes: comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn't applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

38.10.213 Properties

38.10.214 accessibilityDescription as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: The image's accessibility description.
Notes: A short localized string that does not include the name of the interface element.

This description will be used automatically by interface elements that display images. Like all accessibility descriptions, the string should be a short localized string that does not include the name of the interface element. For instance, "delete" rather than "delete button".
(Read and Write property)

38.10.215 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The background color of image.
Notes: The background color of the image. The default color is transparent, as returned by the clearColor method of NSColor.
The background color is visible only if the drawn image representation does not completely cover all of the pixels available for the image's current size.

The value of this variant must be an object of class NSColorMBS.
(Read and Write property)

38.10.216 cacheDepthMatchesImageDepth as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether an image's offscreen window caches use the same

bit depth as the image data itself.
Notes: Returns true if the offscreen window caches use the same bit depth as the image data; otherwise, false. The default value is false.
(Read and Write property)

38.10.217 cacheMode as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The receiver's caching mode.
Notes: The caching mode determines when the receiver's image representations use offscreen caches. Offscreen caches speed up rendering time but do so by using extra memory. In the default caching mode (NSImageCacheDefault), each image representation chooses the caching technique that produces the fastest drawing times. For example, in the default mode, the NSPDFImageRep and NSEPSImageRep classes use the NSImageCacheAlways mode but the NSBitmapImageRep class uses the NSImageCacheBySize mode.
(Read and Write property)

38.10.218 EXIFData as Dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns a dictionary with exif data.
Notes: (Read only property)

38.10.219 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The handle to the internally used NSImage object.
Notes: (Read and Write property)

38.10.220 height as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The height of the image or zero.
Notes: If no size has been set and the size cannot be determined from any of the receiver's image representations.
(Read only property)

38.10.221 isCachedSeparately as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether each image representation caches its contents in a separate offscreen window.
Notes: Returns true if the image representations cache their content in separate offscreen windows; otherwise, false. The default value is false.

Discussion:
If this method returns false, it means that the image may be cached in a shared window but is not required to be. Images are cached in a shared window if they have the same general attributes, such as color space, resolution, and bit depth.
(Read and Write property)

38.10.222 isDataRetained as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver retains its source image data.
Notes: Returns true if the image retains its source data; otherwise, false. The default value is false with some exceptions, which are covered in the discussion.
(Read and Write property)

38.10.223 isFlipped as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the image uses a flipped coordinate system.
Notes: Returns true if the image's coordinate system is flipped; otherwise, false. The default is false.
(Read and Write property)

38.10.224 isTemplate as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the image is a template image.
Example:

```
Var ActionGearTemplate as string // content of PDF file
Var Image as New NSImageMBS( ActionGearTemplate )
Image.setSize( 14,14 )
```

Image.IsTemplate = true

Notes: Value is true if the image is a template image; otherwise, false.
Template images consist of black and clear colors (and an alpha channel). Template images are not intended to be used as standalone images and are usually mixed with other content to create the desired final appearance.
Available in Mac OS X v10.5 and later.
Assigning value to istemplate, will internally call setTemplate.
(Read and Write property)

38.10.225 isValid as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the image can be drawn.
Notes: Return value: true if the receiver can be drawn; otherwise, false.

If the object is initialized with an existing image file, but the corresponding image data is not yet loaded into memory, this method loads the data and expands it as needed. If the object contains no image representations and no associated image file, this method creates a valid cached image representation and initializes it to the default bit depth. This method returns false in cases where the file or URL from which it was initialized is nonexistent or when the data in an existing file is invalid.
(Read only property)

38.10.226 matchesOnMultipleResolution as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether image representations whose resolution is an integral multiple of the device resolution are considered a match.
Notes: Returns true if image representations whose resolution is an integral multiple of the device resolution are considered a match; otherwise, false.

Discussion:
When this method returns false, only image representations whose resolution is exactly the same as the device resolution are considered matches. If this method returns true and multiple image representations fit this criteria, the one whose resolution is closest to the device resolution is chosen.

The default value is true.
(Read and Write property)

38.10.227 MaximumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the height of the heighest one.
Notes: Value is returned in pixels. Returns 0 on any error.
(Read only property)

38.10.228 MaximumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the width of the widest one.
Notes: Value is returned in pixels. Returns 0 on any error.
(Read only property)

38.10.229 MinimumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the width of the smallest one.
Notes: Value is returned in pixels. Returns 0 on any error.
(Read only property)

38.10.230 MinimumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the width of the smallest one.
Notes: Value is returned in pixels. Returns 0 on any error.
(Read only property)

38.10.231 name as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the name associated with the receiver, if any.
Notes: (Read only property)

38.10.232 prefersColorMatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the image prefers to choose image representations using color matching or resolution matching.
Notes: Discussion:
Both color matching and resolution matching may influence the choice of an image representation. This method simply indicates which technique is used first during the selection process. The default value is true.
(Read and Write property)

38.10.233 RepresentationsCount as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Number of represtations this image has.
Notes: Same as Representations.Count
(Read only property)

38.10.234 scalesWhenResized as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether image representations are scaled to fit the receiver's size.
Notes: Returns true if image representations are scaled to fit the receiver; otherwise, false. The default value is false.

Images are not resized during drawing if this method returns true. They are only resized when you change the size by sending the receiver a setSize message.
(Read and Write property)

38.10.235 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The size of the receiver.
Notes: The size of the receiver or (0.0, 0.0) if no size has been set and the size cannot be determined from any of the receiver's image representations.

The size of an NSImage object must be set before it can be used. If the size of the image hasn't already been set when an image representation is added, the size is taken from the image representation's data. For

EPS images, the size is taken from the image's bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation will draw itself in an offscreen window to recreate the cache.
(Read and Write property)

38.10.236 symbolConfiguration as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: The configuration details for a symbol image.
Notes: Use this property to access the traits and rendering attributes the system uses with the symbol image. These details determine which variant of the image to load and draw and how to render it, falling back on the current environment for values that you don,Äôt specify. For symbol images, the default value of this property is a symbol image configuration object with unspecified values.
You can,Äôt modify this property directly, but you can use imageWithSymbolConfiguration() when you want to create a new image object with a specific set of traits.

For macOS 12.0 or newer.
(Read only property)

38.10.237 usesEPSOnResolutionMismatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether EPS image representations are preferred when no other representations match the resolution of the device.
Notes: (Read and Write property)

38.10.238 width as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The width of the image or zero.
Notes: If no size has been set and the size cannot be determined from any of the receiver's image representations.
(Read only property)

38.10.239 Constants

Image Cache Modes

Constant	Value	Description
NSImageCacheAlways	1	Always generate a cache when drawing.
NSImageCacheBySize	2	Cache if cache size is smaller than the original data.
NSImageCacheDefault	0	Caching is unspecified. Use the image rep's default.
NSImageCacheNever	3	Never cache; always draw direct.

Image Load Status

Constant	Value	Description
NSImageLoadStatusCancelled	1	Image loading was canceled. The image contains the portions of the data that have already been success decompressed, if any.
NSImageLoadStatusCompleted	0	Enough data has been provided to completely decompress the image.
NSImageLoadStatusInvalidData	2	An error occurred during image decompression. The image data is probably corrupt. The image contains the portions of data that have already been successfully decompressed, if any.
NSImageLoadStatusReadError	4	Not enough data was available for full decompression of the image. The image contains the portions of the data that have already been success decompressed, if any.
NSImageLoadStatusUnexpectedEOF	3	Not enough data was available for full decompression of the image. The image contains the portions of the data that have already been success decompressed, if any.

38.11 class NSImageRepMBS

38.11.1 class NSImageRepMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSImageRep class is a semiabstract superclass ("semi" because it has some instance variables and implementation of its own).
Notes: Each of its subclasses knows how to draw an image from a particular kind of source data. While an NSImageRep subclass can be used directly, it is typically through an NSImage object. An NSImage object manages a group of image representations, choosing the best one for the current output device.

Subclasses are not implemented in the plugin currently.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.11.2 Methods

38.11.3 canInitWithData(data as memoryblock) as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver can initialize itself from the specified data.
Notes: Returns true if the receiver understands the format of the specified data and can use it to initialize itself; otherwise, false.

This method should be overridden by subclasses. Note that this method does not need to do a comprehensive check of the image data; it should return false only if it knows it cannot initialize itself from the data.

38.11.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

38.11.5 setSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the size of the image representation to the specified value.
Notes: This method determines the size of the image when it's rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation. You must set the image size before you can render it.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.

38.11.6 Properties

38.11.7 bitsPerSample as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of bits per sample in the receiver.
Notes: (Read and Write property)

38.11.8 colorSpaceName as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the receiver's color space.
Notes: The colorspace name, or NSCalibratedRGBColorSpace if no name has been assigned.

By default, an NSImageRep object's color space name is NSCalibratedRGBColorSpace. Color space names are defined as part of the NSColor class, in NSGraphics.h. The following are valid color space names:

NSCalibratedWhiteColorSpace
NSCalibratedBlackColorSpace
NSCalibratedRGBColorSpace
NSDeviceWhiteColorSpace
NSDeviceBlackColorSpace
NSDeviceRGBColorSpace
NSDeviceCMYKColorSpace
NSNamedColorSpace
NSCustomColorSpace
(Read and Write property)

38.11.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

38.11.10 hasAlpha as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver has an alpha channel.
Notes: Returns true if the receiver has a known alpha channel; otherwise, false.

Subclasses should call this method when loading image data to notify the parent class whether that data contains an alpha component. Passing in a value of true does not add an alpha channel to the image data itself; it merely records the fact that the data has an alpha channel.
(Read and Write property)

38.11.11 height as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Height of image in points.
Notes: 0 on any error.
(Read only property)

38.11.12 isOpaque as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver is opaque.
Notes: Use this method to test whether an image representation completely covers the area within the rectangle returned by the size method.

The returned value does not indicate whether the image has an alpha channel or if there is partial or complete transparency when drawing the image rep. Use the hasAlpha method to determine if the image has an alpha channel.
(Read and Write property)

38.11.13 pixelsHigh as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the height of the image, measured in pixels.
Notes: Return Value:
The height of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.
(Read and Write property)

38.11.14 pixelsWide as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the width of the image, measured in pixels.
Notes: Return Value:
The width of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.
(Read and Write property)

38.11.15 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The size of the image representation.
Notes: This size is the size of the image representation when it's rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.
(Read and Write property)

38.11.16 width as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Width of image in points.
Notes: 0 on any error.
(Read only property)

38.11.17 Constants

Constants

Constant	Value	Description
NSImageRepMatchesDevice	0	One of the constants used by NSImageRep to denote an attribute whose value changes to match the display device. Indicates that the value of certain attributes, such as the number of colors or bits per sample, will change to match the display device. This value can be passed in (or received back) as the value of bitsPerSample, pixelsWide, and pixelsHigh.

38.12 class NSImageSymbolConfigurationMBS

38.12.1 class NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: An object that contains the specific font, style, and weight attributes to apply to a symbol image.
Example:

```
Var config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithPointSize(40, 0)
Var n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Var o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

Notes: Symbol image configuration objects include details such as the point size, scale, text style, and weight to apply to your symbol image. The system uses these details to determine which variant of the image to use and how to scale or style the image.

NSImageSymbolConfiguration objects are immutable after you create them. If you use the configurationByApplyingConfiguration method on the object, the new image attributes replace any previous attributes you supplied. After creating a symbol configuration object, assign it to the symbolConfiguration property of the NSImageViewMBS object you use to display the image. If you draw the image directly, use the imageWithSymbolConfiguration method to create a new image that contains the new attributes.

For design guidance, see Human Interface Guidelines.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.12.2 Methods

38.12.3 available as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on macOS 11.0 or later.

38.12.4 configurationByApplyingConfiguration(configuration as NSImageSymbolConfigurationMBS) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a configuration object by applying the values from the configuration you specify.
Notes: for macOS 12.0 or newer.

38.12.5 configurationPreferringMulticolor as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a configuration that specifies that the symbol should prefer its multicolor variant if one exists.
Notes: You can combine this configuration with one of the palette-based configurations. In that case, the symbol uses the multicolor variant if one exists; otherwise the symbol uses the palette version.
If the symbol supports neither, the symbol uses the monochrome (templated) symbol.

38.12.6 configurationWithHierarchicalColor(hierarchicalColor as NSColorMBS) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a hierarchical color configuration using the color you specify.
Notes: This method creates a color scheme based on a single color. The system reduces the intensity of the base color to create the secondary and tertiary colors.
When combining this with another configuration, the last configuration overrides existing values.
If the symbol doesn,Äôt have a palette variant, this color configuration doesn,Äôt have an effect, so the symbol uses the monochrome (templated) symbol.

38.12.7 configurationWithPaletteColors(paletteColors() as NSColorMBS) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a color configuration by specifying a palette of colors.
Example:

```
// shows red colored trash can
Var colors() As NSColorMBS
colors.Append NSColorMBS.redColor
Var config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithPaletteColors(colors)
Var n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Var o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

Notes: The system applies the colors sequentially per layer —the first color for the first layer, and the second color for the second layer. This is independent of the hierarchy level of the layer.
When you combine this with another configuration to create a palette, the last configuration overrides any existing color configuration.
If the symbol doesn,Äôt have a palette variant, this color configuration doesn,Äôt have an effect, so the symbol uses the monochrome (templated) symbol.

38.12.8 configurationWithPointSize(pointSize as Double, weight as Double) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified point size and font weight.
See also:

- 38.12.9 configurationWithPointSize(pointSize as Double, weight as Double, SymbolScale as Integer) as NSImageSymbolConfigurationMBS 7894

38.12.9 configurationWithPointSize(pointSize as Double, weight as Double, SymbolScale as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified point size, font weight, and symbol scale.
See also:

- 38.12.8 configurationWithPointSize(pointSize as Double, weight as Double) as NSImageSymbolConfig-

urationMBS 7894

38.12.10 configurationWithScale(SymbolScale as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration using the scale you specify.
Example:

```
Var config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithScale(NSImageSymbolConfigurationMBS.kSymbolScaleLarge)
Var n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Var o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

38.12.11 configurationWithTextStyle(TextStyle as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified text style.
See also:

- 38.12.12 configurationWithTextStyle(TextStyle as Integer, SymbolScale as Integer) as NSImageSymbolConfigurationMBS 7895

38.12.12 configurationWithTextStyle(TextStyle as Integer, SymbolScale as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified text style and symbol scale.
See also:

- 38.12.11 configurationWithTextStyle(TextStyle as Integer) as NSImageSymbolConfigurationMBS 7895

38.12.13 Constructor

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

38.12.14 NSFontTextStyleBody as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for body text.

38.12.15 NSFontTextStyleCallout as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for callouts.

38.12.16 NSFontTextStyleCaption1 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for standard captions.

38.12.17 NSFontTextStyleCaption2 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for alternate captions.

38.12.18 NSFontTextStyleFootnote as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use in footnotes.

38.12.19 NSFontTextStyleHeadline as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for headings.

38.12.20 NSFontTextStyleLargeTitle as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for titles.

38.12.21 NSFontTextStyleSubheadline as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for subheadings.

38.12.22 NSFontTextStyleTitle1 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for first-level hierarchical headings.

38.12.23 NSFontTextStyleTitle2 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for second-level hierarchical headings.

38.12.24 NSFontTextStyleTitle3 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for third-level hierarchical headings.

38.12.25 Properties

38.12.26 colors as Variant

MBS MacBase Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The color value.
Notes: (Read only property)

38.12.27 Description as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Shows description for debugging.
Example:

Var config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithScale(NSImageSymbolConfigurationMBS.kSymbolScaleLarge)

MessageBox config.Description

Notes: (Read only property)

38.12.28 Handle as Integer

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference number.
Notes: (Read only property)

38.12.29 pointSize as Variant

MBS MacBase Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The point size value.
Notes: (Read only property)

38.12.30 prefersMulticolor as Variant

MBS MacBase Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: Specifies that the symbol should prefer its multicolor variant if one exists.
Notes: (Read only property)

38.12.31 renderingStyle as Variant

MBS MacBase Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The rendering style value.
Notes: (Read only property)

38.12.32 scale as Variant

MBS MacBase Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The scale value.
Notes: (Read only property)

38.12.33 weight as Variant

MBS MacBase Plugin, Plugin Version: 25.5, Platforms: macOS, iOS, Targets: All.

Function: The font weight value.
Notes: (Read only property)

38.12.34 Constants

Constants

Constant	Value	Description
kSymbolScaleLarge	3	Specifies which scale variant of a symbol image to use. The symbol uses the large scale variant. This scale is approximately 30% larger than the kSymbolScaleMedium scale.
kSymbolScaleMedium	2	Specifies which scale variant of a symbol image to use. The symbol uses the default medium scale variant.
kSymbolScaleSmall	1	Specifies which scale variant of a symbol image to use. The symbol uses the small scale variant. This scale is approximately 20% smaller than the kSymbolScaleMedium scale.

38.13 class NSPDFImageRepMBS

38.13.1 class NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPDFImageRep object can render an image from a PDF format data stream.
Notes: Subclass of the NSImageRepMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

38.13.2 Methods

38.13.3 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSPDFImageRep object initialized with the specified PDF data.
Notes: Initialized NSPDFImageRep object. Initialization may fail if the PDF data does not conform to the PDF file format.
On success handle property is not zero.

38.13.4 imageRepWithData(data as Memoryblock) as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPDFImageRep object initialized with the specified PDF data.
Notes: Returns an initialized NSPDFImageRep object or nil if the object could not be initialized. Initialization may fail if the PDF data does not conform to the PDF file format.

38.13.5 PDFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the PDF representation of the receiver's image.

38.13.6 Properties

38.13.7 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's bounding rectangle.
Notes: This value is equivalent to the crop box specified by the PDF data.
(Read only property)

38.13.8 currentPage as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The page currently displayed by the image representation.
Notes: A zero-based index indicating the page being displayed.
(Read and Write property)

38.13.9 pageCount as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of pages in the receiver.
Notes: (Read only property)

38.14 class NSPICTImageRepMBS

38.14.1 class NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPICTImageRep object renders an image from a PICT format data stream as described in the Carbon QuickDraw Manager documentation.
Notes: This class can render PICT format version 1, version 2, and extended version 2 pictures.
Subclass of the NSImageRepMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

38.14.2 Methods

38.14.3 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSPICTImageRep object initialized with the specified data.
Notes: data: A data object containing the PICT data.

Initialization may fail if the data does not conform to the PICT file format.
On success the handle property is not zero.

If the PICT data is obtained directly from a PICT file or document, this method ignores most of the 512-byte header that occurs before the start of the actual picture data. It may retrieve some relevant meta information from the header.

38.14.4 imageRepWithData(data as Memoryblock) as NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPICTImageRep object initialized with the specified data.
Notes: Initialization may fail if the data does not conform to the PICT file format.
On failure the handle property is nil.

38.14.5 PICTRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's PICT data.
Notes: A data object containing the PICT data. The returned data does not include the 512-byte header, if it was present in the original data. If you want to write the returned data to a file, you must precede it with a 512-byte header (containing all zeros) if you want to conform to the PICT document format.

38.14.6 Properties

38.14.7 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the rectangle that bounds the receiver.
Notes: The rectangle bounding the receiver. This rectangle is obtained from the the picFrame field in the picture header. See the Carbon QuickDraw Manager documentation for information on the picture header. (Read only property)

Chapter 39

Cocoa Menus

39.1 class NSMenuItemMBS

39.1.1 class NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to represent a menuitem from the Cocoa world.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

39.1.2 Methods

39.1.3 clearAction

MBS MacBase Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop only.

Function: Clears action event.
Notes: Call this method once to have a menuitem which has no action.

39.1.4 Constructor(DesktopMenuitem as DesktopMenuitem)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSMenuItemMBS object for a given MenuItem.
Notes: May raise UnsupportedOperationException or NilObjectException if used incorrectly.
See also:

- 39.1.5 Constructor(Handle as Integer) 7906
- 39.1.6 Constructor(MenuItem as MenuItem) 7907
- 39.1.7 Constructor(Other as NSMenuItemMBS) 7908
- 39.1.8 Constructor(title as string="", keyEquivalent as string="") 7908

39.1.5 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Constructor for creating an instanced based on an existing handle.
Example:

```
Var m as MenuItem = EditCopy
Var h as Integer = m.Handle(MenuItem.HandleType.CocoaNSMenuItem)
Var i as new NSMenuItemMBS(h)

i.Title = "Hello"
```

Notes: Useful if you get a NSMenuItem reference from a declare.
The object is retained.
See also:

- 39.1.4 Constructor(DesktopMenuitem as DesktopMenuitem) 7906
- 39.1.6 Constructor(MenuItem as MenuItem) 7907
- 39.1.7 Constructor(Other as NSMenuItemMBS) 7908
- 39.1.8 Constructor(title as string="", keyEquivalent as string="") 7908

39.1.6 Constructor(MenuItem as MenuItem)

MBS MacBase Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSMenuItemMBS object for a given MenuItem.
Example:

```
Var FileDot, FileDiamond as MenuItem

FileDot.enable
FileDot.checked = true

// via constructor
Var n1 as new NSMenuItemMBS(fileDot)
n1.onStateImage = NSImageMBS.imageNamed("NSMenuItemBullet")

FileDiamond.enable
FileDiamond.checked = true

// via function
Var n2 as NSMenuItemMBS = NSMenuItemMBS.MenuItem(FileDiamond)
n2.onStateImage = NSImageMBS.imageNamed("NSMenuItemDiamond")
```

Notes: May raise UnsupportedOperationException or NilObjectException if used incorrectly.
See also:

- 39.1.4 Constructor(DesktopMenuitem as DesktopMenuitem) 7906
- 39.1.5 Constructor(Handle as Integer) 7906
- 39.1.7 Constructor(Other as NSMenuItemMBS) 7908
- 39.1.8 Constructor(title as string="", keyEquivalent as string="") 7908

39.1.7 Constructor(Other as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSMenuItemMBS object referencing same NSMenuItem with a new Xojo object.
See also:

- 39.1.4 Constructor(DesktopMenuitem as DesktopMenuitem) 7906
- 39.1.5 Constructor(Handle as Integer) 7906
- 39.1.6 Constructor(MenuItem as MenuItem) 7907
- 39.1.8 Constructor(title as string="", keyEquivalent as string="") 7908

39.1.8 Constructor(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new menu items.
Notes: Handle is not 0 after this call if it was successfull.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.
See also:

- 39.1.4 Constructor(DesktopMenuitem as DesktopMenuitem) 7906
- 39.1.5 Constructor(Handle as Integer) 7906
- 39.1.6 Constructor(MenuItem as MenuItem) 7907
- 39.1.7 Constructor(Other as NSMenuItemMBS) 7908

39.1.9 CreateMenuItem(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new menu items.
Notes: Handle is not 0 after this call if it was successfull.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.

Deprecated, please use the Constructor instead.

39.1.10 CreateSeparator

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Creates a Separator menu item.

39.1.11 MenuItem(DesktopMenuItem as DesktopMenuItem) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Queries NSMenuItemMBS for a given menu item.
Notes: Returns nil on any error.
See also:

- 39.1.12 MenuItem(MenuItem as MenuItem) as NSMenuItemMBS 7909

39.1.12 MenuItem(MenuItem as MenuItem) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Queries NSMenuItemMBS for a given menu item.
Example:

```
Var FileDot, FileDiamond as MenuItem

FileDot.enable
FileDot.checked = true

// via constructor
Var n1 as new NSMenuItemMBS(fileDot)
n1.onStateImage = NSImageMBS.imageNamed("NSMenuItemBullet")

FileDiamond.enable
FileDiamond.checked = true

// via function
Var n2 as NSMenuItemMBS = NSMenuItemMBS.MenuItem(FileDiamond)
n2.onStateImage = NSImageMBS.imageNamed("NSMenuItemDiamond")
```

Notes: Returns nil on any error.
See also:

- 39.1.11 MenuItem(DesktopMenuItem as DesktopMenuItem) as NSMenuItemMBS 7909

39.1.13 PerformAction(delay as double = 0)

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: Perform the action for the menu item.
Example:

```
// we ask for the NSMenuItem for an entry on the File menu
Var n As New NSMenuItemMBS(FileTest)

// run it
n.PerformAction
```

Notes: You may find a NSMenuItemMBS object in the menubar, a contextual menu or from a popup menu, where you like to run an action.

39.1.14 sectionHeaderWithTitle(Title as String) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Creates a menu item representing a section header with the provided title.
Example:

```
Var m as NSMenuItemMBS = NSMenuItemMBS.MenuItem(EditMenu)

// add the header
Var h as NSMenuItemMBS = NSMenuItemMBS.sectionHeaderWithTitle("Section Header")
h.Enabled = true
m.submenu.addItem h
self.SectionHeader = h

// and the new entry with our MyNSMenuItemMBS class to handle validate and action.
Var n as new MyNSMenuItemMBS("Hello")
n.Enabled = true
m.submenu.addItem n
self.HelloMenu = n // keep references
```

Notes: Section header items are used to provide context to a grouping of menu items.
Items created using this method are non-interactive and do not perform an action.

Requires macOS Sonoma or newer.

39.1.15 separatorItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new separator menu item.

39.1.16 setAction(target as NSResponderMBS, selectorName as string)

MBS MacBase Plugin, Plugin Version: 23.3, Platform: macOS, Targets: Desktop only.

Function: Sets the target for the menu action.
Example:

```
Var n as NSMenuItemMBS // your menu item

n.setAction(window1.NSWindowMBS, "performClose:")
```

Notes: Please make sure the selector is correct as otherwise you get an exception later.
And make sure the target object stays alive.

39.1.17 setTitleWithMnemonic(title as String)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the title of a menu item with a character denoting an access key.
Notes: Use an ampersand character to mark the character (the one following the ampersand) to be designated.
Deprecated by Apple.

39.1.18 writingToolsItems as NSMenuItemMBS()

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: An array of standard menu items related to Writing Tools.
Example:

```
var items() as NSMenuItemMBS = NSMenuItemMBS.writingToolsItems
var item as NSMenuItemMBS = items(0)
var submenu as NSMenuMBS = item.submenu
var entry as NSMenuItemMBS = submenu.Item(0)

Break // see in debugger
```

Notes: Each call to this method returns an array of newly allocated instances of NSMenuItemMBS.
Requires macOS 15.2 or newer.

39.1.19 Properties

39.1.20 ActionSelector as String

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the objective-c method called for this menu event.
Notes: You can use this to find menu items by their selector. Which is often more save than by index or title.
(Read only property)

39.1.21 Alternate as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether this menu item is an alternate to the previous menu item.
Notes: Available in Mac OS X v10.3 and later.
(Read and Write property)

39.1.22 attributedTitle as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Specifies a custom string for a menu item.
Notes: You can use this method to add styled text and embedded images to menu item strings. If you do not set a text color for the attributed string, it is black when not selected, white when selected, and gray when disabled. Colored text remains unchanged when selected.

When you call this method to set the menu title to an attributed string, the setTitle: method is also called to set the menu title with a plain string. If you clear the attributed title, the plain title remains unchanged.
(Read and Write property)

39.1.23 Enabled as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether this menuitem is enabled.

Notes: (Read and Write property)

39.1.24 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The reference to the NSMenuItem object used internally.
Notes: (Read and Write property)

39.1.25 hasSubmenu as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns true if the menuitem has a submenu, false if it doesn't.
Notes: (Read only property)

39.1.26 Identifier as String

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: A string that identifies this user interface item.
Notes: It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a view but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a view is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

39.1.27 image as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image displayed by the menuitem, or nil if it displays no image.
Notes: (Read and Write property)

39.1.28 indentationLevel as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The menu item indentation level for the menu item.
Notes: The value will be from 0 to 15. The default indentation level is 0.
Available in Mac OS X v10.3 and later.
(Read and Write property)

39.1.29 isHidden as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the menuitem is hidden.
Notes: Mac OS X 10.5 only.
Returns true if the receiver is hidden, otherwise false.
This value can be set to hide or show a menuitem.
(Read and Write property)

39.1.30 isHiddenOrHasHiddenAncestor as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the menuitem or any of its superitems is hidden.
Notes: Mac OS X 10.5 only.
Returns true if the receiver or any of its superitems is hidden, otherwise false.
(Read only property)

39.1.31 isHighlighted as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver should be drawn highlighted.
Notes: Returns true if the receiver should be drawn highlighted, otherwise false.
Mac OS X 10.5 only.
(Read only property)

39.1.32 isSectionHeader as Boolean

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the item is a section header.
Notes: Section header items are created using the sectionHeader() class method.

Requires macOS Sonoma or newer.
(Read only property)

39.1.33 isSeparatorItem as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver is a separator item (that is, a menu item used to visually segregate related menu items).
Notes: (Read only property)

39.1.34 keyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The receiver's unmodified keyboard equivalent, or the empty string if one hasn't been defined.
Example:

```
Var m as new NSMenuItemMBS
m.CreateMenuItem "Hello"
m.keyEquivalent = "a" // A
m.keyEquivalent = "A" // shift-A
```

Notes: Use keyEquivalentModifierMask to determine the modifier mask for the key equivalent. In the current implementation "A" can be interpreted as Shift-A by the system even without the shift in the mask.
(Read and Write property)

39.1.35 keyEquivalentModifierMask as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: the menu item's keyboard equivalent modifier mask.
Example:

```
const NSShiftKeyMask=131072
const NSControlKeyMask=262144
```

```
const NSAlternateKeyMask=524288
const NSCommandKeyMask=1048576

Var d as new NSMenuItemMBS
d.CreateMenuItem "Last menu entry",""
d.Enabled=true
d.KeyEquivalent="A"
d.KeyEquivalentModifierMask=NSShiftKeyMask+NSCommandKeyMask+NSAlternateKeyMask // command-option-shift
```

Notes: Constants for the mask:

NSAlphaShiftKeyMask = 65536
Set if Caps Lock key is pressed.
Available in Mac OS X v10.0 and later.

NSShiftKeyMask = 131072
Set if Shift key is pressed.
Available in Mac OS X v10.0 and later.

NSControlKeyMask = 262144
Set if Control key is pressed.
Available in Mac OS X v10.0 and later.

NSAlternateKeyMask = 524288
Set if Option or Alternate key is pressed.
Available in Mac OS X v10.0 and later.

NSCommandKeyMask = 1048576
Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).
Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
(Read and Write property)

39.1.36 menu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The menu where this menu item is inside.
Notes: nil if no menu belongs to this menuitem.
(Read only property)

39.1.37 mixedStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image used to depict a "mixed state."
Notes: A mixed state is useful for indicating "off" and "on" attribute values in a group of selected objects, such as a selection of text containing bold and plain (nonbolded) words.
(Read and Write property)

39.1.38 offStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image used to depict the receiver's "off" state, or nil if the image has not been set.
Notes: By default, there is no off state image.
(Read and Write property)

39.1.39 onStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image of the receiver that indicates an "on" state.
Notes: The Image object to use for the "on" state of the menu item. If itemImage is nil, any current on-state image is removed.
(Read and Write property)

39.1.40 parentItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item whose submenu contains the receiver.
Notes: Returns the parent menu item, or nil if the receiver does not have a parent item.
Available in Mac OS X v10.6 and later.
(Read only property)

39.1.41 state as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The state of the menuitem.
Notes: An integer constant representing a state; it should be one of NSOffState, NSOnState, or NSMixedState.
Same as Checked property on Xojo's menu items.

Constants:

NSMixedState = -1	The corresponding feature is in effect somewhere.
NSOffState = 0	The corresponding feature is in effect nowhere.
NSOnState = 1	The corresponding feature is in effect everywhere.

(Read and Write property)

39.1.42 submenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The submenu attached to this menuitem.
Notes: nil if there is no submenu.
(Read and Write property)

39.1.43 tag as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The menu item tag value.
Notes: You can use this value as you like.

If you need to store more custom data than just an integer, you should subclass the NSMenuItemMBS class and add properties as needed.
(Read and Write property)

39.1.44 Title as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The title of the menu item.
Notes: (Read and Write property)

39.1.45 toolTip as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The help tag for a menu item.
Notes: (Read and Write property)

39.1.46 userKeyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The user-assigned key equivalent for the menu item.
Notes: (Read only property)

39.1.47 view as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The view to be used for this menuitem.
Notes: Using a view you can draw whatever you like in the menu item.
You can set it to nil to remove the view.
Requires Mac OS X 10.5.

(Read and Write property)

39.1.48 usesUserKeyEquivalents as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether menu items conform to user preferences for key equivalents.
Notes: If true, menu items conform to user preferences for key equivalents; if false, the key equivalents originally assigned to the menu items are used.
(Read and Write computed property)

39.1.49 Events

39.1.50 Action

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The action event called when the user clicks on the statusitem.
Notes: This event is coming from the Cocoa event system. What you can do is a bit limited when using GUI functions from Xojo. To avoid some redraw errors, you may want to start a timer and let your Xojo code run a millisecond after the menu code has finished.
Depending on what you do, you can see the menu not redrawing properly (staying highlighted) and crashes if the Xojo code modifies some global Cocoa states.

39.1.51 validateMenuItem(menuItem as NSMenuItemMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implemented to override the default action of enabling or disabling a specific menu item.
Notes: Return true to enable menuItem, false to disable it.
This is needed to modify the menuitem for a menu attached to a NSSearchFieldMBS.
Menuitem parameter is often the same as self, but for a searchfield menu, self is the template and menuitem parameter the actual menu item.

39.1.52 Constants

Constants

Constant	Value	Description
NSMixedState	-1	One of the constants for the state property. The corresponding feature is in effect somewhere.
NSOffState	0	One of the constants for the state property. The corresponding feature is in effect nowhere.
NSOnState	1	One of the constants for the state property. The corresponding feature is in effect everywhere.

39.2 class NSMenuMBS

39.2.1 class NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to represent a menu in the Cocoa world.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

39.2.2 Methods

39.2.3 addItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Adds a menu item to the end.
Notes: If the menuitem is nil, nothing happens.
The menuitem can only be in one menu.

The menu doesn't references to the RB classes behind, so it's up to you to keep those references if you want to get the events and avoid crashes.
The StatusItem example keeps an array with all those menu item objects it needs so RB will not destroy them.

39.2.4 cancelTracking

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Dismisses the menu and ends all menu tracking.
Notes: Available in Mac OS X v10.5 and later.

39.2.5 cancelTrackingWithoutAnimation

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Dismisses the menu and ends all menu tracking without displaying the associated animation.
Notes: Available in Mac OS X v10.6 and later.

39.2.6 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Constructor for creating an instanced based on an existing handle.
Notes: Useful if you get a NSMenu reference from a declare.
The object is retained.
See also:

- 39.2.7 Constructor(title as string="") 7923

39.2.7 Constructor(title as string="")

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Function: Constructor for a new nsmenu.
Example:

```
Var m as NSMenuMBS
m=new NSMenuMBS("Hello World")
msgbox m.title // shows "Hello World"
```

Notes: Title is optional.
See also:

• 39.2.6 Constructor(Handle as Integer) 7923

39.2.8 helpMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the help menu if one is registered.

39.2.9 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index identifying the location of a specified menu item in the receiver.
Notes: Returns the integer index of the menu item or, if no such menu item is in the menu, –1.

39.2.10 indexOfItemWithSelector(selector as string) as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Searches menu items for one with the given selector.
Notes: Returns -1 if not found.
You can use this to find menu items by their selector. Which is often more save than by index or title.

39.2.11 indexOfItemWithSubmenu(item as NSMenuMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the menu item in the receiver with the given submenu.
Notes: item: A menu object that is a menu item of the receiver (that is, a submenu).

The integer index of the menu item or, if no such menu item is in the menu, –1.

39.2.12 indexOfItemWithTag(tag as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the first menu item in the receiver identified by a tag.
Notes: Returns the integer index of the menu item or, if no such menu item is in the menu, –1.

39.2.13 indexOfItemWithTitle(title as string) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the first menu item in the receiver that has a specified title.
Notes: The integer index of the menu item or, if no such menu item is in the menu, –1.

39.2.14 insertItem(m as NSMenuItemMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Inserts a menu item into the menu at a specific location.
Notes: If the menuitem is nil, nothing happens. A menuitem can only be part of one menu.

index: An integer index identifying the location of the menu item in the menu. Zero based.

39.2.15 Item(index as Integer) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns the item with the given index.
Notes: Index is from 0 to numberOfItems-1.
Remember: The objects returned are not the same Xojo objects used with additem or insertitem.

39.2.16 items as NSMenuItemMBS()

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: Queries all menu items as an array.
Example:

```
Var em as new NSMenuItemMBS(EditMenu)
Var sm as NSMenuMBS = em.submenu

for each it as NSMenuItemMBS in sm.Items
System.DebugLog it.Title
next

Break // see debugitems in debugger
```

Notes: Great for for-each loops.

39.2.17 itemWithSelector(selector as string) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Searches menu items for one with the given selector.
Notes: You can use this to find menu items by their selector. Which is often more save than by index or title.

39.2.18 mainMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the main menu.

39.2.19 menuBarVisible as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the menu bar is visible.
Notes: Available in Mac OS X v10.2 and later.
Returns true if the menu bar is visible, otherwise false.

39.2.20 NSMenuDidAddItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item is added to the menu. The notification object is the instance of NSMenuMBS that just added the new menu item.
This is very useful to customize the menu in Xojo. The runtime rebuilds menu bar often, so you can catch it and edit menu.

The userInfo dictionary contains the following information:
NSMenuItemIndex: An integer index of the menu item that was added.

39.2.21 NSMenuDidBeginTrackingNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes: Posted when menu tracking begins. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo dictionary.

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

39.2.22 NSMenuDidChangeItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item in the menu changes appearance. Changes include enabling/disabling, changes in state, and changes to title. The notification object is the instance of NSMenuMBS with the menu item that changed. The userInfo dictionary contains the following information:

Key	Value
NSMenuItemIndex	An integer index of the menu item that changed.

39.2.23 NSMenuDidEndTrackingNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted when menu tracking ends, even if no action is sent. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo

39.2.24 NSMenuDidRemoveItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification

is sent.

Posted after a menu item is removed from the menu. The notification object is the instance of NSMenu that just removed the menu item. The userInfo dictionary contains the following information:

NSMenuItemIndex: An integer index of the menu item that was removed. Note that this index may no longer be valid and in any event no longer points to the menu item that was removed.

39.2.25 NSMenuDidSendActionNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just after the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:

Key	Value
MenuItem	The menu item that was chosen.

39.2.26 NSMenuWillSendActionNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes: Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just before the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:

Key	Value
MenuItem	The menu item that was chosen.

39.2.27 paletteMenuWithColors(colors() as NSColorMBS, itemTitles() as String, templateImage as NSImageMBS = nil) as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Creates an palette menu displaying user-selectable color tags using the provided template image, tinted using the specified array of colors.
Example:

```
Var m as NSMenuItemMBS = NSMenuItemMBS.MenuItem(EditMenu)

// gather data for menu
Var colors() as NSColorMBS
colors.Append NSColorMBS.whiteColor
colors.Append NSColorMBS.redColor
colors.Append NSColorMBS.blueColor

Var titles() as string = array("White", "Red", "Blue")

// now create palette and attach our handler
paletteMenu = NSMenuMBS.paletteMenuWithColors(Colors, titles)
AddHandler paletteMenu.PaletteSelectionChange, WeakAddressOf PaletteSelectionChange

// now make a dummy menu and add palette
Var n as new MyNSMenuItemMBS("Hello")
n.Enabled = true
n.submenu = paletteMenu
m.submenu.addItem n
self.HelloMenu = n
```

Notes: Optionally allows observing changes to the selection state in the compact menu. The block is invoked after the selection has been updated. Currently selected items can be retrieved from the 'selectedItems' property.

Returns a palette menu.

Requires macOS Sonoma or newer.

39.2.28 performActionForItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Causes the application to send the action message of a specified menu item to its target.
Notes: If a target is not specified, the message is sent to the first responder. As a side effect, this method posts NSMenuWillSendActionNotification and NSMenuDidSendActionNotification.

In Mac OS X v10.6 and laster the performActionForItemAtIndex no longer triggers menu validation. This is because validation is typically done during menu tracking or key equivalent matching, so the subsequent performActionForItemAtIndex validation was redundant. To trigger validation explicitly, use invoke the update method.

In Mac OS X v10.6 performActionForItemAtIndex, when called, now triggers highlighting in the menu bar. It also sends out appropriate accessibility notifications indicating the item was selected.

39.2.29 popUpContextMenu(menu as NSMenuMBS, theEvent as NSEventMBS, view as NSViewMBS, font as NSFontMBS = nil)

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Displays a contextual menu over a view for an event using a specified font.
Notes: menu: The menu object to use for the contextual menu.
event: An NSEvent object representing the event.
view: The view object over which to display the contextual menu.
font: An NSFont object representing the font for the contextual menu. If you pass in nil for the font, the method uses the default font for menu.

Specifying a font using the font parameter is discouraged. Instead set the menu,Äôs font using the setFont: method and pass nil for the font parameter.

39.2.30 popUpMenuPositioningItem(item as NSMenuItemMBS, location as NSPointMBS, view as NSViewMBS = nil) as boolean

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Pops up the menu at the specified location.
Example:

```
// create menu
Var m as new NSMenuMBS
m.autoenablesItems = false

// add some items
Var it as new NSMenuItemMBS
it.CreateMenuItem "Hello"
it.Enabled = true
m.addItem it

it = new NSMenuItemMBS
```

```
it.CreateMenuItem "World"
it.Enabled = true
m.addItem it

// show relative to this view
Var v as NSViewMBS = window1.PushButton1.NSViewMBS

Var r as Boolean
r = m.popUpMenuPositioningItem(nil, nil, v)
// you need to use NSMenuItemMBS subclasses with action event to get an event for which item was selected...
```

Notes: item: The menu item to be positioned at the specified location in the view.
location: The location in the view coordinate system to display the menu item.
view: The view to display the menu item over.

Returns true if menu tracking ended because an item was selected, and false if menu tracking was cancelled for any reason.

Pops up the receiver as a popup menu. The top left corner of the specified item (if specified, item must be present in the receiver) is positioned at the specified location in the specified view, interpreted in the view's own coordinate system.

If item is nil, the menu is positioned such that the top left of the menu content frame is at the given location. If view is nil, the location is interpreted in the screen coordinate system. This allows you to pop up a menu disconnected from any window.

Available in OS X v10.6 and later.

39.2.31 removeAllItems

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Removes all the menu items in the receiver.
Example:

```
Var n as NSMenuMBS // your menu

// for Mac OS X 10.6
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
n.removeItemAtIndex i
```

```
next
```

Notes: This method is more efficient than removing menu items individually.
Unlike the other remove methods, this method does not post NSMenuDidChangeItemNotification notifications.
Available in Mac OS X v10.6 and later.

39.2.32 removeItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the menuitem.
Notes: Does nothing if menuitem is nil.

The Xojo object used to add the menuitem must not be the same as the one you use here, but the values for the menuitems handle property must match.

39.2.33 removeItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the menu item with the given index.
Example:

```
Var n as NSMenuMBS // your menu

// for Mac OS X 10.6
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
n.removeItemAtIndex i
next
```

Notes: Index is from 0 to NumberOfItems-1.

39.2.34 selectedItems as NSMenuItemMBS()

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: The menu items that are selected.
Notes: An item is selected when its state is ‘NSControl.StateValue.on‘.

Requires macOS Sonoma or newer.

39.2.35 setMenuBarVisible(value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets whether the menu bar is visible and selectable by the user.
Notes: value: true if menu bar is to be visible, otherwise false.
Available in Mac OS X v10.2 and later.

39.2.36 setSelectedItems(items() as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Sets the menu items that are selected.
Notes: An item is selected when its state is 'NSControl.StateValue.on'.

Setting 'selectedItems' will select any items that are contained in the provided array, and deselect any previously selected items that are not in the array.

Requires macOS Sonoma or newer.

39.2.37 update

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Enables or disables the receiver's menu items based on the NSMenuValidation informal protocol and sizes the menu to fit its current menu items if necessary.

39.2.38 windowsMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the window menu if one is registered.

39.2.39 Properties

39.2.40 allowsContextMenuPlugIns as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the popup menu allows appending of contextual menu plugin items.
Notes: Value is true if the popup menu allows appending of contextual menu plugin items, otherwise false. Available in Mac OS X v10.6 and later.

Can be used to hide services menu items.
(Read and Write property)

39.2.41 autoenablesItems as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether menu items are automatically enabled and disabled.
Notes: Mac OS X 10.5 only.
(Read and Write property)

39.2.42 automaticallyInsertsWritingToolsItems as boolean

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: Determines whether Writing Tools menu items may be inserted into the menu, if used as a context menu.
Example:

```
var n as new NSMenuItemMBS(EditMenu)
var m as NSMenuMBS = n.submenu

m.automaticallyInsertsWritingToolsItems = true
```

Notes: The default is YES.
Requires macOS 15.2 or newer.
(Read and Write property)

39.2.43 debugItems as Variant

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: Lists all items of the menu for use in debugger.
Example:

```
Var em as new NSMenuItemMBS(EditMenu)
Var sm as NSMenuMBS = em.submenu

for each it as NSMenuItemMBS in sm.Items
System.DebugLog it.Title
next

Break // see debugitems in debugger
```

Notes: (Read only property)

39.2.44 Font as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The font used to display the menu and its submenus.
Notes: This font will be used to display the menu and any submenus that have not had their font set explicitly.
Available in Mac OS X v10.6 and later.
(Read and Write property)

39.2.45 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The internal reference to the NSMenu object.
Notes: (Read and Write property)

39.2.46 highlightedItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the highlighted item in the receiver.
Notes: Returns the highlighted item in the receiver, or nil if no item in the menu is highlighted.
Available in Mac OS X v10.5 and later.
(Read only property)

39.2.47 Identifier as String

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: A string that identifies this user interface item.
Notes: It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a view but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a view is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

39.2.48 menuBarHeight as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the menu bar height for the current application's main menu.
Notes: Returns the receiver's main menu bar height or 0.0 if the receiver is some other menu.
This method supersedes the menuBarHeight class method of the NSMenuView class.
Available in Mac OS X v10.4 and later.
(Read only property)

39.2.49 minimumWidth as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The minimum width of the menu.
Notes: The menu will not draw smaller than its minimum width, but may draw larger if it needs more space. The default value is 0.
Available in Mac OS X v10.6 and later.
(Read and Write property)

39.2.50 numberOfItems as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The number of menu items in this menu.
Notes: (Read only property)

39.2.51 presentationStyle as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: The presentation style of the menu.
Notes: This property is not respected if the menu is the main menu of the app.

Requires macOS Sonoma or newer.
(Read and Write property)

39.2.52 selectionMode as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: The selection mode of the menu.
Notes: Note the selection mode only has effect on menu items that belong to the same selection group. A selection group consists of the items with the same target/action.

Requires macOS Sonoma or newer.
(Read and Write property)

39.2.53 showsStateColumn as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver displays the state column.
Notes: Available in Mac OS X v10.5 and later.
Returns true if the receiver displays the state column, otherwise false.

The state column is the area in the menu items, where state of menuitems are shown like a checkmark.
(Read and Write property)

39.2.54 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the size of the menu.
Notes: Returns the size of the menu in screen coordinates.
The menu may draw at a smaller size when shown, depending on its positioning and display configuration.
Available in Mac OS X v10.6 and later.
(Read only property)

39.2.55 supermenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The parent menu of this menu.
Notes: (Read only property)

39.2.56 Title as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The title of the menu.
Notes: (Read and Write property)

39.2.57 userInterfaceLayoutDirection as Integer

MBS MacBase Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Configures the layout direction of menu items in the menu.
Notes: This property configures the layout direction (a value of type NSUserInterfaceLayoutDirection) of menu items in the menu. If no layout direction is explicitly set for a menu, then the menu defaults to the layout direction specified for the application object. See userInterfaceLayoutDirection in NSApplication Class Reference.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.11 and later.
(Read and Write property)

39.2.58 Events

39.2.59 DidClose

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Invoked after a menu closed.
Notes: Don,Äôt modify the structure of the menu or the menu items during this method.

39.2.60 EnableMenuItems

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: This event is called before the menu opens so you can edit the menu.

39.2.61 PaletteSelectionChange

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the palette selection changes.

39.2.62 willHighlightItem(item as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Invoked to indicate that a menu is about to highlight a given item.
Notes: item: The item about to be highlighted.

Only one item per menu can be highlighted at a time. If item is nil, it means that all items in the menu are about to be unhighlighted.

39.2.63 WillOpen

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Invoked when a menu is about to open.
Notes: Don,Äôt modify the structure of the menu or the menu items during this method.

39.2.64 Constants

Presentation Styles

Constant	Value	Description
PresentationStylePalette	1	The menu marked as palette is to be displayed in place of the menu item presenting it, with its items aligned horizontally.
PresentationStyleRegular	0	The default presentation style. Typically means the menu will be presented as either a popup or pulldown menu, based on the context.

Selection Modes

Constant	Value	Description
SelectionModeAutomatic	0	The menu will determine the appropriate selection mode based on the context and its contents.
SelectionModeSelectAny	2	The user can select multiple items in the menu. A change in selection will not automatically deselect any previously selected item in the same selection group.
SelectionModeSelectOne	1	The user will be allowed to select at most one menu item in the same selection group at a time. A change in selection will deselect any previously selected item.

39.3 class NSMenuPopupEventsMBS

39.3.1 class NSMenuPopupEventsMBS

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: The class to intercept a context menu showing in Xojo applications.
Notes: While the MenuItem class in Xojo can do some things, we like to use our NSMenuMBS and NSMenuItemMBS classes to modify the menu even more.
Blog Entries

- Intercept Menus with MBS Xojo Plugins
- MBS Xojo Plugins, version 25.0pr7

39.3.2 Methods

39.3.3 Constructor

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

39.3.4 Destructor

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: The destructor.

39.3.5 Events

39.3.6 didCloseMenu(menu as NSMenuMBS, theEvent as NSEventMBS, view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: The menu closed.
Notes: This event runs when the menu closes.

39.3.7 popUpMenuAtPosition(menu as NSMenuMBS, item as NSMenuItemMBS, location as NSPointMBS, view as NSViewMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: A contextual menu shows up.
Notes: Also raises willOpenMenu event later.
Return true to skip showing the menu.

39.3.8 willOpenMenu(menu as NSMenuMBS, theEvent as NSEventMBS, view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: The menu will show.
Notes: This event runs when the menu opens.

Chapter 40

Cocoa Networking

40.1 class NSCachedURLResponseMBS

40.1.1 class NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: A cached response to a URL request.
Notes: A NSCachedURLResponseMBS object provides the server,Äôs response metadata in the form of a NSURLResponseMBS object, along with an NSData object containing the actual cached content data. Its storage policy determines whether the response should be cached on disk, in memory, or not at all.
Cached responses also contain a user info dictionary where you can store app-specific information about the cached item.
The NSURLCacheMBS class stores and retrieves instances of NSCachedURLResponseMBS.

40.1.2 Methods

40.1.3 Constructor(response as NSURLResponseMBS, data as MemoryBlock, userInfo as Dictionary = nil, storagePolicy as Integer = 0)

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Creates a cached URL response instance.
Notes: response: The response to cache.
data: The data to cache.

Returns a cached URL response object, containing the response and data.

The cache storage policy is set to the default, kCacheStorageAllowed, and the user info dictionary is set to nil.

40.1.4 copy as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

40.1.5 Properties

40.1.6 Data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The cached response,Äôs data.
Notes: (Read only property)

40.1.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.1.8 Response as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The URL response object associated with the instance.
Notes: (Read only property)

40.1.9 StoragePolicy as Integer

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The cached response,Äôs storage policy.
Notes: (Read only property)

40.1.10 UserInfo as Dictionary

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The cached response,Äôs user info dictionary.
Notes: This value is nil if there is no user info dictionary.
(Read only property)

40.1.11 Constants

Storage Policies

Constant	Value	Description
kCacheStorageAllowed	0	Allow caching.
kCacheStorageAllowedInMemoryOnly	1	Allow caching only in memory.
kCacheStorageNotAllowed	1	Caching is not allowed.

40.2 class NSHTTPCookieMBS

40.2.1 class NSHTTPCookieMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSHTTPCookie object represents an HTTP cookie.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect domain names
Var domains(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
if domains.IndexOf(cookie.domain) <0 then
domains.Append cookie.domain
end if
next

// and display them
MsgBox "You have cookies from this domains: "+Join(domains, ", ")
```

Notes: It's an immutable object initialized from a dictionary containing the cookie attributes.

Two versions of cookies are supported:

Version 0: This version refers to "traditional" or "old-style" cookies, the original cookie format defined by Netscape. The majority of cookies encountered are in this format.
Version 1: This version refers to cookies as defined in RFC 2965, HTTP State Management Mechanism.

40.2.2 Methods

40.2.3 Constructor(properties as dictionary)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an initialized NSHTTPCookie object using the provided properties.
Example:

```
// create dictionary with properties:
Var prop as new Dictionary
Var d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
Var cookie as new NSHTTPCookieMBS(prop)

// and display properties
Var dic as Dictionary = cookie.properties
Var list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes: properties: The properties for the new cookie object, expressed as key value pairs.

Handle is non zero on success.

40.2.4 cookiesWithResponseHeaderFields(headerFields as dictionary, URL as string) as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of NSHTTPCookie objects corresponding to the provided response header

fields for the provided URL.
Notes: headerFields: The header fields used to create the NSHTTPCookie objects.
URL: The URL associated with the created cookies.

Returns the array of created cookies.

This method ignores irrelevant header fields in headerFields, allowing dictionaries to contain additional data.

If headerFields does not specify a domain for a given cookie, the cookie is created with a default domain value of theURL.

If headerFields does not specify a path for a given cookie, the cookie is created with a default path value of "/".

40.2.5 cookieWithProperties(dic as dictionary) as NSHTTPCookieMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and initializes an NSHTTPCookie object using the provided properties.
Example:

```
// create dictionary with properties:
Var prop as new Dictionary
Var d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
Var cookie as NSHTTPCookieMBS = NSHTTPCookieMBS.cookieWithProperties(prop)

// and display properties
Var dic as Dictionary = cookie.properties
Var list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next
```

MsgBox Join(list,EndOfLine)

Notes: dic: The properties for the new cookie object, expressed as key value pairs.

Returns the newly created cookie object. Returns nil if the provided properties are invalid.

See NSHTTPCookie* shared method for more information on the available header field constants and the constraints imposed on the values in the dictionary.

40.2.6 NSHTTPCookieComment as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing the comment for the cookie.
Only valid for Version 1 cookies and later. This header field is optional.

40.2.7 NSHTTPCookieCommentURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing the comment URL for the cookie.
Only valid for Version 1 cookies or later. This header field is optional.

40.2.8 NSHTTPCookieDiscard as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String stating whether the cookie should be discarded at the end of the session.
String value must be either "TRUE" or "FALSE". This header field is optional. Default is "FALSE", unless this is cookie is version 1 or greater and a value for NSHTTPCookieMaximumAge is not specified, in which case it is assumed "TRUE".

40.2.9 NSHTTPCookieDomain as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing the domain for the cookie.
A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL. If this header field is missing the domain is inferred from the value for NSHTTPCookieOriginURL.

40.2.10 NSHTTPCookieExpires as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An Date object or String specifying the expiration date for the cookie.
This header field is only used for Version 0 cookies. This header field is optional.

40.2.11 NSHTTPCookieMaximumAge as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing an integer value stating how long in seconds the cookie should be kept, at most.
Only valid for Version 1 cookies and later. Default is "0". This field is optional.

40.2.12 NSHTTPCookieName as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String object containing the name of the cookie. This field is required.

40.2.13 NSHTTPCookieOriginURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing the URL that set this cookie.
A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL.

40.2.14 NSHTTPCookiePath as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing the path for the cookie. This field is required if you are using the NSHTTP-CookieDomain key instead of the NSHTTPCookieOriginURL key.
If you are using the NSHTTPCookieOriginURL key, the path is inferred if it is not provided. The default value is "/".

40.2.15 NSHTTPCookiePort as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing comma-separated integer values specifying the ports for the cookie.
Only valid for Version 1 cookies or later. The default value is an empty string (""). This header field is optional.

40.2.16 NSHTTPCookieSecure as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String indicating that the cookie should be transmitted only over secure channels.
Providing any value for this key indicates that the cookie should remain secure.

40.2.17 NSHTTPCookieSetByJavaScript as string

MBS MacControls Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An string indicating that the cookie is set via JavaScript.

Requires macOS 15.2 or iOS 18.2.

40.2.18 NSHTTPCookieValue as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String containing the value of the cookie.
This header field is required.

40.2.19 NSHTTPCookieVersion as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String that specifies the version of the cookie.
Must be either "0" or "1". The default is "0". This header field is optional.

40.2.20 portList as Integer()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's port list.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display port list

Var PortList(-1) as Integer = cookie.portList
if UBound(PortList)=-1 then
MsgBox "Port List: all ports."
else
Var list(-1) as string
for each port as Integer in portList
List.Append str(port)
next

MsgBox "Port List: "+Join(list, ", ")
end if
```

Notes: The list of ports for the cookie, returned as an array of integers. If the cookie has no port list this method returns nil and the cookie will be sent to any port. Otherwise, the cookie is only sent to ports specified in the port list.

40.2.21 requestHeaderFieldsWithCookies(cookies() as NSHTTPCookieMBS) as dictionary

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of header fields corresponding to a provided array of cookies.
Example:

```
// create dictionary with properties:
Var prop as new Dictionary
Var d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
Var cookie as new NSHTTPCookieMBS(prop)
Var cookies(-1) as NSHTTPCookieMBS
cookies.Append cookie

// get request headers
Var dic as Dictionary = NSHTTPCookieMBS.requestHeaderFieldsWithCookies(cookies)

// and show them:
Var list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes: cookies: The cookies from which the header fields are created.

Returns the dictionary of header fields created from the provided cookies. This dictionary can be used to add cookies to a request.

40.2.22 Properties

40.2.23 comment as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's comment string.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display comment
MsgBox "Comment: "+Cookie.comment
```

Notes: The receiver's comment string or "" if the cookie has no comment. This string is suitable for presentation to the user, explaining the contents and purpose of this cookie.
(Read only property)

40.2.24 commentURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's comment URL.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display comment URL
MsgBox "commentURL: "+Cookie.commentURL
```

Notes: The receiver's comment URL or "" if the cookie has none. This value specifies a URL which is suitable for presentation to the user as a link for further information about this cookie.
(Read only property)

40.2.25 domain as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the domain of the receiver's cookie.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display domain:
MsgBox "Domain: "+Cookie.Domain
```

Notes: If the domain does not start with a dot, then the cookie is only sent to the exact host specified by the domain. If the domain does start with a dot, then the cookie is sent to other hosts in that domain as well, subject to certain restrictions. See RFC 2965 for more detail.
(Read only property)

40.2.26 expiresDate as date

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's expiration date.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display date:
MsgBox "Domain: "+Cookie.expiresDate.ShortTime+" "+Cookie.expiresDate.LongTime
```

Notes: The receiver's expiration date, or nil if there is no specific expiration date such as in the case of "session-only" cookies. The expiration date is the date when the cookie should be deleted.
(Read only property)

40.2.27 expiresDateTime as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's expiration date.
Notes: (Read only property)

40.2.28 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

40.2.29 isHTTPOnly as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the receiver should only be sent to HTTP servers per RFC 2965.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display isHTTPOnly value:
MsgBox "isHTTPOnly: "+str(Cookie.isHTTPOnly)
```

Notes: Returns true if this cookie should only be sent via HTTP headers, false otherwise.

Cookies may be marked as HTTP only by a server (or by a javascript). Cookies marked as such must only be sent via HTTP Headers in HTTP requests for URL's that match both the path and domain of the respective cookies.

Important: Cookies specified as HTTP only should not be delivered to any javascript applications to prevent cross-site scripting vulnerabilities.
(Read only property)

40.2.30 isSecure as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether his cookie should only be sent over secure channels.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display isSecure value:
MsgBox "isSecure: "+str(Cookie.isSecure)
```

Notes: True if this cookie should only be sent over secure channels, otherwise false.
(Read only property)

40.2.31 isSessionOnly as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the receiver should be discarded at the end of the session (regardless of expiration date).
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display isSessionOnly value:
MsgBox "isSessionOnly: "+str(Cookie.isSessionOnly)
```

Notes: True if the receiver should be discarded at the end of the session (regardless of expiration date), otherwise false.
(Read only property)

40.2.32 name as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's name.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
```

```
Var cookie as NSHTTPCookieMBS = cookies(0)

// display name:
MsgBox "name: "+Cookie.name
```

Notes: (Read only property)

40.2.33 path as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's path.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display path:
MsgBox "path: "+Cookie.path
```

Notes: The cookie will be sent with requests for this path in the cookie's domain, and all paths that have this prefix. A path of "/" means the cookie will be sent for all URLs in the domain.
(Read only property)

40.2.34 properties as dictionary

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's cookie properties.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display properties

Var dic as Dictionary = cookie.properties
Var list(-1) as string
```

```
for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes: Returns dictionary representation of the receiver's cookie properties.
This dictionary can be used with Constructor or cookieWithProperties to create an equivalent NSHTTPCookie object.
(Read only property)

40.2.35 value as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's value.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display value
MsgBox "Value: "+Cookie.value
```

Notes: (Read only property)

40.2.36 version as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's version.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
Var cookie as NSHTTPCookieMBS = cookies(0)

// display version value:
```

```
MsgBox "Version: "+str(Cookie.Version)
```

Notes: Returns the receiver's version. Version 0 maps to "old-style" Netscape cookies. Version 1 maps to RFC 2965 cookies.
(Read only property)

40.3 class NSHTTPCookieStorageMBS

40.3.1 class NSHTTPCookieStorageMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: NSHTTPCookieStorage implements a singleton object (shared instance) that manages the shared cookie storage.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
Var list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes: These cookies are shared among all applications and are kept in sync cross-process.

Note: Changes made to the cookie accept policy affect all currently running applications using the cookie storage.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS REALbasic Plugins, version 11.1pr3

40.3.2 Methods

40.3.3 Constructor

MBS MacControls Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

40.3.4 cookies as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the cookie storage's cookies.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
Var list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes: Returns an array containing all of the cookie storage's cookies.

40.3.5 cookiesForURL(URL as string) as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns all the cookie storage's cookies that are sent to a specified URL.
Example:

```
// query list of all cookies in shared storage
Var cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookiesForURL("http://www.apple.com/")

// we collect values for apple.com:
Var list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes: An application can use NSHTTPCookie method requestHeaderFieldsWithCookies to turn this array into a set of header fields to add to an NSMutableURLRequest object.

40.3.6 cookiesToArray(cookies() as NSHTTPCookieMBS) as Integer

MBS MacControls Plugin, Plugin Version: 16.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Puts the cookie storage's cookies in the given array.
Example:

```
// get storage
Var s as NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage

// predim an array with a lot of space
Var cookies(5000) as NSHTTPCookieMBS

// now ask plugin to put cookies inside
Var c as Integer = s.cookiesToArray(cookies)

// show count
MsgBox str(c)+" cookies"

// pick first and show name
Var cookie as NSHTTPCookieMBS = cookies(0)
MsgBox cookie.name
```

Notes: Returns total number of cookies.
This is for Xojo 2007 where the cookies function doesn't work.
For Xojo and Xojo you can use cookies function.

40.3.7 deleteCookie(cookie as NSHTTPCookieMBS)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the specified cookie from the cookie storage.

40.3.8 NSHTTPCookieManagerAcceptPolicyChangedNotification as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names you can register with the NSNotificationObserverMBS class.
Notes: This notification is posted when the acceptance policy of the NSHTTPCookieStorage instance has changed.
In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo

dictionary.

40.3.9 NSHTTPCookieManagerCookiesChangedNotification as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names you can register with the NSNotificationObserverMBS class.
Notes: This notification is posted when the cookies stored in the NSHTTPCookieStorage instance have changed.
In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo dictionary.

40.3.10 removeCookiesSinceDate(d as date)

MBS MacControls Plugin, Plugin Version: 17.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Delete all cookies from the cookie storage since the provided date.
Notes: Available on macOS 10.10 or newer.
See also:

- 40.3.11 removeCookiesSinceDate(d as dateTime) 7964

40.3.11 removeCookiesSinceDate(d as dateTime)

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Delete all cookies from the cookie storage since the provided date.
Notes: Available on macOS 10.10 or newer.
See also:

- 40.3.10 removeCookiesSinceDate(d as date) 7964

40.3.12 setCookie(cookie as NSHTTPCookieMBS)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stores a specified cookie in the cookie storage if the cookie accept policy permits.
Notes: The cookie replaces an existing cookie with the same name, domain, and path, if one exists in the cookie storage. This method accepts the cookie only if the receiver's cookie accept policy is NSHTTP-CookieAcceptPolicyAlways or NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain. The cookie

is ignored if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyNever.

40.3.13 setCookies(cookies() as NSHTTPCookieMBS, URL as string, mainDocumentURL as string)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds an array of cookies to the receiver if the receiver's cookie acceptance policy permits.
Notes: cookies: The cookies to add.
URL: The URL associated with the added cookies.
mainDocumentURL: The URL of the main HTML document for the top-level frame, if known. Can be "". This URL is used to determine if the cookie should be accepted if the cookie accept policy is NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain.

The cookies will replace existing cookies with the same name, domain, and path, if one exists in the cookie storage. The cookie will be ignored if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyNever.

To store cookies from a set of response headers, an application can use cookiesWithResponseHeaderFields passing a header field dictionary and then use this method to store the resulting cookies in accordance with the receiver's cookie acceptance policy.

40.3.14 sharedHTTPCookieStorage as NSHTTPCookieStorageMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the shared cookie storage instance.
Example:

```
Var s as NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage
Var cookies() as NSHTTPCookieMBS = s.cookies
MsgBox str(UBound(cookies)+1)+" cookies"
```

40.3.15 Properties

40.3.16 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSHTTPCookieStorage object.
Notes: (Read and Write property)

40.3.17 cookieAcceptPolicy as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The cookie storage's cookie accept policy.
Example:

```
Select case NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookieAcceptPolicy
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain
MsgBox "Cookies: only from main document domain"
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyNever
MsgBox "Cookies: never"
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyAlways
MsgBox "Cookies: always"
else
MsgBox "Cookies: unknown setting"
end Select
```

Notes: The default cookie accept policy is NSHTTPCookieAcceptPolicyAlways.

Changing the cookie policy affects all currently running applications using the cookie storage.
(Read and Write computed property)

40.3.18 Constants

One of the cookie accept policy constants.

Constant	Value	Description
NSHTTPCookieAcceptPolicyAlways	0	Accept all cookies. This is the default cookie ac
NSHTTPCookieAcceptPolicyNever	1	Reject all cookies.
NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain	2	Accept cookies only from the main document do

40.4 class NSNetServiceBrowserMBS

40.4.1 class NSNetServiceBrowserMBS

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A network service browser that finds published services on a network using multicast DNS.
Notes: Services can range from standard services, such as HTTP and FTP, to custom services defined by other applications. You can use a network service browser in your code to obtain the list of accessible domains and then to obtain an NSNetServiceMBS object for each discovered service. Each network service browser performs one search at a time, so if you want to perform multiple simultaneous searches, use multiple network service browsers.

A network service browser performs all searches asynchronously using the current run loop to execute the search in the background. Results from a search are returned through the associated delegate object, which your client application must provide. Searching proceeds in the background until the object receives a stop message.

To use an NSNetServiceBrowserMBS object to search for services, use the constructor. Once your object is ready, you begin by gathering the list of accessible domains using either the searchForRegistrationDomains or searchForBrowsableDomains methods. From the list of returned domains, you can pick one and use the searchForServicesOfType method to search for services in that domain.

The NSNetServiceBrowserMBS class provides two ways to search for domains. In most cases, your client should use the searchForRegistrationDomains method to search only for local domains to which the host machine has registration authority. This is the preferred method for accessing domains as it guarantees that the host machine can connect to services in the returned domains. Access to domains outside this list may be more limited.

40.4.2 Methods

40.4.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes an NSNetServiceBrowser object.

40.4.4 Destructor

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The destructor.

40.4.5 searchForBrowsableDomains

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initiates a search for domains visible to the host. This method returns immediately.
Notes: didFindDomain:moreComing event is raised for each domain discovered.

40.4.6 searchForRegistrationDomains

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initiates a search for domains in which the host may register services.
Notes: This method returns immediately, sending a WillSearch event if the network was ready to initiate the search. Subsequent didFindDomain event is raised for each domain discovered.

Most network service browser clients do not have to use this method—it is sufficient to publish a service with the empty string, which registers it in any available registration domains automatically.

40.4.7 searchForServicesOfType(serviceType as string, domainName as string = "")

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts a search for services of a particular type within a specific domain.
Notes: serviceType: Type of the service to search for.
domainName: Domain name in which to perform the search.

This method returns immediately, sending a WillSearch event if the network was ready to initiate the search.The delegate receives subsequent didFindService event for each service discovered.

The serviceType argument must contain both the service type and transport layer information. To ensure

that the mDNS responder searches for services, rather than hosts, make sure to prefix both the service name and transport layer name with an underscore character (,Äú_,Äù). For example, to search for an HTTP service on TCP, you would use the type string ,Äú_http._tcp.,Äú. Note that the period character at the end is required.

The domainName argument can be an explicit domain name, the generic local domain "local." (note trailing period, which indicates an absolute name), or the empty string (""), which indicates the default registration domains. Usually, you pass in an empty string. Note that it is acceptable to use an empty string for the domainName argument when publishing or browsing a service, but do not rely on this for resolution.

40.4.8 stop

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Halts a currently running search or resolution.
Notes: This method sends a DidStop event and causes the browser to discard any pending search results.

40.4.9 Properties

40.4.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

40.4.11 includesPeerToPeer as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Whether to browse over peer-to-peer Bluetooth and Wi-Fi, if available. NO, by default.
Notes: This property must be set before initiating a search to have an effect.
(Read and Write property)

40.4.12 Events

40.4.13 DidFindDomain(domainName as String, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you the sender found a domain.
Notes: domainName: Name of the domain found by netServiceBrowser.
moreComing: True when netServiceBrowser is waiting for additional domains. false when there are no additional domains.

You use this event to compile a list of available domains. It should wait until moreComing is false to do a bulk update of user interface elements.

40.4.14 DidFindService(service as NSNetServiceMBS, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you that it found a service.
Notes: Service: Network service found by netServiceBrowser.
moreComing: True when netServiceBrowser is waiting for additional services. False when there are no additional services.

You use this event to compile a list of available services. It should wait until moreComing is false to do a bulk update of user interface elements.

Special Considerations
If you choose to resolve netService, you need to create a new object with copy constructor in your subclass to catch events. And please store the new reference in an array or property.

40.4.15 DidNotSearch(error as Dictionary)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you that a search was not successful.
Notes: error: Dictionary with the reasons the search was unsuccessful. Use the dictionary keys NSNetServicesErrorCode and NSNetServicesErrorDomain to retrieve the error information from the dictionary.

40.4.16 DidRemoveDomain(domainName as String, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you that a domain has disappeared or has become unavailable.
Notes: domainName: Name of the domain that became unavailable.
moreComing: True when netServiceBrowser is waiting for additional domains. False when there are no additional domains.

You this event to compile a list of unavailable domains. It should wait until moreComing is false to do a bulk update of user interface elements.

40.4.17 DidRemoveService(service as NSNetServiceMBS, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you a service has disappeared or has become unavailable.
Notes: Service: Network service that has become unavailable.
moreComing: True when netServiceBrowser is waiting for additional services. False when there are no additional services.

You this event to compile a list of unavailable services. It should wait until moreComing is false to do a bulk update of user interface elements.

40.4.18 DidStopSearch

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you that a search was stopped.
Notes: Triggered by stop method.

40.4.19 WillSearch

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Tells you that a search is commencing.
Notes: This event is raised only if the underlying network layer is ready to begin a search.

40.5 class NSNetServiceMBS

40.5.1 class NSNetServiceMBS

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A network service that broadcasts its availability using multicast DNS.
Notes: The NSNetServiceMBS class represents a network service, either one your application publishes or is a client of. This class and the NSNetServiceBrowserMBS class use multicast DNS to convey information about network services to and from your application. The API of NSNetServiceMBS provides a convenient way to publish the services offered by your application and to resolve the socket address for a service.

The types of services you access using NSNetServiceMBS are the same types that you access directly using BSD sockets. HTTP and FTP are two services commonly provided by systems. (For a list of common services and the ports used by those services, see the file /etc/services.) Applications can also define their own custom services to provide specific data to clients.

You can use the NSNetServiceMBS class as either a publisher of a service or a client of a service. If your application publishes a service, your code must acquire a port and prepare a socket to communicate with clients. Once your socket is ready, you use the NSNetServiceMBS class to notify clients that your service is ready. If your application is the client of a network service, you can either create an NSNetServiceMBS object directly (if you know the exact host and port information) or use an NSNetServiceBrowserMBS object to browse for services.

To publish a service, initialize your NSNetServiceMBS object with the service name, domain, type, and port information. All of this information must be valid for the socket created by your application. Once initialized, call the publish method to broadcast your service information to the network.

When connecting to a service, use the NSNetServiceBrowserMBS class to locate the service on the network and obtain the corresponding NSNetServiceMBS object. Once you have the object, call the resolve method to verify that the service is available and ready for your application. If it is, the addresses property provides the socket information you can use to connect to the service.

The methods of NSNetServiceMBS operate asynchronously so your application is not impacted by the speed of the network. All information about a service is returned to your application through events. You must subclass and fill event handlers to respond to messages and to handle errors appropriately.

40.5.2 Methods

40.5.3 addresses as String()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An array of addresses.
Notes: We take the raw addresses and decode IPv4 and IPv6 addresses for you.

40.5.4 addressesIPv4 as String()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An array of IPv4 addresses.
Notes: We take the raw addresses and decode only IPv4 addresses for you.

40.5.5 addressesIPv6 as String()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An array of IPv6 addresses.
Notes: We take the raw addresses and decode only IPv6 addresses for you.

40.5.6 addressesRaw as MemoryBlock()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A read-only array containing Memoryblock objects, each of which contains a socket address for the service.
Notes: An array containing Memoryblock objects, each of which contains a socket address for the service. Each Memoryblock object in the returned array contains an appropriate sockaddr structure that you can use to connect to the socket. The exact type of this structure depends on the service to which you are connecting. If no addresses were resolved for the service, the returned array contains zero elements.
It is possible for a single service to resolve to more than one address or not resolve to any addresses. A service might resolve to multiple addresses if the computer publishing the service is currently multihoming.

40.5.7 Constructor(Domain as String, Type as String, Name as String)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the receiver, initialized as a network service of a given type and sets the initial host information.
Notes: domain: The domain for the service. To resolve in the default domains, pass in an empty string (""). To limit resolution to the local domain, use "local.".
If you are creating this object to resolve a service whose information your app stored previously, you should set this to the domain in which the service was originally discovered.
You can also use a NSNetServiceBrowserMBS object to obtain a list of possible domains in which you can discover and resolve services.
type: The network service type.
type must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, as opposed to hosts, prefix both the service name and transport layer name with an underscore character (,Äú_,Äù). For example, to search for an HTTP service on TCP, you would use the type string "_http._tcp.". Note that the period character at the end of the string, which indicates that the domain name is an absolute name, is required.
name: The name of the service to resolve.

Returns the receiver, initialized as a network service named name of type type in the domain domain.

This method is the appropriate initializer to use to resolve a service—to publish a service, use Constructor with port.
If you know the values for domain, type, and name of the service you wish to connect to, you can create an NSNetServiceMBS object using this initializer and call resolve on the result.

You cannot use this initializer to publish a service. This initializer passes an invalid port number to the designated initializer, which prevents the service from being registered. Calling publish on an NSNetService object initialized with this method generates a call to your didNotPublish event with an NSNetServicesBadArgumentError error.

- 40.5.9 Constructor(other as NSNetServiceMBS) 7976

40.5.8 Constructor(Domain as String, Type as String, Name as String, Port as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes the receiver for publishing a network service of type type at the socket location specified by domain, name, and port.
Notes: domain: The domain for the service. To use the default registration domains, pass in an empty string (""). To limit registration to the local domain, use "local.".
You can also use a NSNetServiceBrowser object to obtain a list of possible domains in which you can publish your service.
type: The network service type.
type must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, as opposed to hosts, prefix both the service name and transport layer name with an underscore character (,Äú_,Äù). For example, to search for an HTTP service on TCP, you would use the type string "_http._tcp.". Note that the period character at the end of the string, which indicates that the domain name is an absolute name, is required.
name: The name by which the service is identified to the network. The name must be unique. If you pass the empty string (""), the system automatically advertises your service using the computer name as the service name.
port: The port on which the service is published.
If you specify the NSNetServiceListenForConnections flag, you may pass zero (0), in which case the service automatically allocates an arbitrary (ephemeral) port for your service. When the DidPublish event is called, you can determine the actual port chosen by calling the service object,Äôs NSNetServiceMBS method or accessing the corresponding property.
If your app is listening for connections on its own, the value of port must be a port number acquired by your application for the service.

You use this method to create a service that you wish to publish on the network. Although you can also use this method to create a service you wish to resolve on the network, it is generally more appropriate to use the Constructor method instead.

When publishing a service, you must provide valid arguments in order to advertise your service correctly. If the host computer has access to multiple registration domains, you must create separate NSNetServiceMBS objects for each domain. If you attempt to publish in a domain for which you do not have registration authority, your request may be denied.

It is acceptable to use an empty string for the domain argument when publishing or browsing a service, but do not rely on this for resolution.

This method is the designated initializer.
See also:

- 40.5.7 Constructor(Domain as String, Type as String, Name as String) 7974
- 40.5.9 Constructor(other as NSNetServiceMBS) 7976

40.5.9 Constructor(other as NSNetServiceMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a new object to catch events.
Notes: You can subclass and fill in events. Then create a copy with this constructor to connect events.
See also:

- 40.5.7 Constructor(Domain as String, Type as String, Name as String) 7974
- 40.5.8 Constructor(Domain as String, Type as String, Name as String, Port as Integer) 7975

40.5.10 dataFromTXTRecordDictionary(data as Dictionary) as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an Memoryblock object representing a TXT record formed from a given dictionary.
Notes: Data: A dictionary containing a TXT record.

Returns a Memoryblock representing TXT data formed from txtDictionary. Fails an assertion if data cannot be represented as a MemoryBlock.

40.5.11 Destructor

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The destructor.

40.5.12 dictionaryFromTXTRecordData(data as Memoryblock) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a dictionary representing a TXT record given as a Memoryblock.
Notes: Data: A data object encoding a TXT record.

Returns a dictionary representing txtData. The dictionary,Äôs keys are strings. The values associated with all the dictionary,Äôs keys are Memoryblcoks that encapsulate strings or data.
Fails an assertion if txtData cannot be represented as an Dictionary object.

40.5.13 getStreams(byref inputStream as NSInputStreamMBS, byref outputStream as NSOutputStreamMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a pair of input and output streams for the receiver and returns a Boolean value that indicates whether they were retrieved successfully.
Notes: inputStream: Upon return, the input stream for the receiver.
outputStream: Upon return, the output stream for the receiver.

Returns yes if the streams are created successfully, otherwise false.

After this method is called, no events are called by the receiver.

40.5.14 isEqual(other as NSNetServiceMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Checks whether two services are same.
Notes: Returns true if equal or false if not.

40.5.15 NSNetServicesErrorCode as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: This key identifies the error that occurred during the most recent operation.

40.5.16 NSNetServicesErrorDomain as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: This key identifies the originator of the error, which is either the NSNetService object or the mach network layer.
Notes: For most errors, you should not need the value provided by this key.

40.5.17 publish

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Attempts to advertise the receiver,Äôs on the network.

Notes: This method returns immediately, with success or failure indicated by the events.
This is equivalent to calling publish with the default options (0).
See also:

- 40.5.18 publish(options as Integer) 7978

40.5.18 publish(options as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Attempts to advertise the receiver on the network, with the given options.
Notes: options: Options for the receiver. The supported options are described in constants.

This method returns immediately, with success or failure indicated by the events.
See also:

- 40.5.17 publish 7977

40.5.19 resolve

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts a resolve process for the service.
Notes: Attempts to determine at least one address for the service. This method returns immediately, with success or failure indicated by the callbacks to the delegate.
See also:

- 40.5.20 resolve(timeout as Double) 7978

40.5.20 resolve(timeout as Double)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts a resolve process of a finite duration for the service.
Notes: timeout: The maximum number of seconds to attempt a resolve. A value of 0.0 indicates no timeout and a resolve process of indefinite duration.

During the resolve period, the service sends DidResolveAddress event for each address it discovers that matches the service parameters. Once the timeout is hit, the service sends DidStop event. If no addresses resolve during the timeout period, the service sends didNotResolve event.
See also:

- 40.5.19 resolve 7978

40.5.21 setTXTRecordData(Data as MemoryBlock) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Sets the TXT record for the receiver, and returns a Boolean value that indicates whether the operation was successful.
Notes: Data: The TXT record for the receiver.

True if recordData is successfully set as the TXT record, otherwise false.

40.5.22 startMonitoring

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts the monitoring of TXT-record updates for the receiver.
Notes: Please implement didUpdateTXTRecordData event, which is called when the TXT record for the receiver is updated.

40.5.23 stop

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Halts a currently running attempt to publish or resolve a service.
Notes: We raise DidStop event after the service stops.
It is safe to remove all strong references to the service immediately after calling stop.

40.5.24 stopMonitoring

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Stops the monitoring of TXT-record updates for the receiver.

40.5.25 Properties

40.5.26 Address as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: First address decoded.
Notes: Can be IPv4 or IPv6.

(Read only property)

40.5.27 AddressIPv4 as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: First IPv4 address decoded.
Notes: (Read only property)

40.5.28 AddressIPv6 as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: First IPv6 address decoded.
Notes: (Read only property)

40.5.29 description as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The description string for debugging.
Notes: (Read only property)

40.5.30 domain as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A string containing the domain for this service.
Notes: This can be an explicit domain name or it can contain the generic local domain name, "local." (note the trailing period, which indicates an absolute name).

This property,Äôs value is set when the object is first initialized, whether by your code or by a browser object. See Constructor for more information.
(Read only property)

40.5.31 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

40.5.32 hostName as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A string containing the DNS hostname for this service.
Notes: This value is "" until the service has been resolved (when addresses is non-nil).
(Read only property)

40.5.33 includesPeerToPeer as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Specifies whether to also publish, resolve, or monitor this service over peer-to-peer Bluetooth and Wi-Fi, if available.
Notes: False by default.

This property must be set before calling publish, resolve, or startMonitoring in order to take effect.
(Read and Write property)

40.5.34 name as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A string containing the name of this service.
Notes: This value is set when the object is first initialized, whether by your code or by a browser object. See Constructor for more information.
(Read only property)

40.5.35 port as Integer

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The port on which the service is listening for connections.
Notes: If the object was initialized by calling Constructor (whether by your code or by a browser object), then the value was set when the object was first initialized.
If the object was initialized by calling Constructor without port, the value of this property is not valid (-1) until after the service has successfully been resolved (when addresses is non-nil).

(Read only property)

40.5.36 TXTRecordData as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the TXT record for the receiver.
Notes: (Read only property)

40.5.37 type as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The type of the published service.
Notes: This value is set when the object is first initialized, whether by your code or by a browser object. See Constructor for more information.
(Read only property)

40.5.38 Events

40.5.39 DidAcceptConnection(InputStream as NSInputStreamMBS, outputStream as NSOutputStreamMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Called when a client connects to a service managed by Bonjour.
Notes: inputStream: A stream object for receiving data from the client.
outputStream: A stream object for sending data to the client.

When you publish a service, if you set the NSNetServiceListenForConnections flag in the service options, the service object accepts connections on behalf of your app. Later, when a client connects to that service, the service object calls this method to provide the app with a pair of streams for communicating with that client.

40.5.40 DidNotPublish(Error as Dictionary)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Notifies the delegate that a service could not be published.
Notes: error: A dictionary containing information about the problem. The dictionary contains the keys

NSNetServicesErrorCode and NSNetServicesErrorDomain.

This method may be called long after a WillPublish event has been delivered.

40.5.41 DidNotResolve(Error as Dictionary)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Informs that an error occurred during resolution of a given service.
Notes: error: A dictionary containing information about the problem. The dictionary contains the keys NSNetServicesErrorCode and NSNetServicesErrorDomain.

Clients may try to resolve again upon receiving this error. For example, a DNS rotary may yield different IP addresses on different resolution requests. A common error condition is that no addresses were resolved during the timeout period specified in resolve.

40.5.42 DidPublish

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Notifies you that a service was successfully published.

40.5.43 DidResolveAddress

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Informs you that the address for a given service was resolved.
Notes: The delegate can use the addresses method to retrieve the service,Äôs address. If the delegate needs only one address, it can stop the resolution process using stop. Otherwise, the resolution will continue until the timeout specified in resolve is reached.

40.5.44 DidStop

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Informs you that a publish or resolveWithTimeout: request was stopped.

40.5.45 DidUpdateTXTRecordData(data as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Notifies the delegate that the TXT record for a given service has been updated.
Notes: data: The new TXT record.

40.5.46 WillPublish

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Notifies you that the network is ready to publish the service.
Notes: Publication of the service proceeds asynchronously and may still generate a call to the didNotPublish event if an error occurs.

40.5.47 WillResolve

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Notifies you that the network is ready to resolve the service.
Notes: Resolution of the service proceeds asynchronously and may still generate a call to the didNotResolve event if an error occurs.

40.5.48 Constants

NetService Options

Constant	Value	Description
NSNetServiceListenForConnections	2	Specifies that a TCP listener should be started for both IPv4 and IPv6 on t port specified by this service. If the listening port can't be opened, the serv calls its didNotPublish event to report the error. The listener supports only TCP connections. If the service,Äôs type does n end with _tcp, publication fails with NSNetServicesBadArgumentError. Whenever a client connects to the listening socket, the service calls its didA ceptConnection event with a pair of NSStream objects.
NSNetServiceNoAutoRename	1	Specifies that the network service should not rename itself in the event o name collision.

Errors

Constant	Value	Description
NSNetServicesActivityInProgress	-72003	The net service cannot process the request at this time. N mation about the network state is known.
NSNetServicesBadArgumentError	-72004	An invalid argument was used when creating the NSNetSer
NSNetServicesCancelledError	-72005	The client canceled the action.
NSNetServicesCollisionError	-72001	The service could not be published because the name is al name could be in use locally or on another system.
NSNetServicesInvalidError	-72006	The net service was improperly configured.
NSNetServicesMissingRequiredConfigurationError	-72008	Missing required configuration error.
NSNetServicesNotFoundError	-72002	The service could not be found on the network.
NSNetServicesTimeoutError	-72007	The net service has timed out.
NSNetServicesUnknownError	-72000	An unknown error occurred.

40.6 class NSURLAuthenticationChallengeMBS

40.6.1 class NSURLAuthenticationChallengeMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: A class for an authentication challenge.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

40.6.2 Methods

40.6.3 cancelAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Tells the system to cancel this challenge.

40.6.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

40.6.5 continueWithoutCredentialForAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Tells the system to continue this challenge without a password.

40.6.6 error as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the NSError object representing the last authentication failure.
Notes: This method returns nil if the protocol doesn't use errors to indicate an authentication failure.

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

40.6.7 failureResponse as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the response representing authentication failure.
Notes: If there was a previous authentication failure, and this protocol uses responses to indicate authentication failure, then this method will return the response. Otherwise it will return nil.

40.6.8 previousFailureCount as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get count of previous failed authentication attempts.

40.6.9 proposedCredential as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the proposed credential for this challenge.
Notes: proposedCredential may be nil, if there is no default credential to use for this challenge (either stored or in the URL). If the credential is not nil and returns true for hasPassword, this means the NSURLConnection thinks the credential is ready to use as-is. If it returns false for hasPassword, then the credential is not ready to use as-is, but provides a default username the client could use when prompting.

40.6.10 protectionSpace as NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get a description of the protection space that requires authentication.
Notes: Returns the protection space that needs authentication.

40.6.11 useCredential(credential as NSURLCredentialMBS)

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Tells the system to use a certain credential for this challenge.

40.6.12 Properties

40.6.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this challenge.
Notes: (Read and Write property)

40.7 class NSURLCacheMBS

40.7.1 class NSURLCacheMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The class for the caching.
Notes: NSURLCache implements the caching of responses to URL load requests by mapping NSURLRequest objects to NSCachedURLResponse objects. It is a composite of an in-memory and an on-disk cache. Methods are provided to manipulate the sizes of each of these caches as well as to control the path on disk to use for persistent storage of cache data.

- 17.2, page 10: News

40.7.2 Methods

40.7.3 cachedResponseForRequest(request as NSURLRequestMBS) as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Returns the cached URL response in the cache for the specified URL request.
Notes: request: The URL request whose cached response is desired.

Returns the cached URL response for request, or nil if no response has been cached.

40.7.4 Constructor(memoryCapacity as UInt64, diskCapacity as UInt64, diskPath as folderitem)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Initializes an NSURLCache object with the specified values.
Notes: memoryCapacity: The memory capacity of the cache, in bytes.
diskCapacity: The disk capacity of the cache, in bytes.
path: The location at which to store the on-disk cache.

The returned NSURLCache is backed by disk, so developers can be more liberal with space when choosing the capacity for this kind of cache. A disk cache measured in the tens of megabytes should be acceptable in most cases.

40.7.5 removeAllCachedResponses

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Clears the receiver's cache, removing all stored cached URL responses.

40.7.6 removeCachedResponseForRequest(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Removes the cached URL response for a specified URL request.
Notes: request: The URL request whose cached URL response should be removed. If there is no corresponding cached URL response, no action is taken.

40.7.7 removeCachedResponsesSinceDate(d as date)

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clears the given cache of any cached responses since the provided date.
Notes: d: The earliest date of responses that should remain in the cache. Any responses with dates later than this parameter should be removed.

Available in macOS 10.10 or newer.
See also:

- 40.7.8 removeCachedResponsesSinceDate(d as dateTime) 7990

40.7.8 removeCachedResponsesSinceDate(d as dateTime)

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Clears the given cache of any cached responses since the provided date.
Notes: d: The earliest date of responses that should remain in the cache. Any responses with dates later than this parameter should be removed.

Available in macOS 10.10 or newer.
See also:

- 40.7.7 removeCachedResponsesSinceDate(d as date) 7990

40.7.9 setSharedURLCache(cache as NSURLCacheMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Sets the shared NSURLCache instance to a specified cache object.
Notes: Applications that have special caching requirements or constraints should use this method to specify an NSURLCache instance with customized cache settings.

40.7.10 sharedURLCache as NSURLCacheMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the shared NSURLCache instance.
Notes: The disk path is set to: <user_home_directory>/Library/Caches/<current_process_name>. The user's home directory is determined by calling NSHomeDirectory and the current process name is determined using NSProcessInfoMBS.processName.

Applications that do not have special caching requirements or constraints should find the default shared cache instance acceptable. Applications with more specific needs can create a custom NSURLCache object and set it as the shared cache instance using setSharedURLCache.

40.7.11 storeCachedResponse(cachedResponse as NSCachedURLResponseMBS, request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Stores a cached URL response for a specified request.
Notes: cachedResponse: The cached URL response to store.
request: The request for which the cached URL response is being stored.

If you override this method, you should also override storeCachedResponse.

40.7.12 Properties

40.7.13 currentDiskUsage as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the current size of the receiver's on-disk cache, in bytes.
Notes: (Read only property)

40.7.14 currentMemoryUsage as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the current size of the receiver's in-memory cache, in bytes.
Notes: (Read only property)

40.7.15 diskCapacity as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The on-disk cache capacity.
Notes: (Read and Write property)

40.7.16 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal handle to the NSURLCache object.
Notes: (Read and Write property)

40.7.17 memoryCapacity as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The in-memory cache capacity.
Notes: (Read and Write property)

40.7.18 Constants

Constants

Constant	Value	Description
NSURLCacheStorageAllowed	0	One of the constants for the cache strategy. Specifies that storage in an NSURLCache is allowed without restr
NSURLCacheStorageAllowedInMemoryOnly	1	One of the constants for the cache strategy. Specifies that storage in an NSURLCache is allowed; however sto be done in memory only, no disk storage should be done.
NSURLCacheStorageNotAllowed	2	One of the constants for the cache strategy. Specifies that storage in an NSURLCache is not allowed in any fas in memory or on disk.

40.8 class NSURLConnectionFilterMBS

40.8.1 class NSURLConnectionFilterMBS

MBS MacBase Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to filter URL connections.
Notes: This class is designed to allow you to intercept your application creating NSURLConnection objects and change the NSURLRequest used. This can be useful to change timeouts on Xojo.Net.HTTPSocket class.

40.8.2 Properties

40.8.3 Enabled as Boolean

MBS MacBase Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the event is enabled.
Notes: Default is true.
(Read and Write property)

40.8.4 Events

40.8.5 FilterConnection(request as NSURLRequestMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when a new connection is made.
Example:

```
Function FilterConnection(request as NSURLRequestMBS) Handles FilterConnection as NSURLRequestMBS
system.debuglog CurrentMethodName
system.debuglog "URL: "+request.URL

Var newRequest as NSMutableURLRequestMBS = request.mutableCopy
```

```
// change to 10 minutes
newRequest.setTimeoutInterval 600

return newRequest
End Function
```

Notes: You get the current request and you can return a new request.
If you return nil, we pass through the existing one.
Only requests on main thread trigger the event.

40.9 class NSURLConnectionMBS

40.9.1 class NSURLConnectionMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use NSURLSessionMBS instead. **Function:** An NSURLConnection object provides support to perform the loading of a URL request. **Notes:** The interface for NSURLConnection is sparse, providing only the controls to start and cancel asynchronous loads of a URL request.

NSURLConnection's events allow an object to receive informational callbacks about the asynchronous load of a URL request. Other events provide facilities that allow the subclass to customize the process of performing an asynchronous URL load. These events are called on the thread that started the asynchronous load operation for the associated NSURLConnection object.

NSURLConnection also has a convenience class method, sendSynchronousRequest, to load a URL request synchronously.

The following contract governs the events defined in this class:

- Zero or more willSendRequest events are called before any further event is called if it is determined that the download must redirect to a new location. The delegate can allow the redirect, modify the destination, or deny the redirect.
- Zero or more willSendRequestForAuthenticationChallenge events are called before a request for an authentication challenge is sent. The delegate can call the appropriate NSURLAuthenticationChallengeMBS method and perform any other required task related to credentials.
- Zero or more didReceiveAuthenticationChallenge vents are called if it is necessary to authenticate in order to download the request and the connection does not already have authenticated credentials.
- Zero or more didCancelAuthenticationChallenge vents are called if the connection cancels the authentication challenge due to the protocol implementation encountering an error.
- Zero or more didReceiveResponse events are called before receiving a didReceiveData message. The only case where didReceiveResponse is not sent to a delegate is when the protocol implementation encounters an error before a response can be created.
- Zero or more didReceiveData events are called before any of the following messages are sent to the delegate: willCacheResponse, DidFinishLoading, didFailWithError.
- Zero or one willCacheResponse events are called to the delegate after didReceiveData is sent but before a DidFinishLoading message is sent.

Unless an NSURLConnection object receives a cancel message, the subclasses receives one and only one of DidFinishLoading, or didFailWithError message, but never both. In addition, once either of these messages

is sent, the delegate receives no further messages for the connection.

40.9.2 Methods

40.9.3 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Cancels an asynchronous load of a request.
Notes: After this method is called, the connection's delegate no longer receives any messages for the connection. If you want to reattempt the connection, you should create a new connection object.

40.9.4 canHandleRequest(request as NSURLRequestMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns whether a request can be handled based on a preflight evaluation.
Notes: request: The request to evaluate.

Returns true if a preflight operation determines that a connection with request can be created and the associated I/O can be started, false otherwise.

The result of this method is valid as long as no NSURLProtocol classes are registered or unregistered, and request remains unchanged. Applications should be prepared to handle failures even if they have performed request preflighting by calling this method.

40.9.5 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates URL connection and begins to load the data for the URL request.
Notes: request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.

On success handle property is not zero.

This is equivalent to calling Constructor and passing true for optional startImmediately.
See also:

- 40.9.6 Constructor(request as NSURLRequestMBS, startImmediately as boolean) 7998

40.9.6 Constructor(request as NSURLRequestMBS, startImmediately as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates URL connection and begins to load the data for the URL request, if specified.
Notes: request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.
startImmediately: True if the connection should being loading data immediately, otherwise false.

On success the handle property is not zero.

Available in Mac OS X v10.5 and later.
See also:

- 40.9.5 Constructor(request as NSURLRequestMBS) 7997

40.9.7 data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The data downloaded so far.
Notes: The plugin adds the new data it gets in the didReceiveData event to a big memoryblock and gives you access to it using this event.

40.9.8 sendSynchronousRequest(request as NSURLRequestMBS, byref response as NSURLResponseMBS, byref error as NSErrorMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Performs a synchronous load of the specified URL request.
Example:

```
Var request as new NSURLRequestMBS("http://www.monkeybreadsoftware.de/images/MBSLogo.jpg")
Var error as NSErrorMBS
Var response as NSURLResponseMBS
```

```
Var d as MemoryBlock = NSURLConnectionMBS.sendSynchronousRequest(request, response, error)

if d<>Nil then
Var pic as Picture = JPEGStringToPictureMBS(d, true)
window1.Backdrop = pic
end if

if error<>Nil then
MsgBox "Error: "+error.description
end if
```

Notes: request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.
response: Out parameter for the URL response returned by the server.
error: Out parameter used if an error occurs while processing the request.

Returns the downloaded data for the URL request. Returns nil if a connection could not be created or if the download fails.

A synchronous load is built on top of the asynchronous loading code made available by the class. The calling thread is blocked while the asynchronous loading system performs the URL load on a thread spawned specifically for this load request. No special threading or run loop configuration is necessary in the calling thread in order to perform a synchronous load.

Important: Because this call can potentially take several minutes to fail (particularly when using a cellular network in iOS), you should never call this function from the main thread of a GUI application.

If authentication is required in order to download the request, the required credentials must be specified as part of the URL. If authentication fails, or credentials are missing, the connection will attempt to continue without credentials.

40.9.9 start

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Causes the connection to begin loading data, if it has not already.
Notes: Calling this method is necessary only if you create a connection with the Constructor method and provide false for the startImmediately parameter.

Available in Mac OS X v10.5 and later.

40.9.10 Properties

40.9.11 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.9.12 Events

40.9.13 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURLProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent to determine whether the delegate is able to respond to a protection space's form of authentication.
Notes: protectionSpace: The protection space that generates an authentication challenge.

Return true if you are able to respond to a protection space's form of authentication, otherwise false.

This method is called before didReceiveAuthenticationChallenge, allowing the class to inspect a protection space before attempting to authenticate against it. By returning true, the event indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. If the event returns false, the system attempts to use the user's keychain to authenticate. If your delegate does not implement this method and the protection space uses client certificate authentication or server trust authentication, the system behaves as if you returned false. The system behaves as if you returned true for all other authentication methods.

Available in Mac OS X v10.6 and later.

40.9.14 didCancelAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent when a connection cancels an authentication challenge.
Notes: challenge: The challenge that was canceled.

40.9.15 didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent when a connection fails to load its request successfully.
Notes: error: An error object containing details of why the connection failed to load the request successfully.

Once the delegate receives this message, it will receive no further messages for connection.

40.9.16 didFinishLoading

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent when a connection has finished loading successfully.

40.9.17 didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent when a connection must authenticate a challenge in order to download its request.
Notes: challenge: The challenge that connection must authenticate in order to download its request.

This method gives the class the opportunity to determine the course of action taken for the challenge provide credentials, continue without providing credentials, or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential:forAuthenticationChallenge: message to [challenge sender] , passing the credential and challenge as parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending [challenge sender] a continueWithoutCredentialForAuthenticationChallenge: or a cancelAuthenticationChallenge: message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of the following messages: useCredential:forAuthenticationChallenge:, continueWithoutCredentialForAuthen-

ticationChallenge: or cancelAuthenticationChallenge:.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the [challenge sender] is sent a useCredential:forAuthenticationChallenge: with the credential. If the challenge has no credential or the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge: is sent to [challenge sender] instead.

40.9.18 didReceiveData(newData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent as a connection loads data incrementally.
Notes: newdata: The newly available data.

The data property is updated before this event is called and gives you a way to see all data received so far.

40.9.19 didReceiveResponse(response as NSURLResponseMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent when the connection has received sufficient data to construct the URL response for its request.
Notes: response: The URL response for the connection's request. This object is immutable and will not be modified by the URL loading system once it is presented to the delegate.

In rare cases, for example in the case of an HTTP load where the content type of the load data is multipart/x-mixed-replace, the delegate will receive more than one didReceiveResponse message. In the event this occurs, delegates should discard all data previously delivered by didReceiveData, and should be prepared to handle the, potentially different, MIME type reported by the newly reported URL response.

The only case where this message is not sent to the delegate is when the protocol implementation encounters an error before a response could be created.

40.9.20 didSendBodyData(bytesWritten as Int64, totalBytesWritten as Int64, totalBytesExpectedToWrite as Int64)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent as the body (message data) of a request is transmitted (such as in an http POST request).

Notes: bytesWritten: The number of bytes written in the latest write.
totalBytesWritten: The total number of bytes written for this connection.
totalBytesExpectedToWrite: The number of bytes the connection expects to write.

This method provides an estimate of the progress of a URL upload.
The value of totalBytesExpectedToWrite may change during the upload if the request needs to be retransmitted due to a lost connection or an authentication challenge from the server.
Available in Mac OS X v10.6 and later.

40.9.21 shouldUseCredentialStorage as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent to determine whether the URL loader should consult the credential storage for authenticating the connection.
Notes: This method is called before any attempt to authenticate is made. By returning false, the delegate tells the connection not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returning true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge event.

Available in Mac OS X v10.6 and later.

40.9.22 willCacheResponse(cachedResponse as NSCachedURLResponseMBS) as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The connection will cache this response.
Notes: If you implement this event, please return request to cache or nil to not cache.

40.9.23 willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sent when the connection determines that it must change URLs in order to continue loading a request.
Notes: request: The proposed redirected request. You should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.
redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not

being sent as a result of involving the delegate in redirect processing.

The actual URL request to use in light of the redirection response. The event may return request unmodified to allow the redirect, return a new request, or return nil to reject the redirect and continue processing the connection.

If you wish to cancel the redirect connection, it should call the connection object's cancel method. Alternatively, the delegate method can return nil to cancel the redirect connection, and the original connection will continue to process. This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the connection will be sent to the delegate, and the delegate will receive a connectionDidFinishLoading or didFailLoadingWithError message, as appropriate.

Note: Prior to Mac OS X version 10.5, returning nil in this method sometimes would cancel the connection but other times would cause the connection to use the given request unmodified. In addition, prior to version 10.5, NSURLConnection would often modify the incoming NSURLRequest object before transmission without notifying the delegate. In version 10.5 and later, it always notifies the delegate via willSendRequest, and thus the delegate might receive this message before the connection has even properly begun, prior to transmitting the request to the remote server.
The delegate can receive this message as a result of modifying a request before it is sent, for example to transform the request's URL to its canonical form. To detect this case, examine redirectResponse; if it is nil, the message was not sent due to a redirect.

The delegate should be prepared to receive this message multiple times.

40.9.24 willSendRequestForAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that the connection will send a request for an authentication challenge.
Notes: challenge: The authentication challenge for which a request is being sent.

This method allows the delegate to make an informed decision about connection authentication at once. If the delegate implements this method, it has no need to implement canAuthenticateAgainstProtectionSpace, didReceiveAuthenticationChallenge, shouldUseCredentialStorage. In fact, these other methods are not invoked.

In this method,you must invoke one of the challenge-responder methods (NSURLAuthenticationChallengeSenderMBS):

useCredential
continueWithoutCredentialForAuthenticationChallenge

cancelAuthenticationChallenge
performDefaultHandlingForAuthenticationChallenge
rejectProtectionSpaceAndContinueWithChallenge

You might also want to analyze challenge for the authentication scheme and the proposed credential before calling a NSURLAuthenticationChallengeSenderMBS method. You should never assume that a proposed credential is present. You can either create your own credential and respond with that, or you can send the proposed credential back. (Because this object is immutable, if you want to change it you must copy it and then modify the copy.)

40.10 class NSURLCredentialMBS

40.10.1 class NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: A class for a stored password.
Notes: Var u as NSURLCredentialMBS
Var p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.4pr6

40.10.2 Methods

40.10.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

40.10.4 copy as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Creates a copy of the credential object.

40.10.5 credential(User as string, password as string, persistence as Integer = 0) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Create a new NSURLCredential with a user and password.
Example:

Var u as NSURLCredentialMBS
Var p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)

Notes: user: the username
password: the password
persistence: Integer that says to store per session, permanently or not at all.
Can be NSURLCredentialPersistenceForSession, NSURLCredentialPersistenceNone or NSURLCredentialPersistencePermanent.

40.10.6 credentialWithPEM(Data as MemoryBlock, Password as String = "") as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an identity credentials with certificate and private key in PEM file.
Notes: Password is optional.
This is a convenience function using SecItemImport to read data and then builds the result with credentialWithIdentity function.
Returns nil for any error.

40.10.7 credentialWithPKCS12(Data as MemoryBlock, Password as String = "") as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates an identity credentials with certificate and private key in PKCS#12 file.
Notes: Password is optional.
This is a convenience function using SecPKCS12Import to read data and then builds the result with credentialWithIdentity function.
Returns nil for any error.

40.10.8 credentialWithTrustingServer(ProtectionSpace as NSURLProtectionSpaceMBS) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a credential trusting the server in the protection space.
Notes: This is a convenience function using the ServerTrust in the protection space to wrap it in a new to read data and then builds the result with credential object with credentialForTrust function.

Returns nil for any error.

40.10.9 Properties

40.10.10 CertificateCount as Integer

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Queries number of certificates in this credential object.
Notes: (Read only property)

40.10.11 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this class.
Notes: (Read and Write property)

40.10.12 HasIdentity as Boolean

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this credential object contains an identity reference.
Notes: (Read only property)

40.10.13 hasPassword as Boolean

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Find out if this credential has a password, without trying to get it.
Notes: Returns true if this credential has a password, otherwise false.

If this credential's password is actually kept in an external store, the password method may return "" even if this method returns true, since getting the password may fail, or the user may refuse access.
(Read only property)

40.10.14 password as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the password.
Notes: This method might actually attempt to retrieve the password from an external store, possible resulting in prompting, so do not call it unless needed.
(Read only property)

40.10.15 persistence as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Determine whether this credential is or should be stored persistently.
Notes: Use the constants:
NSURLCredentialPersistenceNone
NSURLCredentialPersistenceForSession
NSURLCredentialPersistencePermanent
(Read only property)

40.10.16 user as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the username.
Notes: (Read only property)

40.10.17 Constants

Constants

Constant	Value	Description
NSURLCredentialPersistenceForSession	1	This credential will only be stored for this session.
NSURLCredentialPersistenceNone	0	This credential won't be saved.
NSURLCredentialPersistencePermanent	2	This credential will be stored permanently and shared with other appli

40.11 class NSURLCredentialStorageMBS

40.11.1 class NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: NSURLCredentialStorage implements a singleton object (shared instance) which manages the shared credentials cache.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

40.11.2 Methods

40.11.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

40.11.4 defaultCredentialForProtectionSpace(space as NSURLProtectionSpaceMBS) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the default credential for the specified protection space.

40.11.5 sharedCredentialStorage as NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the shared singleton authentication storage.

40.11.6 Properties

40.11.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this class.
Notes: (Read and Write property)

40.12 class NSURLDownloadMBS

40.12.1 class NSURLDownloadMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSURL Download class which handles downloads for Webkit.
Notes: NSURLDownload downloads a request asynchronously and saves the data to a file. The interface for NSURLDownload is sparse, providing methods to initialize a download, set the destination path and cancel loading the request.

NSURLDownload's delegate methods—defined by the NSURLDownloadDelegate—allow an object to receive informational callbacks about the asynchronous load of the URL request. Other delegate methods provide facilities that allow the delegate to customize the process of performing an asynchronous URL load.

Note that these delegate methods are called on the thread that started the asynchronous load operation for the associated NSURLDownload object.

The MBS Plugins currently only implement a part of this class for use with WebDownloadDelegateMBS. So please contact us if you need more.

40.12.2 Methods

40.12.3 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels the receiver's download and deletes the downloaded file.

40.12.4 canResumeDownloadDecodedWithEncodingMIMEType(MimeType as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether a URL download object can resume a download that was decoded with the specified MIME type.
Notes: MIMEType: The MIME type the caller wants to know about.
Returns true if the URL download object can resume a download that was decoded with the specified MIME type, false otherwise.
NSURLDownload cannot resume a download that was partially decoded in the gzip format.

40.12.5 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an initialized URL download for a URL request and begins to download the data for the request.
Notes: request: The URL request to download. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.

On success the handle property is not zero.
See also:

- 40.12.6 Constructor(resumeData as Memoryblock, path as folderitem) 8013
- 40.12.7 Constructor(resumeData as Memoryblock, path as string) 8013

40.12.6 Constructor(resumeData as Memoryblock, path as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.
Notes: resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.

On success the handle property is not zero.
See also:

- 40.12.5 Constructor(request as NSURLRequestMBS) 8013
- 40.12.7 Constructor(resumeData as Memoryblock, path as string) 8013

40.12.7 Constructor(resumeData as Memoryblock, path as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.
Notes: resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.

On success the handle property is not zero.
See also:

- 40.12.5 Constructor(request as NSURLRequestMBS) 8013
- 40.12.6 Constructor(resumeData as Memoryblock, path as folderitem) 8013

40.12.8 request as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the request that initiated the receiver's download.

40.12.9 resumeData as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the resume data for a download that is not yet complete.
Notes: The resume data for a download that is not yet complete. This data represents the necessary state information that an NSURLDownload object needs to resume a download. The resume data can later be used when initializing a download with Constructor. Returns nil if the download is not able to be resumed.

Resume data will only be returned if the protocol of the download as well as the server support resuming. In order to later resume a download you must call setDeletesFileUponFailure passing false so the partially downloaded data is not deleted when the initial connection is lost or canceled.

40.12.10 setDestination(path as folderitem, allowOverwrite as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the destination path of the downloaded file.
Notes: path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.
See also:

- 40.12.11 setDestination(path as string, allowOverwrite as boolean) 8015

40.12.11 setDestination(path as string, allowOverwrite as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the destination path of the downloaded file.
Notes: path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.
See also:

- 40.12.10 setDestination(path as folderitem, allowOverwrite as boolean) 8014

40.12.12 Properties

40.12.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

40.12.14 deletesFileUponFailure as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver deletes partially downloaded files when a download stops prematurely.
Notes: True if partially downloaded files should be deleted when a download stops prematurely, false otherwise. The default is true.
(Read and Write computed property)

40.12.15 Events

40.12.16 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURLProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent to determine whether the delegate is able to respond to a protection space's form of authentication. (required)
Notes: protectionSpace: The protection space that generates an authentication challenge.

This method is called before didReceiveAuthenticationChallenge, allowing the delegate to inspect a protection space before attempting to authenticate against it. By returning true, the delegate indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. Not implementing this method is the same as returning false, in which case default authentication handling is used.

Available in Mac OS X v10.6 and later.

40.12.17 decideDestinationWithSuggestedFilename(filename as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The delegate receives this message when download has determined a suggested filename for the downloaded file. (required)
Notes: filename: The suggested filename for the download.

The suggested filename is either derived from the last path component of the URL and the MIME type or, if the download was encoded, from the encoding. If the delegate wishes to modify the path, it should send setDestination to download.

The delegate will not receive this message if setDestination has already been called for the download.

Available in Mac OS X v10.2 and later.

40.12.18 DidBegin

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent immediately after a download object begins a download. (required)
Notes: Available in Mac OS X v10.2 and later.

40.12.19 didCancelAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent if an authentication challenge is canceled due to the protocol implementation encountering an error. (required)
Notes: challenge: The authentication challenge that caused the download object to cancel the download.

If the delegate receives this message the download will fail and the delegate will receive a didFailWithError message.

Available in Mac OS X v10.2 and later.

40.12.20 didCreateDestination(path as string, file as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent when the destination file is created. (required)
Notes: path: The path to the destination file.
file: The path to the destination file as folderitem.

Available in Mac OS X v10.2 and later.

40.12.21 didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent if the download fails or if an I/O error occurs when the file is written to disk. (required)
Notes: error: The error that caused the failure of the download.

Any partially downloaded file will be deleted.

Once the delegate receives this message, it will receive no further messages for download.
Available in Mac OS X v10.2 and later.

40.12.22 DidFinish

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent when a download object has completed downloading successfully and has written its results to disk. (required)
Notes: The delegate will receive no further messages for download.
Available in Mac OS X v10.2 and later.

40.12.23 didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent when the URL download must authenticate a challenge in order to download the request. (required)
Notes: challenge: The URL authentication challenge that must be authenticated in order to download the request.

This method gives the delegate the opportunity to determine the course of action taken for the challenge: provide credentials, continue without providing credentials or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential message to challenge, passing the credential and challenge as parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending challenge a continueWithoutCredentialForAuthenticationChallenge or a cancelAuthenticationChallenge message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of the following messages: useCredential, continueWithoutCredentialForAuthenticationChallenge or cancelAuthenticationChallenge.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the challenge is sent a useCredential:forAuthenticationChallenge with the credential. If the challenge has no credential or

the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge is sent to challenge sender instead.

Available in Mac OS X v10.2 and later.

40.12.24 didReceiveDataOfLength(length as UInt64)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent as a download object receives data incrementally. (required)
Notes: length: The amount of data received in this increment of the download, measured in bytes.

Available in Mac OS X v10.2 and later.

40.12.25 didReceiveResponse(response as NSURLResponseMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent when a download object has received sufficient load data to construct the NSURLResponse object for the download. (required)
Notes: response: The URL response object received as part of the download. response is immutable and will not be modified after this method is called.

In some rare cases, multiple responses may be received for a single download. In this case, the client should assume that each new response resets the download progress to 0 and should check the new response for the expected content length.
Available in Mac OS X v10.2 and later.

40.12.26 shouldDecodeSourceDataOfMIMEType(encodingType as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent when a download object determines that the downloaded file is encoded to inquire whether the file should be automatically decoded. (required)
Notes: encodingType: The type of encoding used by the downloaded file. The supported encoding formats are MacBinary ("application/macbinary"), Binhex ("application/mac-binhex40") and gzip ("application/gzip").

Return true to decode the file, false otherwise.

The delegate may receive this message more than once if the file has been encoded multiple times. This method is not called if the downloaded file is not encoded.
Available in Mac OS X v10.2 and later.

40.12.27 shouldUseCredentialStorage as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent to determine whether the URL loader should consult the credential storage to authenticate the download. (required)
Notes: This method is called before any attempt to authenticate is made. By returning false, the delegate tells the download not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returing true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge message.

Available in Mac OS X v10.6 and later.

40.12.28 willResumeWithResponse(response as NSURLResponseMBS, startingByte as Int64)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent when a download object has received a response from the server after attempting to resume a download. (required)
Notes: response: The URL response received from the server in response to an attempt to resume a download.

The location of the start of the resumed data, in bytes.
Available in Mac OS X v10.4 and later.

40.12.29 willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sent when the download object determines that it must change URLs in order to continue loading a request. (required)
Notes: request: The proposed redirected request. The delegate should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary. redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

Return the actual URL request to use in light of the redirection response. The delegate may copy and modify request as necessary to change its attributes, return request unmodified, or return nil.

If the delegate wishes to cancel the redirect, it should call the download object's cancel method. Alternatively, the delegate method can return nil to cancel the redirect, and the download will continue to process. This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the download will be sent to the delegate, and the delegate will receive a downloadDidFinish: or download:didFailWithError: message, as appropriate.

The delegate can receive this message as a result of transforming a request's URL to its canonical form, or for protocol-specific reasons, such as an HTTP redirect. The delegate implementation should be prepared to receive this message multiple times.

Available in Mac OS X v10.2 and later.

40.13 class NSURLMBS

40.13.1 class NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The class for URL.
Notes: An NSURL object represents a URL that can potentially contain the location of a resource on a remote server, the path of a local file on disk, or even an arbitrary piece of encoded data.

Please also review Apples documentation on this class:
https://developer.apple.com/library/mac/documentation/Cocoa/Reference/Foundation/Classes/NSURL_Class/index.html

MBS Plugin only includes a part of the original class. EMail us if you miss something.

40.13.2 Methods

40.13.3 checkResourceIsReachableAndReturnError as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns whether the URL's resource exists and is reachable.
Notes: This method synchronously checks if the resource's backing store is reachable. Checking reachability is appropriate when making decisions that do not require other immediate operations on the resource, e.g. periodic maintenance of UI state that depends on the existence of a specific document. When performing operations such as opening a file or copying resource properties, it is more efficient to simply try the operation and handle failures. If this method returns false, the optional error is populated. This method is currently applicable only to URLs for file system resources. For other URL types, NO is returned. Symbol is present

in iOS 4, but performs no operation.

40.13.4 Constructor(item as folderitem)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates an URL based on folderItem.
See also:

- 40.13.5 Constructor(scheme as string, host as string, path as string) 8023
- 40.13.6 Constructor(url as string) 8023
- 40.13.7 Constructor(url as string, baseURL as NSURLMBS) 8024

40.13.5 Constructor(scheme as string, host as string, path as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Initializes a newly created NSURL with a specified scheme, host, and path.
Notes: scheme: The scheme for the NSURL object. For example, in the URL http://www.example.com/index.html, the scheme is http.
host: The host for the NSURL object (for example, www.example.com). May be the empty string.
path: The path for the NSURL object (for example, /index.html). If the path begins with a tilde, you must first expand it by calling stringByExpandingTildeInPath.
See also:

- 40.13.4 Constructor(item as folderitem) 8023
- 40.13.6 Constructor(url as string) 8023
- 40.13.7 Constructor(url as string, baseURL as NSURLMBS) 8024

40.13.6 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a provided URL string.
See also:

- 40.13.4 Constructor(item as folderitem) 8023
- 40.13.5 Constructor(scheme as string, host as string, path as string) 8023
- 40.13.7 Constructor(url as string, baseURL as NSURLMBS) 8024

40.13.7 Constructor(url as string, baseURL as NSURLMBS)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a base URL and a relative string.
Notes: This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folder,Äôs URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.
See also:

- 40.13.4 Constructor(item as folderitem) 8023
- 40.13.5 Constructor(scheme as string, host as string, path as string) 8023
- 40.13.6 Constructor(url as string) 8023

40.13.8 copy as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates a copy of the URL object.

40.13.9 fileURLWithFileSystemRepresentation(path as string, isDirectory as boolean, relativeToURL as NSURLMBS) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Initializes a newly created URL referencing the local file or directory at the file system representation of the path.
Notes: File system representation is a string with canonical UTF-8 encoding.

40.13.10 fileURLWithPath(path as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Builds a file URL with given file path.
Notes: Better to use fileURLWithPath with directory parameter if you know if the path is a directory vs non-directory, as it saves an i/o.
See also:

- 40.13.11 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS 8025

40.13.11 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Builds a file URL based on a given file path.
See also:

- 40.13.10 fileURLWithPath(path as string) as NSURLMBS 8024

40.13.12 fileURLWithPathComponents(components() as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Builds an URL based on given components.

40.13.13 getResourceValue(byref value as Variant, key as string, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns the value of the resource property for the specified key.
Notes: value: The location where the value for the resource property identified by key should be stored.
key: The name of one of the URL,Äôs resource properties.
error: The error that occurred if the resource value could not be retrieved.

Returns true if value is successfully populated; otherwise, false.

This method first checks if the URL object already caches the resource value. If so, it returns the cached resource value to the caller. If not, then this method synchronously obtains the resource value from the backing store, adds the resource value to the URL object's cache, and returns the resource value to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for the key you want to access.

If this method returns true and the value is populated with nil, it means that the resource property is not available for the specified resource, and that no errors occurred when determining that the resource property was unavailable.

If this method returns false, an error occurred. The object pointer referenced by error is populated with additional information.

This method applies only to URLs that represent file system resources.

Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).
e.g. NSNumber can be converted to Integer or Boolean depending on content.

40.13.14 isEqual(other as NSURLMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Tests if two NSURLs are equal.
Notes: Returns a Boolean value that indicates whether the receiver and a given object have identical URL strings and base URLs.

40.13.15 Items(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries list of items in the directory the URL points to on disk.
Notes: Error is optional.
See also:

- 40.13.16 Items(VisibleItemsOnly as boolean = false) as NSURLMBS() 8026

40.13.16 Items(VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries list of items in the directory the URL points to on disk.
See also:

- 40.13.15 Items(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS() 8026

40.13.17 mountedVolumeURLs(SkipHidden as boolean = true) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries array of all NSURLs for mounted volumes.
Notes: if SkipHidden is true, hidden volumes are skipped.

Returns nil in case of error.

40.13.18 NSThumbnail1024x1024SizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible keys for the NSURLThumbnailDictionaryKey dictionary.
Notes: A 1024 x 1024 pixel thumbnail as an NSImage on OS X.
Available in OS X v10.10 and later.

40.13.19 NSURLAddedToDirectoryDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The time at which the resource,Äôs was created or renamed into or within its parent directory, returned as an date. Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.

40.13.20 NSURLAttributeModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The time at which the resource,Äôs attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported (read-write).

Available in OS X v10.6 and later.

40.13.21 NSURLContentAccessDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The time at which the resource was most recently accessed, returned as a date object if the volume supports access dates, or nil if access dates are unsupported (read-only).

Available in OS X v10.6 and later.

40.13.22 NSURLContentModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported (read-write).

Available in OS X v10.6 and later.

40.13.23 NSURLCreationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported (read-write).

Available in OS X v10.6 and later.

40.13.24 NSURLCustomIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The icon stored with the resource, returned as an NSImage object, or nil if the resource has no custom icon.
Available in OS X v10.6 and later.

40.13.25 NSURLDocumentIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The document identifier returned as a number (read-only).

The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It

is not transferred when the file is copied, but it survives "safe save" operations. For example, it remains on the path to which it was assigned, even after calling the replaceItemAtURL:withItemAtURL:backupItemName:options:resultingItemURL:error: method. Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.

40.13.26 NSURLEffectiveIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs normal icon, returned as an NSImage object (read-only).

Available in OS X v10.6 and later.

40.13.27 NSURLFileAllocatedSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes: Key for the total size allocated on disk for the file, returned as an NSNumber object (read-only).

Available in OS X v10.6 and later.

40.13.28 NSURLFileResourceIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs unique identifier, returned as an id (read-only).

This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.

If used with getResourceValue will give a MemoryBlock.

40.13.29 NSURLFileResourceTypeBlockSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource is a block special file.
Available in OS X v10.7 and later.

40.13.30 NSURLFileResourceTypeCharacterSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource is a character special file.
Available in OS X v10.7 and later.

40.13.31 NSURLFileResourceTypeDirectory as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource is a directory.
Available in OS X v10.7 and later.

40.13.32 NSURLFileResourceTypeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs object type, returned as an NSString object. See File Resource Types for possible values.
Available in OS X v10.7 and later.

40.13.33 NSURLFileResourceTypeNamedPipe as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource is a named pipe.
Available in OS X v10.7 and later.

40.13.34 NSURLFileResourceTypeRegular as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource is a regular file.
Available in OS X v10.7 and later.

40.13.35 NSURLFileResourceTypeSocket as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource is a socket.
Available in OS X v10.7 and later.

40.13.36 NSURLFileResourceTypeSymbolicLink as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource is a symbolic link.
Available in OS X v10.7 and later.

40.13.37 NSURLFileResourceTypeUnknown as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes: The resource,Äôs type is unknown.
Available in OS X v10.7 and later.

40.13.38 NSURLFileScheme as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: These schemes are the ones that NSURL can parse.
Notes: Identifies a URL that points to a file on a mounted volume.

40.13.39 NSURLFileSecurityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs security information, returned as an NSFileSecurity object (read-write).
Available in OS X v10.7 and later.

40.13.40 NSURLFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes: Key for the file,Äôs size in bytes, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

40.13.41 NSURLGenerationIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: An opaque generation identifier, returned as an id (read-only)

The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file's data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.

40.13.42 NSURLHasHiddenExtensionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource,Äôs extension is normally removed from its localized name, returned as a Boolean (read-write).

40.13.43 NSURLIsAliasFileKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes: Key for determining whether the file is an alias, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

40.13.44 NSURLIsDirectoryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource is a directory, returned as a Boolean- (read-only).
Available in OS X v10.6 and later.

40.13.45 NSURLIsExcludedFromBackupKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource is excluded from all backups of app data, returned as a Boolean NSNumber object (read-write).

You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.

40.13.46 NSURLIsExecutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean (read-only).

Available in OS X v10.7 and later.

40.13.47 NSURLIsHiddenKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource is normally not displayed to users, returned as a Boolean NSNumber object (read-write).

If the resource is hidden because its name begins with a period, setting this value has no effect.
Available in OS X v10.6 and later.

40.13.48 NSURLIsMountTriggerKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the URL is a file system trigger directory, returned as a Boolean NSNumber object (read-only). Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.

Available in OS X v10.7 and later.

40.13.49 NSURLIsPackageKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Example:

```
Var f As New FolderItem("/Applications/Xcode.app", FolderItem.PathTypeNative)
Var n As New NSURLMBS(f)
Var v As Variant
var e as NSErrorMBS

if n.getResourceValue(v, n.NSURLIsPackageKey, e) then
```

```
var IsPackage as Boolean = v
If IsPackage Then
MessageBox "is a package, bundle or application."
Else
MessageBox "not a bundle"
end if

Else
MessageBox "failed to get value: "+e.LocalizedDescription
End If
```

Notes: Key for determining whether the resource is a file package, returned as a Boolean NSNumber object (read-write in OS X v10.8 and later, read-only in previous versions). A true value means that the resource is a file package.

If you attempt to set or clear this key,Äôs value on a file instead of a directory, the system ignores your attempt. If the directory is defined as a package by way of its filename extension or other reason apart from this key, setting this key,Äôs value to false has no effect.

Available in OS X v10.6 and later.

40.13.50 NSURLIsReadableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the current process (as determined by the EUID) can read the resource, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

40.13.51 NSURLIsRegularFileKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource is a regular file, as opposed to a directory or a symbolic link. Returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

40.13.52 NSURLIsSymbolicLinkKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource is a symbolic link, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

40.13.53 NSURLIsSystemImmutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource's system immutable bit is set, returned as a Boolean NSNumber object (read-write).

Available in OS X v10.6 and later.

40.13.54 NSURLIsUbiquitousItemKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the keys for files.
Example:

```
Var f as FolderItem // your folderitem
Var n As New NSURLMBS(f)

Var value as Variant
Var error as NSErrorMBS
Var result As Boolean = n.getResourceValue(value, n.NSURLIsUbiquitousItemKey, error)
break // check in debugger
```

Notes: A boolean that contains true if this item is in iCloud storage, false if it is a local item (read-only).

Available in OS X v10.7 and later.

40.13.55 NSURLIsUserImmutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource's user immutable bit is set, returned as a Boolean NSNumber object (read-write).
Available in OS X v10.6 and later.

40.13.56 NSURLIsVolumeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource is the root directory of a volume, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

40.13.57 NSURLIsWritableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the current process (as determined by the EUID) can write to the resource, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

40.13.58 NSURLKeysOfUnsetValuesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Key for the resource properties that have not been set after setResourceValues returns an error, returned as an array of of strings.

40.13.59 NSURLLabelColorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs label color, returned as an NSColor object, or nil if the resource has no label color (read-only).
Available in OS X v10.6 and later.

40.13.60 NSURLLabelNumberKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs label number, returned as an NSNumber object (read-write).

Available in OS X v10.6 and later.

40.13.61 NSURLLinkCountKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The number of hard links to the resource, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

40.13.62 NSURLLocalizedLabelKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs localized label text, returned as an NSString object, or nil if the resource has no localized label text (read-only).

Available in OS X v10.6 and later.

40.13.63 NSURLLocalizedNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs localized or extension-hidden name, returned as an NSString object (read-only).

Available in OS X v10.6 and later.

40.13.64 NSURLLocalizedTypeDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs localized type description, returned as an NSString object (read-only).
Available in OS X v10.6 and later.

40.13.65 NSURLNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs name in the file system, returned as an NSString object (read-write).
Available in OS X v10.6 and later.

40.13.66 NSURLParentDirectoryURLKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The parent directory of the resource, returned as an NSURL object, or nil if the resource is the root directory of its volume (read-only).
Available in OS X v10.6 and later.

40.13.67 NSURLPathKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The file system path for the URL, returned as an NSString object (read-only).

Available in OS X v10.8 and later.

40.13.68 NSURLPreferredIOBlockSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The optimal block size to use when reading or writing this file's data, returned as an NSNumber object, or nil if the preferred size is not available (read-only).
Available in OS X v10.7 and later.

40.13.69 NSURLQuarantinePropertiesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A key for quarantine properties.
Example:

```
Var f As FolderItem = SpecialFolder.UserHome.Child("Downloads").Child("Installation.pdf")
Var n As New NSURLMBS(f)
'Dim d As Dictionary = n.QuarantineProperties

Var d As Dictionary
Var v As Variant
Var e as NSErrorMBS

If n.getResourceValue(v, n.NSURLQuarantinePropertiesKey, e) Then

d = v
Break // inspect in debugger

Else
Break // failed
End If
```

Notes: The quarantine properties as defined in LSQuarantine.h. To remove quarantine information from a file, pass NSNull as the value when setting this property. (Read-write, value type dictionary)
Available on Mac OS X 10.10 and later.

40.13.70 NSURLTagNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The names of tags attached to the resource, returned as an array of String values (read-write).

Available in OS X v10.9 and later.

40.13.71 NSURLThumbnailDictionaryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: A dictionary of NSImage objects keyed by size (read-write).
See Thumbnail Property Keys for a list of possible keys.
Available in OS X v10.10.

40.13.72 NSURLThumbnailKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: All thumbnails as a single NSImage (read-write).
Available in OS X v10.10.

40.13.73 NSURLTotalFileAllocatedSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes: Key for the total allocated size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

40.13.74 NSURLTotalFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes: Key for the total displayable size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

40.13.75 NSURLTypeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The resource,Äôs uniform type identifier (UTI), returned as a string (read-only).
Available in OS X v10.6 and later.

40.13.76 NSURLUbiquitousItemContainerDisplayNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: A string containing the name of the item,Äôs container, as it is displayed to the user.

Available in OS X v10.10 and later.

40.13.77 NSURLUbiquitousItemDownloadingErrorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: An error object that indicates why downloading the item from iCloud failed.

Available in OS X v10.9 and later.

40.13.78 NSURLUbiquitousItemDownloadingStatusCurrent as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Values that describe the iCloud storage state of a file.
Notes: A local copy of this item exists and is the most up-to-date version known to the device.

Available in OS X v10.9 and later.

40.13.79 NSURLUbiquitousItemDownloadingStatusDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Values that describe the iCloud storage state of a file.
Notes: A local copy of this item exists, but it is stale. The most recent version will be downloaded as soon as possible.

Available in OS X v10.9 and later.

40.13.80 NSURLUbiquitousItemDownloadingStatusKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: The current download state for the item, indicating whether a local copy exists and whether that copy is the most current version of the item. The possible values for this key are described in Ubiquitous Item Downloading Status Constants.

Available in OS X v10.9 and later.

40.13.81 NSURLUbiquitousItemDownloadingStatusNotDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Values that describe the iCloud storage state of a file.
Notes: This item has not been downloaded yet. Use startDownloadingUbiquitousItemAtURL to download it.

Available in OS X v10.9 and later.

40.13.82 NSURLUbiquitousItemDownloadRequestedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: A Boolean indicating whether a call to startDownloadingUbiquitousItemAtURL has already been made to download the item. The value of this key is read-only.

Available in OS X v10.10 and later.

40.13.83 NSURLUbiquitousItemHasUnresolvedConflictsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: A boolean NSNumber that contains true if this item has conflicts outstanding, false otherwise (read-only).

Available in OS X v10.7 and later.

40.13.84 NSURLUbiquitousItemIsDownloadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: A boolean NSNumber that contains true if this item,Äôs data has been downloaded to a ubiquity container, false otherwise (read-only).

Available in OS X v10.7 and later.
Deprecated in OS X v10.9.

40.13.85 NSURLUbiquitousItemIsDownloadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: A boolean NSNumber that contains true if this item is being downloaded from iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.

40.13.86 NSURLUbiquitousItemIsExcludedFromSyncKey as string

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: All.

Function: One of the resource keys.
Notes: Value is a boolean.
The item is excluded from sync, which means it is locally on disk but won't be available on the server. An excluded item is no longer ubiquitous.

40.13.87 NSURLUbiquitousItemIsSharedKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the ubiquitous item is shared. (Read-only, value type boolean)

40.13.88 NSURLUbiquitousItemIsUploadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: A boolean NSNumber that contains true if this item,Äôs data has been uploaded to iCloud storage, false otherwise (read-only).

When waiting for an upload to complete, do not poll this key from within a block passed to coordinateReadingItemAtURL, because the coordinated read required to obtain this value cannot be performed until that block completes and returns. Instead, use NSMetadataQuery or an NSFilePresenter delegate to asynchronously notify your app when the status changes.

Available in OS X v10.7 and later.

40.13.89 NSURLUbiquitousItemIsUploadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: A boolean NSNumber that contains true if this item is being uploaded to iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.

40.13.90 NSURLUbiquitousItemPercentDownloadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: An NSNumber in the range 0–100 that indicates the percentage of the data that has been downloaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentDownloadedKey attribute instead.

Available in OS X v10.7 and later.
Deprecated in OS X v10.8.

40.13.91 NSURLUbiquitousItemPercentUploadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: An NSNumber in the range 0–100 that indicates the percentage of the data that has been uploaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentUploadedKey attribute instead.

Available in OS X v10.7 and later.
Deprecated in OS X v10.8.

40.13.92 NSURLUbiquitousItemUploadingErrorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes: An error object that indicates why uploading the item to iCloud failed.
Available in OS X v10.9 and later.

40.13.93 NSURLUbiquitousSharedItemCurrentUserPermissionsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: returns the permissions for the current user, or nil if not shared. (Read-only, value type string). Possible values below.

40.13.94 NSURLUbiquitousSharedItemCurrentUserRoleKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Returns the current user's role for this shared item, or nil if not shared. (Read-only, value type string). See NSURLUbiquitousSharedItemRoleOwner and NSURLUbiquitousSharedItemRoleParticipant.

40.13.95 NSURLUbiquitousSharedItemMostRecentEditorNameComponentsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: returns a NSPersonNameComponents for the most recent editor of the document, or nil if it is the current user. (Read-only, value type NSPersonNameComponents)

40.13.96 NSURLUbiquitousSharedItemOwnerNameComponentsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: returns a NSPersonNameComponents, or nil if the current user. (Read-only, value type NSPersonNameComponents)

40.13.97 NSURLUbiquitousSharedItemPermissionsReadOnly as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is only allowed to read this item

40.13.98 NSURLUbiquitousSharedItemPermissionsReadWrite as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is allowed to both read and write this item

40.13.99 NSURLUbiquitousSharedItemRoleOwner as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is the owner of this shared item.

40.13.100 NSURLUbiquitousSharedItemRoleParticipant as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is a participant of this shared item.

40.13.101 NSURLVolumeAvailableCapacityForImportantUsageKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Total available capacity in bytes for "Opportunistic" resources, including space expected to be cleared by purging non-essential and cached resources. "Opportunistic" means something that the user is likely to want but does not expect to be present on the local system, but is ultimately non-essential and replaceable. This would include items that will be created or downloaded without an explicit request from the user on the current device.

Examples: A background download of a newly available episode of a TV series that a user has been recently watching, a piece of content explicitly requested on another device, or a new document saved to a network server by the current user from another device.

Value is zero if unknown. Please switch to NSURLVolumeAvailableCapacityKey key in that case.

Read-only, value type number

40.13.102 NSURLVolumeAvailableCapacityForOpportunisticUsageKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Total available capacity in bytes for "Important" resources, including space expected to be cleared by purging non-essential and cached resources. "Important" means something that the user or application clearly expects to be present on the local system, but is ultimately replaceable. This would include items that the user has explicitly requested via the UI, and resources that an application requires in order to provide functionality.

Examples: A video that the user has explicitly requested to watch but has not yet finished watching or an audio file that the user has requested to download.

This value should not be used in determining if there is room for an irreplaceable resource. In the case of irreplaceable resources, always attempt to save the resource regardless of available capacity and handle

failure as gracefully as possible.

Value is zero if unknown. Please switch to NSURLVolumeAvailableCapacityKey key in that case.

Read-only, value type number

40.13.103 NSURLVolumeAvailableCapacityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the volume,Äôs available capacity in bytes, returned as an Int64 (read-only).
Available in OS X v10.6 and later.

40.13.104 NSURLVolumeCreationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the volume,Äôs creation date, returned as a date, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

40.13.105 NSURLVolumeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The unique identifier of the resource,Äôs volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.

If used with getResourceValue will give a MemoryBlock.

40.13.106 NSURLVolumeIsAutomountedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume is automounted, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

40.13.107 NSURLVolumeIsBrowsableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume is visible in GUI-based file-browsing environments, such as the Desktop or the Finder application, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

40.13.108 NSURLVolumeIsEjectableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume is ejectable from the drive mechanism under software control, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

40.13.109 NSURLVolumeIsEncryptedKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume is encrypted. (Read-only, value type boolean)

40.13.110 NSURLVolumeIsInternalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume is connected to an internal bus, returned as a Boolean, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

40.13.111 NSURLVolumeIsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume is currently journaling, returned as a Boolean.
Available in OS X v10.6 and later.

40.13.112 NSURLVolumeIsLocalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
Var f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)

Var n as NSURLMBS = NSURLMBS.URLWithItem(f)
Var value as Variant
Var error as NSErrorMBS

Var Local as Boolean

// network volumes are not local
if n.getResourceValue(value, n.NSURLVolumeIsLocalKey, error) then
MsgBox "Local: "+value.StringValue
Local = value.BooleanValue
else
MsgBox error.LocalizedDescription
end if

// network volumes have an URL
if n.getResourceValue(value, n.NSURLVolumeURLForRemountingKey, error) then
MsgBox "URLForRemounting: "+value.StringValue
else
MsgBox error.LocalizedDescription
end if
```

Notes: Key for determining whether the volume is stored on a local device, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

40.13.113 NSURLVolumeIsReadOnlyKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume is read-only, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

40.13.114 NSURLVolumeIsRemovableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
Var f as FolderItem = GetFolderItem("/Volumes/Test", FolderItem.PathTypeNative)

Var n as NSURLMBS = NSURLMBS.URLWithItem(f)
Var value as Variant
Var error as NSErrorMBS

if n.getResourceValue(value, n.NSURLVolumeIsRemovableKey, error) then
MsgBox "Removable: "+value.StringValue
else
MsgBox error.LocalizedDescription
end if
```

Notes: Key for determining whether the volume is removable from the drive mechanism, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

40.13.115 NSURLVolumeIsRootFileSystemKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume is the root filesystem. (Read-only, value type boolean)

40.13.116 NSURLVolumeLocalizedFormatDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the volume,Äôs descriptive format name, returned as a string (read-only).
Available in OS X v10.6 and later.

40.13.117 NSURLVolumeLocalizedNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: The name of the volume as it should be displayed in the user interface, returned as a string (read-only).
Available in OS X v10.7 and later.

40.13.118 NSURLVolumeMaximumFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the largest file size supported by the volume in bytes, returned as a Boolean, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

40.13.119 NSURLVolumeNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: The name of the volume, returned as an NSString object (read-write). Settable only if NSURLVolumeSupportsRenamingKey is true.

Available in OS X v10.7 and later.

40.13.120 NSURLVolumeResourceCountKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the total number of resources on the volume, returned as an integer (read-only).

Available in OS X v10.6 and later.

40.13.121 NSURLVolumeSupportsAccessPermissionsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports setting POSIX access permissions with the NSURLFileSecurityKey property (Read-only, value type boolean)

40.13.122 NSURLVolumeSupportsAdvisoryFileLockingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume implements whole-file advisory locks in the style of flock, along with the O_EXLOCK and O_SHLOCK flags of the open function, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

40.13.123 NSURLVolumeSupportsCasePreservedNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
Var f as FolderItem = Volume(0)
Var n as new NSURLMBS(f)

Var v as Variant
Var e as NSErrorMBS
if n.getResourceValue(v, n.NSURLVolumeSupportsCasePreservedNamesKey, e) then
MsgBox "VolumeSupportsCasePreservedNames: "+str(v.BooleanValue)
else
MsgBox "Failed to query: "+e.LocalizedDescription
end if
```

Notes: Key for determining whether the volume supports case-preserved names, returned as a Boolean (read-only).

Available in OS X v10.6 and later.

40.13.124 NSURLVolumeSupportsCaseSensitiveNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
Var f as FolderItem = Volume(0)
Var n as new NSURLMBS(f)

Var v as Variant
Var e as NSErrorMBS
if n.getResourceValue(v, n.NSURLVolumeSupportsCaseSensitiveNamesKey, e) then
MsgBox "VolumeSupportsCaseSensitiveNames: "+str(v.BooleanValue)
else
MsgBox "Failed to query: "+e.LocalizedDescription
end if
```

Notes: Key for determining whether the volume supports case-sensitive names, returned as a Boolean (read-only).
Available in OS X v10.6 and later.

40.13.125 NSURLVolumeSupportsCompressionKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports transparent decompression of compressed files using decmpfs. (Read-only, value type boolean)

40.13.126 NSURLVolumeSupportsExclusiveRenamingKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports renamex_np(2)'s RENAME_EXCL option (Read-only, value type boolean)

40.13.127 NSURLVolumeSupportsExtendedSecurityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports extended security (access control lists), returned as a Boolean (read-only) (read-only).

Available in OS X v10.7 and later.

40.13.128 NSURLVolumeSupportsFileCloningKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports clonefile(2) (Read-only, value type boolean)

40.13.129 NSURLVolumeSupportsFileProtectionKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: True if the volume supports the File Protection attribute (see NSURLFileProtectionKey). (Read-only, value type number)

40.13.130 NSURLVolumeSupportsHardLinksKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports hard links, returned as a Boolean.
Available in OS X v10.6 and later.

40.13.131 NSURLVolumeSupportsImmutableFilesKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports making files immutable with the NSURLIsUserImmutableKey or NSURLIsSystemImmutableKey properties (Read-only, value type boolean)

40.13.132 NSURLVolumeSupportsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports journaling, returned as a Boolean.
Available in OS X v10.6 and later.

40.13.133 NSURLVolumeSupportsPersistentIDsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports persistent IDs, returned as a Boolean (read-only).
Available in OS X v10.6 and later.

40.13.134 NSURLVolumeSupportsRenamingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume can be renamed, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

40.13.135 NSURLVolumeSupportsRootDirectoryDatesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports reliable storage of times for the root directory, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

40.13.136 NSURLVolumeSupportsSparseFilesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports sparse files, returned as a Boolean.

Available in OS X v10.6 and later.

40.13.137 NSURLVolumeSupportsSwapRenamingKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports renamex_np(2)'s RENAME_SWAP option (Read-only, value type boolean)

40.13.138 NSURLVolumeSupportsSymbolicLinksKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports symbolic links, returned as a Boolean.
Available in OS X v10.6 and later.

40.13.139 NSURLVolumeSupportsVolumeSizesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports returning volume size information, returned as a Boolean (read-only). If true, volume size information is available as values of the NSURLVolumeTotalCapacityKey and NSURLVolumeAvailableCapacityKey keys.

Available in OS X v10.7 and later.

40.13.140 NSURLVolumeSupportsZeroRunsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for determining whether the volume supports zero runs, returned as a Boolean. (read-only).
Available in OS X v10.6 and later.

40.13.141 NSURLVolumeTotalCapacityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the volume,Äôs capacity in bytes, returned as an Int64 (read-only).

Available in OS X v10.6 and later.

40.13.142 NSURLVolumeURLForRemountingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the URL needed to remount the network volume, returned as an NSURL object, or nil if a URL is not available (read-only).

Available in OS X v10.7 and later.

40.13.143 NSURLVolumeURLKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: The root directory of the resource,Äôs volume, returned as an NSURL object (read-only).
Available in OS X v10.6 and later.

40.13.144 NSURLVolumeUUIDStringKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes: Key for the volume,Äôs persistent UUID, returned as an NSString object, or nil if a persistent UUID is not available (read-only).

Available in OS X v10.7 and later.

40.13.145 pathComponents as string()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: An array containing the path components. (read-only)
Notes: This property contains an array containing the individual path components of the URL. For example, in the URL file:///directory/directory2/file, the path components array would be "/", "directory", "directory2", "file".

40.13.146 removeAllCachedResourceValues

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Removes all cached resource values and temporary resource values from the URL object.
Notes: This method is applicable only to URLs that represent file system resources.
Available in OS X v10.9 and later.

40.13.147 removeCachedResourceValueForKey(key as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Removes the cached resource value identified by a given key from the URL object.
Notes: key: The resource value key whose cached values you want to remove.

Removing a cached resource value may remove other cached resource values because some resource values are cached as a set of values, and because some resource values depend on other resource values. (Temporary resource values have no dependencies.)

This method is currently applicable only to URLs for file system resources.

Available in OS X v10.9 and later.

40.13.148 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns the resource values for the properties identified by specified array of keys.
Notes: Returns a dictionary of resource values indexed by key.

This method first checks if the URL object already caches the specified resource values. If so, it returns the

cached resource values to the caller. If not, then this method synchronously obtains the resource values from the backing store, adds the resource values to the URL object's cache, and returns the resource values to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for the key you want to access.

If the result dictionary does not contain a resource value for one or more of the requested resource keys, it means those resource properties are not available for the URL, and no errors occurred when determining those resource properties were not available.

If an error occurs, this method returns nil and populates the object pointer referenced by error with additional information.

This method applies only to URLs that represent file system resources.
Available in OS X v10.6 and later.
See also:

- 40.13.149 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false) 8062

40.13.149 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Query keys asynchronously.
Notes: The plugin will query values on a different preemptive thread and call your delegate on main thread with results as soon as possible. This way you can keep app responsive while system e.g. loads icons.
For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it's really quick.

The delegate has this parameters:
ResourceValuesForKeysDelegateMBS(URL as NSURLMBS, keys() as String, Values as Dictionary, Error as NSErrorMBS, tag as Variant)
See also:

- 40.13.148 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary 8061

40.13.150 setResourceValue(value as Variant, key as string, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Sets the URL,Äôs resource property for a given key to a given value.
Notes: value: The value for the resource property defined by key.
key: The name of one of the URL,Äôs resource properties.
error: The error that occurred if the resource value could not be set.

Returns true if the resource property named key is successfully set to value; otherwise, false.

This method synchronously writes the new resource value out to disk. Attempts to set a read-only resource property or to set a resource property that is not supported by the resource are ignored and are not considered errors.

If an error occurs, this method returns NO and populates the object pointer referenced by error with additional information.

This method applies only to URLs for file system resources.
Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

40.13.151 setResourceValues(keyedValues as Dictionary, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Sets the URL,Äôs resource properties for a given set of keys to a given set of values.
Notes: keyedValues: A dictionary of resource values to be set.
error: The error that occurred if one or more resource values could not be set.

Returns true if all resource values in keyedValues are successfully set; otherwise, false.

This method synchronously writes the new resource value out to disk. If an error occurs after some resource properties have been successfully changed, the userInfo dictionary in the returned error object contains a kCFURLKeysOfUnsetValuesKey key whose value is an array of the resource values that were not successfully set.

Attempts to set a read-only resource property or to set a resource property that is not supported by the

resource are ignored and are not considered errors.

The order in which the resource values are set is not defined. If you need to guarantee the order in which resource values are set, you should make multiple requests to this method or setResourceValue:forKey:error:.

This method applies only to URLs for file system resources.
Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

40.13.152 setTemporaryResourceValue(value as Variant, key as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Sets a temporary resource value on the URL object.
Notes: value: The value to store.
key: The key where the value should be stored. This key must be unique and must not conflict with any system-defined keys. Reverse-domain-name notation is recommended.

Your app can use a temporary resource value to temporarily store a value for an app-defined resource value key in memory without modifying the actual resource that the URL represents. Once set, you can copy the temporary resource value from the URL object just as you would copy system-defined keys—by calling getResourceValue or resourceValuesForKeys.

Your app can remove a temporary resource value from the URL object by calling removeCachedResourceValueForKey or removeAllCachedResourceValues (to remove all temporary values).

This method is applicable only to URLs for file system resources.
Available in OS X v10.9 and later.

40.13.153 startAccessingSecurityScopedResource as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Starts accessing a security scoped bookmark URL.
Notes: Given a NSURL created by resolving a bookmark data created with security scope, make the resource referenced by the url accessible to the process. When access to this resource is no longer needed the client must call stopAccessingSecurityScopedResource. Each call to startAccessingSecurityScopedResource must be balanced with a call to stopAccessingSecurityScopedResource (Note: this is not reference counted).

40.13.154 stopAccessingSecurityScopedResource

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Revokes the access granted to the url by a prior successful call to startAccessingSecurityScopedResource.

40.13.155 TagNames as string()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The names of tags attached to the resource, returned as an array of String values.
Notes: Available in OS X v10.9 and later.

40.13.156 URLByAppendingPathComponent(pathComponent as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path component to the original URL.
Notes: pathComponent: The path component to add to the URL, in its original form (not URL encoded).

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in OS X v10.6 and later.
See also:

- 40.13.157 URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS 8065

40.13.157 URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path component to the original URL, along with a trailing slash if the component is designated a directory.
Notes: pathComponent: The path component to add to the URL.

isDirectory: If true, a trailing slash is appended after pathComponent.

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in OS X v10.7 and later.
On Mac OS X 10.6 the plugin falls back
See also:

- 40.13.156 URLByAppendingPathComponent(pathComponent as string) as NSURLMBS 8065

40.13.158 URLByAppendingPathExtension(PathExtension as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path extension to the original URL.
Notes: pathExtension: The path extension to add to the URL.

Returns a new URL with pathExtension appended.

If the original URL ends with one or more forward slashes, these are removed from the returned URL. A period is inserted between the two parts of the new URL.
Available in OS X v10.6 and later.

40.13.159 URLByDeletingLastPathComponent as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL created by taking the receiver and removing the last path component.
Notes: If the receiver,Äôs URL represents the root path, this property contains a copy of the original URL. Otherwise, if the original URL has only one path component, this property contains the empty string.

Available in OS X v10.6 and later.

40.13.160 URLByDeletingPathExtension as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL created by taking the receiver and removing the path extension, if any.
Notes: If the receiver represents the root path, this property contains a copy of the original URL. If the URL has multiple path extensions, only the last one is removed.

Available in OS X v10.6 and later.

40.13.161 URLByResolvingSymlinksInPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL that points to the same resource as the receiver and includes no symbolic links.
Notes: If the receiver has no symbolic links, this property contains a copy of the original URL.

If some symbolic links cannot be resolved, this property contains those broken symbolic links.

If the name of the receiving path begins with /private, this property strips off the /private designator, provided the result is the name of an existing file.

This property only works on URLs with the file: path scheme. For all other URLs, it contains a copy of the receiver.
Available in OS X v10.6 and later.

40.13.162 URLByStandardizingPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL that points to the same resource as the original URL using an absolute path.
Notes: This property only works on URLs with the file: path scheme. For all other URLs, it returns a copy of the original URL.

Like stringByStandardizingPath, this property can make the following changes in the provided URL:

- Expand an initial tilde expression using stringByExpandingTildeInPath.
- Reduce empty components and references to the current directory (that is, the sequences "//" and "/./") to single path separators.
- In absolute paths only, resolve references to the parent directory (that is, the component "..") to the real parent directory if possible using stringByResolvingSymlinksInPath, which consults the file system to resolve each potential symbolic link.

- In relative paths, because symbolic links can,Äôt be resolved, references to the parent directory are left in place.
- Remove an initial component of "/private" from the path if the result still indicates an existing file or directory (checked by consulting the file system).

Note that the path contained by this property may still have symbolic link components in it. Note also that this property only works with file paths (not, for example, string representations of URLs).

Available in OS X v10.6 and later.

40.13.163 URLsResourceValuesForKeys(URLs() as NSURLMBS, keys() as string, targetDelegate as URLsResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries several URLs for values.
Notes: Similar to resourceValuesForKeys, this method will start a preemptive thread and queries values for all URLs on all keys in background. Once done it calls the delegate on main thread.
For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it's really quick.

the delegate is declared like this:
URLsResourceValuesForKeysDelegateMBS(URLs() as NSURLMBS, keys() as String, Values() as Dictionary, Errors() as NSErrorMBS, tag as Variant)

40.13.164 URLWithHandle(Handle as Integer) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Creates a new URL object based on a handle value.
Notes: Will retain the reference.

40.13.165 URLWithItem(Item as FolderItem) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates an URL based on folderItem.
Example:

```
Var f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)
Var n as NSURLMBS = NSURLMBS.URLWithItem(f)
MsgBox n.absoluteString
```

40.13.166 URLWithString(URL as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a provided URL string.
See also:

- 40.13.167 URLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS 8069

40.13.167 URLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a base URL and a relative string.
Notes: This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folder,Äôs URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.
See also:

- 40.13.166 URLWithString(URL as string) as NSURLMBS 8069

40.13.168 Properties

40.13.169 absoluteString as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The URL string for the receiver as an absolute URL.
Notes: This property,Äôs value is calculated by resolving the receiver,Äôs string against its base according to the algorithm given in RFC 1808.
(Read only property)

40.13.170 absoluteURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: An absolute URL that refers to the same resource as the receiver.
Notes: If the URL is already absolute, this property contains a copy of the receiver. Resolution is performed per RFC 1808.
(Read only property)

40.13.171 AddedToDirectoryDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time at which the resource,Äôs was created or renamed into or within its parent directory, returned as an date.
Notes: Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.
(Read only property)

40.13.172 AddedToDirectoryDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time at which the resource,Äôs was created or renamed into or within its parent directory, returned as an date.
Notes: Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.
(Read only property)

40.13.173 AttributeModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Modification date.
Notes: The time at which the resource,Äôs attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

40.13.174 AttributeModificationDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Modification date.
Notes: The time at which the resource,Äôs attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

40.13.175 baseURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The base URL.
Notes: This property contains the base URL. If the receiver is an absolute URL, this property contains nil.
(Read only property)

40.13.176 ContentAccessDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time at which the resource was most recently accessed.
Notes: Returned as date object if the volume supports access dates, or nil if access dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

40.13.177 ContentAccessDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time at which the resource was most recently accessed.
Notes: Returned as date object if the volume supports access dates, or nil if access dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

40.13.178 ContentModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The modification date.
Notes: The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

40.13.179 ContentModificationDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The modification date.
Notes: The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

40.13.180 CreationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The creation date.
Notes: The resource,Äôs creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

40.13.181 CreationDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The creation date.
Notes: The resource,Äôs creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

40.13.182 DocumentIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The document identifier returned as a number.
Notes: The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It is not transferred when the file is copied, but it survives "safe save" operations.
Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

40.13.183 EffectiveIcon as Variant

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs normal icon, returned as an NSImage object.
Notes: Available in OS X v10.6 and later.
Value is a NSImageMBS. We use variant to reduce dependency to other plugins.
(Read only property)

40.13.184 filePathURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A file path URL that points to the same resource as the URL object.
Notes: If the receiver is a file reference URL, this property contains a copy of the URL converted to a file path URL. If the receiver,Äôs URL is a file path URL, this property contains the original URL. If the original URL is not a file URL, or if the resource is not reachable or no longer exists, this property contains nil.

Available in OS X v10.6 and later.
(Read only property)

40.13.185 fileReferenceURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new file reference URL that points to the same resource as the receiver.
Notes: File reference URLs use a URL path syntax that identifies a file system object by reference, not by path. This form of file URL remains valid when the file system path of the URL,Äôs underlying resource

changes.

If the original URL is a file path URL, this property contains a copy of the URL converted into a file reference URL. If the original URL is a file reference URL, this property contains the original. If the original URL is not a file URL, this property contains nil.

File reference URLs cannot be created to file system objects which do not exist or are not reachable. This property contains nil instead.

In some areas of the file system hierarchy, file reference URLs cannot be generated to the leaf node of the URL path.

A file reference URL's path should never be persistently stored, because it is not valid across system restarts or remounts of volumes. If you need to store a persistent reference to a file system object, use a bookmark instead. You can create a bookmark by calling bookmarkDataWithOptions.

Available in OS X v10.6 and later.
(Read only property)

40.13.186 FileResourceIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs unique identifier, returned as an id.
Notes: This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.
Returns hex encoded data.
(Read only property)

40.13.187 FileResourceType as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs object type, returned as an NSString object.
Notes: See File Resource Types for possible values.

Available in OS X v10.7 and later.
(Read only property)

40.13.188 fileSystemRepresentation as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A string containing the URL,Äôs file system path.
Notes: (Read only property)

40.13.189 fragment as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The fragment identifier, conforming to RFC 1808. (read-only)
Notes: This property contains the URL,Äôs fragment. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.html#jumpLocation, the fragment identifier is jumpLocation.
(Read only property)

40.13.190 GenerationIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: An opaque generation identifier, returned as an id.
Notes: The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file's data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

40.13.191 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: Can be used as NSURL* or CFURLRef for declares.
(Read and Write property)

40.13.192 HasHiddenExtension as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource,Äôs extension is normally removed from its localized name.
Notes: Returned as a Boolean (read-write).
(Read only property)

40.13.193 host as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The host, conforming to RFC 1808. (read-only)
Notes: This property contains the host. For example, in the URL http://www.example.com/index.html, the host is www.example.com.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

40.13.194 IsAlias as Boolean

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Whether the file is an alias.
Example:

```
Var file As folderitem = specialfolder.desktop.child("Hello.txt")

Var url As New NSURLMBS(file)
MsgBox "IsAlias: " + If(url.IsAlias, "yes", "no")
```

Notes: Returns true for alias files.
(Read only property)

40.13.195 IsDirectory as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is a directory.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.196 IsExcludedFromBackup as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is excluded from all backups of app data.
Notes: You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.
(Read only property)

40.13.197 IsExecutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean.
Notes: Available in OS X v10.7 and later.
(Read only property)

40.13.198 isFileReferenceURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns whether the URL is a file reference URL. S
Notes: (Read only property)

40.13.199 isFileURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the scheme is file.
Notes: if myURL.isFileURL is true, then myURL.path is suitable for input into NSFileManager or NSPathUtilities.
(Read only property)

40.13.200 IsHidden as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is normally not displayed to users.
Notes: If the resource is hidden because its name begins with a period, setting this value has no effect.
Available in OS X v10.6 and later.
(Read only property)

40.13.201 IsMountTrigger as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the URL is a file system trigger directory, returned as a Boolean.
Notes: Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.

Available in OS X v10.7 and later.
(Read only property)

40.13.202 IsPackage as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is a file package
Example:

```
Var f As New FolderItem("/Applications/Xcode.app", FolderItem.PathTypeNative)
Var n As New NSURLMBS(f)

If n.IsPackage Then
MessageBox "is a package, bundle or application."
Else
MessageBox "not a bundle"
end if
```

Notes: A true value means that the resource is a file package.

Available in OS X v10.6 and later.
(Read only property)

40.13.203 IsReadable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the current process (as determined by the EUID) can read the resource.
Notes: Available in OS X v10.7 and later.
(Read only property)

40.13.204 IsRegularFile as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Determining whether the resource is a regular file, as opposed to a directory or a symbolic link.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.205 IsSymbolicLink as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is a symbolic link.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.206 IsSystemImmutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource's system immutable bit is set.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.207 IsUbiquitousItem as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if this item is synced to the cloud, false if it is only a local file.
Notes: (Read only property)

40.13.208 IsUserImmutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource's user immutable bit is set.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.209 IsVolume as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is the root directory of a volume.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.210 IsWritable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the current process (as determined by the EUID) can write to the resource.
Notes: Available in OS X v10.7 and later.
(Read only property)

40.13.211 Item as FolderItem

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: For the file URLs the corresponding folderitem.
Notes: (Read only property)

40.13.212 LabelColor as Variant

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs label color, returned as an NSColor object, or nil if the resource has no label color.
Notes: Available in OS X v10.6 and later.

Value is a NSColorMBS object.
(Read only property)

40.13.213 LabelNumber as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs label number.
Notes: Available in OS X v10.6 and later.

(Read only property)

40.13.214 lastPathComponent as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The last path component. (read-only)
Notes: This property contains the last path component. For example, in the URL file:///path/to/file, the last path component is file.
Available in OS X v10.6 and later.
(Read only property)

40.13.215 LinkCount as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The number of hard links to the resource.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.216 LocalizedLabel as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs localized label text, returned as a string, or empty if the resource has no localized label text.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.217 LocalizedName as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs localized or extension-hidden name, returned as a string.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.218 LocalizedTypeDescription as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs localized type description, returned as a string.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.219 Name as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs name in the file system, returned as a string.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.220 parameterString as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The parameter string conforming to RFC 1808. (read-only)
Notes: This property contains the parameter string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL file:///path/to/file;foo, the parameter string is foo.

This property should not be confused with the query property, which also often contains a string of parameters.
(Read only property)

40.13.221 ParentDirectoryURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The parent directory of the resource, returned as an NSURLMBS object, or nil if the resource is the root directory of its volume.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.222 password as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The password conforming to RFC 1808. (read-only)
Notes: This property contains the password. If the receiver does not conform to RFC 1808, it contains nil. For example, in the URL http://username:password@www.example.com/index.html, the password is password.
(Read only property)

40.13.223 path as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The path, conforming to RFC 1808. (read-only)
Notes: This property contains the path, unescaped with the stringByReplacingPercentEscapesUsingEncoding: method. If the receiver does not conform to RFC 1808, this property contains nil.

If the receiver contains a file or file reference URL (as determined with isFileURL), this property,Äôs value is suitable for input into methods of NSFileManager or NSPathUtilities. If the path has a trailing slash, it is stripped.

If the receiver contains a file reference URL, this property,Äôs value provides the current path for the referenced resource, which may be nil if the resource no longer exists.

If the parameterString property contains a non-nil value, the path may be incomplete. If the receiver contains an unencoded semicolon, the path property ends at the character before the semicolon. The remainder of the URL is provided in the parameterString property.

To obtain the complete path, if parameterString contains a non-nil value, append a semicolon, followed by the parameter string.

Per RFC 3986, the leading slash after the authority (host name and port) portion is treated as part of the path. For example, in the URL http://www.example.com/index.html, the path is /index.html.

Available in OS X v10.8 and later.
(Read only property)

40.13.224 pathExtension as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The path extension. (read-only)
Notes: This property contains the path extension. For example, in the URL file:///path/to/file.txt, the path extension is txt.

Available in OS X v10.6 and later.
(Read only property)

40.13.225 port as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The port, conforming to RFC 1808. (read-only)
Notes: This property contains the port number. For example, in the URL http://www.example.com:8080/index.php, the port number is 8080.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

40.13.226 PreferredIOBlockSize as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The preferred block size.
Notes: The optimal block size to use when reading or writing this file's data, returned as an integer, or zero if the preferred size is not available (read-only).
Available in OS X v10.7 and later.
(Read only property)

40.13.227 QuarantineProperties as Dictionary

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The quarantine properties as defined in LSQuarantine.h.
Example:

```
Var f As FolderItem = SpecialFolder.UserHome.Child("Downloads").Child("Installation.pdf")
Var n As New NSURLMBS(f)
Var d As Dictionary = n.QuarantineProperties

Break // inspect in debugger
```

Notes: Available on Mac OS X 10.10 and later.
(Read only property)

40.13.228 query as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The query string, conforming to RFC 1808. (read-only)
Notes: This property contains the query string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.php?key1=value1&key2=value2, the query string is key1=value1&key2=value2.
(Read only property)

40.13.229 relativePath as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The relative path, conforming to RFC 1808. (read-only)
Notes: This property contains the relative path of the receiver,Äôs URL without resolving against its base URL. If the path has a trailing slash it is stripped. If the receiver is an absolute URL, this property contains the same value as path. If the receiver does not conform to RFC 1808, it contains nil.
(Read only property)

40.13.230 relativeString as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A string representation of the relative portion of the URL. (read-only)
Notes: This property contains a string representation of the relative portion of the URL. If the receiver is an absolute URL this method returns the same value as absoluteString.
(Read only property)

40.13.231 resourceSpecifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource specifier. (read-only)
Notes: This property contains the resource specifier. For example, in the URL http://www.example.com/index.html?key1=value1#jumplink, the resource specifier is //www.example.com/index.html?key1=value1#jumplink (everything after the colon).
(Read only property)

40.13.232 scheme as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The scheme. (read-only)
Notes: This property contains the scheme. For example, in the URL http://www.example.com/index.html, the scheme is http.

The full URL is the concatenation of the scheme, a colon (:), and the value of resourceSpecifier.

The term "protocol" is also sometimes used when talking about network-based URL schemes. However, not all URL schemes are networking protocols—data:// URLs, for example.
(Read only property)

40.13.233 standardizedURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A copy of the URL with any instances of ".." or "." removed from its path. (read-only)
Notes: This property contains a new NSURL object, initialized using the receiver,Äôs path with any instances of ".." or "." removed.

If the URL conforms to RFC 1808 (the most common form of URL), this property contains the specified URL component; otherwise it contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

40.13.234 TypeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs uniform type identifier (UTI), returned as a string.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.235 UbiquitousItemContainerDisplayName as String

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the name of this item's container as displayed to users.
Notes: (Read only property)

40.13.236 UbiquitousItemDownloadingError as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the error when downloading the item from iCloud failed,.
Notes: (Read only property)

40.13.237 UbiquitousItemDownloadingStatus as String

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the download status of this item.
Notes: (Read only property)

40.13.238 UbiquitousItemDownloadRequested as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns whether a download of this item has already been requested with an API like startDownloadingUbiquitousItem.
Notes: (Read only property)

40.13.239 UbiquitousItemHasUnresolvedConflicts as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if this item has conflicts outstanding.
Notes: (Read only property)

40.13.240 UbiquitousItemIsDownloaded as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Has never behaved as documented in earlier releases, hence deprecated.
Notes: Equivalent to UbiquitousItemDownloadingStatus = NSURLUbiquitousItemDownloadingStatusCurrent.
(Read only property)

40.13.241 UbiquitousItemIsDownloading as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if data is being downloaded for this item.
Notes: (Read only property)

40.13.242 UbiquitousItemIsExcludedFromSync as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if the item is excluded from sync, which means it is locally on disk but won't be available on the server.
Notes: An excluded item is no longer ubiquitous.
(Read only property)

40.13.243 UbiquitousItemIsShared as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if the ubiquitous item is shared.
Notes: (Read only property)

40.13.244 UbiquitousItemIsUploaded as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if there is data present in the cloud for this item.
Notes: (Read only property)

40.13.245 UbiquitousItemIsUploading as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if data is being uploaded for this item.
Notes: (Read only property)

40.13.246 UbiquitousItemUploadingError as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the error when uploading the item to iCloud failed.
Notes: (Read only property)

40.13.247 user as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The user name, conforming to RFC 1808. (read-only)
Notes: This property contains the user name. For example, in the URL ftp://username@www.example.com/, the user name is username.

If the receiver,Äôs URL does not conform to RFC 1808, this property returns nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808—specifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

40.13.248 VolumeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The unique identifier of the resource,Äôs volume, returned as an id.
Notes: The unique identifier of the resource,Äôs volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.
Returns hex encoded data.
(Read only property)

40.13.249 VolumeURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The root directory of the resource,Äôs volume, returned as an NSURL object.
Notes: Available in OS X v10.6 and later.
(Read only property)

40.13.250 Delegates

40.13.251 ResourceValuesForKeysDelegateMBS(URL as NSURLMBS, keys() as String, Values as Dictionary, Error as NSErrorMBS, tag as variant)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The delegate to use for resourceValuesForKeys method.

40.13.252 URLsResourceValuesForKeysDelegateMBS(URLs() as NSURLMBS, keys() as String, Values() as Dictionary, Errors() as NSErrorMBS, tag as variant)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The delegate to use with URLsResourceValuesForKeys method.

40.14 class NSURLProtectionSpaceMBS

40.14.1 class NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: A class for the Cocoa URL protection space class.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 20.2pr3

40.14.2 Methods

40.14.3 authenticationMethod as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the authentication method to be used for this protection space

40.14.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

40.14.5 host as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the proxy host if this is a proxy authentication, or the host from the URL.
Notes: Returns the host for this protection space.

40.14.6 isProxy as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Determine if this authenticating protection space is a proxy server
Notes: Returns true if a proxy, false otherwise.

40.14.7 NSURLAuthenticationMethodClientCertificate as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use client certificate authentication for this protection space.
Notes: This authentication method can apply to any protocol.

40.14.8 NSURLAuthenticationMethodDefault as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use the default authentication method for a protocol.

40.14.9 NSURLAuthenticationMethodHTMLForm as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use HTML form authentication for this protection space.
Notes: The URL loading system never issues authentication challenges based on this authentication method. However, if your app authenticates by submitting a web form (or in some other protocol-neutral way), you can specify this protection space when you persist or look up credentials using the NSURLCredentialStorageMBS class.

40.14.10 NSURLAuthenticationMethodHTTPBasic as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use HTTP basic authentication for this protection space.

40.14.11 NSURLAuthenticationMethodHTTPDigest as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use HTTP digest authentication for this protection space.

40.14.12 NSURLAuthenticationMethodNegotiate as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Negotiate whether to use Kerberos or NTLM authentication for this protection space.

40.14.13 NSURLAuthenticationMethodNTLM as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use NTLM authentication for this protection space.

40.14.14 NSURLAuthenticationMethodServerTrust as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Perform server trust authentication (certificate validation) for this protection space.
Notes: This authentication method can apply to any protocol, and is most commonly used for overriding SSL and TLS chain validation.

40.14.15 NSURLProtectionSpaceFTP as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The protocol type for FTP.

40.14.16 NSURLProtectionSpaceFTPProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for FTP proxies.

40.14.17 NSURLProtectionSpaceHTTP as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The protocol type for HTTP.

40.14.18 NSURLProtectionSpaceHTTPProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for HTTP proxies.

40.14.19 NSURLProtectionSpaceHTTPS as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The protocol type for HTTPS.

40.14.20 NSURLProtectionSpaceHTTPSProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for HTTPS proxies.

40.14.21 NSURLProtectionSpaceSOCKSProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for SOCKS proxies.

40.14.22 port as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the proxy port if this is a proxy authentication, or the port from the URL.
Notes: Returns the port for this protection space, or 0 if not set.

40.14.23 protocol as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the protocol of this protection space, if not a proxy.
Notes: Returns the type string, or "" if a proxy.

40.14.24 proxyType as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the type of this protection space, if a proxy.
Notes: Returns the type string, or "" if not a proxy.

40.14.25 realm as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the authentication realm for which the protection space that needs authentication
Notes: This is generally only available for http authentication, and may be "" otherwise.

40.14.26 receivesCredentialSecurely as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Determine if the password for this protection space can be sent securely
Notes: True if a secure authentication method or protocol will be used, false otherwise.

40.14.27 Properties

40.14.28 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this class.
Notes: (Read and Write property)

40.15 class NSURLRequestCertificateFilterMBS

40.15.1 class NSURLRequestCertificateFilterMBS

MBS MacCocoa Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to filter certificate requests.
Notes: This is the only way to fix the problem with the webview that certificates which are not valid can still be used.

40.15.2 Events

40.15.3 allowsAnyHTTPSCertificateForHost(host as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: An event being called for each host which may have a https certificate.
Notes: This event is called very often, so make it very fast.
Also this event is often called with the same host value as it is called for each request.

Retrun true to allow this host to run without a valid https certificate.

40.16 class NSURLRequestMBS

40.16.1 class NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: An NSURLRequest object represents a URL load request in a manner independent of protocol and URL scheme.
Example:

msgbox HTMLViewer1.mainFrameMBS.DataSource.Request.url

Notes: NSURLRequest encapsulates two basic data elements about a URL load request:

The URL to load.
The policy to use when consulting the URL content cache made available by the implementation.

40.16.2 Methods

40.16.3 allHTTPHeaderFields as Dictionary

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns a dictionary of the HTTP header fields associated with the receiver.

40.16.4 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
Var r as NSURLRequestMBS
r=new NSURLRequestMBS("http://www.apple.com")
```

Notes: Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).
On success, handle property is not zero.
See also:

- 40.16.5 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double) 8099

40.16.5 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
Var r as NSURLRequestMBS
r=new NSURLRequestMBS("http://www.apple.com",NSURLRequestMBS.NSURLRequestReturnCacheDataElseLoad,5.0)
```

Notes: On success, handle property is not zero.
See also:

- 40.16.4 Constructor(url as string) 8099

40.16.6 copy as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the request.
Example:

```
// create PUT request
Var m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"

// make a copy
Var r as NSURLRequestMBS = m.copy
```

```
// change first request to POST
m.setHTTPMethod "POST"

// and check values
MsgBox m.HTTPMethod+" "+r.HTTPMethod
```

40.16.7 mutableCopy as NSMutableURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an editable copy of the request.
Example:

```
// create PUT request
Var m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"

// make a copy
Var r as NSMutableURLRequestMBS = m.mutableCopy

// change request to POST
r.setHTTPMethod "POST"

// and check values
MsgBox m.HTTPMethod+" "+r.HTTPMethod
```

40.16.8 requestWithHandle(Handle as Integer) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Creates a new request object based on a handle value.
Notes: Will retain the reference.

40.16.9 requestWithURL(url as string) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
Var r as NSURLRequestMBS
```

r=r.requestWithURL("http://www.apple.com",0,5.0)

Notes: Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).
See also:

- 40.16.10 requestWithURL(url as string, cachePolicy as Integer, timeoutInterval as Double) as NSURLRequestMBS 8101

40.16.10 requestWithURL(url as string, cachePolicy as Integer, timeoutInterval as Double) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

Var r as NSURLRequestMBS

r=r.requestWithURL("http://www.apple.com", NSURLRequestMBS.NSURLRequestUseProtocolCachePolicy, 5.0)

See also:

- 40.16.9 requestWithURL(url as string) as NSURLRequestMBS 8100

40.16.11 valueForHTTPHeaderField(field as string) as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the value of the specified HTTP header field.
Example:

Var m as new NSMutableURLRequestMBS("http://test.test")
m.setValue("just a test", "test")
MsgBox m.valueForHTTPHeaderField("test")

Notes: field: The name of the header field whose value is to be returned. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.

Returns the value associated with the header field field, or "" if there is no corresponding header field.

40.16.12 Properties

40.16.13 allowsCellularAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Whether a connection created with this request is allowed to use the built in cellular radios (if present).
Notes: False if the receiver should not be allowed to use the built in cellular radios to satisfy the request, true otherwise. The default is true.
(Read only property)

40.16.14 allowsConstrainedNetworkAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Whether a connection created with this request is allowed to use network interfaces which have been marked as constrained.
Notes: False if the receiver should not be allowed to use an interface marked as constrained to satisfy the request, true otherwise.
(Read only property)

40.16.15 allowsExpensiveNetworkAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Whether a connection created with this request is allowed to use network interfaces which have been marked as expensive.
Notes: False if the receiver should not be allowed to use an interface marked as expensive to satisfy the request, true otherwise.
(Read only property)

40.16.16 allowsUltraConstrainedNetworkAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Whether a connection created with this request is allowed to use network interfaces which have been marked as ultra constrained.
Notes: False if the receiver should not be allowed to use an interface marked as ultra constrained to satisfy the request, true otherwise.

Available in macOS/iOS 26.1 or later.

(Read only property)

40.16.17 attribution as Integer

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: All.

Function: Returns the NSURLRequestAttribution associated with this request.
Notes: This will return NSURLRequestAttributionDeveloper for requests that have not explicitly set an attribution.
(Read only property)

40.16.18 cachePolicy as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the cache policy of the request.
Example:

```
Var r as NSURLRequestMBS

r=new NSURLRequestMBS("http://www.apple.com",0,5.0)

MsgBox str(r.cachePolicy)
```

Notes: Value is one of the constants in this class.
(Read only property)

40.16.19 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The reference to the internal used NSURLRequest object.
Notes: (Read and Write property)

40.16.20 HTTPBody as memoryblock

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns the body of the request.
Notes: This is the data sent in a POST request.

(Read only property)

40.16.21 HTTPMethod as string

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns the HTTP method associated with the receiver.
Example:

```
Var m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"
MsgBox m.HTTPMethod
```

Notes: (Read only property)

40.16.22 HTTPShouldHandleCookies as boolean

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns a flag indicating whether this request should use standard cookie handling (sending of cookies with the request and storing any cookies returned in the response.
Notes: (Read only property)

40.16.23 HTTPShouldUsePipelining as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Reports whether the receiver is not expected to wait for the previous response before transmitting.
Notes: Returns true if the receiver should transmit before the previous response is received. False if the receiver should wait for the previous response before transmitting.

Available in Mac OS X 10.7 or newer.
(Read only property)

40.16.24 isHTTPRequest as boolean

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Whether this is an HTTP request.
Notes: If true, the allHTTPHeaderFields, HTTPShouldHandleCookies, HTTPMethod and HTTPBody

methods do work.
(Read only property)

40.16.25 mainDocumentURL as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The main document URL associated with this load.
Example:

```
Var m as new NSMutableURLRequestMBS("http://test.test/test.jpg")
m.setMainDocumentURL "http://test.test/"
MsgBox m.mainDocumentURL
```

Notes: This URL is used for the cookie "same domain as main document" policy. There may also be other future uses.

NOTE: In the current implementation, this value is unused by the webkit framework. A fully functional version of this method will be available in the future.
(Read only property)

40.16.26 networkServiceType as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the service type associated with this request.
Notes: This will return NSURLNetworkServiceTypeDefault for requests that have not explicitly set a networkServiceType (using the setNetworkServiceType method). See NSURLNetworkServiceType* constants.

Available in Mac OS X 10.7 or newer.
(Read only property)

40.16.27 timeoutInterval as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the timeout interval of the request.
Example:

```
Var r as NSURLRequestMBS

r=new NSURLRequestMBS("http://www.apple.com",0,5.0)
```

MsgBox str(r.timeoutInterval)

Notes: The timeout interval specifies the limit on the idle interval alloted to a request in the process of loading. The "idle interval" is defined as the period of time that has passed since the last instance of load activity occurred for a request that is in the process of loading. Hence, when an instance of load activity occurs (e.g. bytes are received from the network for a request), the idle interval for a request is reset to 0. If the idle interval ever becomes greater than or equal to the timeout interval, the request is considered to have timed out. This timeout interval is measured in seconds.
(Read only property)

40.16.28 URL as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the URL of the request.
Example:

Var r as NSURLRequestMBS

r=new NSURLRequestMBS("http://www.apple.com")

MsgBox r.URL

Notes: (Read only property)

40.16.29 Constants

Constants

Constant	Value	Description
NSURLRequestReloadIgnoringCacheData	1	A constant that can be used to specify the type of i with the caching system when the URL loading sys Specifically, these constants cover interactions that already-existing cache data is returned to satisfy a NSURLRequestReloadIgnoringCacheData Specifies load should be loaded from the origin source. No exis of its freshness or validity, should be used to satisfy
NSURLRequestReloadIgnoringLocalAndRemoteCacheData	4	A constant that can be used to specify the type of i with the caching system when the URL loading sys Specifies that not only should the local cache data b and other intermediates should be instructed to di as the protocol allows. Available in Mac OS X v10.5 and later.
NSURLRequestReloadRevalidatingCacheData	5	A constant that can be used to specify the type of i with the caching system when the URL loading sys Specifies that the existing cache data may be used confirms its validity, otherwise the URL is loaded fr Available in Mac OS X v10.5 and later.
NSURLRequestReturnCacheDataDontLoad	3	A constant that can be used to specify the type of i with the caching system when the URL loading sys Specifically, these constants cover interactions that already-existing cache data is returned to satisfy a NSURLRequestReturnCacheDataDontLoad Specifi data should be used to satisfy a URL load reques expiration date. However, if there is no existing data to a URL load request, no attempt is made to load source, and the load is considered to have failed. behavior that is similar to an "offline" mode.
NSURLRequestReturnCacheDataElseLoad	2	A constant that can be used to specify the type of i with the caching system when the URL loading sys Specifically, these constants cover interactions that already-existing cache data is returned to satisfy a NSURLRequestReturnCacheDataElseLoad Specifie data should be used to satisfy a URL load reques expiration date. However, if there is no existing dat ing to a URL load request, the URL is loaded from
NSURLRequestUseProtocolCachePolicy	0	A constant that can be used to specify the type of i with the caching system when the URL loading sys Specifically, these constants cover interactions that already-existing cache data is returned to satisfy a NSURLRequestUseProtocolCachePolicy Specifies t fined in the protocol implementation, if any, is used request. This is the default policy for URL load req

Network Service Type Constants

Constant	Value	Description
NSURLNetworkServiceTypeBackground	3	Specifies that the request is for background traffic (such as a file down The service type is used to provide the networking layers a hint of the of the request.
NSURLNetworkServiceTypeDefault	0	Is the default value for an NSURLRequest when created. This value sh left unchanged for the vast majority of requests. The service type is used to provide the networking layers a hint of the of the request.
NSURLNetworkServiceTypeVideo	2	Specifies that the request is for video traffic. The service type is used to provide the networking layers a hint of the of the request.
NSURLNetworkServiceTypeVoice	4	Specifies that the request is for voice data. The service type is used to provide the networking layers a hint of the of the request.
NSURLNetworkServiceTypeVoIP	1	Specifies that the request is for voice over IP control traffic. The service type is used to provide the networking layers a hint of the of the request.

Attribution

Constant	Value	Description
NSURLRequestAttributionDeveloper	0	Indicates that the URL was specified by the developer. This is the de value for an NSURLRequest when created.
NSURLRequestAttributionUser	1	Indicates that the URL was specified by the user.

40.17 class NSURLResponseMBS

40.17.1 class NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: An NSURLResponse object represents a URL load response in a manner independent of protocol and URL scheme.
Notes: NSURLResponse encapsulates the metadata associated with a URL load. Note that NSURLResponse objects do not contain the actual bytes representing the content of a URL.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

40.17.2 Methods

40.17.3 allHeaderFields as Dictionary

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns all the HTTP header fields of the receiver.
Notes: A dictionary containing all the HTTP header fields of the receiver. By examining this dictionary clients can see the "raw" header information returned by the HTTP server.

40.17.4 Constructor(URL as string, MimeType as string, expectedContentLength as Integer, textEncodingName as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initialize an NSURLResponse with the provided values.
Notes: URL: the URL
MIMETYPE: the MIME content type of the response
expectedContentLength: the expected content length of the associated data
textEncodingName: the name of the text encoding for the associated data, if applicable, else "".

Use -1 for an unknown length.
See also FileExtensionToMimeTypeMBS function.

40.17.5 copy as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the object.
Notes: Makes a copy of the RB object and the NSURLResponse object behind.

40.17.6 expectedContentLength as int64

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the expected content length of the response.
Notes: Some protocol implementations report a content length as part of delivering load metadata, but not all protocols guarantee the amount of data that will be delivered in actuality.
Hence, this method returns an expected amount. Clients should use this value as an advisory, and should be prepared to deal with either more or less data.

Returns the expected content length of the receiver, or -1 if there is no expectation that can be arrived at regarding expected content length.

40.17.7 isHTTPResponse as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Whether this response is a http response.
Notes: the StatusCode property can only be used on HTTP Responses.

40.17.8 localizedStringForStatusCode(statusCode as Integer) as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Convenience method which returns a localized string corresponding to the status code for this response.
Notes: statusCode: the status code to use to produce a localized string.
Returns a localized string corresponding to the given status code or an empty string.

40.17.9 MIMEType as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the MIME type of the response.
Example:

msgbox HTMLViewer1.mainFrameMBS.DataSource.response.MIMEType

Notes: The MIME type is based on the information provided from an origin source. However, that value may be changed or corrected by a protocol implementation if it can be determined that the origin server or source reported the information incorrectly or imprecisely. An attempt to guess the MIME type may be made if the origin source did not report any such information.
See also FileExtensionToMimeTypeMBS function.

40.17.10 statusCode as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the HTTP status code of the response.
Notes: Returns -1 if no statuscode is available (e.g. in case this is no ta http response)
See also: localizedStringForStatusCode

40.17.11 suggestedFilename as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a suggested filename if the resource were saved to disk.
Notes: The method first checks if the server has specified a filename using the content disposition header. If no valid filename is specified using that mechanism, this method checks the last path component of the URL. If no valid filename can be obtained using the last path component, this method uses the URL's host as the filename.
If the URL's host can't be converted to a valid filename, the filename "unknown" is used. In mose cases, this method appends the proper file extension based on the MIME type. This method always returns a valid filename.

40.17.12 textEncodingName as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the name of the text encoding of the response.
Notes: This name will be the actual string reported by the origin source during the course of performing a protocol-specific URL load. Clients can inspect this string and convert it to a TextEncoding using the methods and functions made available in the appropriate framework.

Returns the name of the text encoding of the response, or an empty string if no text encoding was specified.

40.17.13 URL as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the URL of the response.
Example:

msgbox HTMLViewer1.mainFrameMBS.DataSource.response.URL

40.17.14 Properties

40.17.15 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The internal used reference to the NSURLResponse object.
Notes: (Read and Write property)

40.17.16 Constants

Constants

Constant	Value	Description
NSURLResponseUnknownLength	-1	The constant for use with expectedContentLength for an unknown length.

40.18 class NSURLSessionConfigurationMBS

40.18.1 class NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A configuration object that defines behavior and policies for a URL session.
Notes: An NSURLSessionConfigurationMBS object defines the behavior and policies to use when uploading and downloading data using an NSURLSessionMBS object. When uploading or downloading data, creating a configuration object is always the first step you must take. You use this object to configure the timeout values, caching policies, connection requirements, and other types of information that you intend to use with your NSURLSessionMBS object.

It is important to configure your NSURLSessionConfigurationMBS object appropriately before using it to initialize a session object. Session objects make a copy of the configuration settings you provide and use those settings to configure the session. Once configured, the session object ignores any changes you make to the NSURLSessionConfigurationMBS object. If you need to modify your transfer policies, you must update the session configuration object and use it to create a new NSURLSessionMBS object.

Note
In some cases, the policies defined in this configuration may be overridden by policies specified by an NSURLRequestMBS object provided for a task. Any policy specified on the request object is respected unless the session,Äôs policy is more restrictive. For example, if the session configuration specifies that cellular networking should not be allowed, the NSURLRequestMBS object cannot request cellular networking.

For more information about using configuration objects to create sessions, see NSURLSessionMBS class.

Types of Session Configurations

The behavior and capabilities of a URL session are largely determined by the kind of configuration used to create the session.

The singleton shared session (which has no configuration object) is for basic requests. It,Äôs not as customizable as sessions that you create, but it serves as a good starting point if you have very limited requirements. You access this session by calling the shared class method. See that method,Äôs discussion for more information about its limitations.

Default sessions behave much like the shared session (unless you customize them further), but let you obtain data incrementally using a delegate. You can create a default session configuration by calling the default method on the URLSessionConfiguration class.

Ephemeral sessions are similar to default sessions, but they don,Äôt write caches, cookies, or credentials to disk. You can create an ephemeral session configuration by calling the ephemeral method on the URLSes-

sionConfiguration class.

Background sessions let you perform uploads and downloads of content in the background while your app isn,Äôt running. You can create a background session configuration by calling the backgroundSessionConfiguration(_:) method on the URLSessionConfiguration class.

- Adding NSURLSession classes for Xojo

40.18.2 Methods

40.18.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.9 or newer.
A lot of properties require higher MacOS versions.

40.18.4 backgroundSessionConfiguration(identifier as String) as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a session configuration object that allows HTTP and HTTPS uploads or downloads to be performed in the background.
Notes: identifier: The unique identifier for the configuration object. This parameter must not be nil or an empty string.

Returns a configuration object that causes the system to perform upload and download tasks in a separate process.

Use this method to initialize a configuration object suitable for transferring data files while the app runs in the background. A session configured with this object hands control of the transfers over to the system, which handles the transfers in a separate process. In iOS, this configuration makes it possible for transfers to continue even when the app itself is suspended or terminated.

If an iOS app is terminated by the system and relaunched, the app can use the same identifier to create a new configuration object and session and to retrieve the status of transfers that were in progress at the

time of termination. This behavior applies only for normal termination of the app by the system. If the user terminates the app from the multitasking screen, the system cancels all of the session,Äôs background transfers. In addition, the system does not automatically relaunch apps that were force quit by the user. The user must explicitly relaunch the app before transfers can begin again.

You can configure an background session to schedule transfers at the discretion of the system for optimal performance using the discretionary property. When transferring large amounts of data, you are encouraged to set the value of this property to true. For an example of using the background configuration, see Downloading Files in the Background.

Requires MacOS 10.10 or newer.

40.18.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Creates a new object for shared session.

40.18.6 copy as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a copy of the configuration.

40.18.7 defaultSessionConfiguration as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A default session configuration object.
Notes: The default session configuration uses a persistent disk-based cache (except when the result is downloaded to a file) and stores credentials in the user,Äôs keychain. It also stores cookies (by default) in the same shared cookie store as the NSURLConnectionMBS and NSURLDownloadMBS classes.

If you,Äôre porting code based on the NSURLConnectionMBS class, use this method to obtain an initial configuration object and then customize that object as needed.

Modifying the returned session configuration object does not affect any configuration objects returned by future calls to this method, and does not change the default behavior for existing sessions. It is therefore always safe to use the returned object as a starting point for additional customization.

40.18.8 ephemeralSessionConfiguration as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A session configuration that uses no persistent storage for caches, cookies, or credentials.
Notes: An ephemeral session configuration object is similar to a default session configuration (see defaultSessionConfiguration), except that the corresponding session object doesn,Äôt store caches, credential stores, or any session-related data to disk. Instead, session-related data is stored in RAM. The only time an ephemeral session writes data to disk is when you tell it to write the contents of a URL to a file.

It is possible to customize a default session configuration object to obtain the same behavior (or any portion thereof) provided by an ephemeral session configuration object, but the use of this method is more convenient.

Privacy and Performance Considerations
The main advantage to using ephemeral sessions is privacy. By not writing potentially sensitive data to disk, you make it less likely that the data will be intercepted and used later. For this reason, ephemeral sessions are ideal for private browsing modes in web browsers and other similar situations.
Because an ephemeral session doesn,Äôt write cached data to disk, the size of the cache is limited by available RAM. This limitation means that previously fetched resources are less likely to be in the cache (and are guaranteed to not be there if the user quits and relaunches your app). This behavior may reduce perceived performance, depending on your app.
When your app invalidates the session, all ephemeral session data is purged automatically. Additionally, in iOS, the in-memory cache isn,Äôt purged automatically when your app is suspended but may be purged when your app is terminated or when the system experiences memory pressure.

40.18.9 Properties

40.18.10 allowsCellularAccess as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether connections should be made over a cellular network.
Notes: This property controls whether tasks in sessions based on this session configuration are allowed to make connections over a cellular network.
The default value is true.

For more information, read Restrict Cellular Networking Correctly on Apple website.
(Read and Write property)

40.18.11 allowsConstrainedNetworkAccess as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether connections may use the network when the user has specified Low Data Mode.
Notes: In iOS 13 and later, users can set their device to use Low Data Mode as one of the Cellular Data Options in the Settings app. Users can turn on Low Data Mode to reduce your app,Äôs network data usage. This property controls a URL session,Äôs behavior when the user turns on Low Data Mode. If there are no nonconstrained network interfaces available and the session,Äôs allowsConstrainedNetworkAccess property is false, any task created from the session fails. In this case, the error provided when the task fails has a networkUnavailableReason property whose value is NSURLErrorNetworkUnavailableReasonConstrained.
Limit your app,Äôs of use of constrained network access to user-initiated tasks, and put off discretionary tasks until a nonconstrained interface becomes available. To do this, set allowsConstrainedNetworkAccess (and allowsExpensiveNetworkAccess) to false and waitsForConnectivity to true. This way, your NSURLSessionTaskMBS waits for a suitable interface to become available before sending or receiving data.

Available in MacOS 10.15 or newer.
(Read and Write property)

40.18.12 allowsExpensiveNetworkAccess as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether connections may use a network interface that the system considers expensive.
Notes: The system determines what constitutes ,Äúexpensive,Äù based on the nature of the network interface and other factors. iOS 13 considers most cellular networks and personal hotspots expensive. If there are no nonexpensive network interfaces available and the session,Äôs allowsExpensiveNetworkAccess property is false, any task created from the session fails. In this case, the error provided when the task fails has a networkUnavailableReason property whose value is NSURLErrorNetworkUnavailableReasonExpensive.

Limit your app,Äôs of use of expensive network access to user-initiated tasks, and put off discretionary tasks until an nonexpensive interface becomes available. To do this, set allowsExpensiveNetworkAccess (and allowsConstrainedNetworkAccess) to false and waitsForConnectivity to true. This way, your NSURLSessionTaskMBS waits for a suitable interface to become available before sending or receiving data.

Available in MacOS 10.15 or newer.
(Read and Write property)

40.18.13 allowsUltraConstrainedNetworkAccess as Boolean

MBS MacFrameworks Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Whether a connection created with this request is allowed to use network interfaces which have been marked as ultra constrained.
Notes: False if the receiver should not be allowed to use an interface marked as ultra constrained to satisfy

the request, true otherwise.

Only for macOS 26.1 or newer.
(Read and Write property)

40.18.14 connectionProxyDictionary as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A dictionary containing information about the proxy to use within this session.
Notes: This property controls which proxy tasks within sessions based on this configuration use when connecting to remote hosts.
The default value is nil, which means that tasks use the default system settings.
See Global Proxy Configuration for more information about these dictionaries.
(Read and Write property)

40.18.15 discretionary as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether background tasks can be scheduled at the discretion of the system for optimal performance.
Notes: For configuration objects created using the backgroundSessionConfigurationWithIdentifier method, use this property to give the system control over when transfers should occur. This property is ignored for configuration objects created using other methods.
When transferring large amounts of data, you are encouraged to set the value of this property to true. Doing so lets the system schedule those transfers at times that are more optimal for the device. For example, the system might delay transferring large files until the device is plugged in and connected to the network via Wi-Fi. The default value of this property is false.
The session object applies the value of this property only to transfers that your app starts while it is in the foreground. For transfers started while your app is in the background, the system always starts transfers at its discretion—in other words, the system assumes this property is true and ignores any value you specified.

Available in MacOS 10.10 or newer.
(Read and Write property)

40.18.16 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.18.17 HTTPAdditionalHeaders as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A dictionary of additional headers to send with requests.
Notes: This property specifies additional headers that are added to all tasks within sessions based on this configuration. For example, you might set the User-Agent header so that it is automatically included in every request your app makes through sessions based on this configuration.

An NSURLSessionMBS object is designed to handle various aspects of the HTTP protocol for you. As a result, you should not modify the following headers:

- Authorization
- Connection
- Host
- Proxy-Authenticate
- Proxy-Authorization
- WWW-Authenticate

Additionally, if the length of your upload body data can be determined automatically—for example, if you provide the body content with an MemoryBlock object—the value of Content-Length is set for you.
If the same header appears in both this array and the request object (where applicable), the request object,Äôs value takes precedence.
The default value is an empty array.
(Read and Write property)

40.18.18 HTTPCookieAcceptPolicy as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A policy constant that determines when cookies should be accepted.
Notes: This property determines the cookie accept policy for all tasks within sessions based on this configuration.
The default value is CookieAcceptPolicyOnlyFromMainDocumentDomain. You can change it to any of the constants defined in the CookieAcceptPolicy enumerated type.
If you want more direct control over what cookies are accepted, set this value to CookieAcceptPolicyNever and then use the allHeaderFields and cookiesWithResponseHeaderFields methods to extract cookies from the URL response object yourself.
(Read and Write property)

40.18.19 HTTPCookieStorage as NSHTTPCookieStorageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The cookie store for storing cookies within this session.
Notes: This property determines the cookie storage object used by all tasks within sessions based on this configuration.
To disable cookie storage, set this property to nil.
For default and background sessions, the default value is the sharedHTTPCookieStorage cookie storage object.
For ephemeralSessionConfiguration sessions, the default value is a private cookie storage object that stores data in memory only, and is destroyed when you invalidate the session.
(Read and Write property)

40.18.20 HTTPMaximumConnectionsPerHost as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The maximum number of simultaneous connections to make to a given host.
Notes: This property determines the maximum number of simultaneous connections made to each host by tasks within sessions based on this configuration.
This limit is per session, so if you use multiple sessions, your app as a whole may exceed this limit. Additionally, depending on your connection to the Internet, a session may use a lower limit than the one you specify.
The default value is 6 in macOS, or 4 in iOS.
(Read and Write property)

40.18.21 HTTPShouldSetCookies as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether requests should contain cookies from the cookie store.
Notes: This property controls whether tasks within sessions based on this configuration should automatically provide cookies from the shared cookie store when making requests.
If you want to provide cookies yourself, set this value to false and provide a Cookie header either through the session,Äôs HTTPAdditionalHeaders property or on a per-request level using a custom NSURLRequestMBS object.
The default value is true.
(Read and Write property)

40.18.22 HTTPShouldUsePipelining as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether the session should use HTTP pipelining.
Notes: This property determines whether tasks within sessions based on this configuration should use HTTP pipelining. You can also enable pipelining on a per-task basis by creating the task with an NSURL-RequestMBS object.
The default value is false.
(Read and Write property)

40.18.23 identifier as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The background session identifier of the configuration object.
Notes: The value of this property is set only when you use the backgroundSessionConfigurationWithIdentifier method to create the configuration object. The string uniquely identifies a background session object. In iOS, you use this string in cases where the app was terminated while transfers were occurring in the background. When the app relaunches, it uses the string to recreate the configuration and session objects associated with the transfers.
(Read only property)

40.18.24 NetworkServiceType as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The type of network service for all tasks within sessions based on this configuration.
Notes: The network service type provides a hint to the operating system about what the underlying traffic is used for. This hint enhances the system's ability to prioritize traffic, determine how quickly it needs to wake up the cellular or Wi-Fi radio, and so on. By providing accurate information, you improve the ability of the system to optimally balance battery life, performance, and other considerations.

For example, specify the NetworkServiceTypeBackground type if your app is performing a download that wasn,Äôt requested by the user, like prefetching content so that it,Äôs available when the user chooses to view it.
This setting can also affect the Wi-Fi Quality of Service (QoS) Priority.
The default value is NetworkServiceTypeDefault.
(Read and Write property)

40.18.25 RequestCachePolicy as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A predefined constant that determines when to return a response from the cache.
Notes: This property determines the request caching policy used by tasks within sessions based on this

configuration.
Set this property to one of the constants defined in CachePolicy constants to specify whether the cache policy should depend on expiration dates and age, whether the cache should be disabled entirely, and whether the server should be contacted to determine if the content has changed since it was last requested.
The default value is CachePolicyUseProtocolCachePolicy.
(Read and Write property)

40.18.26 sharedContainerIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The identifier for the shared container into which files in background URL sessions should be downloaded.
Notes: To create a URL session for use by an app extension, set this property to a valid identifier for a container shared between the app extension and its containing app.

Available in MacOS 10.10 or newer.
(Read and Write property)

40.18.27 shouldUseExtendedBackgroundIdleMode as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether TCP connections should be kept open when the app moves to the background.
Notes: In addition to requesting that the connection be kept open, setting this value to true asks the system to delay reclaiming the connection when the app moves to the background.

Available in MacOS 10.11 or newer.
(Read and Write property)

40.18.28 timeoutIntervalForRequest as Double

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The timeout interval to use when waiting for additional data.
Notes: This property determines the request timeout interval for all tasks within sessions based on this configuration. The request timeout interval controls how long (in seconds) a task should wait for additional data to arrive before giving up. The timer associated with this value is reset whenever new data arrives. When the request timer reaches the specified interval without receiving any new data, it triggers a timeout. The default value is 60.

Important
Any upload or download tasks created by a background session are automatically retried if the original request fails due to a timeout. To configure how long an upload or download task should be allowed to be retried or transferred, use the timeoutIntervalForResource property.
(Read and Write property)

40.18.29 timeoutIntervalForResource as Double

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The maximum amount of time that a resource request should be allowed to take.
Notes: This property determines the resource timeout interval for all tasks within sessions based on this configuration. The resource timeout interval controls how long (in seconds) to wait for an entire resource to transfer before giving up. The resource timer starts when the request is initiated and counts until either the request completes or this timeout interval is reached, whichever comes first.
The default value is 7 days.
(Read and Write property)

40.18.30 URLCache as NSURLCacheMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The URL cache for providing cached responses to requests within the session.
Notes: This property determines the URL cache object used by tasks within sessions based on this configuration.
To disable caching, set this property to nil.
For default sessions, the default value is the shared URL cache object.
For background sessions, the default value is nil.
For ephemeral sessions, the default value is a private cache object that stores data in memory only, and is destroyed when you invalidate the session.
(Read and Write property)

40.18.31 URLCredentialStorage as NSURLCredentialStorageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A credential store that provides credentials for authentication.
Notes: This property determines the credential storage object used by tasks within sessions based on this configuration.
If you don,Äôt want to use a credential store, set this property to nil.
For default and background sessions, the default value is the sharedCredentialStorage credential store object.
For ephemeralSessionConfiguration sessions, the default value is a private credential store object that stores data in memory only, and is destroyed when you invalidate the session.

(Read and Write property)

40.18.32 waitsForConnectivity as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the session should wait for connectivity to become available, or fail immediately.
Notes: Connectivity might be temporarily unavailable for several reasons. For example, a device might only have a cellular connection when allowsCellularAccess is set to false, or the device might require a VPN connection but none is available. If the value of this property is true and sufficient connectivity is unavailable, the session calls the taskIsWaitingForConnectivity: method of NSURLSessionTaskDelegate and waits for connectivity. When connectivity becomes available, the task begins its work and ultimately calls the delegate or completion handler as usual.
If the value of the property is false and connectivity is unavailable, the connection fails immediately with an error, such as NSURLErrorNotConnectedToInternet.
This property is relevant only during the establishment of a connection. If a connection is established and then drops, the completion handler or delegate receives an error, such as NSURLErrorNetworkConnectionLost. For help dealing with dropped connections, see Handling ‚ÄúThe network connection was lost‚Äù Errors.
This property is ignored by background sessions, which always wait for connectivity.

Available in MacOS 10.13 or newer.
(Read and Write property)

40.18.33 Constants

Cache Policy

Constant	Value	Description
CachePolicyReloadIgnoringCacheData	1	The URL load should be loaded only from the originat
CachePolicyReloadIgnoringLocalAndRemoteCacheData	4	Ignore local cache data, and instruct proxies and other gard their caches so far as the protocol allows.
CachePolicyReloadIgnoringLocalCacheData	1	The URL load should be loaded only from the originat
CachePolicyReloadRevalidatingCacheData	5	Use cache data if the origin source can validate it; ot origin.
CachePolicyReturnCacheDataDontLoad	3	Use existing cache data, regardless or age or expirati cached data is available.
CachePolicyReturnCacheDataElseLoad	2	Use existing cache data, regardless or age or expirati originating source only if there is no cached data.
CachePolicyUseProtocolCachePolicy	0	Use the caching logic defined in the protocol implem particular URL load request.

Cookie Accept Policy

Constant	Value	Description
CookieAcceptPolicyAlways	0	Accept all cookies. This is the default cookie accept polic
CookieAcceptPolicyNever	1	Reject all cookies.
CookieAcceptPolicyOnlyFromMainDocumentDomain	2	Accept cookies only from the main document domain.

Multipath TCP Modes

Constant	Value	Description
MultipathServiceTypeAggregate	3	A service that aggregates the capacities of other Multipath options in an attempt to increase throughput and minimize latency.
MultipathServiceTypeHandover	1	A Multipath TCP service that provides seamless handover between Wi-Fi and cellular in order to preserve the connection.
MultipathServiceTypeInteractive	2	A service whereby Multipath TCP attempts to use the lowest-latency interface.
MultipathServiceTypeNone	0	The default service type indicating that Multipath TCP should not be used.

Network Service Types

Constant	Value	Description
NetworkServiceTypeAVStreaming	8	A service type for streaming audio/video data.
NetworkServiceTypeBackground	3	A service type for background traffic. You should specify this type if your app is performing a download that not requested by the user—for example, prefetching content so that it wil available when the user chooses to view it.
NetworkServiceTypeCallSignaling	11	A service type for call signaling. Use this service type with network traffic that establishes, maintains, or t down a VoIP call. Use the NSURLNetworkServiceTypeVoIP type for the ac media of a call.
NetworkServiceTypeDefault	0	A service type for standard network traffic.
NetworkServiceTypeResponsiveAV	9	A service type for responsive (time-sensitive) audio/video data.
NetworkServiceTypeResponsiveData	6	A service type for data that the user is actively waiting for. This service type,Äôs priority is higher than NSURLNetworkServiceType fault. Use this service type for interactive situations where the user is an pating a quick response, like instant messaging or completing a purchase.
NetworkServiceTypeVideo	2	A service type for video traffic.
NetworkServiceTypeVoice	4	A service type for voice traffic.
NetworkServiceTypeVoIP	1	A service type for VoIP traffic. With the VoIP service type, the kernel continues to listen for incoming tr while your app is in the background, then wakes up your app whenever new c arrives. This should be used only for connections that are used to communi with a VoIP service.

40.19 class NSURLSessionDataTaskMBS

40.19.1 class NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that returns downloaded data directly to the app in memory.
Notes: A NSURLSessionDataTaskMBS is a concrete subclass of NSURLSessionTaskMBS. The methods in the NSURLSessionDataTaskMBS class are documented in NSURLSessionTaskMBS.

A data task returns data directly to the app (in memory) as one or more NSData objects. When you use a data task:

- During upload of the body data (if your app provides any), the session periodically calls the taskDidSendBodyData event with status information.
- After receiving an initial response, the session calls the dataTaskDidReceiveResponse event to let you examine the status code and headers, and optionally convert the data task into a download task.
- During the transfer, the session calls dataTaskDidReceiveData event to provide your app with the content as it arrives.
- Upon completion, the session calls the dataTaskWillCacheResponse event to let you determine whether the response should be cached.

For examples of using data tasks for fetching and uploading data, see Fetching Website Data into Memory and Uploading Data to a Website on Apple website.
Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Adding NSURLSession classes for Xojo

40.19.2 Methods

40.19.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.20 class NSURLSessionDownloadTaskMBS

40.20.1 class NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that stores downloaded data to file.
Notes: An NSURLSessionDownloadTaskMBS is a concrete subclass of NSURLSessionTask. Most of the methods associated with this class are documented in NSURLSessionTaskMBS.

Download tasks directly write the server,Äôs response data to a temporary file, providing your app with progress updates as data arrives from the server. When you use download tasks in background sessions, these downloads continue even when your app is suspended or is otherwise not running.

You can pause (cancel) download tasks and resume them later (assuming the server supports doing so). You can also resume downloads that failed because of network connectivity problems.

When you use a download task, your NSURLSessionMBS subclass receives several callbacks unique to download scenarios.

- During download, the session periodically calls the downloadTaskDidWriteData event with status information.
- Upon successful completion, the session calls the downloadTaskDidFinishDownloadingToURL event or completion handler. In that method, you must either open the file for reading or move it to a permanent location in your app,Äôs sandbox container directory.
- Upon unsuccessful completion, the session calls the taskDidCompleteWithError method or completion handler. Unlike NSURLSessionDataTaskMBS or NSURLSessionUploadTaskMBS, a download task reports server-side errors reported through HTTP status codes into corresponding NSError objects.

Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Adding NSURLSession classes for Xojo

40.20.2 Methods

40.20.3 cancelByProducingResumeData(Handler as ProducingResumeDataCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Cancels a download and calls a callback with resume data for later use.
Notes: A download can be resumed only if the following conditions are met:

- The resource has not changed since you first requested it
- The task is an HTTP or HTTPS GET request
- The server provides either the ETag or Last-Modified header (or both) in its response
- The server supports byte-range requests
- The temporary file hasn,Äôt been deleted by the system in response to disk space pressure

Calls the handler later when finished.

40.20.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.20.5 NSURLSessionDownloadTaskResumeData as string

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Key in the userInfo dictionary of an NSErrorMBS received during a failed download.

40.20.6 Delegates

40.20.7 ProducingResumeDataCompletedMBS(downloadTask as NSURLSessionDownloadTaskMBS, resumeData as MemoryBlock, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A completion handler that is called when the download has been successfully canceled.
Notes: If the download is resumable, the completion handler is provided with a resumeData object. Your app can later pass this object to a session,Äôs downloadTaskWithResumeDat methods in NSURLSessionMBS class to create a new task that resumes the download where it left off.

40.21 class NSURLSessionMBS

40.21.1 class NSURLSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An object that coordinates a group of related, network data-transfer tasks.
Notes: Read more on Apple's website:
https://developer.apple.com/documentation/foundation/nsurlsession

MBS Plugin implements all delegates within NSURLSessionMBS class, so you can subclass it and fill events.

40.21.2 Methods

40.21.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on MacOS 10.9 or newer.

40.21.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates new object referencing shared session.
See also:

- 40.21.5 Constructor(configuration as NSURLSessionConfigurationMBS) 8130

40.21.5 Constructor(configuration as NSURLSessionConfigurationMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a session with the specified session configuration.
Notes: configuration: A configuration object that specifies certain behaviors, such as caching policies, timeouts, proxies, pipelining, TLS versions to support, cookie policies, credential storage, and so on.
See NSURLSessionConfigurationMBS class for more information.
See also:

- 40.21.4 Constructor 8129

40.21.6 dataTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of a URL based on the specified URL request object.
Notes: request: A URL request object that provides request-specific information such as the URL, cache policy, request type, and body data or body stream.

Returns he new session data task.

By creating a task based on a request object, you can tune various aspects of the task,Äôs behavior, including the cache policy and timeout interval.
After you create the task, you must start it by calling its resume method.
See also:

- 40.21.7 dataTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8130

40.21.7 dataTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of a URL based on the specified URL request object, and calls a handler upon completion.
Notes: request: A URL request object that provides the URL, cache policy, request type, body data or body stream, and so on.
completionHandler: The completion handler to call when the load request is complete.
See also:

- 40.21.6 dataTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDataTaskMBS 8130

40.21.8 dataTaskWithURL(URL as String) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of the specified URL.
Notes: URL: The URL to be retrieved.

After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the response metadata, response data, and so on.
See also:

- 40.21.9 dataTaskWithURL(URL as String, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8131

40.21.9 dataTaskWithURL(URL as String, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of the specified URL, then calls a handler upon completion.
Notes: url: The URL to be retrieved.
handler: The completion handler to call when the load request is complete.
See also:

- 40.21.8 dataTaskWithURL(URL as String) as NSURLSessionDataTaskMBS 8131

40.21.10 downloadTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of a URL based on the specified URL request object and saves the results to a file.
Notes: request: A URL request object that provides the URL, cache policy, request type, body data or body stream, and so on.

Returns the new session download task.

By creating a task based on a request object, you can tune various aspects of the task,Äôs behavior, including the cache policy and timeout interval.
After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with progress notifications, the location of the resulting temporary file, and so on.

- 40.21.11 downloadTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionUpload-TaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8132

40.21.11 downloadTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of a URL based on the specified URL request object, saves the results to a file, and calls a handler upon completion.
Notes: request: A URL request object that provides the URL, cache policy, request type, body data or body stream, and so on.
Handler: The completion handler to call when the load request is complete.
See also:

- 40.21.10 downloadTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDownloadTaskMBS 8131

40.21.12 downloadTaskWithResumeData(resumeData as MemoryBlock) as NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task to resume a previously canceled or failed download.
Notes: resumeData: A data object that provides the data necessary to resume a download.

After you create the task, you must start it by calling its resume method.
This method is equivalent to the downloadTaskWithResumeData:completionHandler: with a nil completion handler. For detailed usage information, including ways to obtain a resume data object, see that method.
See also:

- 40.21.13 downloadTaskWithResumeData(resumeData as MemoryBlock, handler as NSURLSessionU-ploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8132

40.21.13 downloadTaskWithResumeData(resumeData as MemoryBlock, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task to resume a previously canceled or failed download and calls a handler upon completion.
Notes: resumeData: A data object that provides the data necessary to resume the download.

Handler: The completion handler to call when the load request is complete.
See also:

- 40.21.12 downloadTaskWithResumeData(resumeData as MemoryBlock) as NSURLSessionDownloadTaskMBS 8132

40.21.14 downloadTaskWithURL(URL as String) as NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of the specified URL and saves the results to a file.
Notes: url: The URL to download.

After you create the task, you must start it by calling its resume method.
See also:

- 40.21.15 downloadTaskWithURL(URL as String, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8133

40.21.15 downloadTaskWithURL(URL as String, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of the specified URL, saves the results to a file, and calls a handler upon completion.
Notes: url: An URL that provides the URL to download.
Handler: The completion handler to call when the load request is complete.
See also:

- 40.21.14 downloadTaskWithURL(URL as String) as NSURLSessionDownloadTaskMBS 8133

40.21.16 finishTasksAndInvalidate

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Invalidates the session, allowing any outstanding tasks to finish.
Notes: This method returns immediately without waiting for tasks to finish. Once a session is invalidated, new tasks cannot be created in the session, but existing tasks continue until completion. After the last task finishes and the session makes the last delegate call related to those tasks, the session calls the DidBecomeInvalidWithError event, then breaks references to the delegate and callback objects. After invalidation, session

objects cannot be reused.
To cancel all outstanding tasks, call invalidateAndCancel instead.

Important
Calling this method on the session returned by the sharedSession method has no effect.

40.21.17 flush(Handler as NSURLSessionFlushCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Flushes cookies and credentials to disk, clears transient caches, and ensures that future requests occur on a new TCP connection.
Notes: Handler: The completion handler to call when the flush operation is complete.

40.21.18 invalidateAndCancel

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Cancels all outstanding tasks and then invalidates the session.
Notes: Once invalidated, references to the delegate and callback objects are broken. After invalidation, session objects cannot be reused.
To allow outstanding tasks to run until completion, call finishTasksAndInvalidate instead.

Important
Calling this method on the session returned by the sharedSession method has no effect.

40.21.19 reset(Handler as NSURLSessionResetCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Resets the session.
Notes: Empties all cookies, caches and credential stores, removes disk files, flushes in-progress downloads to disk, and ensures that future requests occur on a new socket.

Handler: The completion handler to call when the reset operation is complete.

40.21.20 sharedSession as NSURLSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The shared singleton session object.
Notes: For basic requests, the NSURLSessionMBS class provides a shared singleton session object that gives you a reasonable default behavior for creating tasks. Use the shared session to fetch the contents of a URL to memory with just a few lines of code.
Unlike the other session types, you don,Äôt create the shared session; you merely access it by using this property directly. As a result, you don,Äôt provide a delegate or a configuration object.

Limitations of the Shared Session
Because the shared session has neither a delegate nor a customizable configuration object, the shared session has important limitations:

- You can,Äôt obtain data incrementally as it arrives from the server.
- You can,Äôt significantly customize the default connection behavior.
- Your ability to perform authentication is limited.
- You can,Äôt perform background downloads or uploads when your app isn,Äôt running.

The shared session uses the shared NSURLCacheMBS, NSHTTPCookieStorageMBS, and NSURLCredentialStorageMBS objects, uses a shared custom networking protocol lis, and is based on a default configuration.

In general, when working with a shared session, you should avoid customizing the cache, cookie storage, or credential storage (unless you are already doing so with NSURLConnectionMBS). There,Äôs a good chance that you,Äôll outgrow the capabilities of the default session, at which point you,Äôll have to rewrite all of those customizations to work with your custom URL sessions.
In other words, if you,Äôre doing anything with caches, cookies, authentication, or custom networking protocols, you should probably be using a default session instead of the shared session.

40.21.21 streamTaskWithHostName(hostname as String, Port as Integer) as NSURLSessionStreamTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that establishes a bidirectional TCP/IP connection to a specified hostname and port.
Notes: hostname: The hostname of the connection endpoint.
port: The port of the connection endpoint.

Returns the new session stream task.

After you create the task, you must start it by calling its resume method.

40.21.22 Tasks as NSURLSessionTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Queries all tasks for the session.
Notes: Please use the asynchronous variant if possible.
See also:

- 40.21.23 Tasks(Handler as NSURLSessionTasksCompletedMBS, tag as variant = nil) 8136

40.21.23 Tasks(Handler as NSURLSessionTasksCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asynchronously calls a completion callback with all data, upload, and download tasks in a session.
Notes: Handler: The completion handler to call with the list of tasks. This handler is executed on the delegate queue.

The arrays passed to the completion handler contain any tasks that you have created within the session, not including any tasks that have been invalidated after completing, failing, or being cancelled.
See also:

- 40.21.22 Tasks as NSURLSessionTaskMBS() 8136

40.21.24 uploadTaskWithRequest(request as NSURLRequestMBS, data as MemoryBlock) as NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for the specified URL request object and uploads the provided data.
Notes: request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
Data: The body data for the request.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like

HTTP request headers.
After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the upload,Äôs progress, response metadata, response data, and so on.
See also:

- 40.21.25 uploadTaskWithRequest(request as NSURLRequestMBS, data as MemoryBlock, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8137
- 40.21.26 uploadTaskWithRequest(request as NSURLRequestMBS, file as folderItem) as NSURLSessionUploadTaskMBS 8138
- 40.21.27 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8139

40.21.25 uploadTaskWithRequest(request as NSURLRequestMBS, data as MemoryBlock, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for the specified URL request object, uploads the provided data, and calls a handler upon completion.
Notes: request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
bodyData: The body data for the request.
Handler: The completion handler to call when the load request is complete.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like HTTP request headers.

Unlike uploadTaskWithRequest, this method returns the response body after it has been received in full, and does not require you to write a custom delegate to obtain the response body.

By using a completion handler, the task bypasses calls to delegate methods for response and data delivery, and instead provides any resulting data, response, or error inside the completion handler. Delegate methods for handling authentication challenges, however, are still called.

Typically you pass a nil completion handler only when creating tasks in sessions whose delegates include a dataTaskDidReceiveData method. However, if you do not need the response data, use key-value observing to watch for changes to the task,Äôs status to determine when it completes.

After you create the task, you must start it by calling its resume method.

If the request completes successfully, the data parameter of the completion handler block contains the resource data, and the error parameter is nil. If the request fails, the data parameter is nil, and the error parameter contains information about the failure. If a response from the server is received, regardless of whether the request completes successfully or fails, the response parameter contains that information.

- 40.21.26 uploadTaskWithRequest(request as NSURLRequestMBS, file as folderItem) as NSURLSessionUploadTaskMBS 8138
- 40.21.27 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8139

40.21.26 uploadTaskWithRequest(request as NSURLRequestMBS, file as folderItem) as NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for uploading the specified file.
Notes: request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
file: The file to upload.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like HTTP request headers.
After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the upload,Äôs progress, response metadata, response data, and so on.

- 40.21.27 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 8139

40.21.27 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for uploading the specified file, then calls a handler upon completion.
Notes: request: An NSURLRequestMBS instance that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
file: The file to upload.
Handler: The completion handler to call when the load request is complete.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like HTTP request headers.

Unlike uploadTaskWithRequest, this method returns the response body after it has been received in full, and does not require you to write a custom delegate to obtain the response body.

By using a completion handler, the task bypasses calls to delegate methods for response and data delivery, and instead provides any resulting data, response, or error inside the completion handler. Delegate methods for handling authentication challenges, however, are still called.

Typically you usually pass a nil completion handler only when creating tasks in sessions whose delegates include a dataTaskDidReceiveData method. However, if you do not need the response data, use key-value observing to watch for changes to the task,Äôs status to determine when it completes.

After you create the task, you must start it by calling its resume method.

If the request completes successfully, the data parameter of the completion handler block contains the resource data, and the error parameter is nil. If the request fails, the data parameter is nil, and the error parameter contains information about the failure. If a response from the server is received, regardless of whether the request completes successfully or fails, the response parameter contains that information.

- 40.21.26 uploadTaskWithRequest(request as NSURLRequestMBS, file as folderItem) as NSURLSessionUploadTaskMBS 8138

40.21.28 uploadTaskWithStreamedRequest(request as NSURLRequestMBS) as NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for uploading data based on the specified URL request.
Notes: request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored, and the session calls its taskNeedNewBodyStream event to provide the body data.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to provide a request object so that you can provide metadata for the upload, such as HTTP request headers.
After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the upload,Äôs progress, response metadata, response data, and so on. The session must have a taskNeedNewBodyStream event that provides the body data to upload.

40.21.29 webSocketTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a WebSocket task for the provided URL request.
Notes: request: A URL request that indicates a WebSockets endpoint with which to connect.

You can modify the request,Äôs properties prior to calling resume on the task. The task uses these properties during the HTTP handshake phase.
To add custom protocols, add a header with the key Sec-WebSocket-Protocol, and a comma-separated list of protocols you want to negotiate with the server. The custom HTTP headers provided by the client remain unchanged for the handshake with the server.

40.21.30 webSocketTaskWithURL(URL as String) as NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a WebSocket task for the provided URL.
Notes: url: The WebSocket URL with which to connect.

The provided URL must have a ws or wss scheme.
See also:

- 40.21.31 webSocketTaskWithURL(URL as String, Protocols() as String) as NSURLSessionWebSocketTaskMBS 8141

40.21.31 webSocketTaskWithURL(URL as String, Protocols() as String) as NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a WebSocket task given a URL and an array of protocols.
Notes: url: The WebSocket URL with which to connect.
protocols: An array of protocols to negotiate with the server.

During the WebSocket handshake, the task uses the provided protocols to negotiate a preferred protocol with the server.

The protocol doesn,Äôt affect the WebSocket framing. More details on the protocol are available in RFC 6455, The WebSocket Protocol.
See also:

- 40.21.30 webSocketTaskWithURL(URL as String) as NSURLSessionWebSocketTaskMBS 8140

40.21.32 Properties

40.21.33 configuration as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A copy of the configuration object for this session.
Notes: Beginning in iOS 9 and OS X 10.11, NSURLSession objects store a copy of the NSURLSessionConfiguration object passed to their initializers, such that a session,Äôs configuration is immutable after initialization. Any further changes to mutable properties on the configuration object passed to a session,Äôs initializer or the value returned from a session,Äôs configuration property do not affect the behavior of that session. However, you can create a new session with the modified configuration object.
(Read only property)

40.21.34 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.21.35 sessionDescription as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An app-defined descriptive label for the session.
Notes: This property contains a human-readable string that you can use for debugging purposes. This value may be "" and defaults to "". The value is ignored by the session.
(Read and Write property)

40.21.36 Events

40.21.37 dataTaskDidBecomeDownloadTask(dataTask as NSURLSessionDataTaskMBS, downloadTask as NSURLSessionDownloadTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The data task was changed to a download task.
Notes: dataTask: The data task that was replaced by a download task.
downloadTask: The new download task that replaced the data task.

When your dataTaskDidReceiveResponse event uses the ResponseBecomeDownload disposition to convert the request to use a download, the session calls this event to provide you with the new download task. After this call, the session receives no further event calls related to the original data task.

40.21.38 dataTaskDidBecomeStreamTask(dataTask as NSURLSessionDataTaskMBS, downloadTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The data task was changed to a stream task.
Notes: dataTask: The data task that was replaced by a stream task.
streamTask: The new stream task that replaced the data task.

When your dataTaskDidReceiveResponse event uses the ResponseBecomeStream disposition to convert the request to use a stream, the session calls this event to provide you with the new stream task. After this call, the session receives no further event calls related to the original data task.

For requests that were pipelined, the stream task allows only reading, and the object immediately sends the delegate message writeClosedForStreamTask. You can disable pipelining for all requests in a session by setting the HTTPShouldUsePipelining property on its NSURLSessionConfigurationMBS object, or for individual requests by setting the HTTPShouldUsePipelining property on an NSURLRequestMBS object.

40.21.39 dataTaskDidReceiveData(dataTask as NSURLSessionDataTaskMBS, data as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The data task has received some of the expected data.
Notes: dataTask: The data task that provided data.
data: A data object containing the transferred data.

This event may be called more than once, and each call provides only data received since the previous call. The app is responsible for accumulating this data if needed.

40.21.40 dataTaskDidReceiveResponse(dataTask as NSURLSessionDataTaskMBS, response as NSURLResponseMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The data task received the initial reply (headers) from the server.
Notes: dataTask:

The data task that received an initial reply.
response: A URL response object populated with headers.

Return your decision whether to continue a transfer, passing a NSURLSessionResponseDisposition constant to indicate whether the transfer should continue as a data task or should become a download task.

- If you pass ResponseAllow, the task continues as a data task.
- If you pass ResponseCancel, the task is canceled.
- If you pass ResponseBecomeDownload, your delegate,Äôs dataTaskDidBecomeDownloadTask method is called to provide the new download task that supersedes the current task.

Implementing this method is optional unless you need to cancel the transfer or convert it to a download task when the response headers are first received. If you don,Äôt provide this event, the session always allows the task to continue.
You also implement this method if you need to support the fairly obscure multipart/x-mixed-replace content

type. With that content type, the server sends a series of parts, each of which is intended to replace the previous part. The session calls this method at the beginning of each part, followed by one or more calls to dataTaskDidReceiveData with the contents of that part.

Each time the dataTaskDidReceiveResponse method is called for a part, collect the data received for the previous part (if any) and process the data as needed for your application. This processing can include storing the data to the filesystem, parsing it into custom types, or displaying it to the user. Next, begin receiving the next part by calling the completion handler with the NSURLSessionResponseAllow constant. Finally, if you have also implemented taskDidCompleteWithError, the session will call it after sending all the data for the last part.

40.21.41 dataTaskWillCacheResponse(dataTask as NSURLSessionDataTaskMBS, proposedResponse as NSCachedURLResponseMBS) as NSCachedURLResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asks the event whether the data (or upload) task should store the response in the cache.
Notes: dataTask: The data (or upload) task.
proposedResponse: The default caching behavior. This behavior is determined based on the current caching policy and the values of certain received headers, such as the Pragma and Cache-Control headers.

Please return the new respnose:

Provide either the original proposed response, a modified version of that response, or nil to prevent caching the response.

The session calls this event after the task finishes receiving all of the expected data. If you don,Äôt implement this method, the default behavior is to use the caching policy specified in the session,Äôs configuration object. The primary purpose of this method is to prevent caching of specific URLs or to modify the userInfo dictionary associated with the URL response.

This method is called only if the NSURLProtocol handling the request decides to cache the response. As a rule, responses are cached only when all of the following are true:

- The request is for an HTTP or HTTPS URL (or your own custom networking protocol that supports caching).
- The request was successful (with a status code in the 200–299 range).
- The provided response came from the server, rather than out of the cache.
- The session configuration,Äôs cache policy allows caching.

- The provided NSURLRequestMBS object's cache policy (if applicable) allows caching.
- The cache-related headers in the server,Äôs response (if present) allow caching.
- The response size is small enough to reasonably fit within the cache. (For example, if you provide a disk cache, the response must be no larger than about 5% of the disk cache size.)

40.21.42 didBecomeInvalid(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Tells the URL session that the session has been invalidated.
Notes: error: The error that caused invalidation, or nil if the invalidation was explicit.

If you invalidate a session by calling its finishTasksAndInvalidate method, the session waits until after the final task in the session finishes or fails before calling this event. If you call the invalidateAndCancel method, the session calls this event immediately.

40.21.43 didReceiveChallenge(challenge as NSURLAuthenticationChallengeMBS, byref disposition as Integer, byref credential as NSURLCredentialMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Requests credentials from the delegate in response to a session-level authentication request from the remote server.
Notes: session: The session containing the task that requested authentication.
challenge: An object that contains the request for authentication.

disposition—One of several constants that describes how the challenge should be handled.
credential—The credential that should be used for authentication if disposition is NSURLSessionAuthChallengeUseCredential, otherwise nil.

This method is called in two situations:

- When a remote server asks for client certificates or Windows NT LAN Manager (NTLM) authentication, to allow your app to provide appropriate credentials
- When a session first establishes a connection to a remote server that uses SSL or TLS, to allow your app to verify the server,Äôs certificate chain

If you do not implement this event, the session calls its delegate,Äôs taskDidReceiveChallenge method instead.
Note

This method handles only the NSURLAuthenticationMethodNTLM, NSURLAuthenticationMethodNegotiate, NSURLAuthenticationMethodClientCertificate, and NSURLAuthenticationMethodServerTrust authentication types. For all other authentication schemes, the session calls only the taskDidReceiveChallenge method.

40.21.44 downloadTaskDidFinishDownloadingToURL(downloadTask as NSURLSessionDownloadTaskMBS, location as String, file as FolderItem)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A download task has finished downloading.
Notes: downloadTask: The download task that finished.
location: A file URL for the temporary file. Because the file is temporary, you must either open the file for reading or move it to a permanent location in your app,Äôs sandbox container directory before returning from this event.

40.21.45 downloadTaskDidResumeAtOffset(downloadTask as NSURLSessionDownloadTaskMBS, fileOffset as Int64, expectedTotalBytes as Int64)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The download task has resumed downloading.
Notes: downloadTask: The download task that resumed. See explanation in the discussion.
fileOffset: If the file's cache policy or last modified date prevents reuse of the existing content, then this value is zero. Otherwise, this value is an integer representing the number of bytes on disk that do not need to be retrieved again.

In some situations, it may be possible for the transfer to resume earlier in the file than where the previous transfer ended.
expectedTotalBytes: The expected length of the file, as provided by the Content-Length header. If this header was not provided, the value is NSURLSessionTransferSizeUnknown (-1).

If a resumable download task is canceled or fails, you can request a resumeData object that provides enough information to restart the download in the future. Later, you can call downloadTaskWithResumeData with that data.

When you call those methods, you get a new download task. As soon as you resume that task, the session calls this method with that new task to indicate that the download is resumed.

40.21.46 downloadTaskDidWriteData(downloadTask as NSURLSessionDownloadTaskMBS, bytesWritten as Int64, totalBytesWritten as Int64, totalBytesExpectedToWrite as Int64)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Periodically informs the delegate about the download,Äôs progress.
Notes: downloadTask: The download task.
bytesWritten: The number of bytes transferred since the last time this event was called.
totalBytesWritten: The total number of bytes transferred so far.
totalBytesExpectedToWrite: The expected length of the file, as provided by the Content-Length header. If this header was not provided, the value is NSURLSessionTransferSizeUnknown (-1).

40.21.47 streamTaskBetterRouteDiscoveredForStreamTask(streamTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A better route to the host has been detected for the stream.
Notes: streamTask: The stream task that discovered a better route.

This method is called when the URL loading system determines that a better route to the endpoint host is available. For example, this method may be called when a Wi-Fi interface becomes available.
You should consider completing pending work and creating a new stream task in order to take advantage of better routes when they become available.

40.21.48 streamTaskDidBecomeInputStream(streamTask as NSURLSessionStreamTaskMBS, inputStream as NSInputStreamMBS, outputStream as NSOutputStreamMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The stream task has been completed as a result of the stream task calling the captureStreams method.
Notes: streamTask: The stream task that has been completed.
inputStream: The created input stream. This NSInputStream object is unopened.
outputStream: The created output stream. This NSOutputStream object is unopened

This event will only be called after all enqueued reads and writes for the stream task have been completed.

40.21.49 streamTaskReadClosedForStreamTask(streamTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The read side of the underlying socket has been closed.
Notes: streamTask: The stream task that closed reads.

This method may be called even if no reads are currently in progress. This method does not indicate that the stream reached end-of-file (EOF), such that no more data can be read.

40.21.50 streamTaskWriteClosedForStreamTask(streamTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The write side of the underlying socket has been closed.
Notes: streamTask: The stream task that closed writes.

This method may be called even if no writes are currently in progress.

40.21.51 taskDidCompleteWithError(task as NSURLSessionTaskMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The task finished transferring data.
Notes: task: The task whose request finished transferring data.
error: If an error occurred, an error object indicating how the transfer failed, otherwise nil.

Server errors are not reported through the error parameter. The only errors your delegate receives through the error parameter are client-side errors, such as being unable to resolve the hostname or connect to the host.

40.21.52 taskDidFinishCollectingMetrics(task as NSURLSessionTaskMBS, metrics as NSURLSessionTaskMetricsMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The session finished collecting metrics for the task.
Notes: task: The task whose metrics have been collected.

metrics: The collected metrics.

40.21.53 taskDidSendBodyData(task as NSURLSessionTaskMBS, bytesSent as Int64, totalBytesSent as Int64, totalBytesExpectedToSend as Integer)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Periodically informs the delegate of the progress of sending body content to the server.
Notes: task: The data task.
bytesSent: The number of bytes sent since the last time this event was called.
totalBytesSent: The total number of bytes sent so far.
totalBytesExpectedToSend: The expected length of the body data. The URL loading system can determine the length of the upload data in three ways:

- From the length of the NSData object provided as the upload body.
- From the length of the file on disk provided as the upload body of an upload task (not a download task).
- From the Content-Length in the request object, if you explicitly set it.

Otherwise, the value is NSURLSessionTransferSizeUnknown (-1) if you provided a stream or body data object, or zero (0) if you did not.

The totalBytesSent and totalBytesExpectedToSend parameters are also available as NSURLSessionTaskMBS properties countOfBytesSent and countOfBytesExpectedToSend.

40.21.54 taskIsWaitingForConnectivity(task as NSURLSessionTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The task is waiting until suitable connectivity is available before beginning the network load.
Notes: task: The task that is waiting for a change in connectivity.

This method is called if the waitsForConnectivity property of NSURLSessionConfigurationMBS is true, and sufficient connectivity is unavailable. The delegate can use this opportunity to update the user interface; for example, by presenting an offline mode or a cellular-only mode.

This method is called, at most, once per task, and only if connectivity is initially unavailable. It is never called for background sessions because waitsForConnectivity is ignored for those sessions.

40.21.55 taskWillPerformHTTPRedirection(task as NSURLSessionTaskMBS, response as NSURLResponseMBS, request as NSURLRequestMBS) as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The remote server requested an HTTP redirect.
Notes: task: The task whose request resulted in a redirect.
response: An object containing the server,Äôs response to the original request.
request: A URL request object filled out with the new location.

Return either the value of the request parameter, a modified URL request object, or NULL to refuse the redirect and return the body of the redirect response.

This method is called only for tasks in default and ephemeral sessions. Tasks in background sessions automatically follow redirects.

40.21.56 webSocketTaskDidCloseWithCode(webSocketTask as NSURLSessionWebSocketTaskMBS, closeCode as Integer, reason as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The WebSocket task received a close frame from the server endpoint, optionally including a close code and reason from the server.
Notes: webSocketTask: The WebSocket task that closed.
closeCode: The close code provided by the server. If the close frame didn,Äôt include a close code, this value is 0.
reason: The close reason provided by the server. If the close frame didn,Äôt include a reason, this value is nil.

40.21.57 webSocketTaskDidOpenWithProtocol(webSocketTask as NSURLSessionWebSocketTaskMBS, protocol as String)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The WebSocket task successfully negotiated the handshake with the endpoint, indicating the negotiated protocol.
Notes: webSocketTask: The WebSocket task that opened.
protocol: The protocol picked during the handshake phase. This parameter is nil if the server did not pick a protocol, or if the client did not advertise protocols when creating the task.

If the handshake fails, the task doesn,Äôt call this event.

40.21.58 Constants

Auth Challenge Disposition Modes

Constant	Value	Description
AuthChallengeCancelAuthenticationChallenge	2	The entire request will be canceled; the credential parameter is i
AuthChallengePerformDefaultHandling	1	Default handling for the challenge - as if this delegate were not the credential parameter is ignored.
AuthChallengeRejectProtectionSpace	3	This challenge is rejected and the next authentication protection be tried; the credential parameter is ignored.
AuthChallengeUseCredential	0	Use the specified credential, which may be nil

Delayed Request Disposition

Constant	Value	Description
DelayedRequestCancel	2	Cancel the task; the request parameter is ignored.
DelayedRequestContinueLoading	0	Use the original request provided when the task was created; the request parameter is ignored.
DelayedRequestUseNewRequest	1	Use the specified request, which may not be nil.

Response Disposition

Constant	Value	Description
ResponseAllow	1	Allow the load operation to continue.
ResponseBecomeDownload	2	Convert the response for this request to use a NSURLSessionDownloadTaskMBS.
ResponseBecomeStream	3	Convert the response for this request to use a NSURLSessionStreamTaskMBS.
ResponseCancel	0	Cancel the load.

40.21.59 Delegates

40.21.60 NSURLSessionAllTasksCompletedMBS(tasks() as NSURLSessionTaskMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asynchronously calls a completion callback with all tasks in a session.
Notes: Handler: The completion handler to call with the list of tasks.

40.21.61 NSURLSessionDataTaskCompletedMBS(data as MemoryBlock, response as NSURLResponseMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call when the load request is complete.
Notes: data: The data returned by the server.
response: An object that provides response metadata, such as HTTP headers and status code. If you are making an HTTP or HTTPS request, the returned object is actually an NSHTTPURLResponseMBS object.
error: An error object that indicates why the request failed, or nil if the request was successful.

40.21.62 NSURLSessionDownloadTaskCompletedMBS(location as String, file as FolderItem, response as NSURLResponseMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call when the load request is complete.
Notes: location: The location of a temporary file where the server,Äôs response is stored. You must move this file or open it for reading before your completion handler returns. Otherwise, the file is deleted, and the data is lost.
response: An object that provides response metadata, such as HTTP headers and status code. If you are making an HTTP or HTTPS request, the returned object is actually an NSHTTPURLResponse object.
error: An error object that indicates why the request failed, or nil if the request was successful.

For your convenience we provide a folderitem for the location URL.

40.21.63 NSURLSessionFlushCompletedMBS(tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call when the flush operation is complete.

40.21.64 NSURLSessionResetCompletedMBS(tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call when the reset operation is complete.

40.21.65 NSURLSessionTasksCompletedMBS(dataTasks() as NSURLSessionDataTaskMBS, uploadTasks() as NSURLSessionUploadTaskMBS, downloadTasks() as NSURLSessionDownloadTaskMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call with the list of tasks.
Notes: The arrays passed to the completion handler contain any tasks that you have created within the session, not including any tasks that have been invalidated after completing, failing, or being cancelled.

40.21.66 NSURLSessionUploadTaskCompletedMBS(data as MemoryBlock, response as NSURLResponseMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call when the load request is complete.
Notes: data: The data returned by the server.
response: An object that provides response metadata, such as HTTP headers and status code. If you are making an HTTP or HTTPS request, the returned object is actually an NSHTTPURLResponse object.
error: An error object that indicates why the request failed, or nil if the request was successful.

40.22 class NSURLSessionStreamTaskMBS

40.22.1 class NSURLSessionStreamTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that is stream-based.
Notes: NSURLSessionStreamTaskMBS is a concrete subclass of NSURLSessionTaskMBS. Many of the methods in the NSURLSessionStreamTaskMBS class are documented in NSURLSessionTaskMBS.
The NSURLSessionStreamTaskMBS class provides an interface a TCP/IP connection created via NSURLSession. Tasks may be created from an NSURLSession using the streamTaskWithHostName and streamTaskWithNetService methods. They may also created as a result of an NSURLSessionDataTaskMBS being upgraded via the HTTP Upgrade: response header and appropriate use of the HTTPShouldUsePipelining option of NSURLSessionConfigurationMBS.

See RFC 2817 and RFC 6455 for information about the Upgrade: header.
An NSURLSessionStreamTask object perform sasynchronous reads and writes, which are enqueued and executed serially, calling a handler upon completion being on the session delegate queue. If the task is canceled, all enqueued reads and writes will call their completion handlers with an appropriate error.

When working with APIs that accept NSStreamMBS objects, you can create NSInputStreamMBS and NSOutputStreamMBS objects from an NSURLSessionStreamTaskMBS object by calling the captureStreams method.
Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Adding NSURLSession classes for Xojo

40.22.2 Methods

40.22.3 captureStreams

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any already enqueued reads and writes, and then invokes the streamTaskDidBecomeInputStream event.

40.22.4 closeRead

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any enqueued reads and writes, and then closes the read side of the underlying socket.
Notes: You may continue to write data using the writeData method after calling this method. Any calls to

readData after calling this method will result in an error.

40.22.5 closeWrite

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any enqueued reads and writes, and then closes the write side of the underlying socket.
Notes: You may continue to read data using the readDat method after calling this method. Any calls to writeData after calling this method will result in an error.
Because the server may continue to write bytes to the client, it is recommended that you continue reading until the stream reaches end-of-file (EOF).

40.22.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.22.7 readData(minBytes as Integer, maxBytes as Integer, timeout as Double, Handler as NSURLSessionStreamTaskReadDataCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asynchronously reads a number of bytes from the stream, and calls a handler upon completion.
Notes: minBytes: The minimum number of bytes to read.
maxBytes: The maximum number of bytes to read.
timeout: A timeout for reading bytes. If the read is not completed within the specified interval, the read is canceled and the completionHandler is called with an error. Pass 0 to prevent a read from timing out.

Handler: The completion handler to call when all bytes are read, or an error occurs.

40.22.8 startSecureConnection

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any enqueued reads and writes, and establishes a secure connection.
Notes: Authentication callbacks are sent to the taskDidReceiveChallenge event in NSURLSessionMBS class.

40.22.9 writeData(data as MemoryBlock, timeout as Double, Handler as NSURLSessionStreamTaskWriteDataCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asynchronously writes the specified data to the stream, and calls a handler upon completion.
Notes: data: The data to be written.
timeout: A timeout for writing bytes. If the write is not completed within the specified interval, the write is canceled and the completionHandler is called with an error. Pass 0 to prevent a write from timing out.

completionHandler: The completion handler to call when all bytes are written, or an error occurs.

There is no guarantee that the remote side of the stream has received all of the written bytes at the time that completionHandler is called, only that all of the data has been written to the kernel.

40.22.10 Delegates

40.22.11 NSURLSessionStreamTaskReadDataCompletedMBS(streamTask as NSURLSessionStreamTaskMBS, data as MemoryBlock, atEOF as Boolean, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call when all bytes are read, or an error occurs.
Notes: data: The data read from the stream.
atEOF: Whether or not the stream reached end-of-file (EOF), such that no more data can be read.
error: An error object that indicates why the read failed, or nil if the read was successful.

40.22.12 NSURLSessionStreamTaskWriteDataCompletedMBS(streamTask as NSURLSessionStreamTaskMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The completion handler to call when all bytes are written, or an error occurs.
Notes: error: An error object that indicates why the write failed, or nil if the write was successful.

40.23 class NSURLSessionTaskMBS

40.23.1 class NSURLSessionTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A task, like downloading a specific resource, performed in a URL session.
Notes: The NSURLSessionTaskMBS class is the base class for tasks in a URL session. Tasks are always part of a session; you create a task by calling one of the task creation methods on a NSURLSession instance. The method you call determines the type of task.

- Use NSURLSessionMBS,Äôs dataTaskWithURL and related methods to create NSURLSessionDataTaskMBS instances. Data tasks request a resource, returning the server,Äôs response as one or more NSData objects in memory. They are supported in default, ephemeral, and shared sessions, but are not supported in background sessions.
- Use NSURLSessionMBS,Äôs uploadTaskWithRequest and related methods to create NSURLSessionUploadTaskMBS instances. Upload tasks are like data tasks, except that they make it easier to provide a request body so you can upload data before retrieving the server,Äôs response. Additionally, upload tasks are supported in background sessions.
- Use NSURLSessionMBS,Äôs downloadTaskWithURL and related methods to create NSURLSessionDownloadTaskMBS instances. Download tasks download a resource directly to a file on disk. Download tasks are supported in any type of session.
- Use NSURLSessionMBS,Äôs streamTaskWithHostName or streamTaskWithNetService to create NSURLSessionStreamTaskMBS instances. Stream tasks establish a TCP/IP connection from a host name and port or a net service object.

After you create a task, you start it by calling its resume method. The session then maintains a strong reference to the task until the request finishes or fails; you don,Äôt need to maintain a reference to the task unless it,Äôs useful for your app,Äôs internal bookkeeping.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Adding NSURLSession classes for Xojo

40.23.2 Methods

40.23.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.9 or newer.

40.23.4 Cancel

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Cancels the task.
Notes: This method returns immediately, marking the task as being canceled. Once a task is marked as being canceled, taskDidCompleteWithError event is called, passing an error in the domain NSURLErrorDomain with the code NSURLErrorCancelled. A task may, under some circumstances, send messages to its delegate before the cancelation is acknowledged.
This method may be called on a task that is suspended.

40.23.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.23.6 copy as NSURLSessionTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Copies the task.

40.23.7 PriorityDefault as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: One of the priorities.
Notes: The default URL session task priority, used implicitly for any task you have not prioritized. The floating point value of this constant is 0.5.

40.23.8 PriorityHigh as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: One of the priorities.
Notes: A high URL session task priority, with a floating point value above the default value and below the maximum of 1.0.

40.23.9 PriorityLow as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: One of the priorities.
Notes: A low URL session task priority, with a floating point value above the minimum of 0 and below the default value.

40.23.10 resume

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Resumes the task, if it is suspended.
Notes: Newly-initialized tasks begin in a suspended state, so you need to call this method to start the task.

40.23.11 suspend

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Temporarily suspends a task.
Notes: A task, while suspended, produces no network traffic and is not subject to timeouts. A download task can continue transferring data at a later time. All other tasks must start over when resumed.

40.23.12 Properties

40.23.13 countOfBytesClientExpectsToReceive as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A best-guess upper bound on the number of bytes the client expects to receive.
Notes: The value set for this property should account for the size of both HTTP response headers and the response body. If no value is specified, the system uses -1 instead. This property is used by the system to optimize the scheduling of URL session tasks. Developers are strongly encouraged to provide an approximate upper bound, or an exact byte count, if possible, rather than accept the default.
(Read only property)

40.23.14 countOfBytesClientExpectsToSend as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A best-guess upper bound on the number of bytes the client expects to send.

Notes: The value set for this property should account for the size of HTTP headers and body data or body stream. If no value is specified, the system uses -1 instead. This property is used by the system to optimize the scheduling of URL session tasks. Developers are strongly encouraged to provide an approximate upper bound, or an exact byte count, if possible, rather than accept the default.
(Read only property)

40.23.15 countOfBytesExpectedToReceive as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task expects to receive in the response body.
Notes: This value is determined based on the Content-Length header received from the server. If that header is absent, the value is NSURLSessionTransferSizeUnknown = -1.
(Read only property)

40.23.16 countOfBytesExpectedToSend as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task expects to send in the request body.
Notes: The URL loading system can determine the length of the upload data in three ways:

- From the length of the data object provided as the upload body.
- From the length of the file on disk provided as the upload body of an upload task (not a download task).
- From the Content-Length in the request object, if you explicitly set it.

Otherwise, the value is NSURLSessionTransferSizeUnknown (-1) if you provided a stream or body data object, or zero (0) if you did not.
(Read only property)

40.23.17 countOfBytesReceived as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task has received from the server in the response body.
Notes: To be notified when this value changes, implement the dataTaskDidReceiveData event (for data and upload tasks) or the downloadTaskDidWriteData event (for download tasks).
(Read only property)

40.23.18 countOfBytesSent as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task has sent to the server in the request body.
Notes: This byte count includes only the length of the request body itself, not the request headers.
To be notified when this value changes, implement the taskDidSendBodyData event in your NSURLSession-MBS class.
(Read only property)

40.23.19 currentRequest as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The URL request object currently being handled by the task.
Notes: This value is typically the same as the initial request (originalRequest) except when the server has responded to the initial request with a redirect to a different URL.
(Read only property)

40.23.20 earliestBeginDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The earliest date at which the network load should begin.
Notes: For tasks created from background NSURLSessionMBS instances, this property indicates that the network load should not begin any earlier than this date. Setting this property does not guarantee that the load will begin at the specified date, but only that it will not begin sooner. If not specified, no start delay is used.
This property has no effect for tasks created from nonbackground sessions.
(Read and Write property)

40.23.21 earliestBeginDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The earliest date at which the network load should begin.
Notes: For tasks created from background NSURLSessionMBS instances, this property indicates that the network load should not begin any earlier than this date. Setting this property does not guarantee that the load will begin at the specified date, but only that it will not begin sooner. If not specified, no start delay is used.
This property has no effect for tasks created from nonbackground sessions.
(Read and Write property)

40.23.22 error as NSErrorMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An error object that indicates why the task failed.
Notes: This value is nil if the task is still active or if the transfer completed successfully.
(Read only property)

40.23.23 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.23.24 originalRequest as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The original request object passed when the task was created.
Notes: This value is typically the same as the currently active request (currentRequest) except when the server has responded to the initial request with a redirect to a different URL.
(Read only property)

40.23.25 Priority as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The relative priority at which you,Äôd like a host to handle the task, specified as a floating point value between 0.0 (lowest priority) and 1.0 (highest priority).
Notes: To provide hints to a host on how to prioritize URL session tasks from your app, specify a priority for each task. Specifying a priority provides only a hint and does not guarantee performance. If you don,Äôt specify a priority, a URL session task has a priority of NSURLSessionTaskPriorityDefault, with a value of 0.5.

There are three named priorities you can employ, described in URL Session Task Priority.

You can specify or change a task,Äôs priority at any time, but not all networking protocols respond to changes after a task has started. There is no API to let you determine the effective priority for a task from a host,Äôs perspective.
(Read and Write property)

40.23.26 response as NSURLResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The server,Äôs response to the currently active request.
Notes: This object provides information about the request as provided by the server. This information always includes the original URL. It may also include an expected length, MIME type information, encoding information, a suggested filename, or a combination of these.
(Read only property)

40.23.27 state as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The current state of the task—active, suspended, in the process of being canceled, or completed.
Notes: (Read only property)

40.23.28 taskDescription as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An app-provided string value for the current task.
Notes: The system doesn,Äôt interpret this value; use it for whatever purpose you see fit. For example, you could store a description of the task for debugging purposes, or a key to track the task in your own data structures.
(Read and Write property)

40.23.29 taskIdentifier as UInt64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An identifier uniquely identifying the task within a given session.
Notes: This value is unique only within the context of a single session; tasks in other sessions may have the same taskIdentifier value.
(Read only property)

40.23.30 Constants

States

Constant	Value	Description
StateCanceling	2	The task has received a cancel message. The delegate may or may not have received a taskDidCompleteWithError message yet. A task in this state is not subject to timeouts.
StateCompleted	3	The task has completed (without being canceled), and the task's delegate receives no further callbacks. If the task completed successfully, the task,Äôs error property is nil. Otherwise, it provides an error object that tells what went wrong. A task in this state is not subject to timeouts.
StateRunning	0	The task is currently being serviced by the session. A task in this state is subject to the request and resource timeouts specified in the session configuration object.
StateSuspended	1	The task was suspended by the app. No further processing takes place until the task is resumed. A task in this state is not subject to timeouts.

40.24 class NSURLSessionTaskMetricsMBS

40.24.1 class NSURLSessionTaskMetricsMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An object encapsulating the metrics for a session task.
Notes: Each NSURLSessionTaskMetricsMBS object contains the taskInterval and redirectCount, as well as metrics for each request-and-response transaction made during the execution of the task.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

40.24.2 Methods

40.24.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.12 or newer.

40.24.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.24.5 transactionMetrics as NSURLSessionTaskTransactionMetricsMBS()

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An array of metrics for each individual request-response transaction made during the execution of the task.

40.24.6 Properties

40.24.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.24.8 redirectCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of redirects that occurred during the execution of the task.
Notes: (Read only property)

40.24.9 taskInterval as NSDateIntervalMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The time interval between when a task is instantiated and when the task is completed.
Notes: (Read only property)

40.25 class NSURLSessionTaskTransactionMetricsMBS

40.25.1 class NSURLSessionTaskTransactionMetricsMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An object that encapsualtes the performance metrics collected by the URL Loading System during the execution of a session task.
Notes: Each NSURLSessionTaskTransactionMetricsMBS object consists of a request and response property, corresponding to the request and response of the corresponding task. It also contains temporal metrics, starting with fetchStartDate and ending with responseEndDate, as well as other characteristics like networkProtocolName and resourceFetchType.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

40.25.2 Methods

40.25.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Wether this class is available.
Notes: Returns true on MacOS 10.12 or later.
Some properties are MacOS 10.15 or later.

40.25.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.25.5 Properties

40.25.6 Cellular as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection operates over a cellular interface.
Notes: You permit or deny use of cellular interfaces with the allowsCellularAccess property on NSURLSessionConfigurationMBS or allowsCellularAccess on NSMutableURLRequestMBS.
(Read only property)

40.25.7 connectEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task finished establishing the connection to the server.
Notes: This value accounts for completion of security-related and other handshakes. The value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

40.25.8 connectEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task finished establishing the connection to the server.
Notes: This value accounts for completion of security-related and other handshakes. The value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

40.25.9 connectStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started establishing a TCP connection to the server.
Notes: This value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

40.25.10 connectStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started establishing a TCP connection to the server.
Notes: This value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

40.25.11 Constrained as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this is a constrained network.
Notes: (Read only property)

40.25.12 countOfRequestBodyBytesBeforeEncoding as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The size of the upload body data, file, or stream, in bytes.
Notes: (Read only property)

40.25.13 countOfRequestBodyBytesSent as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the request body.
Notes: This value includes protocol-specific framing, transfer encoding, and content encoding.
(Read only property)

40.25.14 countOfRequestHeaderBytesSent as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the request header.
Notes: (Read only property)

40.25.15 countOfResponseBodyBytesAfterDecoding as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The size of data delivered to your delegate or completion handler.
Notes: (Read only property)

40.25.16 countOfResponseBodyBytesReceived as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the response body.
Notes: This value includes protocol-specific framing, transfer encoding, and content encoding.
(Read only property)

40.25.17 countOfResponseHeaderBytesReceived as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the response header.
Notes: (Read only property)

40.25.18 domainLookupEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time after the name lookup was completed.
Notes: This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.
(Read only property)

40.25.19 domainLookupEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time after the name lookup was completed.
Notes: This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.
(Read only property)

40.25.20 domainLookupStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started the name lookup for the resource.
Notes: This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.
(Read only property)

40.25.21 domainLookupStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started the name lookup for the resource.
Notes: This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.

(Read only property)

40.25.22 Expensive as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection operates over an expensive interface.
Notes: An expensive interface is one which is more costly or consumes more power, such as 3G or LTE as compared to ethernet or Wi-Fi. You permit or deny use of expensive interfaces with the allowsExpensiveNetworkAccess property on NSURLSessionConfigurationMBS or allowsExpensiveNetworkAccess on NSMutableURLRequestMBS.
(Read only property)

40.25.23 fetchStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time when the task started fetching the resource, from the server or locally.
Notes: (Read only property)

40.25.24 fetchStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time when the task started fetching the resource, from the server or locally.
Notes: (Read only property)

40.25.25 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.25.26 localAddress as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The IP address string of the local interface for the connection.
Notes: For multipath protocols, this is the local address of the initial flow. If the app didn,Äôt use the

connection, this value is empty.
(Read only property)

40.25.27 localPort as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The port number of the local interface for the connection.
Notes: For multipath protocols, this is the local port of the initial flow. If the app didn,Äôt use the connection, this value is 0.
(Read only property)

40.25.28 Multipath as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection uses a successfully negotiated multipath protocol.
Notes: You configure the use of multipath protocols with the multipathServiceType property on NSURLSessionConfigurationMBS.
(Read only property)

40.25.29 negotiatedTLSCipherSuite as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The TLS cipher suite the task negotiated with the endpoint for the connection.
Notes: This value is a 2-byte sequence in host byte order. See TLSCipherSuite* constants for possible values. If the task didn,Äôt negotiate an encrypted connection, this value is 0.
(Read only property)

40.25.30 negotiatedTLSProtocolVersion as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The TLS protocol version the task negotiated with the endpoint for the connection.
Notes: This value is a 2-byte sequence in host byte order. See TLSProtocolVersion* constants for possible values. If the task didn,Äôt negotiate an encrypted connection, this value is 0.
(Read only property)

40.25.31 networkProtocolName as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The network protocol used to fetch the resource.
Notes: When a proxy is configured and a tunnel connection is established, this attribute returns the value for the tunneled protocol, which is identified by the ALPN Protocol ID Identification Sequence, as per RFC 7310. For example:

- If no proxy is used, and HTTP/2 is negotiated, then h2 is returned.
- If HTTP/1.1 is used with the proxy, and the tunneled connection is HTTP/2, then h2 is returned.
- If HTTP/1.1 is used with the proxy, and there,Äôs no tunnel, then http/1.1 is returned.

(Read only property)

40.25.32 ProxyConnection as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicastes whether the task used a proxy connection to fetch the resource.
Notes: (Read only property)

40.25.33 remoteAddress as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The IP address string of the remote interface for the connection.
Notes: For multipath protocols, this is the remote address of the initial flow. If the app didn,Äôt use the connection, this value is empty.
(Read only property)

40.25.34 remotePort as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The port number of the remote interface for the connection.
Notes: For multipath protocols, this is the remote port of the initial flow. If the app didn,Äôt use the connection, this value is 0.
(Read only property)

40.25.35 request as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The transaction request.
Notes: (Read only property)

40.25.36 requestEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task finished requesting the resource, regardless of whether it was retrieved from the server or local resources.
Notes: (Read only property)

40.25.37 requestEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task finished requesting the resource, regardless of whether it was retrieved from the server or local resources.
Notes: (Read only property)

40.25.38 requestStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started requesting the resource, regardless of whether it is retrieved from the server or local resources.
Notes: (Read only property)

40.25.39 requestStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started requesting the resource, regardless of whether it is retrieved from the server or local resources.
Notes: (Read only property)

40.25.40 resourceFetchType as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A value that indicates whether the resource was loaded, pushed, or retrieved from the local cache.
Notes: (Read only property)

40.25.41 response as NSURLResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The transaction response.
Notes: This property is nil if an error occurred and no response was generated.
(Read only property)

40.25.42 responseEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task received the last byte of the resource.
Notes: (Read only property)

40.25.43 responseEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task received the last byte of the resource.
Notes: (Read only property)

40.25.44 responseStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task received the first byte of the response from the server or from local resources.
Notes: (Read only property)

40.25.45 responseStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task received the first byte of the response from the server or from local resources.
Notes: (Read only property)

40.25.46 ReusedConnection as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the task used a persistent connection to fetch the resource.
Notes: (Read only property)

40.25.47 secureConnectionEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the security handshake completed.
Notes: This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

40.25.48 secureConnectionEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the security handshake completed.
Notes: This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

40.25.49 secureConnectionStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started the TLS security handshake to secure the current connection.
Notes: This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.

(Read only property)

40.25.50 secureConnectionStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started the TLS security handshake to secure the current connection.
Notes: This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

40.25.51 Constants

Fetch Types

Constant	Value	Description
FetchTypeLocalCache	3	The resource was retrieved from the local storage.
FetchTypeNetworkLoad	1	The resource was loaded over the network.
FetchTypeServerPush	2	The resource was pushed by the server to the client.
FetchTypeUnknown	0	The manner in which the resource was fetched could not be determined.

TLS Chipher Suites

Constant	Value	Description
TLSCipherSuite_AES_128_GCM_SHA256	&h1301	AES 128 GCM SHA256
TLSCipherSuite_AES_256_GCM_SHA384	&h1302	AES 256 GCM SHA384
TLSCipherSuite_CHACHA20_POLY1305_SHA256	&h1303	CHACHA20 POLY1305 SI
TLSCipherSuite_ECDHE_ECDSA_WITH_3DES_EDE_CBC_SHA	&hC008	ECDHE ECDSA with 3DE
TLSCipherSuite_ECDHE_ECDSA_WITH_AES_128_CBC_SHA	&hC009	ECDHE ECDSA with AES
TLSCipherSuite_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256	&hC023	ECDHE ECDSA with AES
TLSCipherSuite_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256	&hC02B	ECDHE ECDSA with AES
TLSCipherSuite_ECDHE_ECDSA_WITH_AES_256_CBC_SHA	&hC00A	ECDHE ECDSA with AES
TLSCipherSuite_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384	&hC024	ECDHE ECDSA with AES
TLSCipherSuite_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	&hC02C	ECDHE ECDSA with AES
TLSCipherSuite_ECDHE_ECDSA_WITH_CHACHA20_POLY1305_SHA256	&hCCA9	ECDHE ECDSA with CH
TLSCipherSuite_ECDHE_RSA_WITH_3DES_EDE_CBC_SHA	&hC012	ECDHE RSA with 3DES I
TLSCipherSuite_ECDHE_RSA_WITH_AES_128_CBC_SHA	&hC013	ECDHE RSA with AES 12
TLSCipherSuite_ECDHE_RSA_WITH_AES_128_CBC_SHA256	&hC027	ECDHE RSA with AES 12
TLSCipherSuite_ECDHE_RSA_WITH_AES_128_GCM_SHA256	&hC02F	ECDHE RSA with AES 12
TLSCipherSuite_ECDHE_RSA_WITH_AES_256_CBC_SHA	&hC014	ECDHE RSA with AES 25
TLSCipherSuite_ECDHE_RSA_WITH_AES_256_CBC_SHA384	&hC028	ECDHE RSA with AES 25
TLSCipherSuite_ECDHE_RSA_WITH_AES_256_GCM_SHA384	&hC030	ECDHE RSA with AES 25
TLSCipherSuite_ECDHE_RSA_WITH_CHACHA20_POLY1305_SHA256	&hCCA8	ECDHE RSA WITH CHA
TLSCipherSuite_RSA_WITH_3DES_EDE_CBC_SHA	&h000A	RSA with 3DES EDE CB
TLSCipherSuite_RSA_WITH_AES_128_CBC_SHA	&h002F	RSA with AES 128 CBC S
TLSCipherSuite_RSA_WITH_AES_128_CBC_SHA256	&h003C	RSA with AES 128 CBC S
TLSCipherSuite_RSA_WITH_AES_128_GCM_SHA256	&h009C	RSA with AES 1128 GCM
TLSCipherSuite_RSA_WITH_AES_256_CBC_SHA	&h0035	RSA with AES 256 CBC S
TLSCipherSuite_RSA_WITH_AES_256_CBC_SHA256	&h003D	RSA with AES 256 CBC S
TLSCipherSuite_RSA_WITH_AES_256_GCM_SHA384	&h009D	RSA with AES 256 GCM

TLS Protocol Version

Constant	Value	Description
TLSProtocolVersionDTLSv10	&hfeff	The DTLS 1.0 protocol.
TLSProtocolVersionDTLSv12	&hfefd	The DTLS 1.2 protocol.
TLSProtocolVersionTLSv10	&h0301	The TLS 1.0 protocol.
TLSProtocolVersionTLSv11	&h0302	The TLS 1.1 protocol.
TLSProtocolVersionTLSv12	&h0303	The TLS 1.2 protocol.
TLSProtocolVersionTLSv13	&h0304	The TLS 1.3 protocol.

40.26 class NSURLSessionUploadTaskMBS

40.26.1 class NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that uploads data to the network in a request body.
Notes: The NSURLSessionUploadTaskMBS class is a subclass of NSURLSessionDataTaskMBS, which in turn is a concrete subclass of NSURLSessionTaskMBS. The methods associated with the NSURLSessionUploadTaskMBS class are documented in NSURLSessionTaskMBS.
Upload tasks are used for making HTTP requests that require a request body (such as POST or PUT). They behave similarly to data tasks, but you create them by calling different methods on the session that are designed to make it easier to provide the content to upload. As with data tasks, if the server provides a response, upload tasks return that response as one or more MemoryBlock objects in memory.

Unlike data tasks, you can use upload tasks to upload content in the background.

When you create an upload task, you provide a NSURLRequestMBS instance that contains any additional headers that you might need to send alongside the upload, such as the content type, content disposition, and so on. In iOS, when you create an upload task for a file in a background session, the system copies that file to a temporary location and streams data from there.
While the upload is in progress, the task calls the session taskDidSendBodyData event in NSURLSessionMBS class periodically to provide you with status information.

When the upload phase of the request finishes, the task behaves like a data task, calling events on the session to provide you with the server,Äôs response—headers, status code, content data, and so on.
Subclass of the NSURLSessionDataTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

40.26.2 Methods

40.26.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.27 class NSURLSessionWebSocketMessageMBS

40.27.1 class NSURLSessionWebSocketMessageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The client can create a WebSocket message object that will be passed to the send calls and will be delivered from the receive calls.
Notes: The message can be initialized with data or string. If initialized with data, the string property will be nil and vice versa.
Available on MacOS 10.15 or newer.

40.27.2 Methods

40.27.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

40.27.4 Constructor(data as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Create a message with data type

40.27.6 Properties

40.27.7 data as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The data for a data message.
Notes: (Read only property)

40.27.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.27.9 string as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The text of a text message.
Notes: (Read only property)

40.27.10 type as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The type of message.
Notes: (Read only property)

40.27.11 Constants

Types

Constant	Value	Description
TypeData	0	Data Message
TypeString	1	Text Message

40.28 class NSURLSessionWebSocketTaskMBS

40.28.1 class NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A WebSocket task can be created with a ws or wss url.
Notes: A client can also provide a list of protocols it wishes to advertise during the WebSocket handshake phase.
Once the handshake is successfully completed the client will be notified through an optional delegate.
All reads and writes enqueued before the completion of the handshake will be queued up and executed once the hanshake succeeds. Before the handshake completes, the client can be called to handle redirection or authentication using the same delegates as NSURLSessionTask. WebSocket task will also provide support for cookies and will store cookies to the cookie storage on the session and will attach cookies to outgoing HTTP handshake requests.

Available on MacOS 10.15 or newer.
Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Adding NSURLSession classes for Xojo

40.28.2 Methods

40.28.3 cancel(closeCode as Integer, reason as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Sends a close frame with the given closeCode.
Notes: An optional reason can be provided while sending the close frame.
Simply calling cancel on the task will result in a cancellation frame being sent without any reason.

40.28.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

40.28.5 receiveMessage(Handler as NSURLSessionWebSocketTaskReceiveMessageCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Reads a WebSocket message once all the frames of the message are available.
Notes: If the maximumMessage size is hit while buffering the frames, the receiveMessage call will error out and all outstanding work will also fail resulting in the end of the task.

Calls handler later when job is done.

40.28.6 sendMessage(message as NSURLSessionWebSocketMessageMBS, Handler as NSURLSessionWebSocketTaskSendMessageCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Sends a WebSocket message.
Notes: If an error occurs, any outstanding work will also fail.
Note that invocation of the completion handler does not guarantee that the remote side has received all the bytes, only that they have been written to the kernel.

Calls handler on completion.

40.28.7 sendPing(Handler as NSURLSessionWebSocketTaskSendPingWithPongReceivedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Sends a ping frame from the client side.
Notes: The pongReceiveHandler is invoked when the client receives a pong from the server endpoint.
If a connection is lost or an error occurs before receiving the pong from the endpoint, the handler will be invoked with an error.
Note - the pongReceiveHandler will always be called in the order in which the pings were sent.

40.28.8 Properties

40.28.9 closeCode as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A task can be queried for it's close code at any point.
Notes: When the task is not closed, it will be set to CloseCodeInvalid.
(Read only property)

40.28.10 closeReason as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A task can be queried for it's close reason at any point.
Notes: A nil value indicates no closeReason or that the task is still running
(Read only property)

40.28.11 maximumMessageSize as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The maximum number of bytes to be buffered before erroring out.
Notes: This includes the sum of all bytes from continuation frames. Receive calls will error out if this value is reached.
(Read and Write property)

40.28.12 Constants

Close Codes

Constant	Value	Description
CloseCodeAbnormalClosure	1006	Abnormal Closure
CloseCodeGoingAway	1001	Going Away
CloseCodeInternalServerError	1011	Internal Server Error
CloseCodeInvalid	0	Invalid
CloseCodeInvalidFramePayloadData	1007	Invalid Frame Payload Data
CloseCodeMandatoryExtensionMissing	1010	Mandatory Extension Missing
CloseCodeMessageTooBig	1009	Message Too Big
CloseCodeNormalClosure	1000	Normal Closure
CloseCodeNoStatusReceived	1005	No Status Received
CloseCodePolicyViolation	1008	Policy Violation
CloseCodeProtocolError	1002	Protocol Error
CloseCodeTLSHandshakeFailure	1015	TLS Handshake Failure
CloseCodeUnsupportedData	1003	Unsupported Data

40.28.13 Delegates

40.28.14 NSURLSessionWebSocketTaskReceiveMessageCompletedMBS(webSocketTask as NSURLSessionWebSocketTaskMBS, message as NSURLSessionWebSocketMessageMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The handler to be called when receiving finished.

40.28.15 NSURLSessionWebSocketTaskSendMessageCompletedMBS(webSocketTask as NSURLSessionWebSocketTaskMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Sending a web socket message succeeded.

40.28.16 NSURLSessionWebSocketTaskSendPingWithPongReceivedMBS(webSocketTask as NSURLSessionWebSocketTaskMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The ping answer may have been received.

Chapter 41

Cocoa Printing

41.1 class NSPageLayoutMBS

41.1.1 class NSPageLayoutMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: NSPageLayout is a panel that queries the user for information such as paper type and orientation.
Notes: It is normally displayed in response to the user selecting the Page Setup menu item. You obtain an instance with the pageLayout class method. The pane can then be run as a sheet using beginSheetWithPrintInfo or modally using runModal or runModalWithPrintInfo.
Blog Entries

- MBS Real Studio Plugins, version 12.4pr1

41.1.2 Methods

41.1.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window.
Notes: printInfo: The NSPrintInfo object to use.
win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1).

See also:

- 41.1.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 8188
- 41.1.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 8188

41.1.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window.
Notes: printInfo: The NSPrintInfo object to use.
win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1).
See also:

- 41.1.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 8187
- 41.1.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 8188

41.1.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window.
Notes: printInfo: The NSPrintInfo object to use.
win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1).
See also:

- 41.1.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 8187
- 41.1.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 8188

41.1.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new page layout object.

41.1.7 pageLayout as NSPageLayoutMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a newly created NSPageLayout object.

41.1.8 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the NSPrintInfo object used when the receiver is run.
Notes: The NSPrintInfo object is set using the beginSheetWithPrintInfo or runModalWithPrintInfo method.
The shared NSPrintInfo object is used if the receiver is run using runModal.

41.1.9 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver and begins the modal loop using the shared NSPrintInfo object.
Example:

```
Var p as new NSPageLayoutMBS
MsgBox str(p.runModal)
```

Notes: Returns NSCancelButton (0) if the user clicks the Cancel button; otherwise, NSOKButton (1).
The receiver's values are recorded in the shared NSPrintInfo object.

41.1.10 runModalWithPrintInfo(printInfo as NSPrintInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver and begins the modal loop using the given NSPrintInfo object.
Notes: printInfo: The NSPrintInfo object to use.

Returns NSCancelButton if the user clicks the Cancel button; otherwise, NSOKButton.
The receiver's values are recorded in printInfo.

41.1.11 runPageLayout

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the app's page layout panel, an instance of NSPageLayout.
Example:

NSPageLayoutMBS.runPageLayout

Notes: If the NSPageLayout instance does not exist, this method creates one. This method is typically invoked when the user chooses Page Setup from the application's FIle menu.

41.1.12 Properties

41.1.13 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

41.1.14 Events

41.1.15 printPanelDidEnd(returnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Called when the sheet is dismissed.

41.2 class NSPrinterMBS

41.2.1 class NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPrinter object describes a printer's capabilities as defined in its PPD file.
Example:

```
Var p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name+EndOfLine+p.type
```

Notes: An NSPrinter object can be constructed by specifying either the printer name or the make and model of an available printer. You use a printer object to get information about printers, not to modify printer attributes or control a printing job.

- MBS Real Studio Plugins, version 12.4pr1

41.2.2 Methods

41.2.3 booleanForKey(key as string, table as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Boolean value associated with the specified key.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the Boolean value associated with the key. Returns false if the key is not in the table or the receiver lacks a PPD file.

41.2.4 Constructor(name as string = "")

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a printer object.
Notes: On success the handle property is not zero.
Name can be empty to pick default printer. Else pass name of printer.

41.2.5 copy as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a clone of the printer object.

41.2.6 defaultPrinter as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default printer.
Example:

```
Var p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name
```

41.2.7 floatForKey(key as string, table as string) as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the floating-point value associated with the specified key.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the floating-point value. Returns 0.0 if the key is not in the table or the receiver lacks a PPD file.

41.2.8 intForKey(key as string, table as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the integer value associated with the specified key.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the integer value. Returns 0 if the key is not in the table or the receiver lacks a PPD file.

41.2.9 isKey(key as string, table as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the specified key is in the specified table.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.
Returns true if the key is in the table; otherwise, false.

41.2.10 pageSizeForPaper(paperName as string) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the size of the page for the specified paper type.
Notes: paperName: Possible values are printer-dependent and are contained in the printer's PPD file. Typical values are "Letter" and "Legal".

Returns the size of the page, measured in points in the user coordinate space. The returned size is zero if the specified paper name is not recognized or its entry in the PPD file cannot be parsed.

41.2.11 printerNames as string()

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the names of all available printers.
Example:

MsgBox Join(NSPrinterMBS.printerNames, EndOfLine)

Notes: An array of strings, each of which contains the name of an available printer.
The user constructs the list of available printers using the Print Center application.

41.2.12 printerTypes as string()

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns descriptions of the makes and models of all available printers.
Notes: An array of strings, each of which contains the make and model information for a supported printer.

41.2.13 printerWithName(name as string) as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPrinter object initialized with the specified printer name.

Notes: name: The name of the printer.

Returns an initialized NSPrinter object, or nil if the specified printer was not available.

41.2.14 printerWithType(type as string) as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPrinter object initialized to the first available printer with the specified make and model information.
Notes: type: A string describing the make and model information. You can get this string using the printerTypes method.

Returns an initialized NSPrinter object, or nil if the specified printer was not available.

41.2.15 rectForKey(key as string, table as string) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the rectangle associated with the specified key.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the rectangle value. Returns NSRectMBS.Zero if the key is not in the table or the receiver lacks a PPD file.

41.2.16 sizeForKey(key as string, table as string) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the size data type associated with the specified key.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the size value. Returns NSZeroSize if the key is not in the table or the receiver lacks a PPD file.

41.2.17 statusForTable(paperName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the status of the specified table.
Notes: table: The name of a table from the printer's PPD file.

Returns one of the return values described in Constants.

41.2.18 stringForKey(key as string, table as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the first occurrence of a value associated with specified key.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the value for the specified key, or nil if the key is not in the table. The returned string may also be empty.

If key is a main keyword only, and if that keyword has options in the PPD file, this method returns an empty string. Use stringListForKey to retrieve the values for all occurrences of a main keyword.

41.2.19 stringListForKey(key as string, table as string) as string()

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings, one for each occurrence, associated with specified key.
Notes: key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns an array of strings, each containing a value associated with the specified key. Returns nil if the key is not in the table.

41.2.20 Properties

41.2.21 deviceDescription as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of keys and values describing the device.
Notes: A dictionary of the device properties. See NSGraphics.h for possible keys. The only key guaranteed to exist is NSDeviceIsPrinter.
(Read only property)

41.2.22 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

41.2.23 languageLevel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the PostScript language level recognized by the printer.
Example:

```
Var p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox "languageLevel: "+str(p.languageLevel)
```

Notes: Returns the PostScript language level. The value is 0 if the receiver is not a PostScript printer.
(Read only property)

41.2.24 name as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the printer's name.
Example:

```
Var p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name
```

Notes: (Read only property)

41.2.25 type as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a description of the printer's make and model.
Example:

```
Var p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
```

MsgBox p.type

Notes: (Read only property)

41.2.26 Constants

Printer Information Table States

Constant	Value	Description
NSPrinterTableError	2	Printer table is not valid.
NSPrinterTableNotFound	1	Printer table was not found.
NSPrinterTableOK	0	Printer table was found and is valid.

41.3 class NSPrintInfoMBS

41.3.1 class NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPrintInfo object stores information that's used to generate printed output.
Example:

```
// get Xojo printer setup
Var p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
Var n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
Var g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

Notes: A shared NSPrintInfo object is automatically created for an application and is used by default for all printing jobs for that application.

The printing information in an NSPrintInfo object is stored in a dictionary. To access the standard attributes in the dictionary directly, this class defines a set of keys and provides the dictionary method. You can also initialize an instance of this class using the Constructor method.

You can use this dictionary to store custom information associated with a print job. Any non-object values should be stored as NSNumber or NSValue objects in the dictionary. See NSNumber Class Reference for a list of types which should be stored as numbers. For other non-object values, use the NSValue class.

Beginning with OS X v10.5, to store custom information that belongs in printing presets you should use the dictionary returned by the printSettings method.

41.3.2 Methods

41.3.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the print info with a new instance.
Example:

```
// get Xojo printer setup
Var p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
Var n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
Var g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

41.3.4 Constructor(attributes as Dictionary)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize the print info with the parameters in the specified dictionary.
See also:

- 41.3.3 Constructor 8199
- 41.3.5 Constructor(Data as Memoryblock) 8200

41.3.5 Constructor(Data as Memoryblock)

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize the print info with serialized dictionary or NSPrintInfo.
Example:

```
Var p as new PrinterSetup
Var info as new NSPrintInfoMBS(p.SetupString)
MsgBox info.paperName
```

See also:

- 41.3.3 Constructor 8199
- 41.3.4 Constructor(attributes as Dictionary) 8200

41.3.6 copy as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the object.

41.3.7 defaultPrinter as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default printer.

41.3.8 NSPrintAllPages as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean.

41.3.9 NSPrintBottomMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the bottom margin, in points.

41.3.10 NSPrintCancelJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Cancel print job.

41.3.11 NSPrintCopies as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: a number containing the number of copies of the print job to be printed

41.3.12 NSPrintDetailedErrorReporting as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean.

41.3.13 NSPrintFaxNumber as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A string containing a fax number.

41.3.14 NSPrintFirstPage as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A number containing the one-based index of the first job in the page to print.

41.3.15 NSPrintHeaderAndFooter as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean for whether the results of NSView pageHeader and NSView pageFooter should be drawn on pages

41.3.16 NSPrintHorizontallyCentered as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a Boolean value that is true if pages are centered horizontally.

41.3.17 NSPrintHorizontalPagination as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a NSPrintingPaginationMode value.
NSAutoPagination, NSFitPagination, or NSClipPagination. See HorizontalPagination for details.

41.3.18 NSPrintJobDisposition as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A string equal to NSPrintSpoolJob, NSPrintPreviewJob, NSPrintSaveJob, or NSPrintCancelJob.

41.3.19 NSPrintJobSavingFileNameExtensionHidden as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean for whether the job file's name extension should be hidden, for NSPrintSaveJob. Available on Mac OS X 10.6.

41.3.20 NSPrintJobSavingURL as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: An URL containing the location to which the job file will be saved, for NSPrintSaveJob. Available on Mac OS X 10.6.

41.3.21 NSPrintLastPage as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: An number containing the one-based index of the last job in the page to print.

41.3.22 NSPrintLeftMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the left margin, in points.

41.3.23 NSPrintMustCollate as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean value.

41.3.24 NSPrintOrientation as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes: A number containing an NSPrintingOrientation.

NSPortraitOrientation or NSLandscapeOrientation

41.3.25 NSPrintPagesAcross as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A number containing the number of logical pages to be placed across a physical sheet.

41.3.26 NSPrintPagesDown as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A number containing the number of logical pages to be placed down a physical sheet.

41.3.27 NSPrintPaperName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes: A string containing the paper name.

41.3.28 NSPrintPaperSize as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes: A size value specifying the height and width of paper in points.

41.3.29 NSPrintPreviewJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Send to Preview application.

41.3.30 NSPrintPrinter as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: Value in dictionary is a NSPrinterMBS.

41.3.31 NSPrintPrinterName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A string containing the name of a printer.

41.3.32 NSPrintReversePageOrder as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: Value for this key is a boolean value.

41.3.33 NSPrintRightMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the right margin, in points.

41.3.34 NSPrintSaveJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Save to a file.

41.3.35 NSPrintScalingFactor as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes: Scale factor percentage before pagination.

41.3.36 NSPrintSelectionOnly as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean value.
Available on Mac OS X 10.6 or newer.

41.3.37 NSPrintSpoolJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Normal print job.

41.3.38 NSPrintTime as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: An NSDate containing the time at which printing should begin.

41.3.39 NSPrintTopMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the top margin, in points.

41.3.40 NSPrintVerticallyCentered as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a Boolean value that is true if pages are centered vertically.

41.3.41 NSPrintVerticalPagination as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a NSPrintingPaginationMode value.
NSAutoPagination, NSFitPagination, or NSClipPagination. See VerticalPagination for details.

41.3.42 removeObjectForKey(key as String)

MBS MacCocoa Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes an entry from the underlaying dictionary.
Example:

```
Var n As New NSPrintInfoMBS

Var d1 As Dictionary = n.Dictionary

// add a custom key
n.objectForKey("test") = 123

Var d2 As Dictionary = n.Dictionary

// and remove it
n.removeObjectForKey "test"

Var d3 As Dictionary = n.Dictionary

// inspect dictionaries in debugger
Break
```

Notes: This allows you to remove settings.

41.3.43 SetSaveDestination(file as folderitem)

MBS MacCocoa Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the print job to go to a PDF file.
Example:

```
// print to PDF in Xojo Cocoa app

// change print info to go to
Var s as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
```

```
Var d as MemoryBlock = s.data // save old
s.SetSaveDestination SpecialFolder.Desktop.Child("test.pdf")

// now print something
Var g as Graphics = OpenPrinter
if g<>Nil then
g.DrawString "Hello World PDF", 20, 20
end if

s.data = d // restore original settings

// now print something to regular printer
g = OpenPrinter
if g<>Nil then
g.DrawString "Hello World Printer", 20, 20
end if
```

41.3.44 setSharedPrintInfo(printInfo as NSPrintInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the shared NSPrintInfo object to the specified object.
Notes: printInfo: The new shared printer information. This value must not be nil.

The shared NSPrintInfo object defines the settings for the NSPageLayout panel and print operations that will be used if no NSPrintInfo object is specified for those operations.

41.3.45 setUpPrintOperationDefaultValues

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Validates the attributes encapsulated by the receiver.
Notes: Invoked when the print operation is about to start. Subclasses may override this method to set default values for any attributes that are not set.

41.3.46 sharedPrintInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the shared NSPrintInfo object.

41.3.47 Properties

41.3.48 bottomMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The bottom margin, measured in points in the user coordinate space.
Notes: (Read and Write property)

41.3.49 data as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Query or set the current settings as data.
Example:

```
// print to PDF in Xojo Cocoa app

// change print info to go to
Var s as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
Var d as MemoryBlock = s.data // save old
s.SetSaveDestination SpecialFolder.Desktop.Child("test.pdf")

// now print something
Var g as Graphics = OpenPrinter
if g<>Nil then
g.DrawString "Hello World PDF", 20, 20
end if

s.data = d // restore original settings

// now print something to regular printer
g = OpenPrinter
if g<>Nil then
g.DrawString "Hello World Printer", 20, 20
end if
```

Notes: The plugin archives the current settings and you can later assign them back.
(Read and Write property)

41.3.50 dictionary as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's dictionary that contains the printing attributes.
Notes: For Xojo the plugin makes a copy of the internal dictionary as a Xojo dictionary when you read this property.

When you assign a dictionary to this property, we copy from the Xojo dictionary to the Cocoa one.
(Read and Write property)

41.3.51 Duplex as Integer

MBS MacCocoa Plugin, Plugin Version: 24.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get or set the duplex property.
Example:

```
Var n As NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo

n.Duplex = n.PMDuplexTumble

// shows 3
MessageBox "Duplex: "+n.Duplex.ToString

n.Duplex = n.PMDuplexNoTumble

// shows 2
MessageBox "Duplex: "+n.Duplex.ToString
```

Notes: See duplex constants.
Raises exceptions in case of errors.

Exceptions with error -9589 happens if value is not available.
(Read and Write property)

41.3.52 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

41.3.53 HorizontallyCentered as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the image is centered horizontally.
Notes: True if you want the image to be centered horizontally; otherwise, false.
(Read and Write property)

41.3.54 horizontalPagination as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The horizontal pagination to the specified mode.
Notes: One of the pagination modes described in constants.
(Read and Write property)

41.3.55 imageablePageBounds as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the imageable area of a sheet of paper specified by the receiver.
Notes: Return the imageable area, measured in points in the user coordinate space.

This method takes into account the current printer, paper size, and orientation settings, but not scaling factors. Imageable area is the maximum area that can possibly be marked on by the printer hardware, not the area defined by the current margin settings.

The origin (0, 0) of the returned rectangle is in the lower-left corner of the oriented sheet. The imageable bounds may extend past the edges of the sheet when, for example, a printer driver specifies it so that borderless printing can be done reliably.
(Read only property)

41.3.56 jobDisposition as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The action specified for the job.
Notes: One of the following value:

- NSPrintSpoolJob is a normal print job.

- NSPrintPreviewJob sends the print job to the Preview application.
- NSPrintSaveJob saves the print job to a file.
- NSPrintCancelJob aborts the print job.

(Read and Write property)

41.3.57 leftMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The left margin to the specified size.
Notes: The size for the left margin, measured in points in the user coordinate space.
(Read and Write property)

41.3.58 localizedPaperName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the human-readable name of the currently selected paper size, suitable for presentation in user interfaces.
Notes: This is typically different from the name returned by paperName, which is almost never suitable for presentation to the user.
(Read only property)

41.3.59 orientation as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The page orientation to the specified value.
Notes: This printing orientation. See constants for possible values.
For consistency, this method may change either the paper name or the paper size.
(Read and Write property)

41.3.60 paperName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The paper name to the specified value.
Notes: The name for the paper size. The string contains a value such as Letter or Legal. Paper names are implementation specific.

For consistency, this method may change either the paper size or the page orientation.
(Read and Write property)

41.3.61 paperSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The width and height of the paper to the specified size.
Notes: The new size of the paper, measured in points in the user coordinate space.
For consistency, this method may change either the paper name or the page orientation.
(Read and Write property)

41.3.62 printer as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The printer object used for subsequent printing jobs.
Notes: This method iterates through the receiver's dictionary. If a feature in the dictionary is not supported by the new printer (as determined by a query to the PPD file), that feature is removed from the dictionary.
(Read and Write property)

41.3.63 printerName as String

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The printer name of printer used for subsequent printing jobs.
Notes: (Read only property)

41.3.64 printSettings as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a mutable dictionary containing the print settings from Core Printing.
Notes: A mutable dictionary containing the printing system's current settings.

You can use this method to get and set values from the system print settings. The keys in the returned dictionary represent the values returned by the Core Printing function PMPrintSettingsGetValue. They correspond to the settings currently in the print panel and include everything from custom values set by your accessory panels to values provided by the printer driver's print dialog extension.
(Read only property)

41.3.65 rightMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The right margin to the specified size.
Notes: The size for the right margin, measured in points in the user coordinate space.
(Read and Write property)

41.3.66 scalingFactor as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The print info's scaling factor.
Notes: Default is 1.0.
Using smaller value increases paper size.
(Read and Write property)

41.3.67 SelectionOnly as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether only the current selection should be printed.
Notes: True if only the current selection should be printed, otherwise false.
(Read and Write property)

41.3.68 SetupString as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Query or set the current settings as data.
Example:

```
// start with a printer setup
Var p as new PrinterSetup

// clone to NSPrintInfo
Var info as new NSPrintInfoMBS(p.SetupString)

// find out what name second printer has
Var printers() as string = NSPrinterMBS.printerNames
Var printer as NSPrinterMBS = NSPrinterMBS.printerWithName(printers(1))
System.DebugLog printers(1)

// now set a new paper size and this printer
```

```
info.paperSize = new NSSizeMBS(72*5, 72*6) // 5 by 6 inch
info.printer = printer

// and clone back
p.SetupString = info.SetupString

// now print to this printer with this paper
Var g as Graphics = OpenPrinter(p)

g.DrawString "Hello", 10, 10
```

Notes: While data property encodes the dictionary, this property encodes the NSPrintInfo which is same format as PrinterSetup.SetupString in Xojo.
(Read and Write property)

41.3.69 topMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The top margin, measured in points in the user coordinate space.
Notes: The size for the top margin, measured in points in the user coordinate space.
(Read and Write property)

41.3.70 VerticallyCentered as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the image is centered vertically.
Notes: True if you want the image to be centered vertically; otherwise, false.
(Read and Write property)

41.3.71 verticalPagination as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The vertical pagination mode.
Notes: One of the pagination modes described in constants.
(Read and Write property)

41.3.72 objectForKey(key as String) as Variant

MBS MacCocoa Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get or set an entry in the underlaying dictionary.
Example:

```
Var n As New NSPrintInfoMBS

Var d1 As Dictionary = n.Dictionary

// add a custom key
n.objectForKey("test") = 123

Var d2 As Dictionary = n.Dictionary

// and remove it
n.removeObjectForKey "test"

Var d3 As Dictionary = n.Dictionary

// inspect dictionaries in debugger
Break
```

Notes: (Read and Write computed property)

41.3.73 Constants

Pagination Modes

Constant	Value	Description
NSAutoPagination	0	The image is divided into equal-sized rectangles and placed in one column of pages.
NSClipPagination	2	The image is clipped to produce one column or row of pages.
NSFitPagination	1	The image is scaled to produce one column or one row of pages.

Page Orientation Constants

Constant	Value	Description
NSLandscapeOrientation	1	Orientation is portrait (page is taller than it is wide).
NSPortraitOrientation	0	Orientation is landscape (page is wider than it is tall).

Duplex Modes

Constant	Value	Description
PMDuplexNone	1	Print only on one side of sheet of paper
PMDuplexNoTumble	2	Print on both sides of the paper, with no tumbling.
PMDuplexTumble	3	Print on both sides of the paper, tumbling on.
PMSimplexTumble	4	Print on only one side of the paper, but tumble the images while printing.

41.4 class NSPrintOperationMBS

41.4.1 class NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPrintOperation object controls operations that generate Encapsulated PostScript (EPS) code, Portable Document Format (PDF) code, or print jobs.
Notes: An NSPrintOperation object works in conjunction with two other objects: an NSPrintInfo object, which specifies how the code should be generated, and an NSView object, which generates the actual code.

It is important to note that the majority of methods in NSPrintOperation copy the instance of NSPrintInfo passed into them. Future changes to that print info are not reflected in the print info retained by the current NSPrintOperation object. All changes should be made to the print info before passing to the methods of this class.

41.4.2 Methods

41.4.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize the object the current print operation for this thread.
Notes: On success the handle property is not zero.
See also:

- 41.4.4 Constructor(other as NSPrintOperationMBS) 8219

- 41.4.5 Constructor(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) 8219
- 41.4.6 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 8220
- 41.4.7 Constructor(view as NSViewMBS) 8221
- 41.4.8 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 8221

41.4.4 Constructor(other as NSPrintOperationMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Special constructor to create new NSPrintOperationMBS for existing NSPrintOperationMBS object.
Notes: If you have a NSPrintOperationMBS and you want to use printOperationDidRun event, you can initialize a subclass of NSPrintOperationMBS with your existing object to get the event there.
See also:

- 41.4.3 Constructor 8218
- 41.4.5 Constructor(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) 8219
- 41.4.6 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 8220
- 41.4.7 Constructor(view as NSViewMBS) 8221
- 41.4.8 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 8221

41.4.5 Constructor(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
Var n as new NSPrintOperationMBS(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

Notes: View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

- 41.4.6 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 8220
- 41.4.7 Constructor(view as NSViewMBS) 8221
- 41.4.8 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 8221

41.4.6 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil)

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
Var n as new NSPrintOperationMBS(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

Notes: View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

- 41.4.7 Constructor(view as NSViewMBS) 8221
- 41.4.8 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 8221

41.4.7 Constructor(view as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view.
Notes: View: The view whose contents you want to print.

Returns the new NSPrintOperation object. You must run the operation to print the view.

The new NSPrintOperation object uses the settings stored in the shared NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

- 41.4.6 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 8220
- 41.4.8 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 8221

41.4.8 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Notes: View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

41.4.9 context as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the graphics context object used for generating output.

41.4.10 currentOperation as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current print operation for this thread.
Notes: The print operation object, or nil if there is no current operation.

41.4.11 currentPage as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current page number being printed.

41.4.12 data as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the data in PDF/EPS after the operation finished.

41.4.13 Destructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

41.4.14 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view.
Notes: View: The view containing the data to be turned into EPS data.

rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.

After the job is run, use the Data function to get the EPS data.
Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.

The new NSPrintOperation object uses the default NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.15 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 8223
- 41.4.16 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS 8224
- 41.4.17 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS 8224

41.4.15 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view using the specified print settings.
Notes: View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.
PrintInfo: The print settings to use when generating the EPS data.

After the job is run, use the Data function to get the EPS data.
Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

41.4.16 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.
Notes: View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.
path: The path to a file. After the job is run, this file contains the EPS data.
PrintInfo: The print settings to use when generating the EPS data.

Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.
This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

- 41.4.17 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS 8224

41.4.17 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.
Notes: View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.
path: The path to a file. After the job is run, this file contains the EPS data.
PrintInfo: The print settings to use when generating the EPS data.

Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.
This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.16 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS 8224

41.4.18 isCopyingOperation as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver is an EPS or PDF copy operation.
Notes: True if the receiver is an EPS or PDF copy operation; otherwise, false.

41.4.19 NSPrintOperationExistsException as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of an exception raised when there is already a print operation in process.
Notes: The methods that raise the NSExceptionMBS exception are the EPSOperation... and printOperation....

41.4.20 pageRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the print order for the pages.
Notes: The print order. For a list of possible values, see Constants.

41.4.21 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view.
Notes: View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.

After the job is run, the data function gives you the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

The new NSPrintOperation object uses the default NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.22 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 8226
- 41.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS 8226

41.4.22 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view using the specified print settings.
Notes: View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
PrintInfo: The print settings to use when generating the PDF data.

After the job is run, the data function returns the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.
This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.21 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS 8225

- 41.4.24 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS 8227

41.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.
Notes: View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
path: The path to a file. After the job is run, this file contains the PDF data.
PrintInfo: The print settings to use when generating the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.21 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS 8225

- 41.4.24 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS 8227

41.4.24 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.
Notes: View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
path: The path to a file. After the job is run, this file contains the PDF data.
PrintInfo: The print settings to use when generating the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.21 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS 8225

- 41.4.22 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 8226
- 41.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS 8226

41.4.25 preferredRenderingQuality as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the printing quality.
Notes: The preferred printing quality. See constants for the possible values.

If the print sheet is unresponsive or sluggish due to the time is takes to fully render a page, you can check this method in drawRect: and other printing methods such as beginDocument and knowsPageRage: to determine if the print operation prefers speed over fidelity. Most applications render each page fast enough and do not need to call this method. Only use this method after establishing that best quality rendering does indeed make the user interface unresponsive.

41.4.26 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
Var n as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

Notes: View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.27 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 8229
- 41.4.28 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS 8229
- 41.4.29 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 8230

41.4.27 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
Var n as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

Notes: View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.26 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 8228
- 41.4.28 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS 8229
- 41.4.29 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 8230

41.4.28 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view.
Example:

```
// print a text area
Var textView as NSTextViewMBS = TextArea1.NSTextViewMBS
Var o as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(textView)

o.showsPrintPanel = true
o.runOperationModalForWindow(Window1)
o = nil
```

Notes: View: The view whose contents you want to print.

Returns the new NSPrintOperation object. You must run the operation to print the view.

The new NSPrintOperation object uses the settings stored in the shared NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.26 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 8228
- 41.4.27 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 8229
- 41.4.29 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 8230

41.4.29 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Notes: View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 41.4.26 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 8228
- 41.4.27 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 8229
- 41.4.28 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS 8229

41.4.30 runOperation as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Runs the print operation on the current thread.
Notes: Returns true if the operation was successful; otherwise, false.

The operation runs to completion in the current thread, blocking the application. A separate thread is not spawned, even if canSpawnSeparateThread is true. Use runOperationModalForWindow to use document-modal sheets and to allow a separate thread to perform the operation.

41.4.31 runOperationModalForWindow(win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Runs the print operation, calling your custom delegate method upon completion.
Notes: win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.
See also:

- 41.4.32 runOperationModalForWindow(win as NSWindowMBS) 8231
- 41.4.33 runOperationModalForWindow(win as window) 8232

41.4.32 runOperationModalForWindow(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Runs the print operation, calling your custom delegate method upon completion.
Notes: win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.
See also:

- 41.4.31 runOperationModalForWindow(win as DesktopWindow) 8231

• 41.4.33 runOperationModalForWindow(win as window) 8232

41.4.33 runOperationModalForWindow(win as window)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Runs the print operation, calling your custom delegate method upon completion.
Notes: win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.
See also:

• 41.4.31 runOperationModalForWindow(win as DesktopWindow) 8231

• 41.4.32 runOperationModalForWindow(win as NSWindowMBS) 8231

41.4.34 setCurrentOperation(operation as NSPrintOperationMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the current print operation for this thread.
Notes: operation: The print operation to make current. You may specify nil to clear the current print operation.

41.4.35 view as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns the view object that generates the actual data for the print operation.

41.4.36 Properties

41.4.37 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

41.4.38 canSpawnSeparateThread as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver is allowed to spawn a separate printing thread.
Notes: canSpawnSeparateThread: True if the receiver is allowed to spawn a separate thread; otherwise, false.

If canSpawnSeparateThread is true, an NSThread object is detached when the print panel is dismissed (or immediately, if the panel is not to be displayed). The new thread performs the print operation, so that control can return to your application. A thread is detached only if the print operation is run using the runOperationModalForWindow:delegate:didRunSelector:contextInfo: method. If canSpawnSeparateThread is false, the operation runs on the current thread, blocking the application until the operation completes.

If you send setCanSpawnSeparateThread: to an NSPrintOperation object with an argument of true, then the delegate specified in a subsequent invocation of runOperationModalForWindow may be messaged in that spawned, non-main thread.
(Read and Write computed property)

41.4.39 jobTitle as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The title of the print job.
Notes: A string containing the print job title. If set, this value overrides the title returned by the printing view.
Available in OS X v10.5 and later.
(Read and Write computed property)

41.4.40 pageOrder as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the print order for the pages.
Notes: The print order. For a list of possible values, see Constants.
(Read and Write computed property)

41.4.41 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's NSPrintInfo object.

Notes: (Read and Write computed property)

41.4.42 printPanel as NSPrintPanelMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns the NSPrintPanel object used when running the operation.
Notes: (Read and Write computed property)

41.4.43 showsPrintPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Boolean value indicating whether a print panel is displayed during the operation,
Notes: True if the operation displays a print panel; otherwise, false.
Operations that generate EPS or PDF data do no display a print panel (instance of NSPrintPanel), regardless of the value returned by this method.
(Read and Write computed property)

41.4.44 showsProgressPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver displays a progress panel for this operation.
Notes: True if you want to display a progress panel; otherwise, false.
This method does not affect the display of a print panel; that operation is controlled by the ShowsPrintPanel method.
Operations that generate EPS or PDF data do no display a progress panel, regardless of the value in the flag parameter.
(Read and Write computed property)

41.4.45 Events

41.4.46 printOperationDidRun(success as boolean)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when the print operation ends.

41.4.47 Constants

Page Order Constants

Constant	Value	Description
NSAscendingPageOrder	1	Ascending (back to front) page order.
NSDescendingPageOrder	-1	Descending (front to back) page order.
NSSpecialPageOrder	0	The spooler does not rearrange pages—they are printed in the order received by the spooler.
NSUnknownPageOrder	2	No page order specified.

Print Quality Constants

Constant	Value	Description
NSPrintRenderingQualityBest	0	Renders the printing at the best possible quality, regardless of speed. Available in OS X v10.7 and later.
NSPrintRenderingQualityResponsive	1	Sacrifices the least possible amount of rendering quality for speed to main a responsive user interface. This option should be used only after establis that best quality rendering does indeed make the user interface unrespons Available in OS X v10.7 and later.

41.5 class NSPrintPanelMBS

41.5.1 class NSPrintPanelMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: An NSPrintPanel object creates the Print panel used to query the user for information about a print job.
Notes: This panel may lets the user select the range of pages to print and the number of copies before executing the Print command.

Print panels can display a simplified interface when printing certain types of data. For example, the panel can display a list of print-setting presets, which lets the user enable print settings in groups as opposed to individually. The JobStyleHint property activates the simplified interface and identifies which presets to display.

41.5.2 Methods

41.5.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Displays a Print panel sheet and runs it modally for the specified window.
Notes: printInfo: The printing information for the current job.
win: The window on which to display the sheet.

When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

- 41.5.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 8236
- 41.5.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 8237

41.5.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Displays a Print panel sheet and runs it modally for the specified window.
Notes: printInfo: The printing information for the current job.

win: The window on which to display the sheet.

When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

- 41.5.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 8236
- 41.5.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 8237

41.5.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Displays a Print panel sheet and runs it modally for the specified window.
Notes: printInfo: The printing information for the current job.
win: The window on which to display the sheet.

When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

- 41.5.3 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 8236
- 41.5.4 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 8236

41.5.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new print panel.

41.5.7 NSPrintAllPresetsJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
Notes: Output appropriate to all graphics types. Equivalent to Core Printing's kPMPresetGraphicsTypeAll.
Available in OS X v10.6 and later.

41.5.8 NSPrintNoPresetsJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
Notes: Output excludes all graphics printing. Equivalent to Core Printing's kPMPresetGraphicsTypeNone.
Available in OS X v10.6 and later.

41.5.9 NSPrintPhotoJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
Notes: Output contains photographic data.

41.5.10 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the printing information associated with the running Print panel.
Notes: The current printing information. May return nil if the Print panel is not currently running.
This method is a convenience method that your delegate can use to get the printing information while the Print Panel is visible.
Available in OS X v10.5 and later.

41.5.11 printPanel as NSPrintPanelMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns a new PrintPanel object.

41.5.12 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver's Print panel and begins the modal loop.
Notes: NSCancelButton (0) if the user clicks the Cancel button; otherwise NSOKButton (1).
This method uses the printing information associated with the current printing operation.

41.5.13 runModalWithPrintInfo(printInfo as NSPrintInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver's Print panel and runs the modal loop using the specified printing information.
Notes: printInfo: The printing information to use while displaying the Print panel.

Returns NSCancelButton (0) if the user clicks the Cancel button; otherwise NSOKButton (1).

41.5.14 Properties

41.5.15 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

41.5.16 defaultButtonTitle as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The title of the Print panel's default button.
Notes: defaultButtonTitle: The string to use for the button title.

You can use this method to change the default button title from "Print" to something more appropriate for your usage of the panel. For example, if you are using the Print panel to save a representation of the document to a file, you might change the title to "Save".
Available in OS X v10.5 and later.
(Read and Write computed property)

41.5.17 helpAnchor as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The HTML help anchor for the print panel.
Notes: helpAnchor: The anchor name in your Apple Help file. This parameter should contain just the name portion of the HTML anchor element.

For information on how to insert anchors into your Apple Help files, see Authoring User Help in Apple Help

Programming Guide.
Available in OS X v10.5 and later.
(Read and Write computed property)

41.5.18 jobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The type of content the Print panel is representing.
Notes: hint: For a list of supported job style hints, see Job Style Hints functions. Pass nil to this method to deactivate the simplified Print panel interface and use the standard interface instead (the equivalent of Core Printing's kPMPresetGraphicsTypeGeneral).

This method controls the set of items that appear in the Presets menu of the simplified Print panel interface.
(Read and Write computed property)

41.5.19 options as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The configuration options for the Print panel.
Notes: The configuration options, which you specify by adding together the appropriate constant values.
Available in OS X v10.5 and later.
(Read and Write computed property)

41.5.20 Events

41.5.21 printPanelDidEnd(returnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the sheet ends.
Notes: The value passed as returnCode is either NSCancelButton or NSOKButton. The value NSOKButton is returned even if the user clicked the Preview button.

41.5.22 Constants

Print Panel Option Constants

Constant	Value	Description
NSPrintPanelShowsCopies	1	The Print panel includes a field for manipulating the number of cop printed. This field is separate from any accessory views. Available in OS X v10.5 and later.
NSPrintPanelShowsOrientation	8	The Print panel includes a control for manipulating the page orientati control is separate from any accessory views. Available in OS X v10.5 and later.
NSPrintPanelShowsPageRange	2	The Print panel includes a set of fields for manipulating the range being printed. These fields are separate from any accessory views. Available in OS X v10.5 and later.
NSPrintPanelShowsPageSetupAccessory	256	The Print panel includes a separate accessory view for manipulating t size, orientation, and scaling attributes. Page setup fields that are configured for display on the main portion of the Print panel appear t not on this accessory panel. Available in OS X v10.5 and later.
NSPrintPanelShowsPaperSize	4	The Print panel includes a control for manipulating the paper size of th This control is separate from any accessory views. Available in OS X v10.5 and later.
NSPrintPanelShowsPreview	131072	The Print panel displays a built-in preview of the document conten option is only appropriate when the Print panel is used in conjunction NSPrintOperation object to print a document. Available in OS X v10.5 and later.
NSPrintPanelShowsPrintSelection	32	The Print panel includes an additional selection option for paper ran control is separate from any accessory views. Available in OS X v10.6 and later.
NSPrintPanelShowsScaling	16	The Print panel includes a control for scaling the printed output. Thi is separate from any accessory views. Available in OS X v10.5 and later.

Chapter 42

Cocoa Regular Expressions

42.1 class NSDataDetectorMBS

42.1.1 class NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A specialized regular expression object that matches natural language text for predefined data patterns.
Example:

```
// create detector for links and emails
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeLink
Var Error As NSErrorMBS
Var DataDetector As New NSDataDetectorMBS(types, error)

Var s As String = "Email us at john@mbs.test today!"

// look for the links now
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first link
Var r As NSTextCheckingResultMBS = m(0)
MsgBox r.URL
```

Notes: Currently the NSDataDetectorMBS class can match dates, addresses, links, phone numbers and transit information.
(links includes email addresses)

The results of matching content is returned as NSTextCheckingResultMBS objects. However, the NSTextCheckingResultMBS objects returned by NSDataDetectorMBS are different from those returned by the

base class NSRegularExpressionMBS. Results returned by NSDataDetector will be of one of the data detectors types, depending on the type of result being returned, and they will have corresponding properties. For example, results of type NSTextCheckingTypeDate have a date, timeZone, and duration; results of type NSTextCheckingTypeLink have a URL, and so forth.
Subclass of the NSRegularExpressionMBS class.

42.1.2 Methods

42.1.3 Constructor(checkingTypes as Integer, byref error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes and returns a data detector instance.
Example:

```
// create detector for phone number
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypePhoneNumber
Var Error As NSErrorMBS
Var DataDetector As New NSDataDetectorMBS(types, error)

Var s As String = "Call us at (555)-555-555 today!"

// look for the phone number now
```

```
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first phone number found
Var r As NSTextCheckingResultMBS = m(0)
MsgBox r.phoneNumber
```

Notes: checkingTypes: The checking types. The supported checking types are a subset of the types NSTextCheckingType. Those constants can be combined using the BitWiseOR() function.
error: An out parameter that if an error occurs during initialization contains the encountered error.

Returns the newly initialized data detector. If an error was encountered returns nil, and error contains the error.

Currently, the supported data detectors checkingTypes are: NSTextCheckingTypeDate, NSTextCheckingTypeAddress, NSTextCheckingTypeLink, NSTextCheckingTypePhoneNumber, and NSTextCheckingTypeTransitInformation.
See also:

- 42.1.4 Constructor(script as string, options as Integer, byref error as NSErrorMBS) 8245

42.1.4 Constructor(script as string, options as Integer, byref error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Private constructor.
Notes: Here to prevent you from accidentally calling the constructor for NSRegularExpressionMBS class.
See also:

- 42.1.3 Constructor(checkingTypes as Integer, byref error as NSErrorMBS) 8244

42.1.5 copy as NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the object.

42.1.6 dataDetectorWithTypes(checkingTypes as Integer, byref error as NSErrorMBS) as NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates and returns a new data detector instance.
Example:

```
// create detector for time, date and duration
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeDate
Var Error As NSErrorMBS
Var DataDetector As NSDataDetectorMBS = NSDataDetectorMBS.dataDetectorWithTypes(types, error)

Var s As String = "Let's meet sunday at 3 pm!"

// look for it:
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show time
Var r As NSTextCheckingResultMBS = m(0)

Var d As date = r.date
MsgBox d.SQLDateTime
```

Notes: checkingTypes: The checking types. The supported checking types are a subset of the types specified in NSTextCheckingType. Those constants can be combined using the bitwise OR operator.
error: An out parameter that if an error occurs during initialization contains the encountered error.

Returns the newly initialized data detector. If an error was encountered returns nil, and error contains the error.
Discussion
Currently, the supported data detectors checkingTypes are: NSTextCheckingTypeDate, NSTextCheckingTypeAddress, NSTextCheckingTypeLink, NSTextCheckingTypePhoneNumber, and NSTextCheckingTypeTransitInformation.

42.1.7 Properties

42.1.8 checkingTypes as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the checking types for this data detector.
Notes: The supported subset of checking types are specified in NSTextCheckingType. Those constants can be combined using the bitwise OR operator.
Currently, the supported data detectors checkingTypes are: NSTextCheckingTypeDate, NSTextCheckingTypeAddress, NSTextCheckingTypeLink, NSTextCheckingTypePhoneNumber, and NSTextCheckingTypeTransitInformation.
(Read only property)

42.2 class NSRegularExpressionMBS

42.2.1 class NSRegularExpressionMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An immutable representation of a compiled regular expression that you apply to Unicode strings.
Notes: The fundamental matching method for NSRegularExpressionMBS is a Block iterator method that allows clients to supply a Block object which will be invoked each time the regular expression matches a portion of the target string. There are additional convenience methods for returning all the matches as an array, the total number of matches, the first match, and the range of the first match.

An individual match is represented by an instance of the NSTextCheckingResultMBS class, which carries information about the overall matched range (via its range property), and the range of each individual capture group (via the rangeAtIndex: method). For basic NSRegularExpression objects, these match results will be of type NSTextCheckingTypeRegularExpression, but subclasses may use other types.

42.2.2 Methods

42.2.3 Constructor(script as string, options as Integer, byref error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an initialized NSRegularExpression instance with the specified regular expression pattern and options.
Notes: pattern: The regular expression pattern to compile.
options: The regular expression options that are applied to the expression during matching. See NSRegularExpressionOptions for possible values.
error: An out value that returns any error encountered during initialization. Returns an NSErrorMBS object if the regular expression pattern is invalid; otherwise returns nil.

Returns an instance of NSRegularExpressionMBS for the specified regular expression and options

42.2.4 copy as NSRegularExpressionMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the object.

42.2.5 enumerateMatches(text as string, options as Integer, range as NSRangeMBS = nil)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Enumerates the string allowing the event to handle each regular expression match.
Notes: Calls enumerateMatch event.

text: The string.
options: The matching options to report. See MatchingOptions for the supported values.
range: The range of the string to test.

This method is the fundamental matching method for regular expressions and is suitable for overriding by subclassers. There are additional convenience methods for returning all the matches as an array, the total number of matches, the first match, and the range of the first match.

By default, the event iterator method calls the event precisely once for each match, with a non-nil result and the appropriate flags. The client may then stop the operation by setting the contents of stop to true. The stop argument is an out-only argument. You should only ever set this Boolean to true within the event.

If the MatchingReportProgress matching option is specified, the event will also be called periodically during long-running match operations, with nil result and MatchingProgress matching flag set in the event,Äôs flags parameter, at which point the client may again stop the operation by setting the contents of stop to true.

If the MatchingReportCompletion matching option is specified, the event object will be called once after matching is complete, with nil result and the MatchingCompleted matching flag is set in the flags passed to the event, plus any additional relevant MatchingFlags from among MatchingHitEnd, MatchingRequiredEnd, or MatchingInternalError.

MatchingProgress and MatchingCompleted matching flags have no effect for methods other than this method. The MatchingHitEnd matching flag is set in the flags passed to the event if the current match operation reached the end of the search range. The MatchingRequiredEnd matching flag is set in the flags passed to the event if the current match depended on the location of the end of the search range.

The MatchingFlags matching flag is set in the flags passed to the event if matching failed due to an internal error (such as an expression requiring exponential memory allocations) without examining the entire search

range.

The MatchingAnchored, MatchingWithTransparentBounds, and MatchingWithoutAnchoringBounds regular expression options, specified in the options property specified when the regular expression instance is created, can apply to any match or replace method.
If MatchingAnchored matching option is specified, matches are limited to those at the start of the search range.
If MatchingWithTransparentBounds matching option is specified, matching may examine parts of the string beyond the bounds of the search range, for purposes such as word boundary detection, lookahead, etc.

If MatchingWithoutAnchoringBounds matching option is specified, ^and $ will not automatically match the beginning and end of the search range, but will still match the beginning and end of the entire string.

MatchingWithTransparentBounds and MatchingWithoutAnchoringBounds matching options have no effect if the search range covers the entire string.

42.2.6 escapedPatternForString(text as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a string by adding backslash escapes as necessary to protect any characters that would match as pattern metacharacters.
Notes: text: The string.

Returns the escaped string.

Returns a string by adding backslash escapes as necessary to the given string, to escape any characters that would otherwise be treated as pattern metacharacters. You typically use this method to match on a particular string within a larger pattern.
For example, the string "(N/A)" contains the pattern metacharacters (, /, and). The result of adding backslash escapes to this string is "\\(N\\/A\\)".

42.2.7 escapedTemplateForString(text as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a template string by adding backslash escapes as necessary to protect any characters that would match as pattern metacharacters.
Notes: text: The template string

Returns the escaped template string.

Returns a string by adding backslash escapes as necessary to the given string, to escape any characters that would otherwise be treated as pattern metacharacters. You typically use this method to match on a particular string within a larger pattern.
For example, the string "(N/A)" contains the pattern metacharacters (, /, and). The result of adding backslash escapes to this string is "\\(N\\/A\\)".
See Flag Options for the format of the resulting template string.

42.2.8 firstMatch(text as string, options as Integer, range as NSRangeMBS = nil) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the first match of the regular expression within the specified range of the string.
Notes: text: The string to search.
options: The matching options to use. See NSMatchingOptions for possible values.
range: The range of the string to search.

Returns an NSTextCheckingResultMBS object. This result gives the overall matched range via its range property, and the range of each individual capture group via its rangeAtIndex: method. The range { NSNotFound, 0 } is returned if one of the capture groups did not participate in this particular match.

This is a convenience method that calls enumerateMatches.

42.2.9 matches(text as string, options as Integer, range as NSRangeMBS = nil) as NSTextCheckingResultMBS()

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an array containing all the matches of the regular expression in the string.
Notes: text: The string to search.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.

Returns an array of NSTextCheckingResultMBS objects. Each result gives the overall matched range via its range property, and the range of each individual capture group via its rangeAtIndex: method. The range { NSNotFound, 0 } is returned if one of the capture groups did not participate in this particular match.

This is a convenience method that calls enumerateMatches passing the appropriate string, options, and range.

42.2.10 numberOfMatches(text as string, options as Integer, range as NSRangeMBS = nil) as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the number of matches of the regular expression within the specified range of the string.
Notes: text: The string to search.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.

Returns the number of matches of the regular expression.

This is a convenience method that calls enumerateMatches.

42.2.11 rangeOfFirstMatch(text as string, options as Integer, range as NSRangeMBS = nil) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the range of the first match of the regular expression within the specified range of the string.
Notes: string: The string to search.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.

Returns the range of the first match. Returns { NSNotFound, 0 } if no match is found.

This is a convenience method that calls enumerateMatches.

42.2.12 regularExpressionWithPattern(pattern as String, options as Integer, byref error as NSErrorMBS) as NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates an NSRegularExpression instance with the specified regular expression pattern and options.
Notes: pattern: The regular expression pattern to compile.
options: The matching options. See constants for possible values. The values can be combined using the bitwise OR operator.
error: An out value that returns any error encountered during initialization. Returns an NSErrorMBS object if the regular expression pattern is invalid; otherwise returns nil.

Returns an instance of NSRegularExpression for the specified regular expression and options.

42.2.13 replaceMatches(byref text as string, options as Integer, range as NSRangeMBS = nil, template as String) as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Replaces regular expression matches within the mutable string using the template string.
Notes: text: The Text to search and replace values within.
options: The matching options to use. See NSMatchingOptions for possible values.
range: The range of the string to search.
template: The substitution template used when replacing matching instances.

Returns the number of matches.

See Flag Options for the format of template.

42.2.14 replacementStringForResult(result as NSTextCheckingResultMBS, text as string, offset as Integer, template as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Used to perform template substitution for a single result for clients implementing their own replace functionality.
Notes: result: The result of the single match.
text: The string from which the result was matched.
offset: The offset to be added to the location of the result in the string.
template: See Flag Options for the format of template.

Returns a replacement string.

For clients implementing their own replace functionality, this is a method to perform the template substitution for a single result, given the string from which the result was matched, an offset to be added to the location of the result in the string (for example, in cases that modifications to the string moved the result since it was matched), and a replacement template.
This is an advanced method that is used only if you wanted to iterate through a list of matches yourself and do the template replacement for each one, plus maybe some other calculation that you want to do in code, then you would use this at each step.

42.2.15 stringByReplacingMatches(text as string, options as Integer, range as NSRangeMBS = nil, template as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a new string containing matching regular expressions replaced with the template string.
Notes: text: The string to search for values within.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.
template: The substitution template used when replacing matching instances.

Returns a string with matching regular expressions replaced by the template string.

See Flag Options for the format of template.

42.2.16 Properties

42.2.17 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

42.2.18 numberOfCaptureGroups as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the number of capture groups in the regular expression.
Notes: A capture group consists of each possible match within a regular expression. Each capture group can then be used in a replacement template to insert that value into a replacement string.
This value puts a limit on the values of n for $ n in templates, and it determines the number of ranges in the returned NSTextCheckingResultMBS instances returned in the match... methods.
An exception will be generated if you attempt to access a result with an index value exceeding numberOfCaptureGroups-1.
(Read only property)

42.2.19 options as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the options used when the regular expression option was created.
Notes: The options property specifies aspects of the regular expression matching that are always used when matching the regular expression. For example, if the expression is case sensitive, allows comments, ignores metacharacters, etc. See constants for a complete discussion of the possible constants and their meanings.
(Read only property)

42.2.20 pattern as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the regular expression pattern.
Notes: (Read only property)

42.2.21 Events

42.2.22 enumerateMatch(text as String, options as Integer, result as NSTextCheckingResultMBS, flags as Integer, byref stop as Boolean)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The event for enumerateMatches callback.
Notes: We pass through text and options for debugging.
Set stop to true to exit early.
Can be used with addHandler if needed.

result: An NSTextCheckingResultMBS specifying the match. This result gives the overall matched range via its range property, and the range of each individual capture group via its rangeAtIndex: method. The range { NSNotFound, 0 } is returned if one of the capture groups did not participate in this particular match.
flags: The current state of the matching progress. See Matching Flags for the possible values.
stop: A reference to a Boolean value. The event can set the value to true to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to true within the event.

42.2.23 Constants

Matching Options

Constant	Value	Description
MatchingAnchored	4	Specifies that matches are limited to those at the start of the search range. S enumerateMatches for a description of the constant in context.
MatchingReportCompletion	2	Call the Block once after the completion of any matching. This option has effect for methods other than enumerateMatches. See enumerateMatches fo description of the constant in context.
MatchingReportProgress	1	Call the Block periodically during long-running match operations. This opt has no effect for methods other than enumerateMatches. See enumerate atches for a description of the constant in context.
MatchingWithoutAnchoringBounds	16	Specifies that ^and $ will not automatically match the beginning and end the search range, but will still match the beginning and end of the entire stri This constant has no effect if the search range contains the entire string. S enumerateMatches for a description of the constant in context.
MatchingWithTransparentBounds	8	Specifies that matching may examine parts of the string beyond the bou of the search range, for purposes such as word boundary detection, lookahe etc. This constant has no effect if the search range contains the entire stri See enumerateMatches for a description of the constant in context.

Progress

Constant	Value	Description
MatchingCompleted	2	Set when the Block is called after matching has completed.
MatchingHitEnd	4	Set when the current match operation reached the end of the search range.
MatchingInternalError	16	Set when matching failed due to an internal error.
MatchingProgress	1	Set when the Block is called to report progress during a long-running match operation.
MatchingRequiredEnd	8	Set when the current match depended on the location of the end of the search range.

Options

Constant	Value	Description
RegularExpressionAllowCommentsAndWhitespace	2	Ignore whitespace and #-prefixed comments in the pattern.
RegularExpressionAnchorsMatchLines	16	Allow ^and $ to match the start and end of lines.
RegularExpressionCaseInsensitive	1	Match letters in the pattern independent of case.
RegularExpressionDotMatchesLineSeparators	8	Allow . to match any character, including line separators.
RegularExpressionIgnoreMetacharacters	4	Treat the entire pattern as a literal string.
RegularExpressionUseUnicodeWordBoundaries	64	Use Unicode TR#29 to specify word boundaries (otherwise, expression word boundaries are used).
RegularExpressionUseUnixLineSeparators	32	Treat only \n as a line separator (otherwise, all standard l used).

42.3 class NSTextCheckingResultMBS

42.3.1 class NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: An occurrence of textual content found during the analysis of a block of text, such as when matching a regular expression.
Example:

```
// create detector for Address
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeAddress
Var Error As NSErrorMBS
Var DataDetector As New NSDataDetectorMBS(types, error)

Var s As String = "Let's meet at Hauptstra√üe 123 in 12345 Berlin, Deutschland."

// look for it:
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show Address
Var r As NSTextCheckingResultMBS = m(0)

Var dic As Dictionary = r.components
Var lines() As String
For Each key As Variant In dic.keys
lines.Append key.StringValue+": "+dic.Value(key).StringValue
Next

MsgBox Join(lines,EndOfLine)
```

Notes: On both iOS and macOS, instances of NSTextCheckingResultMBS are returned by the NSRegularExpression class and the NSDataDetectorMBS class to indicate the discovery of content. In those cases, what is found may be a match for a regular expression or a date, address, phone number, and so on. In macOS, instances of NSTextCheckingResultMBS are returned by the NSSpellCheckerMBS object to describe the results of spelling, grammar, or text-substitution actions.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

42.3.2 Methods

42.3.3 addressCheckingResult(Range as NSRangeMBS, components as Dictionary) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified address components.
Notes: components: A dictionary containing the address components. The dictionary keys are described in Keys for Address Components.

42.3.4 alternativeStrings as String()

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns alternative strings.

42.3.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The private constructor.

42.3.6 copy as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates a copy of the result.

42.3.7 correctionCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result after detecting a possible correction.
Notes: range: The range of the detected result.
replacementString: The suggested replacement string.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeSpelling.
See also:

- 42.3.8 correctionCheckingResult(Range as NSRangeMBS, replacementString as String, alternativeStrings() as String) as NSTextCheckingResultMBS 8258

42.3.8 correctionCheckingResult(Range as NSRangeMBS, replacementString as String, alternativeStrings() as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result after detecting a possible correction.
Notes: range: The range of the detected result.
replacementString: The suggested replacement string.

Returns an NSTextCheckingResultMBS with the specified range and a resultType of NSTextCheckingTypeSpelling.
See also:

- 42.3.7 correctionCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS 8257

42.3.9 dashCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified dash corrected replacement string.
Notes: range: The range of the detected result.
replacementString: The replacement string.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeDash.

42.3.10 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a text checking result with the specified date.
See also:

- 42.3.11 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 8259
- 42.3.12 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS 8259
- 42.3.13 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 8260

42.3.11 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a text checking result with the specified date, time zone, and duration.
Notes: range: The range of the detected result.
date: The detected date.
timeZone: The detected time zone.
duration: The detected duration.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeDate.
See also:

- 42.3.10 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS 8258
- 42.3.12 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS 8259
- 42.3.13 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 8260

42.3.12 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified date.
See also:

- 42.3.10 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS 8258
- 42.3.11 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 8259

- 42.3.13 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 8260

42.3.13 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified date, time zone, and duration.
Notes: range: The range of the detected result.
date: The detected date.
timeZone: The detected time zone.
duration: The detected duration.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeDate.
See also:

- 42.3.10 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS 8258
- 42.3.11 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 8259
- 42.3.12 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS 8259

42.3.14 grammarCheckingResult(Range as NSRangeMBS, details() as Dictionary) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified array of grammatical errors.
Notes: range: The range of the detected result.
details: An array of details regarding the grammatical errors. This array of strings is suitable for presenting to the user.

Returns an NSTextCheckingResultMBS with the specified range and a resultType of NSTextCheckingTypeGrammar.

42.3.15 grammarDetails as Dictionary()

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The details of a located grammatical type checking result.
Notes: This array of strings is suitable for presenting to the user.

42.3.16 linkCheckingResult(Range as NSRangeMBS, URL as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified URL.

42.3.17 NSTextCheckingAirlineKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the components dictionary.
Notes: A key that corresponds to the airline of a transit result.

42.3.18 NSTextCheckingCityKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the city component of the address.

42.3.19 NSTextCheckingCountryKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the country component of the address.

42.3.20 NSTextCheckingFlightKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the components dictionary.
Example:

```
// create detector for transit information
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeTransitInformation
```

```
Var Error As NSErrorMBS
Var DataDetector As New NSDataDetectorMBS(types, error)

Var s As String = "Let's fly with LH444 to Atlanta!"

// look for it:
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show airline
Var r As NSTextCheckingResultMBS = m(0)

Var dic As Dictionary = r.components
Var Airline As String = dic.Lookup(NSTextCheckingResultMBS.NSTextCheckingAirlineKey, "?")
Var Flight As String = dic.Lookup(NSTextCheckingResultMBS.NSTextCheckingFlightKey, "?")

MsgBox Airline+" "+Flight
```

Notes: A key that corresponds to the flight component of a transit result.

42.3.21 NSTextCheckingJobTitleKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the job component of the address.

42.3.22 NSTextCheckingNameKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the name component of the address.

42.3.23 NSTextCheckingOrganizationKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the organization component of the address.

42.3.24 NSTextCheckingPhoneKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the phone number component of the address.

42.3.25 NSTextCheckingStateKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the state or province component of the address.

42.3.26 NSTextCheckingStreetKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the street address component of the address.

42.3.27 NSTextCheckingZIPKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the zip code or postal code component of the address.

42.3.28 orthographyCheckingResult(Range as NSRangeMBS, orthography as NSOrthographyMBS) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified orthography.
Notes: range: The range of the detected result.
orthography: An orthography object that describes the script.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeOrthography.

42.3.29 phoneNumberCheckingResult(Range as NSRangeMBS, phoneNumber as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified phone number.

42.3.30 quoteCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified quote-balanced replacement string.
Notes: range: The range of the detected result.
replacementString: The replacement string.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeQuote.

42.3.31 rangeAtIndex(index as Integer) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the result type that the range represents.
Notes: index: The index of the result.

Returns the range of the result.

A result must have at least one range, but may optionally have more (for example, to represent regular expression capture groups).
Passing rangeAtIndex the value 0 always returns the value of the the range property. Additional ranges, if any, will have indexes from 1 to numberOfRanges-1.

42.3.32 rangeWithName(name as string) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns range with name.

42.3.33 replacementCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified replacement string.

42.3.34 resultByAdjustingRangesWithOffset(offset as Integer) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns a new text checking result after adjusting the ranges as specified by the offset.
Notes: offset: The amount the ranges are adjusted.

Returns a new NSTextCheckingResultMBS instance with the adjusted range or ranges.

42.3.35 spellCheckingResult(Range as NSRangeMBS) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the range of a misspelled word.
Notes: range: The range of the detected result.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeSpelling.

42.3.36 transitInformationCheckingResult(Range as NSRangeMBS, components as Dictionary) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified transit information.
Notes: components: A dictionary containing the transit components. The currently supported keys are NSTextCheckingAirlineKey and NSTextCheckingFlightKey.

42.3.37 Properties

42.3.38 addressComponents as Dictionary

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The address dictionary of a type checking result.
Notes: The dictionary keys are described in Keys for Address Components.
(Read only property)

42.3.39 components as Dictionary

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: A dictionary containing the components of a type checking result.
Example:

```
// create detector for Address
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeAddress
Var Error As NSErrorMBS
Var DataDetector As New NSDataDetectorMBS(types, error)

Var s As String = "Let's meet at Hauptstra√üe 123 in 12345 Berlin, Deutschland."

// look for it:
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show Address
Var r As NSTextCheckingResultMBS = m(0)

Var dic As Dictionary = r.components
Var lines() As String
For Each key As Variant In dic.keys
lines.Append key.StringValue+": "+dic.Value(key).StringValue
Next

MsgBox Join(lines,EndOfLine)
```

Notes: Currently used by the transit checking result. The supported keys are located in Keys for Transit Components.
(Read only property)

42.3.40 date as Date

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date component of a type checking result.
Example:

```
// create detector for time, date and duration
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeDate
Var Error As NSErrorMBS
Var DataDetector As NSDataDetectorMBS = NSDataDetectorMBS.dataDetectorWithTypes(types, error)

Var s As String = "Let's meet sunday at 3 pm!"

// look for it:
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show time
Var r As NSTextCheckingResultMBS = m(0)

Var d As date = r.date
MsgBox d.SQLDateTime
```

Notes: (Read only property)

42.3.41 dateTime as DateTime

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date component of a type checking result.
Notes: (Read only property)

42.3.42 duration as Double

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The duration component of a type checking result.
Notes: (Read only property)

42.3.43 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

42.3.44 numberOfRanges as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the number of ranges.
Notes: A result must have at least one range, but may optionally have more (for example, to represent regular expression capture groups).
Passing rangeAtIndex the value 0 always returns the value of the the range property. Additional ranges, if any, will have indexes from 1 to numberOfRanges-1.
(Read only property)

42.3.45 orthography as NSOrthographyMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The detected orthography of a type checking result.
Notes: (Read only property)

42.3.46 phoneNumber as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The phone number of a type checking result.
Example:

```
// create detector for phone number
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypePhoneNumber
Var Error As NSErrorMBS
Var DataDetector As New NSDataDetectorMBS(types, error)

Var s As String = "Call us at (555)-555-555 today!"

// look for the phone number now
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first phone number found
Var r As NSTextCheckingResultMBS = m(0)
MsgBox r.phoneNumber
```

Notes: (Read only property)

42.3.47 range as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the range of the result that the receiver represents.
Notes: This property will be present for all returned NSTextCheckingResultMBS instances.
(Read only property)

42.3.48 regularExpression as NSRegularExpressionMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The regular expression of a type checking result.
Notes: (Read only property)

42.3.49 replacementString as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: A replacement string from one of a number of replacement checking results.
Notes: (Read only property)

42.3.50 resultType as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the text checking result type that the receiver represents.
Notes: The possible result types for the built in checking capabilities are described in NSTextCheckingType.
This property will be present for all returned NSTextCheckingResultMBS instances.
(Read only property)

42.3.51 timeZone as NSTimeZoneMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The time zone component of a type checking result.
Notes: (Read only property)

42.3.52 URL as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The URL of a type checking result.
Example:

```
// create detector for links and emails
Var types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeLink
Var Error As NSErrorMBS
Var DataDetector As New NSDataDetectorMBS(types, error)

Var s As String = "Email us at john@mbs.test today!"

// look for the links now
Var m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first link
Var r As NSTextCheckingResultMBS = m(0)
MsgBox r.URL
```

Notes: (Read only property)

42.3.53 Constants

Checking Types

Constant	Value	Description
NSTextCheckingAllCustomTypes	&hffffffff00000000	Checking types that can be used by clients.
NSTextCheckingAllSystemTypes	&hffffffff	Checking types supported by the system. The first 32 typ
NSTextCheckingAllTypes	&hffffffffffffffff	All possible checking types, both system- and user-suppor
NSTextCheckingTypeAddress	16	Attempts to locate addresses.
NSTextCheckingTypeCorrection	512	Performs autocorrection on misspelled words.
NSTextCheckingTypeDash	128	Replaces dashes with em-dashes.
NSTextCheckingTypeDate	8	Attempts to locate dates.
NSTextCheckingTypeGrammar	4	Checks grammar.
NSTextCheckingTypeLink	32	Attempts to locate URL links or emails.
NSTextCheckingTypeOrthography	1	Attempts to identify the language
NSTextCheckingTypePhoneNumber	2048	Matches a phone number.
NSTextCheckingTypeQuote	64	Replaces quotes with smart quotes.
NSTextCheckingTypeRegularExpression	1024	Matches a regular expression.
NSTextCheckingTypeReplacement	256	Replaces characters such as (c) with the appropriate symb
NSTextCheckingTypeSpelling	2	Checks spelling.
NSTextCheckingTypeTransitInformation	4096	Matches a transit information, for example, flight informa

Chapter 43

Cocoa Tasks

43.1 class NSFileHandleMBS

43.1.1 class NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: NSFileHandle objects provide an object-oriented wrapper for accessing open files or communications channels.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataToEndOfFile
end if
```

Notes: Please call closeFile on the end if you want to close the file.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo / Real Studio Plugins, version 14.1pr4

43.1.2 Methods

43.1.3 acceptConnectionInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Accepts a socket connection (for stream-type sockets only) in the background and creates a file handle for the "near" (client) end of the communications channel.
Notes: This method is asynchronous. In a separate "safe" thread it accepts a connection, creates a file handle for the other end of the connection, and returns that object to the client by posting an NSFileHandleConnectionAcceptedNotification in the run loop of the client. The notification includes as data a userInfo dictionary containing the created NSFileHandle object; access this object using the NSFileHandleNotificationFileHandleItem key.
The receiver must be created by an fileHandleWithFileDescriptor message that takes as an argument a stream-type socket created by the appropriate system routine. The object that will write data to the returned file handle must add itself as an observer of NSFileHandleConnectionAcceptedNotification.
Note that this method does not continue to listen for connection requests after it posts NSFileHandleConnectionAcceptedNotification. If you want to keep getting notified, you need to call acceptConnectionInBackgroundAndNotify again in your observer method.

43.1.4 AvailableBytes as Integer

MBS MacCocoa Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Queries number of available bytes.
Notes: Returns -1 if query failed.
You can use this value with readDataOfLength function to have it not block.

43.1.5 availableData as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the data available through the receiver.
Notes: If the receiver is a file, returns the data obtained by reading the file from the file pointer to the end of the file. If the receiver is a communications channel, reads up to a buffer of data and returns it; if no data is available, the method blocks. Returns an empty data object if the end of file is reached. Raises NSFileHandleOperationException if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.

43.1.6 closeFile

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Disallows further access to the represented file or communications channel and signals end of file on communications channels that permit writing.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var e as NSErrorMBS
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then
MsgBox e.localizedDescription
end if

if n<>Nil then
MsgBox n.readDataOfLength(5)
n.closeFile
end if
```

Notes: The file or communications channel is available for other uses after the file handle represented by the receiver is closed. Further read and write messages sent to a file handle to which closeFile has been sent raises an exception.
Sending closeFile to a file handle does not cause its deallocation. The deallocation of an NSFileHandle object deletes its descriptor and closes the represented file or channel unless the NSFileHandle object was created with fileHandleWithFileDescriptor with false as the parameter argument.

43.1.7 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

43.1.8 fileDescriptor as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file descriptor associated with the receiver.
Notes: Returns the POSIX file descriptor associated with the receiver.

You can send this message to file handles originating from both file descriptors and file handles and receive a valid file descriptor so long as the file handle is open. If the file handle has been closed by sending it closeFile, this method raises an exception.

43.1.9 fileHandleForReadingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified path.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataToEndOfFile
end if
```

Notes: path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandle read... messages.

43.1.10 fileHandleForReadingAtPath(path as string) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified path.
Notes: path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandle read... messages.

43.1.11 fileHandleForReadingFromFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified URL.

Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var e as NSErrorMBS
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then
MsgBox e.localizedDescription
end if

if n<>Nil then
MsgBox n.readDataOfLength(5)
MsgBox str(n.offsetInFile) // shows 5
end if
```

Notes: url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandleread... messages.

43.1.12 fileHandleForReadingFromURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified URL.
Notes: url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandleread... messages.

43.1.13 fileHandleForUpdatingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified path.
Notes: path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandle read... messages and writeData.

43.1.14 fileHandleForUpdatingAtPath(path as string) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified path.
Notes: path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandle read... messages and writeData.

43.1.15 fileHandleForUpdatingFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.
Notes: url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

The initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandleread... messages and writeData.

43.1.16 fileHandleForUpdatingURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.
Notes: url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

The initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandleread... messages and writeData.

43.1.17 fileHandleForWritingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified path.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingAtFile(f)

if n<>Nil then
n.writeData "Hello World"
n.closeFile
end if
```

Notes: path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

43.1.18 fileHandleForWritingAtPath(path as string) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified path.
Notes: path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

43.1.19 fileHandleForWritingToFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var e as NSErrorMBS
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingToFile(f, e)

if e<>Nil then
MsgBox e.localizedDescription
else
n.writeData "Hello World"
n.closeFile
end if
```

Notes: url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

43.1.20 fileHandleForWritingToURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.
Notes: url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

43.1.21 fileHandleWithFileDescriptor(fd as Integer) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized with a file descriptor.
Notes: You can create a file handle for a socket by using the result of a socket call as fileDescriptor.
The object creating a file handle using this method owns fileDescriptor and is responsible for its disposition.
See also:

- 43.1.22 fileHandleWithFileDescriptor(fd as Integer, closeOnDealloc as boolean) as NSFileHandleMBS 8279

43.1.22 fileHandleWithFileDescriptor(fd as Integer, closeOnDealloc as boolean) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized with a file descriptor.
Notes: You can create a file handle for a socket by using the result of a socket call as fileDescriptor.
The object creating a file handle using this method owns fileDescriptor and is responsible for its disposition.

closeOnDealloc: True if the file descriptor should be closed when the receiver is deallocated, otherwise false.
See also:

- 43.1.21 fileHandleWithFileDescriptor(fd as Integer) as NSFileHandleMBS 8279

43.1.23 fileHandleWithNullDevice as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle associated with a null device.
Notes: You can use null-device file handles as "placeholders" for standard-device file handles or in collection objects to avoid exceptions and other errors resulting from messages being sent to invalid file handles. Read messages sent to a null-device file handle return an end-of-file indicator (an empty NSData object) rather

than raise an exception. Write messages are no-ops, whereas fileDescriptor returns an illegal value. Other methods are no-ops or return "sensible" values.

43.1.24 fileHandleWithStandardError as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file handle associated with the standard error file.
Example:

```
// for GUI apps this ends on the console: (see console.app)

Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleWithStandardError

n.writeData "Hello World"
```

Notes: Conventionally this is a terminal device to which error messages are sent. There is one standard error file handle per process; it is a shared instance.

43.1.25 fileHandleWithStandardInput as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file handle associated with the standard input file.
Notes: Conventionally this is a terminal device on which the user enters a stream of data. There is one standard input file handle per process; it is a shared instance.

43.1.26 fileHandleWithStandardOutput as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file handle associated with the standard output file.
Example:

```
// for GUI apps this ends on the console: (see console.app)

Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleWithStandardOutput

n.writeData "Hello World"
```

Notes: Conventionally this is a terminal device that receives a stream of data from a program. There is one standard output file handle per process; it is a shared instance.

43.1.27 NSFileHandleConnectionAcceptedNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: This notification is posted when an NSFileHandle object establishes a socket connection between two processes, creates an NSFileHandle object for one end of the connection, and makes this object available to observers by putting it in the userInfo dictionary.
Notes: To cause the posting of this notification, you must send either acceptConnectionInBackgroundAndNotify to an NSFileHandle object representing a server stream-type socket.
The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

NSFileHandleNotificationFileHandleItem	The NSFileHandle object representing the "near" end of a socket connection
NSFileHandleError	An integer representing the UNIX-type error which occurred

43.1.28 NSFileHandleDataAvailableNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: This notification is posted when the background thread determines that data is currently available for reading in a file or at a communications channel.
Notes: The observers can then issue the appropriate messages to begin reading the data. To cause the posting of this notification, you must send either waitForDataInBackgroundAndNotify or waitForDataInBackgroundAndNotifyForModes: to an appropriate NSFileHandle object.
The notification object is the NSFileHandle object that sent the notification. This notification does not contain a userInfo dictionary.

43.1.29 NSFileHandleNotificationDataItem as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: A key in the userinfo dictionary in a NSFileHandleReadCompletionNotification and NSFileHandleReadToEndOfFileCompletionNotification.
Notes: The corresponding value is an memoryblock containing the available data read from a socket connection.

43.1.30 NSFileHandleNotificationFileHandleItem as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: A key in the userinfo dictionary in a NSFileHandleConnectionAcceptedNotification notification.
Notes: The corresponding value is the NSFileHandle object handle representing the "near" end of a socket

connection.

43.1.31 NSFileHandleNotificationMonitorModes as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Currently unused.

43.1.32 NSFileHandleOperationException as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Constant that defines the name of a file operation exception.
Notes: Raised by NSFileHandle if attempts to determine file-handle type fail or if attempts to read from a file or channel fail.

43.1.33 NSFileHandleReadCompletionNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: One of the notification strings for the file handle class.
Notes: This notification is posted when the background thread reads the data currently available in a file or at a communications channel. It makes the data available to observers by putting it in the userInfo dictionary. To cause the posting of this notification, you must send either readInBackgroundAndNotify to an appropriate NSFileHandle object.
The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

NSFileHandleNotificationDataItem	An string containing the available data read from a socket connection
NSFileHandleError	An integer representing the UNIX-type error which occurred

43.1.34 NSFileHandleReadToEndOfFileCompletionNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: This notification is posted when the background thread reads all data in the file or, if a communications channel, until the other process signals the end of data.
Notes: It makes the data available to observers by putting it in the userInfo dictionary. To cause the posting of this notification, you must send either readToEndOfFileInBackgroundAndNotify to an appropriate NSFileHandle object.

The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

NSFileHandleNotificationDataItem: A string containing the available data read from a socket connection

NSFileHandleError An integer representing the UNIX-type error which occurred

43.1.35 readDataOfLength(length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Reads data up to a specified number of bytes from the receiver.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataOfLength(5)
end if
```

Notes: length: The number of bytes to read from the receiver.

Returns the data available through the receiver up to a maximum of length bytes.

If the receiver is a file, returns the data obtained by reading from the file pointer to length or to the end of the file, whichever comes first. If the receiver is a communications channel, the method reads data from the channel up to length. Returns an empty memoryblock if the file is positioned at the end of the file or if an end-of-file indicator is returned on a communications channel. Raises NSFileHandleOperationException if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.

43.1.36 readDataToEndOfFile as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the data available through the receiver up to the end of file or maximum number of bytes.
Example:

```
// file must exist for this sample:
```

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataToEndOfFile
end if
```

Notes: Returns the data available through the receiver up to UINT_MAX bytes (the maximum value for unsigned integers) or, if a communications channel, until an end-of-file indicator is returned.

This method invokes readDataOfLength as part of its implementation.

43.1.37 readInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Reads from the file or communications channel in the background and posts a notification when finished.
Notes: This method performs an asynchronous availableData operation on a file or communications channel and posts an NSFileHandleReadCompletionNotification to the client process's run loop.
The length of the data is limited to the buffer size of the underlying operating system. The notification includes a userInfo dictionary that contains the data read; access this object using the NSFileHandleNotificationDataItem key.
Any object interested in receiving this data asynchronously must add itself as an observer of NSFileHandleReadCompletionNotification. In communication via stream-type sockets, the receiver is often the object returned in the userInfo dictionary of NSFileHandleConnectionAcceptedNotification.
Note that this method does not cause a continuous stream of notifications to be sent. If you wish to keep getting notified, you'll also need to call readInBackgroundAndNotify in your observer method.

43.1.38 readToEndOfFileInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Reads to the end of file from the file or communications channel in the background and posts a notification when finished.
Example:

```
Var path as string = "/tmp/NSFileHandle async reading.txt"
Var f as FolderItem = GetFolderItem(path, FolderItem.PathTypeShell)
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

n.readToEndOfFileInBackgroundAndNotify
```

Notes: This method performs an asynchronous readToEndOfFile operation on a file or communications channel and posts an NSFileHandleReadToEndOfFileCompletionNotification to the client process's run loop. The notification includes a userInfo dictionary that contains the data read; access this object using the NSFileHandleNotificationDataItem key.
Any object interested in receiving this data asynchronously must add itself as an observer of NSFileHandleReadToEndOfFileCompletionNotification. In communication via stream-type sockets, the receiver is often the object returned in the userInfo dictionary of NSFileHandleConnectionAcceptedNotification.

43.1.39 seekToEndOfFile as UInt64

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Puts the file pointer at the end of the file referenced by the receiver and returns the new file offset.
Notes: Returns the file offset with the file pointer at the end of the file. This is therefore equal to the size of the file.

Raises an exception if the message is sent to an NSFileHandle object representing a pipe or socket or if the file descriptor is closed.

43.1.40 seekToFileOffset(offset as UInt64)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Moves the file pointer to the specified offset within the file represented by the receiver.
Notes: Raises an exception if the message is sent to an NSFileHandle object representing a pipe or socket, if the file descriptor is closed, or if any other error occurs in seeking.

43.1.41 synchronizeFile

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Causes all in-memory data and attributes of the file represented by the receiver to be written to permanent storage.
Notes: This method should be invoked by programs that require the file to always be in a known state. An invocation of this method does not return until memory is flushed.

43.1.42 truncateFileAtOffset(offset as UInt64)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Truncates or extends the file represented by the receiver to a specified offset within the file and puts the file pointer at that position.
Notes: offset: The offset within the file that will mark the new end of the file.

If the file is extended (if offset is beyond the current end of file), the added characters are null bytes.

43.1.43 waitForDataInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Checks to see if data is available in a background thread.
Notes: When the data becomes available, the thread notifies all observers with NSFileHandleDataAvailableNotification. After the notification has been posted, the thread is terminated.

43.1.44 writeData(data as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Synchronously writes data to the file, device, pipe, or socket represented by the receiver.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingAtFile(f)

if n<>Nil then
n.writeData "Hello World"
n.closeFile
end if
```

Notes: If the receiver is a file, writing takes place at the file pointer's current position. After it writes the data, the method advances the file pointer by the number of bytes written. Raises an exception if the file descriptor is closed or is not valid, if the receiver represents an unconnected pipe or socket endpoint, if no free space is left on the file system, or if any other writing error occurs.

43.1.45 Properties

43.1.46 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal handle to the NSFileHandle object.
Notes: (Read and Write property)

43.1.47 offsetInFile as UInt64

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the position of the file pointer within the file represented by the receiver.
Example:

```
// file must exist for this sample:

Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var e as NSErrorMBS
Var n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then
MsgBox e.localizedDescription
end if

if n<>Nil then
MsgBox n.readDataOfLength(5)
MsgBox str(n.offsetInFile) // shows 5
end if
```

Notes: The position of the file pointer within the file represented by the receiver.

Raises an exception if the message is sent to a file handle representing a pipe or socket or if the file descriptor is closed.
(Read and Write computed property)

43.2 class NSPipeMBS

43.2.1 class NSPipeMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: NSPipe objects provide an object-oriented interface for accessing pipes.
Notes: An NSPipe object represents both ends of a pipe and enables communication through the pipe. A pipe is a one-way communications channel between related processes; one process writes data, while the other process reads that data. The data that passes through the pipe is buffered; the size of the buffer is determined by the underlying operating system. NSPipe is an abstract class, the public interface of a class cluster.

- MBS Xojo Plugins, version 17.4pr2

43.2.2 Methods

43.2.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The constructor to create a new pipe.
Notes: Handle is not zero on success.

43.2.4 fileHandleForReading as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the receiver's read file handle.
Notes: You use the returned file handle to read from the pipe using NSFileHandle's read methods—availableData, readDataToEndOfFile, and readDataOfLength.
You don't need to send closeFile to this object or explicitly release the object after you have finished using it.

43.2.5 fileHandleForWriting as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the receiver's write file handle.
Notes: You use the returned file handle to write to the pipe using NSFileHandle's writeData: method. When you are finished writing data to this object, send it a closeFile message to delete the descriptor. Deleting the descriptor causes the reading process to receive an end-of-data signal (an empty memoryblock).

43.2.6 pipe as NSPipeMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns an initialized NSPipe object.
Notes: Returns nil if the method encounters errors while attempting to create the pipe or the NSFileHandle objects that serve as endpoints of the pipe.

43.2.7 Properties

43.2.8 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal reference to the NSPipe object.
Notes: (Read and Write property)

43.3 class NSTaskMBS

43.3.1 class NSTaskMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Using the NSTask class, your program can run another program as a subprocess and can monitor that program's execution.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

Var task as new NSTaskMBS

task.launchPath = "/bin/ls"

Var arguments(-1) as string = array("-l", "-a", "-t")

task.setArguments arguments

Var pipe as new NSPipeMBS

task.setStandardOutput pipe

Var file as NSFileHandleMBS = pipe.fileHandleForReading

task.launch

Var data as string = file.readDataToEndOfFile
Var text as string = DefineEncoding(data, encodings.UTF8)

MsgBox text
```

Notes: An NSTask object creates a separate executable entity; it differs from NSThread in that it does not share memory space with the process that creates it.
A task operates within an environment defined by the current values for several items: the current directory, standard input, standard output, standard error, and the values of any environment variables. By default, an NSTask object inherits its environment from the process that launches it. If there are any values that should be different for the task, for example, if the current directory should change, you must change the value before you launch the task. A task's environment cannot be changed while it is running.
An NSTask object can only be run once. Subsequent attempts to run the task raise an error.

This class is comparable to the shell classe built into Xojo.
See also WindowsProcessMBS and WindowsShellExecuteMBS (Windows only), ConsoleExecuteMBS and ShellMBS (cross platform).

- MBS Xojo / Real Studio Plugins, version 15.3pr1

43.3.2 Methods

43.3.3 arguments as string()

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The command arguments that should be used to launch the executable.

43.3.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: On success the handle value is not zero.

43.3.5 Destructor

MBS MacCocoa Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

43.3.6 interrupt

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends an interrupt signal to the receiver and all of its subtasks.
Notes: If the task terminates as a result, which is the default behavior, an NSTaskDidTerminateNotification gets sent to the default notification center. This method has no effect if the receiver was already launched and has already finished executing. If the receiver has not been launched yet, this method raises an NSInvalidArgumentException.
It is not always possible to interrupt the receiver because it might be ignoring the interrupt signal. interrupt sends SIGINT.

43.3.7 launch

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the task represented by the receiver.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

Var task as new NSTaskMBS

task.launchPath = "/bin/ls"

Var arguments(-1) as string = array("-l", "-a", "-t")

task.setArguments arguments

Var pipe as new NSPipeMBS

task.setStandardOutput pipe

Var file as NSFileHandleMBS = pipe.fileHandleForReading

task.launch

Var data as string = file.readDataToEndOfFile
Var text as string = DefineEncoding(data, encodings.UTF8)

MsgBox text
```

Notes: Raises an NSInvalidArgumentException if the launch path has not been set or is invalid or if it fails to create a process.
If you get an exception with posix_spawn and error 13, that's a permission denied.

43.3.8 launchedTaskWithLaunchPath(path as string, arguments() as string) as NSTaskMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and launches a task with a specified executable and arguments.
Example:

```
Var args(-1) as string
Var task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)
```

Notes: path: The path to the executable.
arguments: An array of strings that supplies the arguments to the task.

The task inherits its environment from the process that invokes this method.
The NSTask object converts both path and the strings in arguments to appropriate C-style strings (using fileSystemRepresentation) before passing them to the task via argv [ ]) . The strings in arguments do not undergo shell expansion, so you do not need to do special quoting, and shell variables, such as $ PWD, are

not resolved.

43.3.9 NSTaskDidTerminateNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The notification name used to notify you that the task terminated.
Notes: Posted when the task has stopped execution. This notification can be posted either when the task has exited normally or as a result of terminate being sent to the NSTask object. If the NSTask object gets released, however, this notification will not get sent, as the port the message would have been sent on was released as part of the task release. The observer method can use terminationStatus to determine why the task died. See "Ending an NSTask" for an example.

The notification object is the NSTask object that was terminated. This notification does not contain a userInfo dictionary.

43.3.10 resume as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resumes execution of the receiver task that had previously been suspended with a suspend message.
Notes: If multiple suspend messages were sent to the receiver, an equal number of resume messages must be sent before the task resumes execution.

43.3.11 setArguments(arguments() as string)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the command arguments that should be used to launch the executable.
Example:

```
// Performing complex pipelines.
// You can create multiple NSTasks and a bunch of NSPipes and hook them together,
// or you can use the "sh -c" trick to feed a shell a command, and let it parse
// it and set up all the IPC. This pipeline cats /usr/share/dict/words, finds
// all the words with 'ham' in them, reverses them, and shows you the last 5.

Var task as new NSTaskMBS

task.LaunchPath="/bin/sh"

Var arguments(-1) as string
```

```
arguments.Append "-c"
arguments.Append "cat /usr/share/dict/words | grep -i ham | rev | tail -5"

task.setArguments arguments
```

43.3.12 setStandardError(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard error for the receiver.
Notes: This method can be used with NSPipeMBS or NSFileHandleMBS object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard error is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 43.3.13 setStandardError(p as NSPipeMBS) 8294

43.3.13 setStandardError(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard error for the receiver.
Notes: This method can be used with NSPipeMBS or NSFileHandleMBS object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard error is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 43.3.12 setStandardError(p as NSFileHandleMBS) 8294

43.3.14 setStandardInput(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard input for the receiver.

Notes: file: The standard input for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the read end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the read end of the pipe won't be closed automatically.
If this method isn't used, the standard input is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 43.3.15 setStandardInput(p as NSPipeMBS) 8295

43.3.15 setStandardInput(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard input for the receiver.
Notes: file: The standard input for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the read end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the read end of the pipe won't be closed automatically.
If this method isn't used, the standard input is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 43.3.14 setStandardInput(p as NSFileHandleMBS) 8294

43.3.16 setStandardOutput(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard output for the receiver.
Notes: file: The standard output for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard output is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 43.3.17 setStandardOutput(p as NSPipeMBS) 8296

43.3.17 setStandardOutput(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard output for the receiver.
Notes: file: The standard output for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard output is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 43.3.16 setStandardOutput(p as NSFileHandleMBS) 8295

43.3.18 standardError as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the standard error file used by the receiver.
Notes: The standard error file used by the receiver.

Standard error is where all diagnostic messages are sent. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to setStandardError.

43.3.19 standardInput as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the standard input file used by the receiver.
Notes: The standard input file used by the receiver.

Standard input is where the receiver takes its input from unless otherwise specified. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to the setStandardInput method.

43.3.20 standardOutput as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the standard output file used by the receiver.

Notes: Standard output is where the receiver displays its output. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to the setStandardOutput method.

43.3.21 suspend as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Suspends execution of the receiver task.
Notes: Returns true if the receiver was successfully suspended, false otherwise.

Multiple suspend messages can be sent, but they must be balanced with an equal number of resume messages before the task resumes execution.

43.3.22 terminate

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends a terminate signal to the receiver and all of its subtasks.
Notes: If the task terminates as a result, which is the default behavior, an NSTaskDidTerminateNotification gets sent to the default notification center. This method has no effect if the receiver was already launched and has already finished executing. If the receiver has not been launched yet, this method raises an NSInvalidArgumentException.
It is not always possible to terminate the receiver because it might be ignoring the terminate signal. terminate sends SIGTERM.

43.3.23 waitUntilExit

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Block until the receiver is finished.
Example:

```
Var args(-1) as string
Var task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

task.waitUntilExit

MsgBox "done"
```

Notes: This method first checks to see if the receiver is still running using isRunning. Then it polls the current run loop using NSDefaultRunLoopMode until the task completes.

43.3.24 Properties

43.3.25 currentDirectoryPath as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The task's current directory.
Notes: (Read and Write property)

43.3.26 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSTask object.
Notes: (Read and Write property)

43.3.27 isRunning as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the receiver is still running.
Notes: (Read only property)

43.3.28 launchPath as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The path of the receiver's executable.
Notes: (Read and Write property)

43.3.29 processIdentifier as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's process identifier.
Example:

```
Var args(-1) as string
Var task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)
```

MsgBox "PID: "+str(task.processIdentifier)

Notes: (Read only property)

43.3.30 qualityOfService as Integer

MBS MacCocoa Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The quality of service setting for this application.
Notes: read-only after the task is launched.
(Read and Write property)

43.3.31 terminationReason as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the reason the task was terminated.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

Var args(-1) as string
Var task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

if not task.isRunning then
Var status as Integer = Task.terminationReason

MsgBox "Task termination reason is: "+str(status)
end if
```

Notes: Available in Mac OS X v10.6 and later.

see this constants:

NSTaskTerminationReasonExit	= 1	The task exited normally.
NSTaskTerminationReasonUncaughtSignal	= 2	The task exited due to an uncaught signal.

(Read only property)

43.3.32 terminationStatus as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the exit status returned by the receiver's executable.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

Var args(-1) as string
Var task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

if not task.isRunning then
Var status as Integer = Task.terminationStatus

MsgBox "Task return value is: "+str(status)
end if
```

Notes: The exit status returned by the receiver's executable.

Each task defines and documents how its return value should be interpreted. For example, many commands return 0 if they complete successfully or an error code if they don't. You'll need to look at the documentation for that task to learn what values it returns under what circumstances.
This method raises an NSInvalidArgumentException if the receiver is still running. Verify that the receiver is not running before you use it.
(Read only property)

43.3.33 environment as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A dictionary of variables for the environment from which the receiver was launched.
Notes: The dictionary keys are the environment variable names.
(Read and Write computed property)

43.3.34 Events

43.3.35 Terminated

MBS MacCocoa Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Event called when task terminated.

43.3.36 Constants

Constants

Constant	Value	Description
NSTaskTerminationReasonExit	1	One of the constants used to specify the values that are returned b tionReason. The task exited normally.
NSTaskTerminationReasonUncaughtSignal	2	One of the constants used to specify the values that are returned b tionReason. The task exited due to an uncaught signal.

Quality of Service Constants

Constant	Value	Description
NSQualityOfServiceBackground	&h09	Background QoS is used for work that is not user initiated or visible. In gener a user is unaware that this work is even happening and it will run in the mo efficient manner while giving the most deference to higher QoS work. F example, pre-fetching content, search indexing, backups, and syncing of da with external systems.
NSQualityOfServiceDefault	-1	Default QoS indicates the absence of QoS information. Whenever possible Q information will be inferred from other sources. If such inference is not possib a QoS between UserInitiated and Utility will be used.
NSQualityOfServiceUserInitiated	&h19	UserInitiated QoS is used for performing work that has been explicitly r quested by the user and for which results must be immediately presented order to allow for further user interaction. For example, loading an email af a user has selected it in a message list.
NSQualityOfServiceUserInteractive	&h21	UserInteractive QoS is used for work directly involved in providing an intera tive UI such as processing events or drawing to the screen.
NSQualityOfServiceUtility	&h11	Utility QoS is used for performing work which the user is unlikely to be i mediately waiting for the results. This work may have been requested the user or initiated automatically, does not prevent the user from further i teraction, often operates at user-visible timescales and may have its progre indicated to the user by a non-modal progress indicator. This work will r in an energy-efficient manner, in deference to higher QoS work when resourc are constrained. For example, periodic content updates or bulk file operatio such as media import.

43.4 class NSUserAppleScriptTaskMBS

43.4.1 class NSUserAppleScriptTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to run an AppleScript script.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("Hello.scpt")
Var e as NSErrorMBS
Var n as new NSUserAppleScriptTaskMBS(file, e)

if e <>nil then
MsgBox e.localizedDescription
end if

n.execute

exception u as UnsupportedOperationException

if e <>nil then
MsgBox e.localizedDescription
end if
```

Notes: These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.
Subclass of the NSUserScriptTaskMBS class.

43.4.2 Methods

43.4.3 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a folderitem for a script file.
Notes: The returned object will be of one of the specific sub-classes, or raises exception if the file does not

appear to match any of the known types. (If used from a sub-class, the result will be of that class, or raises exception.)
See also:

- 43.4.4 Constructor(URL as String, byref error as NSErrorMBS) 8303

43.4.4 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be of one of the specific sub-classes, or raises exception if the file does not appear to match any of the known types. (If used from a sub-class, the result will be of that class, or raises exception.)
See also:

- 43.4.3 Constructor(file as folderitem, byref error as NSErrorMBS) 8302

43.4.5 executeWithAppleEvent(eventDesc as NSAppleEventDescriptorMBS, tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the AppleScript script by sending it the given Apple event.
Notes: Pass nil for eventDesc to execute the script's default "run" handler.
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

43.5 class NSUserAutomatorTaskMBS

43.5.1 class NSUserAutomatorTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to run an Automator workflow.
Notes: These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.
Subclass of the NSUserScriptTaskMBS class.

43.5.2 Methods

43.5.3 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 43.5.4 Constructor(URL as String, byref error as NSErrorMBS) 8304

43.5.4 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 43.5.3 Constructor(file as folderitem, byref error as NSErrorMBS) 8304

43.5.5 executeWithInput(input as Variant, tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the Automator workflow, passing it the given input.
Notes: Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

43.5.6 Properties

43.5.7 Variables as Dictionary

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Workflow variables.
Notes: If you want to change, query the current dictionary, change it and assign it back to the variables property.
(Read and Write property)

43.6 class NSUserScriptTaskMBS

43.6.1 class NSUserScriptTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to run a script.
Notes: These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.

43.6.2 Methods

43.6.3 Available as Boolean

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the class is available.
Notes: Should return true on OS X 10.8 and newer.

43.6.4 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 43.6.5 Constructor(URL as String, byref error as NSErrorMBS) 8306

43.6.5 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known

types.
See also:

- 43.6.4 Constructor(file as folderitem, byref error as NSErrorMBS) 8306

43.6.6 execute(tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the script with no input and ignoring any result.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("Hello.scpt")
Var e as NSErrorMBS
Var n as new NSUserScriptTaskMBS(file, e)

n.execute
```

Notes: This and the other "execute" methods may be called at most once on any given instance. If the script completed normally, the ExecuteFinished event's "error" parameter will be nil.
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

43.6.7 ScriptFolder as FolderItem

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The script folder for the application.

43.6.8 Properties

43.6.9 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

43.6.10 scriptURL as String

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The script URL used for initialization.
Notes: (Read only property)

43.6.11 Events

43.6.12 executeFinished(error as NSErrorMBS, tag as Variant, result as Variant, input as Variant)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when execution is finished.
Notes: For AppleEvent call the result and input are NSAppleEventDescriptorMBS objects.
For Automator scripts the result and input are set to the values.
For all other scripts, they are nil.

While a script executes the plugin keeps a reference to the tag and itself, so the script object is not released too early.

43.7 class NSUserUnixTaskMBS

43.7.1 class NSUserUnixTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to run a Unix executable file, typically a shell script.
Notes: These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.

The script should have a valid file extension like ".sh" and the executable bit set (chmod +x) to be able to run. First line of the script should have the shebang line like "#!/bin/bash" and line endings should be Chr(10) as in EndOfLine.Unix.
Subclass of the NSUserScriptTaskMBS class.

- MBS Xojo Plugins, version 22.1pr2
- MBS Xojo Plugins, version 17.2pr5

43.7.2 Methods

43.7.3 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.

The script should have a valid file extension like ".sh" and the executable bit set (chmod +x) to be able to run. First line of the script should have the shebang line like "#!/bin/bash" and line endings should be Chr(10) as in EndOfLine.Unix.
See also:

- 43.7.4 Constructor(URL as String, byref error as NSErrorMBS) 8310

43.7.4 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 43.7.3 Constructor(file as folderitem, byref error as NSErrorMBS) 8309

43.7.5 executeWithArguments(arguments() as string, tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the file with the given arguments.
Notes: The arguments do not undergo shell expansion, so you do not need to do special quoting, and shell variables are not resolved.
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

43.7.6 Properties

43.7.7 standardError as NSFileHandleMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Standard I/O stream for error.
Notes: Setting this to nil (the default) will bind it to /dev/null.

Can be redirected to file via NSFileHandleMBS.fileHandleForWritingToFile() function.
(Read and Write property)

43.7.8 standardInput as NSFileHandleMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Standard I/O stream for input.
Notes: Setting this to nil (the default) will bind it to /dev/null.
(Read and Write property)

43.7.9 standardOutput as NSFileHandleMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Standard I/O stream for output.
Notes: Setting this to nil (the default) will bind it to /dev/null.

Can be redirected to file via NSFileHandleMBS.fileHandleForWritingToFile() function.
(Read and Write property)

Chapter 44

Cocoa Text

44.1 class NSAdaptiveImageGlyphImageMBS

44.1.1 class NSAdaptiveImageGlyphImageMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The image for a NSAdaptiveImageGlyphImage.
Example:

```
// we got a RTF file with a heic image for an emoji
Var f As New FolderItem("/Users/cs/Desktop/test.rtfd/AdaptiveImageGlyph-CEB73273-1BDD-47BD-8B7F-DBE3B09C14E10.heic", FolderItem.PathModes.Native)

// read it to string
Var b As BinaryStream = BinaryStream.Open(f)
Var data As String = b.Read(b.Length)

// initialize glyph
Var d As New NSAdaptiveImageGlyphMBS(data)

// render
Var i As NSAdaptiveImageGlyphImageMBS = d.imageForProposedSize(100, 100, 2)

// now ask for images in various formats
Var n As NSImageMBS = i.NSImage
Var p As Picture = i.Picture
Var c As CGImageMBS = i.CGImage

Break
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

44.1.2 Methods

44.1.3 Constructor

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

44.1.4 Properties

44.1.5 CGImage as Variant

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the image as CGImageMBS object.
Notes: Returned as variant to avoid extra plugin dependency.
Value is nil, if the CGImageMBS class is not compiled into your application.
(Read only property)

44.1.6 Glyph as NSAdaptiveImageGlyphMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The glyph this image is based on.
Notes: (Read only property)

44.1.7 imageOffsetX as Double

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The image offset.
Notes: (Read only property)

44.1.8 imageOffsetY as Double

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The image offset.
Notes: (Read only property)

44.1.9 imageSizeHeight as Double

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The image height.
Notes: (Read only property)

44.1.10 imageSizeWidth as Double

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The image width.
Notes: (Read only property)

44.1.11 NSImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Queries the NSImageMBS object for the glyph.
Notes: Internally converts the CGImage to NSImageMBS.
(Read only property)

44.1.12 Picture as Picture

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the image as Picture.
Notes: Internally converts the CGImage to picture.
(Read only property)

44.1.13 proposedSizeHeight as Double

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The requested size.
Notes: (Read only property)

44.1.14 proposedSizeWidth as Double

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The requested size.
Notes: (Read only property)

44.2 class NSAdaptiveImageGlyphMBS

44.2.1 class NSAdaptiveImageGlyphMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A data object for an emoji-like image that can appear in attributed text.
Notes: An NSAdaptiveImageGlyph contains an image that automatically adapts to different sizes and resolutions. The text system creates instances of this type to represent custom emojis that people create using the system interfaces. This type manages multiple images, along with metadata describing how to adapt those images correctly to different fonts and font attributes.

Typically, you receive new NSAdaptiveImageGlyph objects only from the text-input system. When someone creates a new emoji and inserts it into their text, TextKit creates an instance of this type to represent it. If your app examines or changes the attributes of attributed strings, preserve the adaptiveImageGlyph attribute in Swift or the NSAdaptiveImageGlyphAttributeName attribute in Objective-C when making any changes. For example, if you filter unknown attributes in a custom text-storage object, update your code to preserve this attribute. The value of the attribute is an NSAdaptiveImageGlyph containing the emoji data. You can save the image data with the rest of your content and use the data to recreate the type later.

Also used for genmoji.

44.2.2 Methods

44.2.3 Constructor(Data as MemoryBlock)

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Create an adaptive image glyph from the previously saved data.
Notes: imageContent: The raw image data you obtained previously from an adaptive image glyph. Typically, you receive adaptive images from the text system, store their data with the rest of your content, and use the data to recreate the adaptive image later.

Returns: A new adaptive image glyph with the identifier and details from the image data.

44.2.4 copy as NSAdaptiveImageGlyphMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

44.2.5 imageForProposedSize(proposedSizeWidth as Double, proposedSizeHeight as Double, ScaleFactor as Double = 2) as NSAdaptiveImageGlyphImageMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Renders an image with desired size.
Notes: The callee is to return an image for use at a particular point size and scale factor, as well as its offset and size (in points), which define the placement of the returned image relative to a rect with the proposed size.

44.2.6 insert(control as Variant, replacementRange as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: Inserts the glyph to a text area.
Notes: The control can be a NSTextViewMBS, TextArea or DesktopTextArea.

44.2.7 Properties

44.2.8 attributedString as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Creates an attributed string with an adaptive image glyph.
Notes: (Read only property)

44.2.9 contentDescription as String

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An alternate textual description of the image contents.
Notes: This string contains a brief description of the image, which is useful for searches or places where you need a text-based description. The adaptive image derives the content of this property from the underlying image data.

e.g. Emojis
(Read only property)

44.2.10 contentIdentifier as String

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A unique identifier for this image.
Notes: Use this property to create a persistent reference to this specific image in your code. The image data contains this content identifier, so the value persists between instantiations.

e.g. CEB73273-1BDD-47BD-8B7F-DBE3B09C14E10
(Read only property)

44.2.11 contentType as String

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The image data format to use for this image type.
Example:

```
// shows public.heic
MessageBox NSAdaptiveImageGlyphMBS.contentType
```

Notes: Use this type when you need to specify the type of the image data. Adaptive images are compatible with the HEIC format, but include extra metadata about the supported resolutions and sizes.
(Read only property)

44.2.12 Handle as Integer

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

44.2.13 imageContent as MemoryBlock

MBS MacBase Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The raw data for the image.
Notes: This property contains the image data, the unique identifier for the image, the image description, and additional metadata. When saving your content to disk, save the data for any adaptive images with the rest of your content. If you need to specify a type for the image data, use the value in the contentType property.
(Read only property)

44.3 class NSAttributedStringMBS

44.3.1 class NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: A class to represent a string in the Cocoa world with attached attributes.
Example:

```
Var a as new NSAttributedStringMBS

if a.initWithHTML("<B>Hello</B>") then
MsgBox a.htmlString
end if
```

44.3.2 Methods

44.3.3 AsCFAttributedString as Variant

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new CFAttributedStringMBS object pointing to same attributed string.
Example:

```
// make NS version
Var n as new NSAttributedStringMBS

if n.initWithString("Hello World") then
// convert
Var c as CFAttributedStringMBS = n.AsCFAttributedString

// and check content
MsgBox c.String
end if
```

Notes: For passing to functions which need a CFAttributedStringMBS.

44.3.4 attributeAtIndex(name as string, location as UInt64) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes: name: The name of an attribute.
location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute's value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn't necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 44.3.5 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant 8323

44.3.5 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes: name: The name of an attribute.
location: The index at which to test for attributeName.
longestEffectiveRange: Optional. If the named attribute exists at index, upon return aRange contains the full range over which the value of the named attribute is the same as that at index, clipped to rangeLimit. If the named attribute does not exist at index, upon return aRange contains the full range over which the attribute does not exist, clipped to rangeLimit.
inRange: The range over which to search for continuous presence of attributeName. This value must not exceed the bounds of the receiver.

Returns the value for the attribute named attributeName of the character at index, or nil if there is no such attribute.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.

If you don't need the longest effective range, it's far more efficient to use the other variant method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 44.3.4 attributeAtIndex(name as string, location as UInt64) as Variant 8322

44.3.6 attributeAtIndex2(name as string, location as UInt64, byref effectiveRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Example:

```
// list all links
Var n As NSAttributedStringMBS = TextArea1.NSTextViewMBS.textStorage

Var pos As Integer = 0
Var Len As Integer = n.Length
```

```
Var effectiveRange As NSRangeMBS

While pos <Len

Var v As Variant = n.attributeAtIndex2(n.NSLinkAttributeName, pos, effectiveRange)

If v <>Nil Then
Var url As String = v
Listbox1.AddRow url
End If

pos = pos + effectiveRange.Length

Wend
```

Notes: name: The name of an attribute.
location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute's value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn't necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

44.3.7 attributeAtIndex2(name as string, location as UInt64, byref longestEffectiveRange as NSRangeMBS, inRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes: name: The name of an attribute.
location: The index at which to test for attributeName.
longestEffectiveRange: Optional. If the named attribute exists at index, upon return aRange contains the full range over which the value of the named attribute is the same as that at index, clipped to rangeLimit.

If the named attribute does not exist at index, upon return aRange contains the full range over which the attribute does not exist, clipped to rangeLimit.
inRange: The range over which to search for continuous presence of attributeName. This value must not exceed the bounds of the receiver.

Returns the value for the attribute named attributeName of the character at index, or nil if there is no such attribute.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.

If you don't need the longest effective range, it's far more efficient to use the other variant method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 44.3.6 attributeAtIndex2(name as string, location as UInt64, byref effectiveRange as NSRangeMBS) as Variant 8323

44.3.8 attributedStringWithAdaptiveImageGlyph(adaptiveImageGlyph as NSAdaptiveImageGlyphMBS, withAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an attributed string with an adaptive image glyph and applies the specified attributes to it.
Notes: adaptiveImageGlyph: The adaptive image glyph to place in the string. Typically, you get this type from the text input system.
attributes: The attributes to apply to the adaptive image glyph. Specify an empty dictionary to create the string without any extra attributes.

44.3.9 attributedStringWithAttachment(attachment as NSTextAttachmentMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Creates an attributed string with an attachment.
Example:

```
Var content as MemoryBlock = "Hello World"
```

```
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

Var a as new NSTextAttachmentMBS(f)
Var s as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(a)
```

Notes: This is a convenience method for creating an attributed string containing an attachment using NSAttachmentCharacter as the base character.

44.3.10 attributedStringWithAttributedString(text as NSAttributedStringMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of the given attributed string.

44.3.11 attributedStringWithDocFormat(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.12 attributedStringWithDocFormat(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8326

44.3.12 attributedStringWithDocFormat(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.11 attributedStringWithDocFormat(data as memoryblock) as NSAttributedStringMBS 8326

44.3.13 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.14 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 8327
- 44.3.15 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8327
- 44.3.16 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8328

44.3.14 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.13 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 8327
- 44.3.15 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8327
- 44.3.16 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8328

44.3.15 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.13 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 8327
- 44.3.14 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 8327

- 44.3.16 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8328

44.3.16 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.13 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 8327
- 44.3.14 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 8327
- 44.3.15 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8327

44.3.17 attributedStringWithHTMLOld(data as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: With plugin version 9.4 the attributedStringWithHTML method uses the system function to parse html. The old plugin function is available with the name attributedStringWithHTMLOld.

44.3.18 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Example:

```
// load rtfd file into textarea
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
Var n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.19 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8329

- 44.3.20 attributedStringWithPath(path as string) as NSAttributedStringMBS 8329
- 44.3.21 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8329

44.3.19 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.18 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 8328
- 44.3.20 attributedStringWithPath(path as string) as NSAttributedStringMBS 8329
- 44.3.21 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8329

44.3.20 attributedStringWithPath(path as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.18 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 8328
- 44.3.19 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8329
- 44.3.21 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8329

44.3.21 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.18 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 8328

- 44.3.19 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8329
- 44.3.20 attributedStringWithPath(path as string) as NSAttributedStringMBS 8329

44.3.22 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.23 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8330

44.3.23 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.22 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS 8330

44.3.24 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.25 attributedStringWithRTFD(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8330

44.3.25 attributedStringWithRTFD(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.24 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS 8330

44.3.26 attributedStringWithString(text as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.27 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS 8331

44.3.27 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.26 attributedStringWithString(text as string) as NSAttributedStringMBS 8331

44.3.28 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.29 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8332
- 44.3.30 attributedStringWithURL(url as string) as NSAttributedStringMBS 8332
- 44.3.31 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8332

44.3.29 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.28 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 8331
- 44.3.30 attributedStringWithURL(url as string) as NSAttributedStringMBS 8332
- 44.3.31 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8332

44.3.30 attributedStringWithURL(url as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.28 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 8331
- 44.3.29 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8332
- 44.3.31 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8332

44.3.31 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.28 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 8331
- 44.3.29 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 8332
- 44.3.30 attributedStringWithURL(url as string) as NSAttributedStringMBS 8332

44.3.32 attributedSubstringFromRange(range as NSRangeMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns an NSAttributedString object consisting of the characters and attributes within a given range in the receiver.
Notes: Range: The range from which to create a new attributed string. aRange must lie within the bounds of the receiver.

Returns an NSAttributedString object consisting of the characters and attributes within aRange in the receiver.

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters. This method treats the length of the string as a valid range value that returns an empty string.

44.3.33 attributesAtIndex(location as UInt64) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index.
Notes: location: The index for which to return attributes. This value must lie within the bounds of the receiver.
Range: Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn't necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.
See also:

- 44.3.34 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary 8333

44.3.34 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.
Notes: location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
range: Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.
inRange: The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.
If you don't need the range information, it's far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 44.3.33 attributesAtIndex(location as UInt64) as dictionary 8333

44.3.35 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index.
Notes: location: The index for which to return attributes. This value must lie within the bounds of the receiver.
Range: Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn't necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.
See also:

- 44.3.36 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary 8334

44.3.36 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.
Notes: location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
range: Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.
inRange: The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.
If you don't need the range information, it's far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 44.3.35 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS) as dictionary 8334

44.3.37 boundingRectWithSize(size as NSSizeMBS, Options as Integer = 0) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Returns the bounding rectangle necessary to draw the string.
Notes: size: The width and height constraints to apply when computing the string,Äôs bounding rectangle.
options: Additional drawing options to apply to the string during rendering. For a list of possible values, see NSStringDrawingOptions.

Returns a rectangle whose size component indicates the width and height required to draw the entire contents of the string.

You can use this method to compute the space required to draw the string. The constraints you specify in the size parameter are a guide for the renderer for how to size the string. However, the actual bounding rectangle returned by this method can be larger than the constraints if additional space is needed to render the entire string. Typically, the renderer preserves the width constraint and adjusts the height constraint as needed.
In iOS 7 and later, this method returns fractional sizes (in the size component of the returned rectangle); to use a returned size to size views, you must use raise its value to the nearest higher integer using the ceil function.
Special Considerations
To calculate the bounding rectangle, this method uses the baseline origin by default, so it behaves as a single line. To render the string in multiple lines, specify NSStringDrawingUsesLineFragmentOrigin in options. (see constants in NSGraphicsMBS class)

44.3.38 Constructor

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The constructor to create empty attributed string.

44.3.39 Convert_Operator as string

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Converts to string by just returning string part.

44.3.40 copy as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the attributed string.

44.3.41 CopyToClipboard as Boolean

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Copies styled text to clipboard.

44.3.42 dataFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref error as NSErrorMBS) as memoryblock

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Returns an data object that contains a text stream corresponding to the characters and attributes within the given range.
Notes: offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.
error: An in-out variable containing an encountered error, if any.

Returns the data for the attributed string, or nil if failure. When nil, error encapsulates the error information.

Raises an NSRangeException if any part of range lies beyond the end of the receiver,Äôs characters.

44.3.43 docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates DOC data from the whole string.
Notes: Same as docFormatFromRange(0,length)
Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 44.3.44 docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock 8337

44.3.44 docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates DOC data from the current string range.
Notes: Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 44.3.43 docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock 8337

44.3.45 fileWrapperFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref Error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Returns an NSFileWrapper object that contains a text stream corresponding to the characters and attributes within the given range.
Example:

```
// get styled text from htmlviewer
Var w as WebViewMBS = HTMLViewer1.WebViewMBS
Var f as WebFrameMBS = w.mainFrame
Var v as WebFrameViewMBS = f.frameView
Var d as WebDocumentViewMBS = v.documentView
Var n as NSAttributedStringMBS = d.attributedString
```

```
// package it
Var da as new Dictionary
da.Value(n.NSDocumentTypeDocumentAttribute) = n.NSRTFDTextDocumentType

Var e as NSErrorMBS
Var fw as NSFileWrapperMBS = n.fileWrapperFromRange(0, n.Length, da, e)
if e <>nil then
MsgBox e.LocalizedDescription
Return
end if

// write to disk
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
if fw.writeToFile(file, e) then
MsgBox "OK"
else
MsgBox e.LocalizedDescription
end if
```

Notes: offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.
error: An in-out variable containing an encountered error, if any.

Returns a file wrapper for the appropriate document type, or nil if failure. When nil, error encapsulates the error information.

Raises an NSRangeException if any part of range lies beyond the end of the receiver,Äôs characters.

44.3.46 FromClipboard as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries attributed string from clipboard.

44.3.47 GeneratePDF(PrintOptions as Variant = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a PDF for attributed string.
Example:

```
// read file
Var fi as FolderItem = SpecialFolder.Desktop.Child("test.docx")

Var d as new Dictionary
Var n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(fi, d)

// write pdf
Var p as MemoryBlock = n.GeneratePDF(nil)

Var fo as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var bo as BinaryStream = BinaryStream.Create(fo)
bo.Write p
```

Notes: PrintOptions is optional NSPrintInfoMBS object for print settings like margin.

44.3.48 htmlString as string

MBS MacBase Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: A self made function to return the text content as html string preserving the style information.
Example:

```
Var s as NSAttributedStringMBS

s=new NSAttributedStringMBS

if s.initwithhtml("<b>Hello</b>") then
MsgBox s.htmlstring // shows "<b>Hello</b>"
MsgBox s.text // shows "Hello"
end if
```

Notes: Does not always work well, but can help.
(Apple has no official function for this)

44.3.49 initWithAttributedString(text as NSAttributedStringMBS) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of the given attributed string.
Notes: Returns true on success.

44.3.50 initWithDocFormat(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes: Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.51 initWithDocFormat(data as memoryblock, byref documentAttributes as dictionary) as boolean 8340

44.3.51 initWithDocFormat(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes: Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.50 initWithDocFormat(data as MemoryBlock) as boolean 8340

44.3.52 initWithHTML(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Example:

```
Var n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("<b>test</b>") then
MsgBox n.text
else
MsgBox "failed"
end if

Var attribText as new NSAttributedStringMBS
Var text as string = "<P>Hello √√§√º</P>"

text = ConvertEncoding(text, encodings.ISOLatin1)

If attribText.initWithHTML(text) Then
MsgBox attribText.text
```

```
End If
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.

With plugin version 9.4 this uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

On Mac OS X 10.6 the text encoding expected is ISO Latin 1 as far as I see.
See also:

- 44.3.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 8341
- 44.3.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 8342
- 44.3.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 8342
- 44.3.56 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 8343

44.3.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Example:

```
Var n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("<b>test</b>","http://www.apple.com") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes: Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.52 initWithHTML(data as MemoryBlock) as boolean 8340
- 44.3.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 8342

- 44.3.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 8342
- 44.3.56 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 8343

44.3.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Notes: Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.52 initWithHTML(data as MemoryBlock) as boolean 8340
- 44.3.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 8341
- 44.3.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 8342
- 44.3.56 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 8343

44.3.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.

With plugin version 9.4 this uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

On Mac OS X 10.6 the text encoding expected is ISO Latin 1 as far as I see.
See also:

- 44.3.52 initWithHTML(data as MemoryBlock) as boolean 8340
- 44.3.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 8341
- 44.3.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 8342

- 44.3.56 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 8343

44.3.56 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 22.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Example:

```
Var theBody As String = "<html><body>Test √§√√º</body></html>"

Var documentAttributes As Dictionary
Var documentOptions As New Dictionary

// define the text encoding
Const NSUTF8StringEncoding = 4
documentOptions.Value(NSAttributedStringMBS.NSCharacterEncodingDocumentOption) = NSUTF8StringEncoding
// and a default base URL for finding images
documentOptions.Value(NSAttributedStringMBS.NSBaseURLDocumentOption) = NSURLMBS.URLWithString("https://monkeybreadsoftware.de/")
// and a timeout for network queries
documentOptions.Value(NSAttributedStringMBS.NSTimeoutDocumentOption) = 30

Var BodyAttributed As New NSAttributedStringMBS
If BodyAttributed.initWithHTML(theBody, documentOptions, documentAttributes) Then
MessageBox BodyAttributed.Text
Else
Break // failed?
End If
```

Notes: Returns true on success.
options: Put in some options for parsing the document like NSCharacterEncodingDocumentOption or NSTextEncodingNameDocumentOption.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 44.3.52 initWithHTML(data as MemoryBlock) as boolean 8340
- 44.3.53 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 8341
- 44.3.54 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 8342
- 44.3.55 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 8342

44.3.57 initWithHTMLOld(data as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: With plugin version 9.4 the initWithHTML method uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

44.3.58 initWithPath(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.59 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 8344
- 44.3.60 initWithPath(path as string) as boolean 8344
- 44.3.61 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 8345

44.3.59 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.58 initWithPath(file as folderitem) as boolean 8344
- 44.3.60 initWithPath(path as string) as boolean 8344
- 44.3.61 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 8345

44.3.60 initWithPath(path as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.58 initWithPath(file as folderitem) as boolean 8344
- 44.3.59 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 8344
- 44.3.61 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 8345

44.3.61 initWithPath(path as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.58 initWithPath(file as folderitem) as boolean 8344
- 44.3.59 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 8344
- 44.3.60 initWithPath(path as string) as boolean 8344

44.3.62 initWithRTF(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.63 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean 8345

44.3.63 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.62 initWithRTF(data as MemoryBlock) as boolean 8345

44.3.64 initWithRTFD(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.65 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean 8346

44.3.65 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.64 initWithRTFD(data as MemoryBlock) as boolean 8346

44.3.66 initWithString(text as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Example:

```
Var n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("test") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.67 initWithString(text as string, withAttributes as Dictionary) as boolean 8347

44.3.67 initWithString(text as string, withAttributes as Dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Example:

```
Var n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("test") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.66 initWithString(text as string) as boolean 8346

44.3.68 initWithURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Example:

```
Var n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile")) then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.69 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 8348
- 44.3.70 initWithURL(url as string) as boolean 8348
- 44.3.71 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 8348

44.3.69 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Example:

```
Var n as NSAttributedStringMBS
Var documentAttributes as dictionary
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile"), documentAttributes) then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.68 initWithURL(file as folderitem) as boolean 8347
- 44.3.70 initWithURL(url as string) as boolean 8348
- 44.3.71 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 8348

44.3.70 initWithURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.68 initWithURL(file as folderitem) as boolean 8347
- 44.3.69 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 8348
- 44.3.71 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 8348

44.3.71 initWithURL(url as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 44.3.68 initWithURL(file as folderitem) as boolean 8347
- 44.3.69 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 8348
- 44.3.70 initWithURL(url as string) as boolean 8348

44.3.72 isEqualToAttributedString(other as NSAttributedStringMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Compares both strings.
Example:

```
Var n as NSAttributedStringMBS
Var m as NSAttributedStringMBS

n=new NSAttributedStringMBS
if n.initWithString("test") then
MsgBox n.text
else
MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test") then
MsgBox n.text
else
MsgBox "failed"
end if

if m.isEqualToAttributedString(n) then
MsgBox "Ok"
else
MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test2") then
MsgBox n.text
else
MsgBox "failed"
end if
```

```
if m.isEqualToAttributedString(n) then
MsgBox "failed"
else
MsgBox "Ok"
end if
```

Notes: Returns true if they are equal in content.

44.3.73 itemNumberInTextList(list as NSTextListMBS, location as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the index of the item at the given location within the list.
Notes: list: The text list.
location: The location of the item.

Returns the index within the list.

44.3.74 lineRangeForRange(range as NSRangeMBS) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns the range of characters representing the line or lines containing a given range.
Notes: Range: A range within the receiver. The value must not exceed the bounds of the receiver.

The range of characters representing the line or lines containing aRange, including the line termination characters.

44.3.75 mutableCopy as NSMutableAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a mutable copy of the attributed string.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))
```

```
// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

44.3.76 NSAttachmentAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: NSTextAttachment
Default nil, no attachment

44.3.77 NSAuthorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Example:

```
// get some attributed text:
Var t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
Var dic as new Dictionary
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
Var rtf as string = t.RTFFromRange(dic)

// write to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes: string containing author name.
Available in Mac OS X v10.4 and later.

44.3.78 NSBackgroundColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
// add background color for text in text area:

TextArea1.Text = "Hello"

Var tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Var ts As NSTextStorageMBS = tv.TextStorage

Var value As Color = &cFF0000

Var offset As Integer = 0
Var length As Integer = 5

Var range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSBackgroundColorAttributeName, value, range )
```

Notes: NSColor
Default nil, no background

44.3.79 NSBackgroundColorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: NSColor, representing the document-wide page background color.
Mac OS X v10.3 and earlier string constant is "BackgroundColor".
For applications linked on versions prior to Mac OS X v10.5, HTML import sets the NSBackgroundColorDocumentAttribute to NSColorMBS.whiteColor in cases in which the HTML does not specify a background color. For applications linked on Mac OS X v10.5 and later, no NSBackgroundColorDocumentAttribute is set in these cases.
Available in Mac OS X v10.4 and later.

44.3.80 NSBaselineOffsetAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing floating point value, as points offset from baseline
Default 0.0

44.3.81 NSBaseURLDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: For HTML documents; NSURL containing base URL. Previous string constant was @"BaseURL"
Available in Mac OS X v10.4 and later.

44.3.82 NSBottomMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Example:

```
// get some attributed text:
Var t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
Var dic as new Dictionary
dic.Value(t.NSBottomMarginDocumentAttribute) = 20
dic.Value(t.NSLeftMarginDocumentAttribute) = 20
dic.Value(t.NSRightMarginDocumentAttribute) = 20
dic.Value(t.NSTopMarginDocumentAttribute) = 20
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
Var rtf as string = t.RTFFromRange(dic)

// write to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes: Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "BottomMargin".
Available in Mac OS X v10.4 and later.

44.3.83 NSCategoryDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing the document's category.

Available in Mac OS X v10.6 and later.

44.3.84 NSCharacterEncodingDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing an int specifying the stringEncoding for the file; for reading and writing plain text files and writing HTML; default for plain text is the default encoding; default for HTML is UTF-8.
Mac OS X v10.3 and earlier string constant is "CharacterEncoding".
Available in Mac OS X v10.4 and later.

44.3.85 NSCharacterEncodingDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: For plain text documents; Number containing the unsigned int stringEncoding to override any encoding specified in an HTML document. Previous string constant was @"CharacterEncoding".
Available in Mac OS X v10.4 and later.

44.3.86 NSCharacterShapeAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: An integer value. The value is interpreted as Apple Type Services kCharacterShapeType selector + 1.
The default value is 0 (disable). 1 is kTraditionalCharactersSelector, and so on. Refer to <ATS/SFNTLayoutTypes.h>and "Font Features" in ATSUI Programming Guide for additional information.
Available in Mac OS X v10.0 and later.

44.3.87 NSCocoaVersionDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing a float. For RTF files only, stores the version of Cocoa with which the file was created. Absence of this value indicates RTF file not created by Cocoa or its predecessors.
Values less than 100 are pre–Mac OS X; 100 is Mac OS X v10.0 or v10.1; 102 is Mac OS X v10.2 and 10.3; values greater than 102 correspond to values of NSAppKitVersionNumber on Mac OS X v10.4 and later.

Mac OS X v10.3 and earlier string constant is "CocoaRTFVersion".
Available in Mac OS X v10.4 and later.

44.3.88 NSCommentDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing document comments.
Available in Mac OS X v10.4 and later.

44.3.89 NSCompanyDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing company or organization name.
Available in Mac OS X v10.4 and later.

44.3.90 NSConvertedDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing an int. Indicates whether the file was converted by a filter service.
If missing or 0, the file was originally in the format specified by document type. If negative, the file was originally in the format specified by document type, but the conversion to NSAttributedString may have been lossy. If 1 or more, it was converted to this type by a filter service.
Mac OS X v10.3 and earlier string constant is @"Converted".
Available in Mac OS X v10.4 and later.

44.3.91 NSCopyrightDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing document copyright info.
Available in Mac OS X v10.4 and later.

44.3.92 NSCreationTimeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: NSDate containing the creation date of the document; note that this is not the file system creation date of the file, but of the document.
Available in Mac OS X v10.4 and later.

44.3.93 NSCursorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: NSCursor
Default as returned by the NSCursor method IBeamCursor
Available in Mac OS X v10.3 and later.

44.3.94 NSDefaultAttributesDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the document attributes.
Notes: NSDictionary containing attributes to be applied to plain files. Used by reader methods. This key in options can specify the default attributes applied to the entire document contents. The document attributes can contain this key indicating the actual attributes used.
Available on Mac OS X 10.11.

44.3.95 NSDefaultAttributesDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: For plain text documents; Dictionary containing attributes to be applied to plain files. Previous string constant was @"DefaultAttributes".
Available in Mac OS X v10.4 and later.

44.3.96 NSDefaultTabIntervalDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number containing a float. Represents the document-wide default tab stop interval.
Mac OS X v10.3 and earlier string constant is "DefaultTabInterval".
Available in Mac OS X v10.4 and later.

44.3.97 NSDocFormatTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Microsoft Word document.

44.3.98 NSDocumentTypeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: How the document was interpreted; one of the values in "Document Types."
Mac OS X v10.3 and earlier string constant is "DocumentType".
Available in Mac OS X v10.4 and later.

44.3.99 NSDocumentTypeDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: One of the document types described in "Document Types," indicating a document type to be forced when loading the document. Previous string constant was @"DocumentType".
Available in Mac OS X v10.4 and later.

44.3.100 NSEditorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing name of person who last edited the document.
Available in Mac OS X v10.4 and later.

44.3.101 NSExcludedElementsDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString related to HTML generation.
Notes: An Array object containing string objects, representing HTML elements not to be used in generated HTML.
Available in Mac OS X v10.4 and later.

NSExcludedElementsDocumentAttribute allows control over the tags used. The recognized values in the NSExcludedElementsDocumentAttribute array are (case-insensitive) HTML tags, plus DOCTYPE (representing a doctype declaration) and XML (representing an XML declaration). By default, if this attribute is not present, the excluded elements will be those deprecated in HTML 4 (APPLET, BASEFONT, CENTER, DIR, FONT, ISINDEX, MENU, S, STRIKE, and U) plus XML. If XML is on the list, HTML forms are used; if XML is not on the list, XHTML forms are used where there is a distinction.

44.3.102 NSExpansionAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing floating point value, as log of expansion factor to be applied to glyphs
Default 0.0, no expansion
Available in Mac OS X v10.3 and later.

44.3.103 NSFileTypeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string indicating which document type was used to interpret the document, specified as a UTI; for reading, this is available along with NSDocumentTypeDocumentAttribute, but for writing the two are mutually exclusive.
Available in Mac OS X v10.6 and later.

44.3.104 NSFileTypeDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string indicating a document type to be forced when loading the document, specified as a UTI string; mutually exclusive with NSDocumentTypeDocumentOption.
Available in Mac OS X v10.6 and later.

44.3.105 NSFontAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
MsgBox NSAttributedStringMBS.NSFontAttributeName

Var NSGraphics as New NSGraphicsMBS()
Var NSFont as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 11.0)
Var NSAttributes as New Dictionary

NSAttributes.value(NSAttributedStringMBS.NSFontAttributeName) = nsfont

Var stringWidth as Double = NSGraphics.sizeWithAttributes("Hello World", NSAttributes).Width
MsgBox("StringWidth from NSGraphicsMBS: " + Str(stringWidth))
```

Notes: NSFont
Default Helvetica 12-point

44.3.106 NSForegroundColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
TextArea1.Text = "Hello"

Var tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Var ts As NSTextStorageMBS = tv.TextStorage

Var value As Color = &cFF0000

Var offset As Integer = 0
Var length As Integer = 5

Var range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSForegroundColorAttributeName, value, range )
```

Notes: NSColor
Default blackColor
Available in Mac OS X v10.0 and later.

44.3.107 NSGlyphInfoAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: The name of an NSGlyphInfo object.
NSLayoutManager assigns the glyph specified by this glyph info to the entire attribute range, provided that its contents match the specified base string, and that the specified glyph is available in the font specified by NSFontAttributeName.
Available in Mac OS X v10.2 and later.

44.3.108 NSHTMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Hypertext Markup Language (HTML) document.

44.3.109 NSHyphenationFactorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing a float; 0 = off, 1 = full hyphenation.
Mac OS X v10.3 and earlier string constant is "HyphenationFactor".
Available in Mac OS X v10.4 and later.

44.3.110 NSKernAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing floating point value, as points by which to modify default kerning
Default nil, use default kerning specified in font file; 0.0, kerning off; non-zero, points by which to modify default kerning
Available in Mac OS X v10.0 and later.

44.3.111 NSKeywordsDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Array of string, containing keywords.
Available in Mac OS X v10.4 and later.

44.3.112 NSLeftMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "LeftMargin".
Available in Mac OS X v10.4 and later.

44.3.113 NSLigatureAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing integer
Default 1, standard ligatures; 0, no ligatures; 2, all ligatures.

44.3.114 NSLinkAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: NSURL (preferred) or string
Default nil, no link
Available in Mac OS X v10.0 and later.

44.3.115 NSMacSimpleTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Macintosh SimpleText document.

44.3.116 NSManagerDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing the name of the author's manager.
Available in Mac OS X v10.6 and later.

44.3.117 NSMarkedClauseSegmentAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing an integer, as an index in marked text indicating clause segments
Available in Mac OS X v10.5 and later.

44.3.118 NSModificationTimeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: NSDate containing the modification date of the document contents.
Available in Mac OS X v10.4 and later.

44.3.119 NSObliquenessAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing floating point value, as skew to be applied to glyphs
Default 0.0, no skew
Available in Mac OS X v10.3 and later.

44.3.120 NSOfficeOpenXMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: ECMA Office Open XML text document format.
Available in Mac OS X v10.5 and later.

44.3.121 NSOpenDocumentTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: OASIS Open Document text document format.
Available in Mac OS X v10.5 and later.

44.3.122 NSPaperSizeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: NSValue, containing NSSize.
Mac OS X v10.3 and earlier string constant is "PaperSize".
Available in Mac OS X v10.4 and later.

44.3.123 NSParagraphStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
// change line spacing in a Label

Var n as NSTextFieldMBS = Label1.NSTextFieldMBS
Var a as NSAttributedStringMBS = n.attributedStringValue

Var p as NSParagraphStyleMBS = a.attributeAtIndex(a.NSParagraphStyleAttributeName, 0)
Var m as NSMutableParagraphStyleMBS = p.mutableCopy
m.setLineSpacing 5

Var s as NSMutableAttributedStringMBS = a.mutableCopy
s.addAttribute(a.NSParagraphStyleAttributeName, m, new NSRangeMBS(0, s.length))

n.attributedStringValue = s
```

Notes: NSParagraphStyle
Default as returned by the NSParagraphStyle method defaultParagraphStyle

44.3.124 NSPlainTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Plain text document.

44.3.125 NSPrefixSpacesDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString related to HTML generation.
Notes: An Number containing an integer (default 0) representing the number of spaces per level by which to indent certain nested HTML elements.
Available in Mac OS X v10.4 and later.

NSPrefixSpacesDocumentAttribute allows some control over formatting.

44.3.126 NSReadOnlyDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing int. If missing or 0 or negative, not read only; 1 or more, read only.

Note that this has nothing to do with the file system protection on the file, but instead can affect how the file should be displayed to the user.
Mac OS X v10.3 and earlier string constant is "ReadOnly".
Available in Mac OS X v10.4 and later.

44.3.127 NSRightMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "RightMargin".
Available in Mac OS X v10.4 and later.

44.3.128 NSRTFDTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Rich text format with attachments document.

44.3.129 NSRTFTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Rich text format document.

44.3.130 NSShadowAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: NSShadow
Default nil, no shadow.
Available in Mac OS X v10.3 and later.

44.3.131 NSSpellingStateAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: An integer value. Defaults to 0, indicating no grammar or spelling error. See "NSSpellingStateAttributeName Flags" for possible values.
This key is available in Mac OS X v10.2 and later, but its interpretation changed in Mac OS X v10.5. Previously, any non-zero value caused the spelling indicator to be displayed. For Mac OS X v10.5 and later, the (integer) value is treated as being composed of the spelling and grammar flags.
Available in Mac OS X v10.5 and later.

44.3.132 NSStrikethroughColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: NSColor
Default nil, same as foreground color
Available in Mac OS X v10.3 and later.

44.3.133 NSStrikethroughStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
// underline selected text in TextArea1

Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
Var s as NSTextStorageMBS = t.textStorage

const NSUnderlineStyleSingle = 1

Var d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = NSUnderlineStyleSingle
t.selectedTextAttributes = d
```

Notes: Number containing integer
Default 0, no strikethrough. See "Underlining Patterns", "Underlining Styles", and "Underline Masks" in Apple Documentation for mask values.
Available in Mac OS X v10.3 and later.

44.3.134 NSStrokeColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: NSColor
Default nil, same as foreground color
Available in Mac OS X v10.3 and later.

44.3.135 NSStrokeWidthAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
TextArea1.Text = "Hello World!"

Var v As NSTextViewMBS = TextArea1.NSTextViewMBS
Var a As NSTextStorageMBS = v.textStorage

a.addAttribute(a.NSStrokeWidthAttributeName, 2.0, New NSRangeMBS(6,5))
```

Notes: Number containing floating point value, as percent of font point size
Default 0, no stroke; positive, stroke alone; negative, stroke and fill (a typical value for outlined text would be 3.0)
Available in Mac OS X v10.3 and later.

44.3.136 NSSubjectDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing subject of document.
Available in Mac OS X v10.4 and later.

44.3.137 NSSuperscriptAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing integer

Default 0

44.3.138 NSTextAlternativesAttributeName as string

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the attribute names.
Notes: An NSTextAlternatives object. Used primarily as a temporary attribute, with primaryString equal to the substring for the range to which it is attached, and alternativeStrings representing alternatives for that string that may be presented to the user.
Available on OS X 10.8 and newer.

44.3.139 NSTextEffectAttributeName as string

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the attribute names.
Notes: NSString, default nil: no text effect

44.3.140 NSTextEffectLetterpressStyle as string

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the text effect names.
Notes: Available on Mac OS X 10.10 or newer.

44.3.141 NSTextEncodingNameDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString related to HTML generation.
Notes: An string object containing the name, IANA or otherwise, of a text encoding to be used; mutually exclusive with NSCharacterEncodingDocumentAttribute.
Available in Mac OS X v10.4 and later.

Either NSCharacterEncodingDocumentAttribute or NSTextEncodingNameDocumentAttribute may be used to control the encoding used for generated HTML; character entities are used for characters not representable in the specified encoding.

44.3.142 NSTextEncodingNameDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: string containing the name, IANA or otherwise, of a text encoding to override any encoding specified in an HTML document. Mutually exclusive with @"CharacterEncoding". Previous string constant was @"TextEncodingName".
Available in Mac OS X v10.4 and later.

44.3.143 NSTextLayoutSectionOrientation as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the constants used as by the NSLayoutOrientationSectionsAttribute.
Notes: An Number containing an NSTextLayoutOrientation value. The default value is NSTextLayoutOrientationHorizontal.
Available in Mac OS X v10.7 and later.

44.3.144 NSTextLayoutSectionRange as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the constants used as by the NSLayoutOrientationSectionsAttribute.
Notes: An NSValue containing an NSRange representing a character range. The default value is a range covering the entire string.
Available in Mac OS X v10.7 and later.

44.3.145 NSTextLayoutSectionsAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: An Array containing dictionarys. Each dictionary describes a layout orientation section. The dictionary can have two attributes: NSTextLayoutSectionOrientation and NSTextLayoutSectionRange. When there is a gap between sections, it's assumed to have NSTextLayoutOrientationHorizontal.
Available in Mac OS X v10.7 and later.

44.3.146 NSTextSizeMultiplierDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Specifies a scale factor for font sizes.. Number containing float, default 1.0; for HTML only, corresponding to WebView's textSizeMultiplier.
There is no textual equivalent for Mac OS X v10.3.
Available in Mac OS X v10.4 and later.

44.3.147 NSTimeoutDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing float. Time in seconds to wait for a document to finish loading. Previous string constant was @"Timeout".
Available in Mac OS X v10.4 and later.

44.3.148 NSTitleDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: string containing document title.
Available in Mac OS X v10.4 and later.

44.3.149 NSToolTipAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: string
Default nil, no tooltip
Available in Mac OS X v10.3 and later.

44.3.150 NSTopMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "TopMargin".
Available in Mac OS X v10.4 and later.

44.3.151 NSUnderlineColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: NSColor
Default nil, same as foreground color
Available in Mac OS X v10.3 and later.

44.3.152 NSUnderlineStyleAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: Number containing integer
Default 0, no underline. See "Underlining Patterns", "Underlining Styles", and "Underline Masks" in Apple Documentation for mask values.

44.3.153 NSVerticalGlyphFormAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: An Number containing an integer value, 0 means horizontal text and 1 indicates vertical text. If no value specified, it's interpreted to determine the setting based on higher-level vertical orientation settings such as NSTextLayoutOrientation . The behavior for any other value is undefined.
Available in Mac OS X v10.7 and later.

44.3.154 NSViewModeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: NSValue, containing an int; 0 = normal; 1 = page layout (use value of "PaperSize").
Mac OS X v10.3 and earlier string constant is "ViewMode".
Available in Mac OS X v10.4 and later.

44.3.155 NSViewSizeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: NSValue, containing NSSize.
Mac OS X v10.3 and earlier string constant is "ViewSize".
Available in Mac OS X v10.4 and later.

44.3.156 NSViewZoomDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes: Mac OS X v10.3 and earlier string constant is "ViewZoom".
NSValue, containing a float; 100 = 100% zoom.
Available in Mac OS X v10.4 and later.

44.3.157 NSWebArchiveTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Web Kit WebArchive document.

44.3.158 NSWebPreferencesDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: WebPreferences; for HTML only, specifies a WebPreferences object. If not present, a default set of preferences is used. Previous string constant was @"WebPreferences".
Available in Mac OS X v10.4 and later.

44.3.159 NSWebResourceLoadDelegateDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes: WebResourceLoadDelegateMBS; for HTML only, specifies an object to serve as the web resource loading delegate.
If not present, a default delegate is used that permits the loading of subsidiary resources but does not respond to authentication challenges. Previous string constant was @"WebResourceLoadDelegate".

Available in Mac OS X v10.4 and later.

44.3.160 NSWordMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Microsoft Word XML (WordML schema) document.

44.3.161 NSWritingDirectionAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
const NSWritingDirectionNatural = -1 // Determines direction using the Unicode Bidi Algorithm rules P2 and P3
const NSWritingDirectionLeftToRight = 0 // Left to right writing direction
const NSWritingDirectionRightToLeft = 1 // Right to left writing direction

const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

Var t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage

// get hello in arabic
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("ŸÖÿ±ÿÿ®ÿß")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWritingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```

Notes: An Array of Numbers.
This provides a means to override the default bidi algorithm, equivalent to the use of bidi control characters LRE, RLE, LRO, or RLO paired with PDF, as a higher-level attribute. This is the NSAttributedString equivalent of HTML's dir attribute and/or BDO element. The array represents nested embeddings or overrides, in order from outermost to innermost. The values of the Numbers should be 0, 1, 2, or 3, for LRE, RLE, LRO, or RLO respectively; these should be regarded as NSWritingDirectionLeftToRight or NSWrit-

ingDirectionRightToLeft plus NSTextWritingDirectionEmbedding or NSTextWritingDirectionOverride.
Available in Mac OS X v10.6 and later.

44.3.162 NSWritingToolsExclusionAttributeName as string

MBS MacBase Plugin, Plugin Version: 25.0, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
var a as new NSMutableAttributedStringMBS
a.setString("Hello World!")

var r as new NSRangeMBS(6,5) // the word "World" above
a.addAttribute(a.NSWritingToolsExclusionAttributeName, true, r)

// check what is at position 7
var d as Dictionary = a.attributesAtIndex(7)

Break // check in debugger
```

Notes: Value is a boolean value. Default is false.
The range of text with NSWritingToolsExclusionAttributeName = true is excluded from the WritingTools processing and preserved.

Currently the text value of the attribute name is "WTWritingToolsPreserved".
Requires macOS 15.2, iOS 18.2 or newer.

44.3.163 paragraphRangeForRange(range as NSRangeMBS) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns the range of characters representing the paragraph or paragraphs containing a given range.
Notes: Range: A range within the receiver. The range must not exceed the bounds of the receiver.

The range of characters representing the paragraph or paragraphs containing range, including the paragraph termination characters.

A paragraph is any segment of text delimited by a carriage return (U+000D), newline (U+000A), or paragraph separator (U+2029).

44.3.164 rangeOfTextBlock(textBlock as NSTextBlockMBS, location as Integer) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the range of the individual text block that contains the specified location.

44.3.165 rangeOfTextList(list as NSTextListMBS, location as Integer) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the range of the given text list that contains the given location.
Notes: list: The text list.
location: The location in the text list.

Returns the range of the given text list containing the location.

44.3.166 rangeOfTextTable(textTable as NSTextTableMBS, location as Integer) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the range of the specified text table that contains the specified location.

44.3.167 rtf as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Returns the content of this attributed string as a RTF string.
Example:

```
Var s as NSAttributedStringMBS

s=new NSAttributedStringMBS

if s.initWithString("Hello") then
MsgBox s.RTF
end if

// shows this text:
// { \rtf1\ansi\ansicpg1252\cocoartf949
// { \fonttbl\f0\fswiss\fcharset0 Helvetica; }
// { \colortbl;\red255\green255\blue255; }
```

// \pard\tx560\tx1120\tx1680\tx2240\tx2800\tx3360\tx3920\tx4480\tx5040\tx5600\tx6160\tx6720\ql\qnatural\pardirnatural
//
// \f0\fs24 \cf0 Hello }

Notes: Same as RTFFromRange(0,length)

44.3.168 RTFDFileWrapperFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSFileWrapper object that contains an RTFD document corresponding to the characters and attributes within the given range.
Notes: offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute. If there are no document-level attributes, dict can be nil.

Returns a file wrapper containing the RTFD data.

The file wrapper also includes the document-level attributes in docAttributes, as explained in RTF Files and Attributed Strings.
Raises an NSRangeException if any part of aRange lies beyond the end of the receiver,Äôs characters.
You can save the file wrapper using the NSFileWrapper method writeToFile.

44.3.169 RTFDFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Creates RTFD data from the current string range.
Notes: Returns nil on failure.
Same as RTFDFromRange(0,length)
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 44.3.170 RTFDFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

44.3.170 RTFDFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates RTFD data from the current string range.
Notes: Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 44.3.169 RTFDFromRange(documentAttributes as dictionary = nil) as MemoryBlock 8376

44.3.171 RTFFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates RTF data from whole string.
Notes: Returns nil on failure.
Same as RTFFromRange(0,length)
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 44.3.172 RTFFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock 8377

44.3.172 RTFFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates RTF data from the current string range.
Example:

```
// get some attributed text:
Var t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
Var dic as new Dictionary
dic.Value(t.NSBottomMarginDocumentAttribute) = 20
dic.Value(t.NSLeftMarginDocumentAttribute) = 20
dic.Value(t.NSRightMarginDocumentAttribute) = 20
dic.Value(t.NSTopMarginDocumentAttribute) = 20
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"
```

```
// get rtf
Var rtf as string = t.RTFFromRange(dic)

// write to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes: Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 44.3.171 RTFFromRange(documentAttributes as dictionary = nil) as MemoryBlock 8377

44.3.173 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: All.

Function: Returns the size necessary to draw the string.
Notes: The minimum size required to draw the entire contents of the string.
Discussion
You can use this method prior to drawing to compute how much space is required to draw the string.
This method may return fractional sizes. When setting the size of your view, use the ceil function to round fractional values up to the nearest whole number.

44.3.174 Properties

44.3.175 containsAttachments as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this attributed string has attachments.
Notes: (Read only property)

44.3.176 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: Must not be nil to have the object being valid.
(Read and Write property)

44.3.177 length as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Length of text in characters.
Example:

```
Var n as NSAttributedStringMBS

n=new NSAttributedStringMBS
if n.initWithString("test") then
MsgBox str(n.length) // shows 4
else
MsgBox "failed"
end if
```

Notes: (Read only property)

44.3.178 Range as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates range for whole text.
Notes: (Read only property)

44.3.179 text as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The plain text.
Notes: (Read only property)

44.3.180 Constants

Constants

Constant	Value	Description
NSSpellingStateSpellingFlag	0	One of the constants for spelling state. Flag for spelling issues.

Spelling Constants.

Constant	Value	Description
NSSpellingStateGrammarFlag	1	Flag for grammar issues.

Underline Constants.

Constant	Value	Description
NSUnderlineByWord	&h8000	Draw the line only underneath or through words, not whitespace.
NSUnderlinePatternDash	&h0200	Draw a line of dashes.
NSUnderlinePatternDashDot	&h0300	Draw a line of alternating dashes and dots.
NSUnderlinePatternDashDotDot	&h0400	Draw a line of alternating dashes and two dots.
NSUnderlinePatternDot	&h0100	Draw a line of dots.
NSUnderlinePatternSolid	0	Draw a solid line.
NSUnderlineStyleDouble	9	Draw a double line.
NSUnderlineStyleNone	0	Do not draw a line.
NSUnderlineStyleSingle	1	Draw a single line.
NSUnderlineStyleThick	2	Draw a thick line.

Writing Direction Constants.

Constant	Value	Description
NSWritingDirectionEmbedding	0	Text is embedded in text with another writing direction. For example, an English quotation in the middle of an Arabic sentence could be marked as being embedded left-to-right text.
NSWritingDirectionOverride	1	Enables character types with inherent directionality to be overridden when required for special cases, such as for part numbers made of mixed English, digits, and Hebrew letters to be written from right to left.

44.4 class NSFileWrapperMBS

44.4.1 class NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The NSFileWrapper class provides access to the attributes and contents of file-system nodes.
Example:

```
// insert a file to textview

Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
// read to file
Var b as BinaryStream = BinaryStream.Open(f)
Var s as string = b.Read(b.Length)

// build wrapper
Var fileWrapper as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
fileWrapper.preferredFilename = f.name

// make attachment
Var fileAttachment as new NSTextAttachmentMBS(fileWrapper)
Var attributedString as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

// add to a NSTextViewMBS
textview.insertText attributedString

End Sub
```

Notes: A file-system node is a file, directory, or symbolic link. Instances of this class are known as file wrappers.

File wrappers represent a file-system node as an object that can be displayed as an image (and possibly edited in place), saved to the file system, or transmitted to another application.

There are three types of file wrappers:

- Regular-file file wrapper: Represents a regular file.
- Directory file wrapper: Represents a directory.
- Symbolic-link file wrapper: Represents a symbolic link.

A file wrapper has these attributes:

- Filename. Name of the file-system node the file wrapper represents.
- file-system attributes. See NSFileManager Class Reference for information on the contents of the attributes dictionary.
- Regular-file contents. Applicable only to regular-file file wrappers.
- File wrappers. Applicable only to directory file wrappers.
- Destination node. Applicable only to symbolic-link file wrappers.

44.4.2 Methods

44.4.3 addFileWrapper(child as NSFileWrapperMBS) as String

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Adds a child file wrapper to the receiver, which must be a directory file wrapper.
Notes: child: File wrapper to add to the directory.

Returns Dictionary key used to store fileWrapper in the directory,Äôs list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper's preferred filename unless that name is already in use as a key in the directory,Äôs dictionary of children. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

Use this method to add an existing file wrapper as a child of a directory file wrapper. If the file wrapper does not have a preferred filename, set the preferredFilename property to give it one before calling addFileWrapper. To create a new file wrapper and add it to a directory, use the addRegularFileWithContents method.

Special Considerations
This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.
This method raises NSInvalidArgumentException if the child file wrapper doesn,Äôt have a preferred name.

44.4.4 addRegularFileWithContents(Data as MemoryBlock, preferredFilename as string) as String

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a regular-file file wrapper with the given contents and adds it to the receiver, which must be a directory file wrapper.
Notes: data: Contents for the new regular-file file wrapper.
filename: Preferred filename for the new regular-file file wrapper.

Returns Dictionary key used to store the new file wrapper in the directory,Äôs list of file wrappers. The dictionary key is a unique filename, which is the same as the passed-in file wrapper's preferred filename unless that name is already in use as a key in the directory's dictionary of children. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

This is a convenience method. The default implementation allocates a new file wrapper, initializes it with initRegularFileWithContents, set its preferredFilename property, adds it to the directory with addFileWrapper, and returns what addFileWrapper returned.

This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.
This method raises NSInvalidArgumentException if you pass nil or an empty value for filename.

Available in OS X v10.0 and later.

44.4.5 Constructor

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The constructor.

44.4.6 initDirectoryWithFileWrappers(childrenByPreferredName as Dictionary) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Initializes the receiver as a directory file wrapper, with a given file-wrapper list.
Notes: childrenByPreferredName: Key-value dictionary of file wrappers with which to initialize the receiver. The dictionary must contain entries whose values are the file wrappers that are to become children and whose keys are filenames. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

Returns initialized file wrapper for fileWrappers.

After initialization, the file wrapper is not associated with a file-system node until you save it using writeToURL:options:originalContentsURL:.

The receiver is initialized with open permissions: anyone can read, write, or modify the directory on disk.

If any file wrapper in the directory doesn,Äôt have a preferred filename, its preferred name is automatically set to its corresponding key in the childrenByPreferredName dictionary.

44.4.7 initRegularFileWithContents(data as MemoryBlock) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Initializes the receiver as a regular-file file wrapper.
Example:

```
Var content as MemoryBlock = "Hello World"
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"
```

Notes: After initialization, the file wrapper is not associated with a file-system node until you save it using writeToURL.
The file wrapper is initialized with open permissions: anyone can write to or read the file wrapper.

44.4.8 initWithFile(File as folderItem, Options as Integer, byref error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the folderitem.
Example:

```
Var file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
Var e as NSErrorMBS
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)

if e <>nil then
MsgBox e.localizedDescription
else
Var dic as Dictionary = f.fileAttributes
Break // read dic in debugger
end if
```

Notes: File: FolderItem of the file-system node the file wrapper is to represent.
options: Option flags for reading the node located at folderitem. Can be NSFileWrapperReadingImmediate and/or NSFileWrapperReadingWithoutMapping.

Error: If an error occurs, upon return contains an NSErrorMBS object that describes the problem.

Returns File wrapper for the file-system node at folderitem. May be a directory, file, or symbolic link, depending on what is located at the folderitem. Returns nil if reading is not successful.

If folderitem is a directory, this method recursively creates file wrappers for each node within that directory. Use the fileWrappers property to get the file wrappers of the nodes contained by the directory.

Available in OS X v10.6 and later.

44.4.9 initWithSerializedRepresentation(data as MemoryBlock) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Initializes the receiver as a regular-file file wrapper from given serialized data.
Example:

```
// get a wrapper
Var file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
Var e as NSErrorMBS
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
Var data as MemoryBlock = f.serializedRepresentation

// later restore it
Var other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

Notes: serializedRepresentation: Serialized representation of a file wrapper in the format used for the NSFileContentsPboardType pasteboard type. Data of this format is returned by such methods as serializedRepresentation and RTFDFromRange (in NSAttributedString).

Returns regular-file file wrapper initialized from serializedRepresentation.
The file wrapper is not associated with a file-system node until you save it using writeToURL.

44.4.10 initWithURL(URL as string, Options as Integer, byref error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Initializes a file wrapper instance whose kind is determined by the type of file-system node located by the URL.

Notes: url: URL of the file-system node the file wrapper is to represent.
options: Option flags for reading the node located at url. Can be NSFileWrapperReadingImmediate and/or NSFileWrapperReadingWithoutMapping.
Error: If an error occurs, upon return contains an NSErrorMBS object that describes the problem.

Returns File wrapper for the file-system node at url. May be a directory, file, or symbolic link, depending on what is located at the URL. Returns nil if reading is not successful.

If url is a directory, this method recursively creates file wrappers for each node within that directory. Use the fileWrappers property to get the file wrappers of the nodes contained by the directory.

Available in OS X v10.6 and later.

44.4.11 keyForFileWrapper(child as NSFileWrapperMBS) as String

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Returns the dictionary key used by a directory to identify a given file wrapper.
Notes: child: The child file wrapper for which you want the key.

Returns Dictionary key used to store the file wrapper in the directory,Äôs list of file wrappers. The dictionary key is a unique filename, which may not be the same as the passed-in file wrapper's preferred filename if more than one file wrapper in the directory's dictionary of children has the same preferred filename. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure. Returns nil if the file wrapper specified in child is not a child of the directory.

Special Considerations
This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.

44.4.12 matchesContentsOfFile(File as FolderItem) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.
Notes: file: FolderItem of the file-system node with which to compare the file wrapper.

Returns true when the contents of the file wrapper match the contents of url, false otherwise.

The contents of files are not compared; matching of regular files is based on file modification dates. For a

directory, children are compared against the files in the directory, recursively.

Because children of directory file wrappers are not read immediately by the initWithURL:options:error: method unless the NSFileWrapperReadingImmediate reading option is used, even a newly-created directory file wrapper might not have the same contents as the directory on disk. You can use this method to determine whether the file wrapper's contents in memory need to be updated.

If the file wrapper needs updating, use the readFromURL:options:error: method with the NSFileWrapperReadingImmediate reading option.

This table describes which attributes of the file wrapper and file-system node are compared to determine whether the file wrapper matches the node on disk:

File-wrapper type	Comparison determinants
Regular file	Modification date and access permissions.
Directory	Children (recursive).
Symbolic link	Destination pathname.

Available in OS X v10.6 and later.

44.4.13 matchesContentsOfURL(URL as String) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Indicates whether the contents of a file wrapper matches a directory, regular file, or symbolic link on disk.
Notes: url: URL of the file-system node with which to compare the file wrapper.

Returns true when the contents of the file wrapper match the contents of url, false otherwise.

The contents of files are not compared; matching of regular files is based on file modification dates. For a directory, children are compared against the files in the directory, recursively.

Because children of directory file wrappers are not read immediately by the initWithURL:options:error: method unless the NSFileWrapperReadingImmediate reading option is used, even a newly-created directory file wrapper might not have the same contents as the directory on disk. You can use this method to determine whether the file wrapper's contents in memory need to be updated.

If the file wrapper needs updating, use the readFromURL:options:error: method with the NSFileWrapperReadingImmediate reading option.

This table describes which attributes of the file wrapper and file-system node are compared to determine whether the file wrapper matches the node on disk:

File-wrapper type	Comparison determinants
Regular file	Modification date and access permissions.
Directory	Children (recursive).
Symbolic link	Destination pathname.

Available in OS X v10.6 and later.

44.4.14 readFromFile(File as FolderItem, Options as Integer = 0, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Recursively rereads the entire contents of a file wrapper from the specified location on disk.
Notes: File: FolderItem of the file-system node corresponding to the file wrapper.
options: Option flags for reading the node located at url.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if successful. If not successful, returns false after setting outError to an NSErrorMBS object that describes the reason why the file wrapper could not be reread.

When reading a directory, children are added and removed as necessary to match the file system.
Available in OS X v10.6 and later.

44.4.15 readFromURL(URL as String, Options as Integer = 0, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Recursively rereads the entire contents of a file wrapper from the specified location on disk.
Notes: url: URL of the file-system node corresponding to the file wrapper.
options: Option flags for reading the node located at url.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if successful. If not successful, returns false after setting outError to an NSErrorMBS object that describes the reason why the file wrapper could not be reread.

When reading a directory, children are added and removed as necessary to match the file system.
Available in OS X v10.6 and later.

44.4.16 removeFileWrapper(child as NSFileWrapperMBS)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Removes a child file wrapper from the receiver, which must be a directory file wrapper.
Notes: This method raises NSInternalInconsistencyException if the receiver is not a directory file wrapper.

44.4.17 writeToFile(File as FolderItem, Options as Integer = 0, originalContentsURL as FolderItem = nil, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Recursively writes the entire contents of a file wrapper to a given file-system URL.
Example:

```
// get styled text from htmlviewer
Var w as WebViewMBS = HTMLViewer1.WebViewMBS
Var f as WebFrameMBS = w.mainFrame
Var v as WebFrameViewMBS = f.frameView
Var d as WebDocumentViewMBS = v.documentView
Var n as NSAttributedStringMBS = d.attributedString

// package it
Var da as new Dictionary
da.Value(n.NSDocumentTypeDocumentAttribute) = n.NSRTFDTextDocumentType

Var e as NSErrorMBS
Var fw as NSFileWrapperMBS = n.fileWrapperFromRange(0, n.Length, da, e)
if e <>nil then
MsgBox e.LocalizedDescription
Return
end if

// write to disk
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
if fw.writeToFile(file, e) then
MsgBox "OK"
else
MsgBox e.LocalizedDescription
end if
```

Notes: File: FolderItem of the file-system node to which the file wrapper,Äôs contents are written.
options: Option flags for writing to the node located at url.
originalContentsURL: The location of a previous revision of the contents being written. The default implementation of this method attempts to avoid unnecessary I/O by writing hard links to regular files instead of actually writing out their contents when the contents have not changed. The child file wrappers must return accurate values when its filename property is accessed for this to work. Use the NSFileWrapperWritingWithNameUpdating writing option to increase the likelihood of that. Specify nil for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true when the write operation is successful. If not successful, returns false after setting outError to an NSError object that describes the reason why the file wrapper,Äôs contents could not be written.

Available in OS X v10.6 and later.

44.4.18 writeToURL(URL as String, Options as Integer = 0, originalContentsURL as String = """, byref Error as NSErrorMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Recursively writes the entire contents of a file wrapper to a given file-system URL.
Notes: url: URL of the file-system node to which the file wrapper,Äôs contents are written.
options: Option flags for writing to the node located at url.
originalContentsURL: The location of a previous revision of the contents being written. The default implementation of this method attempts to avoid unnecessary I/O by writing hard links to regular files instead of actually writing out their contents when the contents have not changed. The child file wrappers must return accurate values when its filename property is accessed for this to work. Use the NSFileWrapperWritingWithNameUpdating writing option to increase the likelihood of that. Specify nil for this parameter if there is no earlier version of the contents or if you want to ensure that all the contents are written to files.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true when the write operation is successful. If not successful, returns false after setting outError to an NSError object that describes the reason why the file wrapper,Äôs contents could not be written.

Available in OS X v10.6 and later.

44.4.19 Properties

44.4.20 Directory as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: This property contains a boolean value indicating whether the file wrapper is a directory file wrapper. (read-only)
Notes: This property will contain true when the file wrapper is a directory file wrapper, otherwise it contains false.
Invocations of readFromURL may change the value of this property, if the type of the file on disk has changed.
(Read only property)

44.4.21 fileAttributes as Dictionary

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: A dictionary of file attributes.
Example:

```
Var file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
Var e as NSErrorMBS
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)

if e <>nil then
MsgBox e.localizedDescription
else
Var dic as Dictionary = f.fileAttributes
Break // read dic in debugger
end if
```

Notes: The file attributes,Äô dictionary is the same format as that returned by attributesOfItemAtPath (see NSFileManagerMBS).
(Read and Write property)

44.4.22 filename as String

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The filename of the file wrapper object.
Example:

```
Var content as MemoryBlock = "Hello World"
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"
```

Notes: This property contains the file wrapper,Äôs filename, or nil when the file wrapper has no corresponding file-system node.

The filename is used for record-keeping purposes only and is set automatically when the file wrapper is

created from the file system using initWithURL and when it,Äôs saved to the file system using writeToURL (although this method allows you to request that the filename not be updated).

The filename is usually the same as the preferred filename, but might instead be a name derived from the preferred filename. You can use this method to get the name of a child that's just been read. Don,Äôt use this method to get the name of a child that's about to be written, because the name might be about to change; send keyForFileWrapper to the parent instead.
(Read and Write property)

44.4.23 fileWrappers as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The file wrappers contained by a directory file wrapper.
Notes: The dictionary contains entries whose values are the file wrappers and whose keys are the unique filenames that have been assigned to each one. See Working with Directory Wrappers in File System Programming Guide for more information about the file-wrapper list structure.

This property may contain nil if the user modifies the directory after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the directory. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.

This property raises NSInternalInconsistencyException if the file wrapper object is not a directory file wrapper.
(Read only property)

44.4.24 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: Must not be 0 to have the object being valid.
(Read and Write property)

44.4.25 icon as NSImageMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An image that can be used to represent the file wrapper to the user.
Example:

```
Var file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
Var e as NSErrorMBS
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
Var img as NSImageMBS = f.icon
Var pic as Picture = img.CopyPictureWithMask
window1.Backdrop = pic
```

Notes: An application does not have to use this icon; for example, a file viewer typically looks up icons automatically based on file extensions, and so wouldn,Äôt need this one. Similarly, if a file wrapper represents an image file, an application can display the image directly rather than a file icon.

This method may return nil if the file wrapper is a child created when its parent was read from the file system, and the child was modified before it was read. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.

Because the NSImage object that's returned might be shared by many NSFileWrapper objects, you must not mutate it. If you need to mutate the returned object, make a copy first and mutate the copy instead.
(Read and Write property)

44.4.26 preferredFilename as String

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The preferred filename for the file wrapper object.
Example:

```
// get a wrapper
Var file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
Var e as NSErrorMBS
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
Var data as MemoryBlock = f.serializedRepresentation

// later restore it
Var other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

Notes: This name is normally used as the dictionary key when a child file wrapper is added to a directory file wrapper. However, if another file wrapper with the same preferred name already exists in the directory file wrapper when this object is added, the filename assigned as the dictionary key may differ from the preferred filename.

When you change the preferred filename, the default implementation of this property causes the existing parent directory file wrappers to remove and re-add the child to accommodate the change. Preferred filenames of children are not preserved when you write a file wrapper to disk and then later instantiate another

file wrapper by reading the file from disk. If you need to preserve the user-visible names of attachments, you have to store the names yourself.
(Read and Write property)

44.4.27 RegularFile as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: This property contains a boolean value that indicates whether the file wrapper object is a regular-file. (read-only)
Notes: This property contains true when the file wrapper object is a regular-file wrapper, otherwise it contains false. Invocations of readFromURL may change the value of this property if the type of the file on disk has changed.
(Read only property)

44.4.28 regularFileContents as MemoryBlock

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The contents of the file-system node associated with a regular-file file wrapper. (read-only)
Notes: This property may contain nil if the user modifies the file after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the file. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
This property raises NSInternalInconsistencyException if the file wrapper object is not a regular-file file wrapper.
(Read only property)

44.4.29 serializedRepresentation as MemoryBlock

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The contents of the file wrapper as an opaque collection of data. (read-only)
Example:

```
// get a wrapper
Var file as FolderItem = SpecialFolder.desktop.child("todo.rtf")
Var e as NSErrorMBS
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initWithFile(file, 0, e)
Var data as MemoryBlock = f.serializedRepresentation

// later restore it
Var other as NSFileWrapperMBS = NSFileWrapperMBS.initWithSerializedRepresentation(data)
MsgBox other.preferredFilename
```

Notes: This property contains an MemoryBlock in the format used by the pasteboard type NSFileContentsPboardType. This MemoryBlock is also suitable for passing to initWithSerializedRepresentation.

This property may contain nil if the user modifies the contents of the file-system node after you call readFromURL or initWithURL/File but before NSFileWrapper has read the contents of the file. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
(Read only property)

44.4.30 SymbolicLink as Boolean

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: A boolean that indicates whether the file wrapper object is a symbolic-link file wrapper. (read-only)
Notes: This property contains true when the file wrapper object is a symbolic-link file wrapper, false otherwise.
Invocations of readFromURL may change the value contained by this property, if the type of the file on disk has changed.
(Read only property)

44.4.31 symbolicLinkDestinationURL as String

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The URL referenced by the file wrapper object, which must be a symbolic-link file wrapper. (read-only)
Notes: This property may contain nil if the user modifies the symbolic link after you call readFromURL or initWithURL but before NSFileWrapper has read the contents of the link. Use the NSFileWrapperReadingImmediate reading option to reduce the likelihood of that problem.
This property raises NSInternalInconsistencyException if the file wrapper object is not a symbolic-link file wrapper.
(Read only property)

44.4.32 Constants

Reading Options

Constant	Value	Description
NSFileWrapperReadingImmediate	1	If reading with this option succeeds, then subsequent uses of fileWrapp ularFileContents, symbolicLinkDestinationURL, and serializedRepres sent to the file wrapper and all its child file wrappers will fail and re only if an actual error occurs (for example, the volume has disappeare file server is unreachable)—not as a result of the user moving or delet For performance reasons, NSFileWrapper may not read the contents of packages immediately even when this option is chosen. For example, the contents of bundles (not all file packages are bundles) are immutab user, NSFileWrapper may read the children of such a directory lazily. You can use this option to take a snapshot of a file or folder for writing la example, an application like TextEdit can use this option when creating wrappers to represent attachments that the user creates by copying and or dragging and dropping from the Finder to a TextEdit document. D this option when reading a document file package, because that wou unnecessarily bad performance. For example, an application wouldn't option when creating file wrappers to represent attachments as it's op document stored in a file package. Available in OS X v10.6 and later.
NSFileWrapperReadingWithoutMapping	2	Whether file mapping for regular file wrappers is disallowed. You can use this option to keep NSFileWrapper from memory-mapp This is useful if you want to make sure your application doesn't hold fi (mapped files are open files), therefore preventing the user from ejectin unmounting disk partitions, or unmounting disk images. In OS X v later, NSFileWrapper memory-maps files that are on internal drives never memory-maps files on external drives or network volumes, rega whether this option is used. Available in OS X v10.6 and later.

Writing Options

Constant	Value	Description
NSFileWrapperWritingAtomic	1	Whether writing is done atomically. You can use this option to ensure that, when overwriting a file pa overwriting either completely succeeds or completely fails, with no of leaving the file package in an inconsistent state. Because this op additional I/O, you shouldn't use it unnecessarily. For example, do option in an override of - [NSDocument writeToURL] , because NS safe-saving is already done atomically. Available in OS X v10.6 and later.
NSFileWrapperWritingWithNameUpdating	2	Whether descendant file wrappers,Äôfilename properties are set if t succeeds. This option is necessary when your application passes a URL in nalContentsURL parameter to the writeToURL method. Without option (and reusing child file wrappers properly), subsequent inv writeToURL would not be able to reliably create hard links in a nev age, because the record of names in the old file package would be o Available in OS X v10.6 and later.

44.5 class NSMutableAttributedStringMBS

44.5.1 class NSMutableAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: NSMutableAttributedString declares the programmatic interface to objects that manage mutable attributed strings.
Notes: You can add and remove characters (raw strings) and attributes separately or together as attributed strings. See the class description for NSAttributedString for more information about attributed strings.
Subclass of the NSAttributedStringMBS class.

44.5.2 Methods

44.5.3 addAttribute(name as string, value as Variant, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Adds an attribute with the given name and value to the characters in the specified range.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

Notes: name: A string specifying the attribute name. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
value: The attribute value associated with name.
Range: The range of characters to which the specified attribute/value pair applies.

You may assign any name/value pair you wish to a range of characters, in addition to the standard attributes described in the "Constants" section of NSAttributedString Additions. Raises an NSInvalidArgumentException if name or value is nil and an NSRangeException if any part of range lies beyond the end of the receiver's characters.

Plugin version 16.0 or newer ignores calls here with value = nil or empty name to avoid exceptions.

44.5.4 addAttributes(attrs as Dictionary, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Adds the given collection of attributes to the characters in the specified range.
Example:

```
TextArea1.Text = "Hello"

Var tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Var ts As NSTextStorageMBS = tv.TextStorage

Var value As Color = &cFF0000

Var offset As Integer = 0
Var length As Integer = 5

Var range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSForegroundColorAttributeName, value, range )
```

Notes: attributes: A dictionary containing the attributes to add. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied

attribute keys, see the overview section in NSAttributedString Class Reference.
Range: The range of characters to which the specified attributes apply.

You may assign any name/value pair you wish to a range of characters, in addition to the standard attributes described in the "Constants" section of NSAttributedString Additions. Raises an NSInvalidArgumentException if attributes is nil and an NSRangeException if any part of range lies beyond the end of the receiver's characters.

44.5.5 appendAttributedString(attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Adds the characters and attributes of a given attributed string to the end of the receiver.
Example:

```
const NSWritingDirectionNatural = -1 // Determines direction using the Unicode Bidi Algorithm rules P2 and P3
const NSWritingDirectionLeftToRight = 0 // Left to right writing direction
const NSWritingDirectionRightToLeft = 1 // Right to left writing direction

const NSTextWritingDirectionEmbedding = 0
const NSTextWritingDirectionOverride = 2

Var t as NSTextStorageMBS = TextArea1.NSTextViewMBS.textStorage

// get hello in arabic
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("ŸÖÿ±ÿÿ®ÿß")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

// now set attributes for right to left
m.addAttribute t.NSWritingDirectionAttributeName, array(NSWritingDirectionRightToLeft+NSTextWritingDirectionOverride), new NSRangeMBS(0,m.Length)

// and add to textarea
t.appendAttributedString m
```

Notes: attributedString: The string whose characters and attributes are added.

44.5.6 appendString(attrString as String)

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Adds the text to the end of the receiver.

44.5.7 applyFontTraits(FontTraitMask as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Applies the font attributes specified by mask to the characters in a range.
Notes: See the NSFontManager class specification for a description of the font traits available. Raises an NSRangeException if any part of aRange lies beyond the end of the receiver,Äôs characters.

44.5.8 AsCFMutableAttributedString as Variant

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new CFMutableAttributedStringMBS object pointing to same mutable attributed string.
Example:

```
// make NS version
Var n as new NSAttributedStringMBS

if n.initWithString("Hello World") then

Var m as NSMutableAttributedStringMBS = n.mutableCopy

// convert
Var c as CFMutableAttributedStringMBS = m.AsCFMutableAttributedString

// and check content
MsgBox c.String
end if
```

Notes: For passing to functions which need a CFMutableAttributedStringMBS.

44.5.9 beginEditing

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Overridden by subclasses to buffer or optimize a series of changes to the receiver's characters or attributes, until it receives a matching endEditing message, upon which it can consolidate changes and notify any observers that it has changed.
Notes: You can nest pairs of beginEditing and endEditing messages.

44.5.10 Constructor

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The constructor to create empty mutable attributed string.

44.5.11 containsAttachmentsInRange(offset as Integer, length as Integer) as Boolean

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the receiver contains a property configured (NSAttachmentAttributeName with NSAttachmentCharacter) in range.

44.5.12 deleteCharactersInRange(range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Deletes the characters in the given range along with their associated attributes.
Notes: Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

44.5.13 endEditing

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Overridden by subclasses to consolidate changes made since a previous beginEditing message and to notify any observers of the changes.
Notes: The NSMutableAttributedString implementation does nothing. NSTextStorage, for example, overrides this method to invoke fixAttributesInRange and to inform its NSLayoutManager objects that they need to re-lay the text.

44.5.14 fixAttachmentAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cleans up attachment attributes in a range, removing all attachment attributes assigned to characters other than NSAttachmentCharacter.
Notes: Raises an NSRangeException if any part of aRange lies beyond the end of the receiver,Äôs characters.

44.5.15 fixAttributesInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Invokes the other fix... methods, allowing you to clean up an attributed string with a single message.
Notes: Raises an NSRangeException if any part of aRange lies beyond the end of the receiver,Äôs characters.

NSTextStorage subclasses that return YES from the fixesAttributesLazily method should avoid directly calling fixAttributesInRange: or else bracket such calls with beginEditing and endEditing messages.

44.5.16 fixFontAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Fixes the font attribute in aRange, assigning default fonts to characters with illegal fonts for their scripts and otherwise correcting font attribute assignments.
Notes: For example, Kanji characters assigned a Latin font are reassigned an appropriate Kanji font. Raises an NSRangeException if any part of aRange lies beyond the end of the receiver,Äôs characters.

44.5.17 fixParagraphStyleAttributeInRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Fixes the paragraph style attributes in a range, assigning the first paragraph style attribute value in each paragraph to all characters of the paragraph.
Notes: This method extends the range as needed to cover the last paragraph partially contained. A paragraph is delimited by any of these characters, the longest possible sequence being preferred to any shorter:

- U+000D (\r or CR)
- U+000A (\n or LF)
- U+2029 (Unicode paragraph separator) \r\n, in that order (also known as CRLF)

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver,Äôs characters.

44.5.18 fontAttributesInRange(offset as Integer, length as Integer) as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attributes which should be copied/pasted with "copy font".

44.5.19 insertAttributedString(attrString as NSAttributedStringMBS, location as UInt64)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Inserts the characters and attributes of the given attributed string into the receiver at the given index.
Notes: attributedString: The string whose characters and attributes are inserted.
index: The index at which the characters and attributes are inserted.

The new characters and attributes begin at the given index and the existing characters and attributes from the index to the end of the receiver are shifted by the length of the attributed string. Raises an NSRangeException if index lies beyond the end of the receiver's characters.

44.5.20 insertString(attrString as String, location as UInt64)

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Inserts the text into the receiver at the given index.

44.5.21 removeAttribute(name as string, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Removes the named attribute from the characters in the specified range.
Notes: name: A string specifying the attribute name to remove. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
Range: The range of characters from which the specified attribute is removed.

Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.

44.5.22 replaceCharacters(search as String, text as String, Options as Integer = 1)

MBS MacBase Plugin, Plugin Version: 24.0, Platform: macOS, Targets: All.

Function: Searches and replaces text in a mutable attributed string.
Example:

```
// make some mutable string
Var s As New NSMutableAttributedStringMBS
s.setString "Hello World!"

// now do the replace
s.replaceCharacters("world", "everyone")

// and show result
MessageBox s.Text
```

Notes: Default options is for case insensitive search, but you can pass other options.
(see search flags in PDFDocumentMBS class)

44.5.23 replaceCharactersInRange(range as NSRangeMBS, attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Replaces the characters and attributes in a given range with the characters and attributes of the given attributed string.
Notes: Range: The range of characters and attributes replaced.
attributedString: The attributed string whose characters and attributes replace those in the specified range.

Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.
See also:

- 44.5.24 replaceCharactersInRange(range as NSRangeMBS, text as string) 8405

44.5.24 replaceCharactersInRange(range as NSRangeMBS, text as string)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Replaces the characters in the given range with the characters of the given string.
Notes: Range: A range specifying the characters to replace.
text: A string specifying the characters to replace those in range.

The new characters inherit the attributes of the first replaced character from range. Where the length of range is 0, the new characters inherit the attributes of the character preceding range if it has any, otherwise of the character following range.

Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.
See also:

- 44.5.23 replaceCharactersInRange(range as NSRangeMBS, attrString as NSAttributedStringMBS) 8405

44.5.25 rulerAttributesInRange(offset as Integer, length as Integer) as Dictionary

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attributes which should be copied/pasted with "copy ruler".

44.5.26 setAlignment(alignment as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the alignment characteristic of the paragraph style attribute for the characters in aRange to alignment.
Notes: When attribute fixing takes place, this change will affect only paragraphs whose first character was included in aRange. Raises an NSRangeException if any part of a range lies beyond the end of the receiver,Äôs characters.

44.5.27 setAttributedString(attrString as NSAttributedStringMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Replaces the receiver's entire contents with the characters and attributes of the given attributed string.
Example:

```
// create Hello World in red
Var a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
Var m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

Notes: attributedString: The attributed string whose characters and attributes replace those in the receiver.

44.5.28 setAttributes(attrs as Dictionary, range as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Sets the attributes for the characters in the specified range to the specified attributes.
Notes: attributes: A dictionary containing the attributes to set. Attribute keys can be supplied by another framework or can be custom ones you define. For information about where to find the system-supplied attribute keys, see the overview section in NSAttributedString Class Reference.
Range: The range of characters whose attributes are set.

These new attributes replace any attributes previously associated with the characters in range. Raises an NSRangeException if any part of range lies beyond the end of the receiver's characters.

To set attributes for a zero-length NSMutableAttributedString displayed in a text view, use the NSTextView method setTypingAttributes.

44.5.29 setBaseWritingDirection(writingDirection as Integer, offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the base writing direction for the characters in range to writingDirection.

44.5.30 setString(attrString as String)

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Replaces the receiver's entire contents with the given string.

44.5.31 subscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decrements the value of the superscript attribute for characters in a range by 1.
Example:

```
TextArea1.Text = "Hello World"

Var n as NSTextViewMBS = TextArea1.NSTextViewMBS
Var s as NSTextStorageMBS = n.textStorage

s.subscriptRange(6,5)
```

44.5.32 superscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Increments the value of the superscript attribute for characters in a range by 1.

44.5.33 unscriptRange(offset as Integer, length as Integer)

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the superscript attribute from the characters in a range.

44.5.34 updateAttachmentsFromPath(file as folderitem)

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Updates all attachments based on files contained in the RTFD file package at path.
See also:

- 44.5.35 updateAttachmentsFromPath(path as string) 8408

44.5.35 updateAttachmentsFromPath(path as string)

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Updates all attachments based on files contained in the RTFD file package at path.
See also:

- 44.5.34 updateAttachmentsFromPath(file as folderitem) 8408

44.6 class NSMutableParagraphStyleMBS

44.6.1 class NSMutableParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: NSMutableParagraphStyle adds methods to its superclass, NSParagraphStyle, for changing the values of the subattributes in a paragraph style attribute.
Example:

```
Var n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

Var m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

Notes: See the NSParagraphStyle and NSAttributedString specifications for more information.

Important A paragraph style object should not be mutated after adding it to an attributed string; doing so can cause your program to crash.
Subclass of the NSParagraphStyleMBS class.

44.6.2 Methods

44.6.3 addTabStop(tabstop as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Adds tabStop to the receiver.

44.6.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The constructor.

44.6.5 removeTabStop(tabstop as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Removes the first text tab whose location and type are equal to those of tabStop.

44.6.6 setAlignment(alignment as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the alignment of the receiver to alignment.
Example:

```
Var n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

Var m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

Notes: alignment may be one of:

NSLeftTextAlignment
NSRightTextAlignment
NSCenterTextAlignment
NSJustifiedTextAlignment
NSNaturalTextAlignment

44.6.7 setBaseWritingDirection(writingDirection as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the base writing direction for the receiver.
Notes: It can be NSWritingDirectionNaturalDirection, NSWritingDirectionLeftToRight, or NSWritingDirectionRightToLeft. If you specify NSWritingDirectionNaturalDirection, the receiver resolves the writing direction to either NSWritingDirectionLeftToRight or NSWritingDirectionRightToLeft, depending on the direction for the user's language preference setting.

44.6.8 setDefaultTabInterval(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the default tab interval for the receiver.
Notes: Tabs after the last specified in tabStops are placed at integral multiples of this distance. This value must be nonnegative.

44.6.9 setFirstLineHeadIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the distance in points from the leading margin of a text container to the beginning of the paragraph's first line to value.
Notes: This value must be nonnegative.

44.6.10 setHeaderLevel(level as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.
Notes: Should be set to 0 (the default value) if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.

44.6.11 setHeadIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the distance in points from the leading margin of a text container to the beginning of lines other than the first to value.
Notes: This value must be nonnegative.

44.6.12 setHyphenationFactor(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Specifies the threshold for hyphenation.
Notes: Valid values lie between 0.0 and 1.0 inclusive. The default value is 0.0. Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less than the hyphenation factor. When the paragraph's hyphenation factor is 0.0, the layout manager's hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.

44.6.13 setLineBreakMode(mode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the mode used to break lines in a layout container to mode.
Notes: The mode parameter may be one of:

NSLineBreakByWordWrapping
NSLineBreakByCharWrapping
NSLineBreakByClipping
NSLineBreakByTruncatingHead
NSLineBreakByTruncatingTail
NSLineBreakByTruncatingMiddle
See the description of lineBreakMode in the NSParagraphStyle class specification for descriptions of these values.

44.6.14 setLineHeightMultiple(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the line height multiple for the receiver.
Notes: The natural line height of the receiver is multiplied by this factor before being constrained by minimum and maximum line height. This value must be nonnegative.

44.6.15 setLineSpacing(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the space in points added between lines within the paragraph to value.
Example:

```
// works for Labels, TextArea and TextFields

// control is either a textfield or a textview
Var n as NSTextFieldMBS = me.NSTextFieldMBS
Var v as NSTextViewMBS = me.NSTextViewMBS

// get text with attributes
Var a as NSAttributedStringMBS

if n<>Nil then
a = n.attributedStringValue
elseif v<>nil then
a = v.textStorage
end if
```

```
// get style
Var p as NSParagraphStyleMBS

try
p = a.attributeAtIndex(a.NSParagraphStyleAttributeName, 0)
catch ex as NSExceptionMBS
// we have none, so make one
p = new NSParagraphStyleMBS
end try

// modify it
Var m as NSMutableParagraphStyleMBS = p.mutableCopy
m.setLineSpacing 5

// add back to styled text
Var s as NSMutableAttributedStringMBS = a.mutableCopy
s.addAttribute(a.NSParagraphStyleAttributeName, m, new NSRangeMBS(0, s.length))

// and apply to control
if n<>Nil then
n.attributedStringValue = s
elseif v<>nil then
v.textStorage.setAttributedString s
end if
```

Notes: This value must be nonnegative.

44.6.16 setMaximumLineHeight(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the maximum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to value.
Notes: Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. This value must be nonnegative.

Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.

44.6.17 setMinimumLineHeight(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the minimum height that any line in the paragraph style will occupy, regardless of the font size or size of any attached graphic, to value.
Notes: This value must be nonnegative.

44.6.18 setParagraphSpacing(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the space added at the end of the paragraph to separate it from the following paragraph to value.
Notes: This value must be nonnegative.

44.6.19 setParagraphSpacingBefore(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the distance between the paragraph's top and the beginning of its text content.
Notes: This value must be nonnegative.

44.6.20 setParagraphStyle(ParagraphStyle as NSParagraphStyleMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Replaces the subattributes of the receiver with those in ParagraphStyle.

44.6.21 setTabStops(tabStops() as NSTextTabMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Replaces the tab stops in the receiver with tabStops.

44.6.22 setTailIndent(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Sets the distance in points from the margin of a text container to the end of lines to value.
Notes: If positive, this is the distance from the leading margin (for example, the left margin in left-to-right text). That is, it's the absolute line width. If 0 or negative, it's the distance from the trailing margin—the value is added to the line width.

For example, to create a paragraph style that fits exactly in a 2-inch wide container, set its head indent to 0.0 and its tail indent to 0.0. To create a paragraph style with quarter-inch margins, set its head indent to 0.25 and its tail indent to –0.25.

44.6.23 setTextBlocks(TextBlocks() as NSTextBlockMBS)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the text blocks that contain the paragraph.

44.6.24 setTextLists(TextLists() as NSTextListMBS)

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the text lists containing the paragraph.

44.6.25 setTighteningFactorForTruncation(value as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Specifies the threshold for using tightening as an alternative to truncation.
Notes: When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed 1.0 + the value returned by tighteningFactorForTruncation. Otherwise the text is truncated at a location determined by the line break mode. The default value is 0.05. This method accepts positive and negative values. Values less than or equal to 0.0 result in not tightening.

44.7 class NSParagraphStyleMBS

44.7.1 class NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: NSParagraphStyle and its subclass NSMutableParagraphStyle encapsulate the paragraph or ruler attributes used by the NSAttributedString classes.
Example:

```
Var n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural
```

Notes: Instances of these classes are often referred to as paragraph style objects or, when no confusion will result, paragraph styles.
The mutable subclass of NSParagraphStyle is NSMutableParagraphStyle.

44.7.2 Methods

44.7.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The constructor.

44.7.4 copy as NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a copy of the paragraph style.

44.7.5 defaultParagraphStyle as NSParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the default paragraph style.
Example:

```
Var n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural
```

Notes: The default paragraph style has the following default values:

Subattribute	Default Value
Alignment	NSNaturalTextAlignment
Tab stops	12 left-aligned tabs, spaced by 28.0 points
Line break mode	NSLineBreakByWordWrapping
All others	0.0

44.7.6 defaultWritingDirectionForLanguage(languageName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the default writing direction for the specified language.
Notes: languageName: The language specified in ISO language region format. Can be nil to return a default writing direction derived from the user's defaults database.

44.7.7 mutableCopy as NSMutableParagraphStyleMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a mutable copy of the paragraph style.

44.7.8 NSCenterTextAlignment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the text alignment constants for the alignment property.
Notes: Visually centered

44.7.9 NSRightTextAlignment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the text alignment constants for the alignment property.
Notes: Visually right aligned

44.7.10 tabStops as NSTextTabMBS()

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the receiver's tab stops.
Notes: The NSTextTab objects, sorted by location, that define the tab stops for the paragraph style.

44.7.11 textBlocks as NSTextBlockMBS()

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The text blocks that contain the paragraph.

44.7.12 textLists as NSTextListMBS()

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array specifying the text lists containing the paragraph.

44.7.13 Properties

44.7.14 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the text alignment of the receiver.
Example:

```
Var n as NSParagraphStyleMBS = NSParagraphStyleMBS.defaultParagraphStyle
MsgBox str(n.alignment) // 4 = natural

Var m as NSMutableParagraphStyleMBS = n.mutableCopy
m.setAlignment NSParagraphStyleMBS.NSCenterTextAlignment
MsgBox str(m.alignment) // 2 = center
```

Notes: Natural text alignment is realized as left or right alignment depending on the line sweep direction of the first script contained in the paragraph.
(Read only property)

44.7.15 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the base writing direction for the receiver.
Notes: (Read only property)

44.7.16 defaultTabInterval as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the document-wide default tab interval.
Notes: The default tab interval in points. Tabs after the last specified in tabStops are placed at integer multiples of this distance (if positive). Default return value is 0.0.
(Read only property)

44.7.17 firstLineHeadIndent as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the indentation of the first line of the receiver.
Notes: The distance in points from the leading margin of a text container to the beginning of the paragraph's first line. This value is always nonnegative.
(Read only property)

44.7.18 firstTabStop as NSTextTabMBS

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The first tab stop entry.
Notes: For debugging.
(Read only property)

44.7.19 firstTextList as NSTextListMBS

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The first text list entry.
Notes: For debugging.
(Read only property)

44.7.20 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

44.7.21 headerLevel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Specifies whether the paragraph is to be treated as a header for purposes of HTML generation.
Notes: Returns 0 (the default value), if the paragraph is not a header, or from 1 through 6 if the paragraph is to be treated as a header.
(Read only property)

44.7.22 headIndent as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the indentation of the receiver's lines other than the first.
Notes: The distance in points from the leading margin of a text container to the beginning of lines other than the first. This value is always nonnegative.
(Read only property)

44.7.23 hyphenationFactor as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the paragraph's threshold for hyphenation.
Notes: A value between 0.0 and 1.0 inclusive. The default value is 0.0.

Hyphenation is attempted when the ratio of the text width (as broken without hyphenation) to the width of the line fragment is less than the hyphenation factor. When the paragraph's hyphenation factor is 0.0, the layout manager's hyphenation factor is used instead. When both are 0.0, hyphenation is disabled.
(Read only property)

44.7.24 lineBreakMode as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the mode that should be used to break lines in the receiver.
Notes: The line break mode to be used laying out the paragraph's text.
(Read only property)

44.7.25 lineHeightMultiple as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the line height multiple.
Notes: The line height multiple. The natural line height of the receiver is multiplied by this factor (if positive) before being constrained by minimum and maximum line height. Default return value is 0.0.
(Read only property)

44.7.26 lineSpacing as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the space between lines in the receiver (commonly known as leading).
Notes: The space in points added between lines within the paragraph. This value is always nonnegative.
(Read only property)

44.7.27 maximumLineHeight as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the receiver's maximum line height.
Notes: The maximum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative. The default value is 0.

Glyphs and graphics exceeding this height will overlap neighboring lines; however, a maximum height of 0 implies no line height limit. Although this limit applies to the line itself, line spacing adds extra space between adjacent lines.

(Read only property)

44.7.28 minimumLineHeight as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the receiver's minimum height.
Notes: The minimum height in points that any line in the receiver will occupy, regardless of the font size or size of any attached graphic. This value is always nonnegative.
(Read only property)

44.7.29 paragraphSpacing as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the space after the end of the paragraph.
Notes: The space in points added at the end of the paragraph to separate it from the following paragraph. This value is always nonnegative.

This value is determined by adding the previous paragraph's paragraphSpacing and the current paragraph's paragraphSpacingBefore.
(Read only property)

44.7.30 paragraphSpacingBefore as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the distance between the paragraph's top and the beginning of its text content.
Notes: The distance in points between the paragraph's top and the beginning of its text content. Default return value is 0.0.
(Read only property)

44.7.31 tailIndent as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the trailing indentation of the receiver.
Notes: The distance in points from the margin of a text container to the end of lines.

If positive, this value is the distance from the leading margin (for example, the left margin in left-to-right

text). If 0 or negative, it's the distance from the trailing margin.

For example, a paragraph style designed to fit exactly in a 2-inch wide container has a head indent of 0.0 and a tail indent of 0.0. One designed to fit with a quarter-inch margin has a head indent of 0.25 and a tail indent of –0.25.
(Read only property)

44.7.32 tighteningFactorForTruncation as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the threshold for using tightening as an alternative to truncation.
Notes: The tightening threshold value. The default value is 0.05.

When the line break mode specifies truncation, the text system attempts to tighten intercharacter spacing as an alternative to truncation, provided that the ratio of the text width to the line fragment width does not exceed 1.0 + the tightening factor returned by this method. Otherwise the text is truncated at a location determined by the line break mode.
(Read only property)

44.7.33 Constants

Alignment Modes

Constant	Value	Description
NSJustifiedTextAlignment	3	Fully-justified. The last line in a paragraph is natural-aligned.
NSLeftTextAlignment	0	Visually left aligned
NSNaturalTextAlignment	4	Indicates the default alignment for script.

Line Break Modes

Constant	Value	Description
NSLineBreakByCharWrapping	1	Wrapping occurs before the first character that doesn't fit.
NSLineBreakByClipping	2	Lines are simply not drawn past the edge of the text container.
NSLineBreakByTruncatingHead	3	Each line is displayed so that the end fits in the container and the missing tex is indicated by some kind of ellipsis glyph.
NSLineBreakByTruncatingMiddle	5	Each line is displayed so that the beginning and end fit in the container an the missing text is indicated by some kind of ellipsis glyph in the middle.
NSLineBreakByTruncatingTail	4	Each line is displayed so that the beginning fits in the container and the missin text is indicated by some kind of ellipsis glyph.
NSLineBreakByWordWrapping	0	Wrapping occurs at word boundaries, unless the word itself doesn't fit on single line.

Writing Direction

Constant	Value	Description
NSWritingDirectionLeftToRight	0	The writing direction is left to right. Available in Mac OS X v10.2 and later.
NSWritingDirectionNatural	-1	The writing direction is determined using the Unicode Bidi Algorithm rules P2 and P3. Default. Available in Mac OS X v10.4 and later.
NSWritingDirectionRightToLeft	1	The writing direction is right to left. Available in Mac OS X v10.2 and later.

44.8 class NSShadowMBS

44.8.1 class NSShadowMBS

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: An NSShadow object encapsulates the attributes used to create a drop shadow during drawing operations.
Notes: Shadows are always drawn in the default user coordinate space, regardless of any transformations applied to that space. This means that rotations, translations and other transformations of the current transformation matrix (the CTM) do not affect the resulting shadow. Another way to think about this is that changes to the CTM do not move or change the apparent position of the shadow,Äôs light source.

There are two positional parameters for a shadow: an x-offset and a y-offset. These values are expressed using a single size data type (CGSize on iOS, NSSize on OS X) and using the units of the default user coordinate space. Positive values for these offsets extend up and to the right.

In addition to its positional parameters, a shadow also contains a blur radius, which specifies how much a drawn object's image mask is blurred before it is composited onto the destination. A value of 0 means there is no blur. Larger values give correspondingly larger amounts of blurring.

An NSShadow object may be used in one of two ways. First, it may be set, like a color or a font, in which case its attributes are applied to all content drawn thereafter—or at least until another shadow is applied or a previous graphics state is restored. Second, it may be used as the value for the NSShadowAttributeName text attribute, in which case it is applied to the glyphs corresponding to the characters bearing this attribute.

- MBS Xojo / Real Studio Plugins, version 16.1pr1

44.8.2 Methods

44.8.3 Constructor

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Initialized with 0 as its offset, 0 as its blur radius, and the default color as its color.

44.8.4 copy as NSShadowMBS

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: Creates a copy of the shadow object.

44.8.5 set

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the shadow of subsequent drawing operations to the shadow represented by the receiver.
Notes: The shadow attributes of the receiver are used until another shadow is set or until the graphics state is restored.

44.8.6 Properties

44.8.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

44.8.8 shadowBlurRadius as Double

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The blur radius of the shadow.
Notes: This property contains the blur radius, as measured in the default user coordinate space. A value of 0 indicates no blur, while larger values produce correspondingly larger blurring. The default value is 0.
(Read and Write property)

44.8.9 shadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The color of the shadow.
Notes: The default shadow color is black with an alpha of 1/3. If you set this property to nil, the shadow is not drawn.
(Read and Write property)

44.8.10 shadowOffset as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The offset values of the shadow.
Notes: This property contains the horizontal and vertical offset values, specified using the width and height fields of the NSSize data type. These offsets are measured using the default user coordinate space and are not affected by custom transformations. This means that positive values always extend down and to the right from the user's perspective.
(Read and Write property)

44.9 class NSTextAttachmentMBS

44.9.1 class NSTextAttachmentMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: An attachment to a text.
Notes: NSTextAttachment objects are used by the NSAttributedString class cluster as the values for attachment attributes (stored in the attributed string under the key named NSAttachmentAttributeName). The objects you create with this class are referred to as text attachment objects, or when no confusion will result, as text attachments or merely attachments.

A text attachment object contains an NSFileWrapper in NSFileWrapper Class Reference object, which in turn holds the contents of the attached file. It also uses a cell object conforming to the NSTextAttachmentCell in NSTextAttachmentCell Protocol Reference protocol to draw and handle mouse events. Most of the behavior of a text attachment is relegated to the file wrapper and the attachment cell. See the corresponding class and protocol specifications for more information.

See the NSAttributedString in NSAttributedString Class Reference and NSTextView in NSTextView Class Reference class specifications for general information on text attachments.

44.9.2 Methods

44.9.3 attributedStringWithAttachment(attachment as NSTextAttachmentMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Creates an attributed string with an attachment.
Example:

```
Var content as MemoryBlock = "Hello World"
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

Var a as new NSTextAttachmentMBS(f)
Var s as NSAttributedStringMBS = NSTextAttachmentMBS.attributedStringWithAttachment(a)
```

Notes: This is a convenience method for creating an attributed string containing an attachment using NSAttachmentCharacter as the base character.

44.9.4 Constructor(fileWrapper as NSFileWrapperMBS)

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Initializes a newly allocated NSTextAttachment object to contain the given file wrapper.
Example:

```
Var content as MemoryBlock = "Hello World"
Var f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"

Var a as new NSTextAttachmentMBS(f)

Break // inspect in debugger
```

Notes: If fileWrapper contains an image file that the receiver can interpret as an NSImage object, sets the attachment cell,Äôs image to the NSImage rather than to the icon of fileWrapper.
See also:

- 44.9.5 Constructor(image as NSImageMBS) 8429

44.9.5 Constructor(image as NSImageMBS)

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Initializes a newly allocated NSTextAttachment object with a cell and given image.
Example:

```
Var pic As Picture = LogoMBS(500)
Var image As New NSImageMBS(pic)

// build attachment
Var imageAttachment As New NSTextAttachmentMBS(image)
Var attributedString As NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(imageAttachment)
```

```
// insert image
Var textView As NSTextViewMBS = TextArea1.NSTextViewMBS
textview.insertText attributedString
```

- 44.9.4 Constructor(fileWrapper as NSFileWrapperMBS) 8429

44.9.6 Properties

44.9.7 attachmentCell as Variant

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The attachment cell.
Notes: As our plugin currently has no NSTextAttachmentCell class, we just give you a NSCell object.
This allows accessing most of the properties.
Value is a NSCellMBS declared as Variant to reduce plugin dependencies.
(Read only property)

44.9.8 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 26.2, Platform: macOS, Targets: All.

Function: The layout bounds of the text attachment,Äôs graphical representation in the text coordinate system.
Notes: The bounds rectangle origin is at the current glyph location on the text baseline. The default value is NSRectMBS.zero.
(Read and Write property)

44.9.9 contents as MemoryBlock

MBS MacBase Plugin, Plugin Version: 26.2, Platform: macOS, Targets: All.

Function: The contents for the text attachment.
Notes: Modifying this property has the side effect of invalidating the image property.
(Read and Write property)

44.9.10 fileType as String

MBS MacBase Plugin, Plugin Version: 26.2, Platform: macOS, Targets: All.

Function: The file type of the contents for the text attachment.
Notes: Modifying this property has the side effect of invalidating the image property.
(Read and Write property)

44.9.11 fileWrapper as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The file wrapper.
Notes: The file wrapper holds the contents of the attached file.
(Read and Write property)

44.9.12 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: Must not be 0 to have the object being valid.
(Read and Write property)

44.9.13 image as NSImageMBS

MBS MacBase Plugin, Plugin Version: 26.2, Platform: macOS, Targets: All.

Function: An instance of the relevant image class that represents the contents of the text attachment object.
Notes: For details about using the UIImage/NSImage class to create text attachments that automatically adjust to surrounding font and color attributes.
(Read and Write property)

44.9.14 Constants

Constants

Constant	Value	Description
NSAttachmentCharacter	&hFFFC	This character is used to denote an attachment.

44.10 class NSTextBlockMBS

44.10.1 class NSTextBlockMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A block of text laid out in a subregion of the text container.
Notes: A text block appears as an attribute of a paragraph, and as part of the paragraph style. The most important subclass of NSTextBlockMBS is NSTextTableBlockMBS, which represents a block of text that appears as a cell in a table. The table itself is a NSTextTable object. All NSTextBlockMBS objects reference this table, which controls their sizing and positioning.

44.10.2 Methods

44.10.3 borderColor(edge as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the border color of the specified text block edge.
Notes: edge: The edge of the text block in question.

44.10.4 Constructor

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an empty text block object.

44.10.5 copy as NSTextBlockMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of this object.

44.10.6 setBorderColor(color as NSColorMBS)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the color of all borders of the text block.
Notes: This setting has no visible effect unless the border width is larger than the default, which is 0.
See also:

- 44.10.7 setBorderColor(color as NSColorMBS, edge as Integer) 8433

44.10.7 setBorderColor(color as NSColorMBS, edge as Integer)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the border color of the specified edge of the text block.
Notes: color: The new color.
edge: The edge whose color is to be set.

This setting has no visible effect unless the border width is larger than the default, which is 0.
See also:

- 44.10.6 setBorderColor(color as NSColorMBS) 8433

44.10.8 setContentWidth(value as double, ValueType as Integer)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the width of the text block.
Notes: value: The new value for the width.
ValueType: The type of value being provided. This controls how val is interpreted.

44.10.9 setValue(value as double, ValueType as Integer, dimension as Integer)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets a dimension of the text block.
Notes: value: The new value for the dimension.
ValueType: The type of value being provided. This controls how value is interpreted.
dimension: The dimension to set.

44.10.10 setWidth(value as double, ValueType as Integer, Layer as Integer)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the width of all edges of a specified layer of the text block.
Notes: value: The new value for the specified edge width.
type: The type of value being provided. This controls how val is interpreted.
layer: The layer of the text block to modify.
See also:

- 44.10.11 setWidth(value as double, ValueType as Integer, Layer as Integer, edge as Integer) 8434

44.10.11 setWidth(value as double, ValueType as Integer, Layer as Integer, edge as Integer)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the width of all edges of a specified layer of the text block.
Notes: value: The new value for the specified edge width.
type: The type of value being provided. This controls how val is interpreted.
layer: The layer of the text block to modify.
edge: The edge of the layer to examine.
See also:

- 44.10.10 setWidth(value as double, ValueType as Integer, Layer as Integer) 8434

44.10.12 valueForDimension(dimension as Integer) as Double

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value of the specified text block dimension.
Notes: The value for the specified dimension. This value should be interpreted according to the value type returned by valueTypeForDimension.

44.10.13 valueTypeForDimension(dimension as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value type of the specified text block dimension.
Notes: The value type for the specified text block dimension. This result determines how the value for the dimension should be interpreted.

44.10.14 width(layer as Integer, edge as Integer) as double

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the width of an edge of a specified layer of the text block.
Notes: layer: The layer to examine.
edge: The edge of the layer to examine.

Returns The width of the edge of layer. This value must be interpreted according to the value type returned by widthValueTypeForLayer().

44.10.15 widthValueType(layer as Integer, edge as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the value type of an edge of a specified layer of the text block.
Notes: layer: The layer to examine.
edge: The edge of the layer to examine.

Returns the value type of the edge of layer. This determines how the value for this edge of layer should be interpreted.

44.10.16 Properties

44.10.17 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background color of the text block.
Notes: (Read and Write property)

44.10.18 contentWidth as Double

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The width of the text block.
Notes: This property interpreted according to the value type returned by contentWidthValueType.
(Read only property)

44.10.19 contentWidthValueType as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The type of value stored for the text block width.
Notes: This property determines how the width value should be interpreted.
(Read only property)

44.10.20 Handle as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

44.10.21 verticalAlignment as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The vertical alignment of the text block.
Notes: (Read and Write property)

44.10.22 Constants

Dimension

Constant	Value	Description
DimensionHeight	4	Height of the text block.
DimensionMaximumHeight	6	Maximum height of the text block.
DimensionMaximumWidth	2	Maximum width of the text block.
DimensionMinimumHeight	5	Minimum height of the text block.
DimensionMinimumWidth	1	Minimum width of the text block.
DimensionWidth	0	Width of the text block.

Layer

Constant	Value	Description
LayerBorder	0	The border of the text block.
LayerMargin	1	Margin of the text block: space surrounding the border.
LayerPadding	-1	Padding of the text block: space surrounding the content area extending to the border.

Value Types

Constant	Value	Description
ValueTypeAbsolute	0	Absolute value in points.
ValueTypePercentage	1	Percentage value (out of 100).

Vertical Alignment

Constant	Value	Description
VerticalAlignmentBaseline	3	Aligns adjacent blocks at the baseline of the first line of text in the block.
VerticalAlignmentBottom	2	Aligns adjacent blocks at their bottom.
VerticalAlignmentMiddle	1	Aligns adjacent blocks at their middle.
VerticalAlignmentTop	0	Aligns adjacent blocks at their top.

44.11 class NSTextContainerMBS

44.11.1 class NSTextContainerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The NSTextContainer class defines a region where text is laid out.
Notes: An NSLayoutManager uses NSTextContainer to determine where to break lines, lay out portions of text, and so on. NSTextContainer defines rectangular regions, but you can create subclasses that define regions of other shapes, such as circular regions, regions with holes in them, or regions that flow alongside graphics.

- MBS Real Studio Plugins, version 12.4pr4

44.11.2 Methods

44.11.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop only.

Function: Initializes a text container with no bounds.
Notes: Returns the newly initialized text container.
See also:

- 44.11.4 Constructor(size as NSSizeMBS) 8438

44.11.4 Constructor(size as NSSizeMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Initializes a text container with a specified bounding rectangle.
Notes: size: The size of the text container's bounding rectangle.

Returns the newly initialized text container.

The new text container must be added to an NSLayoutManager object before it can be used. The text container must also have an NSTextView object set for text to be displayed. This method is the designated initializer for the NSTextContainer class.
See also:

• 44.11.3 Constructor 8438

44.11.5 containsPoint(p as NSPointMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return whether a point lies within the receiver's region or on the region's edge—not simply within its bounding rectangle.
Notes: True if aPoint lies within the receiver's region or on the region's edge—not simply within its bounding rectangle - false otherwise.

For example, if the receiver defines a donut shape and aPoint lies in the hole, this method returns false. This method can be used for hit testing of mouse events.

The default NSTextContainer implementation merely checks that aPoint lies within its bounding rectangle.

44.11.6 isSimpleRectangularTextContainer as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return whether the receiver's region is a rectangle with no holes or gaps and whose edges are parallel to the text view's coordinate system axes.
Notes: True if the receiver's region is a rectangle with no holes or gaps and whose edges are parallel to the text view's coordinate system axes, false otherwise.

A text container whose shape changes can return true if its region is currently a simple rectangle, but when its shape does change it must send textContainerChangedGeometry to its layout manager so the layout can be recalculated.

The default NSTextContainer implementation of this method returns true.

44.11.7 replaceLayoutManager(l as NSLayoutManagerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Replaces the layout manager for the group of text system objects containing the receiver.
Notes: All text containers and text views sharing the original layout manager share the new layout manager. This method makes all the adjustments necessary to keep these relationships intact, unlike setLayoutManager.

44.11.8 Properties

44.11.9 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

44.11.10 containerSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver's bounding rectangle.
Notes: size: The new size of the text container's bounding rectangle.
This method also sends textContainerChangedGeometry to the text container's layout manager.
(Read and Write computed property)

44.11.11 heightTracksTextView as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the receiver adjusts the height of its bounding rectangle when its text view is resized.
Notes: value: True if the receiver should follow changes to the height of its text view, false otherwise.
(Read and Write computed property)

44.11.12 layoutManager as NSLayoutManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The layout manager.
Notes: This method is invoked automatically when you add a text container to a layout manager; you should never need to invoke it directly, but might want to override it. If you want to replace the layout manager for an established group of text system objects, use replaceLayoutManager.
(Read and Write computed property)

44.11.13 lineFragmentPadding as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The amount by which text is inset within line fragment rectangles.
Notes: Value: The amount by which text is inset within line fragment rectangles, in points.

This method also sends textContainerChangedGeometry to the text container's layout manager.

Line fragment padding is not designed to express text margins. Instead, use the NSTextView method setTextContainerInset, paragraph margin attributes, or the position of the text view within a superview.
(Read and Write computed property)

44.11.14 textView as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The text view.
Notes: This method sends setTextContainer to aTextView to complete the association of the text container and text view.

Because you usually specify a text container when you create a text view, you should rarely need to invoke this method. A text container doesn't need a text view to calculate line fragment rectangles, but must have one to display text.

You can use this method to disconnect a text view from a group of text system objects by sending this message to its text container and passing nil as aTextView.
(Read and Write computed property)

44.11.15 widthTracksTextView as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the receiver adjusts the width of its bounding rectangle when its text view is resized.
Notes: Returns true if the receiver adjusts the width of its bounding rectangle when its text view is resized, false otherwise.

If the receiver does track the text view width, its width is adjusted to the width of the text view minus twice the inset width (as given by NSTextView's textContainerInset method).
(Read and Write computed property)

44.11.16 Constants

Line Movement Constants

Constant	Value	Description
NSLineDoesntMove	0	Line has no movement.
NSLineMovesDown	3	Lines move from top to bottom.
NSLineMovesLeft	1	Lines move from right to left.
NSLineMovesRight	2	Lines move from left to right.
NSLineMovesUp	4	Lines move from bottom to top.

Line Sweep Direction Constants

Constant	Value	Description
NSLineSweepDown	2	Characters move from top to bottom.
NSLineSweepLeft	0	Characters move from right to left.
NSLineSweepRight	1	Characters move from left to right.
NSLineSweepUp	3	Characters move from bottom to top.

44.12 class NSTextListMBS

44.12.1 class NSTextListMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: A section of text that forms a single list.
Notes: The visible elements of the list, including list markers, appear in the text as they do for lists created by hand. The list object, however, allows the list to be recognized as such by the text system. This enables automatic creation of markers and spacing. Text lists are used in HTML import and export.

Text lists appear as attributes on paragraphs, as part of the paragraph style. An NSParagraphStyle may have an array of text lists, representing the nested lists containing the paragraph, in order from outermost to innermost. For example, if list1 contains four paragraphs, the middle two of which are also in the inner list2, then the text lists array for the first and fourth paragraphs is (list1), while the text lists array for the second and third paragraphs is (list1, list2).
The methods implementing this are textLists on NSParagraphStyle, and textLists on NSMutableParagraph-Style.

In addition, NSAttributedString has convenience methods for lists, such as rangeOfTextList, which determines the range covered by a list, and itemNumberInTextList, which determines the ordinal position within a list of a particular item.

44.12.2 Methods

44.12.3 Constructor(format as String, OptionsMask as Integer = 0)

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an initialized text list.
Notes: format: The marker format for the text list.
mask: The marker options for the text list. Values for mask are listed in Constants.

Returns an initialized text list.

The marker format is specified as a constant string, except for a numbering specifier, which takes the form { keyword } . The currently supported values for keyword include:

- box
- check
- circle
- diamond
- disc
- hyphen
- square
- lower-hexadecimal
- upper-hexadecimal
- octal
- lower-alpha or lower-latin
- upper-alpha or upper-latin
- lower-roman
- upper-roman
- decimal

Thus, for example, "({ decimal })" would specify the format for a list numbered (1), (2), (3), and so on, and @" { upper-roman } " would specify the format for a list numbered I, II, III, IV, and so on. (All of these keywords are included in the Cascading Style Sheets level 3 specification.)

44.12.4 copy as NSTextListMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the text list.

44.12.5 markerForItemNumber(ItemNum as Integer) as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the computed value for a specific ordinal position in the list.
Notes: itemNum: The ordinal position in the list whose computed marker value is desired.

Returns the computed maker value for itemNum.

44.12.6 NSTextListMarkerBox as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.7 NSTextListMarkerCheck as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.8 NSTextListMarkerCircle as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.9 NSTextListMarkerDecimal as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.10 NSTextListMarkerDiamond as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.11 NSTextListMarkerDisc as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.12 NSTextListMarkerHyphen as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.13 NSTextListMarkerLowercaseAlpha as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.14 NSTextListMarkerLowercaseHexadecimal as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.15 NSTextListMarkerLowercaseLatin as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.16 NSTextListMarkerLowercaseRoman as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.17 NSTextListMarkerOctal as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.18 NSTextListMarkerSquare as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.19 NSTextListMarkerUppercaseAlpha as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.20 NSTextListMarkerUppercaseHexadecimal as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.21 NSTextListMarkerUppercaseLatin as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.22 NSTextListMarkerUppercaseRoman as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: One of the format texts.
Notes: Available on MacOS 10.13 or newer.

44.12.23 Properties

44.12.24 Handle as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: The internal reference number.
Notes: (Read and Write property)

44.12.25 listOptions as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the list options mask value of the receiver.
Notes: Can be NSTextListPrependEnclosingMarker.
(Read only property)

44.12.26 markerFormat as String

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the marker format string used by the receiver.
Notes: (Read only property)

44.12.27 startingItemNumber as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platforms: macOS, iOS, Targets: All.

Function: Sets the starting item number for the text list.
Notes: The default value is 1. This value will be used only for ordered lists, and ignored in other cases.
(Read and Write property)

44.12.28 Constants

Constants

Constant	Value	Description
NSTextListPrependEnclosingMarker	1	One of the constants for options. Specifies that a nested list should include the marker for its enclosing supe before its own marker.

44.13 class NSTextMBS

44.13.1 class NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop & iOS.

Function: The Cocoa class for text controls.
Notes: You may prefer to use the NSTextViewMBS class which is a subclass from NSTextMBS.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.

The class is not useful on iOS.
Subclass of the NSViewMBS class.

44.13.2 Methods

44.13.3 alignCenter

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method applies center alignment to selected paragraphs (or all text if the receiver is a plain text object).

44.13.4 alignLeft

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method applies left alignment to selected paragraphs (or all text if the receiver is a plain text object).

44.13.5 alignRight

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method applies right alignment to selected paragraphs (or all text if the receiver is a plain text object).

44.13.6 changeFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method changes the font of the selection for a rich text object, or of all text for a plain text object.
Notes: If the receiver doesn't use the Font panel, this method does nothing.

This method changes the font by sending a convertFont message to the shared NSFontManager and applying each NSFont returned to the appropriate text. See the NSFontManager class specification for more information on font conversion.

44.13.7 checkSpelling

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: This action method searches for a misspelled word in the receiver's text.
Notes: The search starts at the end of the selection and continues until it reaches a word suspected of being misspelled or the end of the text. If a word isn't recognized by the spelling server, a showGuessPanel message then opens the Guess panel and allows the user to make a correction or add the word to the local dictionary.

44.13.8 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new text with size 100/100 and position 0/0
Example:

```
Var t as new NSTextMBS
```

Notes: On success the handle property is not zero.
See also:

- 44.13.9 Constructor(Handle as Integer) 8452
- 44.13.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8452

44.13.9 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSText handle.
Example:

```
Var t as new NSTextMBS(0, 0, 100, 100)
Var v as new NSTextMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSText and the plugin retains this handle.

- 44.13.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8452

44.13.10 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new text with the given size and position.
Example:

```
Var x as new NSTextMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 44.13.8 Constructor 8451
- 44.13.9 Constructor(Handle as Integer) 8452

44.13.11 copy

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method copies the selected text onto the general pasteboard, in as many formats as the receiver supports.

44.13.12 copyFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method copies the font information for the first character of the selection (or for the insertion point) onto the font pasteboard, as NSFontPboardType.

44.13.13 copyRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method copies the paragraph style information for first selected paragraph onto the ruler pasteboard, as NSRulerPboardType, and expands the selection to paragraph boundaries.

44.13.14 cut

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method deletes the selected text and places it onto the general pasteboard, in as many formats as the receiver supports.

44.13.15 delete

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method deletes the selected text.

44.13.16 isRulerVisible as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver's enclosing scroll view shows its ruler.

44.13.17 maxSizeHeight as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's maximum height.

44.13.18 maxSizeWidth as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's maximum width.

44.13.19 minSizeHeight as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's minimum height.

44.13.20 minSizeWidth as Double

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's maximum width.

44.13.21 NSCenterTextAlignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: One of the text alignment constants for the alignment property.
Notes: Visually centered

44.13.22 NSRightTextAlignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: One of the text alignment constants for the alignment property.
Notes: Visually right aligned

44.13.23 paste

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method pastes text from the general pasteboard at the insertion point or over the selection.

44.13.24 pasteFont

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method pastes font information from the font pasteboard onto the selected text or insertion point of a rich text object, or over all text of a plain text object.

44.13.25 pasteRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method pastes paragraph style information from the ruler pasteboard onto the selected paragraphs of a rich text object.

44.13.26 readRTFDFromFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Attempts to read the RTFD file, returning true if successful and false if not.
Notes: file should be the path for an .rtf file or an .rtfd file wrapper, not for the RTF file within an .rtfd file wrapper.

44.13.27 replaceCharactersInRangeWithRTF(start as Integer, length as Integer, rtfData as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Replaces the characters in the given range with RTF text interpreted from the given RTF data.
Notes: This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

44.13.28 replaceCharactersInRangeWithRTFD(start as Integer, length as Integer, rtfdData as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Replaces the characters in the given range with RTFD text interpreted from the given RTFD data.
Notes: This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

This method is designed for transferring text from out-of-process sources such as the pasteboard. In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

44.13.29 replaceCharactersInRangeWithString(start as Integer, length as Integer, text as string)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Replaces the characters in the given range with those in the given string.
Notes: For a rich text object, the text is assigned the formatting attributes of the first character of the text it replaces, or of the character immediately before aRange if the range's length is 0. If the range's location is 0, the formatting attributes of the first character in the receiver are used.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

In most cases, programmatic modification of the text is best done by operating on the text storage directly, using the general methods of NSMutableAttributedString.

44.13.30 RTFDFromRange(start as Integer, length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a string that contains an RTFD stream corresponding to the characters and attributes within aRange.
Notes: Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

When writing data to the pasteboard, you can use the memoryblock object as the first argument to NSPasteboard's setDataForType method, with a second argument of NSRTFDPboardType.

44.13.31 RTFFromRange(start as Integer, length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: eturns a string object that contains an RTF stream corresponding to the characters and attributes within aRange, omitting any attachment characters and attributes.
Notes: Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters.

When writing data to the pasteboard, you can use the memoryblock as the first argument to NSPasteboard's setDataForType method, with a second argument of NSRTFPboardType.

44.13.32 scrollRangeToVisible(start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver in its enclosing scroll view so the first characters of aRange are visible.

44.13.33 selectAll

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method selects all of the receiver's text.

44.13.34 setFontForRange(font as NSFontMBS, start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Sets the font of characters within the given range to font.
Notes: This method applies only to a rich text object.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRanges to include this method in an undoable action.

44.13.35 setMaxSize(width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver's maximum size.

44.13.36 setMinSize(width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver's minimum size.

44.13.37 setTextColorForRange(colorValue as NSColorMBS, start as Integer, length as Integer)

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Sets the text color of characters within the given range to colorValue.
Notes: Removes the text color attribute if colorValue is nil. This method applies only to rich text objects.

This method does not include undo support by default. Clients must invoke shouldChangeTextInRange to include this method in an undoable action.

44.13.38 showGuessPanel

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: This action method opens the Spelling panel, allowing the user to make a correction during spell checking.

44.13.39 sizeToFit

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Resizes the receiver to fit its text.
Notes: The text view will not be sized any smaller than its minimum size, however.

44.13.40 subscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method applies a subscript attribute to selected text (or all text if the receiver is a plain text object), lowering its baseline offset by a predefined amount.

44.13.41 superscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method applies a superscript attribute to selected text (or all text if the receiver is a plain text object), raising its baseline offset by a predefined amount.

44.13.42 textLength as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the length of the text in unicode chars.

44.13.43 toggleRuler

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method shows or hides the ruler, if the receiver is enclosed in a scroll view.

44.13.44 underline

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Adds the underline attribute to the selected text attributes if absent; removes the attribute if present.
Notes: If there is a selection and the first character of the selected range has any form of underline on it, or if there is no selection and the typing attributes have any form of underline, then underline is removed; otherwise a single simple underline is added.

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

44.13.45 unscript

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method removes any superscripting or subscripting from selected text (or all text if the receiver is a plain text object).

44.13.46 writeRTFDToFile(file as folderitem, atomically as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Writes the receiver's text as RTF with attachments to a file or directory at file.
Notes: Returns true on success and false on failure. If atomically is true, attempts to write the file safely so that an existing file at path is not overwritten, nor does a new file at path actually get created, unless the write is successful.

44.13.47 Properties

44.13.48 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The text alignment.
Notes: (Read and Write computed property)

44.13.49 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: (Read and Write computed property)

44.13.50 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The initial writing direction used to determine the actual writing direction for text.
Notes: The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly. If no writing direction is set, returns NSWritingDirectionNatural.

Available in Mac OS X v10.4 and later.
(Read and Write computed property)

44.13.51 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the scrollview draws its background.
Notes: (Read and Write computed property)

44.13.52 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Enables/disables the control.
Notes: If enabled, text is in default text color.
if disabled, you can't edit or select and the text color is gray.
(Read and Write computed property)

44.13.53 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The font of the first character in the receiver's text, or of the insertion point if there's no text.
Notes: (Read and Write computed property)

44.13.54 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows the user to import files by dragging.
Notes: (Read and Write computed property)

44.13.55 isEditable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows the user to edit text, false if it doesn't.
Notes: You can change the receiver's text programmatically regardless of this setting.

If the receiver is editable, it's also selectable.
(Read and Write computed property)

44.13.56 isFieldEditor as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder.
Notes: True if the receiver interprets Tab, Shift-Tab, and Return (Enter) as cues to end editing and possibly to change the first responder; false if it accepts them as text input.

See the NSWindow class specification for more information on field editors. By default, NSText objects don't behave as field editors.
(Read and Write computed property)

44.13.57 isHorizontallyResizable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the receiver automatically changes its width to accommodate the width of its text, false if it doesn't.
Notes: By default, an NSText object is not horizontally resizable.
(Read and Write computed property)

44.13.58 isRichText as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the NSText allows the user to apply attributes to specific ranges of the text.
Notes: (Read and Write computed property)

44.13.59 isSelectable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the text allows the user to select text, false if it doesn't.
Notes: (Read and Write computed property)

44.13.60 isVerticallyResizable as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the receiver automatically changes its height to accommodate the height of its text, false if it doesn't.
Notes: By default, an NSText object is vertically resizable.
(Read and Write computed property)

44.13.61 selectedRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The range of selected characters.
Example:

```
Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
Var s as NSTextStorageMBS = t.textStorage

const NSUnderlineStyleSingle = 1

Var r as NSRangeMBS = t.selectedRange
s.addAttribute NSAttributedStringMBS.NSStrikethroughStyleAttributeName, NSUnderlineStyleSingle, r
```

Notes: (Read and Write computed property)

44.13.62 text as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The characters of the text.
Notes: For performance reasons, this method returns the current backing store of the text object. If you want to maintain a snapshot of this as you manipulate the text storage, you should make a copy of the appropriate substring.
(Read and Write computed property)

44.13.63 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The text color.
Notes: (Read and Write computed property)

44.13.64 usesFontPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver uses the Font panel.
Notes: (Read and Write computed property)

44.13.65 Events

44.13.66 textDidBeginEditing

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Informs you that the text object has begun editing (that the user has begun changing it).

44.13.67 textDidChange

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Informs you that the text object has changed its characters or formatting attributes.

44.13.68 textDidEndEditing

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Informs you that the text object has finished editing (that it has resigned first responder status).

44.13.69 textShouldBeginEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Invoked when a text object begins to change its text, this method requests permission to begin editing.
Notes: If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

44.13.70 textShouldEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

44.13.71 Constants

Constants

Constant	Value	Description
NSBackspaceCharacter	8	One of the constants to specify commonly used Unicode characters.
NSBackTabCharacter	&h19	One of the constants to specify commonly used Unicode characters.
NSBacktabTextMovement	&h12	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The Backtab (Shift-Tab) key was pressed.
NSCancelTextMovement	&h17	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The user cancelled the completion. Available in Mac OS X v10.3 and later.
NSCarriageReturnCharacter	13	One of the constants to specify commonly used Unicode characters.
NSDeleteCharacter	&h7F	One of the constants to specify commonly used Unicode characters.
NSDownTextMovement	&h16	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The down arrow key was pressed.
NSEnterCharacter	3	One of the constants to specify commonly used Unicode characters.
NSFormFeedCharacter	12	One of the constants to specify commonly used Unicode characters.
NSIllegalTextMovement	0	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" Currently unused.
NSLeftTextMovement	&h13	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The left arrow key was pressed.
NSLineSeparatorCharacter	&h2028	One of the constants to specify commonly used Unicode characters.
NSNewlineCharacter	10	One of the constants to specify commonly used Unicode characters.
NSOtherTextMovement	0	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The user performed some undefined action. Available in Mac OS X v10.3 and later.
NSParagraphSeparatorCharacter	&h2029	One of the constants to specify commonly used Unicode characters.
NSReturnTextMovement	&h10	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The Return key was pressed.
NSRightTextMovement	&h14	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The right arrow key was pressed.
NSTabCharacter	9	One of the constants to specify commonly used Unicode characters.
NSTabTextMovement	&h11	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The Tab key was pressed.
NSTextWritingDirectionEmbedding	0	An additional constant to specify the writing direction. Direction is embedded. Available in Mac OS X v10.6 and later.
NSTextWritingDirectionOverride	1	An additional constant to specify the writing direction. Direction override Available in Mac OS X v10.6 and later.
NSUpTextMovement	&h15	One of the constants used to specify the reason for a change of editing among text fields, in essence answering the question "why am I leavin field?" The up arrow key was pressed.

Alignment Modes

Constant	Value	Description
NSJustifiedTextAlignment	3	Fully-justified. The last line in a paragraph is natural-aligned.
NSLeftTextAlignment	0	Visually left aligned
NSNaturalTextAlignment	4	Indicates the default alignment for script.

Writing Direction

Constant	Value	Description
NSWritingDirectionLeftToRight	0	The writing direction is left to right. Available in Mac OS X v10.2 and later.
NSWritingDirectionNatural	-1	The writing direction is determined using the Unicode Bidi Algorithm rules P2 and P3. Default. Available in Mac OS X v10.4 and later.
NSWritingDirectionRightToLeft	1	The writing direction is right to left. Available in Mac OS X v10.2 and later.

44.14 class NSTextStorageMBS

44.14.1 class NSTextStorageMBS

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: The class for the text storage of a text view.
Notes: NSTextStorage is a semiconcrete subclass of NSMutableAttributedString that manages a set of client NSLayoutManager objects, notifying them of any changes to its characters or attributes so that they can relay and redisplay the text as needed. NSTextStorage defines the fundamental storage mechanism of the Application Kit's extended text-handling system.

NSTextStorage also defines a set of methods, listed under "Getting and setting scriptable properties" in the Method Types section, useful for getting and setting scriptable properties of NSTextStorage objects. Unless you are dealing with scriptability, you do not normally need to invoke these methods directly. In particular, using the characters, words or paragraphs methods or their corresponding setter methods is an inefficient way to manipulate the text storage, since these methods create and return many objects. Instead, use the text access methods defined by NSMutableAttributedString, NSAttributedString, NSMutableString, and NSString to perform character-level manipulation.
Subclass of the NSMutableAttributedStringMBS class.

44.14.2 Methods

44.14.3 addLayoutManager(l as NSLayoutManagerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Adds a layout manager to the receiver's set of layout managers.
Notes: l: The layout manager to add.

44.14.4 changeInLength as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the difference between the current length of the edited range and its length before editing began.
Notes: Returns the difference between the current length of the edited range and its length before editing began. That is, before the receiver was sent the first beginEditing message or a single edited:range:changeInLength: message.

This difference is accumulated with each invocation of edited:range:changeInLength:, until a final message processes the changes.

The receiver's delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

44.14.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The constructor to create a new empty text storage object.

44.14.6 editedMask as Integer

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the kinds of edits pending for the receiver.
Notes: Returns a mask describing the kinds of edits pending for the receiver.

44.14.7 editedRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: eturns the range of the receiver to which pending changes have been made, whether of characters or of attributes.
Notes: The receiver's delegate and layout managers can use this information to determine the nature of edits in their respective notification methods.

44.14.8 ensureAttributesAreFixedInRange(Range as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Ensures that attributes are fixed in the given range.
Notes: range: The range of characters whose attributes might be examined.

An NSTextStorage object using lazy attribute fixing is required to call this method before accessing any attributes within range. This method gives attribute fixing a chance to occur if necessary. NSTextStorage subclasses wishing to support laziness must call this method from all attribute accessors they implement.

44.14.9 fixesAttributesLazily as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver fixes attributes lazily.
Notes: By default, custom NSTextStorage subclasses are not lazy, but the provided concrete subclass is lazy by default.

44.14.10 invalidateAttributesInRange(Range as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Invalidates attributes in the specified range.
Notes: range: The range of characters whose attributes should be invalidated.

Called from processEditing to invalidate attributes when the text storage changes. If the receiver is not lazy, this method simply calls fixAttributesInRange. If lazy attribute fixing is in effect, this method instead records the range needing fixing.

44.14.11 processEditing

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Cleans up changes made to the receiver and notifies its delegate and layout managers of changes.

44.14.12 removeLayoutManager(l as NSLayoutManagerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Removes a layout manager from the receiver's set of layout managers.
Notes: l: The layout manager to remove.

44.14.13 Constants

Constants

Constant	Value	Description
NSTextStorageEditedAttributes	1	The constants for text messages. Attributes were added, removed, or changed.
NSTextStorageEditedCharacters	2	The constants for text messages. Characters were added, removed, or replaced.

44.15 class NSTextTableBlockMBS

44.15.1 class NSTextTableBlockMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A text block that appears as a cell in a text table.
Notes: Subclass of the NSTextBlockMBS class.

44.15.2 Methods

44.15.3 Constructor

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 44.15.4 Constructor(table as NSTextTableMBS, startingRow as Integer, rowSpan as Integer, startingColumn as Integer, colSpan as Integer) 8472

44.15.4 Constructor(table as NSTextTableMBS, startingRow as Integer, rowSpan as Integer, startingColumn as Integer, colSpan as Integer)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Returns an initialized text table block.

table: The text table containing this text table block.
startingRow: The table row at which the text table block starts.
rowSpan: How many rows the text table block covers.
startingColumn: The table column at which the text table block starts.
colSpan: How many columns the text table block covers.

44.15.5 Properties

44.15.6 columnSpan as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of table columns spanned by this text table block.
Notes: (Read only property)

44.15.7 rowSpan as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of table rows spanned by this text table block.
Notes: (Read only property)

44.15.8 startingColumn as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The table column at which this text table block starts.
Notes: (Read only property)

44.15.9 startingRow as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The table row at which this text table block starts.
Notes: (Read only property)

44.15.10 table as NSTextTableMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the table containing this text table block.
Notes: (Read only property)

44.16 class NSTextTableMBS

44.16.1 class NSTextTableMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An object that represents a text table as a whole.
Notes: A text table is responsible for laying out and drawing the text table blocks it contains, and it maintains the basic parameters of the table.
Subclass of the NSTextBlockMBS class.

44.16.2 Methods

44.16.3 Constructor

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

44.16.4 Properties

44.16.5 collapsesBorders as Boolean

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value indicating whether the text table borders are collapsible.
Notes: The value of this property is true when the text table borders are collapsible.
(Read and Write property)

44.16.6 hidesEmptyCells as Boolean

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value indicating whether the text table hides empty cells.
Notes: The value of this property is true when the text table hides empty cells. If empty cells are hidden, locations with empty cells allow the background of the enclosing block or text container to show through.

(Read and Write property)

44.16.7 layoutAlgorithm as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The text table layout algorithm.
Notes: (Read and Write property)

44.16.8 numberOfColumns as Integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of columns in the text table.
Notes: (Read and Write property)

44.16.9 Constants

Text table layout algorithm

Constant	Value	Description
LayoutAlgorithmAutomatic	0	Specifies automatic layout algorithm
LayoutAlgorithmFixed	1	Specifies fixed layout algorithm

44.17 class NSTextTabMBS

44.17.1 class NSTextTabMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: An NSTextTab object represents a tab in an NSParagraphStyle object, storing an alignment type and location.
Notes: NSTextTab objects are most frequently used with the Application Kit's text system and with NSRulerView and NSRulerMarker objects. See the appropriate class specifications for more information on these uses.

The text system supports four alignment types: left, center, right, and decimal (based on the decimal separator character of the locale in effect). These alignment types are absolute, not based on the line sweep direction of text. For example, tabbed text is always positioned to the left of a right-aligned tab, whether the line sweep direction is left to right or right to left. A tab's location, on the other hand, is relative to the back margin. A tab set at 1.5", for example, is at 1.5" from the right in right to left text.

44.17.2 Methods

44.17.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The default constructor.
See also:

- 44.17.4 Constructor(alignment as Integer, location as Double, options as dictionary) 8476
- 44.17.5 Constructor(type as Integer, location as Double) 8477

44.17.4 Constructor(alignment as Integer, location as Double, options as dictionary)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Initializes a text tab with the text alignment, location, and options.
Notes: The text alignment is used to determine the position of text inside the tab column. See NSTextTabType for a mapping between alignments and tab stop types.
See also:

- 44.17.3 Constructor 8476

• 44.17.5 Constructor(type as Integer, location as Double) 8477

44.17.5 Constructor(type as Integer, location as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Initializes a newly allocated NSTextTab with an alignment of type at location on the paragraph.
Notes: The location is relative to the back margin, based on the line sweep direction of the paragraph. type can be any of the values described in NSTextTabType.
See also:

• 44.17.3 Constructor 8476

• 44.17.4 Constructor(alignment as Integer, location as Double, options as dictionary) 8476

44.17.6 copy as NSTextTabMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a copy of the text tab.

44.17.7 Properties

44.17.8 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the text alignment of the receiver.
Notes: (Read only property)

44.17.9 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

44.17.10 location as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the receiver's ruler location relative to the back margin.
Notes: (Read only property)

44.17.11 options as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the dictionary of attributes associated with the receiver.
Notes: (Read only property)

44.17.12 tabStopType as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Returns the receiver's tab stop type.
Notes: (Read only property)

44.17.13 Constants

Tab Stop Types

Constant	Value	Description
NSCenterTabStopType	2	A center-aligned tab stop.
NSDecimalTabStopType	3	Aligns columns of numbers by the decimal point.
NSLeftTabStopType	0	A left-aligned tab stop.
NSRightTabStopType	1	A right-aligned tab stop.

44.18 class NSUndoManagerMBS

44.18.1 class NSUndoManagerMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: NSUndoManager is a general-purpose recorder of operations for undo and redo.
Notes: You register an undo operation by specifying the object that's changing (or the owner of that object), along with a method to invoke to revert its state, and the arguments for that method. When performing undo an NSUndoManager saves the operations reverted so that you can redo the undos. If used in a Cocoa Application Kit-based application, NSUndoManager groups all operations within a single cycle of the run loop, so that performing an undo reverts all changes that occurred during the cycle.

NSUndoManager is implemented as a class of the Foundation framework because executables other than applications might want to revert changes to their states. For example, you might have an interactive command-line tool with undo and redo commands, or there could be distributed object implementations that can revert operations "over the wire." However, users typically see undo and redo as application features. The Application Kit implements undo and redo in its NSTextView object and makes it easy to implement it in objects along the responder chain.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

44.18.2 Methods

44.18.3 beginUndoGrouping

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Marks the beginning of an undo group.
Notes: All individual undo operations before a subsequent endUndoGrouping message are grouped together and reversed by a later undo message. By default undo groups are begun automatically at the start of the event loop, but you can begin your own undo groups with this method, and nest them within other groups.

44.18.4 canRedo as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver has any actions to redo.

44.18.5 canUndo as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver has any actions to undo.
Notes: The return value does not mean you can safely invoke undo or undoNestedGroup—you may have to close open undo groups first.

44.18.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

44.18.7 disableUndoRegistration

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Disables the recording of undo operations.
Notes: This method can be invoked multiple times by multiple clients. The enableUndoRegistration method must be invoked an equal number of times to re-enable undo registration.

44.18.8 enableUndoRegistration

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Enables the recording of undo operations.
Notes: Because undo registration is enabled by default, it is often used to balance a prior disableUndoRegistration message. Undo registration isn't actually re-enabled until an enable message balances the last disable message in effect. Raises an NSInternalInconsistencyException if invoked while no disableUndoRegistration message is in effect.

44.18.9 endUndoGrouping

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Marks the end of an undo group.
Notes: All individual undo operations back to the matching beginUndoGrouping message are grouped together and reversed by a later undo or undoNestedGroup message. Undo groups can be nested, thus providing functionality similar to nested transactions. Raises an NSInternalInconsistencyException if there's no beginUndoGrouping message in effect.

44.18.10 groupingLevel as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the number of nested undo groups (or redo groups, if Redo was invoked last) in the current event loop.
Notes: An integer indicating the number of nested groups. If 0 is returned, there is no open undo or redo group.

44.18.11 isRedoing as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver is in the process of performing its redo method.
Notes: True if the method is being performed, otherwise false.

44.18.12 isUndoing as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver is in the process of performing its undo or undoNestedGroup method.
Notes: True if the method is being performed, otherwise false.

44.18.13 isUndoRegistrationEnabled as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the recording of undo operations is enabled.
Notes: True if registration is enabled; otherwise, false.
Undo registration is enabled by default.

44.18.14 redo

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Performs the operations in the last group on the redo stack, if there are any, recording them on the undo stack as a single group.
Notes: Raises an NSInternalInconsistencyException if the method is invoked during an undo operation.

44.18.15 redoActionName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the name identifying the redo action.
Notes: The redo action name. Returns an empty string if no action name has been assigned or if there is nothing to redo.

For example, if the menu title is "Redo Delete," the string returned is "Delete."

44.18.16 redoMenuItemTitle as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the complete title of the Redo menu command, for example, "Redo Paste."
Notes: Returns "Redo" if no action name has been assigned or an empty string if there is nothing to redo.

44.18.17 redoMenuTitleForUndoActionName(actionName as string) as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the complete, localized title of the Redo menu command for the action identified by the given name.
Notes: Override this method if you want to customize the localization behavior. This method is invoked by redoMenuItemTitle.

Available in Mac OS X v10.0 and later.

44.18.18 removeAllActions

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Clears the undo and redo stacks and re-enables the receiver.

44.18.19 setActionName(actionName as string)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the name of the action associated with the Undo or Redo command.
Notes: If actionName is an empty string, the action name currently associated with the menu command is

removed. There is no effect if actionName is "".

44.18.20 undo

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Closes the top-level undo group if necessary and invokes undoNestedGroup.
Notes: This method also invokes endUndoGrouping if the nesting level is 1. Raises an NSInternalInconsistencyException if more than one undo group is open (that is, if the last group isn't at the top level).

44.18.21 undoActionName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the name identifying the undo action.
Notes: The undo action name. Returns an empty string if no action name has been assigned or if there is nothing to undo.

For example, if the menu title is "Undo Delete," the string returned is "Delete."

44.18.22 undoMenuItemTitle as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the complete title of the Undo menu command, for example, "Undo Paste."
Notes: Returns "Undo" if no action name has been assigned or "" if there is nothing to undo.

44.18.23 undoMenuTitleForUndoActionName(actionName as string) as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the complete, localized title of the Undo menu command for the action identified by the given name.
Notes: Override this method if you want to customize the localization behavior. This method is invoked by undoMenuItemTitle.

44.18.24 undoNestedGroup

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Performs the undo operations in the last undo group (whether top-level or nested), recording the operations on the redo stack as a single group.
Notes: Raises an NSInternalInconsistencyException if any undo operations have been registered since the last enableUndoRegistration message.

44.18.25 Properties

44.18.26 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The internal uses reference to the NSUndoManager object.
Notes: (Read and Write property)

44.18.27 groupsByEvent as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver automatically creates undo groups around each pass of the run loop.
Notes: True if the receiver automatically creates undo groups around each pass of the run loop, otherwise false.
(Read and Write computed property)

44.18.28 levelsOfUndo as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the maximum number of top-level undo groups the receiver holds.
Notes: An integer specifying the number of undo groups. A limit of 0 indicates no limit, so old undo groups are never dropped.

When ending an undo group results in the number of groups exceeding this limit, the oldest groups are dropped from the stack. The default is 0.
(Read and Write computed property)

Chapter 45

Cocoa Threading

45.1 class NSOperationMBS

45.1.1 class NSOperationMBS

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to do operations in Cocoa.
Notes: Requires Mac OS X 10.5.

The NSOperation class manages the execution of a single encapsulated task. Operations are typically scheduled by adding them to an operation queue object (an instance of the NSOperationQueue class), although you can also execute them directly by explicitly invoking their start method.

Operation objects are single-shot objects, that is, they perform their task once. You cannot reuse the same NSOperation object to perform a task (or a slight variant of the task) multiple times in succession. Attempting to execute an operation that has already finished results in an exception.

When manually executing operations, you are responsible for making sure the object is ready to execute. Starting an operation that is not in the ready state generally results in an exception being thrown. If you use an operation queue to manage the execution, the NSOperationQueue object ensures that the operation is executed only when it is ready.

45.1.2 Methods

45.1.3 addDependency(op as NSOperationMBS)

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Makes the receiver dependent on the completion of the specified operation.
Notes: op: The operation on which the operation is dependent. The same dependency should not be added more than once to the operation, and the results of doing so are undefined.

The dependent is not considered ready to execute until all of its dependent operations finish executing. If the receiver is already executing its task, adding dependencies is unlikely to have any practical effect. This method may change the isReady and dependencies properties of the dependent.

It is a programmer error to create any circular dependencies among a set of operations. Doing so can cause a deadlock among the operations and may freeze your program.

Please setup dependencies before you add the operation to a queue. Once the operation is in the queue it may be executed directly.

45.1.4 cancel

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Advises the operation object that it should stop executing its task.
Notes: This method does not force your operation code to stop. The code for your operation must invoke the isCancelled method periodically to determine whether the operation should be stopped. Once cancelled, an operation cannot be restarted.

If the operation is already finished executing, this method has no effect. Canceling an operation that is currently in an operation queue, but not yet executing, causes it to be removed from the queue (although not necessarily right away).

45.1.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
See also:

- 45.1.6 Constructor(Handle as Integer)

45.1.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: You can pass in handle to NSOperation object.
See also:

- 45.1.5 Constructor 8486

45.1.7 dependencies as NSOperationMBS()

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: the operations on which the operation is dependent.
Notes: The receiver is not considered ready to execute until all of its dependent operations finish executing.

45.1.8 dependenciesCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of the dependencies.

45.1.9 dependency(index as Integer) as NSOperationMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the dependency at the given index.
Notes: The receiver is not considered ready to execute until all of its dependent operations finish executing.

Operations are not removed from this dependency list as they finish executing. You can therefore use this list to track all dependent operations, including those that have already finished executing. The only way to remove an operation from this list is to use the removeDependency method.

Available in Mac OS X v10.5 and later.

45.1.10 isCancelled as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the operation has been cancelled.
Notes: True if the operation was explicitly cancelled by an invocation of the operation's cancel method;

otherwise, false. This method may return true even if the operation is currently executing.

Discussion
Canceling an operation does not actively stop the operation's code from executing. An operation object is responsible for calling this method periodically and stopping itself if the method returns true.

45.1.11 isConcurrent as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the operation runs asynchronously.
Notes: True if the operation is asynchronous; otherwise, false if the operation runs synchronously on whatever thread started it. This method returns false by default.

45.1.12 isExecuting as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the operation is currently executing.
Notes: True if the operation is executing; otherwise, false if the operation has not been started or is already finished.

45.1.13 isFinished as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value indicating whether the operation is done executing.
Notes: True if the operation is no longer executing; otherwise, false.

45.1.14 isReady as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the operation can be performed now.
Notes: True if the operation can be performed now; otherwise, false.

Operations may not be ready due to dependencies on other operations or because of external conditions that might prevent needed data from being ready. The NSOperation class manages dependencies on other operations and reports the readiness of the receiver based on those dependencies.

Note: If the operation is cancelled before it starts, operations that are dependent on the completion of the receiver will never become ready.

45.1.15 Lock

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Locks the semaphore.
Example:

```
Var o as NSOperationMBS // your operation
Var myarray(-1) as window

o.lock
myarray.append window1
o.unlock
```

Notes: You need to pair all calls to Xojo runtime into lock and unlock to make sure you don't crash. Xojo is not reentrant safe, so you need to lock.

Be aware that locking costs performance. You should do locks often, so in the time between two locks another thread can get a lock. Also you should group locks nearby so you don't waste too much time waiting for the lock. Finally you need your main application thread to run nice so it doesn't lock too much, too.

45.1.16 main

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs the operation's non-concurrent task.
Notes: This will just call to the work event.

45.1.17 removeDependency(op as NSOperationMBS)

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the operation's dependence on the specified operation.
Notes: This method may change the isReady and dependencies properties of the operation.

45.1.18 start

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Begins the execution of the operation.
Notes: The default implementation of this method configures the execution environment for a non-concurrent operation and invokes the operation's main method. As part of the default configuration, this method performs several checks to ensure that the non-concurrent operation can actually run and generates appropriate KVO notifications for each change in the operation's state. If the operation's operation has already been performed, was cancelled, or is not yet ready to run, this method throws an NSInvalidArgumentException exception. If the operation is to be performed on a separate thread, this method may return before the operation itself completes on the other thread.

45.1.19 Unlock

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unlocks the semaphore.
Example:

```
Var o as NSOperationMBS // your operation
Var myarray(-1) as window

o.lock
myarray.append window1
o.unlock
```

Notes: You need to pair all calls to Xojo runtime into lock and unlock to make sure you don't crash. Xojo is not reentrant safe, so you need to lock.

Be aware that locking costs performance. You should do locks often, so in the time between two locks another thread can get a lock. Also you should group locks nearby so you don't waste too much time waiting for the lock. Finally you need your main application thread to run nice so it doesn't lock too much, too.

45.1.20 waitUntilFinished

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Spend time waiting for the operation to finish.

45.1.21 Properties

45.1.22 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle to the internal used NSOperation reference.
Notes: (Read and Write property)

45.1.23 queuePriority as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The priority of the operation in an operation queue.
Notes: The relative priority of the operation. The returned value always corresponds to one of the predefined constants. If no priority is explicitly set, this method returns NSOperationQueuePriorityNormal.

You should use priority values only as needed to classify the relative priority of non-dependent operations. Priority values should not be used to implement dependency management among different operation objects. If you need to establish dependencies between operations, use the addDependency method instead.

If you attempt to specify a priority value that does not match one of the defined constants, this method automatically adjusts the value you specify towards the NSOperationQueuePriorityNormal priority, stopping at the first valid constant value. For example, if you specified the value -10, this method would adjust that value to match the NSOperationQueuePriorityVeryLow constant. Similarly, if you specified +10, this method would adjust the value to match the NSOperationQueuePriorityVeryHigh constant.
(Read and Write computed property)

45.1.24 threadPriority as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The thread priority to use when executing the operation.
Notes: A floating-point number in the range 0.0 to 1.0, where 1.0 is the highest priority. The default thread priority is 0.5.

Available in Mac OS X v10.6 and later.
(Read and Write computed property)

45.1.25 Events

45.1.26 Close

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called just before the operation object is destroyed.

45.1.27 Finished

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called after work has finished.
Notes: This event is called asynchronously on the main thread, so you can do GUI stuff here to show the result.
Not called if object is released earlier.

45.1.28 Open

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when the object is created.
Notes: Called on the main thread.

45.1.29 Work

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called for an operation to do the work.
Notes: You should test isCancelled regularly to see whether operation was cancelled.

Please read on the ThreadMBS.Work event for more details.
(NSOperationMBS is a Mac OS X feature, but the ThreadMBS class, does nearly the same on all platforms)

45.1.30 Constants

Constants

Constant	Value	Description
NSOperationQueuePriorityHigh	4	One of the constants for the priority property. Operations receive high priority for execution.
NSOperationQueuePriorityLow	-4	One of the constants for the priority property. Operations receive low priority for execution.
NSOperationQueuePriorityNormal	0	One of the constants for the priority property. Operations receive the normal priority for execution.
NSOperationQueuePriorityVeryHigh	8	One of the constants for the priority property. Operations receive very high priority for execution.
NSOperationQueuePriorityVeryLow	-8	One of the constants for the priority property. Operations receive very low priority for execution.

45.2 class NSOperationQueueMBS

45.2.1 class NSOperationQueueMBS

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queues NSOperations for later execution.
Notes: Available in Mac OS X v10.5 and later.

The NSOperationQueue class manages a set of NSOperation objects in a priority queue and regulates their execution. Operations remain in the queue until they are explicitly cancelled or finish executing. An application may create multiple operation queues, with each queue running up to its designated maximum number of operations.

A specific NSOperation object can be in only one operation queue at a time. Operations within a single queue coordinate their execution order using both priority levels and inter-operation object dependencies. Operation objects in different queues can coordinate their execution order using dependencies, which are not queue-specific.

Inter-operation dependencies provide an absolute execution order for operations. An operation object is not considered ready to execute until all of its dependent operations have finished executing. For operations that are ready to execute, the operation queue always executes the one with the highest priority relative to the other ready operations. For details on how to set priority levels and dependencies, see NSOperation Class Reference.

You should never manually start an operation while it is sitting in an operation queue. Once added, an operation stays in its queue until it finishes executing or is cancelled.

45.2.2 Methods

45.2.3 addOperation(op as NSOperationMBS)

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds the specified operation object to the operation queue.
Notes: An operation object can be in at most one operation queue at a time and cannot be added if it is currently executing or finished. This method throws an NSInvalidArgumentException exception if any of these conditions is true.

Once added, the specified operation remains in the queue until it is executed or cancelled.

Please setup dependencies before you add the operation to a queue. Once the operation is in the queue it

may be executed directly.

45.2.4 addOperations(ops() as NSOperationMBS, wait as boolean)

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds the specified array of operations to the queue.
Notes: ops: The array of NSOperation objects that you want to add to the receiver.
wait: If true, the current thread is blocked until all of the specified operations finish executing. If false, the operations are added to the queue and control returns immediately to the caller.

An operation object can be in at most one operation queue at a time and cannot be added if it is currently executing or finished. This method throws an NSInvalidArgumentException exception if any of those error conditions are true for any of the operations in the ops parameter.

Once added, the specified operation remains in the queue until it its isFinished method returns true.

Available in Mac OS X v10.6 and later.

45.2.5 areAllOperationsFinished as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether all operations have been finished.
Notes: True if all operations have finished.

45.2.6 cancelAllOperations

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels all queued and executing operations.
Notes: This method sends a cancel message to all operations currently in the queue or executing. Queued operations are cancelled before they begin executing. If an operation is already executing, it is up to that operation to recognize the cancellation and stop what it is doing.

45.2.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor creating a new operation queue.
Notes: On success the handle property is not 0.

45.2.8 currentQueue as NSOperationQueueMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the operation queue that launched the current operation.
Notes: Returns the operation queue that started the operation or nil if the queue could not be determined.

You can use this method from within a running operation object to get a reference to the operation queue that started it. Calling this method from outside the context of a running operation typically results in nil being returned.

Available in Mac OS X v10.6 and later.

45.2.9 isOneOperationExecuting as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether at least one operation is still executing.
Notes: True if one of the operations is executing.
False if no operation is executing.

45.2.10 mainQueue as NSOperationQueueMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the operation queue associated with the main thread.
Notes: The returned queue executes operations serially on the main thread. The main thread's run loop controls the execution times of these operations.
Available in Mac OS X v10.6 and later.

45.2.11 operation(index as UInt32) as NSOperationMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a noperations currently in the queue at the given index.
Notes: You can use this method to access the operations queued at any given moment. Operations remain queued until they finish their task. Therefore, the returned array may contain operations that are either

executing or waiting to be executed.

Available in Mac OS X v10.5 and later.

45.2.12 operationCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of operations currently in the queue.
Notes: The value returned by this method reflects the instantaneous number of objects in the queue and changes as operations are completed. As a result, by the time you use the returned value, the actual number of operations may be different. You should therefore use this value only for approximate guidance and should not rely on it for object enumerations or other precise calculations.

Available in Mac OS X v10.6 and later.

45.2.13 operations as NSOperationMBS()

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The operations currently in the queue.

45.2.14 waitUntilAllOperationsAreFinished

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Blocks the current thread until all of the receiver's queued and executing operations finish executing.
Notes: When called, this method blocks the current thread and waits for the receiver's current and pending operations to finish executing. While the thread is blocked, the receiver continues to launch already queued operations and monitor those that are executing. During this time, the current thread cannot add operations to the queue, but other threads may. Once all of the pending operations are finished, this method returns.

45.2.15 Properties

45.2.16 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle to the internal used NSOperationQueue reference.
Notes: (Read and Write property)

45.2.17 isSuspended as boolean

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value indicating whether the receiver is scheduling queued operations for execution.
Notes: True if operations are being scheduled for execution; otherwise, false.
(Read and Write computed property)

45.2.18 maxConcurrentOperationCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The maximum number of concurrent operations that the queue can execute.
Notes: (Read and Write computed property)

45.2.19 name as string

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of this queue.
Notes: The default value of this string is "NSOperationQueue <id>", where <id>is the memory address of the operation queue. If you want to know when a queue's name changes, configure a KVO observer to observe the name key path of the operation queue.
Available in Mac OS X v10.6 and later.
(Read and Write computed property)

45.2.20 Constants

Constants

Constant	Value	Description
NSOperationQueueDefaultMaxConcurrentOperationCount	-1	One of the constants to be used with the maxConcur erty. The default maximum number of operations is deter NSOperationQueue object based on current system

Chapter 46

Cocoa Toolbar

46.1 class CustomNSToolbarItemMBS

46.1.1 class CustomNSToolbarItemMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The class for a custom toolbar item.
Notes: Use this class if you need to fill events.
Subclass of the NSToolbarItemMBS class.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr5
- MBS Real Studio Plugins, version 11.3pr14
- MBS Real Studio Plugins, version 11.3pr4

46.1.2 Methods

46.1.3 Constructor(itemIdentifier as string)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.
Notes: itemIdentifier: The identifier for the receiver. itemIdentifier is never seen by users and should not be localized.

The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.

46.1.4 Destructor

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.

46.1.5 Events

46.1.6 Action

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The action event called when user clicks toolbar item.

46.1.7 allowsDuplicatesInToolbar as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.
Notes: You use this event to override the default behavior in a subclass.
By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move it to the new position.

If you leave this event empty (no code), you get the default behavior.

46.1.8 validate as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Validates a toolbar item.
Notes: If this event is implemented and returns false, NSToolbar will disable theItem; returning true causes theItem to be enabled.

NSToolbar only calls this method for image items.
validateis called very frequently, so it must be efficient.

If you don't have code in this event, the plugin will simply return enabled value.
This methods may not be called if you set Autovalidates to true.

46.2 class CustomNSToolbarMBS

46.2.1 class CustomNSToolbarMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The toolbar class for the case you need to use the events.
Notes: Subclass of the NSToolbarMBS class.

46.2.2 Methods

46.2.3 Constructor(Identifier as string)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.

46.2.4 Destructor

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.

46.2.5 Events

46.2.6 allowsSizeMode(mode as Integer, SuperAllows as boolean) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether to allow the given size mode.
Example:

```
Function allowsSizeMode(mode as Integer, SuperAllows as boolean) As boolean
#if DebugBuild then
```

```
System.DebugLog CurrentMethodName+" "+str(SuperAllows)
#endif

if mode = NSToolbarMBS.NSToolbarSizeModeSmall then
Return false
else
Return SuperAllows
end if

End Function
```

Notes: If you have nothing in the event, the default behavior is to allow all.
You can return false for a mode to disable it. e.g. NSToolbarSizeModeSmall
SuperAllows parameter tells you if mode is enabled by default.

46.2.7 canBeInsertedAtIndex(itemIdentifier as string, index as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Asks your class for a Boolean value that indicates whether the toolbar can place the item at the specified position.
Notes: itemIdentifier: The identifier of the toolbar item to insert at the specified index.
index: The proposed index at which to place the item. If the toolbar is removing the item, this value is NSNotFound.

Returns true to allow the toolbar to place the item at the specified location, or NO to prevent the toolbar from placing the item in that location.

Implement this method to control the placement of items in the toolbar. During a drag operation, the toolbar calls this method to determine if the specified index is an acceptable location for the item. Return a Boolean value that indicates whether the new posiition is acceptable.

Don,Äôt use the index parameter to determine the final location of the toolbar item. During a drag operation, the toolbar can call this method multiple times, so the index value can change later.

If not implemented, it returns true.

46.2.8 itemForItemIdentifier(identifier as string, willBeInsertedIntoToolbar as boolean) as NSToolbarItemMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Sent to request a new toolbar item; returns a toolbar item of the identified kind for the specified toolbar.
Notes: itemIdentifier: The identifier for the requested item.
willBeInsertedIntoToolbar: True if the item will be immediately inserted into the toolbar. If flag is false the toolbar item is being requested for display in the toolbar customization sheet and should always be enabled or provide some other canonical representation. If you ignore this parameter the same toolbar item will be used in the toolbar and in the customization sheet.
Return Value
The toolbar item for the specified toolbar and identifier. Return nil to indicate that the identified kind of toolbar item is not supported. When an item is requested again, you may return the same NSToolbarItem object returned earlier or a different instance.

Implement this method to create new toolbar item instances. This method is called lazily on behalf of a toolbar instance, which must be the sole owner of the toolbar item. A toolbar may ask again for a kind of toolbar item already supplied to it, in which case this method may return the same toolbar item it returned before or a different one. If your delegate services multiple toolbars, each attached to a different window, it is best to return a different item for each toolbar—an NSToolbarItem object can only be in one toolbar at a time.

If the item is a custom view item, the NSView object must be fully formed when the item is returned. Do not assume that the returned item is going to be added as an active item in the toolbar, as it could be that it will be used only in the customization palette. (The customization palette makes a copy of the returned item.)

This event must be implemented if the associated toolbar is created programatically.

46.2.9 toolbarAllowedItemIdentifiers as string()

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Sent to discover the allowed item identifiers for a toolbar.
Notes: An array of toolbar item identifiers for toolbar, specifying the contents and the order of the items in the configuration palette.

Every allowed item must be explicitly listed, even the standard ones. The identifiers returned should include all of those returned by toolbarDefaultItemIdentifiers:.

This event must be implemented if the associated toolbar is created programatically.

46.2.10 toolbarDefaultItemIdentifiers as string()

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Sent to discover the default item identifiers for a toolbar.

Notes: Return an array of toolbar item identifiers for toolbar, specifying the contents and the order of the items in the default toolbar configuration.

During initialization of toolbar, this method is called only if a toolbar configuration for the identifier of toolbar is not found in the user preferences. This method is called during initialization of the toolbar customization palette.

This event must be implemented if the associated toolbar is created programatically.

46.2.11 toolbarDidRemoveItem(item as NSToolbarItemMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Sent just after an item has been removed from a toolbar.
Notes: This method allows you to remove information related to the item that may have been cached.

46.2.12 toolbarImmovableItemIdentifiers as string()

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Asks your class to provide the items that people can,Äôt remove from the toolbar or rearrange during the customization process.
Notes: Returns the set of item identifiers that people can,Äôt remove from the toolbar or move to other locations in the toolbar. Return an empty set to let someone customize all toolbar items.

Implement this method in your delegate and return any items you don,Äôt want people to remove or rearrange. If you don,Äôt implement this method, the toolbar lets people rearrange and remove all toolbar items.

46.2.13 toolbarItemAction(item as NSToolbarItemMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The action event called when user clicks toolbar item.
Notes: Only for instances of CustomNSToolbarItemMBS, the plugin can forward the allowsDuplicatesInToolbar event to the CustomNSToolbarMBS, so you can handle it in a central place for all toolbar items.

46.2.14 toolbarItemAllowsDuplicatesInToolbar(item as NSToolbarItemMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.
Notes: You use this event to override the default behavior in a subclass.
By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move it to the new position.

If you leave this event empty (no code), you get the default behavior.

Only for instances of CustomNSToolbarItemMBS, the plugin can forward the allowsDuplicatesInToolbar event to the CustomNSToolbarMBS, so you can handle it in a central place for all toolbar items.

46.2.15 toolbarItemValidate(item as NSToolbarItemMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Validates a toolbar item.
Notes: If this event is implemented and returns false, NSToolbar will disable theItem; returning true causes theItem to be enabled.

NSToolbar only calls this method for image items.
validateis called very frequently, so it must be efficient.

If you don't have code in this event, the plugin will simply return enabled value.
This methods may not be called if you set Autovalidates to true.

Only for instances of CustomNSToolbarItemMBS, the plugin can forward the allowsDuplicatesInToolbar event to the CustomNSToolbarMBS, so you can handle it in a central place for all toolbar items.

46.2.16 toolbarSelectableItemIdentifiers as string()

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Sent to discover the selectable item identifiers for a toolbar.
Notes: Return an array of item identifiers that should indicate selection in the specified toolbar.

Toolbars that need to indicate item selection should return an array containing the identifiers of the se-

lectable toolbar items.

If implemented, toolbar will display the currently selected item with a visual highlight. Clicking on an item whose identifier is selectable will automatically update the toolbar's selected item identifier, when possible. Clicking an item whose identifier is not selectable will not update the toolbar's selected item identifier.

46.2.17 toolbarWillAddItem(item as NSToolbarItemMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Sent just before a new item is added to a toolbar.
Notes: If you need to cache a reference to a toolbar item or need to set up some initial state before a toolbar item is added, this is where to do it.

46.3 class NSMenuToolbarItemMBS

46.3.1 class NSMenuToolbarItemMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A control that presents a menu in a window,Äôs toolbar.
Notes: If you set an action on an NSMenuToolbarItem control item, the user invokes the action when clicking on the item through pressing and holding to display the menu. If you set an action on the item and showsIndicator to true, the system displays the indicator as a separate segment so the user can invoke the menu with a click on that segment.

If you don,Äôt set an action on the NSMenuToolbarItem, a simple click invokes the menu, and the indicator is purely decorative.
Subclass of the NSToolbarItemMBS class.

46.3.2 Methods

46.3.3 Constructor(itemIdentifier as string)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The constructor.

46.3.4 Properties

46.3.5 menu as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The menu presented from the toolbar item.
Notes: (Read and Write property)

46.3.6 showsIndicator as Boolean

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines whether the toolbar item displays an indicator of additional functionality.
Notes: If true, the menu toolbar item shows an indicator that additional functionality is available.
(Read and Write property)

46.4 class NSSearchToolbarItemMBS

46.4.1 class NSSearchToolbarItemMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A toolbar item that contains a search field optimized for performing text-based searches.
Notes: NSSearchToolbarItem automatically resizes to accommodate typing when the focus switches to the toolbar item. When the toolbar is low on space, the system may collapse the search item into a button representation, which then expands to a full search field when the user clicks on it.

Requires macOS 11.0
Subclass of the NSToolbarItemMBS class.

46.4.2 Methods

46.4.3 beginSearchInteraction

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Starts a search interaction and moves the keyboard focus to the search field.
Notes: If the system displays a compressed search field, starting the search interaction expands the field to the width stored in the preferredWidthForSearchField property and moves the keyboard focus into the search field. Use beginSearchInteraction and endSearchInteraction to programmatically control a search.

46.4.4 Constructor(itemIdentifier as string)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The constructor.

46.4.5 endSearchInteraction

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Ends a search interaction by giving up the first responder and adjusting the size of the search field to the available width for the toolbar item if necessary.
Notes: Use beginSearchInteraction and endSearchInteraction to programmatically control a search.

46.4.6 Properties

46.4.7 preferredWidthForSearchField as Double

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The preferred width for the toolbar item when it has keyboard focus.
Notes: (Read and Write property)

46.4.8 resignsFirstResponderWithCancel as Boolean

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that enables the cancel button in the search field to resign the first responder in addition to clearing the contents.
Notes: The default value is true. If set to false, the cancel button only clears the contents of the search field.
(Read and Write property)

46.4.9 searchField as NSSearchFieldMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The search field inside the toolbar item.
Notes: When you set searchField to nil, it uses the default configuration for the toolbar item, and inherits the item,Äôs properties and layout constraints. However, if you want to customize the search field, you,Äôll need to add those settings before assigning it to the toolbar item. For more information about customizing a search field, see NSSearchFieldMBS.
(Read and Write property)

46.4.10 view as NSViewMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The view property.
Notes: Please use searchField property instead.
(Read and Write property)

46.5 class NSToolbarItemGroupMBS

46.5.1 class NSToolbarItemGroupMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: NSToolbarItemGroup is a subclass of NSToolbarItem which contains subitems.
Example:

Var t As New MyNSToolbarItemGroupMBS("test", Array("Hello", "World"), NSToolbarItemGroupMBS.SelectionModeSelectOne, Array("Hello", "World"))
t.label = "Test"

Notes: The views and labels of the subitems are used, but the parent's attributes take precedence.
Subclass of the NSToolbarItemMBS class.

46.5.2 Methods

46.5.3 Constructor(itemIdentifier as string)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.
Notes: itemIdentifier: The identifier for the receiver. itemIdentifier is never seen by users and should not be localized.

The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.
See also:

- 46.5.4 Constructor(itemIdentifier as string, images() as NSImageMBS, selectionMode as Integer, labels() as String) 8512
- 46.5.5 Constructor(itemIdentifier as string, titles() as String, selectionMode as Integer, labels() as String) 8513

46.5.4 Constructor(itemIdentifier as string, images() as NSImageMBS, selectionMode as Integer, labels() as String)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Creates a grouped toolbar item with labels.
Notes: itemIdentifier: The identifier for the grouped toolbar item.
images: An array of images to present as subitems in the grouped toolbar item.
selectionMode
A value that indicates how the grouped toolbar item presents selections.
labels: Labels that correspond to the specified images.
See also:

- 46.5.3 Constructor(itemIdentifier as string) 8512
- 46.5.5 Constructor(itemIdentifier as string, titles() as String, selectionMode as Integer, labels() as String) 8513

46.5.5 Constructor(itemIdentifier as string, titles() as String, selectionMode as Integer, labels() as String)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Creates a grouped toolbar item with images.
Example:

```
Var t As New MyNSToolbarItemGroupMBS("test", Array("Hello", "World"), NSToolbarItemGroupMBS.SelectionModeSelectOne, Array("Hello", "World"))

t.label = "Test"
```

Notes: itemIdentifier: The identifier for the grouped toolbar item.
titles: An array of titles to present as subitems in the grouped toolbar item.
selectionMode: A Boolean value that indicates how the grouped toolbar item presents selections.
labels: Labels that correspond to the specified titles.
See also:

- 46.5.3 Constructor(itemIdentifier as string) 8512
- 46.5.4 Constructor(itemIdentifier as string, images() as NSImageMBS, selectionMode as Integer, labels() as String) 8512

46.5.6 SetSubItems(items() as NSToolbarItemMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Sets the subitems for the receiver.
Notes: subitems: An array of instances of NSToolbarItem objects that form the subitems for the receiver.

You should call this method to set the subitems before returning the item to the toolbar. NSToolbarItemGroup objects cannot contain other NSToolbarItemGroup objects as subitems.

46.5.7 subitems as NSToolbarItemMBS()

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns the subitems for the receiver.
Notes: By default, an NSToolbarItemGroup instance has an empty array of subitems.

46.5.8 Properties

46.5.9 controlRepresentation as Integer

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A value that represents how a toolbar displays a grouped toolbar item.
Notes: (Read and Write property)

46.5.10 selectedIndex as Integer

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The index value for the most recently selected subitem of a grouped toolbar item.
Notes: When using the NSToolbarItemGroupSelectionModeSelectAny or NSToolbarItemGroupSelection-ModeMomentary selection mode, don,Äôt assume that this value represents the selected subitem. This method returns the index of the most recently selected subitem.

To determine if a specific subitem of a grouped toolbar item is selected, use the isSelectedAtIndex: method. (Read and Write property)

46.5.11 selectionMode as Integer

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The selection mode of the grouped toolbar item.
Notes: (Read and Write property)

46.5.12 Selected(index as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Indicates whether a specified index is currently selected.
Notes: Gets or sets the selected state of a subitem in a grouped toolbar item.

Use this method when you specify the NSToolbarItemGroupSelectionModeSelectAny selection mode for the grouped toolbar item to determine which subitems are currently selected.
(Read and Write computed property)

46.5.13 Events

46.5.14 Action

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The action event.

46.5.15 Constants

Constants

Constant	Value	Description
ControlRepresentationAutomatic	0	One of the constants that indicates the display style for a grouped toolbar item The system dynamically changes the display mode based on the available space
ControlRepresentationExpanded	1	One of the constants that indicates the display style for a grouped toolbar item The system displays the subitems of a grouped toolbar item horizontally.

Display Styles

Constant	Value	Description
ControlRepresentationCollapsed	2	The system displays the subitems of a grouped toolbar item as a menu.

Selection Modes

Constant	Value	Description
SelectionModeMomentary	2	The system temporarily highlights the select group item when the user selects the item.
SelectionModeSelectAny	1	The system toggles a highlight on any item selected.
SelectionModeSelectOne	0	The system displays a highlighted mode on the most recent item selected.

46.6 class NSToolbarItemMBS

46.6.1 class NSToolbarItemMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The class for Cocoa toolbar items.
Notes: Each item in an NSToolbar is an instance of NSToolbarItem.

46.6.2 Methods

46.6.3 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Constructor for creating an instanced based on an existing handle.
Notes: Useful if you get a NSToolbarItem reference from a declare.
The object is retained.
See also:

- 46.6.4 Constructor(itemIdentifier as string) 8517

46.6.4 Constructor(itemIdentifier as string)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.
Notes: itemIdentifier: The identifier for the receiver. itemIdentifier is never seen by users and should not be localized.

The identifier is used by the toolbar and its delegate to identify the kind of the toolbar item.
See also:

- 46.6.3 Constructor(Handle as Integer) 8516

46.6.5 copy as NSToolbarItemMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Creates a copy of the toolbar item.
Notes: You can't really copy CustomNSToolbarItemMBS objects.

46.6.6 NSToolbarCloudSharingItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: A standard toolbar item identifier for cloud sharing via NSSharingServiceNameCloudSharing.
Notes: It validates itself and modifies its appearance by using the NSCloudSharingValidation protocol. It sends performCloudSharing to the firstResponder.
Requires macOS 10.12 or newer.

46.6.7 NSToolbarCustomizeToolbarItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: The Customize item. Shows the customization palette.

Deprecated. In OS X v10.7 and later the customization icon has been removed from the toolbar and customization palettes. This constant is ignored.

46.6.8 NSToolbarFlexibleSpaceItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: The Flexible Space item.

46.6.9 NSToolbarInspectorTrackingSeparatorItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A standard item for cloud sharing via NSSharingServiceNameCloudSharing. It validates itself and modifies its appearance by using the NSCloudSharingValidation protocol. It sends performCloudSharing to the firstResponder.

46.6.10 NSToolbarPrintItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: The Print item. Sends printDocument to firstResponder, but you can change this in toolbarWillAddItem if you need to do so.

46.6.11 NSToolbarSeparatorItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: The Separator item.

46.6.12 NSToolbarShowColorsItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: The Colors item. Shows the color panel.

46.6.13 NSToolbarShowFontsItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: The Fonts item. Shows the font panel.

46.6.14 NSToolbarSidebarTrackingSeparatorItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: One of the standard identifiers.
Notes: Requires macOS 11.0 or newer.

46.6.15 NSToolbarSpaceItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: The Space item.

46.6.16 NSToolbarToggleInspectorItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A standard item that is configured to send toggleInspector to the firstResponder when invoked.

46.6.17 NSToolbarToggleSidebarItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: A standard toolbar item identifier for sidebars.
Notes: It sends toggleSidebar to the firstResponder.
Requires macOS 10.11 or newer.

46.6.18 NSToolbarWritingToolsItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: One of the standard toolbar item identifiers.
Notes: A standard item that is configured to send -showWritingTools: to the firstResponder when invoked.
Requires macOS 15.2 or newer.

Text value is currently ”NSToolbarWritingToolsItem”.

46.6.19 possibleLabels as String()

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The set of labels that the item might display.
Notes: Use this property to specify all of the labels you might possibly use for the toolbar item. Specify all strings in the current locale. To ensure there,Äôs space for the longest label, the item sizes itself using the strings you provide.

46.6.20 setPossibleLabels(Labels() as String)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The set of labels that the item might display.
Notes: Use this property to specify all of the labels you might possibly use for the toolbar item. Specify all strings in the current locale. To ensure there,Äôs space for the longest label, the item sizes itself using the strings you provide.

46.6.21 validate

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: This method is called by the receiver’s toolbar during validation.
Notes: You may invoke this method directly if you have disabled automatic validation for an item—typically you do this for performance reasons if your validation code is slow.

46.6.22 Properties

46.6.23 allowsDuplicatesInToolbar as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver can be represented in the toolbar at more than one position.
Notes: Returns true to allow dragging the receiver into the toolbar at more than one position, otherwise false.

You use this method by overriding it in a subclass to always return true; typically, you wouldn’t call it. By default, if an item with the same identifier is already in the toolbar, dragging it in again will effectively move

it to the new position.
(Read only property)

46.6.24 autovalidates as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether this item auto validates.
Notes: By default NSToolbar automatically invokes the receiver's validate method on a regular basis. If your validate method is time consuming, you can disable auto validation on a per toolbar item basis.
(Read and Write property)

46.6.25 backgroundTintColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: A color applied to tint the background of the toolbar item only if the item's style is prominent.
Notes: For macOS 26 or newer.
(Read and Write property)

46.6.26 Bordered as Boolean

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: When set on an item without a custom view, the button produced will have a bordered style.
Notes: Defaults to false.

Requires macOS 10.15 or newer.
(Read and Write property)

46.6.27 ClassName as String

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The name of this NSWindow class.
Notes: (Read only property)

46.6.28 ClassPath as String

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The path of this NSView class.
Notes: Useful for debugging to know what super classes the window has.
(Read only property)

46.6.29 Enabled as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver is enabled.
Notes: For a view item, this method calls isEnabled/setEnabled on the view if it responds and returns the result.
(Read and Write property)

46.6.30 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The internal reference to the NSToolbarItem object.
Notes: (Read and Write property)

46.6.31 Hidden as Boolean

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Whether this item is hidden.
Notes: When an item is hidden it will not be visible in the toolbar. The item will still be visible in the customization panel. Because hidden items may be visible during user customization, use the ‘visible‘ property to determine if an item is currently displayed. Note that even hidden toolbar items are sync’d to other toolbars with a shared identifier, but its ‘hidden‘ state can be unique to each instance. Use this property to show a toolbar item in one toolbar instance but not another.

Available on macOS 15.0 or newer.
(Read and Write property)

46.6.32 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The image for this toolbar item.
Notes: For a custom view item (one whose view has already been set), this method calls setImage on the view if it responds. If image contains multiple representations, NSToolbarItem chooses the most appropriately sized representation when displaying.
(Read and Write property)

46.6.33 itemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The receiver's identifier.
Notes: Returns the receiver's identifier, which was provided in the initializer.
(Read only property)

46.6.34 label as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The label, which normally appears in the toolbar and in the overflow menu.
Notes: The length of the label should be appropriate and not too long. The label may be empty.
(Read and Write property)

46.6.35 MaxSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The maximum size.
Notes: (Read and Write property)

46.6.36 menuFormRepresentation as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The menu form representation.
Notes: By default, this method returns nil, even though there is a default menu form representation.
(Read and Write property)

46.6.37 MinSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The minimum size.
Notes: (Read and Write property)

46.6.38 Navigational as Boolean

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: Whether or not the item behaves as a navigation item (i.e. back/forward) in the toolbar.
Notes: Navigation items may be specially positioned by the system outside the normal list of items of the toolbar in the order specified by toolbarDefaultItemIdentifiers.

Requires macOS 11.0 or newer.
(Read and Write property)

46.6.39 paletteLabel as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The label that appears when the receiver is in the customization palette.
Notes: An item must have a palette label if the customization palette is to be used, and for most items it is reasonable to set paletteLabel to be the same value as label. One reason for paletteLabel to be different from label would be if it's more descriptive; another might be if there is no label.
(Read and Write property)

46.6.40 Style as integer

MBS MacControls Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Defines the toolbar item,Äôs appearance.
Notes: The default style is plain.
Prominent style tints the background. If a background tint color is set, it uses it; otherwise, it uses the app,Äôs or system,Äôs accent color. If grouped with other items, it moves to its own to avoid tinting other items' background.

For macOS 26 or newer.
(Read and Write property)

46.6.41 tag as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The tag value.
Notes: You can use the tag for your own custom purpose.
(Read and Write property)

46.6.42 Title as String

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: Set and get the title of an item.
Notes: For custom views, this method will call setTitle:/title on the view if it responds.
(forwards to -view if it responds)

Requires macOS 10.15 or newer.
(Read and Write property)

46.6.43 toolbar as NSToolbarMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the toolbar that is using the receiver.
Notes: (Read only property)

46.6.44 toolTip as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The tooltip to be used when the receiver is displayed in the toolbar.
Notes: (Read and Write property)

46.6.45 view as NSViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The custom view for this item.
Notes: view: The view for the receiver. The view and all of its contents must conform to the NSCoding protocol if the toolbar supports customization.

Note that many of the set/get methods are implemented by calls forwarded to view, if it responds to it.
(Read and Write property)

46.6.46 visibilityPriority as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The visibility priority.
Notes: (Read and Write property)

46.6.47 Constants

Constants

Constant	Value	Description
NSToolbarItemVisibilityPriorityHigh	1000	One of the visibility priority constants. When a toolbar does not have enough space to fit all its items, it m some items into the overflow menu. These values allow you to suggest a for a toolbar item. Items with this priority are less inclined to be pushed to the overflow
NSToolbarItemVisibilityPriorityLow	-1000	One of the visibility priority constants. When a toolbar does not have enough space to fit all its items, it m some items into the overflow menu. These values allow you to suggest a for a toolbar item. Items with this priority will be the first items to be pushed to the menu.
NSToolbarItemVisibilityPriorityStandard	0	One of the visibility priority constants. When a toolbar does not have enough space to fit all its items, it m some items into the overflow menu. These values allow you to suggest a for a toolbar item. The default visibility priority.
NSToolbarItemVisibilityPriorityUser	2000	One of the visibility priority constants. When a toolbar does not have enough space to fit all its items, it m some items into the overflow menu. These values allow you to suggest a for a toolbar item. Items with this priority are the last to be pushed to the overflow mer the user should set items to this priority.

Styles

Constant	Value	Description
NSToolbarItemStylePlain	0	A plain style maintains the item,Äôs standard appearance.
NSToolbarItemStyleProminent	1	For macOS 26 or newer.

46.7 class NSToolbarMBS

46.7.1 class NSToolbarMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: NSToolbar and NSToolbarItem provide the mechanism for a titled window to display a toolbar just below its title bar.

46.7.2 Methods

46.7.3 centeredItemIdentifiers as String()

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The set of custom items to display in the center of the toolbar.

46.7.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop only.

Function: Constructor for creating an instanced based on an existing handle.
Notes: Useful if you get a NSToolbar reference from a declare.
The object is retained.
See also:

- 46.7.5 Constructor(Identifier as string) 8528

46.7.5 Constructor(Identifier as string)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.
Notes: Initializes a newly allocated toolbar with the specified identifier.
identifier is never seen by users and should not be localized.
See also:

- 46.7.4 Constructor(Handle as Integer) 8527

46.7.6 insertItemWithItemIdentifier(identifier as string, atIndex as Integer)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Inserts the specified item at the specified index.
Notes: Identifier: The identifier of the item to insert.
index: The index at which to insert the item.

If the toolbar needs a new instance, it will get it from itemForItemIdentifier. Typically, you should not call this method; you should let the user reconfigure the toolbar.

46.7.7 itemIdentifiers as String()

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: An array of itemIdentifiers that represent the current items in the toolbar.
Notes: Setting this property will set the current items in the toolbar by diffing against items that already exist.
Use this with great caution if ‘allowsUserCustomization‘ is enabled as it will override any customizations the user has made.

Available on macOS 15.0 or newer.

46.7.8 items as NSToolbarItemMBS()

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver’s current items, in order.

46.7.9 NSToolbarDidRemoveItemNotification as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification identifiers.
Notes: Posted after an item is removed from a toolbar. The notification item is the NSToolbar object that had an item removed from it. The userInfo dictionary contains the following information: item: The NSToolbarItem object that was removed.

46.7.10 NSToolbarWillAddItemNotification as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification identifiers.
Notes: Posted before a new item is added to the toolbar. The notification item is the NSToolbar object having an item added to it. The userInfo dictionary contains the following information: item: The NSToolbarItem object being added.

46.7.11 removeItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Removes the specified item.
Notes: Typically, you should not call this method; you should let the user reconfigure the toolbar.

Index is zero based.

46.7.12 removeItemWithItemIdentifier(itemIdentifier as String)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Removes the item with matching ‘itemIdentifier‘ in the receiving toolbar.
Notes: If multiple items share the same identifier (as is the case with space items) all matching items will be removed. To remove only a single space item, use removeItemAtIndex instead.

Any change made will be propagated immediately to all other toolbars with the same identifier.

Available on macOS 15.0 or newer.

46.7.13 runCustomizationPalette

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Runs the receiver's customization palette.

46.7.14 setCenteredItemIdentifiers(Identifiers() as String)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Sets the custom items to display in the center of the toolbar.
Notes: Set this property to the items you want to appear together in the center of the toolbar. Specify the initial order of the items using the toolbarDefaultItemIdentifiers event.

46.7.15 validateVisibleItems

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Called on window updates to validate the visible items.
Notes: You typically use this method by overriding it in a subclass. The default implementation of this method iterates through the list of visible items, sending each a validate message. Override it and call super if you want to know when this method is called.

In Mac OS X v 10.6 and later toolbars no longer automatically validate for some events, including: NSLeftMouseDragged, NSRightMouseDragged, NSOtherMouseDragged, NSMouseEntered, NSMouseExited, NSScrollWheel, NSCursorUpdate, NSKeyDown. In addition, validation for NSKeyUp and NSFlagsChanged events is deferred with the timer restarting for every new deferrable event. So a sequence of key events will not trigger any validation at all, until either a pause of .85 seconds, or an event other than NSKeyUp or NSFlagsChanged is processed. This change was made as an optimization.

To trigger validation for a single toolbar manually, send the toolbar a validateVisibleItems message. To trigger validation for all toolbars, invoke NSApplication's setWindowsNeedUpdate passing true.

46.7.16 visibleItems as NSToolbarItemMBS()

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's currently visible items.
Notes: Items in the overflow menu are not considered visible.

46.7.17 Properties

46.7.18 allowsDisplayModeCustomization as Boolean

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The current display mode of items in the toolbar.
Notes: In toolbars with 'allowsDisplayModeCustomization' enabled this is a user modifiable property.

Available on macOS 15.0 or newer.
(Read and Write property)

46.7.19 allowsExtensionItems as Boolean

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the toolbar can add items for Action extensions.
Notes: When true, the toolbar can dynamically create toolbar items for Action extensions in the toolbar configuration panel. To be included, an extension needs to set the NSExtensionServiceAllowsToolbarItem key to true in its Info.plist.

The default value is false.
(Read and Write property)

46.7.20 allowsUserCustomization as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether users are allowed to modify the toolbar.
Notes: True if users are allowed to modify the toolbar, false otherwise. The default is false.

If the value is false, then the Customize Toolbar,Ä¶ menu item is disabled and other modification is disabled. This attribute does not affect the user's ability to show or hide the toolbar.
(Read and Write property)

46.7.21 autosavesConfiguration as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver autosaves its configuration.
Notes: True if the receiver autosaves its configuration, otherwise false. The default is false.

When autosaving is enabled, the receiver will automatically write the toolbar settings to user defaults if the toolbar configuration changes. The toolbar's configuration is identified in user defaults by the toolbar identifier. If there are multiple toolbars active with the same identifier, they all share the same configuration.
(Read and Write property)

46.7.22 centeredItemIdentifier as String

MBS MacControls Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** The center item identifier. **Notes:** The item with the specified identifier will be positioned in the absolute center of the Toolbar relative to the window assuming space allows. When the window shrinks, the highest priority is to have the most items visible. Thus, centering is broken first (it'll be pushed off to the left/right as necessary). Next, items will be shrunk down a little at a time towards their min size, at the same rate. Finally, items will be removed based on their visibility priority.

This property is archived.
(Read and Write property)

46.7.23 configurationDictionary as dictionary

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The receiver's configuration as a dictionary.
Notes: Set/get a dictionary containing configuration information for the toolbar.

Contains displayMode, isVisible, and a list of the item identifiers currently in the toolbar.
Do not depend on any details of the normal contents of a configuration dictionary.
(Read and Write property)

46.7.24 configurationDictionaryData as Memoryblock

MBS MacControls Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The receiver's configuration as a memoryblock.
Notes: Set/get a memoryblock containing configuration information for the toolbar.

Contains displayMode, isVisible, and a list of the item identifiers currently in the toolbar.
Do not depend on any details of the normal contents of a configuration dictionary.

you can read/write the data to preferences.
(Read and Write property)

46.7.25 customizationPaletteIsRunning as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver's customization palette is running (in use).
Notes: True if the receiver's customization palette is running, otherwise false.
(Read only property)

46.7.26 displayMode as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The receiver's display mode.
Notes: (Read and Write property)

46.7.27 fullScreenAccessoryView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** The fullscreen mode accessory view.
Notes: Requires Mac OS X 10.7.
(Read and Write property)

46.7.28 fullScreenAccessoryViewMaxHeight as Double

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** The fullscreen mode accessory view's maximum height.
Notes: Requires Mac OS X 10.7.
(Read and Write property)

46.7.29 fullScreenAccessoryViewMinHeight as Double

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** The fullscreen mode accessory view's minimum height.
Notes: Requires Mac OS X 10.7.
(Read and Write property)

46.7.30 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The internal reference for this object.
Notes: (Read and Write property)

46.7.31 identifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's identifier.
Notes: Returns the receiver's identifier, a string used by the class to identify the kind of toolbar.

Within the application all toolbars with the same identifier are synchronized to maintain the same state, including for example, the display mode and item order. The identifier is used as the autosave name for toolbars that save their configuration.
(Read only property)

46.7.32 selectedItemIdentifier as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The selected item to the specified toolbar item.
Notes: Typically, a toolbar will manage the selection of items automatically. This method can be used to select identifiers of custom view items, or to force a selection change. See toolbarSelectableItemIdentifiers for more details. If itemIdentifier is not recognized by the receiver, the current selected item identifier does not change.
(Read and Write property)

46.7.33 showsBaselineSeparator as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the toolbar shows the separator between the toolbar and the main window contents.
Notes: True if the toolbar shows the separator between the toolbar and the main window contents, otherwise false. The default is true.
(Read and Write property)

46.7.34 sizeMode as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The size mode.
Notes: If there is no icon of the given size for a toolbar item, the toolbar item creates one by scaling an icon of another size.
(Read and Write property)

46.7.35 toolbarView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The internal NSView used for displaying the toolbar.
Notes: Useful to query values like the bounds of the toolbar.

Works for 64-bit with 17.5 version, but returns nil in older versions.
(Read only property)

46.7.36 visible as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver is visible or hidden.
Notes: True to indicate the receiver should be made visible, false to indicate it should be hidden.
(Read and Write property)

46.7.37 Constants

Display Mode Constants

Constant	Value	Description
NSToolbarDisplayModeDefault	0	The default display mode.
NSToolbarDisplayModeIconAndLabel	1	The toolbar will display icons and labels.
NSToolbarDisplayModeIconOnly	2	The toolbar will display only icons.
NSToolbarDisplayModeLabelOnly	3	The toolbar will display only labels.

SizeMode Constants

Constant	Value	Description
NSToolbarSizeModeDefault	0	The toolbar uses the system-defined default size, which is NSToolbarSizeModeRegular.
NSToolbarSizeModeRegular	1	The toolbar uses regular-sized controls and 32 by 32 pixel icons.
NSToolbarSizeModeSmall	2	The toolbar uses small-sized controls and 24 by 24 pixel icons.

46.8 class NSTrackingSeparatorToolbarItemMBS

46.8.1 class NSTrackingSeparatorToolbarItemMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: A toolbar separator that aligns with the vertical split view in the same window.
Notes: Use a NSTrackingSeparatorToolbarItem to divide an NSToolbarMBS into sections that visually align with the views on either side of the divider of the splitView. This keeps NSToolbarItemMBS objects above the content that,Äôs the target for the item,Äôs action.

The splitView must be in the same window as the toolbar containing this item before showing the toolbar.
Subclass of the NSToolbarItemMBS class.

46.8.2 Methods

46.8.3 Constructor(itemIdentifier as string, splitView as NSSplitViewMBS, dividerIndex as Integer)

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new tracking separator toolbar item and configures it to align with the divider of the split view.
Notes: identifier: The identifier of the toolbar item.
splitView: The split view to align with the tracking separator.
dividerIndex: The index of the divider in the split view.

46.8.4 Properties

46.8.5 dividerIndex as Integer

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The index of the split view divider to align with the tracking separator.
Notes: (Read and Write property)

46.8.6 splitView as NSSplitViewMBS

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: The vertical split view to align with the toolbar separator.
Notes: The splitView must be in the same window as the toolbar containing the NSTrackingSeparatorToolbarItem before showing the toolbar.
(Read and Write property)

Chapter 47

Collaboration

47.1 class CBGroupIdentityMBS

47.1.1 class CBGroupIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: An object of the CBGroupIdentity class represents a group identity and is used for viewing the attributes of group identities from an identity authority.
Example:

```
// get staff group
Var a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
Var i as CBGroupIdentityMBS = CBGroupIdentityMBS.groupIdentityWithPosixGID(20,a)
MsgBox i.fullName
```

Notes: The principal attributes of a CBGroupIdentity object are a POSIX group identifier (GID) and a list of members.
Available in OS X v10.5 and later.
Subclass of the CBIdentityMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Collaboration Framework: CBIdentityPickerMBS class

47.1.2 Methods

47.1.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The private constructor.

47.1.4 copy as CBGroupIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

47.1.5 groupIdentityWithPosixGID(groupID as Integer, authority as CBIdentityAuthorityMBS) as CBGroupIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the group identity with the given POSIX GID in the specified identity authority.
Example:

```
// get staff group
Var a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
Var i as CBGroupIdentityMBS = CBGroupIdentityMBS.groupIdentityWithPosixGID(20,a)

MsgBox i.fullName
```

Notes: groupID: The GID of the group identity you are searching for.
authority: An identity authority in which to search for the group identity.

Returns the group identity object with the given GID in the specified identity authority, or nil if no identity exists with the specified GID.

47.1.6 members as CBIdentityMBS()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: An array of CBIdentity objects each representing a member of the group identity.
Example:

```
// get staff group
Var a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
Var i as CBGroupIdentityMBS = CBGroupIdentityMBS.groupIdentityWithPosixGID(20,a)

MsgBox i.fullName

Var members() as CBIdentityMBS = i.members
```

```
for each m as CBIdentityMBS in members
MsgBox m.fullName
next
```

Notes: This method only returns direct members of a group, it does not return members of members. Both user and group identities can be members of a group, but a group cannot be a member of itself. You also cannot have "circular" membership, i.e. a group be a member of another group that is a member of the first group.

47.1.7 posixGID as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the POSIX GID of the identity.
Notes: The POSIX GID is an integer that can identify a group within an identity authority. GIDs are not guaranteed to be unique within an identity authority.

47.2 class CBIdentityAuthorityMBS

47.2.1 class CBIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: An identity authority is a database that stores information about identities.
Notes: The CBIdentityAuthority class defines one or more identity authorities. This database can be searched for identities in conjunction with the CBIdentity class factory methods.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Collaboration Framework: CBIdentityPickerMBS class

47.2.2 Methods

47.2.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Whether this class is available.
Example:

```
if CBIdentityAuthorityMBS.Available then
MsgBox "CBIdentityAuthorityMBS class is available"
else
MsgBox "CBIdentityAuthorityMBS class is not available"
end if
```

Notes: Returns true on Mac OS X 10.5 and newer.

47.2.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The private constructor.

47.2.5 CSIdentityAuthority as Variant

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns an identity authority for use with the Core Services Identity API.
Notes: Returns CSIdentityAuthorityMBS object.

This method, along with identityAuthorityWithCSIdentityAuthority:, is used for interoperability with the Core Services Identity API.
Available in OS X v10.5 and later.

47.2.6 defaultIdentityAuthority as CBIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns an identity authority that contains the identities in both the local and the network-bound authorities.
Example:

MsgBox CBIdentityAuthorityMBS.defaultIdentityAuthority.localizedName

Notes: The default identity authority is the logical union of the identities in the local and managed authorities.

47.2.7 identityAuthorityWithCSIdentityAuthority(CSIdentityAuthority as Variant) as CBIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns an identity authority specified by a given Core Services Identity authority object.
Notes: CSIdentityAuthority: The Core Services Identity opaque object. Must be a CSIdentityAuthorityMBS.
Returns the identity authority object for use with the Collaboration framework.
This method, along with CSIdentityAuthority, is used for interoperability with the Core Services Identity API.
Available in OS X v10.5 and later.

47.2.8 localIdentityAuthority as CBIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the identity authority on the local system.
Example:

MsgBox CBIdentityAuthorityMBS.localIdentityAuthority.localizedName

Notes: Any identities stored on the local system are contained within this identity authority.

47.2.9 localizedName as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the localized name of the identity authority.
Notes: The computer's name if the authority is local, or Managed Network Directory if the authority is managed.

47.2.10 managedIdentityAuthority as CBIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the identity authority that contains all the identities in bound network directory servers.
Example:

MsgBox CBIdentityAuthorityMBS.managedIdentityAuthority.localizedName

Notes: If you are bound to a network directory server (such as an LDAP server) that has an identity authority, use this method to search those authorities.

47.2.11 Properties

47.2.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

47.3 class CBIdentityMBS

47.3.1 class CBIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: A CBIdentity object is used for accessing the attributes of an identity stored in an identity authority.
Notes: You can use an identity object for finding identities, and storing them in an access control list (ACL). If you need to edit these attributes, take advantage of the CSIdentity class in Core Services.

You can obtain a CBIdentity object from one of the following class factory methods: identityWithName, identityWithUUIDString, identityWithPersistentReference, or identityWithCSIdentity.

There are two subclasses of CBIdentity: CBGroupIdentity and CBUserIdentity. If you are working specifically with a group identity, use CBGroupIdentityMBS. Similarly, if you are working with a user identity, use CBUserIdentityMBS.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Collaboration Framework: CBIdentityPickerMBS class

47.3.2 Methods

47.3.3 aliases as string()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns an array of aliases (alternate names) for the identity.
Notes: Returns an array of strings containing the alternate names for the identity.
An identity can have zero or more aliases. Like the full and short names, two identities cannot share an alias.

47.3.4 authority as CBIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the identity authority where the identity is stored.

47.3.5 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.5 and newer.

47.3.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The private constructor.

47.3.7 copy as CBIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

47.3.8 CSIdentity as Variant

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns an opaque object for use with the Core Services Identity API.
Notes: This method, along with identityWithCSIdentity, is used for interoperability with the Core Services Identity API.
Available in OS X v10.5 and later.

47.3.9 emailAddress as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the email address of an identity.
Notes: The email address of an identity or "" if none exists.

47.3.10 fullName as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the full name of the identity.

47.3.11 identityWithCSIdentity(CSIdentity as Variant) as CBIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns an identity object created from the specified Core Services Identity opaque object.
Notes: csIdentity: The Core Services Identity opaque object. Must be a CSIdentityMBS object.

Returns the identity object for use with the Collaboration framework.
This method is used for interoperability with the Core Services Identity API.

Available in OS X v10.5 and later.

47.3.12 identityWithName(name as string, authority as CBIdentityAuthorityMBS) as CBUserIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the identity object with the given name from the specified identity authority.
Example:

```
Var name as string = "cs" // put your name here
Var a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
Var i as CBIdentityMBS = CBIdentityMBS.identityWithName(name, a)

MsgBox i.fullName+": "+Join(i.aliases,", ")
```

Notes: name: The name of the identity.
authority: The identity authority to search.

Returns the identity object, or nil if no identity is found with the specified name.
The name is compared against all valid identity names, including full names, short names, email addresses, and aliases.

47.3.13 identityWithPersistentReference(ref as Memoryblock) as CBUserIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the identity object matching the persistent reference data.

Notes: ref: The persistent data object that refers to an identity.

Returns the identity object matching the persistent data object, or nil if the identity is not found.
A persistent reference is an opaque data object suitable for persistent storage.

47.3.14 identityWithUUIDString(uuid as string, authority as CBIdentityAuthorityMBS) as CBUserIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the identity object with the given UUID from the specified identity authority.
Notes: uuid: The UUID of the identity you are searching for.
authority: The identity authority to search.

Returns the identity object, or nil if no identity is found with the matching criteria.

47.3.15 image as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the image associated with an identity.
Notes: The image associated with an identity, or nil if none exists.

47.3.16 isHidden as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating the state of the identity's hidden property.
Notes: A hidden identity does not show up in the Identity Picker. A hidden identity refers to system identities such as root, www, and wheel.
True if the identity is hidden; false if it is not.

47.3.17 isMemberOfGroup(g as CBGroupIdentityMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the identity is a member of the specified group.
Notes: g: The group to check for membership.

Returns true if the identity is a member of the group; false if it is not.

47.3.18 persistentReference as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns a persistent reference to store a reference to an identity.
Notes: Returns a memoryblock that uniquely references an identity.

A persistent reference data object is an object generated from an identity. Persistent data objects can be written to and read from a file, making them extremely useful for storing identities in an ACL.

47.3.19 posixName as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the POSIX name of the identity.
Notes: The POSIX name is also referred to as the "short name" for an identity. It can only contain the characters A-Z, a-z, 0-9, -, _, ., and @.

47.3.20 UUIDString as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the UUID of the identity as a string.
Notes: The UUID string is generated so it is unique across all identity authorities. When storing ACLs, one method is to store the UUID of each identity. However, it is recommended that you use a persistent data object instead (see persistentReference).

47.3.21 Properties

47.3.22 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

47.4 class CBIdentityPickerMBS

47.4.1 class CBIdentityPickerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: A CBIdentityPicker object allows a user to select identities—for example, user or group objects—that it wants one or more services or shared resources to have access to.
Example:

```
Var c as new CBIdentityPickerMBS
c.Title = "Please choose your identity"

Var n as Integer = c.runModal
if n = c.NSOKButton then
for each i as CBIdentityMBS in c.identities
MsgBox i.fullName
next
end if
```

Notes: An identity picker can be displayed either as an application-modal dialog or as a sheet attached to a document window. An identity picker returns the selected records to be added to access control lists using Collaboration. If a selected record is not a user or group identity, then an identity picker prompts the end user for additional information—such as a password—to promote that record to a sharing account.
Blog Entries

- Collaboration Framework: CBIdentityPickerMBS class

47.4.2 Methods

47.4.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.5 and newer.

47.4.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

47.4.5 identities as CBIdentityMBS()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the identities selected using the identity picker.

47.4.6 runModal as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Runs the receiver as an application-modal dialog.
Notes: NSOKButton if the user selected OK; otherwise, NSCancelButton.
The receiver may create identities for selected records if necessary.

47.4.7 runModalForWindow(win as DesktopWindow)

MBS MacFrameworks Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Runs the receiver modally as a sheet attached to a specified window.
Notes: window: The parent window for the sheet.

Calls identityPickerDidEnd event later.
See also:

- 47.4.8 runModalForWindow(win as window) 8551

47.4.8 runModalForWindow(win as window)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Runs the receiver modally as a sheet attached to a specified window.
Notes: window: The parent window for the sheet.

Calls identityPickerDidEnd event later.
See also:

- 47.4.7 runModalForWindow(win as DesktopWindow) 8551

47.4.9 Properties

47.4.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

47.4.11 allowsMultipleSelection as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Allows a user to make select multiple identities.
Notes: By default, you cannot select multiple records.
Set to true if you can select multiple records; otherwise, false.
(Read and Write computed property)

47.4.12 title as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The title of the identity picker.
Example:

```
Var c as new CBIdentityPickerMBS
c.Title = "Please choose your identity"
```

Notes: (Read and Write computed property)

47.4.13 Events

47.4.14 identityPickerDidEnd(returnCode as Integer)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The event called when runModalForWindow finished.
Notes: ReturnCode is NSOKButton if the user selected OK; otherwise, NSCancelButton.

47.4.15 Constants

Constants

Constant	Value	Description
NSCancelButton	0	One of the result codes you may need with this class.
NSOKButton	1	One of the result codes you may need with this class.

47.5 class CBUserIdentityMBS

47.5.1 class CBUserIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: An object of the CBUserIdentity class represents a user identity and is used for accessing the attributes of a user identity from an identity authority.
Notes: The principal attributes of CBUserIdentity are a POSIX user identifier (UID), password, and certificate.
Subclass of the CBIdentityMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Collaboration Framework: CBIdentityPickerMBS class

47.5.2 Methods

47.5.3 authenticateWithPassword(password as string) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the given password is correct for the identity.
Notes: Returns true if the password is correct; otherwise, false.

47.5.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The private constructor.

47.5.5 copy as CBUserIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

47.5.6 isEnabled as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the identity is allowed to authenticate.
Notes: If the identity does not have authentication credentials (a password or certificate), it is not able to log in. However, an identity with authentication credentials does not ensure that it is enabled. Any identity can be disabled.
Returns true if the identity can authenticate; otherwise, false.

47.5.7 posixUID as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the POSIX UID of the identity.
Notes: The POSIX UID is a integer that can identify a user within an identity authority. UIDs are not guaranteed to be unique within an identity authority.

47.5.8 userIdentityWithPosixUID(userID as Integer, authority as CBIdentityAuthorityMBS) as CBUserIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the user identity with the given POSIX UID in the specified identity authority.
Example:

```
// get first user
Var a as CBIdentityAuthorityMBS = CBIdentityAuthorityMBS.localIdentityAuthority
Var i as CBUserIdentityMBS = CBUserIdentityMBS.userIdentityWithPosixUID(501,a)

MsgBox i.fullName
```

Notes: uid: The UID of the identity you are searching for.
authority: The identity authority to search.

Retruns the user identity with the given UID in the specified identity authority, or nil if no identity exists with the specified UID.
Available in OS X v10.5 and later.

47.6 class CSIdentityAuthorityMBS

47.6.1 class CSIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: A CSIdentityAuthority object represents an identity authority.
Example:

```
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
MsgBox a.localizedName
```

Notes: An identity authority is a logical repository of user and group information, such the users and groups database on a local system or on a directory server.

The local authority contains all users and groups defined on the local system. The managed authority contains all users and groups defined in directory servers to which the system is bound (LDAP, ActiveDirectory, etc.). The Default authority is a union of the local and managed authorities and is used to locate user/group info from both sources in one query.

Use one of the class factory methods to return an CSIdentityAuthority object, which can be used to search for an identity with an CSIdentityQuery object.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Real Studio Plugins, version 13.0pr6

47.6.2 Methods

47.6.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Whether the CSIdentityAuthority functions are available.
Example:

```
if not CSIdentityAuthorityMBS.Available then
MsgBox "not supported."
end if
```

47.6.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: The private constructor.

47.6.5 defaultIdentityAuthority as CSIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns the system's default identity authority.
Example:

```
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.defaultIdentityAuthority
MsgBox a.localizedName
```

Notes: The default identity authority is a pseudo-authority representing the union of the local identity authority and the managed identity authority. The function CSIdentityMBS.Authority will never return the default authority instance.

47.6.6 localIdentityAuthority as CSIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns the identity authority for identities defined on the local host.
Example:

```
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
MsgBox a.localizedName
```

47.6.7 managedIdentityAuthority as CSIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns the identity authority for identities defined in the system's managed directory server(s).
Example:

```
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.managedIdentityAuthority
MsgBox a.localizedName
```

Notes: There is always a valid managed identity authority instance, but if the system is not bound to any managed directory servers, the managed identity authority will contain no identities.

47.6.8 Properties

47.6.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

47.6.10 localizedName as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns the localized name of an identity authority.
Example:

```
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
MsgBox a.localizedName
```

Notes: (Read only property)

47.7 class CSIdentityMBS

47.7.1 class CSIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: A CSIdentity object represents a user or group entity known to the system.
Notes: An identity object has the following required attributes: a class (user or group), a unique identitfier (UUID), a full name, a Posix ID (UID or GID), and a Posix name (a.k.a. "short" name). There are also a number of optional attributes such as email address, image data, etc.

Group identities have a membership which may include both users as well as other groups. An identity can be tested for membership in a specific group.

A CSIdentity object is a private copy of the identity information. It can be modified in memory, but requires authorization to commit changes back to the identity authority database. On OS X version 10.5, only local identities can be created, modified or deleted, and only by users with Administrator credentials.

Changes may be committed synchronously or asynchronously. All data validation occurs at commit time.
Two identities are equal if they have the same class and UUID.

47.7.2 Methods

47.7.3 AddAlias(alias as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Add a name alias to an identity.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
c.AddAlias "Hello"
```

MsgBox join(c.Aliases, EndOfLine)

Notes: This change must be committed.

47.7.4 AddMember(user as CSIdentityMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Add an identity to a group.
Notes: User: The identity to add to the group. Can be a user or group identity.

Please call only on group identities.
This change to the group must be committed.

47.7.5 Aliases as string()

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the aliases of an identity.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox join(c.Aliases, EndOfLine)
```

Notes: Returns an array containing the identity's name aliases as strings. The array may be empty.

Aliases are alternate names for identities. As with all identity names, aliases must be unique within the entire namespace of of the identity authority.

47.7.6 AuthenticateUsingPassword(password as string) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Attempt to autenticate a password for a user identity.
Notes: password: The password to authenticate
Returns true if the passord is correct for the specified user.
Please call only on user identity.

47.7.7 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Whether the CSIdentity functions are available.
Example:

```
if not CSIdentityMBS.Available then
MsgBox "not supported."
end if
```

47.7.8 Commit as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Synchronously commit all pending changes to the identity authority database.
Notes: error: Optional variant for CFErrorMBS which will be set if this function returns false. When this occurs, the caller is responsible for releasing the error.
Returns true if successful, false if an error occurred.
See also:

- 47.7.9 Commit(byref error as Variant) as Boolean 8561

47.7.9 Commit(byref error as Variant) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Synchronously commit all pending changes to the identity authority database.
Notes: error: Optional variant for CFErrorMBS which will be set if this function returns false. When this occurs, the caller is responsible for releasing the error.
Returns true if successful, false if an error occurred.
See also:

- 47.7.8 Commit as Boolean 8561

47.7.10 Constructor(identityClass as Integer, fullName as string, posixName as string, flags as Integer, authority as CSIdentityAuthorityMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates a new identity.
Example:

```
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.localIdentityAuthority
Var c as new CSIdentityMBS(CSIdentityMBS.kCSIdentityClassUser, "Test User", "TestUser", 0, a)
```

```
Var e as CFErrorMBS
Var v as Variant
if c.Commit(v) then
MsgBox "OK"
else
e = v
if e<>Nil then
MsgBox "Failed"+EndOfLine+e.Description
else
MsgBox "Failed"
end if
end if
```

Notes: identityClass: The type of identity to be created. Specifying kCSIdentityClassUser creates a user, while kCSIdentityClassGroup creates a group.
fullName: The primary name of the new identity.
posixName: The POSIX name of the new identity. Specify kCSIdentityGeneratePosixName to have a name generated automatically from the full name.
flags: Attributes of the new identity
authority: The identity authority to host the identity. Caller must have write access to the identity authority or commit will fail. Currently, only local identities may be created, so callers must specify the local identity authority for this argument.

On success the handle property is not zero.

The new identity is allocated but is not committed to the identity authority's database. It will become persistent and available to other clients after being committed using Commit or CommitAsynchronously.

47.7.11 copy as CSIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates a copy of an identity.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser
Var v as CSIdentityMBS = u.copy
v.SetFullName "Hello World" // modify the copy only
MsgBox u.fullName+" "+v.fullName
```

47.7.12 CurrentUser as CSIdentityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Queries current user identity.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox u.fullName
```

47.7.13 Delete

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Permanently delete an identity from the identity database.
Notes: Sets an identity to deleted state. This change must be committed.

47.7.14 GroupMembershipQuery as CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates a query to find a group's members.
Notes: Please call on the group identity whose members are to be queried
Returns the CSIdentityQueryMBS of the newly created object. The query is ready to be executed.
Using a query to lookup group membership allows the caller to execute the query synchronously or asynchronously.

47.7.15 IsMemberOfGroup(group as CSIdentityMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Check if an identity is a memeber of a group.
Notes: Please call only on a group identity.
group: The group identity whose membership is to be checked
Returns true if the identity is a member (directly or indirectly) of the specified group

47.7.16 kCSIdentityGeneratePosixName as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: A special string for posix names to use to auto generate the posix name.

47.7.17 PersistentReference as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Create an opaque, persistent data reference to an identity.
Example:

```
// get a reference
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser
Var p as MemoryBlock = u.PersistentReference
u = nil

// and search back later:
Var q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForPersistentReference(p)
if q.Execute then
Var r() as CSIdentityMBS = q.Results
MsgBox r(0).fullName
end if
```

Notes: Returns a new persistent reference for the identity.
A persistent identity reference is an opaque data object from which an identity object may queried the future (see CreateForPersistentReference). A persistent reference is suitable for storage in an external data store, for example, as an entry in an application-specific access control list associated with a shared resource. Use of a persistent identity reference is preferred over a pure UUID-based identity reference because the persistent reference contains additional information needed to optimize the identity query and to improve the user experience when working in a distributed identity environment (LDAP, Active Directory, etc.).

47.7.18 RemoveAlias(alias as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Remove an alias name from an identity.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
c.AddAlias "Hello"
MsgBox join(c.Aliases, EndOfLine)
c.RemoveAlias "Hello"
MsgBox join(c.Aliases, EndOfLine)
```

Notes: alias: The alias name to remove
This change must be committed.

47.7.19 RemoveClient

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Invalidate an identity's client structure to stop client events.
Notes: After returning, this function guarantees that client event will never be invoked again. Use this function when releasing an identity which may have an outstanding asynchronous request. This function does not cancel an outstanding commit operation because a commit cannot be interrupted.

47.7.20 RemoveMember(user as CSIdentityMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Remove a member from a group.
Notes: Please call only on group identities.
member: The member identity to remove
This change to the group must be committed.

47.7.21 SetEmailAddress(email as string = "")

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Set an identity's email address.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser

u.SetEmailAddress("test@test.test")
MsgBox u.emailAddress
```

Notes: emailAddress: The user's new email address value. Pass "" to remove an email address.
This change must be committed.

47.7.22 SetFullName(name as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Sets an identity's full name.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser

// get old name
```

```
Var o as string = u.fullName

// change
u.SetFullName("Hello World")

// and report
MsgBox o+" ->"+u.fullName
```

Notes: fullName: The new full name of the identity
This change must be committed.

47.7.23 SetImageData(data as memoryblock = nil, datatype as string = "public.jpeg")

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Set the internally-stored image data and data type for an identity.
Notes: imageData: The image data. Pass nil to remove image data.
imageDataType: The uniform type identitier (UTI) of the image data. Currently, kUTTypeJPEG ("public.jpeg") is the only type supported.
This change must be committed.

47.7.24 SetImageURL(URL as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Set the URL of an identity's external image storage.
Notes: url: The URL file of the image. For local identities, this must be a file URL. Pass "" to remove the image URL from the identity.
This change must be committed.

47.7.25 SetIsEnabled(value as boolean)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Enable or disable a user.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser

u.SetIsEnabled(true)
MsgBox str(u.isEnabled)
```

Notes: isEnabled: The new value of the isEnabled attribute
A disabled user account cannot authenticate. Credentials (password and certificate) are not affected. This change must be committed.

47.7.26 SetPassword(password as string)

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Set a user password.
Notes: Please call only on user identites.
password: The new password, or "" to remove the current password and disable password-based authentication.
Setting the password to "" removes the current password and disables password authentication for the user. Setting the password to a zero-length string allows authentication with a blank password. This change must be committed.

47.7.27 Properties

47.7.28 Authority as CSIdentityAuthorityMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns the identity authority of an identity.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox u.Authority.localizedName
```

Notes: (Read only property)

47.7.29 EmailAddress as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the email address of a user identity.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.emailAddress
```

Notes: Returns the email address of the identity or "" if there is no email address.
(Read and Write property)

47.7.30 FullName as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the full name of an identity.
Example:

```
Var i as CSIdentityMBS = CSIdentityMBS.CurrentUser

MsgBox i.fullName
```

Notes: The full name is the name that is displayed in the user interface.
(Read and Write property)

47.7.31 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

47.7.32 IdentityClass as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns an identity's class.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(u.IdentityClass) // shows 1 for user
```

Notes: (Read only property)

47.7.33 ImageData as memoryblock

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the image associated with a user identity.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
Var data as MemoryBlock = c.ImageData
Var pic as Picture = JPEGStringToPictureMBS(data)
Backdrop = pic
```

Notes: Returns the identity's image data as a memoryblock or nil if there is no image data.
(Read only property)

47.7.34 ImageDataType as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the uniform type identifier (UTI) of an identity's image.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.ImageDataType
```

Notes: Returns a UTI as a string for this identity's image data or "" if there is no image data. The identity object may release its reference to the return value when the identity is modified.
(Read only property)

47.7.35 ImageURL as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the URL to an identity's image file.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.ImageURL
```

Notes: Returns a URL that contains the location of the user's image file, or niol if there is no image URL.
(Read and Write property)

47.7.36 IsCommitting as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Determine if a commit operation is in progress.
Notes: Returns true if a commit operation is in progress.

(Read only property)

47.7.37 IsEnabled as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Determine if a user is enabled.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.IsEnabled)
```

Notes: Returns true if the user is enabled. A user that is not enabled cannot authenticate.
A user that is not enabled cannot authenticate. This setting may be used to temporarily allow a user's access to all services and resources.
(Read and Write property)

47.7.38 IsGroup as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Checks if identity class is group.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.IsUser)+" "+str(c.IsGroup)
```

Notes: (Read only property)

47.7.39 IsHidden as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Determine if a identity's hidden attribute is enabled.
Example:

```
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(u.IsHidden)
```

Notes: Returns true if the identity was created with the hidden attribute
(Read only property)

47.7.40 IsUser as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Checks if identity class is user.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.IsUser)+" "+str(c.IsGroup)
```

Notes: (Read only property)

47.7.41 PosixID as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve POSIX ID of an identity.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox str(c.PosixID)
```

Notes: Returns an identity's POSIX identifier (a UID or GID).
(Read only property)

47.7.42 PosixName as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the POSIX name (short name) of an identity.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.PosixName
```

Notes: Returns an identity's POSIX name. This attribute is always non-empty.
The POSIX name cannot be changed after an identity has been created.
(Read only property)

47.7.43 UUID as string

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns an identity's UUID as string.
Example:

```
Var c as CSIdentityMBS = CSIdentityMBS.CurrentUser
MsgBox c.UUID
```

Notes: (Read only property)

47.7.44 Constants

Constants

Constant	Value	Description
kCSIdentityFlagHidden	-1	One of the flags for identity creation. This flag causes the identity to be "hidden," that is, excluded from most user-visible identity lists. Hidden identities include administrative users and groups such as root, www, and mysql. System service access control groups should be created with the hidden flag.
kCSIdentityFlagNone	0	One of the flags for identity creation. Use this flag to set no optional attributes for a new identity.

Identity Class Constants

Constant	Value	Description
kCSIdentityClassGroup	2	The class value for group identities.
kCSIdentityClassUser	1	The class value for user identities.

47.8 class CSIdentityQueryMBS

47.8.1 class CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: A CSIdentityQuery object provides synchronous or asynchronous access to a collection of identities managed by an identity authority.
Notes: Clients call one of the CSIdentityQueryCreate* functions to define the query criteria. A query can be executed exactly once, in either synchronous or asynchronous mode.

For synchronous execution, the client calls CSIdentityQueryExecute. This function will return when all identies matching the criteria have been found. The results are accessed as an array via Results(). No live updates to the results array are provided in synchronous mode.

To execute in asynchronous mode, the client calls ExecuteAsynchronously, specifying a client object to receive callbacks and a runloop/mode on which callbacks are scheduled.

ExecuteAsynchronously returns immediately, and events will be reported to the callback function as results are added by the query. The client may request live updates to the query which will track changes to the results as changes are made to the identity authority by other processes. Currently, only changes to the local identity authority are monitored.

Asynchronous clients must call Stop when done processing query results to prevent the client callbacks from being called again.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Real Studio Plugins, version 13.0pr6

47.8.2 Methods

47.8.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Whether the CSIdentityQuery functions are available.
Example:

```
if not CSIdentityQueryMBS.Available then
MsgBox "not supported."
end if
```

47.8.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: The private constructor.

47.8.5 Create(identityClass as Integer, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates an identity query object for all identities in the specified authority.
Example:

```
Var c as CSIdentityQueryMBS = CSIdentityQueryMBS.Create(CSIdentityMBS.kCSIdentityClassUser, CSIdentityAuthorityMBS.localIdentityAuthority)

if c.Execute then
Var a() as CSIdentityMBS = c.Results

Var names() as string
for each p as CSIdentityMBS in a
names.append p.fullName
next

MsgBox join(names,EndOfLine)
end if
```

Notes: identityClass: The class of identity to find
authority: The identity authority to query

Returns a new CSIdentityQuery object.

The results of this query include all of the identities in the specified authority's database.

47.8.6 CreateForCurrentUser as CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates a query for the current session user's identity.
Example:

```
Var q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForCurrentUser
```

```
if q.Execute then
Var r() as CSIdentityMBS = q.Results

if UBound(r) = 0 then
Var i as CSIdentityMBS = r(0)

MsgBox i.fullName
end if
end if
```

47.8.7 CreateForName(name as string, comparisonMethod as Integer, identityClass as Integer, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates an identity query object based on a name.
Example:

```
// search for short name and show full name
Var name as string = SystemInformationMBS.ShortUsername
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.defaultIdentityAuthority
Var f as Integer = CSIdentityQueryMBS.kCSIdentityQueryStringEquals
Var q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForName(name, f, CSIdentityMBS.kCSIdentityClassUser, a)

if q.Execute then
Var r() as CSIdentityMBS = q.Results
MsgBox r(0).fullName
end if
```

Notes: name: The name criteria for the query.
comparisonMethod: The comparision function (equal or begins with)
identityClass: The class of identity to find
authority: The identity authority to query

Returns a new CSIdentityQuery object
The query finds identities by name. It searches the full names, posix names and aliases for matches.

47.8.8 CreateForPersistentReference(data as memoryblock) as CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates an identity query object based on an identity reference data object.
Example:

```
// get a reference
Var u as CSIdentityMBS = CSIdentityMBS.CurrentUser
Var p as MemoryBlock = u.PersistentReference
u = nil

// and search back later:
Var q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForPersistentReference(p)
if q.Execute then
Var r() as CSIdentityMBS = q.Results
MsgBox r(0).fullName
end if
```

Notes: referenceData: The reference data that fully describes an identity
Returns a new CSIdentityQuery object.
Finds an identity by reference data obtained from ReferenceData.

47.8.9 CreateForPosixID(posixID as Integer, identityClass as Integer, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates an identity query object based on a POSIX ID.
Example:

```
// search for short name and show full name
Var a as CSIdentityAuthorityMBS = CSIdentityAuthorityMBS.defaultIdentityAuthority
Var f as Integer = CSIdentityQueryMBS.kCSIdentityQueryStringEquals
Var q as CSIdentityQueryMBS = CSIdentityQueryMBS.CreateForPosixID(501, CSIdentityMBS.kCSIdentityClassUser, a)

if q.Execute then
Var r() as CSIdentityMBS = q.Results
MsgBox r(0).fullName
end if
```

Notes: posixID: The UID or GID of the identity to find
identityClass: The class of identity to find
authority: The identity authority to query

Returns a new CSIdentityQuery object
Finds an identity by its UID or GID

47.8.10 CreateForUUID(uuid as string, authority as CSIdentityAuthorityMBS) as CSIdentityQueryMBS

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates an identity query object based on a UUID.
Notes: uuid: The UUID of the identity to find
authority: The identity authority to query
Returns a new CSIdentityQuery object
Finds an identity by its UUID.

47.8.11 Execute(flags as Integer = 0) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Execute an identity query synchronously.
Notes: flags: Execution options.
error: Optional pointer to a variant which is filled with CFErrorMBS object if function returns false.
Returns true if the query executed successfully, false if an error occurred.
See also:

- 47.8.12 Execute(flags as Integer, byref error as Variant) as Boolean 8577

47.8.12 Execute(flags as Integer, byref error as Variant) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Execute an identity query synchronously.
Notes: flags: Execution options.
error: Optional pointer to a variant which is filled with CFErrorMBS object if function returns false.
Returns true if the query executed successfully, false if an error occurred.
See also:

- 47.8.11 Execute(flags as Integer = 0) as Boolean 8577

47.8.13 Results as CSIdentityMBS()

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Retrieve the results of executing an identity query.

47.8.14 Stop

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Invalidate an identity query client.
Notes: Invalidate a query client so that its callback will never be called in the future. Clients should call Stop when an query will no longer be used, prior to releasing the final query reference.

47.8.15 Properties

47.8.16 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

47.8.17 Constants

Execution flags

Constant	Value	Description
kCSIdentityQueryGenerateUpdateEvents	1	After the intial query phase is complete, monitor the result set for live
kCSIdentityQueryIncludeHiddenIdentities	2	Include all matching identities in the result set, including hidden "syst and groups (root, www, etc.).

String Operation

Constant	Value	Description
kCSIdentityQueryStringBeginsWith	2	The identity name must begin with the search string. When searching for identities by name, this value specifies the string comp son function.
kCSIdentityQueryStringEquals	1	The identity name must equal the search string. When searching for identities by name, this value specifies the string comp son function.

Chapter 48

ColorSync

48.1 module CSDeviceMBS

48.1.1 module CSDeviceMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: A module for device related Colorsync methods.
Blog Entries

- MBS Xojo Plugins, version 26.2pr4
- MBS REALbasic Plugins, version 10.5pr5

48.1.2 Methods

48.1.3 DeviceInfo(deviceClass as string, deviceID as CFUUIDMBS) as dictionary

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Queries information on the device.
Notes: Returns a dictionary with the following keys and values resolved for the current host and current user.

kColorSyncDeviceClass: camera, display, printer, scanner
kColorSyncDeviceID: CFUUIDRef registered with ColorSync
kColorSyncDeviceDescription: localized device description
kColorSyncDeviceUserScope: kCFPreferencesAnyUser or kCFPreferencesCurrentUser
kColorSyncDeviceHostScope: kCFPreferencesAnyHost or kCFPreferencesCurrentHost
kColorSyncFactoryProfiles: dictionary with ProfileID and kColorSyncCustomProfiles keys.

kColorSyncCustomProfiles: dictionary with keys ProfileID and values CFURLMBS or nil.

ProfileID is a dictionary with the following keys:

kColorSyncDeviceProfileURL: CFURLMBS or kCFNull
kColorSyncDeviceModeDescription: localized mode description

48.1.4 DeviceProfiles as dictionary()

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Queris the device profiles.
Notes: The dictionaries contain the following keys:

kColorSyncDeviceClass	camera, display, printer, scanner
kColorSyncDeviceID	CFUUIDRef registered with ColorSync
kColorSyncDeviceDescription	localized device description
kColorSyncDeviceModeDescription	localized device mode description
kColorSyncDeviceProfileID	ProfileID registered with ColorSync
kColorSyncDeviceProfileURL	CFURLMBS registered with ColorSync
kColorSyncDeviceProfileIsFactory	Boolean
kColorSyncDeviceProfileIsDefault	Boolean
kColorSyncDeviceProfileIsCurrent	Boolean

48.1.5 kColorSyncCameraDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: A constant for a possible value for the device class.

48.1.6 kColorSyncCustomProfiles as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.
Notes: Dictionary containing custom profile info.

48.1.7 kColorSyncDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.8 kColorSyncDeviceDefaultProfileID as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.9 kColorSyncDeviceDescription as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.
Notes: String with a name in current locale.

48.1.10 kColorSyncDeviceDescriptions as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.
Notes: Dictionary with localized names.

48.1.11 kColorSyncDeviceHostScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.12 kColorSyncDeviceID as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.
Notes: Value is a CFUUIDMBS for this key.

48.1.13 kColorSyncDeviceModeDescription as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.
Notes: String, e.g. Glossy, Best Quality.

48.1.14 kColorSyncDeviceModeDescriptions as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.
Notes: Dictionary with localized mode names.

48.1.15 kColorSyncDeviceProfileID as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.16 kColorSyncDeviceProfileIsCurrent as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.17 kColorSyncDeviceProfileIsDefault as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.18 kColorSyncDeviceProfileIsFactory as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.19 kColorSyncDeviceProfilesNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.20 kColorSyncDeviceProfileURL as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.21 kColorSyncDeviceRegisteredNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.22 kColorSyncDeviceUnregisteredNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.23 kColorSyncDeviceUserScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.24 kColorSyncDisplayDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: A constant for a possible value for the device class.

48.1.25 kColorSyncDisplayDeviceProfilesNotification as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.26 kColorSyncFactoryProfiles as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.
Notes: Dictionary containing factory profile info.

48.1.27 kColorSyncPrinterDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: A constant for a possible value for the device class.

48.1.28 kColorSyncProfileHostScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.29 kColorSyncProfileUserScope as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the key constants for the info/options dictionaries.

48.1.30 kColorSyncScannerDeviceClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: A constant for a possible value for the device class.

48.1.31 RegisterDevice(deviceClass as string, deviceID as CFUUIDMBS, deviceInfo as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Registeres a device.
Notes: deviceInfo: A dictionary containing information needed to register a device.

Required keys:

kColorSyncDeviceDescriptions: Dictionary with localized names of the device. Localization keys must be five character strings containing language code and region code in the lc_RG format and it must contain (at least) the "en_US" locale.
kColorSyncFactoryProfiles: Dictionary with factory profile info Dictionaries The keys are the profile IDs and the values are the profile info dictionaries.

Optional keys:

kColorSyncDeviceHostScope: host scope of the device; one of kCFPreferences { Current,Any } Host; if unspecified kCFPreferencesCurrentHost is assumed.
kColorSyncDeviceUserScope: user scope of the device; one of kCFPreferences { Current,Any } User; if unspecified kCFPreferencesCurrentUser is assumed.

factory profiles dictionary - value for the key kColorSyncFactoryProfiles in deviceInfo

Required keys and values:

Each profile is identified by a ProfileID (of String type) which used as the key. Value associated with the key is a profile info dictionary that describes an individual device profile.

kColorSyncDeviceDefaultProfileID: the associated value must be one of the ProfileID present in the dictionary. Presence of this key is not required if there is only one factory profile.

profile info Dictionary

Required keys:

kColorSyncDeviceProfileURL: CFURLMBS of the profile to be registered
kColorSyncDeviceModeDescriptions: Dictionary with localized device mode names for the profile. Localization keys must be five character strings containing language code and region code in the lc_RG format and it must contain (at least) the "en_US" locale. E.g. "en_US" "Glossy Paper with best quality"

Example of deviceInfo dictionary:

kColorSyncDeviceDescriptions:
en_US My Little Printer
de_DE Mein Kleiner Drucker
fr_FR Mon petit immprimeur
...

kColorSyncFactoryProfiles: "Profile 1"
kColorSyncDeviceProfileURL: CFURLMBS
kColorSyncDeviceModeDescriptions:
en_US Glossy Paper
de_DE Glanzpapier
fr_FR Papier glace
...

kColorSyncDeviceDefaultProfileID: "Profile 1"
kColorSyncDeviceUserScope: kCFPreferencesAnyUser
kColorSyncDeviceHostScope: kCFPreferencesCurrentHost

Notes:
1. Scope for factory profiles is exactly the same as the device scope.
2. Pass CFNullRef in lieu of the profile URL or no URl key/value pair at all if factory profile is not available. This will enable setting custom profile.
3. For the reasons of compatibility with legacy API, it is recommended that the profile keys are created as CFStrings from uint32 numbers as follows: key = encodings.UTF32.chr(value)

Returns true on success and false in case of failure

48.1.32 SetCustomProfiles(deviceClass as string, deviceID as CFUUIDMBS, profileInfo as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Sets a custom profile:
Notes: profileInfo is a CFDictionary containing the information about custom profiles to be set in lieu of factory profiles.

Required keys:

ProfileIDs which must be the subset of the ProfileIDs that device was registered with or kColorSyncDeviceDefaultProfileID for setting custom default profile.

Required values:

CFURLMBS (folderitem) of the profile to be set as a custom profile.

Optional keys:

kColorSyncProfileHostScope: host scope of the profile; one of kCFPreferences { Current,Any } Host; if unspecified kCFPreferencesCurrentHost is assumed.
kColorSyncProfileUserScope: user scope of the profile; one of kCFPreferences { Current,Any } User; if unspecified kCFPreferencesCurrentUser is assumed.

Notes:
1. Profile scope for custom profiles cannot exceed scope of the factory profiles.
2. There is only one host scope and user scope per dictionary (i.e. per call)
3. Pass CFNullRef in lieu of the profile URL to unset the custom profile and reset the current profile to the factory profile.

Returns true on success and false in case of failure.

48.1.33 UnregisterDevice(deviceClass as string, deviceID as CFUUIDMBS) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Unregisters a device of given deviceClass and deviceID.
Notes: Returns true on success and false in case of failure.

48.2 class CSManagementModuleMBS

48.2.1 class CSManagementModuleMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for a Color Management Module module.
Notes: Color conversions are performed by a Color Management Module (CMM) which is a plugin to ColorSync. ColorSync contains Apple CMM, which is not replaceable, but third parties can install their own CMMs. ColorSync provides access to installed CMMs as well as those that can be part of the application bundle. CMM can be selected and specified as a preferred CMM per color transform created by the application. If the third party CMM fails to perform a task, Apple CMM will take it over.
Subclass of the CFObjectMBS class.
Blog Entries

- MBS REALbasic Plugins, version 10.5pr5

48.2.2 Methods

48.2.3 Bundle as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The bundle of the Color Management Module.
Notes: Nil for built-in Apple CMM.

48.2.4 CMMIdentifier as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal identifier for this Color Management Module.
Example:

```
Var a(-1) as CSManagementModuleMBS = CSManagementModuleMBS.InstalledCMMs

for each m as CSManagementModuleMBS in a
MsgBox m.CMMIdentifier
next
```

48.2.5 Constructor(Bundle as CFBundleMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a Color Management Module object from a given CF Bundle.
Example:

```
Var f as FolderItem = GetFolderItem("/Library/ColorSync/CMMs/AdobeCMM.cmm", FolderItem.PathTypeShell)
Var b as CFBundleMBS = CreateBundleMBS(F)
Var m as new CSManagementModuleMBS(b)

' MsgBox stR(m.Handle) // must be non zero

MsgBox m.LocalizedName
MsgBox m.CMMIdentifier
```

48.2.6 InstalledCMMs as CSManagementModuleMBS()

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The list of installed Color Management Modules.
Example:

```
Var a(-1) as CSManagementModuleMBS = CSManagementModuleMBS.InstalledCMMs

for each m as CSManagementModuleMBS in a
Var path as string
Var bundle as CFBundleMBS = m.Bundle
if bundle<>nil then
Var ExecutableFileURL as CFURLMBS = bundle.URL
if ExecutableFileURL<>nil then
Var s as CFStringMBS = ExecutableFileURL.Str
if s<>nil then
path = s.str
end if
end if
end if

MsgBox m.CMMIdentifier+EndOfLine+EndOfLine+m.LocalizedName+EndOfLine+path
next
```

Notes: Returns an empty array on failure.

48.2.7 LocalizedName as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The localized name of this Color Management Module.

Example:

```
Var a(-1) as CSManagementModuleMBS = CSManagementModuleMBS.InstalledCMMs

for each m as CSManagementModuleMBS in a
MsgBox m.LocalizedName
next
```

48.3 class CSMutableProfileMBS

48.3.1 class CSMutableProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: The class for a mutable colorsync profile.
Notes: Subclass of the CSProfileMBS class.
Blog Entries

- MBS REALbasic Plugins, version 10.5pr5

48.3.2 Methods

48.3.3 Constructor

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new empty mutable profile.
See also:

- 48.3.4 Constructor(profile as CSProfileMBS) 8591

48.3.4 Constructor(profile as CSProfileMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a mutable copy of the given profile.
See also:

- 48.3.3 Constructor 8591

48.3.5 RemoveTag(signature as string)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Removes the tag with the signature.

48.3.6 SetHeader(data as string)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Sets the raw header data.

48.3.7 SetRawTag(signature as string, data as string)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Sets a tag with the raw data in a string.

48.4 class CSProfileMBS

48.4.1 class CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: The class for a Colorsync profile.
Notes: Subclass of the CFObjectMBS class.

48.4.2 Methods

48.4.3 Constructor(data as string, byref error as CFErrorMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a profile with the data in the given string.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic Gray Profile.icc",
FolderItem.PathTypeShell)
Var stream as BinaryStream = file.OpenAsBinaryFile(False) // BinaryStream.Open(f, false)
Var data as string = stream.read(stream.length)
Var e as CFErrorMBS
Var p as new CSProfileMBS(data, e)

MsgBox p.Description
```

Notes: On success the handle property is not zero.
See also:

- 48.4.4 Constructor(DisplayID as Integer) 8594
- 48.4.5 Constructor(file as folderitem) 8594

- 48.4.6 Constructor(file as folderitem, byref error as CFErrorMBS) 8595
- 48.4.7 Constructor(name as string) 8595
- 48.4.8 Constructor(profileSequence() as dictionary, options as dictionary) 8596

48.4.4 Constructor(DisplayID as Integer)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile with the given display.
Notes: displayID: system-wide unique display ID (defined by IOKIt); pass 0 for main display.

On success the handle property is not zero.
See also:

- 48.4.3 Constructor(data as string, byref error as CFErrorMBS) 8593
- 48.4.5 Constructor(file as folderitem) 8594
- 48.4.6 Constructor(file as folderitem, byref error as CFErrorMBS) 8595
- 48.4.7 Constructor(name as string) 8595
- 48.4.8 Constructor(profileSequence() as dictionary, options as dictionary) 8596

48.4.5 Constructor(file as folderitem)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile based on the given file.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc",
FolderItem.PathTypeShell)
Var p as new CSProfileMBS(file)

MsgBox p.Description
```

Notes: On success the handle property is not zero.
See also:

- 48.4.3 Constructor(data as string, byref error as CFErrorMBS) 8593
- 48.4.4 Constructor(DisplayID as Integer) 8594
- 48.4.6 Constructor(file as folderitem, byref error as CFErrorMBS) 8595
- 48.4.7 Constructor(name as string) 8595
- 48.4.8 Constructor(profileSequence() as dictionary, options as dictionary) 8596

48.4.6 Constructor(file as folderitem, byref error as CFErrorMBS)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile based on the given file.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc",
FolderItem.PathTypeShell)
Var e as CFErrorMBS
Var p as new CSProfileMBS(file, e)

MsgBox p.Description
```

Notes: On success the handle property is not zero.
See also:

- 48.4.3 Constructor(data as string, byref error as CFErrorMBS) 8593
- 48.4.4 Constructor(DisplayID as Integer) 8594
- 48.4.5 Constructor(file as folderitem) 8594
- 48.4.7 Constructor(name as string) 8595
- 48.4.8 Constructor(profileSequence() as dictionary, options as dictionary) 8596

48.4.7 Constructor(name as string)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a profile with the given predefined name.
Example:

```
Var c as new CSProfileMBS(CSProfileMBS.kColorSyncGenericXYZProfile)
MsgBox c.Description
```

Notes: On success the handle property is not zero.
See also:

- 48.4.3 Constructor(data as string, byref error as CFErrorMBS) 8593
- 48.4.4 Constructor(DisplayID as Integer) 8594
- 48.4.5 Constructor(file as folderitem) 8594
- 48.4.6 Constructor(file as folderitem, byref error as CFErrorMBS) 8595
- 48.4.8 Constructor(profileSequence() as dictionary, options as dictionary) 8596

48.4.8 Constructor(profileSequence() as dictionary, options as dictionary)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a link profile.
Notes: profileSequence: An array of dictionaries, each one containing a profile object and the information on the usage of the profile in the transform.

Required keys:

kColorSyncProfile: CSProfileMBS
kColorSyncRenderingIntent: String defining rendering intent
kColorSyncTransformTag: String defining which tags to use

Optional key:

kColorSyncBlackPointCompensation: Boolean to enable/disable BPC

options: dictionary with additional public global options (e.g. preferred CMM, quality, etc... It can also contain custom options that are CMM specific.

On success the handle property is not zero.
See also:

- 48.4.3 Constructor(data as string, byref error as CFErrorMBS) 8593
- 48.4.4 Constructor(DisplayID as Integer) 8594
- 48.4.5 Constructor(file as folderitem) 8594
- 48.4.6 Constructor(file as folderitem, byref error as CFErrorMBS) 8595
- 48.4.7 Constructor(name as string) 8595

48.4.9 ContainsTag(signature as string) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Whether the tag is contained in the profile.

48.4.10 CreateDeviceProfile(deviceClass as string, deviceID as CFUUIDMBS, profileID as Variant) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a device profile.
Notes: deviceClass: ColorSync device class
deviceID: deviceID registered with ColorSync
profileID: profileID registered with ColorSync; pass kColorSyncDeviceDefaultProfileID to get the default profile.

See CSDeviceMBS for more info on deviceClass, deviceID and profileID

Returns nil on failure and Profile object on success.

48.4.11 CreateLink(profileSequence() as dictionary, options as dictionary) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a link profile.
Notes: profileSequence: An array of dictionaries, each one containing a profile object and the information on the usage of the profile in the transform.

Required keys:

kColorSyncProfile: CSProfileMBS
kColorSyncRenderingIntent: String defining rendering intent
kColorSyncTransformTag: String defining which tags to use

Optional key:

kColorSyncBlackPointCompensation: Boolean to enable/disable BPC

options: dictionary with additional public global options (e.g. preferred CMM, quality, etc... It can also contain custom options that are CMM specific.

Returns nil on failure and Profile object on success.

48.4.12 CreateWithData(data as string) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a profile with the data in the given string.
Notes: Returns nil on failure and Profile object on success.

See also:

- 48.4.13 CreateWithData(data as string, byref error as CFErrorMBS) as CSProfileMBS 8598

48.4.13 CreateWithData(data as string, byref error as CFErrorMBS) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a profile with the data in the given string.
Notes: Returns nil on failure and Profile object on success.
See also:

- 48.4.12 CreateWithData(data as string) as CSProfileMBS 8597

48.4.14 CreateWithDisplayID(DisplayID as Integer) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile with the given display.
Notes: displayID: system-wide unique display ID (defined by IOKIt); pass 0 for main display.

Returns nil on failure and Profile object on success.

48.4.15 CreateWithFile(file as folderitem) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile based on the given file.
Notes: Returns nil on failure and Profile object on success.
See also:

- 48.4.16 CreateWithFile(file as folderitem, byref error as CFErrorMBS) as CSProfileMBS 8598

48.4.16 CreateWithFile(file as folderitem, byref error as CFErrorMBS) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile based on the given file.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc",
FolderItem.PathTypeShell)
```

```
Var e as CFErrorMBS
Var p as new CSProfileMBS(file, e)

MsgBox p.Description
```

Notes: Returns nil on failure and Profile object on success.
See also:

- 48.4.15 CreateWithFile(file as folderitem) as CSProfileMBS 8598

48.4.17 CreateWithName(name as string) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a profile with the given name.
Example:

```
Var s as string = CSProfileMBS.kColorSyncGenericXYZProfile
Var c as CSProfileMBS = CSProfileMBS.CreateWithName(s)
MsgBox c.Description
```

Notes: Returns nil on failure and Profile object on success.

48.4.18 CreateWithURL(url as string) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile based on the file at the given URL.
Notes: Returns nil on failure and Profile object on success.
See also:

- 48.4.19 CreateWithURL(url as string, byref error as CFErrorMBS) as CSProfileMBS 8599

48.4.19 CreateWithURL(url as string, byref error as CFErrorMBS) as CSProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new profile based on the file at the given URL.
Notes: Returns nil on failure and Profile object on success.
See also:

- 48.4.18 CreateWithURL(url as string) as CSProfileMBS 8599

48.4.20 Data as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Returns a string with the raw data of the profile.

48.4.21 Edit as CSMutableProfileMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates an editable copy of the profile.
Notes: Returns nil on any error.

48.4.22 EstimateGamma as Double

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Calculates the estimated gamma for this profile.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic Gray Profile.icc",
FolderItem.PathTypeShell)
Var p as new CSProfileMBS(file)

MsgBox str(p.EstimateGamma) // 1.8
```

Notes: Returns non-zero value if success or 0.0 in case of error.
See also:

- 48.4.23 EstimateGamma(byref error as CFErrorMBS) as Double 8600

48.4.23 EstimateGamma(byref error as CFErrorMBS) as Double

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Calculates the estimated gamma for this profile.
Notes: Returns non-zero value if success or 0.0 in case of error.
See also:

- 48.4.22 EstimateGamma as Double 8600

48.4.24 EstimateGammaWithDisplayID(displayID as Integer) as Double

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Calculates the estimated gamma value for the given display.
Notes: displayID: system-wide unique display ID.
See also:

- 48.4.25 EstimateGammaWithDisplayID(displayID as Integer, byref error as CFErrorMBS) as Double 8601

48.4.25 EstimateGammaWithDisplayID(displayID as Integer, byref error as CFErrorMBS) as Double

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Calculates the estimated gamma value for the given display.
Notes: displayID: system-wide unique display ID.
See also:

- 48.4.24 EstimateGammaWithDisplayID(displayID as Integer) as Double 8601

48.4.26 File as folderitem

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: The file reference for this profile.
See also:

- 48.4.27 File(byref error as CFErrorMBS) as folderitem 8601

48.4.27 File(byref error as CFErrorMBS) as folderitem

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: The file reference for this profile.
See also:

- 48.4.26 File as folderitem 8601

48.4.28 Header as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Returns a string with the raw header content.

48.4.29 InstalledProfiles(wait as boolean = false) as dictionary()

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Queries the list of installed profiles.
Example:

```
Var a(-1) as Dictionary = CSProfileMBS.InstalledProfiles
Var lines(-1) as string

for each d as Dictionary in a
lines.Append d.Value(CSProfileMBS.kColorSyncProfileDescription)
next

MsgBox Join(lines,EndOfLine)
```

Notes: Returns an empty array on any error.

Note: When called for the first time this function will return only system profiles because profile iteration is a slow process requiring multiple access to file system.

e.g. you may call it in app.open, so later when you call it again, the list is gathered.

48.4.30 kColorSyncAdobeRGB1998Profile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the predefined profile names.

48.4.31 kColorSyncGenericCMYKProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the predefined profile names.

48.4.32 kColorSyncGenericGrayGamma22Profile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the predefined profile names.

48.4.33 kColorSyncGenericGrayProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the predefined profile names.

48.4.34 kColorSyncGenericLabProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the predefined profile names.

48.4.35 kColorSyncGenericRGBProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the predefined profile names.

48.4.36 kColorSyncGenericXYZProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the predefined profile names.

48.4.37 kColorSyncProfileClass as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.38 kColorSyncProfileColorSpace as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.39 kColorSyncProfileDescription as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.40 kColorSyncProfileHeader as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.41 kColorSyncProfileMD5Digest as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.42 kColorSyncProfilePCS as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.43 kColorSyncProfileURL as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.44 kColorSyncSRGBProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the tag signature constants.
Notes: Can be used with the dictionary returned by the InstalledProfiles method.

48.4.45 MD5 as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: MD5 digest for the profile calculated as defined by ICC specification.
Notes: Returns a 16 byte string with the raw bytes of the signature.
Returns an empty string on any error.

48.4.46 RawTag(signature as string) as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Returns the raw tag value as string.

48.4.47 TagSignatures as string()

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Returns an array of the tag signatures.

48.4.48 URL as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: The URL reference for this profile.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc",
FolderItem.PathTypeShell)
Var p as new CSProfileMBS(file)

MsgBox p.URL
```

See also:

- 48.4.49 URL(byref error as CFErrorMBS) as string 8606

48.4.49 URL(byref error as CFErrorMBS) as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: The URL reference for this profile.
See also:

- 48.4.48 URL as string 8605

48.4.50 Verify(byref errors as CFErrorMBS, byref warnings as CFErrorMBS) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Verifies the profile.
Notes: errors: returns error strings in case problems are found which would prevent use of the profile.
warnings: returns warning strings indicating problems due to lack of conformance with the ICC specification, but not preventing use of the profile.

Returns true if profile can be used or false otherwise.

48.4.51 Properties

48.4.52 Description as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Returns the containing profile description localized to current locale.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc",
FolderItem.PathTypeShell)
Var p as new CSProfileMBS(file)

MsgBox p.Description
```

Notes: (Read only property)

48.4.53 MD5String as String

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: MD5 digest for the profile calculated as defined by ICC specification.
Example:

```
Var file as FolderItem = GetFolderItem("/System/Library/ColorSync/Profiles/Generic XYZ Profile.icc",
FolderItem.PathTypeShell)
Var p as new CSProfileMBS(file)

MsgBox p.MD5String
```

Notes: Returns a 32 byte human readable hexstring with the bytes of the signature.
Returns an empty string on any error.
(Read only property)

48.5 class CSTransformMBS

48.5.1 class CSTransformMBS

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: The class for a ColorSync transformation.
Notes: This class uses newer APIs than those in the older ColorSyncWorldMBS class.
Subclass of the CFObjectMBS class.
Blog Entries

- MBS Xojo Plugins, version 26.2pr4
- MBS Xojo Plugins, version 19.3pr1
- MBS REALbasic Plugins, version 10.5pr5

48.5.2 Methods

48.5.3 Constructor(profileSequence() as dictionary, options as dictionary)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Creates a new transformation.
Notes: profileSequence: Array of dictionaries, each one containing a profile object and the information on the usage of the profile in the transform.

Required keys:

kColorSyncProfile: CSProfileMBS
kColorSyncRenderingIntent: String defining rendering intent
kColorSyncTransformTag: String defining which tags to use

Optional key:
kColorSyncBlackPointCompensation: Boolean to enable/disable BPC

options: dictionary with additional public global options (e.g. preferred CMM, quality, etc... It can also contain custom options that are CMM specific.

On success the handle property is not zero.

48.5.4 Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the convert methods to transform data.
Notes: dest: Destination picture.
source: Source picture.
src: A memroyblock to the data to be converted.
srcDepth: Describes the bit depth and type of the source color components
srcFormat: Describes the format and byte packing of the source pixels
srcBytesPerRow: Number of bytes in the row of data

returns true if conversion was successful or false otherwise
See also:

- 48.5.5 Convert(dest as picture, src as picture, options as dictionary) as boolean 8609
- 48.5.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean 8610
- 48.5.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean 8610

48.5.5 Convert(dest as picture, src as picture, options as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the convert methods to transform data.
Notes: dest: Destination picture.
source: Source picture.

Should only be used with RGB for source/dest profile.

returns true if conversion was successful or false otherwise
See also:

- 48.5.4 Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean 8609
- 48.5.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean 8610

- 48.5.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean 8610

48.5.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the convert methods to transform data.
Notes: dest: Destination picture.
dst: A memroyblock to the destination where the results will be written.
dstDepth: Describes the bit depth and type of the destination color components
dstFormat: Describes the format and byte packing of the destination pixels
dstBytesPerRow: number of bytes in the row of data
source: Source picture.

returns true if conversion was successful or false otherwise
See also:

- 48.5.4 Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean 8609
- 48.5.5 Convert(dest as picture, src as picture, options as dictionary) as boolean 8609
- 48.5.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean 8610

48.5.7 Convert(width as Integer, height as Integer, dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the convert methods to transform data.
Notes: width: Width of the image in pixels. (or taken from picture object)
height: Height of the image in pixels. (or taken from picture object)
dst: A memroyblock to the destination where the results will be written.
dstDepth: Describes the bit depth and type of the destination color components
dstFormat: Describes the format and byte packing of the destination pixels
dstBytesPerRow: number of bytes in the row of data
src: A memroyblock to the data to be converted.
srcDepth: Describes the bit depth and type of the source color components

srcFormat: Describes the format and byte packing of the source pixels
srcBytesPerRow: Number of bytes in the row of data

returns true if conversion was successful or false otherwise
See also:

- 48.5.4 Convert(dest as picture, src as memoryblock, srcDepth as Integer, srcLayout as Integer, srcBytesPerRow as Integer, options as dictionary) as boolean 8609
- 48.5.5 Convert(dest as picture, src as picture, options as dictionary) as boolean 8609
- 48.5.6 Convert(dst as memoryblock, dstDepth as Integer, dstLayout as Integer, dstBytesPerRow as Integer, src as picture, options as dictionary) as boolean 8610

48.5.8 GetProperty(key as Variant) as Variant

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Queries a property.
Notes: Returns nil if the value is nil or we had an error.

48.5.9 kColorSyncBestQuality as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncConvertQuality key.
Notes: do not coalesce profile transforms (default)

48.5.10 kColorSyncBlackPointCompensation as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the keys used for profile info and options.

48.5.11 kColorSyncConversion1DLut as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.12 kColorSyncConversion3DLut as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.13 kColorSyncConversionBPC as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.14 kColorSyncConversionChannelID as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.15 kColorSyncConversionGridPoints as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.16 kColorSyncConversionInpChan as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.17 kColorSyncConversionMatrix as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.18 kColorSyncConversionOutChan as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.19 kColorSyncConversionParamCurve0 as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.20 kColorSyncConversionParamCurve1 as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.21 kColorSyncConversionParamCurve2 as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.22 kColorSyncConversionParamCurve3 as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.23 kColorSyncConversionParamCurve4 as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.24 kColorSyncConvertQuality as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the transform options keys.

48.5.25 kColorSyncDraftQuality as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncConvertQuality key.
Notes: coalesce all transforms, do not interpolate

48.5.26 kColorSyncNormalQuality as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncConvertQuality key.
Notes: coalesce all transforms

48.5.27 kColorSyncPreferredCMM as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the transform options keys.
Notes: Value is a CSManagementModuleMBS object.

48.5.28 kColorSyncProfile as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the keys used for profile info and options.

48.5.29 kColorSyncRenderingIntent as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the keys used for profile info and options.

48.5.30 kColorSyncRenderingIntentAbsolute as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncRenderingIntent key.

48.5.31 kColorSyncRenderingIntentPerceptual as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncRenderingIntent key.

48.5.32 kColorSyncRenderingIntentRelative as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncRenderingIntent key.

48.5.33 kColorSyncRenderingIntentSaturation as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncRenderingIntent key.

48.5.34 kColorSyncRenderingIntentUseProfileHeader as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncRenderingIntent key.

48.5.35 kColorSyncTransformCreator as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the dictionary used with the kColorSyncTranformInfo keys.
Notes: name of the CMM that created the transform

48.5.36 kColorSyncTransformDeviceToDevice as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncTransformTag key.

48.5.37 kColorSyncTransformDeviceToPCS as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncTransformTag key.

48.5.38 kColorSyncTransformDstSpace as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the dictionary used with the kColorSyncTranformInfo keys.

48.5.39 kColorSyncTransformFullConversionData as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.40 kColorSyncTransformGamutCheck as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncTransformTag key.

48.5.41 kColorSyncTransformParametricConversionData as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.42 kColorSyncTransformPCSToDevice as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncTransformTag key.

48.5.43 kColorSyncTransformPCSToPCS as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the kColorSyncTransformTag key.

48.5.44 kColorSyncTransformSimplifiedConversionData as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the option keys.
Notes: For more information lookup details in Apples headers/documentation.

48.5.45 kColorSyncTransformSrcSpace as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the value constants for use with the dictionary used with the kColorSyncTranformInfo keys.

48.5.46 kColorSyncTransformTag as string

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: One of the keys used for profile info and options.

48.5.47 SetProperty(key as Variant, value as Variant)

MBS MacCF Plugin, Plugin Version: 10.5, Platform: macOS, Targets: All.

Function: Sets a property.

48.5.48 Constants

Constants

Constant	Value	Description
kColorSync16BitFloat	4	One of the possible data depth values constants. 16 bit floats.
kColorSync16BitInteger	3	One of the possible data depth values constants. 16 bit integers (short)
kColorSync1BitGamut	1	One of the possible data depth values constants. 1 bit graphics.
kColorSync32BitFloat	7	One of the possible data depth values constants. 32 bit float (single in Xojo)
kColorSync32BitInteger	5	One of the possible data depth values constants. 32 bit integer
kColorSync32BitNamedColorIndex	6	One of the possible data depth values constants. 32 bit integers with index of named color.
kColorSync8BitInteger	2	One of the possible data depth values constants. 8 bit graphics (this is used in Xojo Picture objects)
kColorSyncAlphaFirst	4	One of the alpha constants. For example, non-premultiplied ARGB
kColorSyncAlphaInfoMask	&h1F	One of the alpha constants. The bitmask for bitwise.BitAnd to extract the alpha value.
kColorSyncAlphaLast	3	One of the alpha constants. For example, non-premultiplied RGBA
kColorSyncAlphaNone	0	One of the alpha constants. For example, RGB.
kColorSyncAlphaNoneSkipFirst	6	One of the alpha constants. For example, XRGB.
kColorSyncAlphaNoneSkipLast	5	One of the alpha constants. For example, RBGX.
kColorSyncAlphaPremultipliedFirst	2	One of the alpha constants. For example, premultiplied ARGB
kColorSyncAlphaPremultipliedLast	1	One of the alpha constants. For example, premultiplied RGBA
kColorSyncByteOrder16Big	12288	One of the byte order constants. 16 bit, big endian.
kColorSyncByteOrder16Little	4096	One of the byte order constants. 16 bit, little endian.
kColorSyncByteOrder32Big	16384	One of the byte order constants. 32 bit, big endian.
kColorSyncByteOrder32Little	8192	One of the byte order constants. 32 bit, little endian.
kColorSyncByteOrderDefault	0	One of the byte order constants.
kColorSyncByteOrderMask	&h7000	One of the byte order constants.

Chapter 49

Common Types

49.1 Globals

49.1.1 MakeDoublePointMBS(x as Double, y as Double) as DoublePointMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new double point.
Notes: Returns nil on low memory.

49.1.2 MakeDoubleRectMBS(left as Double, top as Double, width as Double, height as Double) as DoubleRectMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new double rectangle.
Notes: Returns nil on low memory.

49.1.3 MakeIntegerPointMBS(x as Integer, y as Integer) as IntegerPointMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new integer point.
Notes: Returns nil on low memory.

49.1.4 MakeIntegerRectMBS(left as Integer, top as Integer, width as Integer, height as Integer) as IntegerRectMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new integer rectangle.
Notes: Returns nil on low memory.

49.2 class DoublePointMBS

49.2.1 class DoublePointMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a double point.

49.2.2 Methods

49.2.3 Move(deltax as Double, deltay as Double)

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the point.

49.2.4 Properties

49.2.5 x as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The X property of the point.
Notes: (Read and Write property)

49.2.6 y as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Y property of the point.
Notes: (Read and Write property)

49.3 class DoubleRectMBS

49.3.1 class DoubleRectMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a double rectangle.

49.3.2 Methods

49.3.3 Intersection(other as DoubleRectMBS) as DoubleRectMBS

MBS Util Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The intersection area of two rectangles.
Notes: Returns nil if no intersection was found.

49.3.4 Intersects(other as DoubleRectMBS) as boolean

MBS Util Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether two rectangle intersect.
Notes: Returns true if yes and no on false.

49.3.5 Move(deltax as Double, deltay as Double)

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the rectangle.

49.3.6 Properties

49.3.7 Bottom as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom property of the rectangle.
Notes: (Read and Write property)

49.3.8 height as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height property of the rectangle.
Notes: Setting this property changes the right property.
(Read and Write property)

49.3.9 left as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left property of the rectangle.
Notes: (Read and Write property)

49.3.10 right as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right property of the rectangle.
Notes: (Read and Write property)

49.3.11 Size as Double

MBS Util Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of this rectangle.
Notes: (Read only property)

49.3.12 top as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top property of the rectangle.
Notes: (Read and Write property)

49.3.13 width as Double

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width property of the rectangle.
Notes: Setting this property changes the bottom property.
(Read and Write property)

49.4 class IntegerPointMBS

49.4.1 class IntegerPointMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an integer point.

49.4.2 Methods

49.4.3 Move(deltax as Integer, deltay as Integer)

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the point.

49.4.4 Properties

49.4.5 x as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The X property of the point.
Notes: (Read and Write property)

49.4.6 y as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Y property of the point.
Notes: (Read and Write property)

49.5 class IntegerRectMBS

49.5.1 class IntegerRectMBS

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an integer rectangle.

49.5.2 Methods

49.5.3 Intersection(other as IntegerRectMBS) as IntegerRectMBS

MBS Util Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The intersection area of two rectangles.
Notes: Returns nil if no intersection was found.

49.5.4 Intersects(other as IntegerRectMBS) as boolean

MBS Util Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether two rectangle intersect.
Notes: Returns true if yes and no on false.

49.5.5 Move(deltax as Integer, deltay as Integer)

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the rectangle.

49.5.6 Properties

49.5.7 bottom as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom property of the rectangle.
Notes: (Read and Write property)

49.5.8 height as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height property of the rectangle.
Notes: Setting this property changes the right property.
(Read and Write property)

49.5.9 left as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left property of the rectangle.
Notes: (Read and Write property)

49.5.10 right as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right property of the rectangle.
Notes: (Read and Write property)

49.5.11 Size as Integer

MBS Util Plugin, Plugin Version: 7.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of this rectangle.
Notes: (Read only property)

49.5.12 top as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top property of the rectangle.
Notes: (Read and Write property)

49.5.13 width as Integer

MBS Util Plugin, Plugin Version: 2.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width property of the rectangle.
Notes: Setting this property changes the right property.
(Read and Write property)

Chapter 50

Compression

50.1 Globals

50.1.1 CompressBZip2MBS(buf as string,level as Integer) as string

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses the data and returns it as string.
Example:

```
Var s as string = "Hello World"
s=CompressBZip2MBS(s,9)
```

Notes: Compression level is going from 0 to 9, where 0 is no compression and 9 is best compression.

50.1.2 DecompressBZip2MBS(buf as string,size as Integer) as string

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses the data and returns it as string.
Example:

```
Var s as string = "Hello World"
s=CompressBZip2MBS(s,9)
s=DecompressBZip2MBS(s,10000)

MsgBox s
```

Notes: As DecompressZLibMBS can't know the size of the decompressed data you should give it a hint.

Best is to save the size of the decompressed data on compression. Else you must guess the size which can be 10 times the size of the compressed data.

50.1.3 CompressZLibMBS(Buffer as string, level as Integer = 9) as string

MBS Compression Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses the data and returns it as string.
Example:

```
Var s as string = "Hello World"
Var l as Integer = lenb(s)

Var c as string = CompressZLibMBS(s,9)
Var d as string = DecompressZLibMBS(c, l)

MsgBox d
```

Notes: Compression level is going from 0 to 9, where 0 is no compression and 9 is best compression.
Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

For result and temp memory this function needs maximum something like 110% of lenb(buf).

Version 18.5 and newer use level 9 as default.
See also:

- 50.1.4 CompressZLibMBS(Buffer as string, level as Integer, byref error as Integer) as string 8632

50.1.4 CompressZLibMBS(Buffer as string, level as Integer, byref error as Integer) as string

MBS Compression Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses the data and returns it as string.
Notes: Compression level is going from 0 to 9, where 0 is no compression and 9 is best compression.
Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

For result and temp memory this function needs maximum something like 110% of lenb(buf).
Blog Entries

- MBS Real Studio Plugins, version 12.4pr10

See also:

- 50.1.3 CompressZLibMBS(Buffer as string, level as Integer = 9) as string 8632

50.1.5 DecompressZLibMBS(Buffer as string, size as Integer = 0) as string

MBS Compression Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses the data and returns it as string.
Example:

```
Var s as string = "Hello World"
s=CompressZLibMBS(s,9)
s=DecompressZLibMBS(s,10000)

MsgBox s
```

Notes: As DecompressZLibMBS can't know the size of the decompressed data you should give it a hint. Best is to save the size of the decompressed data on compression. Else you must guess the size which can be 10 times the size of the compressed data.
Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

Version 18.5 and newer ignore size and manage it automatically.
See also:

- 50.1.6 DecompressZLibMBS(Buffer as string, size as Integer, byref error as Integer) as string 8633

50.1.6 DecompressZLibMBS(Buffer as string, size as Integer, byref error as Integer) as string

MBS Compression Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses the data and returns it as string.
Notes: As DecompressZLibMBS can't know the size of the decompressed data you should give it a hint. Best is to save the size of the decompressed data on compression. Else you must guess the size which can be 10 times the size of the compressed data.
Error: Optional parameter to receive the error code. (see error codes in ZLibCompressMBS)

Returned data is a string without known encoding.

Version 18.5 and newer ignore size and manage it automatically.
Blog Entries

- MBS Xojo Plugins, version 18.5pr8
- MBS Xojo Plugins, version 18.5pr7

- MBS Real Studio Plugins, version 12.4pr10

See also:

- 50.1.5 DecompressZLibMBS(Buffer as string, size as Integer = 0) as string 8633

50.1.7 CompressLZWMBS(buf as string) as string

MBS Compression Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses string using LZW algorithm.
Example:

```
Var s as string
Var b as BinaryStream
Var f as FolderItem
Var l as Integer

f=SpecialFolder.Desktop.Child("output.tiff")
b=f.OpenAsBinaryFile(false)
s=b.Read(b.Length)
b.Close

l=lenb(s)
s=CompressLZWMBS(s)

f=SpecialFolder.Desktop.Child("output.compressed.tiff")
b=f.CreateBinaryFile("text")
b.Write s
b.Close

s=DecompressLZWMBS(s,l)

f=SpecialFolder.Desktop.Child("output.uncompressed.tiff")
b=f.CreateBinaryFile("text")
b.Write s
b.Close
```

Notes: Please remember that the LZW algorithm can be implemented quite different. This one is byte based, uses 12bit offsets and a 4096 entry table.

Returns "" on low memory or Stack Overlow or Output buffer overlow.
(buffer and stack size may be increased on request for future plugin versions)
Blog Entries

- MBS Real Studio Plugins, version 11.3pr2

50.1.8 DecompressLZWMBS(buf as string, size as Integer) as string

MBS Compression Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses string using LZW algorithm.
Notes: Please remember that the LZW algorithm can be implemented quite different. This one is byte based, uses 12bit offsets and a 4096 entry table.

Returns "" on low memory or Stack Overlow or Output buffer overlow.
(buffer and stack size may be increased on request for future plugin versions)

Size of the uncompressed length is only a guess for how big the output buffer needs to be. Actual string returned will often be smaller.

50.2 class BZip2CompressMBS

50.2.1 class BZip2CompressMBS

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for bzip2 compression.
Notes: See also BZip2DecompressMBS class.
Blog Entries

- News from the MBS Xojo Plugins Version 24.3
- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.3
- MBS Xojo Plugins, version 24.3pr2
- MBS Xojo Plugins, version 24.3pr1

50.2.2 Methods

50.2.3 Close

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

50.2.4 Constructor(BufferPtr as Ptr, BufferSize as Integer)

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking an existing buffer.
Notes: For advanced users who use declares to preallocate the output buffer.
Stores Ptr in OutputPtr property for later access.
See also:

- 50.2.5 Constructor(BufferSize as Integer=20000) 8636

50.2.5 Constructor(BufferSize as Integer=20000)

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: The buffer size you specify is the output buffer size.
If this size is small, you need to flush with ProcessZip.
See also:

- 50.2.4 Constructor(BufferPtr as Ptr, BufferSize as Integer) 8636

50.2.6 EndZip

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finalizes the current compression stream.
Notes: You may check the Output property after this.
Error is set.

50.2.7 GetOutput as string

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the content of the output buffer.
Notes: The buffer is cleared after this function returns.

50.2.8 InitZip(level as Integer)

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the stream.
Notes: Level is from 0 to 9.

Error is set.

50.2.9 InputAvail as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of bytes available in the input buffer.

50.2.10 OutputSize as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of bytes available in the output buffer.

50.2.11 ProcessZip(Flush as boolean=false)

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does zip compression.
Notes: Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not empty after this call, you need to call it again, but empty the output buffer before.
Error is set.

If flush is true, the data is flushed to output. Using flush=true all the the time will slow down compression, so use it only on the end to clear the output buffers.

50.2.12 SetInput(data as Memoryblock) as boolean

MBS Compression Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if size is <= 0.

The data is read directly from the Memoryblock and the plugin keeps a reference until destructor runs or you set a new input data.
See also:

- 50.2.13 SetInput(data as ptr, Size as Integer) as boolean 8638
- 50.2.14 SetInput(data as string) as boolean 8638

50.2.13 SetInput(data as ptr, Size as Integer) as boolean

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if Size is <= 0.

The data is read directly from the Ptr and you need to keep reference to the memory and prevent it from being released too early.
See also:

- 50.2.12 SetInput(data as Memoryblock) as boolean 8637
- 50.2.14 SetInput(data as string) as boolean 8638

50.2.14 SetInput(data as string) as boolean

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if length is <= 0.

The data is read directly from the String and the plugin keeps a reference until destructor runs or you set a new input data.
See also:

- 50.2.12 SetInput(data as Memoryblock) as boolean 8637
- 50.2.13 SetInput(data as ptr, Size as Integer) as boolean 8638

50.2.15 Properties

50.2.16 Error as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

50.2.17 OutputBufferSize as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output buffer size used in the constructor.
Notes: (Read only property)

50.2.18 OutputPtr as Ptr

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer to the internal output buffer.
Notes: For advanced users to directly use the buffer for declares.
See OutputUsedSize property to see how many bytes are filled.
(Read only property)

50.2.19 OutputUsedSize as Integer

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes used in output buffer currently.
Notes: (Read only property)

50.2.20 TotalInput as UInt64

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.2.21 TotalOutput as UInt64

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.2.22 Version as String

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the used zlib library.
Notes: (Read only property)

50.2.23 Constants

Errors

Constant	Value	Description
kCONFIG_ERROR	-9	Indicates that the library has been improperly compiled on your platform – a major configuration error. Specifically, it means that sizeof(char), sizeof(short) and sizeof(int) are not 1, 2 and 4 respectively, as they should be. Note that the library should still work properly on 64-bit platforms which follow the LP64 programming model – that is, where sizeof(long) and sizeof(void*) are 8. Under LP64, sizeof(int) is still 4, so libbzip2, which doesn't use the long type, is OK. This should never happen with the plugin.
kDATA_ERROR	-4	Returned when a data integrity error is detected during decompression. Most importantly, this means when stored and computed CRCs for the data do not match. This value is also returned upon detection of any other anomaly in the compressed data.
kDATA_ERROR_MAGIC	-5	As a special case of kDATA_ERROR, it is sometimes useful to know when the compressed stream does not start with the correct magic bytes ('B' 'Z' 'h').
kFINISH_OK	3	In Compress, the requested flush/finish/nothing-special action was completed successfully.
kFLUSH_OK	2	In Compress, the requested flush/finish/nothing-special action was completed successfully.
kIO_ERROR	-6	Returned by Read and Write when there is an error reading or writing in the compressed file, and by ReadOpen and WriteOpen for attempts to use a file for which the error indicator (viz, ferror(f)) is set. On receipt of kIO_ERROR, the caller should consult errno and/or perror to acquire operating-system specific information about the problem.
kMEM_ERROR	-3	Returned when a request to allocate memory failed. Note that the quantity of memory needed to decompress a stream cannot be determined until the stream's header has been read. So Decompress and Read may return kMEM_ERROR even though some of the compressed data has been read. The same is not true for compression; once CompressInit or WriteOpen have successfully completed, kMEM_ERROR cannot occur.
kOK	0	The requested action was completed successfully.
kOUTBUFF_FULL	-8	Returned by BuffToBuffCompress and BuffToBuffDecompress to indicate that the output data will not fit into the output buffer provided.
kPARAM_ERROR	-2	Returned when a parameter to a function call is out of range or otherwise manifestly incorrect. As with kSEQUENCE_ERROR, this denotes a bug in the client code. The distinction between kPARAM_ERROR and kSEQUENCE_ERROR is a bit hazy, but still worth making.
kRUN_OK	1	In Compress, the requested flush/finish/nothing-special action was completed successfully.
kSEQUENCE_ERROR	-1	When using the library, it is important to call the functions in the correct sequence and with data structures (buffers etc) in the correct states. libbzip2 checks as much as it can to ensure this is happening, and returns kSEQUENCE_ERROR if not. Code which complies precisely with the function semantics, as detailed below, should never receive this value; such an event denotes buggy code which you should investigate.
kSTREAM_END	4	Compression of data was completed, or the logical stream end was detected during decompression.
kUNEXPECTED_EOF	-7	Returned by Read when the compressed file finishes before the logical end of stream is detected.

Commands

Constant	Value	Description
kFINISH	2	
kFLUSH	1	
kRUN	0	

50.3 class BZip2DecompressMBS

50.3.1 class BZip2DecompressMBS

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for bzip2 decompression.
Notes: See also BZip2CompressMBS class.
Blog Entries

- News from the MBS Xojo Plugins Version 24.3
- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.3
- MBS Xojo Plugins, version 24.3pr2
- MBS Xojo Plugins, version 24.3pr1

50.3.2 Methods

50.3.3 Close

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

50.3.4 Constructor(BufferPtr as Ptr, BufferSize as Integer)

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking an existing buffer.
Notes: For advanced users who use declares to preallocate the output buffer.
Stores Ptr in OutputPtr property for later access.
See also:

- 50.3.5 Constructor(BufferSize as Integer=20000) 8643

50.3.5 Constructor(BufferSize as Integer=20000)

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: The buffer size you specify is the output buffer size.

If this size is small, you need to flush with ProcessZip.
See also:

- 50.3.4 Constructor(BufferPtr as Ptr, BufferSize as Integer) 8643

50.3.6 EndZip

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finalizes the current decompression stream.
Notes: You may check the Output property after this.
Error is set.

50.3.7 GetOutput as string

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the content of the output buffer.
Notes: The buffer is cleared after this function returns.

50.3.8 InitZip

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the stream.
Notes: Error is set.

50.3.9 InputAvail as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of bytes available in the input buffer.

50.3.10 OutputSize as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of bytes available in the output buffer.

50.3.11 ProcessZip

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does zip decompression.
Notes: Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not "" after this call, you need to call it again, but empty the output buffer before.
Error is set.

50.3.12 SetInput(data as Memoryblock) as boolean

MBS Compression Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if size is <= 0.

The data is read directly from the Memoryblock and the plugin keeps a reference until destructor runs or you set a new input data.
See also:

- 50.3.13 SetInput(data as ptr, Size as Integer) as boolean 8645
- 50.3.14 SetInput(data as string) as boolean 8645

50.3.13 SetInput(data as ptr, Size as Integer) as boolean

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if Size is <= 0.

The data is read directly from the Ptr and you need to keep reference to the memory and prevent it from being released too early.
See also:

- 50.3.12 SetInput(data as Memoryblock) as boolean 8645
- 50.3.14 SetInput(data as string) as boolean 8645

50.3.14 SetInput(data as string) as boolean

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if length is <= 0.

The data is read directly from the String and the plugin keeps a reference until destructor runs or you set a new input data.
See also:

- 50.3.12 SetInput(data as Memoryblock) as boolean 8645
- 50.3.13 SetInput(data as ptr, Size as Integer) as boolean 8645

50.3.15 Properties

50.3.16 Error as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

50.3.17 OutputBufferSize as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output buffer size used in the constructor.
Notes: (Read only property)

50.3.18 OutputPtr as Ptr

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer to the internal output buffer.
Notes: For advanced users to directly use the buffer for declares.
See OutputUsedSize property to see how many bytes are filled.
(Read only property)

50.3.19 OutputUsedSize as Integer

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes used in output buffer currently.
Notes: (Read only property)

50.3.20 TotalInput as UInt64

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.3.21 TotalOutput as UInt64

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.3.22 Version as String

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the used zlib library.
Notes: (Read only property)

50.3.23 Constants

Errors

Constant	Value	Description
kCONFIG_ERROR	-9	Indicates that the library has been improperly compiled on your platform – a major configuration error. Specifically, it means that sizeof(char), sizeof(short) and sizeof(int) are not 1, 2 and 4 respectively, as they should be. Note that the library should still work properly on 64-bit platforms which follow the LP64 programming model – that is, where sizeof(long) and sizeof(void*) are 8. Under LP64, sizeof(int) is still 4, so libbzip2, which doesn't use the long type, is OK. This should never happen with the plugin.
kDATA_ERROR	-4	Returned when a data integrity error is detected during decompression. Most importantly, this means when stored and computed CRCs for the data do not match. This value is also returned upon detection of any other anomaly in the compressed data.
kDATA_ERROR_MAGIC	-5	As a special case of kDATA_ERROR, it is sometimes useful to know when the compressed stream does not start with the correct magic bytes ('B' 'Z' 'h').
kFINISH_OK	3	In Compress, the requested flush/finish/nothing-special action was completed successfully.
kFLUSH_OK	2	In Compress, the requested flush/finish/nothing-special action was completed successfully.
kIO_ERROR	-6	Returned by Read and Write when there is an error reading or writing in the compressed file, and by ReadOpen and WriteOpen for attempts to use a file for which the error indicator (viz, ferror(f)) is set. On receipt of kIO_ERROR, the caller should consult errno and/or perror to acquire operating-system specific information about the problem.
kMEM_ERROR	-3	Returned when a request to allocate memory failed. Note that the quantity of memory needed to decompress a stream cannot be determined until the stream's header has been read. So Decompress and Read may return kMEM_ERROR even though some of the compressed data has been read. The same is not true for compression; once CompressInit or WriteOpen have successfully completed, kMEM_ERROR cannot occur.

kOUTBUFF_FULL	-8	Returned by BuffToBuffCompress and BuffToBuffDecompress to indicate that the output data will not fit into the output buffer provided.
kPARAM_ERROR	-2	Returned when a parameter to a function call is out of range or otherwise manifestly incorrect. As with kSEQUENCE_ERROR, this denotes a bug in the client code. The distinction between kPARAM_ERROR and kSEQUENCE_ERROR is a bit hazy, but still worth making.
kRUN_OK	1	In Compress, the requested flush/finish/nothing-special action was completed successfully.
kSEQUENCE_ERROR	-1	When using the library, it is important to call the functions in the correct sequence and with data structures (buffers etc) in the correct states. libbzip2 checks as much as it can to ensure this is happening, and returns kSEQUENCE_ERROR if not. Code which complies precisely with the function semantics, as detailed below, should never receive this value; such an event denotes buggy code which you should investigate.
kSTREAM_END	4	Compression of data was completed, or the logical stream end was detected during decompression.
kUNEXPECTED_EOF	-7	Returned by Read when the compressed file finishes before the logical end of stream is detected.

Commands

Constant	Value	Description
kFINISH	2	
kFLUSH	1	
kRUN	0	

50.4 class BZip2FileMBS

50.4.1 class BZip2FileMBS

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to read and write bzip2 byte streams.
Notes: A .bz2 file is just the content of the original file compressed. No header.

50.4.2 Methods

50.4.3 Close

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

Lasterror and LasterrorMessage are set.

50.4.4 Flush

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flushes all pending output into the compressed file.
Notes: Lasterror and LasterrorMessage are set.

50.4.5 Open(file as folderitem, mode as string) as boolean

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a .bz2 file for reading or writing, using the given file path.
Notes: Returns false on failure.
Mode can be "r" for reading and "w" for writing. Or other values fopen accepts.

Lasterror and LasterrorMessage are set.

50.4.6 OpenString(data as string) as boolean

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a bzip compressed file from the given string.
Notes: Returns true on success and false on failure.

Lasterror and LasterrorMessage are set.

50.4.7 Read(ByteCount as Int64) as string

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data form a compresses file.
Notes: Lasterror and LasterrorMessage are set.

50.4.8 ReadByte as integer

MBS Compression Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a single byte.
Notes: Lasterror and LasterrorMessage are set.

50.4.9 ReadData(ByteCount as Int64) as Memoryblock

MBS Compression Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data into memoryblock.
Notes: Lasterror and LasterrorMessage are set.

50.4.10 Write(data as Memoryblock)

MBS Compression Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to the file and compresses it.
Notes: Lasterror and LasterrorMessage are set.
See also:

- 50.4.11 Write(data as string) 8652

50.4.11 Write(data as string)

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to the file and compresses it.
Notes: Lasterror and LasterrorMessage are set.
See also:

- 50.4.10 Write(data as Memoryblock) 8651

50.4.12 WriteByte(data as integer)

MBS Compression Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a single byte.
Notes: Lasterror and LasterrorMessage are set.

50.4.13 Properties

50.4.14 ErrorCode as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use Lasterror instead. **Function:** The last error code.
Notes: (Read and Write property)

50.4.15 ErrorMessage as String

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use LasterrorMessage instead.
Function: The last error message.
Notes: (Read and Write property)

50.4.16 Handle as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current bzip file handle.
Notes: (Read and Write property)

50.4.17 Lasterror as Integer

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error value.
Notes: (Read and Write property)

50.4.18 LasterrorMessage as String

MBS Compression Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message.
Notes: (Read and Write property)

50.4.19 Version as String

MBS Compression Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string indicating the library version.
Notes: (Read only property)

50.5 class GZipFileMBS

50.5.1 class GZipFileMBS

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to read and write gzip byte streams.
Notes: A .gz file is just the content of the original file compressed. No header.

See also ArchiveReaderMBS and ArchiveWriterMBS classes for more features and compression formats.

Xojo Developer Magazine

- 16.5, page 9: News

50.5.2 Methods

50.5.3 Adler32(start as UInt32, data as string) as UInt32

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Adler Checksum about a given string.
Notes: Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

50.5.4 Close

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

50.5.5 CloseForString as string

MBS Compression Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the file and returns the string.
Example:

```
Function GZIPStringWriteMBS(data as string) As string
Var g as new GZipFileMBS

if g.CreateForString then
g.Write data

Return g.CloseForString
end if
End Function
```

Notes: Only for use with CreateForString function.
Returns empty string on any error.

50.5.6 CRC32(start as UInt32, data as string) as UInt32

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Checksum about a given string.
Notes: Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

50.5.7 CreateForString as boolean

MBS Compression Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new gzip file in memory.
Example:

```
Function GZIPStringWriteMBS(data as string) As string
Var g as new GZipFileMBS

if g.CreateForString then
g.Write data

Return g.CloseForString
end if
End Function
```

Notes: Use with the CloseForString method to compress data in memory.
Returns false on any error and true on success.

50.5.8 Flush(flush as Integer)

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flushes all pending output into the compressed file.
Notes: The parameter flush is as in the zlib deflate() function.
Lasterror is set.
Flush should be called only when strictly necessary because it can degrade compression.

50.5.9 Open(file as folderitem, mode as string) as boolean

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a gzip (.gz) file for reading or writing.
Notes: The mode parameter is as in fopen ("rb" read binary or "wb" for write binary) but can also include a compression level ("wb9") or a strategy: 'f' for filtered data as in "wb6f", 'h' for Huffman only compression as in "wb1h".

Open can be used to read a file which is not in gzip format; in this case Read will directly read from the file without decompression.

Open returns NULL if the file could not be opened or if there was insufficient memory to allocate the (de)compression state; errno can be checked to distinguish the two cases (if errno is zero, the zlib error is Z_MEM_ERROR).

Returns false on any error and true on success.

50.5.10 OpenString(data as string) as boolean

MBS Compression Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a gzip (.gz) file for reading from a file.
Example:

```
Function GZipStringReadMBS(compressedData as string) As string
Var g as new GZipFileMBS

const BlockSize=1000000

if g.OpenString(compressedData) then

Var parts(-1) as string

while not g.eof
Var s as string=g.Read(BlockSize)
parts.Append s
wend

Return Join(parts,"")
end if
End Function
```

Notes: Same as Open, but reading from the given string.

50.5.11 Read(ByteCount as Int64) as string

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the given number of bytes into a string.
Notes: Returns "" on any error.
May return less bytes than requested.
Lasterror is set.

50.5.12 ReadByte as Integer

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads one byte from the file.

50.5.13 ReadData(ByteCount as Int64) as Memoryblock

MBS Compression Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the given number of bytes into a memoryblock.
Notes: Returns nil on any error.
May return less bytes than requested.
Lasterror is set.

50.5.14 Rewind

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the file position for reading files to the file start.
Notes: Equal to: position=0

50.5.15 SetParameter(level as Integer, strategy as Integer)

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dynamically update the compression level or strategy.
Notes: Lasterror is set.

Possible values:

FILTERED	1
HUFFMAN_ONLY	2
DEFAULT_STRATEGY	0

50.5.16 Write(data as Memoryblock)

MBS Compression Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a Memoryblock to a file.
Notes: Lasterror is set.
See also:

- 50.5.17 Write(data as string)

50.5.17 Write(data as string)

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a string to a file.
Notes: Note that encoding can make trouble as the raw bytes from the string are written.
Lasterror is set.
See also:

- 50.5.16 Write(data as Memoryblock) 8658

50.5.18 WriteByte(data as Integer)

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes one byte to the file.

50.5.19 Properties

50.5.20 Direct as Boolean

MBS Compression Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if file is being copied directly while reading, or false if file is a gzip stream being decompressed.
Notes: If the input file is empty, Direct will return true, since the input does not contain a gzip stream.
(Read only property)

50.5.21 EOF as Boolean

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if reading is on the end of the file.
Notes: Returns true on any error.
(Read only property)

50.5.22 ErrorCode as Integer

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last zlib error number.
Notes: If an error occurred in the file system and not in the compression library, errnum is set to Z_ERRNO

and the application may consult errno to get the exact error code. (errno is currently not available in Xojo)

Error codes:

Z_OK	0
Z_STREAM_END	1
Z_NEED_DICT	2
Z_ERRNO	-1
Z_STREAM_ERROR	-2
Z_DATA_ERROR	-3
Z_MEM_ERROR	-4
Z_BUF_ERROR	-5
Z_VERSION_ERROR	-6

(Read only property)

50.5.23 ErrorMessage as String

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the error message for the last error which occurred on the given compressed file.
Notes: (Read only property)

50.5.24 Handle as Integer

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current zlib file handle.
Notes: (Read and Write property)

50.5.25 Lasterror as Integer

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: 0 for success.
-1 for failure.
(Read and Write property)

50.5.26 Position as Integer

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current file position.
Notes: Not all positions are available.
e.g. on writing you can not move back.
Moving forward will add bytes with value 0 to the file.
Lasterror is set.
(Read and Write property)

50.5.27 Version as String

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the used zlib library.
Notes: (Read only property)

50.6 module LZ4MBS

50.6.1 module LZ4MBS

MBS Compression Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for LZ4 compression.
Example:

```
Var m As String = "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Lorem ipsum dolor site amat."

// make sure encoding is set
m = ConvertEncoding(m, encodings.UTF8)

// compress
Var c As String = LZ4MBS.Compress(m)

// decompress
Var d As String = LZ4MBS.Decompress(c)

// set encoding after decompressing
d = DefineEncoding(d, encodings.UTF8)

// and check
If d = m Then
MsgBox "Text match"
Else
MsgBox "Text doesn't match"
End If
```

50.6.2 Methods

50.6.3 Compress(InputData as MemoryBlock) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses a MemoryBlock.
Example:

```
// some 10 million zeros will compress well
Var m As New MemoryBlock(100000000)

// compress
Var c As MemoryBlock = LZ4MBS.Compress(m)

// decompress
Var d As MemoryBlock = LZ4MBS.Decompress(c)

// and check
If d.Size = m.size Then
MsgBox "Sizes match"
Else
MsgBox "Sizes don't match"
End If
```

Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns string on success.
See also:

- 50.6.4 Compress(InputData as Ptr, Size as Integer) as MemoryBlock 8663
- 50.6.5 Compress(InputData as string) as string 8664

50.6.4 Compress(InputData as Ptr, Size as Integer) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses data in ptr.
Notes: Same as memoryblock version, but with ptr parameter, so you can pass ptr with size.
Works also for passing memoryblocks and a custom size.
See also:

- 50.6.3 Compress(InputData as MemoryBlock) as MemoryBlock 8663
- 50.6.5 Compress(InputData as string) as string 8664

50.6.5 Compress(InputData as string) as string

MBS Compression Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses a string.
Example:

```
Var m As String = "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Lorem ipsum dolor site amat."

// make sure encoding is set
m = ConvertEncoding(m, encodings.UTF8)

// compress
Var c As String = LZ4MBS.Compress(m)

// decompress
Var d As String = LZ4MBS.Decompress(c)

// set encoding after decompressing
d = DefineEncoding(d, encodings.UTF8)

// and check
If d = m Then
MsgBox "Text match"
Else
MsgBox "Text doesn't match"
End If
```

Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns string on success.
See also:

- 50.6.3 Compress(InputData as MemoryBlock) as MemoryBlock 8663
- 50.6.4 Compress(InputData as Ptr, Size as Integer) as MemoryBlock 8663

50.6.6 CompressFast(InputData as MemoryBlock, Acceleration as Integer = 1) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses a memoryblock.
Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns string on success.

Same as Compress(), but allows selection of "acceleration" factor.
The larger the acceleration value, the faster the algorithm, but also the lesser the compression.

It's a trade-off. It can be fine tuned, with each successive value providing roughly +
textasciitilde 3% to speed.
An acceleration value of "1" is the same as regular Compress()
Values <= 0 will be replaced by AccelerationDefault (currently = 1).
See also:

- 50.6.7 CompressFast(InputData as Ptr, Size as Integer, Acceleration as Integer = 1) as MemoryBlock 8665
- 50.6.8 CompressFast(InputData as string, Acceleration as Integer = 1) as string 8665

50.6.7 CompressFast(InputData as Ptr, Size as Integer, Acceleration as Integer = 1) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses data in ptr.
Notes: Same as memoryblock version, but with ptr parameter, so you can pass ptr with size.
Works also for passing memoryblocks and a custom size.
See also:

- 50.6.6 CompressFast(InputData as MemoryBlock, Acceleration as Integer = 1) as MemoryBlock 8664
- 50.6.8 CompressFast(InputData as string, Acceleration as Integer = 1) as string 8665

50.6.8 CompressFast(InputData as string, Acceleration as Integer = 1) as string

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses a string.
Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns string on success.

Same as Compress(), but allows selection of "acceleration" factor.
The larger the acceleration value, the faster the algorithm, but also the lesser the compression.
It's a trade-off. It can be fine tuned, with each successive value providing roughly +
textasciitilde 3% to speed.
An acceleration value of "1" is the same as regular Compress()
Values <= 0 will be replaced by AccelerationDefault (currently = 1).
See also:

- 50.6.6 CompressFast(InputData as MemoryBlock, Acceleration as Integer = 1) as MemoryBlock 8664
- 50.6.7 CompressFast(InputData as Ptr, Size as Integer, Acceleration as Integer = 1) as MemoryBlock 8665

50.6.9 CompressHC(InputData as MemoryBlock, compressionLevel as Integer = 9) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses a memoryblock with high compression.
Example:

```
// lets make some data to compress
Var p As Picture = LogoMBS(500)
Var m As MemoryBlock = p.GetData(Picture.FormatBMP)

// compress
Var c1 As MemoryBlock = LZ4MBS.Compress(m)
Var c2 As MemoryBlock = LZ4MBS.CompressHC(m, LZ4MBS.CompressionLevelMin)
Var c3 As MemoryBlock = LZ4MBS.CompressHC(m, LZ4MBS.CompressionLevelDefault)
Var c4 As MemoryBlock = LZ4MBS.CompressHC(m, LZ4MBS.CompressionLevelOptMin)
Var c5 As MemoryBlock = LZ4MBS.CompressHC(m, LZ4MBS.CompressionLevelMax)

MsgBox _
Str(c1.Size)+" normal"+EndOfLine+_
Str(c2.size)+" min"+EndOfLine+_
Str(c3.size)+" default"+EndOfLine+_
Str(c4.size)+" opt min"+EndOfLine+_
Str(c5.size)+" max"
```

Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns string on success.

Compression level, with # being any value from 1 to 12. Higher values trade compression speed for compression ratio. Values above 12 are considered the same as 12. Recommended values are 1 for fast compression (default), and 9 for high compression. Speed/compression trade-off will vary depending on data to compress\. Decompression speed remains fast at all settings.
See also:

- 50.6.10 CompressHC(InputData as Ptr, Size as Integer, compressionLevel as Integer = 9) as MemoryBlock 8666
- 50.6.11 CompressHC(InputData as string, compressionLevel as Integer = 9) as string 8667

50.6.10 CompressHC(InputData as Ptr, Size as Integer, compressionLevel as Integer = 9) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses data in ptr.

Notes: Same as memoryblock version, but with ptr parameter, so you can pass ptr with size.
Works also for passing memoryblocks and a custom size.
See also:

- 50.6.9 CompressHC(InputData as MemoryBlock, compressionLevel as Integer = 9) as MemoryBlock 8666
- 50.6.11 CompressHC(InputData as string, compressionLevel as Integer = 9) as string 8667

50.6.11 CompressHC(InputData as string, compressionLevel as Integer = 9) as string

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses a string with high compression.
Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns string on success.

Compression level, with # being any value from 1 to 12. Higher values trade compression speed for compression ratio. Values above 12 are considered the same as 12. Recommended values are 1 for fast compression (default), and 9 for high compression. Speed/compression trade-off will vary depending on data to compress\. Decompression speed remains fast at all settings.
See also:

- 50.6.9 CompressHC(InputData as MemoryBlock, compressionLevel as Integer = 9) as MemoryBlock 8666
- 50.6.10 CompressHC(InputData as Ptr, Size as Integer, compressionLevel as Integer = 9) as MemoryBlock 8666

50.6.12 Decompress(CompressedData as MemoryBlock, UncompressedSize as Integer = 0) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses a MemoryBlock.
Example:

```
// some 10 million zeros will compress well
Var m As New MemoryBlock(100000000)

// compress
Var c As MemoryBlock = LZ4MBS.Compress(m)

// decompress
Var d As MemoryBlock = LZ4MBS.Decompress(c)
```

```
// and check
If d.Size = m.size Then
MsgBox "Sizes match"
Else
MsgBox "Sizes don't match"
End If
```

Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns memoryblock on success.

If UncompressedSize is zero, we try to determinate it.
If you know the size of decompressed data, please pass it to make function more efficient.
See also:

- 50.6.13 Decompress(CompressedData as Ptr, Size as Integer, UncompressedSize as Integer = 0) as MemoryBlock 8668
- 50.6.14 Decompress(CompressedData as string, UncompressedSize as Integer = 0) as string 8668

50.6.13 Decompress(CompressedData as Ptr, Size as Integer, UncompressedSize as Integer = 0) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses data in ptr.
Notes: Same as memoryblock version, but with ptr parameter, so you can pass ptr with size.
Works also for passing memoryblocks and a custom size.

If UncompressedSize is zero, we try to determinate it.
If you know the size of decompressed data, please pass it to make function more efficient.
See also:

- 50.6.12 Decompress(CompressedData as MemoryBlock, UncompressedSize as Integer = 0) as MemoryBlock 8667
- 50.6.14 Decompress(CompressedData as string, UncompressedSize as Integer = 0) as string 8668

50.6.14 Decompress(CompressedData as string, UncompressedSize as Integer = 0) as string

MBS Compression Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses a String.
Example:

```
Var m As String = "Lorem ipsum dolor sit amet, consectetur adipiscing elit. Lorem ipsum dolor site amat."

// make sure encoding is set
m = ConvertEncoding(m, encodings.UTF8)

// compress
Var c As String = LZ4MBS.Compress(m)

// decompress
Var d As String = LZ4MBS.Decompress(c)

// set encoding after decompressing
d = DefineEncoding(d, encodings.UTF8)

// and check
If d = m Then
MsgBox "Text match"
Else
MsgBox "Text doesn't match"
End If
```

Notes: Raises exception on failure (OutOfMemoryException or UnsupportedOperationException) and returns memoryblock on success.

If UncompressedSize is zero, we try to determinate it.
If you know the size of decompressed data, please pass it to make function more efficient.
See also:

- 50.6.12 Decompress(CompressedData as MemoryBlock, UncompressedSize as Integer = 0) as MemoryBlock 8667
- 50.6.13 Decompress(CompressedData as Ptr, Size as Integer, UncompressedSize as Integer = 0) as MemoryBlock 8668

50.6.15 LibVersion as string

MBS Compression Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version of the LZ4 library.

50.6.16 Constants

Constants

Constant	Value	Description
AccelerationDefault	1	The default acceleration level.
MaxInputSize	&h7E000000	Maximum input size LZ4 can handle.

Compression Levels

Constant	Value	Description
CompressionLevelDefault	9	Default compression level.
CompressionLevelMax	12	Maximum compression.
CompressionLevelMin	3	Minimum compression.
CompressionLevelOptMin	10	

50.7 module PackbitsMBS

50.7.1 module PackbitsMBS

MBS Compression Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A module with functions for packbits compression/decompression.
Example:

```
Var test As String = "Hellllo Woooooorld"

Var compressed As String = PackbitsMBS.Compress(test)
Var uncompressed As String = PackbitsMBS.Decompress(compressed)

Print uncompressed
Var Match As Boolean = test.Compare(uncompressed, ComparisonOptions.Binary) = 0

Print "Match: "+match.ToString
Break
```

Notes: see wikipedia:
http://en.wikipedia.org/wiki/PackBits

50.7.2 Methods

50.7.3 Compress(data as MemoryBlock) as MemoryBlock

MBS Compression Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses data in a memoryblock.
Notes: Can raise out of memory exception if running low on memory.
See also:

- 50.7.4 Compress(data as string) as string 8671
- 50.7.5 Compress(InputFile as FolderItem, OutputFile as FolderItem) as boolean 8672

50.7.4 Compress(data as string) as string

MBS Compression Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Ccompresses data in a string.
Notes: Can raise out of memory exception if running low on memory.
Returned data is a string without known encoding. If you plan to store it in a file, use binarystream class, not textoutputstream. If you plan to store it in a database, please use BLOB field. For storing in a text field, you may need to use Base64 encoding.
See also:

- 50.7.3 Compress(data as MemoryBlock) as MemoryBlock 8671
- 50.7.5 Compress(InputFile as FolderItem, OutputFile as FolderItem) as boolean 8672

50.7.5 Compress(InputFile as FolderItem, OutputFile as FolderItem) as boolean

MBS Compression Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compresses data in a file.
Notes: Returns true on success.
See also:

- 50.7.3 Compress(data as MemoryBlock) as MemoryBlock 8671
- 50.7.4 Compress(data as string) as string 8671

50.7.6 Decompress(data as MemoryBlock) as MemoryBlock

MBS Compression Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses data in a memoryblock.
Notes: Can raise out of memory exception if running low on memory.
See also:

- 50.7.7 Decompress(data as string) as string 8672
- 50.7.8 Decompress(InputFile as FolderItem, OutputFile as FolderItem) as boolean 8673

50.7.7 Decompress(data as string) as string

MBS Compression Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses data in a string.
Notes: Can raise out of memory exception if running low on memory.
Returned data is a string without known encoding.
See also:

- 50.7.6 Decompress(data as MemoryBlock) as MemoryBlock 8672
- 50.7.8 Decompress(InputFile as FolderItem, OutputFile as FolderItem) as boolean 8673

50.7.8 Decompress(InputFile as FolderItem, OutputFile as FolderItem) as boolean

MBS Compression Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decompresses data in a file.
Notes: Returns true on success.
See also:

- 50.7.6 Decompress(data as MemoryBlock) as MemoryBlock 8672
- 50.7.7 Decompress(data as string) as string 8672

50.8 class UnZipFileInfoMBS

50.8.1 class UnZipFileInfoMBS

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class keeps the metadata for a zip file.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr1

50.8.2 Properties

50.8.3 CompressedSize as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The compressed file size.
Notes: (Read and Write property)

50.8.4 CompressionMethod as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The compression method.
Notes: (Read and Write property)

50.8.5 CRC as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The 32bit file checksum.
Notes: (Read and Write property)

50.8.6 Date as Date

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The date as a Xojo date object.
Notes: (Read and Write property)

50.8.7 Day as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: day of the month - [1,31]
(Read and Write property)

50.8.8 DiskNumStart as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Disk number start.
Notes: (Read and Write property)

50.8.9 DosDate as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Last mod file date in DOS format.
Notes: (Read and Write property)

50.8.10 ExternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: External file attributes.
Notes: (Read and Write property)

50.8.11 Flag as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: general purpose bit flag.
Notes: A 16 bit value.

The flag is a bit field with various values.
Last bit of the flag is encryption state: value is 1 (odd) for encrypted and 0 (even) for unencrypted value.
The bit values 2 and 4 define compression level between 0 to 9.

Flag Value	Encryption	Compression Level
0	no	6
1	yes	6
2	no	9
3	yes	9
4	no	2
5	yes	2
6	no	1
7	yes	1

(Read and Write property)

50.8.12 Hour as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: hours since midnight - [0,23]
(Read and Write property)

50.8.13 InternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal file attributes.
Notes: (Read and Write property)

50.8.14 Minute as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: minutes after the hour - [0,59]
(Read and Write property)

50.8.15 Month as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: months since January - [0,11]
(Read and Write property)

50.8.16 Second as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: seconds after the minute - [0,59]
(Read and Write property)

50.8.17 SizeFileComment as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: file comment length.
Notes: (Read and Write property)

50.8.18 SizeFileExtra as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: extra field length.
Notes: (Read and Write property)

50.8.19 SizeFilename as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: filename length.
Notes: (Read and Write property)

50.8.20 UncompressedSize as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The uncompressed file size.
Notes: (Read and Write property)

50.8.21 Version as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version used to make the archive.
Notes: (Read and Write property)

50.8.22 VersionNeeded as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version needed to extract.
Notes: (Read and Write property)

50.8.23 Year as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: years - [1980..2044]
(Read and Write property)

50.9 class UnZipFilePositionMBS

50.9.1 class UnZipFilePositionMBS

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class contains information about a file in the zipfile.

50.9.2 Properties

50.9.3 NumberOfFile as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The index of the file.
Notes: (Read and Write property)

50.9.4 PositionInZipDirectory as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offset in zip file directory.
Notes: (Read and Write property)

50.10 class UnZipMBS

50.10.1 class UnZipMBS

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to decompress a zip archive.
Example:

```
// open zip archive
Var f as FolderItem=SpecialFolder.Desktop.Child("test.zip")
Var z as new UnZipMBS(f)

// let's start
z.GoToFirstFile
do

// get details on this file:
Var info as UnZipFileInfoMBS = z.FileInfo
Var name as string = z.FileName

if left(name,8) <>"__MACOSX" then // ignore Mac special files for metadata
z.OpenCurrentFile
if z.Lasterror=0 then

// create output file (if you want to support folders, this needs to be changed. See other examples)
Var outfile as folderitem = GetFolderItem(Name)
Var b as BinaryStream = BinaryStream.Create(outfile, true)
Var s as string

// now read 100 KB chunks and write them to new file
do
s=z.ReadCurrentFile(100000)
b.Write s
loop until lenb(s)=0

// cleanup
b.Close
z.CloseCurrentFile

end if
end if

// move to next file until we reach the end
z.GoToNextFile
loop until z.Lasterror<>0
```

Notes: This is a simple class which uses zlib and has some limitations:

- only deflate as compression method
- only one date per file is preserved
- no resource forks on Mac OS
- no text encoding handling
- no Apple or Microsoft extensions for special file flags or permissions.

See also ArchiveReaderMBS and ArchiveWriterMBS classes for more features and compression formats.

50.10.2 Methods

50.10.3 Close

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close a ZipFile.
Notes: Use CloseCurrentFile to close any open file before using Close.
Lasterror is UnZipOK on success.

50.10.4 CloseCurrentFile

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close the file in the zip archive opened with OpenCurrentFile.
Notes: Lasterror is set to UnzipCRCError if all the file was read but the CRC was not correct.

50.10.5 Comment as string

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the global comment string of the ZipFile.

50.10.6 CommentSize as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Size of the global comment of the zipfile.

50.10.7 CompareFileNames(filename1 as string, filename2 as string, CaseSensitive as Integer) as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compare two filename (fileName1,fileName2).
Notes: If iCaseSenisivity = 1, comparision is case sensitivity (like strcmp)
If iCaseSenisivity = 2, comparision is not case sensitivity (like strcmpi or strcasecmp)
If iCaseSenisivity = 0, case sensitivity is defaut of your operating system (like 1 on Unix, 2 on Windows)

50.10.8 Constructor(data as memoryblock)

MBS Compression Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a Zip file from data in the memoryblock.
Notes: The Handle property is zero on failure and not zero on success.
The memory block must have a known size.
See also:

- 50.10.9 Constructor(data as string) 8683
- 50.10.10 Constructor(file as folderitem) 8683
- 50.10.11 Constructor(file as folderitem, Offset as Integer) 8684

50.10.9 Constructor(data as string)

MBS Compression Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a Zip file from data in the string.
Notes: The Handle property is zero on failure and not zero on success.
See also:

- 50.10.8 Constructor(data as memoryblock) 8683
- 50.10.10 Constructor(file as folderitem) 8683
- 50.10.11 Constructor(file as folderitem, Offset as Integer) 8684

50.10.10 Constructor(file as folderitem)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a Zip file from a file.
Notes: The Handle property is zero on failure and not zero on success.

If you run this class in a thread, please make sure your thread has a big stack (1 MB or more). Else it will crash.
See also:

- 50.10.8 Constructor(data as memoryblock) 8683
- 50.10.9 Constructor(data as string) 8683
- 50.10.11 Constructor(file as folderitem, Offset as Integer) 8684

50.10.11 Constructor(file as folderitem, Offset as Integer)

MBS Compression Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a Zip file from a file starting at the offset.
Notes: The Handle property is zero on failure and not zero on success.
See also:

- 50.10.8 Constructor(data as memoryblock) 8683
- 50.10.9 Constructor(data as string) 8683
- 50.10.10 Constructor(file as folderitem) 8683

50.10.12 Count as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Total number of entries in the zip archive.
Notes: This value is stored in the zip archive as 16 bit integer, so maximum value is 65535. The plugin can extract more files than that number.

50.10.13 EOF as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns 1 if you are on the end of a file.
Notes: This is not to test whether you are on the end of the zip archive.

50.10.14 ExtractFiles(DestFolder as FolderItem, ExtractWithoutPath as boolean = false, Overwrite as Boolean = false, Password as String = """, byref ErrorMessage as String) as boolean

MBS Compression Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Simple function to extract all files from archive into folder.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.zip")

Var folder as FolderItem = SpecialFolder.Desktop.Child("test")
folder.CreateAsFolder

Var u as new UnZipMBS(f)
Var error as string
```

```
if u.ExtractFiles(folder, error) then
MsgBox "OK"
else
MsgBox "Error: "+error
end if
```

Notes: DestFolder: Destination folder.
ExtractWithoutPath: If true, all files are put in one folder.
Overwrite: Whether to allow overwriting files.
Password: The password to decrypt files.
ErrorMessage: An english error message.

Returns true on success or false on failure.
This function does not restore file permissions or other metadata.
And it may not work with non ASCII characters.

If you need more control over files being extracted, stored or error checking, please use example projects coming with plugin.

50.10.15 FileInfo as UnZipFileInfoMBS

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries file information for the current file.
Notes: Returns nil on any error.

50.10.16 FileName as string

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The filename of the current open file.
Notes: This name has no text encoding defined, as the plugin has no idea what text encoding was used. You may need to define the text encoding as being ASCII, Windows, MacRoman or whatever, when you work with this file name.
This name may include path components for folders.

50.10.17 GetLocalExtrafield as string

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read extra field from the current file (opened by unzOpenCurrentFile)

Notes: This is the local-header version of the extra field (sometimes, there is more info in the local-header version than in the central-header)

50.10.18 GoToFirstFile

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the current file of the zipfile to the first file.
Notes: Lasterror is UnzipOk on success.

50.10.19 GoToNextFile

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the current file of the zipfile to the next file.
Notes: Lasterror is UnzipOk if there is no problem and UnzipEndOfListError if the actual file was the latest.

50.10.20 LocateFile(filename as string, CaseSensitive as Integer)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Try locate the file filename in the zipfile.
Example:

```
// open zip archive
Var f as FolderItem=SpecialFolder.Desktop.Child("test.zip")
Var z as new UnZipMBS(f)

// let's search the file
z.LocateFile "test.rtf",2

if z.Lasterror = z.UnzipOk then
Var info as UnZipFileInfoMBS = z.FileInfo
MsgBox "OK: "+str(info.UncompressedSize)+" bytes"
else
MsgBox "Failed."
end if
```

Notes: For the CaseSensitivity signification, see CompareFileNames. Text encoding must match the text encoding of the files.

Lasterror is UnzipOk if the file is found. It becomes the current file, UnzipEndOfListError if the file is not

found.

50.10.21 OpenCurrentFile

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open for reading data the current file in the zipfile.
See also:

- 50.10.22 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean) 8687
- 50.10.23 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean, password as string) 8687
- 50.10.24 OpenCurrentFile(password as string) 8688

50.10.22 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same than OpenCurrentFile, but opens file for reading raw data (not uncompressed).
Notes: if raw=true the file data is returned uncompressed. If raw is false, it is decompressed for you.
Method will receive the method of compression.
level will receive the level of compression.
See also:

- 50.10.21 OpenCurrentFile 8687
- 50.10.23 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean, password as string) 8687
- 50.10.24 OpenCurrentFile(password as string) 8688

50.10.23 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean, password as string)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same than OpenCurrentFile, but opens file for reading raw data (not uncompressed) and with a password.
Notes: if raw=true the file data is returned uncompressed. If raw is false, it is decompressed for you.
Method will receive the method of compression.
level will receive the level of compression.
See also:

- 50.10.21 OpenCurrentFile 8687
- 50.10.22 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean) 8687
- 50.10.24 OpenCurrentFile(password as string) 8688

50.10.24 OpenCurrentFile(password as string)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open for reading data the current file in the zipfile.
Notes: password is a crypting password.
See also:

- 50.10.21 OpenCurrentFile 8687
- 50.10.22 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean) 8687
- 50.10.23 OpenCurrentFile(byref method as Integer, byref level as Integer, raw as boolean, password as string) 8687

50.10.25 Position as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current position in uncompressed data.

50.10.26 Position2 as UInt64

MBS Compression Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current position in compressed data.
Notes: This property is useful to show progressbar with progress over reading the original zip file.

50.10.27 ReadCurrentFile(size as Integer) as string

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read bytes from the current file (opened by OpenCurrentFile).
Notes: Returns "" on any error or on file end.

50.10.28 Properties

50.10.29 Handle as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal handle for the unzip object.
Notes: (Read and Write property)

50.10.30 Lasterror as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

50.10.31 FilePosition as UnZipFilePositionMBS

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current file position.
Notes: You can read or set the current file you edit.
(Read and Write computed property)

50.10.32 Offset as UInt64

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set the current index of the file in the zip directory.
Notes: If you set this value, you basicly move to another file.
(Read and Write computed property)

50.10.33 Constants

Constants

Constant	Value	Description
CompressionBestCompression	9	One of the compression level constants.
CompressionBestSpeed	1	One of the compression level constants.
CompressionDefault	-1	One of the compression level constants.
CompressionNo	0	One of the compression level constants.
MethodDeflated	8	One of the compression methods.
MethodNone	0	One of the compression methods.
StrategyDefault	0	One of the strategy constants.
StrategyFiltered	1	One of the strategy constants.
StrategyFixed	4	One of the strategy constants.
StrategyHuffmanOnly	2	One of the strategy constants.
StrategyRLE	3	One of the strategy constants.
UnzipBadUnZipFile	-103	One of the error constants.
UnzipCRCError	-105	One of the error constants.
UnzipEndOfListError	-100	One of the error constants.
UnzipInternalError	-104	One of the error constants.
UnzipOk	0	One of the error constants.
UnzipParameterError	-102	One of the error constants.

50.11 class ZipFileInfoMBS

50.11.1 class ZipFileInfoMBS

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class keeps the metadata for a zip file.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr1

50.11.2 Methods

50.11.3 SetDate(d as date)

MBS Compression Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the date with a Xojo date object.
Notes: A convenience function to make your life easier.

50.11.4 SetDateTime(d as dateTime)

MBS Compression Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the date with a Xojo dateTime object.
Notes: A convenience function to make your life easier.

50.11.5 Properties

50.11.6 Day as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: day of the month - [1,31]
(Read and Write property)

50.11.7 DosDate as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The date in the 32bit DOS format.
Notes: If dos_date = 0, the plugin will calculate it from the day, month, year, hour, minute and second properties.
(Read and Write property)

50.11.8 ExternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: external file attributes.
Notes: A 32 bit value.
(Read and Write property)

50.11.9 Hour as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: hours since midnight - [0,23]
(Read and Write property)

50.11.10 InternalFileAttributes as UInt32

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal file attributes.
Notes: A 16 bit value.
(Read and Write property)

50.11.11 Minute as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: minutes after the hour - [0,59]
(Read and Write property)

50.11.12 Month as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: months since January - [0,11]
(Read and Write property)

50.11.13 Second as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: seconds after the minute - [0,59]
(Read and Write property)

50.11.14 Year as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file time.
Notes: years - [1980..2044]
(Read and Write property)

50.12 class ZipMBS

50.12.1 class ZipMBS

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for writing to a zip file.
Notes: This is a simple class which uses zlib and has some limitations:

- only deflate as compression method
- only one date per file is preserved
- no resource forks on Mac OS
- no encoding handling
- no Apple or Microsoft extensions for special file flags or permissions.

But it works nice to provide a zip file to clients. For example a download of JPEG files in an archive with one download from Web Edition.

Be aware that you can't compress Mac applications with this class, as the we don't preserve permissions, so the decompressed file has not the right flags set to make it executable.

See also ArchiveReaderMBS and ArchiveWriterMBS classes for more features and compression formats.

- 9.5, page 11: News

50.12.2 Methods

50.12.3 Close(GlobalComment as string="")

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close the zipfile.

50.12.4 CloseFile

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close the current file in the zipfile.

50.12.5 CloseFileRaw(UncompressedSize as Integer, CRC32 as Integer)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close the current file in the zipfile.
Notes: For files opened with parameter raw=true in CreateFile
UncompressedSize and crc32 are value for the uncompressed size,

50.12.6 CompressFiles(ZipFile as FolderItem, SourceFolder as FolderItem, files() as string, Overwrite as Integer = 0, Password as string = """, CompressionLevel as Integer = 9, byref ErrorMessage as string) as Integer

MBS Compression Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Simple implementation of a batch file compression method.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.zip")
Var folder as FolderItem = SpecialFolder.Pictures // some folder with images
Var files() As string

Var c as Integer = folder.count
for i as Integer = 1 to c
Var file as FolderItem = folder.TrueItem(i)

if file.Directory then
// we go here for this example only one level deep

Var subfolder as FolderItem = file
Var cc as Integer = subfolder.count
for ii as Integer = 1 to cc
Var subfile as FolderItem = subfolder.TrueItem(ii)
if subfile.name.Right(4) = ".jpg" then
// here we pass a relative path
files.Append subfolder.name+"/"+subfile.name
```

```
end if
next

else

if file.name.Right(4) = ".jpg" then
// just padd a file name for files directly in source folder
files.Append file.name
end if
end if
next

Var ErrorMessage as string
Var e as Integer = ZipMBS.CompressFiles(f, folder, files, errorMessage)

MsgBox "Error: "+str(e)
```

Notes: ZipFile: The destination zip file.
SourceFolder: The source folder for the files.
files: relative file paths to source folder.
Overwrite: pass 1 to overwrite zip archive, 2 to append or 0 to not overwrite.
Password: the password for encryption.
CompressionLevel: The compression level to use from 0 (no compression) to 9 (maximum).
ErrorMessage: An english error message.

Returns 0 on success or error code on failure.

This is a simple function to compress a couple of files.
It does not preserve file permissions on Mac/Linux or other metadata.
And it may not work with non ASCII characters.

If you need more control over files being added, compression or error checking, please use example projects coming with plugin.

50.12.7 Constructor(file as folderitem, append as Integer = 0)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a zipfile.
Notes: If the file exist and append is AppendStatusCreateAfter, the zip will be created at the end of the file.
(useful if the file contain a self extractor code)
If the file exist and append is AppendStatusAddInZip, we will add files in existing zip (be sure you don't add file that doesn't exist)

If the zipfile cannot be opened, the handle value will be zero.

AppendStatusCreateAfter seems not to be working currently.

If you run this class in a thread, please make sure your thread has a big stack (1 MB or more). Else it will crash.

50.12.8 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string = """, ExtraGlobal as string = """, Comment as String = """, CompressionMethod as Integer = 8, Level as Integer = 9, Zip64 as boolean = false)

MBS Compression Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a file in the ZIP for writing.
Notes: filename: the filename in zip. This can include path information with slash as delimiter. e.g. "foldername/file.txt"
FileInfo: the file date.
ExtraLocal: contains the extrafield data the the local header.
ExtraGlobal: contains the extrafield data the the local header.
Comment: comment contain the comment string
CompressionMethod: contain the compression method (see Method* constants)
Level: contain the level of compression (a value from -1 to 9. see Compression* constants)
Zip64: If you want to have the zip file support more than 2 GB of data, set this to true to create a 64 bit file.
See also:

- 50.12.9 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean) 8698
- 50.12.10 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32) 8698
- 50.12.11 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32, versionMadeBy as UInt32, flagBase as UInt32) 8700

50.12.9 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean)

MBS Compression Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a file in the ZIP for writing with the possibility to write raw files.
Notes: filename: the filename in zip. This can include path information with slash as delimiter. e.g. "foldername/file.txt"
FileInfo: the file date.
ExtraLocal: contains the extrafield data the the local header.
ExtraGlobal: contains the extrafield data the the local header.
Comment: comment contain the comment string
CompressionMethod: contain the compression method (see Method* constants)
Level: contain the level of compression (a value from -1 to 9. see Compression* constants)
Zip64: If you want to have the zip file support more than 2 GB of data, set this to true to create a 64 bit file.
Raw: If true you read the file raw (the data will not be compressed).
See also:

- 50.12.8 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string = "", ExtraGlobal as string = "", Comment as String = "", CompressionMethod as Integer = 8, Level as Integer = 9, Zip64 as boolean = false) 8697
- 50.12.10 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32) 8698
- 50.12.11 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32, versionMadeBy as UInt32, flagBase as UInt32) 8700

50.12.10 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32)

MBS Compression Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a file in the ZIP for writing with the possibility to write raw files, chnage the compression and add a password.
Notes: filename: the filename in zip. This can include path information with slash as delimiter. e.g. "foldername/file.txt"
FileInfo: the file date.

ExtraLocal: contains the extrafield data the the local header.
ExtraGlobal: contains the extrafield data the the local header.
Comment: comment contain the comment string
CompressionMethod: contain the compression method (see Method* constants)
Level: contain the level of compression (a value from -1 to 9. see Compression* constants)
Zip64: If you want to have the zip file support more than 2 GB of data, set this to true to create a 64 bit file.
Raw: If true you read the file raw (the data will not be compressed).
windowBits: Parameters for zlib compression. (for example -15)
memLevel: Parameters for zlib compression. (for example 8 or 9)
Strategy: Parameters for zlib compression. (See Strategy* constants)
Password: The password to use.
crcForCtypting: the CRC value of the input file.

The windowBits parameter is the base two logarithm of the window size (the size of the history buffer). It should be in the range 8..15 for this version of the library. Larger values of this parameter result in better compression at the expense of memory usage. The default value is 15.

windowBits can also be -8..-15 for raw deflate. In this case, -windowBits determines the window size.

The memLevel parameter specifies how much memory should be allocated for the internal compression state. memLevel=1 uses minimum memory but is slow and reduces compression ratio; memLevel=9 uses maximum memory for optimal speed. The default value is 8. See zconf.h for total memory usage as a function of windowBits and memLevel.

The strategy parameter is used to tune the compression algorithm. Use the value StrategyDefault for normal data, StrategyFiltered for data produced by a filter (or predictor), StrategyHuffmanOnly to force Huffman encoding only (no string match), or StrategyRLE to limit match distances to one (run-length encoding). Filtered data consists mostly of small values with a somewhat random distribution. In this case, the compression algorithm is tuned to compress them better. The effect of StrategyFiltered is to force more Huffman coding and less string matching; it is somewhat intermediate between StrategyDefault and StrategyHuffmanOnly. StrategyRLE is designed to be almost as fast as StrategyHuffmanOnly, but give better compression for PNG image data. The strategy parameter only affects the compression ratio but not the correctness of the compressed output even if it is not set appropriately. StrategyFixed prevents the use of dynamic Huffman codes, allowing for a simpler decoder for special applications.

as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32, versionMadeBy as UInt32, flagBase as UInt32) 8700

50.12.11 CreateFile(Filename as string, FileInfo as ZipFileInfoMBS, ExtraLocal as string, ExtraGlobal as string, Comment as String, CompressionMethod as Integer, Level as Integer, Zip64 as boolean, Raw as boolean, WindowBits as Integer, MemLevel as Integer, Strategy as Integer, Password as string, crcForCtypting as UInt32, versionMadeBy as UInt32, flagBase as UInt32)

MBS Compression Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a file in the ZIP for writing with the possibility to write raw files, chnage the compression and add a password.
Notes: filename: the filename in zip. This can include path information with slash as delimiter. e.g. "foldername/file.txt"
FileInfo: the file date.
ExtraLocal: contains the extrafield data the the local header.
ExtraGlobal: contains the extrafield data the the local header.
Comment: comment contain the comment string
CompressionMethod: contain the compression method (see Method* constants)
Level: contain the level of compression (a value from -1 to 9. see Compression* constants)
Zip64: If you want to have the zip file support more than 2 GB of data, set this to true to create a 64 bit file.
Raw: If true you read the file raw (the data will not be compressed).
windowBits: Parameters for zlib compression. (for example -15)
memLevel: Parameters for zlib compression. (for example 8 or 9)
Strategy: Parameters for zlib compression. (See Strategy* constants)
Password: The password to use.
crcForCtypting: the CRC value of the input file.
versionMadeBy: value for Version made by field
flagBase: value for flag field (compression level info will be added)

The windowBits parameter is the base two logarithm of the window size (the size of the history buffer). It should be in the range 8..15 for this version of the library. Larger values of this parameter result in better compression at the expense of memory usage. The default value is 15.

windowBits can also be -8..-15 for raw deflate. In this case, -windowBits determines the window size.

The memLevel parameter specifies how much memory should be allocated for the internal compression state. memLevel=1 uses minimum memory but is slow and reduces compression ratio; memLevel=9 uses maximum memory for optimal speed. The default value is 8. See zconf.h for total memory usage as a function of windowBits and memLevel.

The strategy parameter is used to tune the compression algorithm. Use the value StrategyDefault for normal data, StrategyFiltered for data produced by a filter (or predictor), StrategyHuffmanOnly to force Huffman encoding only (no string match), or StrategyRLE to limit match distances to one (run-length encoding). Filtered data consists mostly of small values with a somewhat random distribution. In this case, the compression algorithm is tuned to compress them better. The effect of StrategyFiltered is to force more Huffman coding and less string matching; it is somewhat intermediate between StrategyDefault and StrategyHuffmanOnly. StrategyRLE is designed to be almost as fast as StrategyHuffmanOnly, but give better compression for PNG image data. The strategy parameter only affects the compression ratio but not the correctness of the compressed output even if it is not set appropriately. StrategyFixed prevents the use of dynamic Huffman codes, allowing for a simpler decoder for special applications.

50.12.12 Write(data as string)

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write data in the zipfile.
Notes: A file in the zip archive must have been created.

50.12.13 Properties

50.12.14 Handle as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal handle for the open zip archive.
Notes: If 0 the constructor failed to create the file.
(Read and Write property)

50.12.15 Lasterror as Integer

MBS Compression Plugin, Plugin Version: 8.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

50.12.16 Constants

Constants

Constant	Value	Description
AppendStatusAddInZip	2	One of the values for the constructor.
AppendStatusCreate	0	One of the values for the constructor.
AppendStatusCreateAfter	1	One of the values for the constructor.
CompressionBestCompression	9	One of the compression level constants.
CompressionBestSpeed	1	One of the compression level constants.
CompressionDefault	-1	One of the compression level constants.
CompressionNo	0	One of the compression level constants.
MethodDeflated	8	One of the compression method constants.
MethodNone	0	One of the compression method constants. Use this value for no compression.
StrategyDefault	0	One of the strategy modes.
StrategyFiltered	1	One of the strategy modes.
StrategyFixed	4	One of the strategy modes.
StrategyHuffmanOnly	2	One of the strategy modes.
StrategyRLE	3	One of the strategy modes.
ZipBadZipFile	-103	One of the error constants.
ZipInternalError	-104	One of the error constants.
ZipOk	0	One of the error constants.
ZipParameterError	-102	One of the error constants.

50.13 class ZLibCompressMBS

50.13.1 class ZLibCompressMBS

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for zlib compression.
Notes: See also ArchiveReaderMBS and ArchiveWriterMBS classes for more features and compression formats.

See ZLibDecompressMBS class to decompress what this class compressed.
Blog Entries

- MBS Xojo Plugins, version 26.2pr4
- News from the MBS Xojo Plugins Version 24.3
- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.3
- MBS Xojo Plugins, version 24.3pr1
- MBS Xojo / Real Studio Plugins, version 14.4pr3
- MBS REALbasic plug-ins version 9.4

50.13.2 Methods

50.13.3 Adler32(start as UInt32, data as string) as UInt32

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Adler Checksum about a given string.
Notes: Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

50.13.4 close

MBS Compression Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

50.13.5 Constructor(BufferPtr as Ptr, BufferSize as Integer)

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking an existing buffer.
Notes: For advanced users who use declares to preallocate the output buffer.
Stores Ptr in OutputPtr property for later access.
See also:

- 50.13.6 Constructor(BufferSize as Integer=20000) 8704

50.13.6 Constructor(BufferSize as Integer=20000)

MBS Compression Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Example:

```
// we do a one off compression
Var data as string = "Hello World Hello World"
Var z As new ZLibcompressMBS

z.InitZip(9)
call z.SetInput(data)
z.ProcessZip
z.EndZip

Var CompressedData as string = z.GetOutput

// and one off decompression
Var d As New ZLibDecompressMBS
d.InitZip
call d.SetInput(CompressedData)
d.ProcessZip
d.EndZip

Var UncompressedData as string = d.GetOutput

If UncompressedData = data Then
MessageBox "match"
Else
MessageBox "no match"
end if
```

Notes: The buffer size you specify is the output buffer size.
If this size is small, you need to flush with ProcessZip.
See also:

• 50.13.5 Constructor(BufferPtr as Ptr, BufferSize as Integer) 8704

50.13.7 CRC32(start as UInt32, data as string) as UInt32

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Checksum about a given string.
Notes: Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

50.13.8 EndZip

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finalizes the current compression stream.
Notes: You may check the Output buffer after this.
Error is set.

50.13.9 GetOutput as string

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the contents of the output buffer.
Notes: The buffer is cleared after this function returns.

50.13.10 InitZip(level as Integer)

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the stream.
Notes: Level is from 0 to 9.
Error is set.
See also:

• 50.13.11 InitZip(level as integer, Raw as Boolean) 8705

50.13.11 InitZip(level as integer, Raw as Boolean)

MBS Compression Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the stream.
Example:

```
// we do a one off compression
Var data as string = "Hello World Hello World"
Var z As new ZLibcompressMBS

const raw = true

z.InitZip(9, raw)
call z.SetInput(data)
z.ProcessZip
z.EndZip

Var CompressedData as string = z.GetOutput

// and one off decompression
Var d As New ZLibDecompressMBS
d.InitZip(raw)
call d.SetInput(CompressedData)
d.ProcessZip
d.EndZip

Var UncompressedData as string = d.GetOutput

If UncompressedData = data Then
MessageBox "match"
Else
MessageBox "no match"
end if
```

Notes: Level is from 0 to 9.
Error is set.
Raw: Wether to provide raw compression, without header.
See also:

- 50.13.10 InitZip(level as Integer) 8705

50.13.12 InputAvail as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of bytes available in the input buffer.

50.13.13 OutputSize as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of bytes available in the output buffer.

50.13.14 ProcessFinish

MBS Compression Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as process, but for finishing.
Notes: If error is zero after this function, please call it again.
Error is 1 if stream is at end, so you can call EndZip to finish.

50.13.15 ProcessZip(Flush as boolean=false)

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does zip compression.
Notes: Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not empty after this call, you need to call it again, but empty the output buffer before.
Error is set.

If flush is true, the data is flushed to output. Using flush=true all the the time will slow down compression, so use it only on the end to clear the output buffers.

50.13.16 SetInput(data as MemoryBlock) as boolean

MBS Compression Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if size is <= 0.

The data is read directly from the Memoryblock and the plugin keeps a reference until destructor runs or you set a new input data.
See also:

- 50.13.17 SetInput(data as ptr, Size as Integer) as boolean 8708
- 50.13.18 SetInput(data as string) as boolean 8708

50.13.17 SetInput(data as ptr, Size as Integer) as boolean

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if Size is <= 0.

The data is read directly from the Ptr and you need to keep reference to the memory and prevent it from being released too early.
See also:

- 50.13.16 SetInput(data as MemoryBlock) as boolean 8707
- 50.13.18 SetInput(data as string) as boolean 8708

50.13.18 SetInput(data as string) as boolean

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if length is <= 0.

The data is read directly from the String and the plugin keeps a reference until destructor runs or you set a new input data.#
See also:

- 50.13.16 SetInput(data as MemoryBlock) as boolean 8707
- 50.13.17 SetInput(data as ptr, Size as Integer) as boolean 8708

50.13.19 Properties

50.13.20 CRC as UInt32

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Adler32 CRC value of the uncompressed data.
Notes: (Read only property)

50.13.21 Error as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: Values:

Z_OK	0	(no error)
Z_STREAM_END	1	(Should be handles by the plugin inside)
Z_NEED_DICT	2	
Z_ERRNO	-1	
Z_STREAM_ERROR	-2	
Z_DATA_ERROR	-3	
Z_MEM_ERROR	-4	
Z_BUF_ERROR	-5	
Z_VERSION_ERROR	-6	

(Read and Write property)

50.13.22 ErrorMessage as String

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message for the last error.
Notes: (Read only property)

50.13.23 OutputBufferSize as Integer

MBS Compression Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output buffer size used in the constructor.
Notes: (Read only property)

50.13.24 OutputPtr as Ptr

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer to the internal output buffer.
Notes: For advanced users to directly use the buffer for declares.
See OutputUsedSize property to see how many bytes are filled.
(Read only property)

50.13.25 OutputUsedSize as Integer

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes used in output buffer currently.
Notes: (Read only property)

50.13.26 TotalInput as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.13.27 TotalOutput as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.13.28 Version as String

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the used zlib library.
Example:

```
Var z As New ZLibCompressMBS
MessageBox z.Version
```

Notes: (Read only property)

50.13.29 Constants

Data Types

Constant	Value	Description
kBLOCK	5	
kFINISH	4	
kFULL_FLUSH	3	
kNO_FLUSH	0	
kPARTIAL_FLUSH	1	
kSYNC_FLUSH	2	

Errors

Constant	Value	Description
kBUF_ERROR	-5	Negative values are errors, positive values are used for special but normal events.
kDATA_ERROR	-3	Negative values are errors, positive values are used for special but normal events.
kERRNO	-1	Negative values are errors, positive values are used for special but normal events.
kMEM_ERROR	-4	Negative values are errors, positive values are used for special but normal events.
kNEED_DICT	2	Negative values are errors, positive values are used for special but normal events.
kOK	0	Negative values are errors, positive values are used for special but normal events.
kSTREAM_END	1	Negative values are errors, positive values are used for special but normal events.
kSTREAM_ERROR	-2	Negative values are errors, positive values are used for special but normal events.
kVERSION_ERROR	-6	Negative values are errors, positive values are used for special but normal events.

Compression Strategies

Constant	Value	Description
kDEFAULT_STRATEGY	0	
kFILTERED	1	
kFIXED	4	
kHUFFMAN_ONLY	2	
kRLE	3	

Compression Methods

Constant	Value	Description
kDEFLATED	8	The deflate compression method (the only one supported in this version)

50.14 class ZLibDecompressMBS

50.14.1 class ZLibDecompressMBS

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for zlib decompression.
Example:

```
// we do a one off compression
Var data as string = "Hello World Hello World"
Var z As new ZLibcompressMBS

z.InitZip(9)
call z.SetInput(data)
z.ProcessZip
z.EndZip

Var CompressedData as string = z.GetOutput

// and one off decompression
Var d As New ZLibDecompressMBS
d.InitZip
call d.SetInput(CompressedData)
d.ProcessZip
d.EndZip

Var UncompressedData as string = d.GetOutput

If UncompressedData = data Then
MessageBox "match"
Else
MessageBox "no match"
end if
```

Notes: See also ArchiveReaderMBS and ArchiveWriterMBS classes for more features and compression formats.

See ZLibCompressMBS class to compress first.

50.14.2 Methods

50.14.3 Adler32(start as UInt32, data as string) as UInt32

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Adler Checksum about a given string.
Notes: Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

50.14.4 close

MBS Compression Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

50.14.5 Constructor(BufferPtr as Ptr, BufferSize as Integer)

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking an existing buffer.
Notes: For advanced users who use declares to preallocate the output buffer.
Stores Ptr in OutputPtr property for later access.
See also:

- 50.14.6 Constructor(BufferSize as Integer=20000) 8714

50.14.6 Constructor(BufferSize as Integer=20000)

MBS Compression Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: The buffer size you specify is the output buffer size.
If this size is small, you need to flush with ProcessZip.
See also:

- 50.14.5 Constructor(BufferPtr as Ptr, BufferSize as Integer) 8714

50.14.7 CRC32(start as UInt32, data as string) as UInt32

MBS Compression Plugin, Plugin Version: 4.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates a 32bit Checksum about a given string.
Notes: Set start to 0 for the first call.
Later you can pass the result as the new start value to add data to your checksum.

This function is part of the zlib library and given as a free utility function to this class.

50.14.8 EndZip

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finalizes the current decompression stream.
Notes: You may check the Output property after this.
Error is set.

50.14.9 GetOutput as string

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the content of the output buffer.
Notes: The buffer is cleared after this function returns.

50.14.10 InitZip

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the stream.
Notes: Error is set.
See also:

- 50.14.11 InitZip(Raw as Boolean) 8715

50.14.11 InitZip(Raw as Boolean)

MBS Compression Plugin, Plugin Version: 26.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the stream.
Example:

```
// we do a one off compression
Var data as string = "Hello World Hello World"
Var z As new ZLibcompressMBS

const raw = true

z.InitZip(9, raw)
call z.SetInput(data)
z.ProcessZip
z.EndZip

Var CompressedData as string = z.GetOutput

// and one off decompression
Var d As New ZLibDecompressMBS
d.InitZip(raw)
call d.SetInput(CompressedData)
d.ProcessZip
d.EndZip

Var UncompressedData as string = d.GetOutput

If UncompressedData = data Then
MessageBox "match"
Else
MessageBox "no match"
end if
```

Notes: Error is set.
Raw: Wether to provide raw compression, without header.
See also:

- 50.14.10 InitZip 8715

50.14.12 InputAvail as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes available in the input buffer.

50.14.13 OutputSize as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes available in the output buffer.

50.14.14 ProcessZip(Flush as boolean=false)

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Does zip decompression.
Notes: Reduces the size of the input buffer and writes new data to the output buffer.
If the input buffer is not "" after this call, you need to call it again, but empty the output buffer before.
Error is set.

If flush is true, the data is flushed to output. Using flush=true all the the time will slow down compression, so use it only on the end to clear the output buffers.

50.14.15 SetInput(data as Memoryblock) as boolean

MBS Compression Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if size is <= 0.

The data is read directly from the Memoryblock and the plugin keeps a reference until destructor runs or you set a new input data.
See also:

- 50.14.16 SetInput(data as ptr, Size as Integer) as boolean 8717
- 50.14.17 SetInput(data as string) as boolean 8718

50.14.16 SetInput(data as ptr, Size as Integer) as boolean

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if Size is <= 0.

The data is read directly from the Ptr and you need to keep reference to the memory and prevent it from being released too early.
See also:

- 50.14.15 SetInput(data as Memoryblock) as boolean 8717

- 50.14.17 SetInput(data as string) as boolean 8718

50.14.17 SetInput(data as string) as boolean

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fills the input buffer.
Notes: Returns true if successfull.
Returns false if length is <= 0.

The data is read directly from the String and the plugin keeps a reference until destructor runs or you set a new input data.
See also:

- 50.14.15 SetInput(data as Memoryblock) as boolean 8717
- 50.14.16 SetInput(data as ptr, Size as Integer) as boolean 8717

50.14.18 Properties

50.14.19 CRC as UInt32

MBS Compression Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CRC checksum.
Notes: (Read only property)

50.14.20 Error as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: Values:

(Read and Write property)

50.14.21 ErrorMessage as String

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message for the last error.
Notes: (Read only property)

Z_OK	0	(no error)
Z_STREAM_END	1	(Should be handles by the plugin inside)
Z_NEED_DICT	2	
Z_ERRNO	-1	
Z_STREAM_ERROR	-2	
Z_DATA_ERROR	-3	
Z_MEM_ERROR	-4	
Z_BUF_ERROR	-5	
Z_VERSION_ERROR	-6	

50.14.22 OutputBufferSize as Integer

MBS Compression Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output buffer size used in the constructor.
Notes: (Read only property)

50.14.23 OutputPtr as Ptr

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer to the internal output buffer.
Notes: For advanced users to directly use the buffer for declares.
See OutputUsedSize property to see how many bytes are filled.
(Read only property)

50.14.24 OutputUsedSize as Integer

MBS Compression Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes used in output buffer currently.
Notes: (Read only property)

50.14.25 TotalInput as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.14.26 TotalOutput as Integer

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bytes processed so far.
Notes: (Read and Write property)

50.14.27 Version as String

MBS Compression Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the used zlib library.
Example:

```
Var z As New ZLibDecompressMBS
MessageBox z.Version
```

Notes: (Read only property)

50.14.28 Constants

Data Types

Constant	Value	Description
kASCII	1	ASCII
kBINARY	0	Binary
kTEXT	1	Text
kUNKNOWN	2	Unknown

Compression Levels

Constant	Value	Description
kBEST_COMPRESSION	9	
kBEST_SPEED	1	
kDEFAULT_COMPRESSION	-1	
kNO_COMPRESSION	0	

Flush modes

Constant	Value	Description
kBLOCK	5	
kFINISH	4	
kFULL_FLUSH	3	
kNO_FLUSH	0	
kPARTIAL_FLUSH	1	
kSYNC_FLUSH	2	

Errors

Constant	Value	Description
kBUF_ERROR	-5	Negative values are errors, positive values are used for special but normal events.
kDATA_ERROR	-3	Negative values are errors, positive values are used for special but normal events.
kERRNO	-1	Negative values are errors, positive values are used for special but normal events.
kMEM_ERROR	-4	Negative values are errors, positive values are used for special but normal events.
kNEED_DICT	2	Negative values are errors, positive values are used for special but normal events.
kOK	0	Negative values are errors, positive values are used for special but normal events.
kSTREAM_END	1	Negative values are errors, positive values are used for special but normal events.
kSTREAM_ERROR	-2	Negative values are errors, positive values are used for special but normal events.
kVERSION_ERROR	-6	Negative values are errors, positive values are used for special but normal events.

Compression Strategies

Constant	Value	Description
kDEFAULT_STRATEGY	0	
kFILTERED	1	
kFIXED	4	
kHUFFMAN_ONLY	2	
kRLE	3	

Compression Methods

Constant	Value	Description
kDEFLATED	8	The deflate compression method (the only one supported in this version)

50.15 class ZStdMBS

50.15.1 class ZStdMBS

MBS Compression Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for ZStandard compression scheme.
Example:

```
Var InputText As String = "Hello World. Hello World. Hello World. Hello World. Just a test! Hello World. Testing üòù"

Var Compressed As String = ZStdMBS.Compress(InputText)
Var OutputText As String = ZStdMBS.Decompress(Compressed).DefineEncoding(encodings.UTF8)

Break
```

50.15.2 Methods

50.15.3 Compress(Data as MemoryBlock, CompressionLevel as Integer = 1) as MemoryBlock

MBS Compression Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compresses the given MemoryBlock.
Example:

```
Var InputText As String = "Hello World. Hello World. Hello World. Hello World. Just a test! Hello World. Testing üòù"
Var InputData As MemoryBlock = InputText

Var Compressed As MemoryBlock = ZStdMBS.Compress(InputData)
Var OutputData As MemoryBlock = ZStdMBS.Decompress(Compressed)
```

```
Var OutputText As String = DefineEncoding(OutputData, encodings.UTF8)

Break
```

Notes: CompressionLevel range from 1 to 22 where 22 is best with most memory usage.

Raises exception (UnsupportedOperationException or OutOfMemoryException) in case it fails. Please read message property for details.
See also:

- 50.15.4 Compress(Data as String, CompressionLevel as Integer = 1) as String 8723

50.15.4 Compress(Data as String, CompressionLevel as Integer = 1) as String

MBS Compression Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compresses the given string.
Example:

```
Var InputText As String = "Hello World. Hello World. Hello World. Hello World. Just a test! Hello World. Testing üòù"

Var Compressed As String = ZStdMBS.Compress(InputText)
Var OutputData As String = ZStdMBS.Decompress(Compressed).DefineEncoding(encodings.UTF8)

Break
```

Notes: CompressionLevel range from 1 to 22 where 22 is best with most memory usage.

Raises exception (UnsupportedOperationException or OutOfMemoryException) in case it fails. Please read message property for details.
See also:

- 50.15.3 Compress(Data as MemoryBlock, CompressionLevel as Integer = 1) as MemoryBlock 8722

50.15.5 Decompress(Data as MemoryBlock) as MemoryBlock

MBS Compression Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Decompresses MemoryBlock.
Example:

```
Var InputText As String = "Hello World. Hello World. Hello World. Hello World. Just a test! Hello World. Testing üòù"
Var InputData As MemoryBlock = InputText
```

```
Var Compressed As MemoryBlock = ZStdMBS.Compress(InputData)
Var OutputData As MemoryBlock = ZStdMBS.Decompress(Compressed)

Var OutputText As String = DefineEncoding(OutputData, encodings.UTF8)

Break
```

Notes: Raises exception (UnsupportedOperationException or OutOfMemoryException) in case it fails. Please read message property for details.
See also:

- 50.15.6 Decompress(Data as String) as String 8724

50.15.6 Decompress(Data as String) as String

MBS Compression Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Decompresses string.
Example:

```
Var InputText As String = "Hello World. Hello World. Hello World. Hello World. Just a test! Hello World. Testing üòù"

Var Compressed As String = ZStdMBS.Compress(InputText)
Var OutputData As String = ZStdMBS.Decompress(Compressed).DefineEncoding(encodings.UTF8)

Break
```

Notes: Raises exception (UnsupportedOperationException or OutOfMemoryException) in case it fails. Please read message property for details.
See also:

- 50.15.5 Decompress(Data as MemoryBlock) as MemoryBlock 8723

Chapter 51

Contacts

51.1 class CNChangeHistoryAddContactEventMBS

51.1.1 class CNChangeHistoryAddContactEventMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A contact was added.
Notes: Subclass of the CNChangeHistoryEventMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.1.2 Methods

51.1.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

51.1.4 Properties

51.1.5 contact as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The contact added.
Notes: (Read only property)

51.1.6 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The identifier for the container.
Notes: (Read only property)

51.2 class CNChangeHistoryAddGroupEventMBS

51.2.1 class CNChangeHistoryAddGroupEventMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A group was added.
Notes: Subclass of the CNChangeHistoryEventMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.9.2 Methods

51.9.3 additionalContactKeyDescriptors as CNKeyDescriptorMBS()

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Additional keys to include in the fetched contacts.

51.9.4 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Returns true on macOS 10.15 or iOS 13 or later.

51.9.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The constructor.

51.9.6 excludedTransactionAuthors as String()

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Exclude changes made by certain authors.
Notes: If set, transactions made by the specified authors will be excluded from the results. Use this, in conjunction with CNSaveRequest.transactionAuthor, to suppress processing of changes you already know about.

51.9.7 setAdditionalContactKeyDescriptors(additionalContactKeyDescriptors() as CNKeyDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Additional keys to include in the fetched contacts.
Notes: By default, only CNContactIdentifierKey will be fetched. If you would like to include additional key descriptors to process the contacts, include the key descriptors you need.

CNContactIdentifierKey will always be fetched, whether you request it or not.

51.9.8 setExcludedTransactionAuthors(setExcludedTransactionAuthors() as String)

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Exclude changes made by certain authors.
Notes: If set, transactions made by the specified authors will be excluded from the results. Use this, in conjunction with CNSaveRequest.transactionAuthor, to suppress processing of changes you already know about.

51.9.9 Properties

51.9.10 includeGroupChanges as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Set to true to also fetch group changes.
Notes: Default is false.
(Read and Write property)

51.9.11 mutableObjects as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: To return mutable contacts and groups.
Notes: If true returns mutable contacts and groups. Default is false.

(Read and Write property)

51.9.12 shouldUnifyResults as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns contact changes as unified contacts.
Notes: If true, returns unified contact history. Otherwise returns individual contact history. Default is true.

A unified contact is the aggregation of properties from a set of linked individual contacts.
If an individual contact is not linked then the unified contact is simply that individual contact.
(Read and Write property)

51.9.13 startingToken as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Request changes made after a certain point.
Notes: If non-nil, only changes made after this point in history will be returned.

If nil, a CNChangeHistoryDropEverythingEventMBS will be returned, followed by an add event for every contact and group currently in the contacts database.
(Read and Write property)

51.10 class CNChangeHistoryRemoveMemberFromGroupEventMBS

51.10.1 class CNChangeHistoryRemoveMemberFromGroupEventMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A contact was removed from a group.
Notes: Subclass of the CNChangeHistoryEventMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.10.2 Methods

51.10.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

51.10.4 Properties

51.10.5 group as CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The group.
Notes: (Read only property)

51.10.6 member as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The member removed.
Notes: (Read only property)

51.11 class CNChangeHistoryRemoveSubgroupFromGroupEventMBS

51.11.1 class CNChangeHistoryRemoveSubgroupFromGroupEventMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A subgroup was removed from a group.
Notes: Subclass of the CNChangeHistoryEventMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.11.2 Methods

51.11.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

51.11.4 Properties

51.11.5 group as CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The group.
Notes: (Read only property)

51.11.6 subgroup as CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The sub group.
Notes: (Read only property)

51.12 class CNChangeHistoryUpdateContactEventMBS

51.12.1 class CNChangeHistoryUpdateContactEventMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A contact was updated.
Notes: Subclass of the CNChangeHistoryEventMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.13.2 Methods

51.13.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

51.13.4 Properties

51.13.5 group as CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The group used.
Notes: (Read only property)

51.14 class CNContactFetchRequestMBS

51.14.1 class CNContactFetchRequestMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A contact fetch request.
Notes: The CNContactFetchRequest class defines fetching options to use while fetching contacts. It is required to have contact property key(s) to fetch a contact,Äôs properties. Use this class with the enumerateContactsWithFetchRequest method to execute the contact fetch request.

51.14.2 Methods

51.14.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.14.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The designated initializer for a fetch request that uses all keys.
Notes: Same as calling other Constructor and passing result of CNContactStoreMBS.AllFetchKeys function.
See also:

- 51.14.5 Constructor(keysToFetch() as CNKeyDescriptorMBS) 8741

51.14.5 Constructor(keysToFetch() as CNKeyDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The designated initializer for a fetch request that uses the specified keys.
Notes: keysToFetch: An array of contact property keys and/or key descriptors from contacts objects to be fetched in the returned contacts.
See also:

- 51.14.4 Constructor 8741

51.14.6 keysToFetch as CNKeyDescriptorMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The properties to fetch in the returned contacts.
Notes: An array of contact property keys or key descriptors from contact objects to be fetched in the returned contacts. For example, CNContactEmailAddressesKey, CNContactPhoneNumbersKey, CNContactFormatterStyleFullName fetches the contact,Äôs email addresses, phone numbers, and contact,Äôs full name with the contact formatter.

51.14.7 setKeysToFetch(keysToFetch() as CNKeyDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the properties to fetch in the returned contacts.

51.14.8 Properties

51.14.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContactFetchRequest object.
(Read and Write property)

51.14.10 mutableObjects as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether to return mutable contacts.
Notes: When the value of this property is true, the fetch returns CNMutableContact objects; otherwise it returns CNContact objects. The default value of this property is false.
(Read and Write property)

51.14.11 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The predicate to match contacts against.
Notes: Set the value of this property to nil to match all contacts or use the predicates define in CNContact

Predicates. Compound predicates are not supported.
(Read and Write property)

51.14.12 SortOrder as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The sort order for contacts.
Notes: The default sort order is CNContactSortOrderNone.
(Read and Write property)

51.14.13 unifyResults as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether to return linked contacts as unified contacts.
Notes: A unified contact is an aggregation of properties from a set of linked individual contacts. When the value of this property is true, the fetch returns unified contacts; otherwise, it returns individual contacts. The default value of this property is true.
(Read and Write property)

51.15 class CNContactFormatterMBS

51.15.1 class CNContactFormatterMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContactFormatter class defines the different formatting styles for contacts.
Example:

```
Var m as new CNMutableContactMBS
m.givenName = "Bob"
m.familyName = "Miller"

Var f as new CNContactFormatterMBS
Var style as Integer = CNContactFormatterMBS.CNContactFormatterStyleFullName
MsgBox CNContactFormatterMBS.stringFromContact(m, style)
```

Notes: This class handles international ordering and delimiting for the contact name components. When formatting many contacts, create an instance of this class and use the instance methods; otherwise use the class methods.

51.15.2 Methods

51.15.3 attributedStringFromContact(contact as CNContactMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Formats the contact name as an attributed string.
Notes: contact: The contact whose name is to be formatted.
attributes: The default attributes to use. For more information, see NSFormatter.

Returns the formatted contact name as an attributed string.

This method behaves similarly to stringFromContact, except that it returns an attributed string. It includes the attribute key CNContactPropertyAttribute whose attribute values are contact property keys, such as CNContactGivenNameKey. This identifies the name components in the formatted contact name.
See also:

- 51.15.4 attributedStringFromContact(contact as CNContactMBS, Style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

51.15.4 attributedStringFromContact(contact as CNContactMBS, Style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Formats the contact name as an attributed string.
Notes: contact: The contact whose name is to be formatted.
style: The formatting style to be used for the contact name.
attributes: The default attributes to use. For more information, see NSFormatter.

Returns the formatted contact name as an attributed string.

This method behaves similarly to stringFromContact, except that it returns an attributed string. It includes the attribute key CNContactPropertyAttribute, whose attribute values are contact property keys, such as CNContactGivenNameKey. This identifies the name components in the formatted contact name.
See also:

- 51.15.3 attributedStringFromContact(contact as CNContactMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS 8744

51.15.5 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.15.6 CNContactPropertyAttribute as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the attributes in the attribute dictionary.
Notes: If the attributes include the key CNContactPropertyAttribute whose attribute values are contact property keys, such as CNContactGivenNameKey. This identifies the name components in the formatted contact name.

51.15.7 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.15.8 delimiterForContact(contact as CNContactMBS) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the delimiter to use between name components.
Notes: contact: The contact whose name is to be formatted.

Returns the delimiter to use between name components.

If contact is nil, or if it has no first name, middle name, or last name, this method returns an empty string.

51.15.9 descriptorForRequiredKeysForStyle(Style as Integer) as CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the required key descriptor for the specified formatting style of the contact.
Notes: style: The formatting style to be used for contact name.

Returns the contact key descriptor for the formatting style.

Include this method with the keys to fetch when fetching contacts. To format multiple styles, you can include multiple key descriptors with the keys to fetch.

51.15.10 nameOrderForContact(contact as CNContactMBS) as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the display name order.
Notes: contact: The contact whose name is to be formatted.

Returns the display order to use when combining the given name and family name components.

For more information about display name orders, see CNContactDisplayNameOrder.

51.15.11 stringFromContact(contact as CNContactMBS) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Formats the contact name.
See also:

- 51.15.12 stringFromContact(contact as CNContactMBS, Style as Integer) as String 8747

51.15.12 stringFromContact(contact as CNContactMBS, Style as Integer) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the contact name, formatted with the specified formatter.
Notes: contact: The contact whose name is to be formatted.
style: The formatting style to be used for the contact name.
See also:

- 51.15.11 stringFromContact(contact as CNContactMBS) as String 8746

51.15.13 Properties

51.15.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContactFormatter object.
(Read and Write property)

51.15.15 Style as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The formatting style for the contact name.
Notes: The style for a contact formatter instance. The default value for this property is CNContactFormatterStyleFullName. For more information on formatting styles, see CNContactFormatterStyle.
(Read and Write property)

51.15.16 Constants

Display Name Order

Constant	Value	Description
CNContactDisplayNameOrderFamilyNameFirst	2	Display name order by family name first.
CNContactDisplayNameOrderGivenNameFirst	1	Display name order by given name first.
CNContactDisplayNameOrderUserDefault	0	Display name order by user default.

Styles

Constant	Value	Description
CNContactFormatterStyleFullName	0	Combines the contact name components into a full name.
CNContactFormatterStylePhoneticFullName	1	Combines the contact phonetic name components into a phonetic

51.16 class CNContactMBS

51.16.1 class CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a contact.
Notes: The CNContact is a thread-safe class that represents an immutable value object for contact properties, such as the first name and phone numbers of a contact. CNContact is similar to a complex Foundation collection, in that it has a mutable subclass (CNMutableContact). Neither the CNContact nor CNMutableContact class maintain a reference to their data store. Every contact has a unique ID, which you obtain using the identifier property.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.16.2 Methods

51.16.3 areKeysAvailable(keyDescriptors() as CNKeyDescriptorMBS) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Determines whether all contact property values for the specified keys are fetched.
Notes: The isKeyAvailable or areKeysAvailable methods are used where you are not certain of the keys that when fetched. If this method returns false, refetch the contact using the contact identifier and the keys you want to fetch. Accessing a property that was not fetched will throw an CNContactPropertyNotFetchedExceptionName exception.

51.16.4 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.16.5 CNContactBirthdayKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Birthday.

51.16.6 CNContactDatesKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Contact dates.

51.16.7 CNContactDepartmentNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Department name.

51.16.8 CNContactEmailAddressesKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Email address.

51.16.9 CNContactFamilyNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Family name.

51.16.10 CNContactGivenNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Given name.

51.16.11 CNContactIdentifierKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: The identifier.

51.16.12 CNContactImageDataAvailableKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Image data availability.
Available in OS X 10.12 or newer.

51.16.13 CNContactImageDataKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Image data.

51.16.14 CNContactInstantMessageAddressesKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Instant messages.

51.16.15 CNContactJobTitleKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Job title.

51.16.16 CNContactMiddleNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Middle name.

51.16.17 CNContactNamePrefixKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Name prefix.

51.16.18 CNContactNameSuffixKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Name suffix.

51.16.19 CNContactNicknameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Nickname.

51.16.20 CNContactNonGregorianBirthdayKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Non-Gregorian birthday.

51.16.21 CNContactNoteKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Note.

51.16.22 CNContactOrganizationNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Organization name.

51.16.23 CNContactPhoneNumbersKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Phone number.

51.16.24 CNContactPhoneticFamilyNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Phonetic family name.

51.16.25 CNContactPhoneticGivenNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Phonetic given name.

51.16.26 CNContactPhoneticMiddleNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Phonetic middle name.

51.16.27 CNContactPhoneticOrganizationNameKey as String

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic spelling of the contact's organization name.
Notes: Requires macOS 10.12 or newer.

51.16.28 CNContactPostalAddressesKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Postal address.

51.16.29 CNContactPreviousFamilyNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Previous family name.

51.16.30 CNContactPropertyNotFetchedExceptionName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Exception thrown when an accessed property was not fetched.
Notes: The plugin throws a NSExceptionMBS where the name is this value in case a property is not available.

51.16.31 CNContactRelationsKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Contact relations.

51.16.32 CNContactSocialProfilesKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Social profile.

51.16.33 CNContactThumbnailImageDataKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Thumbnail data.

51.16.34 CNContactTypeKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: Contact type.

51.16.35 CNContactUrlAddressesKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for contact properties.
Notes: URL Address.

51.16.36 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

51.16.37 contactRelations as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of labeled relations for the contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNContactRelation value. This property was previously known as related names.

51.16.38 copy as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the contact object.

51.16.39 dates as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array containing labeled Gregorian dates.
Notes: This property is an array of CNLabeledValue objects, each of which has an NSString label and NSDateComponents value. You can use this property to store Gregorian dates such as anniversaries. Day and month components are required and year is optional. The calendar component can be nil or NSCalendarIdentifierGregorian. All other date components are invalid and including them results in an NSError object that includes the key paths of the invalid components and the error code CNErrorCodeValidationConfigurationError.

51.16.40 descriptorForAllComparatorKeys as CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches all the keys required for the contact sort comparator.
Notes: This method implements the CNKeyDescriptor protocol and can be used as an array element when fetching keys for contacts.

51.16.41 emailAddresses as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of labeled email addresses for the contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and an NSString that contains the email address.

51.16.42 instantMessageAddresses as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of labeled IM addresses for the contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNInstantMessageAddress value.

51.16.43 isKeyAvailable(key as String) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Determines whether the contact property value for the specified key is fetched.
Notes: The isKeyAvailable or areKeysAvailable methods are used when you are not certain of the keys that were fetched. If this method returns false, refetch the contact using the contact identifier and the keys you want to fetch. Accessing a property that was not fetched will throw CNContactPropertyNotFetchedExceptionName.

51.16.44 isUnifiedWithContactWithIdentifier(contactIdentifier as String) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns true if the receiver was fetched as a unified contact and includes the contact having contactIdentifier in its unification.

51.16.45 localizedStringForKey(key as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a string containing the localized contact property name.
Notes: key: A string containing the contact property key.

Returns a localized string containing the contact property name.

This method returns a localized string for a contact property key. For example, the value of a Canadian CNContactPostalAddressesKey field would be ‚ÄúPostal Code‚Äù, while the value of a French one would be ‚ÄúCode Postal‚Äù.

51.16.46 mutableCopy as CNMutableContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a mutable copy of this contact.

51.16.47 phoneNumbers as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of labeled phone numbers for a contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNPhoneNumber value.

51.16.48 postalAddresses as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of labeled postal addresses for a contact.
Example:

```
Var c As CNContactMBS // your contact

Var postalAddresses() As CNLabeledValueMBS = c.postalAddresses
For Each postalAddresse As CNLabeledValueMBS In postalAddresses

Var p As CNPostalAddressMBS = postalAddresse.Value

MsgBox p.Street + EndOfLine + p.PostalCode + " " + p.City
Next
```

Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNPostalAddress value.

51.16.49 predicateForContactsInContainerWithIdentifier(containerIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the contacts in the specified container.
Notes: Returns a predicate that can be used to fetch contacts from CNContactStore.

51.16.50 predicateForContactsInGroupWithIdentifier(groupIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the contacts that are members in the specified group.
Notes: Returns a predicate that can be used to fetch contacts from CNContactStore.

51.16.51 predicateForContactsMatchingEmailAddress(emailAddress as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the contacts whose email address matches the specified value.
Example:

```
Var keysToFetch() As CNKeyDescriptorMBS
keysToFetch.append CNContactVCardSerializationMBS.descriptorForRequiredKeys

Var predicate As NSPredicateMBS = CNContactMBS.predicateForContactsMatchingEmailAddress("test@test.test")

Var error As NSErrorMBS
Var contacts() As CNContactMBS = m.unifiedContactsMatchingPredicate(predicate, keysToFetch, error)

If error <>Nil Then
List.AddRow "Error: "+error.LocalizedDescription
Else
List.AddRow Str(contacts.Ubound+1)+" contacts found"
End If
```

Notes: emailAddress: The email address to be matched.

Returns a predicate that you can use to fetch contacts from CNContactStoreMBS class.

Requires macOS 10.13 or newer.

51.16.52 predicateForContactsMatchingName(name as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the contacts matching the specified name.
Example:

```
Var keysToFetch() As CNKeyDescriptorMBS
keysToFetch.append CNContactVCardSerializationMBS.descriptorForRequiredKeys

Var predicate As NSPredicateMBS = CNContactMBS.predicateForContactsMatchingName("Peter")

Var error As NSErrorMBS
Var contacts() As CNContactMBS = m.unifiedContactsMatchingPredicate(predicate, keysToFetch, error)

If error <>Nil Then
List.AddRow "Error: "+error.LocalizedDescription
```

```
Else
List.AddRow Str(contacts.Ubound+1)+" contacts found"
End If
```

Notes: The name can contain any number of words.
Returns a predicate that can be used to fetch contacts from CNContactStore.

51.16.53 predicateForContactsMatchingPhoneNumber(phoneNumber as CNPhoneNumberMBS) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the contacts whose phone number matches the specified value.
Example:

```
Var keysToFetch() As CNKeyDescriptorMBS
keysToFetch.append CNContactVCardSerializationMBS.descriptorForRequiredKeys

Var phone As New CNPhoneNumberMBS("123456789,Ä¨")
Var predicate As NSPredicateMBS = CNContactMBS.predicateForContactsMatchingPhoneNumber(phone)

Var error As NSErrorMBS
Var contacts() As CNContactMBS = m.unifiedContactsMatchingPredicate(predicate, keysToFetch, error)

If error <>Nil Then
List.AddRow "Error: "+error.LocalizedDescription
Else
List.AddRow Str(contacts.Ubound+1)+" contacts found"
End If
```

Notes: Returns a predicate that you can use to fetch contacts from CNContactStoreMBS.

Requires macOS 10.13 or newer.

51.16.54 predicateForContactsWithIdentifiers(Identifiers() as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the contacts matching the specified identifiers.
Notes: Returns a predicate that can be used to fetch contacts from CNContactStore.

51.16.55 socialProfiles as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of labeled social profiles for a contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNSocialProfile value.

51.16.56 urlAddresses as CNLabeledValueMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of labeled URL addresses for a contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and an NSString value that contains the URL.

51.16.57 valueForKey(key as String) as Variant

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop & iOS.

Function: Queries value for a given key.
Example:

```
// your contact
Var c as CNContactMBS

Var value as Variant = c.valueForKey(c.CNContactPreviousFamilyNameKey)
if value = nil then
// empty
else
MsgBox value.StringValue
end if
```

Notes: Normally you use the properties, but if you loop over a list of keys, you can use this function to query value for key.

51.16.58 Properties

51.16.59 birthday as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A date component for the Gregorian birthday of the contact.

Notes: Birthdays are represented by this property, whose values are the relevant properties of an NSDateComponents object. Day and month components are required for this property, and year is optional. The calendar component can be nil or NSCalendarIdentifierGregorian. All other date components are invalid and including them results in an NSError object that includes the key paths of the invalid components and the error code CNErrorCodeValidationConfigurationError.
(Read only property)

51.16.60 contactType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An enum identifying the contact type.
Notes: Can be CNContactMBS.CNContactTypeOrganization or CNContactMBS.CNContactTypePerson.
(Read only property)

51.16.61 departmentName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the department associated with the contact.
Notes: (Read only property)

51.16.62 familyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The family name of the contact.
Notes: (Read only property)

51.16.63 givenName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The given name of the contact.
Notes: The given name is often known as the first name of the contact.
(Read only property)

51.16.64 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContact object.
(Read and Write property)

51.16.65 identifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A value that uniquely identifies a contact on the device.
Notes: It is recommended that you use the identifier when re-fetching the contact. An identifier can be persisted between the app launches. Note that this identifier only uniquely identifies the contact on the current device.
(Read only property)

51.16.66 imageData as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The profile picture of a contact.
Notes: It is recommended that you fetch this property only when you need to access its value, such as when you need to display the contact,Äôs profile picture.
(Read only property)

51.16.67 imageDataAvailable as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether a contact has a profile picture.
Notes: (Read only property)

51.16.68 jobTitle as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The contact,Äôs job title.
Notes: (Read only property)

51.16.69 middleName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The middle name of the contact.
Notes: (Read only property)

51.16.70 namePrefix as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name prefix of the contact.
Notes: (Read only property)

51.16.71 nameSuffix as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name suffix of the contact.
Notes: (Read only property)

51.16.72 nickname as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The nickname of the contact.
Notes: (Read only property)

51.16.73 nonGregorianBirthday as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A date component for the non-Gregorian birthday of the contact.
Notes: Non-Gregorian birthdays can be displayed using this property, whose values are the relevant properties of an NSDateComponents object. Day and month components are required; year and leap month are optional. The calendar component is also required and must be an NSCalendar object with an identifier other than NSCalendarIdentifierGregorian. For example, some supported calendars are Chinese, Hebrew, and Islamic. All other date components are invalid and including them results in an NSError object that includes the key paths of the invalid components and the error code CNErrorCodeValidationConfigurationError.
(Read only property)

51.16.74 note as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A string containing notes for the contact.
Notes: To fetch the note property in iOS 13 or later or macOS 16 or later, add the com.apple.developer.contacts.notes entitlement to your app. The entitlement requires permission from Apple to use, and you can,Äôt publicly distribute your app until you have permission to use it. For more information about adding the entitlement and getting permission, see com.apple.developer.contacts.notes.
(Read only property)

51.16.75 organizationName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the organization associated with the contact.
Notes: (Read only property)

51.16.76 phoneticFamilyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A string for the phonetic family name of the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs family (or last) name.
(Read only property)

51.16.77 phoneticGivenName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic given name of the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs given (or first) name.
(Read only property)

51.16.78 phoneticMiddleName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic middle name of the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs middle name.

(Read only property)

51.16.79 phoneticOrganizationName as String

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic name of the organization associated with the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs organization name.
Requires macOS 10.12 or newer.
(Read only property)

51.16.80 previousFamilyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A string for the previous family name of the contact.
Notes: The previous family name is often known as the maiden name of the contact.
(Read only property)

51.16.81 thumbnailImageData as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The thumbnail version of the contact,Äôs profile picture.
Notes: The thumbnailImageData property is derived from the imageData property, including cropping information from vCards or edits from contact viewing. It is recommended that you fetch this property only when you need to access its value, such as when you need to display the contact,Äôs profile thumbnail picture.
(Read only property)

51.16.82 Constants

Sort Orders

Constant	Value	Description
CNContactSortOrderFamilyName	3	Order by Family Name.
CNContactSortOrderGivenName	2	Order by Given Name.
CNContactSortOrderNone	0	Order by no order.
CNContactSortOrderUserDefault	1	Order by user preference.

Contact Types

Constant	Value	Description
CNContactTypeOrganization	1	The contact is an Organization.
CNContactTypePerson	0	The contact is a person.

51.17 class CNContactPickerMBS

51.17.1 class CNContactPickerMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The CNContactPicker object displays the popover-based system interface for selecting a contact.
Notes: The methods and properties of this class help you choose a contact or a contact's value, such as a phone number or email address, of a contact.

51.17.2 Methods

51.17.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.17.4 close

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Closes the popover.

51.17.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

51.17.6 Destructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The destructor.

51.17.7 displayedKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The keys to be displayed when a contact is expanded.
Notes: If no keys are provided, the picker selects contacts instead of values. For a list of possible keys, see Metadata Keys in CNContact.

51.17.8 setDisplayedKeys(keys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Set the keys to be displayed when a contact is expanded.
Notes: If no keys are provided, the picker selects contacts instead of values. For a list of possible keys, see Metadata Keys in CNContact.

51.17.9 showRelativeToRect(positioningRect as NSRectMBS, view as NSViewMBS, edge as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Shows the picker popover anchored to the specified view.
Notes: positioningRect: The content size of the popover.
positioningView: The view to which the popover should be positioned.
preferredEdge: The edge to which the popover should be anchored to. Can be MinYEdge, MinXEdge, MaxYEdge or MaxXEdge.

51.17.10 Properties

51.17.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: Value is a pointer to a CNContactPicker object.
(Read and Write property)

51.17.12 Events

51.17.13 DidClose

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Called when the contact picker,Äôs popover has closed.

51.17.14 didSelectContact(contact as CNContactMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Called after a contact has been selected by the user.
Notes: The contact may only be partial loaded and not have all fields available as the picker may not need/show all fields.

51.17.15 didSelectContactProperty(contactProperty as CNContactPropertyMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The event called when a contact property was selected.
Notes: The contact may only be partial loaded and not have all fields available as the picker may not need/show all fields.

51.17.16 WillClose

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Called when the contact picker,Äôs popover is about to close.

51.17.17 Constants

Edge Constants

Constant	Value	Description
MaxXEdge	2	
MaxYEdge	3	
MinXEdge	0	
MinYEdge	1	

51.18 class CNContactPickerViewControllerMBS

51.18.1 class CNContactPickerViewControllerMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: A view controller that displays an interface for picking contacts.
Notes: A CNContactPickerViewController allows the user to select one or more contacts (or their properties) from the list of contacts displayed in the contact view controller (CNContactViewController). The picker supports both single selection and multiselection of the contacts. The app using contact picker view does not need access to the user,Äôs contacts and the user will not be prompted for ,Äúgrant permission,Äù access. The app has access only to the user,Äôs final selection.
There are predefined predicates in this class that let you control the user selection of the contact. Changing the predicates only take effect before the view is presented.
Subclass of the NSViewControllerMBS class.

51.18.2 Methods

51.18.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Whether this class is available.
Notes: Requires iOS 9.0

51.18.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The constructor.

51.18.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The destructor.

51.18.6 Dismiss

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Dismisses the controller.

51.18.7 displayedPropertyKeys as String()

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The CNContact property keys to display in the contact detail card.
Notes: All the properties of the contact are displayed if this property is not set.

51.18.8 Present

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Presents the controller.

51.18.9 setdisplayedPropertyKeys(displayedPropertyKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: The CNContact property keys to display in the contact detail card.
Notes: All the properties of the contact are displayed if this property is not set.

51.18.10 Properties

51.18.11 isBeingPresented as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Whether the controller is presented.
Notes: Returns true if the dialog is visible.
(Read only property)

51.18.12 predicateForEnablingContact as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: A predicate to determine the contact selectability in the list of contacts.
Notes: You can set a value for this property to determine which contact should become selectable, such as emailAddresses.@count >0 to enable all the contacts that have an email address to become selectable. If no predicate is set for this property, all contacts become selectable. To learn about predicate syntax, see NSPredicateMBS.
(Read and Write property)

51.18.13 predicateForSelectionOfContact as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: A predicate to control the return of the selected contact.
Notes: This property determines whether a selected contact should be returned (when the predicate evaluates to TRUE), or a default action for the property should be performed (when the predicate evaluates to FALSE). By default the contact picker view controller displays the contact,Äôs detail card when a contact is selected. To learn about predicates, see NSPredicateMBS.
(Read and Write property)

51.18.14 predicateForSelectionOfProperty as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: A predicate to control the properties of the selected contact.
Notes: This property determines whether a selected contact should be returned (when the predicate evaluates to TRUE), or a default action for the property should be performed (when the predicate evaluates to FALSE). By default the contact picker view controller returns the first selected property of the contact. This predicate is evaluated on the CNContactProperty property that is being selected, such as (key == 'emailAddresses') AND (value LIKE '*@apple.com') to return email address of the contact if the address contains the string ,Äú@apple.com,Äù.
(Read and Write property)

51.18.15 Events

51.18.16 didCancel

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: In iOS, called when the user taps Cancel.
Notes: The picker is dismissed automatically after a contact or property is picked.

51.18.17 didSelectContact(contact as CNContactMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Called after a contact has been selected by the user.
Notes: This event is called when the user selects a single contact.

51.18.18 didSelectContactProperties(contactProperties() as CNContactPropertyMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Called after contact properties have been selected by the user.
Notes: This event is invoked when the user selects more than one property. Implementing this method configures the picker for multi-selection.

51.18.19 didSelectContactProperty(contactProperty as CNContactPropertyMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Called when a property of the contact has been selected by the user.
Notes: This event ia called when the user selects a single property of the contact.

51.18.20 didSelectContacts(contacts() as CNContactMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: iOS, Targets: iOS only.

Function: Called after contacts have been selected by the user.
Notes: This event is called when the user selects more than one contact. Implementing this method configures the picker for multi-selection.

51.19 class CNContactPropertyMBS

51.19.1 class CNContactPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContactProperty is a convenience class and returns a tuple or quadruple to a contact,Äôs property.
Notes: A property contains related information for a specific contact. A contact (an instance of CNContact) has properties, such as firstName, phoneNumber, and jobTitle. Each property is represented by an instance of CNContactProperty, which provides a tuple that can contain three or five values, depending on whether the property is a member of an array of labeled values. For example, the phoneNumbers property is a member of an array of labeled values, so the CNContactProperty tuple contains the contact, key, value, identifier, and label. For the givenName property, which is not contained in a labeled array, CNContactProperty returns a tuple that contains the contact, key, and value. The CNContactProperty class is used by the CNContactPicker to return the user's selected property.

51.19.2 Methods

51.19.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.19.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.19.5 copy as CNContactPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the social property object.

51.19.6 Properties

51.19.7 Contact as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: CNContact property of the selected contact.
Notes: This property is used for properties that may or may not be in labeled arrays.
(Read only property)

51.19.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContactProperty object.
(Read and Write property)

51.19.9 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The identifier of the labeled value in the array of labeled.
Notes: Identifier is used only for properties in labeled arrays. If the property is not an array of labeled values, the value of the identifier is "".
(Read only property)

51.19.10 Key as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The key of the contact property.
Notes: This property is used for properties that may or may not be in labeled arrays.
(Read only property)

51.19.11 Label as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The label of the labeled value of the property array.
Notes: Labeled property is used only for properties that are in labeled arrays. If the property is not an

array of labeled values, the value of the label is "".
(Read only property)

51.19.12 Value as Variant

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The value of the property.
Notes: This property is used for properties that may or may not be in labeled arrays.
(Read only property)

51.20 class CNContactRelationMBS

51.20.1 class CNContactRelationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContactRelation class defines an immutable value object representing a contact related to another.
Notes: This is a thread-safe class.

51.20.2 Methods

51.20.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.20.4 CNLabelContactRelationAssistant as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Assistant.

51.20.5 CNLabelContactRelationBrother as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Brother

51.20.6 CNLabelContactRelationChild as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Child

51.20.7 CNLabelContactRelationDaughter as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Daugther
for macOS 10.13 or newer.

51.20.8 CNLabelContactRelationFather as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Father

51.20.9 CNLabelContactRelationFriend as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Friend

51.20.10 CNLabelContactRelationManager as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Manager

51.20.11 CNLabelContactRelationMother as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Mother

51.20.12 CNLabelContactRelationParent as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Parent

51.20.13 CNLabelContactRelationPartner as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Partner

51.20.14 CNLabelContactRelationSister as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Sister

51.20.15 CNLabelContactRelationSon as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Son
for macOS 10.13 or newer.

51.20.16 CNLabelContactRelationSpouse as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the relation values.
Notes: Spouse

51.20.17 Constructor(name as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Initialize a class instance with the name of the related contact.

51.20.18 contactRelationWithName(name as string) as CNContactRelationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new contact relation with a name.

51.20.19 copy as CNContactRelationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the contact relation object.

51.20.20 Properties

51.20.21 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContactRelation object.
(Read and Write property)

51.20.22 Name as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the related contact.
Notes: (Read only property)

51.21 class CNContactStoreMBS

51.21.1 class CNContactStoreMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContactStore class is a thread-safe class that can fetch and save contacts, groups, and containers.
Notes: The CNContactStore class provides ways to execute fetch and save requests. There are a few recommended ways you can implement these requests in your app to load contacts:

- Fetch only the contact properties that will be used.
- When fetching all contacts and caching the results, first fetch all contacts identifiers, then fetch batches of detailed contacts by identifiers as required.
- To aggregate several contacts fetches, first collect a set of unique identifiers from the fetches. Then fetch batches of detailed contacts by those unique identifiers.
- If you cache the fetched contacts, groups, or containers, you need to refetch these objects (and release the old cached objects) when CNContactStoreDidChangeNotification is posted.

Because CNContactStore fetch methods perform I/O, it,Äôs recommended that you avoid using the main thread to execute fetches.

Your app must be code signed to see contacts.

Warning: Do not use in macOS 10.11 or earlier due to bugs, which have been fixed in macOS 10.12.

51.21.2 Methods

51.21.3 allContacts(byref error as NSErrorMBS) as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Searches all contacts.
Notes: Same as ContactsWithFetchRequest function with key list from CNContactStoreMBS.AllFetchKeys function.

51.21.4 AllFetchKeys as String()

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns list of all keys used by the plugin to query all properties for contacts.

51.21.5 authorizationStatusForEntityType(entityType as Integer = 0) as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the current authorization status to access the contact data.
Notes: entityType: Set to CNEntityType, e.g. CNEntityTypeContacts.

Returns the current authorization status to access the contact data.

Based on the authorization status, your application might display or hide its UI elements that access any Contacts API. This method is thread-safe and will not block your application. To see different authorization status, see CNAuthorizationStatus.

51.21.6 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.21.7 CNContactStoreDidChangeNotification as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The notification posted when changes occur in another CNContactStore.

51.21.8 CNErrorDomain as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The error domain for NSErrorMBS.

51.21.9 CNErrorUserInfoAffectedRecordIdentifiersKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A key for the NSError userInfo dictionary.
Notes: When available an array of one or more NSString objects for which the error code applies.

51.21.10 CNErrorUserInfoAffectedRecordsKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A key for the NSError userInfo dictionary.
Notes: When available an array of one or more CNContact, CNGroup or CNContainer objects for which the error code applies.

51.21.11 CNErrorUserInfoKeyPathsKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A key for the NSError userInfo dictionary.
Notes: An array of key paths associated with a given error. For validation errors this will contain key paths to specific object properties.

51.21.12 CNErrorUserInfoValidationErrorsKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A key for the NSError userInfo dictionary.
Notes: An array of NSErrors for CNErrorCodeValidationMultipleErrors.

51.21.13 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.21.14 ContactsWithFetchRequest(fetchRequest as CNContactFetchRequestMBS, byref error as NSErrorMBS) as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns all contacts matching a contact fetch request.
Notes: fetchRequest: The contact fetch request that specifies the search criteria.
error: Error information, if an error occurred.

This method waits until the enumeration is finished. If there are no results, the method returns an empty array.
This can be used to fetch all contacts without keeping all of them at once in memory because this is expensive.

Your app must be code signed to see contacts.

51.21.15 containersMatchingPredicate(predicate as NSPredicateMBS, byref error as NSErrorMBS) as CNContainerMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches all containers matching the specified predicate.
Notes: predicate: The predicate to use to fetch matching containers. Set this property to nil to match all containers.
error: Error information, if an error occurred.

Returns an array of CNContainer objects that match the predicate.

A container holds a collection of contacts, a contact (each contact can be in only one container). CardDAV accounts usually have only one container of contacts. Exchange accounts may have multiple containers, where each container represents an Exchange folder.

This method returns an empty array when no matching container is found. In case of an error this method returns nil. You should use only the predicates defined CNContainer class. Compound predicates are not supported.

51.21.16 defaultContainerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the identifier of the default container.
Notes: This identifier can be used to fetch a default container. A default container is where the user wants new contacts to be added implicitly.

51.21.17 Destructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The destructor.

51.21.18 enumerateContactsWithFetchRequest(fetchRequest as CNContactFetchRequestMBS, byref error as NSErrorMBS, tag as Variant = nil) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value that indicates whether the enumeration of all contacts matching a contact fetch request executed successfully.
Notes: fetchRequest: The contact fetch request that specifies the search criteria.
error: Error information, if an error occurred.

Calls enumerateContactsWithFetchRequest event for each contact found.

Returns true if enumeration of all contacts matching a contact fetch request executes successfully; otherwise, false.

This method waits until the enumeration is finished. If there are no results, the event is not called and the method returns true.

This can be used to fetch all contacts without keeping all of them at once in memory because this is expensive.
See also:

- 51.21.37 enumerateContactsWithFetchRequest(contact as CNContactMBS, byref stop as boolean, tag as Variant) 8793

51.21.19 enumeratorForChangeHistoryFetchRequest(request as CNChangeHistoryFetchRequestMBS, byref error as NSErrorMBS) as CNFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: Enumerate a change history fetch request.
Notes: Executes the given fetch request and returns an enumerator for the results.
This may prevent all events from being loaded into memory at once.

An exception may be thrown if an error occurs during enumeration.

request: A description of the events to fetch.
error: If the fetch fails, contains an NSErrorMBS object with more information.

Returns an enumerator of the events matching the result, or nil if there was an error.

51.21.20 enumeratorForContactFetchRequest(request as CNContactFetchRequestMBS, byref error as NSErrorMBS) as CNFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: Enumerate a contact fetch request.
Notes: Executes the given fetch request and returns an enumerator for the results.
This may prevent all records from being loaded into memory at once.

An exception may be thrown if an error occurs during enumeration.

request: A description of the records to fetch.
error: If the fetch fails, contains an NSErrorMBS object with more information.

An enumerator of the records matching the result, or nil if there was an error.

51.21.21 executeSaveRequest(saveRequest as CNSaveRequestMBS, byref Error as NSErrorMBS) as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Executes a save request and returns success or failure.
Notes: saveRequest: The save request to execute.

error: Error information, if an error occurred.

Returns true if the save request executes successfully; otherwise, false.

It is recommended that you do not access objects in the save request from other threads when it is in the process of being executed, because it may modify the contacts in the process. A save request only applies the changes to the objects. If there are overlapping changes with multiple or concurrent CNSaveRequest then the last saved change wins.

Warning: Do not use in macOS 10.11 or earlier due to bugs, which have been fixed in macOS 10.12.

51.21.22 groupsByName(name as String, byref error as NSErrorMBS) as CNGroupMBS()

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Looks for groups with matching names.
Notes: Returns empty array if nothing found.
Comparison is localized case insensitive.

51.21.23 groupsForContact(contact as CNContactMBS, byref error as NSErrorMBS) as CNGroupMBS()

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Searches all groups for a given contact.

51.21.24 groupsMatchingPredicate(predicate as NSPredicateMBS, byref error as NSErrorMBS) as CNGroupMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches all groups matching the specified predicate.
Notes: predicate: The predicate to use to fetch the matching groups. Set predicate to nil to match all groups.
error: Error information, if an error occurred.

Returns an array of CNGroup objects that match the predicate.

This method returns an empty array when no matching groups are found. If an error occurs, this method returns nil. You should use only the predicates defined in CNGroup class predicates. Compound predicates are not supported. Contacts may be members of one or more groups, depending upon the account they come from.

51.21.25 requestAccessForEntityType(entityType as Integer = 0, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Requests access to the user's contacts.
Notes: entityType: Set to CNEntityTypeContacts.

Users are able to grant or deny access to contact data on a per-application basis. Request access to contact data by calling requestAccessForEntityType method. This will not block your application while the user is being asked for permission. The user will only be prompted the first time access is requested; any subsequent CNContactStore calls will use the existing permissions. The requestAccessForEntityType event is later called. This method is optional when CNContactStore is used in the background thread. If this method is not used, CNContactStore may block your application while the user is asked for access permission.

Your app must be code signed to see contacts.
See also:

- 51.21.38 requestAccessForEntityType(granted as boolean, error as NSErrorMBS, tag as Variant) 8793

51.21.26 unifiedContactsMatchingPredicate(predicate as NSPredicateMBS, byref error as NSErrorMBS) as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches all unified contacts matching the specified predicate.
Notes: predicate: The predicate to match against.
error: Error information, if an error occurred.

Returns an array of CNContact objects matching the predicate.

If no matches are found, this method returns an empty array (or nil in case of error). Use only the predicates from the CNContact class predicates. Compound predicates are not supported by this method. Due to unification, the returned contacts may have different identifiers than you specify. To fetch all contacts, use enumerateContactsWithFetchRequest.

Same as other unifiedContactsMatchingPredicate function with key list from CNContactStoreMBS.AllFetchKeys

function.
See also:

- 51.21.27 unifiedContactsMatchingPredicate(predicate as NSPredicateMBS, keysToFetch() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS() 8790

51.21.27 unifiedContactsMatchingPredicate(predicate as NSPredicateMBS, keysToFetch() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches all unified contacts matching the specified predicate.
Notes: predicate: The predicate to match against.
keys: The properties to fetch in the returned CNContact objects. You should fetch only the properties that you plan to use. Note that you can combine contact keys and contact key descriptors.
error: Error information, if an error occurred.

Returns an array of CNContact objects matching the predicate.

If no matches are found, this method returns an empty array (or nil in case of error). Use only the predicates from the CNContact class predicates. Compound predicates are not supported by this method. Due to unification, the returned contacts may have different identifiers than you specify. To fetch all contacts, use enumerateContactsWithFetchRequest.
See also:

- 51.21.26 unifiedContactsMatchingPredicate(predicate as NSPredicateMBS, byref error as NSErrorMBS) as CNContactMBS() 8789

51.21.28 unifiedContactWithIdentifier(identifier as string, byref error as NSErrorMBS) as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches a unified contact for the specified contact identifier.
Notes: identifier: The identifier of the contact to fetch.
error: Error information, if an error occurred.

Returns an unified contact matching or linked to the identifier.

Due to unification, the returned contact may have a different identifier, than you specify. To fetch a batch of contacts by identifiers use predicateForContactsWithIdentifiers with unifiedContactsMatchingPredicate. It is recommended to fetch only the properties that will be used. You can combine contact keys and contact

key descriptors together.

Same as other unifiedContactWithIdentifier function with key list from CNContactStoreMBS.AllFetchKeys function.
See also:

- 51.21.29 unifiedContactWithIdentifier(identifier as string, keys() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS 8791

51.21.29 unifiedContactWithIdentifier(identifier as string, keys() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Fetches a unified contact for the specified contact identifier.
Notes: identifier: The identifier of the contact to fetch.
keys: The properties to fetch in the returned CNContact object.
error: Error information, if an error occurred.

Returns an unified contact matching or linked to the identifier.

Due to unification, the returned contact may have a different identifier, than you specify. To fetch a batch of contacts by identifiers use predicateForContactsWithIdentifiers with unifiedContactsMatchingPredicate. It is recommended to fetch only the properties that will be used. You can combine contact keys and contact key descriptors together.
See also:

- 51.21.28 unifiedContactWithIdentifier(identifier as string, byref error as NSErrorMBS) as CNContactMBS 8790

51.21.30 unifiedMeContact(byref error as NSErrorMBS) as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: Queries an unified contact for the user.
Example:

```
Var ContactStore as CNContactStoreMBS // your store
Var error As NSErrorMBS
Var contact As CNContactMBS = ContactStore.unifiedMeContact(Error)

If contact <>nil then
MsgBox contact.familyName
Else
MsgBox "No contact?"
```

End If

Notes: Same as unifiedMeContactWithKeysToFetch function with key list from CNContactStoreMBS.AllFetchKeys function.

51.21.31 unifiedMeContactWithKeysToFetch(keys() as CNKeyDescriptorMBS, byref error as NSErrorMBS) as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Queries an unified contact for the user.

51.21.32 Properties

51.21.33 currentHistoryToken as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop & iOS.

Function: Retrieve the current history token.
Notes: If you are fetching contacts or change history events, you should use the token on the CNFetchResultMBS class instead.
(Read only property)

51.21.34 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContactStore object.
(Read and Write property)

51.21.35 Events

51.21.36 DidChange

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The event posted when changes occur in another CNContactStore.

51.21.37 enumerateContactsWithFetchRequest(contact as CNContactMBS, byref stop as boolean, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The event called by enumerateContactsWithFetchRequest for each new contact found.
See also:

- 51.21.18 enumerateContactsWithFetchRequest(fetchRequest as CNContactFetchRequestMBS, byref error as NSErrorMBS, tag as Variant = nil) as Boolean 8786

51.21.38 requestAccessForEntityType(granted as boolean, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The request for access completed.
Notes: Set granted to true if the user allows access and error is nil.
See also:

- 51.21.25 requestAccessForEntityType(entityType as Integer = 0, tag as Variant = nil) 8789

51.21.39 Constants

Constants

Constant	Value	Description
CNAuthorizationStatusAuthorized	3	One of the authorization status values the user can grant for an app to the specified entity type. The application is authorized to access contact data.
CNAuthorizationStatusDenied	2	One of the authorization status values the user can grant for an app to the specified entity type. The user explicitly denied access to contact data for the application.
CNAuthorizationStatusNotDetermined	0	One of the authorization status values the user can grant for an app to the specified entity type. The user has not yet made a choice regarding whether the applicatio access contact data.
CNAuthorizationStatusRestricted	1	One of the authorization status values the user can grant for an app to the specified entity type. The application is not authorized to access contact data. The user c change this application,Äôs status, possibly due to active restrictions s parental controls being in place.

Contact Types

Constant	Value	Description
CNEntityTypeContacts	0	Contacts

Error Codes

Constant	Value	Description
CNErrorCodeAuthorizationDenied	100	Authentication denied error.
CNErrorCodeCommunicationError	1	Communication error.
CNErrorCodeContainmentCycle	202	Code containment cycle error.
CNErrorCodeContainmentScope	203	Code containment scope error.
CNErrorCodeDataAccessError	2	Data access error.
CNErrorCodeInsertedRecordAlreadyExists	201	Record already exists.
CNErrorCodeParentRecordDoesNotExist	204	The contact does not exist error.
CNErrorCodePolicyViolation	500	Policy validation error.
CNErrorCodePredicateInvalid	400	Invalid predicate error.
CNErrorCodeRecordDoesNotExist	200	Record not found.
CNErrorCodeRecordIdentifierInvalid	205	Record identifier not valid.
CNErrorCodeValidationConfigurationError	302	Configuration validation error.
CNErrorCodeValidationMultipleErrors	300	Multiple validation error.
CNErrorCodeValidationTypeMismatch	301	Type mismatch validation error.

51.22 class CNContactsUserDefaultsMBS

51.22.1 class CNContactsUserDefaultsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContactsUserDefaults class defines properties used to access the user defaults for a contact.

51.22.2 Methods

51.22.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.22.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.22.5 sharedDefaults as CNContactsUserDefaultsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The singleton instance of the CNContactsUserDefaults class.

51.22.6 Properties

51.22.7 countryCode as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An ISO country code.
Notes: ISO is the default country code for phone numbers. This is determined by the device,Äôs SIM card or the operating system,Äôs configured language.

(Read only property)

51.22.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContactsUserDefaults object.
(Read and Write property)

51.22.9 sortOrder as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Default sorting order by name.
Notes: Sort order is determined by the operating system,Äôs configured language or overridden by the user.
(Read only property)

51.23 class CNContactVCardSerializationMBS

51.23.1 class CNContactVCardSerializationMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContactVCardSerialization supports vCard representation for the given set of contacts.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.23.2 Methods

51.23.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.23.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

51.23.5 contactsWithData(Data as MemoryBlock, byref error as NSErrorMBS) as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the contacts from the vCard data.

51.23.6 dataWithContacts(Contacts() as CNContactMBS, byref error as NSErrorMBS) as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the vCard representation of the specified contacts.

51.23.7 descriptorForRequiredKeys as CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Use to fetch all contact keys required to create vCard data from a contact.
Notes: A key descriptor to be used in the keysToFetch array when fetching the contacts.

51.24 class CNContactViewControllerMBS

51.24.1 class CNContactViewControllerMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContactViewController class implements the view to display a contact.
Notes: CNContactViewController can display a new contact, unknown contact, or existing contact.
Subclass of the NSViewControllerMBS class.
Blog Entries

- MBS Xojo Plugins, version 17.5pr3

51.24.2 Methods

51.24.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.24.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.24.5 descriptorForRequiredKeys as CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Descriptor for all keys that must be fetched on a contact before setting it on the view controller.
Notes: Pass this descriptor to the keysToFetch of the CNContactFetchRequest if you want to display the contact in a CNContactViewController.

51.24.6 Properties

51.24.7 Contact as CNContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A contact to display.
Notes: When contact is nil, displays an empty selection state.
(Read and Write property)

51.25 class CNContainerMBS

51.25.1 class CNContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNContainer class is a thread-safe class that defines an immutable object that represents a container.
Notes: A container has a collection of contacts. A contact can be in only one container. CardDAV accounts usually have only one container whereas Exchange accounts may have multiple containers, where each container represents an Exchange folder
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.25.2 Methods

51.25.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.25.4 CNContainerIdentifierKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined keys representing container properties that can be used with key value coding on CNContainer objects.
Notes: Identifier key.
This key represents the container identifier property for KVC/KVO usage. This property is always fetched.

51.25.5 CNContainerNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined keys representing container properties that can be used with key value coding on CNContainer objects.
Notes: Name key.
This key represents the container identifier property for KVC/KVO usage. This property is always fetched.

51.25.6 CNContainerTypeKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined keys representing container properties that can be used with key value coding on CNContainer objects.
Notes: Type key.
This key represents the container identifier property for KVC/KVO usage. This property is always fetched.

51.25.7 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private container.

51.25.8 copy as CNContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the container object.

51.25.9 predicateForContainerOfContactWithIdentifier(contactIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the container of the specified contact.
Notes: If the identifier is for a unified contact then this method returns an empty array. To fetch the containers of a unified contact, first fetch the linked contacts and then fetch the container of each linked contact.

51.25.10 predicateForContainerOfGroupWithIdentifier(groupIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the container of the specified group.

51.25.11 predicateForContainersWithIdentifiers(Identifiers() as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find the containers with the specified identifiers.

51.25.12 Properties

51.25.13 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNContainer object.
(Read and Write property)

51.25.14 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The unique identifier for a contacts container on the device.
Notes: It is recommended that you use the identifier when re-fetching the container. The identifier can be persisted between app launches.
(Read only property)

51.25.15 Name as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the container.
Notes: (Read only property)

51.25.16 Type as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The type of the container.
Notes: can be CNContainerTypeUnassigned, CNContainerTypeLocal, CNContainerTypeExchange or CNContainerTypeCardDAV.

(Read only property)

51.25.17 Constants

Container Types

Constant	Value	Description
CNContainerTypeCardDAV	3	A container for contacts stored in an CardDAV server, such as iCloud.
CNContainerTypeExchange	2	A container for contacts stored in an Exchange folder from an Exchange server.
CNContainerTypeLocal	1	A container for contacts only stored locally on the device. There is only one local container for a device.
CNContainerTypeUnassigned	0	

51.26 class CNFetchResultMBS

51.26.1 class CNFetchResultMBS

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The class for a fetch result with a time stamp.
Notes: Allows you to query contacts and changes with checking again later with new time.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

51.26.2 Methods

51.26.3 ChangeHistoryEvents as CNChangeHistoryEventMBS()

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The history events.

51.26.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

51.26.5 Contacts as CNContactMBS()

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The contacts found.

51.26.6 Destructor

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The destructor.

51.26.7 Properties

51.26.8 currentHistoryToken as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The current history token.
Notes: Retrieve the current history token. If you are fetching contacts or change history events, you should use the token on the CNFetchResultMBS class instead.
(Read only property)

51.27 class CNGroupMBS

51.27.1 class CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNGroup is a thread-safe class that defines an immutable object that represents a group.
Notes: Contacts may be members of one or more groups, depending upon their accounts.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 17.2pr5

51.27.2 Methods

51.27.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.27.4 CNGroupIdentifierKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined keys representing group properties that can be used with key value coding on CNGroup objects.
Notes: Group identifier.
This key takes a string value.

51.27.5 CNGroupNameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined keys representing group properties that can be used with key value coding on CNGroup objects.
Notes: Group name.
This key takes a string value.

51.27.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

51.27.7 copy as CNGroupMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the group object.

51.27.8 mutableCopy as CNMutableGroupMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a mutable copy of this group.

51.27.9 predicateForGroupsInContainerWithIdentifier(groupIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find groups in the specified container.
Notes: containerIdentifier: The container identifier to be matched.

Returns a predicate that can be used to fetch groups from CNContactStore.

51.27.10 predicateForGroupsWithIdentifiers(Identifiers() as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a predicate to find groups with the specified identifiers.
Notes: identifiers: The group identifiers to be matched.

Returns a predicate that can be used to fetch groups from CNContactStore.

51.27.11 predicateForSubgroupsInGroupWithIdentifier(contactIdentifier as String) as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a predicate to find all subgroups for a group.

51.27.12 valueForKey(key as String) as Variant

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop & iOS.

Function: Queries value for a given key.

51.27.13 Properties

51.27.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNGroup object.
(Read and Write property)

51.27.15 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The unique identifier for a group on the device.
Notes: It is recommended that you use the identifier when re-fetching the group. The identifier can be persisted between app launches.
(Read only property)

51.27.16 Name as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the group.
Notes: (Read only property)

51.28 class CNInstantMessageAddressMBS

51.28.1 class CNInstantMessageAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNInstantMessageAddress class is a thread-safe class that defines an immutable value object representing an instant message address.
Notes: Use the methods and properties of this class to identify instant messaging address. Some instant message services, such as Facebook and Skype are predefined in this class. You can also specify your own instant message service using Constructor.

51.28.2 Methods

51.28.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.28.4 CNInstantMessageAddressServiceKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Instant message address service key.
Notes: This key takes a string value.

51.28.5 CNInstantMessageAddressUsernameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Instant message address user name key.
Notes: This key takes a string value.

51.28.6 CNInstantMessageServiceAIM as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for AIM.

This key takes a string value.

51.28.7 CNInstantMessageServiceFacebook as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for Facebook.
This key takes a string value.

51.28.8 CNInstantMessageServiceGaduGadu as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for Gadu Gadu.
This key takes a string value.

51.28.9 CNInstantMessageServiceGoogleTalk as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for Google Talk.
This key takes a string value.

51.28.10 CNInstantMessageServiceICQ as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for ICQ.
This key takes a string value.

51.28.11 CNInstantMessageServiceJabber as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for Jabber.

This key takes a string value.

51.28.12 CNInstantMessageServiceMSN as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for MSN.
This key takes a string value.

51.28.13 CNInstantMessageServiceQQ as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for QQ.
This key takes a string value.

51.28.14 CNInstantMessageServiceSkype as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for Skype.
This key takes a string value.

51.28.15 CNInstantMessageServiceYahoo as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the service types.
Notes: Instant message service for Yahoo.
This key takes a string value.

51.28.16 Constructor(username as String, Service as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a CNInstantMessageAddress object initialized with the specified user name and service.
Notes: username: The user name with which to initialize the CNInstantMessageAddress object.

service: The service with which to Initialize the CNInstantMessageAddress object.

Returns the initialized CNInstantMessageAddress object with the specified user name and service.
User name and service are required to initialize CNInstantMessageAddress object.

51.28.17 copy as CNInstantMessageAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the instant message address object.

51.28.18 localizedStringForKey(key as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a string containing the localized property name.

51.28.19 localizedStringForService(key as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a string containing the localized name of the specified service.

51.28.20 Properties

51.28.21 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNInstantMessageAddress object.
(Read and Write property)

51.28.22 service as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Instant message address service.
Notes: (Read only property)

51.28.23 username as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The user name for instant message service address.
Notes: (Read only property)

51.29 class CNKeyDescriptorMBS

51.29.1 class CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The class for key descriptors.
Blog Entries

- Contacts history for Xojo

51.29.2 Methods

51.29.3 Constructor(Key as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a key descriptor from a string value.

51.29.4 copy as CNKeyDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the key descriptor object.

51.29.5 Operator_Convert as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Converts key to string value.
Notes: Same as using StringValue property, but automatic.
See also:

- 51.29.6 Operator_Convert(Key as String) 8815

51.29.6 Operator_Convert(Key as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a key descriptor from a string value.
Example:

Var k as CNKeyDescriptorMBS = CNContactMBS.CNContactJobTitleKey

Notes: Same as constructor, but automatic.
See also:

- 51.29.5 Operator_Convert as String 8815

51.29.7 Properties

51.29.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNKeyDescriptor object.
(Read and Write property)

51.29.9 StringValue as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Queries string value of the key descriptor.
Notes: (Read only property)

51.30 class CNLabeledValueMBS

51.30.1 class CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The class for labeled values.
Notes: The CNLabeledValue class is a thread-safe class that defines an immutable value object that combines a contact property value with a label. For example, a contact phone number could have a label of Home, Work, iPhone, etc.
Blog Entries

Xojo Developer Magazine

- 23.1, pages 65 to 67: First Contact, Adding New Contact into Apple Contacts by Stefanie Juchmes-Simonis

51.30.2 Methods

51.30.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.30.4 CNLabelDateAnniversary as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: This constant is a predefined label that can be used in a CNLabeledValue object having an NSDateComponents value.

51.30.5 CNLabelEmailiCloud as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: This constant is a predefined label that can be used in a CNLabeledValue object having an email address string value.
Notes: Email.

This label takes a string value.

51.30.6 CNLabelHome as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined labels that can be used in a CNLabeledValue object having any value.
Notes: Home label.
This label takes a string value.

51.30.7 CNLabelOther as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined labels that can be used in a CNLabeledValue object having any value.
Notes: Other label.
This label takes a string value.

51.30.8 CNLabelURLAddressHomePage as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: This constant is a predefined label that can be used in a CNLabeledValue object having a URL address string value.
Notes: Identifier for the URL property.
This label takes a string value.

51.30.9 CNLabelWork as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the predefined labels that can be used in a CNLabeledValue object having any value.
Notes: Work label.
This label takes a string value.

51.30.10 Constructor(label as string, value as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new labeled value identifier initialized with the specified label and value.
Notes: label: A string value for the label of the labeled ,Ä¶value object, or nil if the value doesn,Äôt have a label.
value: A value for the labeled value object. For valid values, see CNContact properties that are arrays of labeled value objects.

Returns a new labeled value object initialized with the specified identifier.

51.30.11 copy as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the labeled value object.

51.30.12 labeledValueBySettingLabel(label as string) as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a labeled value object with an existing value and identifier.
Notes: label: The label of the copied labeled value object, or nil if the contact property value doesn,Äôt have a label.

Returns a labeled value object with an existing value and identifier.
See also:

- 51.30.13 labeledValueBySettingLabel(label as string, value as Variant) as CNLabeledValueMBS 8819

51.30.13 labeledValueBySettingLabel(label as string, value as Variant) as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a labeled value object with the specified label and value with the existing identifier.
Notes: label: The label of the copied labeled value object, or "" if the contact property value doesn,Äôt have a label.
value: The copied labeled value object. For valid values, see CNContact properties that are arrays of labeled value objects.

Returns a labeled value object with the existing identifier.
See also:

- 51.30.12 labeledValueBySettingLabel(label as string) as CNLabeledValueMBS 8819

51.30.14 labeledValueBySettingValue(value as Variant) as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new value for an existing label and identifier.
Notes: value: A new value for the copied labeled value object. For valid values, see CNContact properties that are arrays of labeled value objects.

Returns the CNLabeledValue object with an existing label and identifier.

51.30.15 labeledValueWithLabel(label as string, value as Variant) as CNLabeledValueMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new labeled value identifier object with the specified label and value.
Notes: label: A string value for the label of the labeled value object, or nil if the value doesn,Äôt have a label.
value: A value for the labeled value object. For valid values, see CNContact properties that are arrays of labeled value objects.

Returns a new CNLabeledValue object with a new identifier.

51.30.16 localizedStringForLabel(label as string) as string

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a localized string for the specified label.
Notes: label: The label to be localized.

Returns a localized string for the label.

All predefined label constants are localized and this method returns their localized strings. A custom label will be returned as is, so this method can be used to convert all labels for display.

51.30.17 Properties

51.30.18 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNLabeledValue object.
(Read and Write property)

51.30.19 Identifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A unique identifier for the labeled value object.
Notes: It is recommended that you use the identifier when searching for a previously known labeled value object in a re-fetched contact. The identifier can be persisted between the app launches.
(Read only property)

51.30.20 Label as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The label for a contact property value.
Notes: A contact property can have a label, such as Home, Work, iPhone, etc. For some predefined label constants, seeCNPhoneNumber, and CNContactRelation. Custom labels can also be used. Labels are not used for CNSocialProfile and CNInstantMessageAddress properties.
(Read only property)

51.30.21 Value as Variant

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A contact property value.
Notes: A contact property value, such as CNPhoneNumberMBS for a phone number, String for an email address, and so on. For valid values, see CNContact properties that are arrays of labeled value objects.
(Read only property)

51.31 class CNMutableContactMBS

51.31.1 class CNMutableContactMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNMutableContact class represents a mutable value object for the contact properties, such as the first name and the phone number of a contact.
Notes: When CNMutableContact object is a mutable copy of a CNContact object, if you access a CNMutableContact property value that was not fetched for the CNContact object, it throws an CNContactPropertyNotFetchedExceptionName exception. When needed, you can remove contact properties by setting string and array properties to empty, and all other properties to nil.
Available in OS X v10.11 and later.
Subclass of the CNContactMBS class.

- MBS Xojo Plugins, version 20.5pr1

Xojo Developer Magazine

- 23.1, page 64: First Contact, Adding New Contact into Apple Contacts by Stefanie Juchmes-Simonis

51.31.2 Methods

51.31.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.31.4 setContactRelations(contactRelations() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array of labeled contact relations for the contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNContactRelationMBS value.

51.31.5 setDates(dates() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array containing labeled Gregorian dates.
Notes: This property is an array of CNLabeledValue objects, each of which has an String label and NSDateComponentsMBS value. You can use this property to store Gregorian dates such as anniversaries. Day and month are required and year is optional. Calendar is nil or Gregorian. All other date components are invalid.

51.31.6 setEmailAddresses(emailAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array of labeled email addresses for the contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a String value.

51.31.7 setInstantMessageAddresses(instantMessageAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array of labeled IM addresses for the contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNInstantMessageAddressMBS value.

51.31.8 setPhoneNumbers(phoneNumbers() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array of labeled phone numbers for a contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNPhoneNumberMBS value.

51.31.9 setPostalAddresses(postalAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array of labeled postal addresses for a contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNPostalAddressMBS value.

51.31.10 setSocialProfiles(socialProfiles() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array of labeled social profiles for a contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a CNSocialProfileMBS value.

51.31.11 setURLAddresses(urlAddresses() as CNLabeledValueMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the array of labeled URL addresses for a contact.
Notes: This property is an array of CNLabeledValue objects, each of which has a label and a string value that contains the URL.

51.31.12 Properties

51.31.13 birthday as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A date component for the Gregorian birthday of the contact.
Notes: A Gregorian birthday can be displayed using this property, whose values are the relevant properties of an NSDateComponents object. Day and month are required for this property, and year is optional. Calendar can be nil or Gregorian. All other date components are invalid.
(Read and Write property)

51.31.14 contactType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: An enum identifying the contact type.
Notes: Can be CNContactMBS.CNContactTypeOrganization or CNContactMBS.CNContactTypePerson.
(Read and Write property)

51.31.15 departmentName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the department associated with the contact.

Notes: (Read and Write property)

51.31.16 familyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The family name of the contact.
Example:

```
Var m as new CNMutableContactMBS
m.familyName = "Miller"
msgbox "name: "+m.familyName
```

Notes: The family name is often known as the last name of the contact.
(Read and Write property)

51.31.17 givenName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The given name of the contact.
Notes: The given name is often known as the first name of the contact.
(Read and Write property)

51.31.18 imageData as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The profile picture of a contact.
Notes: It is recommended that you fetch this property only when you need to access its value, such as when you need to display the contact,Äôs profile picture.
(Read and Write property)

51.31.19 jobTitle as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The contact,Äôs job title.
Notes: (Read and Write property)

51.31.20 middleName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The middle name of the contact.
Notes: (Read and Write property)

51.31.21 namePrefix as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name prefix of the contact.
Notes: (Read and Write property)

51.31.22 nameSuffix as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name suffix of the contact.
Notes: (Read and Write property)

51.31.23 nickname as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The nickname of the contact.
Notes: (Read and Write property)

51.31.24 nonGregorianBirthday as NSDateComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A date component for the non-Gregorian birthday of the contact.
Notes: A non-Gregorian birthday such as Lunisolar birthdays can be displayed using this property, whose values are the relevant properties of an NSDateComponents object. Day and month are required; year and leapMonth are optional. The calendar property is also required and must be non-Gregorian. Some supported calendars are Buddhist, Chinese, and Islamic. All other date components are invalid.
(Read and Write property)

51.31.25 note as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: A string containing notes for the contact.
Notes: (Read and Write property)

51.31.26 organizationName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of the organization associated with the contact.
Notes: (Read and Write property)

51.31.27 phoneticFamilyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic family name of the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs family (or last) name.
(Read and Write property)

51.31.28 phoneticGivenName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic given name of the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs given (or first) name.
(Read and Write property)

51.31.29 phoneticMiddleName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic middle name of the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs middle name.
(Read and Write property)

51.31.30 phoneticOrganizationName as String

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop & iOS.

Function: The phonetic name of the organization associated with the contact.
Notes: This property contains a string that specifies the pronunciation of the contact,Äôs organization name.
Requires macOS 10.12 or newer.
(Read and Write property)

51.31.31 previousFamilyName as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The previous family name of the contact.
Notes: The previous family name is often known as the maiden name of the contact.
(Read and Write property)

51.31.32 valueForKey(key as String) as Variant

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop & iOS.

Function: Queries or sets value for a given key.
Notes: (Read and Write computed property)

51.32 class CNMutableGroupMBS

51.32.1 class CNMutableGroupMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNMutableGroup class defines a mutable value object representing a group for a contact.
Notes: Contacts may be members of one or more groups, depending upon the accounts they come from.
Subclass of the CNGroupMBS class.

51.32.2 Methods

51.32.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.32.4 Properties

51.32.5 Name as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Name of the group.
Example:

```
Var m as new CNMutableGroupMBS
m.Name = "Hello"
```

Notes: (Read and Write property)

51.32.6 valueForKey(key as String) as Variant

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop & iOS.

Function: Queries or sets value for a given key.
Notes: (Read and Write computed property)

51.33 class CNMutablePostalAddressMBS

51.33.1 class CNMutablePostalAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNMutablePostalAddress class defines a mutable value object representing the postal address for a contact.
Notes: To remove properties when saving a mutable postal address, set string properties to empty values.
Subclass of the CNPostalAddressMBS class.

- 18.5, page 83: Maps (Part 6), A deep dive into Annotations by Markus Winter

51.33.2 Methods

51.33.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.33.4 Properties

51.33.5 City as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The city name.
Example:

```
Var m as new CNMutablePostalAddressMBS
m.City = "New York"
MsgBox m.city
```

Notes: (Read and Write property)

51.33.6 Country as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The country name.
Notes: (Read and Write property)

51.33.7 ISOCountryCode as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The ISO country code.
Notes: (Read and Write property)

51.33.8 PostalCode as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The postal code.
Notes: (Read and Write property)

51.33.9 State as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The state name.
Notes: (Read and Write property)

51.33.10 Street as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The street name.
Notes: A multiline address is delimited with carriage returns (that is, ,Äú\n,Äù).
(Read and Write property)

51.34 class CNPhoneNumberMBS

51.34.1 class CNPhoneNumberMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNPhoneNumber class defines an immutable value object representing a phone number for a contact.
Notes: It is a thread-safe class.

51.34.2 Methods

51.34.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.34.4 CNLabelPhoneNumberAppleWatch as String

MBS Mac64bit Plugin, Plugin Version: 21.1, Platform: macOS, Targets: Desktop & iOS.

Function: Phone number for Apple Watch.
Notes: This label takes a string value.
Available in macOS 11.1 or newer.

51.34.5 CNLabelPhoneNumberHomeFax as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Home fax number.
Notes: This label takes a string value.

51.34.6 CNLabelPhoneNumberiPhone as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: iPhone number.
Notes: This label takes a string value.

51.34.7 CNLabelPhoneNumberMain as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Main phone number.
Notes: This label takes a string value.

51.34.8 CNLabelPhoneNumberMobile as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Mobile phone number.
Notes: This label takes a string value.

51.34.9 CNLabelPhoneNumberOtherFax as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Other fax number.
Notes: This label takes a string value.

51.34.10 CNLabelPhoneNumberPager as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Pager phone number.
Notes: This label takes a string value.

51.34.11 CNLabelPhoneNumberWorkFax as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Work fax number.
Notes: This label takes a string value.

51.34.12 Constructor(value as string)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new phone number object initialized with the specified phone number string.
Notes: You should initialize this with a phone number string. This method fails when the value of string is empty.

51.34.13 copy as CNPhoneNumberMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the phone number object.

51.34.14 phoneNumberWithStringValue(p as string) as CNPhoneNumberMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new phone number object initialized with the specified phone number string.
Notes: This is a convenience class method that provides the same functionality as Constructor.
This method fails when the value of stringValue is "".

51.34.15 Properties

51.34.16 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNPhoneNumber object.
(Read and Write property)

51.34.17 stringValue as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The string value of the phone number.
Notes: (Read only property)

51.35 class CNPostalAddressFormatterMBS

51.35.1 class CNPostalAddressFormatterMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNPostalAddressFormatter class formats the postal address in a contact.
Notes: This class handles international formatting of postal addresses. It is recommended that you create an instance of this class when formatting many postal addresses, and use the instance methods; otherwise use the class methods.

51.35.2 Methods

51.35.3 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a formatted postal address as an attributed string.
Notes: postalAddress: The postal address to format.
DefaultAttributes: The default attributes to use. To learn more, see NSFormatter.

Returns the formatted postal address as an attributed string.

This method behaves similarly to stringFromPostalAddress, except that it returns an attributed string. It includes the attribute key CNPostalAddressPropertyAttribute, whose attribute values are postal address property keys, such as CNPostalAddressStreetKey. This identifies the postal address components in the formatted postal address. Also includes the attribute key CNPostalAddressLocalizedPropertyNameAttribute whose attribute values are the localized strings for the postal address property keys.
See also:

- 51.35.4 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS 8836

51.35.4 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a formatted postal address as an attributed string.
Notes: postalAddress: The postal address to format.

DefaultAttributes: The default attributes to use. To learn more, see NSFormatter.

Returns the formatted postal address as an attributed string.

This method behaves similarly to stringFromPostalAddress, except that it returns an attributed string. It includes the attribute key CNPostalAddressPropertyAttribute, whose attribute values are postal address property keys, such as CNPostalAddressStreetKey. This identifies the postal address components in the formatted postal address. Also includes the attribute key CNPostalAddressLocalizedPropertyNameAttribute whose attribute values are the localized strings for the postal address property keys.
See also:

- 51.35.3 attributedStringFromPostalAddress(postalAddress as CNPostalAddressMBS, DefaultAttributes as Dictionary = nil) as NSAttributedStringMBS 8836

51.35.5 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.35.6 CNPostalAddressLocalizedPropertyNameAttribute as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: This constant is a key in the attributed string whose value is a localized version of the CNPostalAddress property key.
Notes: This label takes a string value.

51.35.7 CNPostalAddressPropertyAttribute as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: This constant is a key in the attributed string whose value is a CNPostalAddress property key.
Notes: This key takes a string value.

51.35.8 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.35.9 stringFromPostalAddress(postalAddress as CNPostalAddressMBS) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a formatted postal address.
See also:

- 51.35.10 stringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer) as String 8838

51.35.10 stringFromPostalAddress(postalAddress as CNPostalAddressMBS, style as Integer) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a formatted postal address.
Notes: Style can currently only be CNPostalAddressFormatterStyleMailingAddress.
See also:

- 51.35.9 stringFromPostalAddress(postalAddress as CNPostalAddressMBS) as String 8838

51.35.11 Properties

51.35.12 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNPostalAddressFormatter object.
(Read and Write property)

51.35.13 Style as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The style to use.
Notes: Style can currently only be CNPostalAddressFormatterStyleMailingAddress.
(Read and Write property)

51.35.14 Constants

Constants

Constant	Value	Description
CNPostalAddressFormatterStyleMailingAddress	0	One of the style constants.

51.36 class CNPostalAddressMBS

51.36.1 class CNPostalAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNPostalAddress class defines an immutable object that represents the postal address for a contact.
Notes: This is a thread-safe class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 18.5, page 83: Maps (Part 6), A deep dive into Annotations by Markus Winter

51.36.2 Methods

51.36.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.36.4 CNPostalAddressCityKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties to fetch.
Notes: City.
This key takes a string value.

51.36.5 CNPostalAddressCountryKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties to fetch.
Notes: Country.
This key takes a string value.

51.36.6 CNPostalAddressISOCountryCodeKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties to fetch.
Notes: ISO country code.
This key takes a string value.

51.36.7 CNPostalAddressPostalCodeKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties to fetch.
Notes: Postal code.
This key takes a string value.

51.36.8 CNPostalAddressStateKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties to fetch.
Notes: State.
This key takes a string value.

51.36.9 CNPostalAddressStreetKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties to fetch.
Notes: Street.
This key takes a string value.

51.36.10 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

51.36.11 copy as CNPostalAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the postal address object.

51.36.12 localizedStringForKey(key as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the localized name for the property associated with the specified key.
Example:

MsgBox CNPostalAddressMBS.localizedStringForKey(CNPostalAddressMBS.CNPostalAddressStreetKey)

51.36.13 mutableCopy as CNMutablePostalAddressMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a mutable copy of this postal address.

51.36.14 Properties

51.36.15 City as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The city name in a postal address.
Notes: (Read only property)

51.36.16 Country as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The country name in a postal address.
Notes: (Read only property)

51.36.17 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNPostalAddress object.
(Read and Write property)

51.36.18 ISOCountryCode as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The ISO country code for the country in a postal address.
Notes: (Read only property)

51.36.19 PostalCode as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The postal code in a postal address.
Notes: (Read only property)

51.36.20 State as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The state name in a postal address.
Notes: (Read only property)

51.36.21 Street as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The street name in a postal address.
Notes: Multiline addresses are delimited by carriage returns (that is, ,Äú\n,Äù).
(Read only property)

51.37 class CNSaveRequestMBS

51.37.1 class CNSaveRequestMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNSaveRequest class defines a save request operation for contacts.
Notes: The CNSaveRequest class creates a new save request for each save operation on the contact store. You can batch multiple changes into one save request (note that these changes only apply to objects). In the case of overlapping changes in multiple or concurrent save requests, the last change wins. If you try to add an object (that is, a contact, or a group,) that already exists in the contact store, the CNErrorCodeInsertedRecordAlreadyExists error occurs and the CNErrorUserInfoAffectedRecordsKey array is updated to contain the object you tried to add. If you try to update or delete an object that is not present in the contact store, the save request does not perform the update or deletion, the CNErrorCodeRecordDoesNotExist error occurs, and the CNErrorUserInfoAffectedRecordsKey array is updated to contain the object you tried to update or delete. Do not access objects in the save request while a save request is executing.

Xojo Developer Magazine

- 23.1, page 67: First Contact, Adding New Contact into Apple Contacts by Stefanie Juchmes-Simonis

51.37.2 Methods

51.37.3 addContact(contact as CNMutableContactMBS, ContainerIdentifier as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Adds the specified contact to the contact store.
Notes: contact: The new contact to add.
identifier: The identifier of the container to add the new contact. To add the new contact to the default container set identifier to "".

This method overrides any previously made deletion requests for the contact. The new contact may be modified by executing the save request.

51.37.4 addGroup(group as CNMutableGroupMBS, identifier as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a group to the contact store.
Notes: group: The group to add.
identifier: The identifier of the container to add the new group. To add the new group to the default container, set identifier to "".

This method overrides any previously made delete request for the group.

51.37.5 addMember(contact as CNContactMBS, group as CNGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a contact as a member of a group.
Notes: contact: The contact to add to the group membership.
group: The group to add the contact to its membership.

This method overrides any previously made remove membership request on the contact from the group.

51.37.6 addSubgroup(subgroup as CNGroupMBS, group as CNGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Adds a subgroup to a group.

51.37.7 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.37.8 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

51.37.9 deleteContact(contact as CNMutableContactMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Deletes a contact from the contact store.
Notes: contact: Contact to be delete.

51.37.10 deleteGroup(contact as CNMutableGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Deletes a group from the contact store.
Notes: group: The group to delete.

This method overrides any previously made add request on the group. The group to be deleted must already exist in the contact store. If it does not, the delete request fails, the CNErrorCodeRecordDoesNotExist error is thrown, and the CNErrorUserInfoAffectedRecordsKey array is updated to contain that object.

51.37.11 removeMember(contact as CNContactMBS, group as CNGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes a contact as a member of a group.
Notes: contact: The contact to remove from the group membership.
group: The group to remove the contact from its membership.

This method removes the contact from the group, but does not delete it from the contact store. This method overrides any previously made add membership request on the contact to the group.

51.37.12 removeSubgroup(subgroup as CNGroupMBS, group as CNGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Removes a subgroup from a group.

51.37.13 updateContact(contact as CNMutableContactMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Updates an existing contact in the contact store.

Notes: contact: The contact to update.

The contact to be updated must already exist in the contact store. If it does not, the update request fails, the CNErrorCodeRecordDoesNotExist error occurs, and the CNErrorUserInfoAffectedRecordsKey array is updated to contain the object. Note that the contact may be modified when the save request is executing.

51.37.14 updateGroup(contact as CNMutableGroupMBS)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Updates an existing group in the contact store.
Notes: group: The group to update.

The group to be updated must already exist in the contact store. If it does not, the update request fails, the CNErrorCodeRecordDoesNotExist error is thrown, and the CNErrorUserInfoAffectedRecordsKey array is updated to contain that object.

51.37.15 Properties

51.37.16 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNSaveRequest object.
(Read and Write property)

51.37.17 shouldRefetchContacts as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.5, Platform: macOS, Targets: Desktop & iOS.

Function: Should the contacts be refetched as part of executing the save request.
Notes: Default is true where added and updated contacts are refetched by the executing save request.
Set to false to suppress this refetch behavior and reduce the execution time of the save request.

If set to false do not use the contacts after the executed save request as they may not be in a current state.
(Read and Write property)

51.37.18 transactionAuthor as String

MBS Mac64bit Plugin, Plugin Version: 22.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The author of this transaction.
Notes: Use this, in conjunction with CNChangeHistoryFetchRequestMBS.excludedTransactionAuthors, to suppress fetching of changes the author already knows about.
(Read and Write property)

51.38 class CNSocialProfileMBS

51.38.1 class CNSocialProfileMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The CNSocialProfile class defines an immutable object representing a social profile.
Example:

```
Var ContactStore as new CNContactStoreMBS
Var c as new CNMutableContactMBS

c.givenName = "Bob"

Var sr as new CNSaveRequestMBS

Var ContainerIdentifier as string = ContactStore.defaultContainerIdentifier
sr.addContact c, ContainerIdentifier

Var e as NSErrorMBS
if ContactStore.executeSaveRequest(sr, e) then
MsgBox "Saved"
else
MsgBox "Failed to save contact"+EndOfLine+EndOfLine+e.localizedDescription
end if
```

Notes: This is a thread-safe class. Some social profile services, such as Facebook and Twitter are predefined in this class. You can also specify your own social profile service with Constructor.

51.38.2 Methods

51.38.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Notes: Should return true in a 64-bit Mac app on Mac OS X 10.11 or newer.

51.38.4 CNSocialProfileServiceFacebook as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: Facebook

51.38.5 CNSocialProfileServiceFlickr as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: Flickr

51.38.6 CNSocialProfileServiceGameCenter as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: Game Center

51.38.7 CNSocialProfileServiceKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties.
Notes: The social profile service.
This key takes a string value.

51.38.8 CNSocialProfileServiceLinkedIn as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: LinkedIn

51.38.9 CNSocialProfileServiceMySpace as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: MySpace

51.38.10 CNSocialProfileServiceSinaWeibo as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: Sina Weibo

51.38.11 CNSocialProfileServiceTencentWeibo as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: Tencent Weibo

51.38.12 CNSocialProfileServiceTwitter as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: Twitter

51.38.13 CNSocialProfileServiceYelp as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the possible service keys.
Notes: Yelp

51.38.14 CNSocialProfileURLStringKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties.
Notes: The URL of the service.

51.38.15 CNSocialProfileUserIdentifierKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties.
Notes: The social profile user identifier.
This key takes a string value.

51.38.16 CNSocialProfileUsernameKey as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys for properties.
Notes: The social profile user name.
This key takes a string value.

51.38.17 Constructor(URLString as String, UserName as String, Identifier as String, Service as String)

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes a new social profile object with the specified URL.
Notes: urlString: The URL for the social profile.
username: The user name for the social profile.
userIdentifier: The service,Äôs user identifier for the social profile.
service: The service name of the social profile.

51.38.18 copy as CNSocialProfileMBS

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Create a copy of the social profile object.

51.38.19 localizedStringForKey(key as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the localized name of the property for the specified key.
Example:

MsgBox CNSocialProfileMBS.localizedStringForService(CNSocialProfileServiceGameCenter)

Notes: key: Key for which to get the localized property name.

51.38.20 localizedStringForService(service as String) as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the localized name of the specified service.
Example:

MsgBox CNSocialProfileMBS.localizedStringForKey(CNSocialProfileUsernameKey)

Notes: service: The service name for which to get the localized name.

51.38.21 Properties

51.38.22 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: Value is a pointer to a CNSocialProfile object.
(Read and Write property)

51.38.23 service as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The social profile,Äôs service name.
Notes: (Read only property)

51.38.24 urlString as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The URL associated with the social profile.
Notes: (Read only property)

51.38.25 userIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The service,Äôs user identifier associated with the social profile.
Notes: (Read only property)

51.38.26 username as String

MBS Mac64bit Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop & iOS.

Function: The user name for the social profile.
Notes: (Read only property)

Chapter 52

Continuity Camera

52.1 class ContinuityCameraMBS

52.1.1 class ContinuityCameraMBS

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: The class to work with Continuity feature in MacOS Mojave.
Notes: Works also with services to receive e.g. screenshot for older versions.

See also VNDocumentCameraViewControllerMBS for iOS.

52.1.2 Methods

52.1.3 Constructor

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: The constructor.

52.1.4 Destructor

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

52.1.5 Import(index as Integer)

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Starts import.
Notes: Index is 0 for photo, 1 for document or 2 for sketch.

If you have multiple devices, you may add 3 to switch to next device or better use popup menu.
If index is too big, nothing happens.
See also:

- 52.1.6 Import(index as Integer, Control as control) 8857
- 52.1.7 Import(index as Integer, Control as DesktopControl) 8857
- 52.1.8 Import(index as Integer, Win as DesktopWindow) 8858
- 52.1.9 Import(index as Integer, Win as window) 8858

52.1.6 Import(index as Integer, Control as control)

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Starts import for control.
Notes: Index is 0 for photo, 1 for document or 2 for sketch.

If you have multiple devices, you may add 3 to switch to next device or better use popup menu.
If index is invalid, nothing happens.
See also:

- 52.1.5 Import(index as Integer) 8856
- 52.1.7 Import(index as Integer, Control as DesktopControl) 8857
- 52.1.8 Import(index as Integer, Win as DesktopWindow) 8858
- 52.1.9 Import(index as Integer, Win as window) 8858

52.1.7 Import(index as Integer, Control as DesktopControl)

MBS MacExtras Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Starts import for control.
Notes: Index is 0 for photo, 1 for document or 2 for sketch.

If you have multiple devices, you may add 3 to switch to next device or better use popup menu.
If index is invalid, nothing happens.
See also:

- 52.1.5 Import(index as Integer) 8856

- 52.1.9 Import(index as Integer, Win as window) 8858

52.1.8 Import(index as Integer, Win as DesktopWindow)

MBS MacExtras Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Starts import for window.
Notes: Index is 0 for photo, 1 for document or 2 for sketch.

If you have multiple devices, you may add 3 to switch to next device or better use popup menu.
If index is invalid, nothing happens.
See also:

- 52.1.5 Import(index as Integer) 8856
- 52.1.6 Import(index as Integer, Control as control) 8857
- 52.1.7 Import(index as Integer, Control as DesktopControl) 8857
- 52.1.9 Import(index as Integer, Win as window) 8858

52.1.9 Import(index as Integer, Win as window)

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Starts import for window.
Notes: Index is 0 for photo, 1 for document or 2 for sketch.

If you have multiple devices, you may add 3 to switch to next device or better use popup menu.
If index is invalid, nothing happens.
See also:

- 52.1.5 Import(index as Integer) 8856
- 52.1.6 Import(index as Integer, Control as control) 8857

- 52.1.8 Import(index as Integer, Win as DesktopWindow) 8858

52.1.10 InstallForCanvas

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Installs receiver for Xojo canvas controls.

52.1.11 InstallForListbox

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Installs receiver for Xojo listbox controls.

52.1.12 InstallForWindow

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Installs receiver for Xojo windows.

52.1.13 PopupMenu as NSMenuMBS

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Shows the import from device popup menu.
Notes: You can show this menu with popup method.
May return nil if unavailable.

52.1.14 SetDelegate(d as ContinuityCameraDelegateMBS)

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Sets delegate to call when we got new data.

52.1.15 Properties

52.1.16 Enabled as Boolean

MBS MacExtras Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Whether this is enabled.
Notes: Defaults to true.
(Read and Write property)

52.1.17 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: The handle for the internal controller.
Notes: Is zero in case the constructor failed.
(Read only property)

52.1.18 Events

52.1.19 Allow(Handle as Integer) as boolean

MBS MacExtras Plugin, Plugin Version: 22.5, Platform: macOS, Targets: Desktop only.

Function: Whether to allow the control to receive data.
Example:

```
Function Allow(Handle as Integer) Handles Allow as boolean
System.DebugLog CurrentMethodName+": "+Str(Handle)

For Each control As RectControl In allowedControls

// we hit our control
If control.handle = handle Then
Return True
End If

// are we within the coordinates with the mouse?

Var cx As Integer = control.MouseX
Var cy As Integer = control.MouseY

'System.DebugLog Str(cx)+"/"+Str(cy)

Var controlLeft As Integer = control.Left
Var controlTop As Integer = control.top
Var controlRight As Integer = controlLeft + control.Width
Var controlBottom As Integer = controlTop + control.Height

Var win As Window = control.Window // container?
If win <>control.TrueWindow Then
controlLeft = controlLeft + win.Left
controlTop = controlTop + win.Top
controlRight = controlRight + win.Left
controlBottom = controlBottom + win.Top
End If

If cX >= controlLeft And cY >= controlTop And cX <controlRight And cy <controlBottom Then
return true
```

```
End If

Next
End Function
```

Notes: Return true to allow or false to disallow.
You may get the call for the control below mouse and for other control below it like containers.
So you may best decide based on the

52.1.20 Received(Data as MemoryBlock, type as String)

MBS MacExtras Plugin, Plugin Version: 22.5, Platform: macOS, Targets: Desktop only.

Function: Data was received.
Example:

```
Sub Received(Data as MemoryBlock, type as String)
Select Case type
Case "JPEG"
WriteFile("import.jpg", data)

Var p As Picture = Picture.FromData(data)
MainWindow.setPicture p

Else
MsgBox "new type: "+type
End Select
End Sub
```

Notes: Alternatively to using the delegate, you can subclass ContinuityCameraMBS and add this event to have a central place to receive data.

52.1.21 Constants

Index Values

Constant	Value	Description
kIndexDrawSketch	2	Draw a sketch.
kIndexScanDocument	1	Scan a document as PDF.
kIndexTakePhoto	0	Take a picture.

52.1.22 Delegates

52.1.23 ContinuityCameraDelegateMBS(Data as MemoryBlock, type as String)

MBS MacExtras Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: The delegate definition for the callback.
Notes: Please define a method in app or a module and pass addressOf that method to SetDelegate method.

52.2 class VNDocumentCameraScanMBS

52.2.1 class VNDocumentCameraScanMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A single document scanned in the document camera.
Notes: When the document camera scans a document, it returns the resulting information in this format, through the didFinishWithScan event.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

52.2.2 Methods

52.2.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The private constructor.

52.2.4 imageOfPageAtIndex(Index as Integer) as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The image of the page at a specified index.
Notes: We return a NSImageMBS wrapping the UIImage.

52.2.5 pictureOfPageAtIndex(Index as Integer) as Picture

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The picture of the page at a specified index.
Notes: We build a Picture wrapping the UIIMage.

52.2.6 Properties

52.2.7 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

52.2.8 pageCount as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The number of pages in the scanned document.
Notes: (Read only property)

52.2.9 title as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The title of the scanned document.
Notes: (Read only property)

52.3 class VNDocumentCameraViewControllerMBS

52.3.1 class VNDocumentCameraViewControllerMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Shows a panel to allow the user to scan a document.
Notes: A view controller that shows what the document camera sees.
Present this view controller, as follows, and add it to your view controller hierarchy to scan documents.

See also ContinuityCameraMBS for macOS.

52.3.2 Methods

52.3.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

52.3.4 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

52.3.5 Dismiss

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Dismisses the controller.

52.3.6 Present

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Presents the controller.

52.3.7 Properties

52.3.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

52.3.9 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Whether the controller is presented.
Notes: Returns true if the dialog is visible.
(Read only property)

52.3.10 Supported as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Whether you can use this class on the current device.
Notes: Returns false for unsupported hardware.
(Read only property)

52.3.11 title as String

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: A localized string that represents the view this controller manages.
Notes: Set the title to a human-readable string that describes the view. If the view controller has a valid navigation item or tab-bar item, assigning a value to this property updates the title text of those objects.
(Read and Write property)

52.3.12 Events

52.3.13 didCancel

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the user cancels.
Notes: The plugin dismisses the dialog automatically.

52.3.14 didFailWithError(error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event called when the user is unable to scan, with the following error.
Notes: The plugin dismisses the dialog automatically.

52.3.15 didFinishWithScan(scan as VNDocumentCameraScanMBS)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The event to be called when something was scanned.
Notes: The plugin dismisses the dialog automatically.

Chapter 53

Controls

53.1 control ButtonMBS

53.1.1 control ButtonMBS

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use Canvas instead. **Function:** A control to have a custom button in Xojo.
Notes: You provide the images for the button and the control will do the rest.

There are possibilities that this control shows thru pagepanels from a hidden panel.

53.1.2 Properties

53.1.3 ImageDisabled as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image used if the button is disabled.
Notes: (Read and Write property)

53.1.4 ImageMouseOver as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image used for the unpressed button if the mouse is over the button.
Notes: (Read and Write property)

53.1.5 ImageNormal as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image for the normal state.
Notes: (Read and Write property)

53.1.6 ImagePressed as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image used for the pressed button.
Notes: (Read and Write property)

53.1.7 ImagePressedDisabled as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image used when the button is pressed and the button is disabled.
Notes: If this image is nil, the ImagePressed picture is used.
(Read and Write property)

53.1.8 ImagePressedMouseOver as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image used when the button is pressed and the mouse is over the button.
Notes: If this image is nil, the ImagePressed picture is used.
(Read and Write property)

53.1.9 Sticky as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the button is sticky.
Notes: Normally the value is set to false when you release the mouse button.
If Sticky is true, the button is not unpressed.
(Read and Write property)

53.1.10 TestEnabled as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This property can be used to see in the window editor how the button looks like when the button is enabled.
Notes: This property is only for designing, not for runtime.
(Read and Write property)

53.1.11 TestMouseOver as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This property can be used to see in the window editor how the button looks like if the mouse is over the button.
Notes: This property is only for designing, not for runtime.
(Read and Write property)

53.1.12 TestPressed as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This property can be used to see in the window editor how the button looks like when the button is pressed.
Notes: This property is only for designing, not for runtime.
(Read and Write property)

53.1.13 Toggle as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the button should toggle.
Notes: If pressed the button switches the value property.

Set Sticky to true if use set Toggle to true.
(Read and Write property)

53.1.14 Value as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the button is currently pressed.
Notes: True if the button is pressed.
(Read and Write property)

53.1.15 Events

53.1.16 Action(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when the mouse button is clicked in the control.
Notes: Currently called after each MouseUp event.

53.1.17 Close

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The control is about to close.

53.1.18 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Overlay Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event is called when it is appropriate to display a contextual menu for the control.

53.1.19 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

53.1.20 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event where you can enable menu items.

53.1.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

53.1.22 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The mouse drag event.

53.1.23 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when the mouse button is released.

53.1.24 Open

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The control is about to was created and you can initialize it.

53.1.25 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

53.2 class Control

53.2.1 class Control

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in Control class in Xojo.

53.2.2 Methods

53.2.3 CALayerMBS as CALayerMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the Core Animation layer that the receiver uses as its backing store.
Notes: Works only in Cocoa target.
Also sets wantsLayer to true for the view to make sure it has a layer.

53.2.4 NSControlMBS as NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a NSControlMBS object for the given control.
Example:

```
BevelButton1.NSControlMBS.StringValue = "Hello"
```

Notes: This way you can manipulate Cocoa controls directly.

53.2.5 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSViewMBS object for the given control.
Example:

```
MsgBox PushButton1.NSViewMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.
For a pushbutton you may want to cast the NSViewMBS to NSButtonMBS to have more options.

53.2.6 WinClassNameMBS as string

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop only.

Function: Returns internal control class name for a Windows control.

53.3 Globals

53.3.1 ShowModalWithinThreadSafeMBS(extends theMessageDialog as MessageDialog, parent as DesktopWindow)

MBS Util Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Call ShowModalWithin method on main thread.
Notes: This method is to allow you to call the ShowModalWithin method of a MessageDialog in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

Of course as this is asynchronously, you do not get details on which button was pressed.
Deprecated. Behavior from Xojo changed, so this method does no longer work.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.3.2 ShowModalThreadSafeMBS(extends theMessageDialog as MessageDialog)

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Call ShowModal method on main thread.
Notes: This method is to allow you to call the ShowModal method of a MessageDialog in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

Of course as this is asynchronously, you do not get details on which button was pressed.
Deprecated. Behavior from Xojo changed, so this method does no longer work.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

- MBS Real Studio Plugins, version 13.0pr6

53.4 control CustomControlMBS

53.4.1 control CustomControlMBS

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use Canvas instead. **Function:** A control where you can in the IDE define the paint event and see in the IDE what you see in the compiled application.

53.4.2 Properties

53.4.3 Code as String

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The code for the paint event.
Notes: Commands:
PenWidth n
PenHeight n
ForeColor n
FillRect x,y,w,h
DrawRect x,y,w,h
FillRoundRect x,y,w,h,X,Y
DrawRoundRect x,y,w,h,X,Y
FillOval x,y,w,h
DrawOval x,y,w,h
DrawPicture X,x,y,w,h - draws picture number X into the given rectangle
DrawLine x1,y1,x1,y1 - draws line

Variables:
width: width of control
height: height of control
left: left position of control
top: top position of control
ValueX: Value of the ValueX property (X from 1 to 4)
ColorX: Value of the Color1 property (X from 1 to 4)
(Read and Write property)

53.4.4 Color1 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the color properties.
Notes: (Read and Write property)

53.4.5 Color2 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the color properties.
Notes: (Read and Write property)

53.4.6 Color3 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the color properties.

Notes: (Read and Write property)

53.4.7 Color4 as Color

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the color properties.
Notes: (Read and Write property)

53.4.8 Picture1 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the picture properties you can use for the drawpicture command.
Notes: (Read and Write property)

53.4.9 Picture2 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the picture properties you can use for the drawpicture command.
Notes: (Read and Write property)

53.4.10 Picture3 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the picture properties you can use for the drawpicture command.
Notes: (Read and Write property)

53.4.11 Picture4 as Picture

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the picture properties you can use for the drawpicture command.
Notes: (Read and Write property)

53.4.12 Value1 as String

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the value properties.
Notes: (Read and Write property)

53.4.13 Value2 as String

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the value properties.
Notes: (Read and Write property)

53.4.14 Value3 as String

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the value properties.
Notes: (Read and Write property)

53.4.15 Value4 as String

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: One of the value properties.
Notes: (Read and Write property)

53.4.16 Events

53.4.17 Close

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to close.

53.4.18 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Overlay Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

53.4.19 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

53.4.20 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event where you can enable menu items.

53.4.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user clicks with the mouse in the control area.
Notes: Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

53.4.22 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The mouse drag event.

53.4.23 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user releases the mouse button and you returned true on the MouseDown event.

53.4.24 Open

MBS Overlay Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to was created and you can initialize it.

53.4.25 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

53.5 class DesktopControl

53.5.1 class DesktopControl

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in Control class in Xojo.

53.5.2 Methods

53.5.3 CALayerMBS as CALayerMBS

MBS MacCG Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the Core Animation layer that the receiver uses as its backing store.
Notes: Works only in Cocoa target.
Also sets wantsLayer to true for the view to make sure it has a layer.

53.5.4 NSControlMBS as NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSControlMBS object for the given control.
Example:

```
BevelButton1.NSControlMBS.StringValue = "Hello"
```

Notes: This way you can manipulate Cocoa controls directly.

53.5.5 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSViewMBS object for the given control.
Example:

```
MsgBox PushButton1.NSViewMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.
For a pushbutton you may want to cast the NSViewMBS to NSButtonMBS to have more options.

53.5.6 WinClassNameMBS as string

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Returns internal control class name for a Windows control.

53.6 class DesktopLabel

53.6.1 class DesktopLabel

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: An extension of Xojo's internal control.

53.6.2 Methods

53.6.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

53.6.4 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Notes: This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.7 class DesktopListbox

53.7.1 class DesktopListbox

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in listbox class in Xojo.

53.7.2 Methods

53.7.3 HorizontalNSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns horizontal scrollbar for a listbox.
Notes: Only for Cocoa target.

53.7.4 RefreshCellThreadSafeMBS(Row As Integer, Column As Integer)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Calls refresh cell on main thread.
Notes: This method is to allow you to invalidate a listbox cell in a thread without a problem.

If called on main thread, the plugin will simply call through directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.7.5 VerticalNSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns vertical scrollbar for a listbox.
Notes: Only for Cocoa target.

53.8 class DesktopProgressbar

53.8.1 class DesktopProgressbar

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in progressbar class in Xojo.

53.8.2 Methods

53.8.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSProgressIndicatorMBS object for the given control.
Example:

MsgBox ProgressBar1.NSProgressIndicatorMBS.className

Notes: This way you can manipulate Cocoa controls directly.

53.8.4 SetMaximumThreadSafeMBS(maximum as integer)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets maximum property on main thread.
Notes: This method is to allow you to set the maximum property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set maximum property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.8.5 SetValueThreadSafeMBS(value as integer)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets value property on main thread.
Notes: This method is to allow you to set the value property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set value property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.9 class DesktopTextField

53.9.1 class DesktopTextField

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in TextField class in Xojo.

53.9.2 Methods

53.9.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.
Seems like Xojo 2011r1 uses a NSTextField, so this method should return an object on Cocoa targets.

53.9.4 NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextViewMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.
Seems like Xojo 2011r1 uses a NSTextField, so this method should return nil on Cocoa targets. Please use NSTextFieldMBS method in this case.

53.9.5 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Notes: This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.10 class DesktopUIControl

53.10.1 class DesktopUIControl

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: An extension of Xojo's internal control.

53.10.2 Methods

53.10.3 RefreshThreadSafeMBS(immediately as Boolean = False)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Call refresh method on main thread.
Notes: This method is to allow you to call the refresh method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
See also:

- 53.10.4 RefreshThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, immediately as Boolean = False) 8891

53.10.4 RefreshThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, immediately as Boolean = False)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Call refresh method on main thread.
Notes: This method is to allow you to call the refresh method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
See also:

- 53.10.3 RefreshThreadSafeMBS(immediately as Boolean = False) 8891

53.10.5 SetEnabledThreadSafeMBS(value as boolean)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets enabled property on main thread.
Notes: This method is to allow you to set the enabled property of a control in a thread without a problem.

If called on main thread, the plugin will simply set enabled property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.10.6 SetVisibleThreadSafeMBS(value as boolean)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets visible property on main thread.
Notes: This method is to allow you to set the visible property of a control in a thread without a problem.

If called on main thread, the plugin will simply set visible property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.11 control ImageMBS

53.11.1 control ImageMBS

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use Canvas instead. **Function:** A control for Xojo to draw an image into a window.
Notes: The image is scaled to the size of the control.

53.11.2 Properties

53.11.3 Backdrop as Picture

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The image to display.
Notes: This image is scaled to the needed size.
(Read and Write property)

53.11.4 Events

53.11.5 Close

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The control is about to close.

53.11.6 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Overlay Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event is called when it is appropriate to display a contextual menu for the control.

53.11.7 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

53.11.8 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event where you can enable menu items.

53.11.9 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when the user clicks with the mouse in the control area.
Notes: Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

53.11.10 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The mouse drag event.

53.11.11 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when the user releases the mouse button and you returned true on the MouseDown event.

53.11.12 Open

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The control is about to was created and you can initialize it.

53.11.13 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

53.12 class Label

53.12.1 class Label

Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: An extension of Xojo's internal control.

53.12.2 Methods

53.12.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 13.3, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

53.12.4 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Notes: This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.13 control LineMBS

53.13.1 control LineMBS

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use Line instead. **Function:** A control for Xojo to draw a line into a window.
Notes: Basicly the same as the original Line control from Xojo.

Xojo Developer Magazine

- 6.6, page 8: News

53.13.2 Properties

53.13.3 BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the line.
Notes: Set to 0 to disabled the border.
(Read and Write property)

53.13.4 LineColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for drawing the line.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

53.13.5 Mirror as Boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the line is mirrored.
Notes: Normally the line is drawn from top left to bottom right.

If Mirror is true, the line is drawn from bottom left to top right.
(Read and Write property)

53.13.6 Events

53.13.7 Close

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to close.

53.13.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Overlay Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

53.13.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

53.13.10 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event where you can enable menu items.

53.13.11 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user clicks with the mouse in the control area.
Notes: Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

53.13.12 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The mouse drag event.

53.13.13 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user releases the mouse button and you returned true on the MouseDown event.

53.13.14 Open

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to was created and you can initialize it.

53.13.15 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

53.14 class Listbox

53.14.1 class Listbox

Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in listbox class in Xojo.

53.14.2 Methods

53.14.3 HorizontalNSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Returns horizontal scrollbar for a listbox.
Notes: Only for Cocoa target.
Blog Entries

- MBS Real Studio Plugins, version 13.0fc1

53.14.4 InvalidateCellThreadSafeMBS(Row as Integer, Column as Integer)

MBS Util Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Calls invalide cell on main thread.
Notes: This method is to allow you to invalidate a listbox cell in a thread without a problem.

If called on main thread, the plugin will simply call through directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

- MBS Xojo / Real Studio Plugins, version 13.5pr1

53.14.5 VerticalNSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Returns vertical scrollbar for a listbox.
Notes: Only for Cocoa target.
Blog Entries

- MBS Real Studio Plugins, version 13.0fc1

53.15 control OvalMBS

53.15.1 control OvalMBS

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use Oval instead. **Function:** A control for Xojo to draw an oval into a window.
Notes: Basicly the same as the original Oval control from Xojo.

53.15.2 Properties

53.15.3 BorderColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for drawing the border.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

53.15.4 BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the border line.
Notes: Set to 0 to disabled the border.
(Read and Write property)

53.15.5 FillColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for filling the oval.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.

(Read and Write property)

53.15.6 Events

53.15.7 Close

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to close.

53.15.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Overlay Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

53.15.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

53.15.10 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event where you can enable menu items.

53.15.11 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user clicks with the mouse in the control area.
Notes: Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

53.15.12 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The mouse drag event.

53.15.13 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user releases the mouse button and you returned true on the MouseDown event.

53.15.14 Open

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to was created and you can initialize it.

53.15.15 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

53.16 class ProgressBar

53.16.1 class ProgressBar

Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in progressbar class in Xojo.

53.16.2 Methods

53.16.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSProgressIndicatorMBS object for the given control.
Example:

MsgBox ProgressBar1.NSProgressIndicatorMBS.className

Notes: This way you can manipulate Cocoa controls directly.

53.16.4 SetMaximumThreadSafeMBS(maximum as Integer)

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets maximum property on main thread.
Notes: This method is to allow you to set the maximum property of a progressbar in a thread without a problem.

If called on main thread, the plugin will simply set maximum property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.17.2 Properties

53.17.3 BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the border line.
Notes: Set to 0 to disabled the border.
(Read and Write property)

53.17.4 BottomRightColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for drawing the bottom and right border lines.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

53.17.5 FillColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for filling the rectangle.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.

(Read and Write property)

53.17.6 TopLeftColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for drawing the top and left border lines.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

53.17.7 Events

53.17.8 Close

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The control is about to close.

53.17.9 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Overlay Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This event is called when it is appropriate to display a contextual menu for the control.

53.17.10 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

53.17.11 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event where you can enable menu items.

53.17.12 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when the user clicks with the mouse in the control area.
Notes: Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

53.17.13 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The mouse drag event.

53.17.14 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The event called when the user releases the mouse button and you returned true on the MouseDown event.

53.17.15 Open

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The control is about to was created and you can initialize it.

53.17.16 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

53.18 class RectControl

53.18.1 class RectControl

Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: An extension of Xojo's internal control.

53.18.2 Methods

53.18.3 InvalidateThreadSafeMBS(EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Call invalidate method on main thread.
Notes: This method is to allow you to call the invalidate method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
See also:

- 53.18.4 InvalidateThreadSafeMBS(X as Integer, Y as Integer, Width as Integer, Height as Integer, EraseBackground as boolean = true) 8911

53.18.4 InvalidateThreadSafeMBS(X as Integer, Y as Integer, Width as Integer, Height as Integer, EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Call invalidate method on main thread.
Notes: This method is to allow you to call the invalidate method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.
See also:

- 53.18.3 InvalidateThreadSafeMBS(EraseBackground as boolean = true) 8911

53.18.5 RefreshThreadSafeMBS(EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Call refresh method on main thread.
Notes: This method is to allow you to call the refresh method of a control in a thread without a problem.

If called on main thread, the plugin will simply call method directly.
If called on other threads the plugin will schedule to call the method a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

53.18.6 SetEnabledThreadSafeMBS(value as boolean)

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets enabled property on main thread.
Notes: This method is to allow you to set the enabled property of a control in a thread without a problem.

If called on main thread, the plugin will simply set enabled property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

- MonkeyBread Software Releases the MBS REALbasic plug-ins 8.4

53.19.2 Properties

53.19.3 BorderColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for drawing the border lines.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

53.19.4 BorderWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the border line.
Notes: Set to 0 to disabled the border.
(Read and Write property)

53.19.5 FillColor as Color

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The color for filling the rectangle.
Notes: There is a bug in Xojo. If you enter the color as a hex value (e.g. "&c123456"), the control will get black as color. If you use the color panel using the "..." buttons, the control will get the correct color.
(Read and Write property)

53.19.6 OvalHeight as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The height of the rounded corners in pixels.
Notes: (Read and Write property)

53.19.7 OvalWidth as Integer

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the rounded corners in pixels.
Notes: (Read and Write property)

53.19.8 Events

53.19.9 Close

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to close.

53.19.10 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Overlay Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

53.19.11 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

53.19.12 EnableMenuItems

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event where you can enable menu items.

53.19.13 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user clicks with the mouse in the control area.
Notes: Return true to handle the event and enable the MouseUp event.

This event exists because RB does not add a Mousedown event by default to the plugin control.

53.19.14 MouseDrag(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The mouse drag event.

53.19.15 MouseUp(x as Integer, y as Integer)

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The event called when the user releases the mouse button and you returned true on the MouseDown event.

53.19.16 Open

MBS Overlay Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The control is about to was created and you can initialize it.

53.19.17 ScaleFactorChanged(NewFactor as Double)

MBS Overlay Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

53.20 class TabPanel

53.20.1 class TabPanel

Platform: macOS, Targets: Desktop only.

Function: Extends the TabPanel control inside Xojo.

53.20.2 Methods

53.20.3 NSTabViewMBS as NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTabViewMBS object for the given control.
Example:

MsgBox TabPanel1.NSTabViewMBS.className

Notes: This way you can manipulate Cocoa controls directly.

53.21 class TextField

53.21.1 class TextField

Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in TextField class in Xojo.

53.21.2 Methods

53.21.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.
Seems like Xojo 2011r1 uses a NSTextField, so this method should return an object on Cocoa targets.

53.21.4 NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextViewMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.
Seems like Xojo 2011r1 uses a NSTextField, so this method should return nil on Cocoa targets. Please use NSTextFieldMBS method in this case.

53.21.5 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Notes: This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

Chapter 54

CoreAnimation

54.1 class CALayerMBS

54.1.1 class CALayerMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The plugin class for a CoreAnimation.
Example:

```
// add gray layer over Xojo window. Or hide it on second call, show on third call, etc...

If view = Nil Then
// view is property in window/module

Var win As NSWindowMBS = Self.NSWindowMBS

view = New NSViewMBS(0, 0, Width, Height)

win.contentView.AddSubView(view)

view.wantsLayer = True
view.autoresizesSubviews = True
view.autoresizingMask = view.NSViewWidthSizable + view.NSViewHeightSizable

Var layer As CALayerMBS = view.layer
layer.backgroundColor = CGColorMBS.CreateDeviceGray(0.3, 0.5)

Else

// show or hide
view.isHidden = Not view.isHidden
```

End If

Notes: The CALayer class manages image-based content and allows you to perform animations on that content. Layers are often used to provide the backing store for views but can also be used without a view to display content. A layer's main job is to manage the visual content that you provide but the layer itself has visual attributes that can be set, such as a background color, border, and shadow. In addition to managing visual content, the layer also maintains information about the geometry of its content (such as its position, size, and transform) that is used to present that content onscreen. Modifying the properties of the layer is how you initiate animations on the layer's content or geometry. A layer object encapsulates the duration and pacing of a layer and its animations by adopting the CAMediaTiming protocol, which defines the layer's timing information.

If the layer object was created by a view, the view typically assigns itself as the layer's delegate automatically, and you should not change that relationship. For layers you create yourself, you can assign a delegate object and use that object to provide the contents of the layer dynamically and perform other tasks. A layer may also have a layout manager object (assigned to the layoutManager property) to manage the layout of subviews separately.

Available in OS X v10.5 and later.

54.1.2 Methods

54.1.3 addSublayer(layer as CALayerMBS)

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Appends the layer to the layer's list of sublayers.
Notes: If the array in the sublayers property is nil, calling this method creates an array for that property and adds the specified layer to it.

54.1.4 available as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns true if CALayer is available.
Notes: True on Mac and False on Windows/Linux.

54.1.5 Constructor

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes the layer.
Notes: Available in OS X v10.5 and later.

54.1.6 display

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Reloads the content of this layer.
Notes: Do not call this method directly. The layer calls this method at appropriate times to update the layer's content. If the layer has a delegate object, this method attempts to call the delegate's Configuring the Layer's Rendering Behavior method, which the delegate can use to update the layer's contents. If the delegate does not implement the Configuring the Layer's Rendering Behavior method, this method creates a backing store and calls the layer's drawInContext: method to fill that backing store with content. The new backing store replaces the previous contents of the layer.

Subclasses can override this method and use it to set the layer's contents property directly. You might do this if your custom layer subclass handles layer updates differently.

54.1.7 displayIfNeeded

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initiates the update process for a layer if it is currently marked as needing an update.
Notes: You can call this method as needed to force an update to your layer's contents outside of the normal update cycle. Doing so is generally not needed, though. The preferred way to update a layer is to call setNeedsDisplay and let the system update the layer during the next cycle.
Available in OS X v10.6 and later.

54.1.8 layer as CALayerMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates and returns an instance of the layer object.
Notes: Returns the initialized layer object or nil if initialization was not successful.
If you subclass CALayer, you may override this method and use it to provide an instance of your specific subclass.

54.1.9 layerFromHandle(Handle as Integer) as CALayerMBS

MBS MacCG Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: Returns a new MBS layer object for the given handle.
Notes: Handle must be pointing to a CALayer, UIView or NSView.
Returns nil in case of an error.
See also:

- 54.1.10 layerFromHandle(Handle as Ptr) as CALayerMBS 8924

54.1.10 layerFromHandle(Handle as Ptr) as CALayerMBS

MBS MacCG Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: Returns a new MBS layer object for the given handle.
Notes: Handle must be pointing to a CALayer, UIView or NSView.
Returns nil in case of an error.
See also:

- 54.1.9 layerFromHandle(Handle as Integer) as CALayerMBS 8924

54.1.11 layoutIfNeeded

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Recalculate the receiver's layout, if required.
Notes: When this message is received, the layer's super layers are traversed until a ancestor layer is found that does not require layout. Then layout is performed on the entire layer-tree beneath that ancestor.

54.1.12 layoutSublayers

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Tells the layer to update its layout.
Notes: Subclasses can override this method and use it to implement their own layout algorithm. Your implementation must set the frame of each sublayer managed by the receiver.

The default implementation of this method calls the layoutSublayersOfLayer method of the layer's delegate object. If there is no delegate object, or the delegate does not implement that method, this method calls the layoutSublayersOfLayer method of the object in the layoutManager property.

54.1.13 removeAllAnimations

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Remove all animations attached to the layer.

54.1.14 removeFromSuperlayer

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Detaches the layer from its parent layer.
Notes: You can use this method to remove a layer (and all of its sublayers) from a layer hierarchy. This method updates both the superlayer's list of sublayers and sets this layer's superlayer property to nil.
Available in OS X v10.5 and later.

54.1.15 renderInContext(CGContextHandle as Integer) as boolean

MBS MacCG Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: Renders content of CALayer into given CGContext.
Notes: Renders the receiver and its sublayers into the specified context.
This method renders directly from the layer tree, ignoring any animations added to the render tree. Renders in the coordinate space of the layer.

Returns true if plugin called render command, so layer can draw itself.
Not all layers support drawing into context.

54.1.16 renderInPicture(Pic as Picture) as boolean

MBS MacCG Plugin, Plugin Version: 16.1, Platform: macOS, Targets: Desktop only.

Function: Renders content of CALayer into given Picture.

Notes: Renders the receiver and its sublayers into the specified context.
This method renders directly from the layer tree, ignoring any animations added to the render tree. Renders in the coordinate space of the layer.

Returns true if plugin called render command, so layer can draw itself.
Not all layers support drawing into context.

54.1.17 setNeedsDisplay

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Marks the layer's contents as needing to be updated.
Notes: Calling this method causes the layer to recache its content. This results in the layer potentially calling either the displayLayer or drawLayer:inContext method of its delegate. The existing content in the layer's contents property is removed to make way for the new content.

Available in OS X v10.5 and later.

54.1.18 setNeedsDisplayInRect(r as CGRectMBS)

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Marks the region within the specified rectangle as needing to be updated.
Notes: r: The rectangular region of the layer to mark as invalid. You must specify this rectangle in the layer's own coordinate system.
Available in OS X v10.5 and later.

54.1.19 setNeedsLayout

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Invalidates the layer's layout and marks it as needing an update.
Notes: You can call this method to indicate that the layout of a layer's sublayers has changed and must be updated. The system typically calls this method automatically when the layer's bounds change or when sublayers are added or removed. In OS X, if your layer's layoutManager property contains an object that implements the invalidateLayoutOfLayer method, that method is called too.

During the next update cycle, the system calls the layoutSublayers method of any layers requiring layout updates.
Available in OS X v10.5 and later.

54.1.20 sublayers as CALayerMBS()

MBS MacCG Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The array with sublayers.

54.1.21 Properties

54.1.22 affineTransform as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The affine version of the layer's transform..
Notes: The affine transform structure that corresponds to the value in the layer's transform property.
(Read and Write property)

54.1.23 anchorPoint as CGRectMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Defines the anchor point of the layer's bounds rectangle. Animatable.
Notes: You specify the value for this property using the unit coordinate space. The default value of this property is (0.5, 0.5), which represents the center of the layer's bounds rectangle. All geometric manipulations to the view occur about the specified point. For example, applying a rotation transform to a layer with the default anchor point causes the layer to rotate around its center. Changing the anchor point to a different location would cause the layer to rotate around that new point.

For more information about the relationship between the frame, bounds, anchorPoint and position properties, see Core Animation Programming Guide.
Available in OS X v10.5 and later.
(Read and Write property)

54.1.24 anchorPointZ as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The anchor point for the layer's position along the z axis. Animatable.
Notes: This property specifies the anchor point on the z axis around which geometric manipulations occur. The point is expressed as a distance (measured in points) along the z axis. The default value of this property is 0.
Available in OS X v10.6 and later.

(Read and Write property)

54.1.25 AutoresizingMask as Integer

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: A bitmask defining how the layer is resized when the bounds of its superlayer changes.
Notes: If your app does not use a layout manager or constraints to handle layout changes, you can assign a value to this property to adjust the layer's size in response to changes in the superlayer's bounds. For a list of possible values, see "Autoresizing Mask".

The default value of this property is kCALayerNotSizable.
(Read and Write property)

54.1.26 backgroundColor as Variant

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The background color of the receiver. Animatable.
Notes: Value is a CGColorMBS. We use variant to reduce dependency to other plugins.

The default value of this property is nil.

The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.
(Read and Write property)

54.1.27 borderColor as Variant

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The color of the layer's border. Animatable.
Notes: Value is a CGColorMBS. We use variant to reduce dependency to other plugins.

The default value of this property is an opaque black color.

The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.

(Read and Write property)

54.1.28 borderWidth as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The width of the layer's border. Animatable.
Notes: When this value is greater than 0.0, the layer draws a border using the current borderColor value. The border is drawn inset from the receiver's bounds by the value specified in this property. It is composited above the receiver's contents and sublayers and includes the effects of the cornerRadius property.

The default value of this property is 0.0.
(Read and Write property)

54.1.29 bounds as CGRectMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The layer's bounds rectangle. Animatable.
Notes: The bounds rectangle is the origin and size of the layer in its own coordinate space. When you create a new standalone layer, the default value for this property is an empty rectangle, which you must change before using the layer. The values of each coordinate in the rectangle are measured in points.

For more information about the relationship between the frame, bounds, anchorPoint and position properties, see Core Animation Programming Guide.
(Read and Write property)

54.1.30 className as string

MBS MacCG Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The class name of the layer.
Notes: Useful for debugging.
(Read only property)

54.1.31 classPath as string

MBS MacCG Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The path of this layer class.

Notes: Useful for debugging to know what super classes the layer has.
(Read only property)

54.1.32 contents as Variant

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The contents of the layer.
Notes: Value is a CGImageMBS. We use variant to reduce dependency to other plugins.
(Read and Write property)

54.1.33 contentsCenter as CGRectMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The rectangle that defines how the layer contents are scaled during a resizing operation. Animatable.
Notes: You can use this property to subdivide the layer's content into a 3x3 grid. The value in this property specifies the location and size of the center rectangle in that grid. If the layer's contentsGravity property is set to one of the resizing modes, resizing the layer causes scaling to occur differently in each rectangle of the grid. The center rectangle is stretched in both dimensions, the top-center and bottom-center rectangles are stretched only horizontally, the left-center and right-center rectangles are stretched only vertically, and the four corner rectangles are not stretched at all. Therefore, you can use this technique to implement stretchable backgrounds or images using a three-part or nine-part image.

The value in this property is set to the unit rectangle (0.0,0.0) (1.0,1.0) by default, which causes the entire image to scale in both dimensions. If you specify a rectangle that extends outside the unit rectangle, the result is undefined. The rectangle you specify is applied only after the contentsRect property has been applied to the image.

Note: If the width or height of the rectangle in this property is very small or 0, the value is implicitly changed to the width or height of a single source pixel centered at the specified location.
(Read and Write property)

54.1.34 contentsRect as CGRectMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The rectangle, in the unit coordinate space, that defines the portion of the layer's contents that should be used. Animatable.
Notes: Defaults to the unit rectangle (0.0, 0.0, 1.0, 1.0).
If pixels outside the unit rectangle are requested, the edge pixels of the contents image will be extended

outwards.
If an empty rectangle is provided, the results are undefined.
(Read and Write property)

54.1.35 contentsScale as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The scale factor applied to the layer.
Notes: This value defines the mapping between the logical coordinate space of the layer (measured in points) and the physical coordinate space (measured in pixels). Higher scale factors indicate that each point in the layer is represented by more than one pixel at render time. For example, if the scale factor is 2.0 and the layer's bounds are 50 x 50 points, the size of the bitmap used to present the layer's content is 100 x 100 pixels.

The default value of this property is 1.0. For layers attached to a view, the view changes the scale factor automatically to a value that is appropriate for the current screen. For layers you create and manage yourself, you must set the value of this property yourself based on the resolution of the screen and the content you are providing. Core Animation uses the value you specify as a cue to determine how to render your content.

Available in OS X v10.7 and later.
(Read and Write property)

54.1.36 cornerRadius as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The radius to use when drawing rounded corners for the layer's background. Animatable.
Notes: Setting the radius to a value greater than 0.0 causes the layer to begin drawing rounded corners on its background. By default, the corner radius does not apply to the image in the layer's contents property; it applies only to the background color and border of the layer. However, setting the masksToBounds property to true causes the content to be clipped to the rounded corners.

The default value of this property is 0.0.
(Read and Write property)

54.1.37 DoubleSided as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: A Boolean indicating whether the layer displays its content when facing away from the viewer. Animatable.

Notes: When the value in this property is false, the layer hides its content when it faces away from the viewer. The default value of this property is true.
Available in OS X v10.5 and later.
(Read and Write property)

54.1.38 drawsAsynchronously as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: A Boolean indicating whether drawing commands are deferred and processed asynchronously in a background thread.
Notes: When this property is set to true, the graphics context used to draw the layer's contents queues drawing commands and executes them on a background thread rather than executing them synchronously. Performing these commands asynchronously can improve performance in some apps. However, you should always measure the actual performance benefits before enabling this capability.

The default value for this property is false.
Available in OS X v10.8 and later.
(Read and Write property)

54.1.39 frame as CGRectMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The layer's frame rectangle.
Notes: The frame rectangle is position and size of the layer specified in the superlayer's coordinate space. For layers, the frame rectangle is a computed property that is derived from the values in the bounds, anchorPoint and position properties. When you assign a new value to this property, the layer changes its position and bounds properties to match the rectangle you specified. The values of each coordinate in the rectangle are measured in points.

For more information about the relationship between the frame, bounds, anchorPoint and position properties, see Core Animation Programming Guide.

Note: The frame property is not directly animatable. Instead you should animate the appropriate combination of the bounds, anchorPoint and position properties to achieve the desired result.
(Read and Write property)

54.1.40 Handle as Integer

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The internal reference to the layer.
Notes: (Read and Write property)

54.1.41 Hidden as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: A Boolean indicating whether the layer is displayed. Animatable.
Notes: The default value of this property is false.
(Read and Write property)

54.1.42 mask as CALayerMBS

MBS MacCG Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The layer to be used as mask for this layer.
Notes: A layer whose alpha channel is used as a mask to select between the layer's background and the result of compositing the layer's contents with its filtered background. Defaults to nil. When used as a mask the layer's 'compositingFilter' and 'backgroundFilters' properties are ignored. When setting the mask to a new layer, the new layer must have a nil superlayer, otherwise the behavior is undefined. Nested masks (mask layers with their own masks) are unsupported.
(Read and Write property)

54.1.43 masksToBounds as Boolean

MBS MacCG Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether to mask by bounds.
Notes: When true an implicit mask matching the layer bounds is applied to the layer (including the effects of the 'cornerRadius' property). If both 'mask' and 'masksToBounds' are non-nil the two masks are multiplied to get the actual mask values. Defaults to false. Animatable.
(Read and Write property)

54.1.44 minificationFilterBias as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The bias factor used by the minification filter to determine the levels of detail.
Notes: This value is used by the minificationFilter when it is set to kCAFilterTrilinear.
The default value of this property is 0.0.
Available in OS X v10.6 and later.

(Read and Write property)

54.1.45 modelLayer as CALayerMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns the model layer object associated with the receiver, if any.
Notes: Calling this method on a layer in the presentation tree returns the corresponding layer object in the model tree. This method returns a value only when a transaction involving changes to the presentation layer is in progress. If no transaction is in progress, the results of calling this method are undefined.

Available in OS X v10.5 and later.
(Read only property)

54.1.46 needsDisplay as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a Boolean indicating whether the layer has been marked as needing an update.
Notes: True if the layer needs to be updated.
Available in OS X v10.6 and later.
(Read only property)

54.1.47 needsDisplayOnBoundsChange as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: A Boolean indicating whether the layer contents must be updated when its bounds rectangle changes.
Notes: When this property is set to true, the layer automatically calls its setNeedsDisplay method whenever its bounds property changes. The default value of this property is false.
(Read and Write property)

54.1.48 needsLayout as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a Boolean indicating whether the layer has been marked as needing a layout update.
Notes: True if the layer has been marked as requiring a layout update.
Available in OS X v10.6 and later.

(Read only property)

54.1.49 opacity as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The opacity of the receiver. Animatable.
Notes: The value of this property must be in the range 0.0 (transparent) to 1.0 (opaque). Values outside that range are clamped to the minimum or maximum. The default value of this property is 1.0.
(Read and Write property)

54.1.50 Opaque as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the layer contains completely opaque content.
Notes: The default value of this property is false. If your app draws completely opaque content that fills the layer's bounds, setting this property to true lets the system optimize the rendering behavior for the layer. Specifically, when the layer creates the backing store for your drawing commands, Core Animation omits the alpha channel of that backing store. Doing so can improve the performance of compositing operations. If you set the value of this property to true, you must fill the layer's bounds with opaque content.

Setting this property affects only the backing store managed by Core Animation. If you assign an image with an alpha channel to the layer's contents property, that image retains its alpha channel regardless of the value of this property.
(Read and Write property)

54.1.51 position as CGRectMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The layer's position in its superlayer's coordinate space. Animatable.
Notes: The value of this property is specified in points and is always specified relative to the value in the anchorPoint property. For new standalone layers, the default position is set to (0.0, 0.0). Changing the frame property also updates the value in this property.

For more information about the relationship between the frame, bounds, anchorPoint and position properties, see Core Animation Programming Guide.
(Read and Write property)

54.1.52 preferredFrameSize as CGSizeMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns the preferred size of the layer in the coordinate space of its superlayer.
Notes: In OS X, the default implementation of this method calls the preferredSizeOfLayer method of its layout manager—that is, the object in its layoutManager property. If that object does not exist or does not implement that method, this method returns the size of the layer's current bounds rectangle mapped into the coordinate space of its superlayer.
(Read only property)

54.1.53 presentationLayer as CALayerMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a copy of the presentation layer object that represents the state of the layer as it currently appears onscreen.
Notes: The layer object returned by this method provides a close approximation of the layer that is currently being displayed onscreen. While an animation is in progress, you can retrieve this object and use it to get the current values for those animations.

The sublayers, mask, and superlayer properties of the returned layer return the corresponding objects from the presentation tree (not the model tree). This pattern also applies to any read-only layer methods. For example, the hitTest: method of the returned object queries the layer objects in the presentation tree.

Available in OS X v10.5 and later.
(Read only property)

54.1.54 rasterizationScale as Double

MBS MacCG Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: The scale at which the layer will be rasterized.
Notes: (when the shouldRasterize property has been set to true) relative to the coordinate space of the layer. Defaults to one. Animatable.
(Read and Write property)

54.1.55 shadowColor as Variant

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The color of the layer,Äôs shadow. Animatable.

Notes: The default value of this property is an opaque black color.

The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.

Value is a CGColorMBS. We use variant to reduce dependency to other plugins.
(Read and Write property)

54.1.56 shadowOffset as CGSizeMBS

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The offset (in points) of the layer,Äôs shadow. Animatable.
Notes: The default value of this property is (0.0, -3.0).
(Read and Write property)

54.1.57 shadowOpacity as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The opacity of the layer's shadow. Animatable.
Notes: The value in this property must be in the range 0.0 (transparent) to 1.0 (opaque). The default value of this property is 0.0.
Available in OS X v10.5 and later.
(Read and Write property)

54.1.58 shadowPath as Variant

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The shadow path.
Notes: Value is a CGPathMBS. We use variant to reduce dependency to other plugins.

The default value of this property is nil, which causes the layer to use a standard shadow shape. If you specify a value for this property, the layer creates its shadow using the specified path instead of the layer,Äôs composited alpha channel. The path you provide defines the outline of the shadow. It is filled using the non-zero winding rule and the current shadow color, opacity, and blur radius.

Unlike most animatable properties, this property (as with all CGPathRef animatable properties) does not support implicit animation. However, the path object may be animated using any of the concrete subclasses

of CAPropertyAnimation. Paths will interpolate as a linear blend of the "on-line" points; "off-line" points may be interpolated non-linearly (to preserve continuity of the curve's derivative). If the two paths have a different number of control points or segments, the results are undefined. If the path extends outside the layer bounds it will not automatically be clipped to the layer, only if the normal layer masking rules cause that.

Specifying an explicit path usually improves rendering performance.

The value of this property is retained using the Core Foundation retain/release semantics. This behavior occurs despite the fact that the property declaration appears to use the default assign semantics for object retention.
(Read and Write property)

54.1.59 shadowRadius as Double

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The blur radius (in points) used to render the layer,Äôs shadow. Animatable.
Notes: You specify the radius The default value of this property is 3.0.
(Read and Write property)

54.1.60 shouldRasterize as Boolean

MBS MacCG Plugin, Plugin Version: 15.3, Platform: macOS, Targets: All.

Function: Whether view should raster.
Notes: When true, the layer is rendered as a bitmap in its local coordinate space ("rasterized"), then the bitmap is composited into the destination (with the minificationFilter and magnificationFilter properties of the layer applied if the bitmap needs scaling). Rasterization occurs after the layer's filters and shadow effects are applied, but before the opacity modulation. As an implementation detail the rendering engine may attempt to cache and reuse the bitmap from one frame to the next. (Whether it does or not will have no affect on the rendered output.) When false the layer is composited directly into the destination whenever possible (however, certain features of the compositing model may force rasterization, e.g. adding filters). Defaults to false. Animatable.
(Read and Write property)

54.1.61 superlayer as CALayerMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The superlayer of the layer.
Notes: The superlayer manages the layout of its sublayers.

Available in OS X v10.5 and later.
(Read only property)

54.1.62 zPosition as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The layer's position on the z axis. Animatable.
Notes: The default value of this property is 0. Changing the value of this property changes the the front-to-back ordering of layers onscreen. This can affect the visibility of layers whose frame rectangles overlap.

The value of this property is measured in points.
Available in OS X v10.5 and later.
(Read and Write property)

54.1.63 Constants

Edge constants

Constant	Value	Description
kCALayerBottomEdge	4	Specifies that the bottom edge of the receiver's content should be antialiased.
kCALayerLeftEdge	1	Specifies that the left edge of the receiver's content should be antialiased.
kCALayerRightEdge	2	Specifies that the right edge of the receiver's content should be antialiased.
kCALayerTopEdge	8	Specifies that the top edge of the receiver's content should be antialiased.

Autoresize Mask Constants

Constant	Value	Description
kCALayerHeightSizable	16	The receiver's height is flexible.
kCALayerMaxXMargin	4	The left margin between the receiver and its superview is flexible.
kCALayerMaxYMargin	32	The top margin between the receiver and its superview is flexible.
kCALayerMinXMargin	1	The left margin between the receiver and its superview is flexible.
kCALayerMinYMargin	8	The top margin between the receiver and its superview is flexible.
kCALayerNotSizable	0	The receiver cannot be resized.
kCALayerWidthSizable	2	The receiver's width is flexible.

54.2 class CATextLayerMBS

54.2.1 class CATextLayerMBS

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The text layer provides simple text layout and rendering of plain or attributed strings.
Notes: The first line is aligned to the top of the layer.
Subclass of the CALayerMBS class.

54.2.2 Methods

54.2.3 Constructor

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The constructor.

54.2.4 kCAAlignmentCenter as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for alignment.

54.2.5 kCAAlignmentJustified as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for alignment.

54.2.6 kCAAlignmentLeft as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for alignment.

54.2.7 kCAAlignmentNatural as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for alignment.

54.2.8 kCAAlignmentRight as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for alignment.

54.2.9 kCATruncationEnd as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for truncation.

54.2.10 kCATruncationMiddle as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for truncation.

54.2.11 kCATruncationNone as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for truncation.

54.2.12 kCATruncationStart as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: One of the modes for truncation.

54.2.13 Properties

54.2.14 alignmentMode as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Describes how individual lines of text are aligned within the layer bounds.
Notes: The possible options are 'natural', 'left', 'right', 'center' and 'justified'. Defaults to 'natural'.
(Read and Write property)

54.2.15 allowsFontSubpixelQuantization as Boolean

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Sets allowsFontSubpixelQuantization parameter of CGContextMBS passed to the drawInContext method.
Notes: Defaults to false.
(Read and Write property)

54.2.16 font as Variant

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The font to use.
Notes: May be either a CTFontMBS, NSFontMBS, CGFontMBS, or a string naming the font.
Defaults to the Helvetica font. Only used when the 'string' property is not an NSAttributedStringMBS object.
(Read and Write property)

54.2.17 fontSize as Double

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The font size.
Notes: Defaults to 36. Only used when the 'string' property is not an NSAttributedStringMBS. Animatable

(Mac OS X 10.6 and later.)
(Read and Write property)

54.2.18 foregroundColor as Variant

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The color object used to draw the text.
Notes: Defaults to opaque white.
Only used when the 'string' property is not an NSAttributedStringMBS object.
Animatable (Mac OS X 10.6 and later.)
(Read and Write property)

54.2.19 String as Variant

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The text to be rendered, should be either a string or an NSAttributedString.
Notes: Defaults to nil.
(Read and Write property)

54.2.20 truncationMode as String

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Describes how the string is truncated to fit within the layer bounds.
Notes: The possible options are 'none', 'start', 'middle' and 'end'. Defaults to 'none'.
(Read and Write property)

54.2.21 Wrapped as Boolean

MBS MacCG Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: When true the string is wrapped to fit within the layer bounds.
Notes: Defaults to false.
(Read and Write property)

54.3 class CATransactionMBS

54.3.1 class CATransactionMBS

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The plugin class for a CoreAnimation transaction.
Notes: CATransaction is the Core Animation mechanism for batching multiple layer-tree operations into atomic updates to the render tree. Every modification to a layer tree must be part of a transaction. Nested transactions are supported.

Core Animation supports two types of transactions: implicit transactions and explicit transactions. Implicit transactions are created automatically when the layer tree is modified by a thread without an active transaction and are committed automatically when the thread's run-loop next iterates. Explicit transactions occur when the the application sends the CATransaction class a begin message before modifying the layer tree, and a commit message afterwards.

CATransaction allows you to override default animation properties that are set for animatable properties. You can customize duration, timing function, whether changes to properties trigger animations, and provide a handler that informs you when all animations from the transaction group are completed.

During a transaction you can temporarily acquire a recursive spin-lock for managing property atomicity.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr9

54.3.2 Methods

54.3.3 animationDuration as Double

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns the animation duration used by all animations within this transaction group.

54.3.4 available as boolean

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns true if transaction class is available.
Notes: Returns true on Mac and false on Linux/Windows.

54.3.5 begin

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Begin a new transaction for the current thread.
Notes: The transaction is nested within the thread's current transaction, if there is one.
Available in OS X v10.5 and later.

54.3.6 commit

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Commit all changes made during the current transaction.
Notes: Raises an exception if no current transaction exists.
Available in OS X v10.5 and later.

54.3.7 Constructor

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

54.3.8 flush

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Flushes any extant implicit transaction.
Notes: Delays the commit until any nested explicit transactions have completed.

Flush is typically called automatically at the end of the current runloop, regardless of the runloop mode. If your application does not have a runloop, you must call this method explicitly.

However, you should attempt to avoid calling flush explicitly. By allowing flush to execute during the runloop your application will achieve better performance, atomic screen updates will be preserved, and transactions and animations that work from transaction to transaction will continue to function.

Available in OS X v10.5 and later.

54.3.9 kCATransactionAnimationDuration as string

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the keys for values of a transaction.
Notes: Duration, in seconds, for animations triggered within the transaction group. The value for this key must be a number.
Available in OS X v10.5 and later.

54.3.10 kCATransactionDisableActions as string

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the keys for values of a transaction.
Notes: If true, implicit actions for property changes made within the transaction group are suppressed. The value for this key must be a boolean.
Available in OS X v10.5 and later.

54.3.11 setAnimationDuration(value as Double)

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Sets the animation duration used by all animations within this transaction group.
Notes: Available in OS X v10.6 and later.

54.3.12 setValue(value as Variant, key as string)

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Sets the arbitrary keyed-data for the specified key.
Notes: value: The value for the key identified by key.
key: The name of one of the receiver's properties.

Nested transactions have nested data scope; setting a key always sets it in the innermost scope.
Available in OS X v10.5 and later.

54.3.13 valueForKey(key as string) as Variant

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns the arbitrary keyed-data specified by the given key.
Notes: key: The name of one of the receiver's properties.

Returns the value for the data specified by the key.
Nested transactions have nested data scope. Requesting a value for a key first searches the innermost scope, then the enclosing transactions.
Available in OS X v10.5 and later.

54.3.14 Properties

54.3.15 Handle as Integer

MBS MacCG Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The internal transaction handle.
Notes: (Read and Write property)

Chapter 55

CoreAudio

55.1 class AudioPlayThruMBS

55.1.1 class AudioPlayThruMBS

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to do active play through on Mac OS X using CoreAudio.
Notes: Requires Mac OS X 10.4.
Blog Entries

- MBS Real Studio Plugins, version 13.0pr3

55.1.2 Methods

55.1.3 Constructor

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Example:

Var a as AudioPlayThruMBS
a=new AudioPlayThruMBS

Notes: Does nothing.
Only useful if you want to create an object, set the buffersize and call Init after that.
See also:

- 55.1.4 Constructor(InputDeviceID as Integer, OutputDeviceID as Integer, BufferSizeWish as Integer

= 0) 8950

55.1.4 Constructor(InputDeviceID as Integer, OutputDeviceID as Integer, BufferSizeWish as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Example:

```
Var InputDeviceID,OutputDeviceID as Integer
// get device IDs
Var a as AudioPlayThruMBS

a=new AudioPlayThruMBS(InputDeviceID, OutputDeviceID)
```

Notes: Calls Init method behind scenes with default buffer size.
Lasterror is set.
Device IDs are the IDs you get in the CoreAudio classes.
BufferSizeWish is the buffer size you prefer to use. If value is too small the default value will be used.
See also:

- 55.1.3 Constructor 8949

55.1.5 Init(InputDeviceID as Integer, OutputDeviceID as Integer, BufferSizeWish as Integer = 0)

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the engine behind this class.
Example:

```
Var InputDeviceID as Integer
Var OutputDeviceID as Integer
// get device IDs

Var a as AudioPlayThruMBS
a=new AudioPlayThruMBS
a.Init(InputDeviceID, OutputDeviceID)
```

Notes: Lasterror is set.
Device IDs are the IDs you get in the CoreAudio classes.
Can be used to set the buffersize before calling this method.

55.1.6 IsRunning as boolean

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether playthrough is active.

55.1.7 SetInputDeviceAsCurrent(DeviceID as Integer)

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets input device.
Notes: Device IDs are the IDs you get in the CoreAudio classes.

55.1.8 SetOutputDeviceAsCurrent(DeviceID as Integer)

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets output device.
Notes: Lasterror is set.
Device IDs are the IDs you get in the CoreAudio classes.

55.1.9 Start

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Starts playing.
Notes: Lasterror is set.

55.1.10 Stop

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops playing.
Notes: Lasterror is set.

55.1.11 Properties

55.1.12 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 6.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: 0 for success. -1 in case function is not available.
(Read and Write property)

55.1.13 Volume as Double

MBS MacOSX Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get or set the volume of the output audio unit.
Notes: Lasterror is set.
Range is from 0.0 to 1.0.
(Read and Write computed property)

Chapter 56

CoreFoundation

56.1 Globals

56.1.1 NewCFObjectMBSFromXML(XMLdata as MemoryBlock) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Parses the XML data and returns a CFObject.
Notes: Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.
See also:

- 56.1.2 NewCFObjectMBSFromXML(XMLdata as String) as CFObjectMBS 8953

56.1.2 NewCFObjectMBSFromXML(XMLdata as String) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Parses the XML data and returns a CFObject.
Notes: Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.
See also:

- 56.1.1 NewCFObjectMBSFromXML(XMLdata as MemoryBlock) as CFObjectMBS 8953

56.1.3 NewCFStringMBS2(s as string) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 8.5, Platform: macOS, Targets: All.

Function: Returns a CFStringMBS object created using the given string.
Example:

```
Var s as CFStringMBS

s=NewCFStringMBS2("")
// s is not nil here
MsgBox str(s.Handle)
```

Notes: The cfstring may be unicode.
See also NewCFStringMBS.

56.1.4 kCFCharacterSetMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFCharacterSetMBS object.

56.1.5 NewCFObjectMBSFromXMLMT(data as string) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Parses the XML data and returns a CFObject.
Notes: Same as NewCFObjectMBSFromXML, but with additional multithreading.

Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 56.1.6 NewCFObjectMBSFromXMLMT(file as folderitem) as CFObjectMBS 8954
- 56.1.7 NewCFObjectMBSFromXMLMT(XMLdata as CFBinaryDataMBS) as CFObjectMBS 8955

56.1.6 NewCFObjectMBSFromXMLMT(file as folderitem) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Parses the XML data and returns a CFObject.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.xml")
Var o as CFObjectMBS = NewCFObjectMBSFromXMLMT(f)

if o = nil then
MsgBox "Error"
else
MsgBox "OK"
end if
```

Notes: Same as NewCFObjectMBSFromXML, but with additional multithreading.

Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 56.1.5 NewCFObjectMBSFromXMLMT(data as string) as CFObjectMBS 8954
- 56.1.7 NewCFObjectMBSFromXMLMT(XMLdata as CFBinaryDataMBS) as CFObjectMBS 8955

56.1.7 NewCFObjectMBSFromXMLMT(XMLdata as CFBinaryDataMBS) as CFObjectMBS

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Parses the XML data and returns a CFObject.
Notes: Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 56.1.5 NewCFObjectMBSFromXMLMT(data as string) as CFObjectMBS 8954
- 56.1.6 NewCFObjectMBSFromXMLMT(file as folderitem) as CFObjectMBS 8954

56.1.8 CFShowCFStringMBS(cfstring as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Prints the content of the given CFString to the console.
Blog Entries

- MBS Real Studio Plugins, version 12.4pr3

56.1.9 CFShowMBS(cfobject as CFObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: All.

Function: Prints the content of the given CFObject to the console.
Notes: Very useful for e.g. CFDictionarys.
Blog Entries

- MBS Real Studio Plugins, version 12.4pr3

56.1.10 CreateBundleMBS(file as folderitem) as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 10.1, Platform: macOS, Targets: All.

Function: Creates a CFBundle object for the bundle folder on the given position.
Example:

```
// Find and show the main executable file of a bundled application

Var f as FolderItem

f=SpecialFolder.Applications.Child("Mail.app")
MsgBox f.NativePath // shows app bundle path

Var b as CFBundleMBS
Var u as CFURLMBS

b=CreateBundleMBS(f)
if b<>nil then
u=b.ExecutableFile
if u<>nil then
MsgBox f.NativePath // shows app executable path
end if
end if
```

Notes: Returns nil on any error.
See also:

- 56.1.11 CreateBundleMBS(url as CFURLMBS) as CFBundleMBS

56.1.11 CreateBundleMBS(url as CFURLMBS) as CFBundleMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a CFBundle object for the bundle folder on the given position.
Example:

```
// Find and show the main executable file of a bundled application

Var f as FolderItem

f=SpecialFolder.Applications.Child("Mail.app")
MsgBox f.NativePath // shows app bundle path

Var b as CFBundleMBS
Var u as CFURLMBS

u=NewCFURLMBSFile(f)
if u<>Nil then
b=CreateBundleMBS(u)
if b<>nil then
u=b.ExecutableFile
if u<>nil then
MsgBox f.NativePath // shows app executable path
end if
end if
end if
```

Notes: Returns nil on any error.
See also:

- 56.1.10 CreateBundleMBS(file as folderitem) as CFBundleMBS 8956

56.1.12 CreateBundlesFromDirectoryMBS(url as CFURLMBS, type as CFStringMBS) as CFArrayMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a list of all bundles in a folder.
Notes: Returns nil on any error.

With the Type parameter you can limit the bundles to a certain type.
The abstract type of the bundles you wish to locate and create. The type is expressed as a filename extension, such as bundle. Pass NULL to create CFBundle objects for bundles of any type.

56.1.13 CreateCFTimeZoneMBS(name as CFStringMBS, data as CFBinaryDataMBS) as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Creates a new timezone object with the given name and data.
Notes: Returns nil on any error.

56.1.14 CreateCFTimeZoneMBSwithName(name as CFStringMBS, TryAbbrev as boolean) as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Creates a new timezone object with the object from the system which matches the given name.
Notes: If TryAbbrev is true the system also checks if the name matches the abbreviated name of the timezone object.
Returns nil on any error.

56.1.15 CreateCFTimeZoneMBSwithTimeIntervalFromGMT(time as CFTimeIntervalMBS) as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Creates a new timezone object with the given time interval.
Notes: Returns nil on any error.

56.1.16 CreateStringByAddingPercentEscapesMBS(original as CFStringMBS,charactersToLeaveEscaped as CFStringMBS,legalURLCharactersToBeEscaped as CFStringMBS,encoding as Integer) as CFStringMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Addes percent escapes inside a string.
Notes: If charactersToLeaveEscaped=nil then no string is changed. If charactersToLeaveEscaped contains an emptry string (””) all escapes are changed and if charactersToLeaveEscaped contains a string<>”” then this characters are not escaped.

56.1.17 CreateStringByReplacingPercentEscapesMBS(original as CFStringMBS,charactersToLeaveEscaped as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Replaces percent escapes inside a string.
Notes: If charactersToLeaveEscaped=nil then no string is changed. If charactersToLeaveEscaped contains an emptry string ("") all escapes are changed and if charactersToLeaveEscaped contains a string<>"" then this characters are not escaped.

56.1.18 CurrentCFAbsoluteTimeMBS as CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The current time as an absolute time object.
Example:

```
// get current timezone
Var c as CFTimeZoneMBS = SystemCFTimeZoneMBS

// and current time
Var time as CFAbsoluteTimeMBS = CurrentCFAbsoluteTimeMBS

// Do we have daylight saving time?
MsgBox str(c.IsDaylightSavingTime(time))
```

Notes: Returns nil on any error.

56.1.19 GetAllBundlesMBS as CFArrayMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a list of all known bundles on the system.
Notes: Returns nil on any error.

56.1.20 GetBundleWithIdentifierMBS(id as CFStringMBS) as CFBundleMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a CFBundle object for the bundle with the given ID.
Notes: Returns nil on any error.

Returns only a bundle if that bundle has been loaded before.

For a bundle to be located using its identifier, the bundle object must have already been created. The principal intended purpose for locating bundles by identifier is so that code (in frameworks, plugins, etc.) can find its own bundle. If a bundle is created, then the bundle deleted from the filesystem and this function invoked afterwards, it will still return the original bundle.

56.1.21 GetDefaultCFTimeZoneMBS as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The default time zone.
Example:

msgBox str(GetDefaultCFTimeZoneMBS.SecondsFromGMT(nil).Value)

Notes: Returns nil on any error.

56.1.22 kCFArrayMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFArrayMBS object.

56.1.23 kCFBagMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFBagMBS object.

56.1.24 kCFBinaryDataMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFBinary object.

56.1.25 kCFBooleanMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFBooleanMBS object.

56.1.26 kCFBundleMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFBundle object.
Notes: CFBundle objects may be supported in a future version of this plugin.
Request if you need more than the app.bundle functions offer you.

56.1.27 kCFDateMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFDateMBS object.

56.1.28 kCFDictionaryMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFDictionaryMBS object.

56.1.29 kCFNumberMBSNaN as CFNumberMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFNumberMBS object for NaN (not a number).

56.1.30 kCFNumberMBSNegativeInfinity as CFNumberMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFNumberMBS object for negative infinity.

56.1.31 kCFNumberMBSPositiveInfinity as CFNumberMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFNumberMBS object for positive infinity.

56.1.32 kCFNumberMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFNumberMBS object.

56.1.33 kCFSetMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFSetMBS object.

56.1.34 kCFStringMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFStringMBS object.

56.1.35 kCFTimeZoneMBSTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFTimeZone object.

56.1.36 kCFURLMBSTypeID as Integer

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns the Type ID of a CFURLMBS object.

56.1.37 KnownTimeZoneNamesAsCFArrayMBS as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: An array of all known time zone names.
Notes: Returns nil on any error.

56.1.38 MacShowAboutBoxMBS(options as CFDictionaryMBS) as Integer

MBS MacCF Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Displays an HI-conformant about box.
Example:

```
Var kHIAboutBoxNameKey as CFStringMBS = NewCFStringMBS("HIAboutBoxName")
Var kHIAboutBoxVersionKey as CFStringMBS = NewCFStringMBS("HIAboutBoxVersion")
Var kHIAboutBoxCopyrightKey as CFStringMBS = NewCFStringMBS("HIAboutBoxCopyright")
Var kHIAboutBoxDescriptionKey as CFStringMBS = NewCFStringMBS("HIAboutBoxDescription")
Var kHIAboutBoxStringFileKey as CFStringMBS = NewCFStringMBS("HIAboutBoxStringFile")

Var d as CFMutableDictionaryMBS

d=NewCFMutableDictionaryMBS

// name, version and copyright are optional:
d.add(kHIAboutBoxNameKey, NewCFStringMBS("MyApp"))
d.add(kHIAboutBoxVersionKey, NewCFStringMBS("1.0"))
d.add(kHIAboutBoxCopyrightKey, NewCFStringMBS("©2009 by Christian Schmitz"))

// description is needed
d.add(kHIAboutBoxDescriptionKey, NewCFStringMBS("The best application I ever made!"))

// optional
'd.add(kHIAboutBoxStringFileKey, NewCFStringMBS("somefile"))

MsgBox Str(MacShowAboutBoxMBS(d))
```

Notes: This about box is a generic about box that automatically can display your application name, version string, and copyright string. It peeks into either the Info.plist (for the CFBundleName, CFBundleVersion, and CFBundleGetInfoString keys) or your bundle resource (not recommended) to get the information by default. You can customize what it displays by passing in various options in the input dictionary. Note that currently the description string can only be specified in the options dictionary; this function does not check your Info.plist for a descriptions string.

There are three basic ways to call this function. First, you can pass nil for inOptions. As mentioned, default information will be displayed. Second, you can pass the actual values for the strings displayed by passing the strings in the inOptions dictionary using the keys provided, such as kHIAboutBoxNameKey. If a replacement string is not passed, the default behavior kicks in. For example, you could pass some variant of your application name in the dictionary, but not pass a replacement version or copyright strings. The Toolbox would

display your replacement string, and fall back to looking in the Info.plist for the other strings. The third way to call this is to pass the name of a string file in the dictionary with the key kHIAboutBoxStringFileKey. We will automatically use that file to find the strings for the about box. The keys in the string file should be the same value as the keys you would use to pass into the inOptions dictionary. Again, if a string is not found in that file, we would fall back to looking for a string in the dictionary, and then finally the Info.plist. Certainly this is not the be-all-end-all of about boxes, but it does provide a simple no-work about box for your application. The standard Toolbox application handler now responds to the kHICommandAbout command ID by calling HIAboutBox for you. This means that any Carbon Event-based application will get this behavior for free right out of the box. If you wish for the window to respond to cmd-W in the menu bar, you should make sure that menu item has the kHICommandClose commandID.

Options: A dictionary of replacement strings, or the name of a string file to retrieve the strings from, or nil. See the discussion for how this is used.

Returns a Mac OS error code or -1 if function is not available.
Not supported on 64 bit targets.

Xojo Developer Magazine

- 7.4, page 8: News

56.1.39 NewCFAbsoluteTimeMBS(time as Double) as CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns a new absolute time object with the given value.
Notes: Returns nil on any error.

56.1.40 NewCFBinaryDataMBSMem(mem as memoryblock,len as Integer) as CFBinaryDataMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFBinary object for the given memoryblock.

56.1.41 NewCFBinaryDataMBSStr(s as string) as CFBinaryDataMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFBinary object for the given string.
Example:

```
Var t as TextOutputStream
Var f as FolderItem
Var o as CFObjectMBS
Var s as string
Var i as TextInputStream

f=SpecialFolder.Desktop.Child("test")
o=NewCFStringMBS("Hello")

// write

s=o.XML.str
s=ConvertEncoding(s,Encodings.UTF8)

t=f.CreateTextFile
t.Write s
t.Close

// clear

o=nil

// now read back

i=f.OpenAsTextFile
s=i.ReadAll(Encodings.UTF8)
i.Close

o=NewCFObjectMBSFromXML(NewCFBinaryDataMBSStr(s))

MsgBox CFStringMBS(o).str
```

56.1.42 NewCFBooleanMBS(value as boolean) as CFBooleanMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFBooleanMBS object created using the given boolean.

56.1.43 NewCFDateMBS as CFDateMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a new emptry CFDateMBS.

56.1.44 NewCFMutableArrayMBS as CFMutableArrayMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new empty mutable array.
Notes: The array's maximum capacity is unlimited (or rather, only limited by address space and available memory constraints).

56.1.45 NewCFMutableBagMBS as CFMutableBagMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a new emptry CFMutableBagMBS.

56.1.46 NewCFMutableBinaryDataMBSMem(len as Integer) as CFMutableBinaryDataMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFMutableBinary object with the given size in bytes.

56.1.47 NewCFMutableDictionaryMBS as CFMutableDictionaryMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a new emptry CFMutableDictionaryMBS.
Example:

```
Var d as CFMutableDictionaryMBS

d=NewCFMutableDictionaryMBS
d.Add NewCFStringMBS("Key"),NewCFStringMBS("Value")
MsgBox d.XML.str
```

- MBS Real Studio Plugins, version 11.1pr10

56.1.48 NewCFMutableSetMBS as CFMutableSetMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a new emptry CFMutableSetMBS.

56.1.49 NewCFNumberMBSDouble(doubleValue as Double) as CFNumberMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFNumberMBS object for the given double value.

56.1.50 NewCFNumberMBSInteger(integerValue as Integer) as CFNumberMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFNumberMBS object for the given integer value.

56.1.51 NewCFNumberMBSSingle(singleValue as single) as CFNumberMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFNumberMBS object for the given single value.

56.1.52 NewCFObjectMBS(handle as Integer) as CFObjectMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFObjectMBS object for the given handle.
Example:

```
Var d as CFMutableDictionaryMBS
Var s as CFStringMBS
Var o as CFObjectMBS
Var t as CFStringMBS

d=NewCFMutableDictionaryMBS
s=NewCFStringMBS("Hello")

d.Add s,s

o=d.Value(s) // uses NewCFObjectMBS internally
```

```
t=cfstringMBS(o) // Now you can cast here in v5.2!

MsgBox t.str
```

Notes: Handle is just a CFTypeRef.
If release is true, the destructor of the CFObjectMBS will release the handle later.
In Version 5.2 this function can return objects which may be casted to CFURL, CFDictionary, CFString, CFNumber, CFCharacterSet, CFBag, CFArray, CFBoolean, CFBinaryData or CFSet.

56.1.53 NewCFObjectMBSFromXML(XMLdata as CFBinaryDataMBS) as CFObjectMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Parses the XML data and returns a CFObject.
Example:

```
Var f as FolderItem
Var t as TextInputStream
Var s as String
Var o as CFObjectMBS
Var d as CFDictionaryMBS

// get file name
f=GetFolderItem("CF XML Test.txt")
// open file
t=f.OpenAsTextFile
// Read String
s=t.ReadAll

// Create back
o=NewCFObjectMBSFromXML(NewCFBinaryDataMBSStr(s))

// now check if the dictionary we saved is there:
if o<>nil then
if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)
MsgBox CFStringMBS(d.Value(NewCFStringMBS("Key"))).str
end if
end if
```

Notes: Note that the CFObject returned is in most times a CFDictionary or a CFArray.
This function takes text and binary plist file content.

56.1.54 NewCFStringMBS(s as string) as CFStringMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a CFStringMBS object created using the given string.
Notes: Returns nil if s is empty.
The cfstring may be unicode.

See also NewCFStringMBS2 if you want to get an empty CFString object for an empty string.

56.1.55 NewCFTimeIntervalMBS(time as Double) as CFTimeIntervalMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns a new time interval object with the given value.
Notes: Returns nil on any error.

56.1.56 NewCFURLMBSCFStringMBS(cfstr as CFStringMBS, baseurl as CFURLMBS) as CFURLMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new CFURLMBS from the CFStringMBS.

56.1.57 NewCFURLMBSFile(f as folderitem) as CFURLMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new CFURLMBS from a file.

56.1.58 NewCFURLMBSHFSPath(cfstr as CFStringMBS,directory as boolean) as CFURLMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new CFURLMBS from the CFStringMBS which is interpreted as a HFS path.

56.1.59 NewCFURLMBSMem(mem as memoryblock,len as Integer,encoding as Integer,baseurl as CFURLMBS) as CFURLMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new CFURLMBS from the data inside the memoryblock.
Notes: Len is the len of the data inside the memoryblock.
Encoding the ID of the text encoding.
BaseURL is the base url. If baseurl=nil then the current application directory is used.

56.1.60 NewCFURLMBSPosixPath(cfstr as CFStringMBS,directory as boolean) as CFURLMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new CFURLMBS from the CFStringMBS which is interpreted as a Posix path.

56.1.61 NewCFURLMBSStr(str as string, baseurl as CFURLMBS) as CFURLMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new CFURLMBS from the string.
Example:

```
Var s as string
Var f as FolderItem
Var cu as CFURLMBS

s="file://localhost/Users/cs/Music/iTunes/iTunes%20Music"

cu=NewCFURLMBSStr(s,nil) // true=isdirectory
f=cu.file

MsgBox f.NativePath
```

Notes: BaseURL is the base url. If baseurl=nil then the current application directory is used.

56.1.62 NewCFURLMBSWindowsPath(cfstr as CFStringMBS,directory as boolean) as CFURLMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Creates a new CFURLMBS from the CFStringMBS which is interpreted as a Windows path.

56.1.63 SetDefaultCFTimeZoneMBS(timezone as CFTimeZoneMBS)

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The default time zone.
Example:

msgBox str(GetDefaultCFTimeZoneMBS.SecondsFromGMT(nil).Value)

Notes: Returns nil on any error.

56.1.64 SystemCFTimeZoneMBS as CFTimeZoneMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The current system time zone.
Example:

Var s as CFTimeZoneMBS
s=SystemCFTimeZoneMBS
MsgBox s.Name.str

Notes: Returns nil on any error.

56.1.65 TypeIDDescriptionMBS(TypeID as Integer) as CFStringMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: Returns a string with the name for the CoreFoundation data type.
Notes: e.g. "CFStringMBS" for a CFStringMBS.

56.2 class CFAbsoluteTimeMBS

56.2.1 class CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: A class for an absolute time value.
Example:

```
Var t as new CFAbsoluteTimeMBS
MsgBox str(T.Value)
```

Notes: Basicly just a double property.
Subclass of the CFTimeIntervalMBS class.

56.2.2 Methods

56.2.3 AddGregorianUnits(timezone as CFTimeZoneMBS, units as CFGregorianUnitsMBS) as CFAbsoluteTimeMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Adds gregorian time units to the given absolute time and returns the result.
Notes: Returns nil on any error.
Timezone is optional and can be nil.

56.2.4 Constructor

MBS MacCF Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The constructor to initialize the absolution time with the current time.
Example:

```
Var CFDateLocal as new CFAbsoluteTimeMBS
Var CFTimeZone as new CFTimeZoneMBS

Var MyDSTState as Boolean = CFTimeZone.IsDaylightSavingTime(CFDateLocal)

MsgBox str(MyDSTState)
```

See also:

- 56.2.5 Constructor(value as Double) 8972

56.2.5 Constructor(value as Double)

MBS MacCF Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The constructor to initialize the absolution time with the given value.
Example:

```
Var a as new CFAbsoluteTimeMBS(5)
MsgBox str(a.Value)
```

See also:

- 56.2.4 Constructor 8972

56.2.6 DayofWeek(timezone as CFTimeZoneMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns an integer representing the day of the week indicated by the specified date.
Example:

```
Var t as new CFAbsoluteTimeMBS
MsgBox str(t.DayofWeek(nil))
```

56.2.7 DayofYear(timezone as CFTimeZoneMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns an integer representing the day of the year indicated by the specified date.
Example:

```
Var t as new CFAbsoluteTimeMBS
MsgBox str(t.DayofYear(nil))
```

56.2.8 GetDifferenceAsGregorianUnits(secondtime as CFAbsoluteTimeMBS, timezone as CFTimeZoneMBS, flags as Integer) as CFGregorianUnitsMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns the difference of the two absolute times in gregorian units.
Notes: Timezone is optional and may be nil.

For flags:

```
kCFGregorianUnitsYears      = 1
kCFGregorianUnitsMonths     = 2
kCFGregorianUnitsDays       = 4
kCFGregorianUnitsHours      = 8
kCFGregorianUnitsMinutes    = 16
kCFGregorianUnitsSeconds    = 32
kCFGregorianAllUnits        = &hFFFFFF
```

56.2.9 GregorianDate(timezone as CFTimeZoneMBS) as CFGregorianDateMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns the gregorian date for the given absolute time.
Example:

```
Var t as new CFAbsoluteTimeMBS
Var g as CFGregorianDateMBS = t.GregorianDate(nil)
MsgBox str(g.Year)
```

Notes: Timezone is optional and can be nil.
Returns nil on any error.

56.2.10 WeekofYear(timezone as CFTimeZoneMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns an integer representing the week of the year indicated by the specified date.
Example:

```
Var t as new CFAbsoluteTimeMBS
MsgBox str(t.WeekofYear(nil))
```

56.2.11 Properties

56.2.12 Date as CFDateMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date object representing this absolute time value.
Notes: Returns nil on any error.
(Read only property)

56.3 class CFArrayMBS

56.3.1 class CFArrayMBS

MBS MacCF Plugin, Platform: macOS, Targets: All.

Function: A class for a core foundation Array.
Example:

```
// copy names of recent items in Xojo Preferences

Var names() as string
Var c as new CFPreferencesMBS

Var o as CFObjectMBS = c.CopyAppValue(NewCFStringMBS("Recent Items Dict"), NewCFStringMBS("com.realsoftware.realstudio"))

if o isa CFArrayMBS then
Var a as CFArrayMBS = CFArrayMBS(o)

Var u as Integer = a.Count-1
for i as Integer = 0 to u

o = a.Item(i)

if o isa CFDictionaryMBS then
Var d as CFDictionaryMBS = CFDictionaryMBS(o)

Var no as CFObjectMBS = d.Value(NewCFStringMBS("Name"))
if no isa CFStringMBS then

Var ns as CFStringMBS = CFStringMBS(no)

names.Append ns.str
end if
end if
next
end if

MsgBox Join(names,EndOfLine)
```

Notes: If the release property is true, the destructor of this class will release the array reference.

From CFArrayMBS.h:

CFArray implements an ordered, compact container of pointer-sized values. Values are accessed via integer

keys (indices), from the range 0 to N-1, where N is the number of values in the array when an operation is performed. The array is said to be "compact" because deleted or inserted values do not leave a gap in the key space – the values with higher-numbered indices have their indices renumbered lower (or higher, in the case of insertion) so that the set of valid indices is always in the integer range [0, N-1] . Thus, the index to access a particular value in the array may change over time as other values are inserted into or deleted from the array.

Arrays come in two flavors, immutable, which cannot have values added to them or removed from them after the array is created, and mutable, to which you can add values or from which remove values. Mutable arrays have two subflavors, fixed-capacity, for which there is a maximum number set at creation time of values which can be put into the array, and variable capacity, which can have an unlimited number of values (or rather, limited only by constraints external to CFArray, like the amount of available memory). Fixed-capacity arrays can be somewhat higher performing, if you can put a definate upper limit on the number of values that might be put into the array.

As with all CoreFoundation collection types, arrays maintain hard references on the values you put in them, but the retaining and releasing functions are user-defined callbacks that can actually do whatever the user wants (for example, nothing).

Computational Complexity The access time for a value in the array is guaranteed to be at worst O(lg N) for any implementation, current and future, but will often be O(1) (constant time). Linear search operations similarly have a worst case complexity of O(N*lg N), though typically the bounds will be tighter, and so on. Insertion or deletion operations will typically be linear in the number of values in the array, but may be O(N*lg N) clearly in the worst case in some implementations. There are no favored positions within the array for performance; that is, it is not necessarily faster access values with low indices, or to insert or delete values with high indices, or whatever.

This class works on Windows with QuickTime 7 installed.
Subclass of the CFObjectMBS class.
