Notes: Use this block to receive information about the selected printer or information about any errors that occurred.

151.2.13 DidDismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker was dismissed.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

This method is called when the user dismisses the picker, either by selecting a printer or by canceling the picker interface. This method is not called when you dismiss the picker programmatically using the dismiss method.

151.2.14 DidPresent

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker was displayed and is now visible.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

151.2.15 DidSelectPrinter

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A printer was selected.
Notes: Implement this event if you want to be notified of the selected printer. The selected printer can be either one that the user selected or the initially selected printer that you specified when creating your UIPrinterPickerControllerMBS object.

151.2.16 shouldShowPrinter(printer as UIPrinterMBS) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether the specified printer should be included in the picker.
Notes: printer: The printer object to consider.

Return true if the printer should be displayed or false if it should not.

Implement this event if you want to filter the list of printers displayed by the printer picker interface. You might use this method to display only printers with specific capabilities. The printer picker interface calls this method once for each printer it is preparing to display, so your implementation should perform any required checks and return as quickly as possible. Do not perform any lengthy operations in this method.
If you do not implement this method, the picker interface displays all of the printers that it finds.

151.2.17 WillDismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker is about to be dismissed.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

This method is called when the user dismisses the picker, either by selecting a printer or by canceling the picker interface. This method is not called when you dismiss the picker programmatically using the dismiss method.

151.2.18 WillPresent

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The printer picker is about to be displayed.
Notes: Use this method to perform any tasks associated with displaying the printer picker controller.

151.3 class UIPrintInfoMBS

151.3.1 class UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The class for the print settings.
Example:

```
Var info As New UIPrintInfoMBS

info.outputType = info.OutputGrayscale
info.duplex = info.DuplexLongEdge
info.jobName = "testing"
```

- MBS Xojo Plugins, version 24.2pr1

Xojo Developer Magazine

- 22.5, page 10: News
- 22.4, page 9: News

151.3.2 Methods

151.3.3 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a print-information object initialized with default values.

151.3.4 copy as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Creates a clone of the object.

151.3.5 printInfo as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a print-information object initialized with default values.
Notes: An instance of UIPrintInfo or nil if the object could not be created.

151.3.6 printInfoWithDictionary(Dic as Dictionary) as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a print-information object that is initialized with the data in the passed-in dictionary.
Notes: Dic: A dictionary that contains data to initialize the UIPrintInfo object with.

Returns an instance of UIPrintInfo or nil if the object could not be created.

You use the dictionary parameter to initialize a UIPrintInfoMBS object with stored print-job information. Some applications might archive a previous UIPrintInfoMBS object and use that for a future print job with this method.

You can later access the dictionary by calling the dictionaryRepresentation method on the UIPrintInfoMBS object.

151.3.7 Properties

151.3.8 dictionaryRepresentation as Dictionary

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A dictionary representation of a print-information object.
Example:

```
Var info As New UIPrintInfoMBS

info.outputType = info.OutputGrayscale
info.duplex = info.DuplexLongEdge
info.jobName = "testing"

Var dic As Dictionary = info.dictionaryRepresentation

Break
```

Notes: A dictionary representation of a UIPrintInfoMBS object that can be archived and used to create a

new UIPrintInfoMBS object. Returns nil if no dictionary can be created.
(Read only property)

151.3.9 duplex as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The duplex mode to use for the print job.
Example:

```
Var info As New UIPrintInfoMBS
info.duplex = info.DuplexLongEdge
```

Notes: Some printers can print either duplex (double-sided) or single-sided. If double-sided is selected, a printer can either print flipping the back page along the long edge of the paper or along the short edge. The default option for duplex-capable printers is based on document type: single-sided (none) for photos, double-sided and long edge for other documents. If a printer is capable of duplex printing, a switch in the printing options allows users to toggle between single-side and double-sided printing.
(Read and Write property)

151.3.10 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

151.3.11 jobName as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The name of the print job.
Notes: The name of the print job appears in the Print Center when the job is printing. An app should set this property to a name appropriate to the content that,Äôs printing. The default job name is the app name.
(Read and Write property)

151.3.12 outputType as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The kind of printable content.
Example:

```
Var info As New UIPrintInfoMBS
info.outputType = info.OutputGrayscale
```

Notes: The output type can be general, photo, or grayscale. An application can set this property to a value thats appropriate to the printable content. The default is OutputGeneral.

The output type controls the quality and default paper size used in printing. For example, if your application only prints black text, setting this property to OutputGrayscale can result in better performance in many cases.
(Read and Write property)

151.3.13 printerID as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: An identifier of the printer to use for the print job.
Notes: This property is set through user selection in the printing user interface. You may provide a printer ID as a hint (for example, the last printer used from a particular print job). The default value is "".

e.g. "Laserdrucker._ipp._tcp.local."
(Read and Write property)

151.3.14 Constants

Duplex

Constant	Value	Description
DuplexLongEdge	1	Duplex printing that flips the back page along the long edge of the paper.
DuplexNone	0	No double-sided (duplex) printing; single-sided printing only.
DuplexShortEdge	2	Duplex print that flips the back page along the short edge of the paper.

Output Types

Constant	Value	Description
OutputGeneral	0	Specifies that the printed content consists of mixed text, graphics, and images. The default paper is Letter, A4, or similar locale-specific designation. Output is normal quality, duplex.
OutputGrayscale	2	Specifies that the printed content is a grayscale image. Set the output type to this value when your printable content contains no color—for example, it,Äôs black text only. The default paper is Letter/A4. Output is high quality grayscale, duplex.
OutputPhoto	1	Specifies that the printed content consists of black-and-white or color images. The default paper is 4x6, A6, or similar locale-specific designation. Output is high quality, simplex.
OutputPhotoGrayscale	3	Specifies that the printed content is grayscale. Set the output type to this value when your printable content contains no color—for example, it,Äôs black text only. The default paper is Letter/A4. Output is grayscale quality, duplex. This content type can produce a performance improvement in some cases.

151.4 class UIPrintInteractionControllerMBS

151.4.1 class UIPrintInteractionControllerMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A user interface that manages the printing of documents, images, and other printable content in iOS.
Example:

```
Sub Pressed()
printController = New MyUIPrintInteractionControllerMBS

Var printinfo As New UIPrintInfoMBS
printinfo.outputType = printinfo.OutputGrayscale
printinfo.duplex = printinfo.DuplexLongEdge
printinfo.jobName = "testing"
printinfo.printerID = "Laserdrucker._ipp._tcp.local."

printController.showsNumberOfCopies = True
printController.printInfo = printinfo
printController.printingItem = LogoImageData

printController.Present
End Sub
```

Notes: UIPrintInteractionController is the central class for printing in iOS. The shared instance of it represents a print job. A print job includes the content to print and information and options related to its printing, such as output type, job name, paper size, and orientation.

If the showsPageRange property is true, the number of pages is more than 1, and you assign an object to any of these properties except for the printingItems property, the printing options include a control that allows users to select a page range.

When users tap a print button on the app,Äôs user interface, a controller object of the app should respond to the action message by obtaining the shared instance of UIPrintInteractionController and preparing it for the print job. When the app calls one of the present methods, UIPrintInteractionController displays a view containing printing options. This interface is simple, allowing users to select a printer, specify the number of copies and possibly a range of pages, and choose single-sided or double-sided printing (if the printer supports duplex printing). When users make their selections and tap Print, the print job begins.

151.4.2 Methods

151.4.3 canPrintData(data as MemoryBlock) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether UIKit can print the contents of a data object.
Example:

```
Var pic As Picture = LogoMBS(500)
Var data As MemoryBlock = pic.ToData(picture.Formats.JPEG)

If UIPrintInteractionControllerMBS.canPrintData(data) Then
MessageBox "Can print it"
Else
MessageBox "Can't print it"
End If
```

Notes: data: The memoryblock that contains PDF data or an image in a format supported by the Image I/O framework.

Returns true if UIKit can print the contents of the data object, otherwise false. The method returns false if data is PDF data that specifies that printing is not allowed.

You should call this method to test a data object prior to assigning it to printingItem or printingItems.

151.4.4 canPrintFile(File as FolderItem) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether UIKit can print the file that the specified URL references.
Example:

```
Var file As FolderItem = SpecialFolder.Resource("test.pdf")

If UIPrintInteractionControllerMBS.canPrintFile(file) Then
MessageBox "Can print it"
Else
```

```
MessageBox "Can't print it"
End If
```

Notes: url: An object representing a URL. Valid folderitem must use the file: or any scheme that can return an NSData object with a registered protocol. The file referenced by the URL must contain PDF data or an image in a format supported by the Image I/O framework. See View Programming Guide for iOS in View Programming Guide for iOS for a list of the supported image formats.

Return true if UIKit can print the contents of the referenced file, otherwise false. The method returns false if url references PDF data that specifies that printing is not allowed.

You should call this method to test the data referenced by a URL prior to assigning that URL to printingItem or printingItems.

151.4.5 canPrintURL(URL as string) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether UIKit can print the file that the specified URL references.
Notes: URL: An object representing a URL. Valid URLs must use the file: or any scheme that can return an NSData object with a registered protocol. The file referenced by the URL must contain PDF data or an image in a format supported by the Image I/O framework.

Returns ture if UIKit can print the contents of the referenced file, otherwise false. The method returns false if url references PDF data that specifies that printing is not allowed.

You should call this method to test the data referenced by a URL prior to assigning that URL to printingItem or printingItems.

151.4.6 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The constructor.

151.4.7 Destructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The destructor.

151.4.8 Dismiss

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Dismisses the printing-options sheet or popover.
Notes: You should dismiss the printing options when they are presented in a sheet or animated from a rectangle and the user changes the orientation of the device. (This, of course, assumes your application responds to orientation changes.) You should then present the printing options again once the new orientation takes effect. You can observe the UIApplicationWillChangeStatusBarOrientationNotification notification to find out when the device orientation is about to change.

151.4.9 Present

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Presents the iPhone printing user interface in a sheet, optionally animating it to slide up from the bottom of the screen.
Notes: Calls Completed events later.

151.4.10 printableUTIs as String()

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns a set of the Uniform Type Identifiers for the types of data that UIKit can print.
Notes: An array object that contains, as strings, the UTIs identifying data types that UIKit knows how to print natively.

151.4.11 printingItems as Variant()

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Queries the printing items.

151.4.12 printToPrinter(printer as UIPrinterMBS) as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Prints directly to the specified printer.
Notes: printer: The printer to use for printing. You can obtain a list of available printers using a UIPrinterPickerControllerMBS object.

Calls Completed event later.

Returns true if printing was successful or false if there was a problem.

This method starts the print job and displays the printing progress indicator to the user. This method associates the current printing information (available in the printInfo property) with the job but disables duplex printing. Upon completion of the print job, the print interaction controller executes the block in the completion parameter.

151.4.13 setPrintingItems(items() as Variant)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Set the printing items.
Notes: You can pass an array of ready-to-print objects containing:

- NSURLMBS objects
- FolderItems
- MemoryBlocks
- Pictures
- NSImageMBS objects

Items are printed in array-index order. The array is released at the end of the print job. The default value is nil.

If you set this property, UIPrintInteractionController sets the printingItem, printPageRenderer, and printFormatter properties to nil. (Only one of these properties can be set for a print job.)

If this property is set, the printing options do not include the control for selecting a page range, even if the showsPageRange property is set to false. If you want page-range selection, you should use the printingItem property instead.

151.4.14 UIPrintErrorDomain as String

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The error domain used in the NSErrorMBS objects.

151.4.15 Properties

151.4.16 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

151.4.17 isBeingPresented as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Whether the controller is currently presented.
Notes: (Read only property)

151.4.18 printInfo as UIPrintInfoMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: Returns an object that encapsulates information about the print job.
Notes: An instance of UIPrintInfo includes properties such as the print-job name, the printer identifier, the orientation of the printed content, the duplex mode, and the kind of content (general, photo, or grayscale). If you do not assign an instance of UIPrintInfo to this property, the UIKit printing system assumes defaults for many of these properties. Users can modify the selected printer and the duplex mode (if available on the printer). Once the printing options are presented, any changes to the UIPrintInfo object referenced by this property are ignored. The object is released when printing completes.
(Read and Write property)

151.4.19 printingAvailable as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the device supports printing.
Notes: This value is true if the device supports printing, otherwise false. An application can show or hide

any print buttons based on this value.
(Read only property)

151.4.20 printingItem as Variant

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A single ready-to-print object.
Notes: You can assign:

- an NSURLMBS object
- a FolderItem
- a MemoryBlock
- a Picture
- a NSImageMBS object

The object must be an instance of (or convertible to) the NSURL, NSData, or UIImage class. An object of the first two types must reference or contain image data or PDF data. NSURL objects must use the file: or any scheme that can return an NSData object with a registered protocol. Image data (including that encapsulated by UIImage) must be in a format supported by the Image I/O framework;

The object is released at the end of the print job. The default value is nil.
If you set this property, UIPrintInteractionController sets the printingItems to nil. (You can only set one of these properties for a print job).

If this property is set and the showsPageRange property is set to truej—and the printing item is a PDF document of more than one page—the printing options include the control for selecting a page range.
(Read and Write property)

151.4.21 printPaper as UIPrintPaperMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: An object that represents the paper size and printing area for the print job.
Notes: UIPrintInteractionControllerMBS sets this property immediately after the user selects a printer and before it calls the WillStartJob event.
(Read only property)

151.4.22 showsNumberOfCopies as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the printing options include the number of copies.
Notes: The default value is true.
(Read and Write property)

151.4.23 showsPaperOrientation as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the printing options include the paper-orientation control.
Notes: The default value is true.
(Read and Write property)

151.4.24 showsPaperSelectionForLoadedPapers as Boolean

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether the paper selection menu displays.
Notes: The default value of this property is false. Setting the value to true enables a paper selection menu on printers that support different types of paper and have more than one paper type loaded. On printers where only one paper type is available, no paper selection menu is displayed, regardless of the value of this property.
(Read and Write property)

151.4.25 Events

151.4.26 Completed(completed as Boolean, error as NSErrorMBS)

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The print operation completed.
Example:

```
Class MyUIPrintInteractionControllerMBS Inherits UIPrintInteractionControllerMBS
Sub Completed(completed as Boolean, error as NSErrorMBS)
System.DebugLog CurrentMethodName+" "+completed.ToString

If error <>Nil Then
MessageBox error.LocalizedDescription
```

```
End If

Var printInfo As UIPrintInfoMBS = Self.printInfo

If printInfo <>Nil Then
System.DebugLog printInfo.printerID
End If
End Sub
End Class
```

Notes: When a print job concludes, you can reset any state set up for printing and do related housekeeping tasks. If the print job encountered an error, it is likely to be a programming error, so you might want to log the error for debugging purposes.

completed: A Boolean value that indicates whether the print job completed successfully.
error: An instance of the NSErrorMBS that contains information about the printing error. The printing domain is UIPrintErrorDomain. If the print job completes successfully, this parameter is nil.

151.4.27 DidDismissPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device is dismissing the printing-options user interface.
Notes: This message is sent both when the user taps Print on the printing-options view and when the user dismisses the view by tapping outside it.

151.4.28 DidFinishJob

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The print job has ended.
Notes: You can implement this method to do clean-up tasks related to the print job. This method is called after the last page of the print job is generated but before the Completed event is called.

151.4.29 DidPresentPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device has presented the printing-options user interface.

151.4.30 WillDismissPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device is about to dismiss the printing-options user interface.

151.4.31 WillPresentPrinterOptions

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The device is about to display the printing-options user interface.

151.4.32 WillStartJob

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The print job is about to start.
Notes: You can implement this method to do set-up tasks related to the print job. For example, an application that needs to do intensive rendering could implement this method to pause animations. This method is called before drawing begins but after the printing user interface is dismissed.

151.4.33 Constants

Print Errors

Constant	Value	Description
PrintingNotAvailableError	1	An image is in a format that UIKit doesn,Äôt recognize for printing.
PrintJobFailedError	4	An internal error occurred with the print job.
PrintNoContentError	2	UIKit hasn,Äôt assigned a print formatter, page renderer, or printing item to print.
PrintUnknownImageFormatError	3	Unknown image format.

151.5 class UIPrintPaperMBS

151.5.1 class UIPrintPaperMBS

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The size of paper for a print job and the rectangular area that the content prints within.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.2
- MBS Xojo Plugins, version 24.2pr1

151.5.2 Methods

151.5.3 Constructor

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The private constructor.

151.5.4 Properties

151.5.5 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

151.5.6 paperHeight as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The size of the sheet to use for printing.
Notes: The paper size is often associated with a standard designation, such as ,ÄúLetter,Äù and ,ÄúA4,Äù. For example, the paper size for a Letter sheet of paper is 612 points wide and 792 points high.
(Read only property)

151.5.7 paperWidth as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The size of the sheet to use for printing.
Notes: The paper size is often associated with a standard designation, such as ,ÄúLetter,Äù and ,ÄúA4,Äù. For example, the paper size for a Letter sheet of paper is 612 points wide and 792 points high.
(Read only property)

151.5.8 printableRectHeight as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

151.5.9 printableRectLeft as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

151.5.10 printableRectTop as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

151.5.11 printableRectWidth as Double

MBS iOS Plugin, Plugin Version: 24.2, Platform: iOS, Targets: iOS only.

Function: The rectangle that represents the portion of the paper that can be imaged upon.
Notes: (Read only property)

Chapter 152

Printing Mac

152.1 Globals

152.1.1 NewCPMPageFormatMBS as CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new page format object.
Notes: Returns nil on any error.

152.1.2 NewCPMPrintSessionMBS as CPMPrintSessionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new print session object.
Example:

```
'get a print session

// print this PDF
Var pathPrinted as FolderItem=GetFolderItem("test.pdf")

Var thePrintSession as CPMPrintSessionMBS = NewCPMPrintSessionMBS
if thePrintSession = nil then Return

'get default page format and print settings and attach it to the print settings
Var thePageFormat as CPMPageFormatMBS = NewCPMPageFormatMBS
Var thePrintSettings as CPMPrintSettingsMBS = NewCPMPrintSettingsMBS
thePrintSession.DefaultPageFormat thePageFormat
thePrintSession.DefaultPrintSettings thePrintSettings
```

```
'show the print dialog
if not thePrintSession.PrintDialog(thePrintSettings,thePageFormat) then return

'open the file which will be printed
Var thePdfDocument as CGPDFDocumentMBS = pathPrinted.OpenAsCGPDFDocumentMBS

' limit page counts to the one we have
Var LastPage as Integer = thePdfDocument.PageCount
if thePrintSettings.LastPage<lastpage then
lastpage=thePrintSettings.LastPage
end if

' you get better progress bar if you tell how many pages will come
thePrintSettings.LastPage=lastpage

'begin the printing
thePrintSession.BeginDocument(thePrintSettings, thePageFormat)

'loop over the number of copies
for currentCopy as Integer = 1 to thePrintSettings.Copies

'loop over the pages
for currentPage as Integer = thePrintSettings.FirstPage to LastPage

'prepage the page
Var PrintRect as CPMRectMBS =thePageFormat.AdjustedPageSize
Var CGRect as CGRectMBS =CGMakeRectMBS(PrintRect.left, PrintRect.top, PrintRect.Width, Print-
Rect.Height)
thePrintSession.BeginPage(thePageFormat, nil)
Var thePrintContext as CGContextMBS = thePrintSession.PageContext
if thePrintContext = Nil then return

'print the page
thePrintContext.DrawCGPDFDocument thePdfDocument, CGRect, currentPage

'end the page
thePrintContext = nil
thePrintSession.EndPage
next

next

'end the printing
thePrintSession.EndDocument
```

Notes: Returns nil on any error.

152.1.3 NewCPMPrintSettingsMBS as CPMPrintSettingsMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new print settings object.
Notes: Returns nil on any error.

152.2 class CPMLanguageInfoMBS

152.2.1 class CPMLanguageInfoMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a language info.
Notes: Only a data class.

152.2.2 Properties

152.2.3 Level as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The level string of the printer.
Notes: (Read and Write property)

152.2.4 Release as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The release string of the printer.
Notes: (Read and Write property)

152.2.5 Version as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The version string of the printer.
Notes: (Read and Write property)

152.3 class CPMPageFormatMBS

152.3.1 class CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a page format.

152.3.2 Methods

152.3.3 AdjustedPageSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The adjusted page size.
Notes: Lasterror is set.

152.3.4 AdjustedPaperSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The adjusted page size.
Notes: Lasterror is set.

152.3.5 Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new page format object.

152.3.6 CopySettings(Destination as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Copies the settings to another pageformat object.

152.3.7 CreateDataRepresentation(Format as Integer = 0) as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Returns a data representation of a PMPageFormat object as a data string.
Example:

```
Var p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
Var d as string = p.CreateDataRepresentation
break // check in debugger
```

Notes: Use CreateWithDataRepresentation to create a CPMPageFormatMBS from a string created by this call.
Format can be kPMDataFormatXMLDefault, kPMDataFormatXMLMinimal or kPMDataFormatXMLCompressed.

152.3.8 CreateWithDataRepresentation(Data as String) as CPMPageFormatMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Creates a PMPageFormat object from a data representation created with CreateDataRepresentation.
Example:

```
Var p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
Var d as string = p.CreateDataRepresentation

Var other as CPMPageFormatMBS = CPMPageFormatMBS.CreateWithDataRepresentation(d)
MsgBox str(other.Orientation)
```

Notes: Returns nil in case of error.

152.3.9 PrinterID as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Obtains the formatting printer for the pageformat.
Notes: Will either return the formatting printer for the pageformat or will return nil if the pageformat doesn't have that information.

152.3.10 UnadjustedPageSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The unadjusted page size.
Notes: Lasterror is set.

152.3.11 UnadjustedPaperSize as CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The unadjusted page size.
Notes: Lasterror is set.

152.3.12 Properties

152.3.13 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the page format.
Notes: It's a PMPageFormat which you find in CMTypes.h in the Toolbox.
(Read and Write property)

152.3.14 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successfull, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

152.3.15 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

152.3.16 Orientation as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The page orientation.
Example:

```
Var p as new CPMPageFormatMBS
p.orientation = p.kPMLandscape
```

Notes: Lasterror is set.

Possible values:

kPMPortrait	1	
kPMLandscape	2	
kPMReversePortrait	3	will revert to kPortrait for current drivers
kPMReverseLandscape	4	will revert to kLandscape for current drivers

(Read and Write computed property)

152.3.17 Scale as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The page scaling.
Notes: Lasterror is set.
Value is 100 for 100%.
(Read and Write computed property)

152.3.18 Constants

Data Formats

Constant	Value	Description
kPMDataFormatXMLCompressed	2	kPMDataFormatXMLCompressed is only compatible and usable with Mac O X version 10.5 and later. Data in this format can be only be reconsistuted int the equivalent printing manager object with the appropriate PMXXXCreat WithDataRepresentation function. The data representation produced when u ing kPMDataFormatXMLCompressed is approximately 20 times smaller tha kPMDataFormatXMLDefault. This format is a good choice when executio on versions of Mac OS X prior to 10.5 is not necessary and the minimum dat size is important.
kPMDataFormatXMLDefault	0	Specifies a data format that is compatible with all Mac OS X versions. Dat in this format can be used with the PMUnflattenXXX routines present in a versions of Mac OS X prior to 10.5. However, this data representation is muc larger than the more modern data representations described below.
kPMDataFormatXMLMinimal	1	XMLMinimal is only compatible and usable with Mac OS X version 10.5 an later. Data in this format can be only be reconsistuted into the equivalent prin ing manager object with the appropriate CreateWithDataRepresentation fun tion. The data representation produced when using kPMDataFormatXMLMi imal is approximately 3-5 times smaller than kPMDataFormatXMLDefaul This format is a good choice when execution on versions of Mac OS X prior t 10.5 is not necessary and an uncompressed XML representation of the data needed.

Orientation Constants

Constant	Value	Description
kPMLandscape	2	Landscape
kPMPortrait	1	Portrait
kPMReverseLandscape	4	Reverse Landscape
kPMReversePortrait	3	Reverse Portrait

152.4 class CPMPrinterMBS

152.4.1 class CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a printer.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr5
- MonkeyBread Software Releases the MBS REALbasic plug-ins 9.2

152.4.2 Methods

152.4.3 Constructor(name as string)

MBS MacCG Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a new printer object given the printer name.
Notes: Raises exception if lookup fails.
This accepts both CUPS names and the Mac GUI names in printing control panel.

152.4.4 CreateFromPrinterID(PrinterID as String) as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Create a PMPrinter instance from the supplied printerID.
Example:

```
Var p as CPMPrinterMBS = CPMPrinterMBS.CreateFromPrinterID("Brother_DCP_8085DN")
MsgBox p.name
```

152.4.5 CreateGenericPrinter as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Creates a generic PMPrinter.

152.4.6 CreateLocalPrinterList as CPMPrinterMBS()

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries list of local printers.
Example:

```
Var a() as CPMPrinterMBS = CPMPrinterMBS.CreateLocalPrinterList
for each p as CPMPrinterMBS in a
MsgBox p.Name
next
```

152.4.7 DescriptionURL as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the description URL for this printer.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox printer.DescriptionURL
```

Notes: Should be the path to a PPD file for a laser printer.
Lasterror is set.

152.4.8 DeviceURI as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Hand back the URI of the printer's device.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox printer.DeviceURI
```

Notes: On success returns a CFURLMBS object describing the printer's device.
Lasterror is set.

152.4.9 DriverCreator as String

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns a 4 letter code for the creator of the printer.

Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "DriverCreator: "+str(printer.DriverCreator)
```

Notes: Lasterror is set.

152.4.10 DriverReleaseInfo as CPMVersionMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries printer driver version.

152.4.11 HostName as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Hand back the host name of the print server hosting the printer's print queue.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "HostName: "+str(printer.HostName)
```

Notes: Lasterror is set.

152.4.12 ID as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Returns the ID of the string.

152.4.13 IndexedPrinterResolution(index as Integer) as CPMResolutionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns a printer resolution.
Notes: Lasterror is set.

Index is from 1 to ResolutionCount.

152.4.14 IsDefault as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Whether this printer is the default printer.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "IsDefault: "+str(printer.IsDefault)
```

152.4.15 IsFavorite as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Return true if the printer is in the user's favorite printer list.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "IsFavorite: "+str(printer.IsFavorite)
```

152.4.16 IsPostScriptCapable as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Can this printer do postscript?
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "IsPostScriptCapable: "+str(printer.IsPostScriptCapable)
```

Notes: Lasterror is set.

152.4.17 IsPostScriptPrinter as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: If the result is true if the printer is a PostScript printer.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "IsPostScriptPrinter: "+str(printer.IsPostScriptPrinter)
```

Notes: A PostScript printer is one whose driver takes PostScript directly.

152.4.18 IsRemote as boolean

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Hand back a boolean indicating whether the printer is hosted by remote print server.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox "IsRemote: "+str(printer.IsRemote)
```

Notes: If result is true, the print queue represents a printer hosted and managed by a remote print server.

If result is false, the print queue represents a directly connected printer, a network printer, or a remote printer that is locally managed. Consult the queue's device URI to determine the type of connection that is used to communicate with the printer.

Whether a printer is remote is derived from the CUPS printer-type attribute for the print queue.

152.4.19 LanguageInfo as CPMLanguageInfoMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns language information about the printer.
Notes: Lasterror is set.

152.4.20 Location as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Returns the location of the printer.

152.4.21 MakeAndModelName as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: A string with the name for the model and the maker.
Notes: Lasterror is set.
Returns "" on any error.

152.4.22 Name as string

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the string.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS
Var printer as CPMPrinterMBS = session.CurrentPrinter

MsgBox printer.name
```

152.4.23 ResolutionCount as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns how much resolutions are supported by the printer.
Notes: Lasterror is set.

152.4.24 SetDefault

MBS MacCG Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Set the default printer for the current user.
Notes: It is not typical for an application to set the current default printer for the user; the printing system itself takes care of managing the default printer.
This function should be used only in rare circumstances.

Requires Mac OS X 10.5.

152.4.25 State as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries printer state.
Example:

```
Var p as CPMPrinterMBS = CPMPrinterMBS.CreateFromPrinterID("Brother_DCP_8085DN")
MsgBox str(p.State)
```

Notes: Can be kPMPrinterIdle, kPMPrinterProcessing or kPMPrinterStopped.

152.4.26 Properties

152.4.27 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the printer.
Notes: It's a PMPrinter which you find in CMTypes.h in the Toolbox.
(Read and Write property)

152.4.28 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successfull, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

152.4.29 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

152.4.30 Constants

Printer States

Constant	Value	Description
kPMPrinterIdle	3	Printer is idle.
kPMPrinterProcessing	4	Printer is processing.
kPMPrinterStopped	5	Printer is stopped.

152.5 class CPMPrintSessionMBS

152.5.1 class CPMPrintSessionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a print session.
Notes: Works only in Carbon Stuff and can only be used with CGContext which works only on Mac OS X.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr5

152.5.2 Methods

152.5.3 BeginDocument(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new document with the given settings.
Notes: Lasterror is set.

152.5.4 BeginDocumentNoDialog(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new document with the given settings.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

152.5.5 BeginPage(pageformat as CPMPageFormatMBS, rect as CPMRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new page.
Notes: Lasterror is set.

152.5.6 BeginPageNoDialog(pageformat as CPMPageFormatMBS, rect as CPMRectMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Begins a new page.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

152.5.7 Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new print session object.

152.5.8 CreatePrinterList(list() as string)

MBS MacCG Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Creates a list of all printers.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS

Var list() as string
session.CreatePrinterList(list)

MsgBox join(list, EndOfLine)
```

Notes: List is an array of strings with the names of the printers.
Lasterror is set.
See also:

- 152.5.9 CreatePrinterList(list() as string, byref index as Integer, byref currentprinter as CPMPrinterMBS) 19703

152.5.9 CreatePrinterList(list() as string, byref index as Integer, byref currentprinter as CPMPrinterMBS)

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a list of all printers.
Example:

```
Var session as CPMPrintSessionMBS = NewCPMPrintSessionMBS

Var list() as string
Var currentprinter as CPMPrinterMBS
Var index as Integer
session.CreatePrinterList(list, index, currentprinter)

MsgBox join(list, EndOfLine)
```

Notes: List is an array of strings with the names of the printers.
Index is the index of the current printer inside this list.
CurrentPrinter is the current printer selected.
Lasterror is set.
See also:

- 152.5.8 CreatePrinterList(list() as string) 19703

152.5.10 DefaultPageFormat(pageformat as CPMPageFormatMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Sets the page format object to the default settings.
Notes: Lasterror is set.

152.5.11 DefaultPrintSettings(printsettings as CPMPrintSettingsMBS)

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Sets the settings object to the default settings.
Notes: Lasterror is set.

152.5.12 EndDocument

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current document.
Notes: Lasterror is set.

152.5.13 EndDocumentNoDialog

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current document.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

152.5.14 EndPage

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current page.
Notes: Lasterror is set.

152.5.15 EndPageNoDialog

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Ends the current page.
Notes: Doesn't use the print progress dialog.
Lasterror is set.

152.5.16 GetDestinationFormat(printsettings as CPMPrintSettingsMBS) as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the destination format value.
Notes: Lasterror is set.

152.5.17 GetDestinationLocation(printsettings as CPMPrintSettingsMBS) as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the destination location value.
Notes: Lasterror is set.

152.5.18 GetDestinationType(printsettings as CPMPrintSettingsMBS) as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Returns the destination type value.
Notes: Lasterror is set.

152.5.19 kPMDocumentFormatDefault as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the document format.

152.5.20 kPMDocumentFormatPDF as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the document format.

152.5.21 kPMDocumentFormatPostScript as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the document format.

152.5.22 kPMGraphicsContextCoreGraphics as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the graphics context.

152.5.23 kPMGraphicsContextDefault as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the graphics context.

152.5.24 PageContext as CGContextMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new CGContext object for the current page.
Notes: Lasterror is set.

152.5.25 PageSetupDialog(pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Shows the page setup dialog.
Notes: Lasterror is set.

152.5.26 PrintDialog(settings as CPMPrintSettingsMBS, pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Shows the print dialog.
Notes: Lasterror is set.

152.5.27 SetDestination(printsettings as CPMPrintSettingsMBS, desttype as Integer, destformat as String, desturl as String)

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Sets a new destination.
Notes: Some destinations so you may need to specify a format, else you can pass "" for the default format. Some destinations require a URL to a file.

Destination type codes:

kPMDestinationInvalid	0
kPMDestinationPrinter	1
kPMDestinationFile	2
kPMDestinationFax	3
kPMDestinationPreview	4

Destformat strings:

Lasterror is set.

kPMDocumentFormatPDF	application/pdf
kPMDocumentFormatPICT	application/vnd.apple.printing-pict
kPMDocumentFormatPICTPS	application/vnd.apple.printing-pict-ps
kPMDocumentFormatPostScript	application/postscript

152.5.28 UseSheets(docWindow as window)

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Specifies that a printing dialog should be displayed as a sheet.
Notes: docWindow: The window to which the sheet dialog should be attached.
Lasterror is set. (-1 for the docWindow parameter being nil)

152.5.29 ValidatePageFormat(pageformat as CPMPageFormatMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Validates the page format.
Notes: Lasterror is set.

152.5.30 ValidatePrintSettings(printsettings as CPMPrintSettingsMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Validates the print settings.
Notes: Lasterror is set.

152.5.31 Properties

152.5.32 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the print session.
Notes: It's a PMPrintSession which you find in CMTypes.h in the Toolbox.
(Read and Write property)

152.5.33 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successfull, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

152.5.34 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

152.5.35 SheetTarget as Window

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: The window set by UseSheets.
Notes: This property is to reference the window used for the sheets so Xojo does not destroy the window too early.
(Read and Write property)

152.5.36 CurrentPrinter as CPMPrinterMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The current printer for this session.
Notes: Lasterror is set.
Setting this can only be done on Mac OS X.
(Read and Write computed property)

152.5.37 CurrentPrinterName as string

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The current printer for this session by name.
Notes: Lasterror is set.
(Read and Write computed property)

152.5.38 Events

152.5.39 SheetDone(WindowHandle as Integer, accepted as boolean)

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: This event is called for a finished print sheet.
Notes: Accepted is false if the cancel button was used. True if OK was clicked.

152.5.40 Constants

Destination Types

Constant	Value	Description
kPMDestinationFax	3	Fax
kPMDestinationFile	2	File
kPMDestinationInvalid	0	Invalid
kPMDestinationPreview	4	Preview
kPMDestinationPrinter	1	Printer
kPMDestinationProcessPDF	5	Process to PDF
kPMDestinationTypeDefault	1	Default is printer.

152.6 class CPMPrintSettingsMBS

152.6.1 class CPMPrintSettingsMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a print session.

152.6.2 Methods

152.6.3 Constructor

MBS MacCG Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new print settings object.

152.6.4 CopyPrintSettings(dest as CPMPrintSettingsMBS)

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Copes the settings to the other settings.

152.6.5 CreateDataRepresentation(Format as Integer = 0) as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Returns a data representation of a PMPageFormat object as a data string.
Example:

```
Var p as new CPMPrintSettingsMBS
p.Collate = true
p.Duplex = p.kPMDuplexTumble
Var data as string = p.CreateDataRepresentation
Break // check in debugger
```

152.6.6 CreateWithDataRepresentation(Data as String) as CPMPrintSettingsMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Creates a PMPageFormat object from a data representation created with CreateDataRepresentation.

152.6.7 Dictionary as Dictionary

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Represent these print settings as a dictionary.

152.6.8 GetPageRange(byref minPage as UInt32, byref maxPage as UInt32)

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries the page range to print.
Notes: Obtains the valid range of pages that can be printed.
The default page range is 1 - (all pages). The page range is something that is set by the application. It is NOT the first and last page to print. It serves as limits for setting the first and last page.

152.6.9 Keys as String()

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Queries list of keys.
Example:

```
Var p as new CPMPrintSettingsMBS
p.Collate = true
p.Duplex = p.kPMDuplexTumble
Var keys() as string = p.keys
Break // check in debugger
```

152.6.10 SetPageRange(minPage as UInt32, maxPage as UInt32)

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Sets the page range to print.

152.6.11 Properties

152.6.12 handle as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The handle for the print settings.
Notes: It's a PMPrintSettings which you find in CMTypes.h in the Toolbox.
(Read and Write property)

152.6.13 Lasterror as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The error code from the last command.
Notes: 0 if successfull, -1 if function is not available or a required parameter was not set. Else a Mac OS error code.
(Read and Write property)

152.6.14 release as boolean

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will release the handle.
Notes: (Read and Write property)

152.6.15 Collate as boolean

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The collate setting.
Notes: (Read and Write computed property)

152.6.16 Copies as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The number of copies that the user requests to be printed.
Notes: Lasterror is set.
(Read and Write computed property)

152.6.17 Duplex as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The duplex setting.
Notes: (Read and Write computed property)

152.6.18 FirstPage as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The number of the first page to print.
Notes: Lasterror is set.
(Read and Write computed property)

152.6.19 JobName as String

MBS MacCG Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the name of a print job.
Notes: Lasterror is set.
(Read and Write computed property)

152.6.20 LastPage as Integer

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The number of the last page to print.
Example:

```
'get a print session

// print this PDF
Var pathPrinted as FolderItem=GetFolderItem("test.pdf")

Var thePrintSession as CPMPrintSessionMBS = NewCPMPrintSessionMBS
if thePrintSession = nil then Return

'get default page format and print settings and attach it to the print settings
Var thePageFormat as CPMPageFormatMBS = NewCPMPageFormatMBS
Var thePrintSettings as CPMPrintSettingsMBS = NewCPMPrintSettingsMBS
thePrintSession.DefaultPageFormat thePageFormat
thePrintSession.DefaultPrintSettings thePrintSettings

'show the print dialog
if not thePrintSession.PrintDialog(thePrintSettings,thePageFormat) then return
```

```
'open the file which will be printed
Var thePdfDocument as CGPDFDocumentMBS = pathPrinted.OpenAsCGPDFDocumentMBS

' limit page counts to the one we have
Var LastPage as Integer = thePdfDocument.PageCount
if thePrintSettings.LastPage<lastpage then
lastpage=thePrintSettings.LastPage
end if

' you get better progress bar if you tell how many pages will come
thePrintSettings.LastPage=lastpage

'begin the printing
thePrintSession.BeginDocument(thePrintSettings, thePageFormat)

'loop over the number of copies
for currentCopy as Integer = 1 to thePrintSettings.Copies

'loop over the pages
for currentPage as Integer = thePrintSettings.FirstPage to LastPage

'prepage the page
Var PrintRect as CPMRectMBS =thePageFormat.AdjustedPageSize
Var CGRect as CGRectMBS =CGMakeRectMBS(PrintRect.left, PrintRect.top, PrintRect.Width, Print-
Rect.Height)
thePrintSession.BeginPage(thePageFormat, nil)
Var thePrintContext as CGContextMBS = thePrintSession.PageContext
if thePrintContext = Nil then return

'print the page
thePrintContext.DrawCGPDFDocument thePdfDocument, CGRect, currentPage

'end the page
thePrintContext = nil
thePrintSession.EndPage
next

next

'end the printing
thePrintSession.EndDocument
```

Notes: Lasterror is set.
(Read and Write computed property)

152.6.21 Value(key as String) as Variant

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The value in settings.
Example:

```
Var p as new CPMPrintSettingsMBS
p.Collate = true
Var value as Variant = p.value("com.apple.print.PrintSettings.PMCopyCollate")
Break // check in debugger
```

Notes: (Read and Write computed property)

152.6.22 Constants

Duplex Modes

Constant	Value	Description
kPMDuplexNone	1	Duplex off.
kPMDuplexNoTumble	2	Duplex with no tumble.
kPMDuplexTumble	3	Duplex with tumble.
kPMSimplexTumble	4	No duplex.

152.7 class CPMRectMBS

152.7.1 class CPMRectMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a rectangle.
Notes: Only a data class.

152.7.2 Properties

152.7.3 Bottom as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The bottom distance to the border.
Notes: (Read and Write property)

152.7.4 Height as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The height of the rectangle.
Notes: Setting the height changes the bottom property.
(Read and Write property)

152.7.5 Left as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The left distance to the border.
Notes: (Read and Write property)

152.7.6 Right as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The right distance to the border.
Notes: (Read and Write property)

152.7.7 Top as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The top distance to the border.
Notes: (Read and Write property)

152.7.8 Width as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The width of the rectangle.
Notes: Setting the height changes the right property.
(Read and Write property)

152.8 class CPMResolutionMBS

152.8.1 class CPMResolutionMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a resolution.
Notes: Only a data class.

152.8.2 Properties

152.8.3 Horizontal as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The horizontal resolution.
Notes: (Read and Write property)

152.8.4 Vertical as Double

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: The vertical resolution.
Notes: (Read and Write property)

152.9 class CPMVersionMBS

152.9.1 class CPMVersionMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for version information.

152.9.2 Properties

152.9.3 CountryCode as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The country code.
Notes: (Read and Write property)

152.9.4 LongVersion as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The long version string.
Notes: (Read and Write property)

152.9.5 ShortVersion as String

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The short version string.
Notes: (Read and Write property)

152.9.6 VersionMajor as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The major version number.
Notes: (Read and Write property)

152.9.7 VersionMinor as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The minor version number.
Notes: (Read and Write property)

152.9.8 VersionRevision as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The reversion number.
Notes: (Read and Write property)

152.9.9 VersionStage as Integer

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The version stage.
Notes: (Read and Write property)

Chapter 153

Printing Windows

153.1 class WindowsAddPrintJobMBS

153.1.1 class WindowsAddPrintJobMBS

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to send raw data to a printer.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MsgBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"

if not w.StartDocPrinter("My Document", w.kDataFormatRAW) then
MsgBox "StartDocPrinter failed."
Return
end if

MsgBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rect-
```

```
fill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MsgBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: Perfect for printing postscript data to a postscript printer.
You can use this class in several ways:

1. OpenPrinter, AddJob, WriteJob and ScheduleJob.
2. OpenPrinter, StartDocPrinter, StartPagePrinter, WritePrinter, EndPagePrinter, EndDocPrinter and ClosePrinter.
3. OpenPrinter, StartDocPrinter, WritePrinter, EndDocPrinter and ClosePrinter.

Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.2pr1
- More on printing on Windows
- MBS Plugins 10.3 Release Notes

153.1.2 Methods

153.1.3 AddJob as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new print job.
Notes: Returns true on success and false on failure.

153.1.4 ClosePrinter

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes printer connection.

153.1.5 EndDocPrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The EndDocPrinter function ends a print job for the specified printer.
Notes: If the function succeeds, the return value is a true.

The EndDocPrinter function returns an error if the print job was not started by calling the StartDocPrinter function.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it may fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

153.1.6 EndPagePrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The EndPagePrinter function notifies the print spooler that the application is at the end of a page in a print job.
Notes: If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error

message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

153.1.7 OpenPrinter(PrinterName as string) as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer for printing.
Notes: Returns true on success and false on failure.
PrinterName can be "" for the default printer.

153.1.8 ScheduleJob as boolean

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Schedules the printing.
Notes: Returns true on success and false on failure.

153.1.9 StartDocPrinter(DocName as string, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MsgBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"

if not w.StartDocPrinter("My Document", w.kDataFormatRAW) then
MsgBox "StartDocPrinter failed."
Return
end if
```

```
MsgBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rectfill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MsgBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: DocName: A string that specifies the name of the document.
OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.
Datatype: A string that identifies the type of data used to record the document.

If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

- 153.1.11 StartDocPrinter(DocName as string, OutputFilePath as string, Datatype as string) as boolean 19729

153.1.10 StartDocPrinter(DocName as string, OutputFile as folderitem, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MsgBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"

// output to a file
Var file as FolderItem = SpecialFolder.Desktop.Child("test.ps")

if not w.StartDocPrinter("My Document", file, w.kDataFormatRAW) then
MsgBox "StartDocPrinter failed."
Return
end if

MsgBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rect-
fill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MsgBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: DocName: A string that specifies the name of the document.
OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.

Datatype: A string that identifies the type of data used to record the document.

If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

153.1.11 StartDocPrinter(DocName as string, OutputFilePath as string, Datatype as string) as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartDocPrinter function notifies the print spooler that a document is to be spooled for printing.
Example:

```
// Print Postscript directly to Postscript printer
const PrinterName = "Brother DCP-8085DN"

Var w as new WindowsAddPrintJobMBS

if not w.OpenPrinter(PrinterName) then
MsgBox "OpenPrinter failed. Is the printer name correct in the source code?"
Return
end if

const DocName = "My Document"
```

```
// output to a file
Var file as string = "C:\test.ps"

if not w.StartDocPrinter("My Document", file, w.kDataFormatRAW) then
MsgBox "StartDocPrinter failed."
Return
end if

MsgBox "Print Job ID: "+str(w.JobID)

call w.StartPagePrinter

Var PostScript as string = "%!PS"+EndOfLine.UNIX+".1 setgray"+EndOfLine.UNIX+"0 0 100 100 rect-
fill"+EndOfLine.UNIX+"showpage"+EndOfLine.UNIX

Var BytesSent as Integer = w.WritePrinter(PostScript)

MsgBox str(BytesSent)+" bytes of "+str(lenb(PostScript))+" bytes sent."

call w.EndPagePrinter
call w.EndDocPrinter

w = nil // close printer
```

Notes: DocName: A string that specifies the name of the document.
OutputFile: Optional a path string or a folderitem that specifies the name of an output file. To print to a printer, set this to "" or nil or leave away.
Datatype: A string that identifies the type of data used to record the document.

If the function succeeds, the return value is true and the JobID property is set.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.
See also:

- 153.1.9 StartDocPrinter(DocName as string, Datatype as string) as boolean 19726
- 153.1.10 StartDocPrinter(DocName as string, OutputFile as folderitem, Datatype as string) as boolean 19728

153.1.12 StartPagePrinter as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The StartPagePrinter function notifies the spooler that a page is about to be printed on the specified printer.
Notes: If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

153.1.13 WriteJob(data as string) as Integer

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds data to the spool file.
Notes: You need to pass raw data for the printer, e.g. postscript data.
Returns the number of bytes written.
So lenb(data) should be equal to the result.
Only available between a call to AddJob and ScheduleJob.

153.1.14 WritePrinter(data as string) as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WritePrinter function notifies the print spooler that data should be written to the specified printer.

Notes: data: The data that should be written to the printer.

If the function succeeds, the return value is a true.

The sequence for a print job is as follows:

1. To begin a print job, call StartDocPrinter.
2. To begin each page, call StartPagePrinter.
3. To write data to a page, call WritePrinter.
4. To end each page, call EndPagePrinter.
5. Repeat 2, 3, and 4 for as many pages as necessary.
6. To end the print job, call EndDocPrinter.

When a high-level document (such as an Adobe PDF or Microsoft Word file) or other printer data (such PCL, PS, or HPGL) is sent directly to a printer, the print settings defined in the document take precedent over Windows print settings.

When a page in a spooled file exceeds approximately 350 MB, it can fail to print and not send an error message. For example, this can occur when printing large EMF files. The page size limit depends on many factors including the amount of virtual memory available, the amount of memory allocated by calling processes, and the amount of fragmentation in the process heap.

153.1.15 Properties

153.1.16 JobID as Integer

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The JobID of this print.
Notes: For information only.
Maybe be useful for the user to find this print job later.
(Read and Write property)

153.1.17 JobPath as String

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file name of the temporary file used.
Notes: Just for information and only available between a call to AddJob and ScheduleJob.
(Read and Write property)

153.1.18 lastError as Integer

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Zero for no error.
-1 if the plugin has a problem like invalid parameter or called on Mac/Linux.
others are Windows error codes.
(Read and Write property)

153.1.19 lastErrorMessage as String

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The localized text message for LastError property.
Notes: (Read and Write property)

153.1.20 PrinterHandle as Integer

MBS Win Plugin, Plugin Version: 6.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the printer.
Notes: (Read and Write property)

153.1.21 Constants

Constants

Constant	Value	Description
kDataFormatRAW	"RAW"	One of the data format constants. Use this constant if you send to both local and networked printers that us GDI-based printer drivers.
kDataFormatXPS_PASS	"XPS_PASS"	One of the data format constants. Use this constant to send printer control data directly to printers that us XPSDrv printer drivers.

153.2 class WindowsDeviceModeMBS

153.2.1 class WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for device modue information for a Windows printer.
Example:

```
Var d as new WindowsDeviceModeMBS
Var name as string = "My printer"

// here we define which values we want to change
d.Fields = d.DM_ORIENTATION
// and change value
d.Orientation = d.DMORIENT_PORTRAIT

Var w as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
if w.ChangePrinterSettings(d, 2) then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Basicly this class wraps the Windows DEVMODE structure.

For more information on the DEVMODE structure, visit this website:
http://msdn.microsoft.com/en-us/library/dd183565(VS.85).aspx

153.2.2 Methods

153.2.3 ApplyToSetupString(SetupString as String) as string

MBS Win Plugin, Plugin Version: 17.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies current device mode to the given setup string.
Example:

```
Var p as new PrinterSetup

if p.PageSetupDialog then

Var w as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(s)

w.Copies = 3
w.Fields = BitwiseOr(w.Fields, w.DM_COPIES)

Var s as string = w.SetupString
Var t as string = w.ApplyToSetupString(s)

Break // check

end if
```

Notes: The setup string contains a device mode and we replace the one from Xojo with our own. The other information is kept the same.

153.2.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new empty device mode.
Notes: Size is set for you to default name of the data structure.

153.2.5 FromRawData(data as memoryblock, Unicode as boolean = true) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new WindowsDeviceModeMBS object with given data.
Notes: The data is expected to the in format of DEVMODEW structure with some extra data and the right values inside.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.
See also:

- 153.2.6 FromRawData(data as string, Unicode as boolean = true) as WindowsDeviceModeMBS 19736

153.2.6 FromRawData(data as string, Unicode as boolean = true) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new WindowsDeviceModeMBS object with given data.
Notes: The data is expected to the in format of DEVMODEW structure with some extra data and the right values inside.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.
See also:

- 153.2.5 FromRawData(data as memoryblock, Unicode as boolean = true) as WindowsDeviceModeMBS 19736

153.2.7 FromSetupString(SetupString as String) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initialized DevMode object from setup string.
Example:

```
Var p as new PrinterSetup

// setup something
call p.PageSetupDialog

// now we have nice setupstring
Var ss as string = p.SetupString

// parse it in device mode
Var d as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(ss)

// duplex is?
MsgBox "Duplex: "+str(d.Duplex)
```

```
// change printer
d.DeviceName = "Deskjet 2540 series#:2"

// enable duplex
d.Fields = BitwiseOr(d.Fields, d.DM_DUPLEX)
d.Duplex = d.DMDUP_HORIZONTAL

// now duplex is?
MsgBox "Duplex: "+str(d.Duplex)

// get back as setup string
Var da as string = d.SetupString

if da = "" then
MsgBox "failed to create setup string"
Return
end if

// assign back
p.SetupString = da

// take a look
call p.PageSetupDialog

// and print something
Var g as Graphics = OpenPrinter(p)

g.DrawString "Page 1", 20, 20
g.NextPage
g.DrawString "Page 2", 20, 20
```

Notes: You can pass string from PrinterSetup.SetupString.

Supports Xojo 2017r1 with 17.3 plugins.

153.2.8 RawData(Unicode as boolean = true) as memoryblock

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies the raw data of the WindowsDeviceModeMBS class.
Notes: Returns nil on any error.
If Unicode is true, we use DEVMODEW and if Unicode is false, we use DEVMODEA structure.

153.2.9 SetupString(ActualHorizontalResolution as integer, ActualVerticalResolution as integer, MaxHorizontalResolution as integer, MaxVerticalResolution as integer, MarginLeft as integer = 2500, MarginRight as integer = 2500, MarginTop as integer = 2500, MarginBottom as integer = 2500, MinMarginLeft as integer = 0, MinMarginRight as integer = 0, MinMarginTop as integer = 0, MinMarginBottom as integer = 0, PageSetupFlags as integer = 8) as string

MBS Win Plugin, Plugin Version: 17.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a setup string from devmode.
Notes: This setupstring is empty on error.
If not empty, you can assign to PrinterSetup.SetupString.

Please pass reasonable flags.
Check existing SetupStrings from Xojo for possible values.
Resolution parameters can e.g. bei 72.

Supports Xojo 2017r1 with 17.3 plugins.
See also:

- 153.2.10 SetupString(Margin as Integer = 2500) as string 19738

153.2.10 SetupString(Margin as Integer = 2500) as string

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a setup string from devmode.
Example:

```
Var p as new PrinterSetup

// setup something
call p.PageSetupDialog

// now we have nice setupstring
Var ss as string = p.SetupString

// parse it in device mode
Var d as WindowsDeviceModeMBS = WindowsDeviceModeMBS.FromSetupString(ss)

// duplex is?
MsgBox "Duplex: "+str(d.Duplex)

// change printer
d.DeviceName = "Deskjet 2540 series#:2"
```

```
// enable duplex
d.Fields = BitwiseOr(d.Fields, d.DM_DUPLEX)
d.Duplex = d.DMDUP_HORIZONTAL

// now duplex is?
MsgBox "Duplex: "+str(d.Duplex)

// get back as setup string
Var da as string = d.SetupString

if da = "" then
MsgBox "failed to create setup string"
Return
end if

// assign back
p.SetupString = da

// take a look
call p.PageSetupDialog

// and print something
Var g as Graphics = OpenPrinter(p)

g.DrawString "Page 1", 20, 20
g.NextPage
g.DrawString "Page 2", 20, 20
```

Notes: This setupstring is empty on error.
If not empty, you can assign to PrinterSetup.SetupString.

Supports Xojo 2017r1 with 17.3 plugins.
See also:

- 153.2.9 SetupString(ActualHorizontalResolution as integer, ActualVerticalResolution as integer, MaxHorizontalResolution as integer, MaxVerticalResolution as integer, MarginLeft as integer = 2500, MarginRight as integer = 2500, MarginTop as integer = 2500, MarginBottom as integer = 2500, MinMarginLeft as integer = 0, MinMarginRight as integer = 0, MinMarginTop as integer = 0, MinMarginBottom as integer = 0, PageSetupFlags as integer = 8) as string 19738

153.2.11 Properties

153.2.12 Collate as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether collation should be used when printing multiple copies.
Notes: This member is ignored unless the printer driver indicates support for collation by setting the dmFields member to DM_COLLATE.
This member can be one of the following values:

Value	Meaning
DMCOLLATE_TRUE	Collate when printing multiple copies.
DMCOLLATE_FALSE	Do not collate when printing multiple copies.

(Read and Write property)

153.2.13 Color as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Switches between color and monochrome on color printers.
Notes: The following are the possible values:
DMCOLOR_COLOR
DMCOLOR_MONOCHROME
(Read and Write property)

153.2.14 Copies as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects the number of copies printed if the device supports multiple-page copies.
Example:

```
Var w as WindowsDeviceModeMBS // your device mode object

w.Copies = 3
w.Fields = BitwiseOr(w.Fields, w.DM_COPIES)
```

Notes: (Read and Write property)

153.2.15 Data as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The raw data pointer to the DEVMODEW structure.
Notes: (Read only property)

153.2.16 DefaultSource as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the paper source.
Notes: Use the DMBIN_* constants.
(Read and Write property)

153.2.17 DeviceName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the "friendly" name of the printer or display; for example, "PCL/HP LaserJet" in the case of PCL/HP LaserJet.
Notes: This string is unique among device drivers. Note that this name may be truncated to fit in the dmDeviceName field.
(Read and Write property)

153.2.18 DitherType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how dithering is to be done.
Notes: The member can be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMDITHER_USER.

Value	Meaning
DMDITHER_NONE	No dithering.
DMDITHER_COARSE	Dithering with a coarse brush.
DMDITHER_FINE	Dithering with a fine brush.
DMDITHER_LINEART	Line art dithering, a special dithering method that produces well defined borders between black, white, and gray scaling. It is not suitable for images that include continuous graduations in intensity and hue, such as scanned photographs.
DMDITHER_GRAYSCALE	Device does gray scaling.

(Read and Write property)

153.2.19 DriverExtra as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the number of bytes of private driver-data that follow this structure. If a device driver does not use device-specific information, set this member to zero.
Notes: (Read and Write property)

153.2.20 DriverVersion as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The driver version number assigned by the driver developer.
Notes: (Read and Write property)

153.2.21 Duplex as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects duplex or double-sided printing for printers capable of duplex printing.
Notes: Following are the possible values.

Value	Meaning
DMDUP_SIMPLEX	Normal (nonduplex) printing.
DMDUP_HORIZONTAL	Short-edge binding, that is, the long edge of the page is horizontal.
DMDUP_VERTICAL	Long-edge binding, that is, the long edge of the page is vertical.

(Read and Write property)

153.2.22 Fields as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies whether certain properties have been initialized.
Notes: If a property is initialized, its corresponding bit is set, otherwise the bit is clear. A driver supports only those properties that are appropriate for the printer or display technology.

Use the DM_* constants which match by name their property. So the DM_ORIENTATION bit value is related to the Orientation property.
(Read and Write property)

153.2.23 FormName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string array that specifies the name of the form to use; for example, "Letter" or "Legal".
Notes: A complete set of names can be retrieved by using the GetPrinterFormats function on the WindowsPrinterListMBS class.
(Read and Write property)

153.2.24 ICMIntent as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies which color matching method, or intent, should be used by default.
Notes: This member is primarily for non-ICM applications. ICM applications can establish intents by using the ICM functions. This member can be one of the following predefined values, or a driver defined value greater than or equal to the value of DMICM_USER.

Value	Meaning
DMICM_ABS_COLORIMETRIC	Color matching should optimize to match the exact color requested without white point mapping. This value is most appropriate for use with proofing.
DMICM_COLORIMETRIC	Color matching should optimize to match the exact color requested. This value is most appropriate for use with business logos or other images when an exact color match is desired.
DMICM_CONTRAST	Color matching should optimize for color contrast. This value is the most appropriate choice for scanned or photographic images when dithering is desired.
DMICM_SATURATE	Color matching should optimize for color saturation. This value is the most appropriate choice for business graphs when dithering is not desired.

(Read and Write property)

153.2.25 ICMMethod as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how ICM is handled.
Notes: For a non-ICM application, this member determines if ICM is enabled or disabled. For ICM applications, the system examines this member to determine how to handle ICM support. This member can

be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMICMMETHOD_USER.

Value	Meaning
DMICMMETHOD_NONE	Specifies that ICM is disabled.
DMICMMETHOD_SYSTEM	Specifies that ICM is handled by Windows.
DMICMMETHOD_DRIVER	Specifies that ICM is handled by the device driver.
DMICMMETHOD_DEVICE	Specifies that ICM is handled by the destination device.

The printer driver must provide a user interface for setting this member. Most printer drivers support only the DMICMMETHOD_SYSTEM or DMICMMETHOD_NONE value. Drivers for PostScript printers support all values.
(Read and Write property)

153.2.26 LogPixels as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of pixels per logical inch.
Notes: Printer drivers do not use this member.
(Read and Write property)

153.2.27 MediaType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the type of media being printed on.
Notes: The member can be one of the following predefined values, or a driver-defined value greater than or equal to the value of DMMEDIA_USER.

Value	Meaning
DMMEDIA_STANDARD	Plain paper.
DMMEDIA_GLOSSY	Glossy paper.
DMMEDIA_TRANSPARENCY	Transparent film.

(Read and Write property)

153.2.28 Nup as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies where the NUP is done.
Notes: It can be one of the following.

Value	Meaning
DMNUP_SYSTEM	The print spooler does the NUP.
DMNUP_ONEUP	The application does the NUP.

(Read and Write property)

153.2.29 Orientation as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, selects the orientation of the paper.
Example:

```
Var d as new WindowsDeviceModeMBS
Var name as string = "My printer"

// here we define which values we want to change
d.Fields = d.DM_ORIENTATION
// and change value
d.Orientation = d.DMORIENT_PORTRAIT

Var w as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
if w.ChangePrinterSettings(d, 2) then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: This member can be either DMORIENT_PORTRAIT (1) or DMORIENT_LANDSCAPE (2).
(Read and Write property)

153.2.30 PaperLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, overrides the length of the paper specified by the PaperSize member, either for custom paper sizes or for devices such as dot-matrix printers that can print on a page of arbitrary length.
Notes: These values, along with all other values in this structure that specify a physical length, are in

tenths of a millimeter.
(Read and Write property)

153.2.31 PaperSize as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, selects the size of the paper to print on.
Notes: This member can be set to zero if the length and width of the paper are both set by the PaperLength and PaperWidth members. Otherwise, the PaperSize member can be set to a device specific value greater than or equal to DMPAPER_USER or to one of the following predefined values with DMPAPER_* constants.
(Read and Write property)

153.2.32 PaperWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printer devices only, overrides the width of the paper specified by the PaperSize member.
Notes: Unit is tenths of a millimeter.
(Read and Write property)

153.2.33 PrintQuality as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the printer resolution.
Notes: There are four predefined device-independent values:

DMRES_HIGH
DMRES_MEDIUM
DMRES_LOW
DMRES_DRAFT

If a positive value is specified, it specifies the number of dots per inch (DPI) and is therefore device dependent.
(Read and Write property)

153.2.34 Scale as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the factor by which the printed output is to be scaled.
Notes: The apparent page size is scaled from the physical page size by a factor of Scale /100. For example, a letter-sized page with a dmScale value of 50 would contain as much data as a page of 17- by 22-inches because the output text and graphics would be half their original height and width.
(Read and Write property)

153.2.35 Size as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the size, in bytes, of the DEVMODE structure, not including any private driver-specific data that might follow the structure's public members.
Notes: You don't need to set this field normally as the plugin does that for you.
(Read and Write property)

153.2.36 SpecVersion as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The version number of the initialization data specification on which the structure is based.
Notes: You don't need to set this field normally as the plugin does that for you.
(Read and Write property)

153.2.37 TTOption as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how TrueType fonts should be printed.
Notes: This member can be one of the following values:

Value	Meaning
DMTT_BITMAP	Prints TrueType fonts as graphics. This is the default action for dot-matrix printers.
DMTT_DOWNLOAD	Downloads TrueType fonts as soft fonts. This is the default action for Hewlett-Packard printers that use Printer Control Language (PCL).
DMTT_DOWNLOAD_OUTLINE	Downloads TrueType fonts as outline soft fonts.
DMTT_SUBDEV	Substitutes device fonts for TrueType fonts. This is the default action for PostScript printers.

(Read and Write property)

153.2.38 YResolution as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the y-resolution, in dots per inch, of the printer.
Notes: If the printer initializes this member, the PrintQuality member specifies the x-resolution, in dots per inch, of the printer.
(Read and Write property)

153.2.39 Constants

Constants

Constant	Value	Description
DMBIN_AUTO	7	One of the source bin constants. Auto
DMBIN_CASSETTE	14	One of the source bin constants. Cassette
DMBIN_ENVELOPE	5	One of the source bin constants. Envelope
DMBIN_ENVMANUAL	6	One of the source bin constants. Envelope Manual.
DMBIN_FORMSOURCE	15	One of the source bin constants. Form Source.
DMBIN_LARGECAPACITY	11	One of the source bin constants. Large Capacity
DMBIN_LARGEFMT	10	One of the source bin constants. Large Format
DMBIN_LOWER	2	One of the source bin constants. Lower
DMBIN_MANUAL	4	One of the source bin constants. Manual
DMBIN_MIDDLE	3	One of the source bin constants. Middle
DMBIN_ONLYONE	1	One of the source bin constants. Only One.
DMBIN_SMALLFMT	9	One of the source bin constants. Small Format
DMBIN_TRACTOR	8	One of the source bin constants. Tractor
DMBIN_UPPER	1	One of the source bin constants. Upper
DMBIN_USER	256	One of the source bin constants. User
DMCOLLATE_FALSE	0	One of the collate mode constants. Do not collate when printing multiple copies
DMCOLLATE_TRUE	1	One of the collate mode constants. Collate when printing multiple copies.
DMCOLOR_COLOR	2	One of the color mode constants. Color
DMCOLOR_MONOCHROME	1	One of the color mode constants. Monochrome.
DMDITHER_COARSE	2	One of the dither constants. Dithering with a coarse brush.
DMDITHER_ERRORDIFFUSION	5	One of the dither constants.
DMDITHER_FINE	3	One of the dither constants. Dithering with a fine brush.
DMDITHER_GRAYSCALE	10	One of the dither constants. Device does gray scaling.
DMDITHER_LINEART	4	One of the dither constants. Line art dithering, a special dithering metho ders between black, white, and gray scalin that include continuous graduations in intens tographs.
DMDITHER_NONE	1	One of the dither constants. No dithering.
DMDITHER_RESERVED6	6	One of the dither constants.
DMDITHER_RESERVED7	7	One of the dither constants.
DMDITHER_RESERVED8	8	One of the dither constants.
DMDITHER_RESERVED9	9	One of the dither constants.
DMDITHER_USER	256	One of the dither constants.
DMDUP_HORIZONTAL	3	One of the duplex mode constants.

153.3 class WindowsGraphicsInfoMBS

153.3.1 class WindowsGraphicsInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class gives information for Windows Device contexts.
Example:

```
Var g as Graphics = OpenPrinter
Var info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS

MsgBox _
"Printer physical page size: "+str(info.PhysicalWidth)+" "+str(info.PhysicalHeight)+_
EndOfLine+_
"Useable paper size: "+str(info.ResolutionX)+ " x "+str(info.ResolutionY)+_
EndOfLine+_
"Paper size: "+str(info.SizeX)+" x "+str(info.Sizey)+" mm"
```

Notes: Main use currently is to learn about native resolution of a printer graphics object.

153.3.2 Methods

153.3.3 Constructor

MBS Win Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes properties for main screen.
See also:

- 153.3.4 Constructor(c as control) 19751
- 153.3.5 Constructor(c as DesktopControl) 19751
- 153.3.6 Constructor(g as graphics) 19751

- 153.3.7 Constructor(p as Picture) 19752
- 153.3.8 Constructor(w as DesktopWindow) 19752
- 153.3.9 Constructor(w as window) 19753

153.3.4 Constructor(c as control)

MBS Win Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop only.

Function: Initializes properties for this control object.
See also:

- 153.3.3 Constructor 19750
- 153.3.5 Constructor(c as DesktopControl) 19751
- 153.3.6 Constructor(g as graphics) 19751
- 153.3.7 Constructor(p as Picture) 19752
- 153.3.8 Constructor(w as DesktopWindow) 19752
- 153.3.9 Constructor(w as window) 19753

153.3.5 Constructor(c as DesktopControl)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Initializes properties for this control object.
See also:

- 153.3.3 Constructor 19750
- 153.3.4 Constructor(c as control) 19751

153.3.10 Properties

153.3.11 AspectX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Relative width of a device pixel used for line drawing.
Notes: (Read and Write property)

153.3.12 AspectXY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Diagonal width of the device pixel used for line drawing.
Notes: (Read and Write property)

153.3.13 AspectY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Relative height of a device pixel used for line drawing.
Notes: (Read and Write property)

153.3.14 BitsPerPixel as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of adjacent color bits for each pixel.
Example:

```
Var p as new Picture(200, 200, 32)
Var info as new WindowsGraphicsInfoMBS(p.Graphics)

MsgBox "Color Depth: "+str(info.BitsPerPixel)
```

Notes: As example gives a display device context, the bits per pixel is the screen depth.
(Read and Write property)

153.3.15 BrushesCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of device-specific brushes.
Notes: (Read and Write property)

153.3.16 ColorCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of entries in the device's color table, if the device has a color depth of no more than 8 bits per pixel.
Notes: For devices with greater color depths, 1 is returned.
(Read and Write property)

153.3.17 DesktopResolutionX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Horizontal width of entire desktop in pixels.
Example:

```
Var p as new Picture(200, 200, 32)
Var info as new WindowsGraphicsInfoMBS(p.Graphics)

MsgBox "Size of Windows Desktop: "+str(info.DesktopResolutionX)+ " x "+str(info.DesktopResolutionY)
```

Notes: (Read and Write property)

153.3.18 DesktopResolutionY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Vertical height of entire desktop in pixels.
Example:

```
Var p as new Picture(200, 200, 32)
Var info as new WindowsGraphicsInfoMBS(p.Graphics)

MsgBox "Size of Windows Desktop: "+str(info.DesktopResolutionX)+ " x "+str(info.DesktopResolutionY)
```

Notes: (Read and Write property)

153.3.19 DriverVersion as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device driver version.
Notes: (Read and Write property)

153.3.20 FontCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of device-specific fonts.
Notes: (Read and Write property)

153.3.21 LogPixelsX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen width.
Example:

```
Var g as Graphics = OpenPrinter
Var info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS

MsgBox "Printer resolution: "+str(info.LogPixelsX)+" x "+str(info.LogPixelsY)
```

Notes: In a system with multiple display monitors, this value is the same for all monitors.
(Read and Write property)

153.3.22 LogPixelsY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen height.
Example:

```
Var g as Graphics = OpenPrinter
Var info as WindowsGraphicsInfoMBS = g.WindowsGraphicsInfoMBS

MsgBox "Printer resolution: "+str(info.LogPixelsX)+" x "+str(info.LogPixelsY)
```

Notes: In a system with multiple display monitors, this value is the same for all monitors.
(Read and Write property)

153.3.23 MakersCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of markers the device has.
Notes: (Read and Write property)

153.3.24 PenCount as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of device-specific pens.
Notes: (Read and Write property)

153.3.25 PhysicalHeight as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the height of the physical page, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper has a physical height value of 6600 device units. Note that the physical page is almost always greater than the printable area of the page, and never smaller.

(Read and Write property)

153.3.26 PhysicalOffsetX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the distance from the left edge of the physical page to the left edge of the printable area, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper, that cannot print on the leftmost 0.25-inch of paper, has a horizontal physical offset of 150 device units.
(Read and Write property)

153.3.27 PhysicalOffsetY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the distance from the top edge of the physical page to the top edge of the printable area, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-by-11-inch paper, that cannot print on the topmost 0.5-inch of paper, has a vertical physical offset of 300 device units.
(Read and Write property)

153.3.28 PhysicalWidth as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For printing devices: the width of the physical page, in device units.
Notes: For example, a printer set to print at 600 dpi on 8.5-x11-inch paper has a physical width value of 5100 device units. Note that the physical page is almost always greater than the printable area of the page, and never smaller.
(Read and Write property)

153.3.29 Planes as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of color planes.
Notes: (Read and Write property)

153.3.30 ResolutionX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width, in pixels, of the screen; or for printers, the width, in pixels, of the printable area of the page.
Notes: (Read and Write property)

153.3.31 ResolutionY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height, in raster lines, of the screen; or for printers, the height, in pixels, of the printable area of the page.
Notes: (Read and Write property)

153.3.32 ScalingFactorX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scaling factor for the x-axis of the printer.
Notes: (Read and Write property)

153.3.33 ScalingFactorY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scaling factor for the y-axis of the printer.
Notes: (Read and Write property)

153.3.34 SizeX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width, in millimeters, of the physical screen.
Notes: (Read and Write property)

153.3.35 SizeY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height, in millimeters, of the physical screen.
Notes: (Read and Write property)

153.3.36 Technology as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Device technology. It can be any one of the kTechnology* constants.
Notes: (Read and Write property)

153.3.37 VRefresh as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For display devices: the current vertical refresh rate of the device, in cycles per second (Hz).
Notes: (Read and Write property)

153.3.38 Constants

Technology Constants

Constant	Value	Description
kTechnologyCharStream	4	Character stream
kTechnologyDisplayFile	6	Display file
kTechnologyMetaFile	5	Metafile
kTechnologyPlotter	0	Vector plotter
kTechnologyRasterCamera	3	Raster camera
kTechnologyRasterDisplay	1	Raster display
kTechnologyRasterPrinter	2	Raster printer

153.4 class WindowsPageFormatMBS

153.4.1 class WindowsPageFormatMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a page format.
Example:

```
// change the printer name to your printer's name
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
Var formats(-1) as WindowsPageFormatMBS = w.GetPrinterFormats

for each p as WindowsPageFormatMBS in formats
MsgBox p.Name
next
```

Notes: This class wraps the FORM_INFO_1 structure. You can find more information here:
http://msdn.microsoft.com/en-us/library/dd144836(v=VS.85).aspx
Blog Entries

- MBS Real Studio Plugins, version 12.1pr1

153.4.2 Properties

153.4.3 DisplayName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The form's display name in the language specified by LangId.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

153.4.4 Flags as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The flags for this page format.
Notes: The following values are defined.

(Read and Write property)

Value	Meaning
FORM_USER	If this bit flag is set, the form has been defined by the user. Forms with this flag set are defined in the registry.
FORM_BUILTIN	If this bit-flag is set, the form is part of the spooler. Form definitions with this flag set do not appear in the registry.
FORM_PRINTER	If this bit flag is set, the form is associated with a certain printer, and its definition appears in the registry.

153.4.5 ImageableAreaBottom as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.6 ImageableAreaHeight as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.7 ImageableAreaLeft as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.8 ImageableAreaRight as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.9 ImageableAreaTop as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.10 ImageableAreaWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The imageable area, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.11 Keyword as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A non-localizable string identifier of the form.
Notes: When passed to AddForm or SetForm, this gives the caller a means of identifying the form in all locales.
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

153.4.12 LangId as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The language of the DisplayName.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

153.4.13 Mode as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The mode.
Notes: Value can be 1 (Windows 2000 and newer) or 2 (Windows Vista and newer).
(Read and Write property)

153.4.14 MuiDll as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Multilingual User Interface localized resource DLL that contains the localized display name.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

153.4.15 Name as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the form.
Notes: (Read and Write property)

153.4.16 ResourceId as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The resource ID of the form's display name in MuiDll.
Notes: Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

153.4.17 SizeHeight as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.18 SizeWidth as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width, in thousandths of millimeters, of the form.
Notes: (Read and Write property)

153.4.19 StringType as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies how a localized display name for the form is obtained at runtime.
Notes: The following values are defined. Only one can be set in any given call to AddForm or SetForm. Both STRING_MUIDLL and STRING_LANGPAIR can be set in the WindowsPageFormatMBS (s) returned by

GetForm or GetPrinterFormats.

Can be STRING_LANGPAIR, STRING_MUIDLL or STRING_NONE.
Only available in Windows Vista and newer and only valid if mode = 2.
(Read and Write property)

153.4.20 Constants

Constants

Constant	Value	Description
FORM_BUILTIN	1	One of the flag constants. If this bit-flag is set, the form is part of the spooler. Form definitions with this flag set do not appear in the registry.
FORM_PRINTER	2	One of the flag constants. If this bit flag is set, the form is associated with a certain printer, and its definition appears in the registry.
FORM_USER	0	One of the flag constants. If this bit flag is set, the form has been defined by the user. Forms with this flag set are defined in the registry.

String Type Constants

Constant	Value	Description
STRING_LANGPAIR	4	The display name and language ID are provided directly by DisplayName and the language is specified by LangId.
STRING_MUIDLL	2	The display name is extracted from the Multilingual User Interface localized resources DLL specified in MuiDll. The ID is in the ResourceId member.
STRING_NONE	1	There is no localized display name.

153.5 class WindowsPageSetupDialogMBS

153.5.1 class WindowsPageSetupDialogMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The class to run the Windows Page Setup dialog.
Blog Entries

- MBS Xojo Plugins, version 21.6pr3
- MBS Real Studio Plugins, version 12.1pr7

153.5.2 Methods

153.5.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

153.5.4 GetDevNames(byref DriverName as string, byref DeviceName as string, byref OutputName as string, byref flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Queries the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true if values are available and false if not.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

153.5.5 PageSetupDialog as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Creates a Page Setup dialog box that enables the user to specify the attributes of a printed page.
Notes: These attributes include the paper size and source, the page orientation (portrait or landscape), and the width of the page margins.

If the user clicks the OK button, the return value is true. The members of the object indicate the user's selections.
If the user cancels or closes the Page Setup dialog box or an error occurs, the return value is false. To get extended error information, use the lasterror property.

Starting with Windows Vista, the PageSetupDialog does not contain the Printer button. To switch printer selection other functions.

153.5.6 SetDevNames(DriverName as string, DeviceName as string, OutputName as string, flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Sets the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true on success and false on failure.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

153.5.7 Properties

153.5.8 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The device mode object.
Notes: On input, if an object is specified, the values in the corresponding DEVMODE structure are used to initialize the controls in the dialog box. On output, the dialog box sets DevMode to a new object that contains values specifying the user's selections. If the user's selections are not available, the dialog box sets DevMode to nil.

(Read and Write property)

153.5.9 Flags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: A set of bit flags that you can use to initialize the Page Setup dialog box.
Notes: When the dialog box returns, it sets these flags to indicate the user's input.
See the PSD_* constants for possible values.
(Read and Write property)

153.5.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

153.5.11 MarginBottom as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the bottom margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

153.5.12 MarginLeft as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the left margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

153.5.13 MarginRight as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the right margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

153.5.14 MarginTop as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The widths of the top margin.
Notes: If you set the PSD_MARGINS flag, rtMargin specifies the initial margin values. When PageSetupDlg returns, rtMargin contains the margin widths selected by the user. The PSD_INHUNDREDTHSOFMILLIMETERS or PSD_INTHOUSANDTHSOFINCHES flag indicates the units of measurement.
(Read and Write property)

153.5.15 MinMarginBottom as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the bottom margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

153.5.16 MinMarginLeft as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the left margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

153.5.17 MinMarginRight as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the right margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

153.5.18 MinMarginTop as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum allowable widths for the top margin.
Notes: The system ignores this member if the PSD_MINMARGINS flag is not set. These values must be less than or equal to the values specified in the Margin* member. The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

153.5.19 PaperSizeX as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The dimensions of the paper selected by the user.
Notes: The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

153.5.20 PaperSizeY as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The dimensions of the paper selected by the user.
Notes: The PSD_INTHOUSANDTHSOFINCHES or PSD_INHUNDREDTHSOFMILLIMETERS flag indicates the units of measurement.
(Read and Write property)

153.5.21 Parent as Variant

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The window that owns the dialog box.
Notes: This member can be any valid window, or it can be nil if the dialog box has no owner.
Can reference a Window or DesktopWindow object.
(Read and Write property)

153.5.22 Constants

Constants

Constant	Value	Description
DN_DEFAULTPRN	1	The flag for default printer on the SetDevNames/GetDevNames flag parameter.

Flags

Constant	Value	Description
PSD_DEFAULTMINMARGINS	&h00000000	Sets the minimum values that the user can specify for th be the minimum margins allowed by the printer. This is flag is ignored if the PSD_MARGINS and PSD_MINMAR specified.
PSD_DISABLEMARGINS	&h00000010	Disables the margin controls, preventing the user from sett
PSD_DISABLEORIENTATION	&h00000100	Disables the orientation controls, preventing the user fro orientation.
PSD_DISABLEPAPER	&h00000200	Disables the paper controls, preventing the user from settin such as the paper size and source.
PSD_DISABLEPRINTER	&h00000020	Obsolete. Windows XP/2000: Disables the Printer button, preven invoking a dialog box that contains additional printer setu
PSD_INHUNDREDTHSOFMILLIMETERS	&h00000008	Indicates that hundredths of millimeters are the unit of me gins and paper size. The values in the Margin, MinMarg members are in hundredths of millimeters. You can set to override the default unit of measurement for the user's function returns, the dialog box sets this flag to indicate th
PSD_INTHOUSANDTHSOFINCHES	&h00000004	Indicates that thousandths of inches are the unit of measu and paper size. The values in the Margin, MinMargin, and are in thousandths of inches. You can set this flag on in default unit of measurement for the user's locale. When th the dialog box sets this flag to indicate the units used.
PSD_MARGINS	&h00000002	Causes the system to use the values specified in the Marg initial widths for the left, top, right, and bottom margins. is not set, the system sets the initial widths to one inch for
PSD_MINMARGINS	&h00000001	Causes the system to use the values specified in the MinM the minimum allowable widths for the left, top, right, an The system prevents the user from entering a width that is ified minimum. If PSD_MINMARGINS is not specified, t minimum allowable widths to those allowed by the printer.
PSD_NONETWORKBUTTON	&h00200000	Hides and disables the Network button.
PSD_NOWARNING	&h00000080	Prevents the system from displaying a warning message whe printer.
PSD_RETURNDEFAULT	&h00000400	PageSetupDialog does not display the dialog box. Instea Names and DevMode members to objects that are initiali default printer. PageSetupDlg returns an error if either Dev is not nil.
PSD_SHOWHELP	&h00000800	Causes the dialog box to display the Help button. The hw must specify the window to receive the HELPMSGSTRING that the dialog box sends when the user clicks the Help bu

153.6 class WindowsPrintDialogMBS

153.6.1 class WindowsPrintDialogMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The class for showing the windows print dialog.
Blog Entries

- MBS Xojo Plugins, version 21.6pr3
- MBS Xojo Plugins, version 21.3pr2
- MBS Real Studio Plugins, version 12.1pr7

153.6.2 Methods

153.6.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The constructor.

153.6.4 GetDevNames(byref DriverName as string, byref DeviceName as string, byref OutputName as string, byref flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Queries the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true if values are available and false if not.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

153.6.5 getPageRange(index as Integer, byref fromPage as Integer, byref toPage as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Queries a page range entry.

153.6.6 PrintDialog as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a Print Dialog Box or a Print Setup dialog box.
Notes: The Print dialog box enables the user to specify the properties of a particular print job.

If the user clicks the OK button, the return value is true. The members of the object indicate the user's selections.

If the user canceled or closed the Print or Printer Setup dialog box or an error occurred, the return value is zero. To get extended error information, use the lasterror property. If the user canceled or closed the dialog box, lasterror returns zero.

This is the older function. PrintDialogEx is the newer function.

153.6.7 PrintDialogEx as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a Print property sheet that enables the user to specify the properties of a particular print job.
Notes: Changed from Boolean to Integer in v21.3 to allow you to distinguish between different different results. Result is either 0 for OK or an COM error code.

A Print property sheet has a General page that contains controls similar to the Print dialog box. The property sheet can also have additional application-specific and driver-specific property pages as well as the General page.
If the function succeeds, the return value is S_OK (0) and the ResultAction member contains one of the following values.

Lasterror is set.
The values of DevMode and DevNames in WindowsPrintDialogMBS may change when they are passed into

Constant	Value	Description
PD_RESULT_APPLY	2	The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not yet want to print. The WindowsPrintDialogMBS contains the information specified by the user at the time the Apply button was clicked.
PD_RESULT_CANCEL	0	The user clicked the Cancel button. The information in the WindowsPrintDialogMBS is unchanged.
PD_RESULT_PRINT	1	The user clicked the Print button. The WindowsPrintDialogMBS contains the information specified by the user.

PrintDialog. This is because these members are filled on both input and output.
If PD_RETURNDC is set but PD_USEDEVMODECOPIESANDCOLLATE flag is not set, the PrintDialog functions return incorrect number of copies. To get the correct number of copies, ensure that the calling application always uses PD_USEDEVMODECOPIESANDCOLLATE with PD_RETURNDC.

http://msdn.microsoft.com/en-us/library/windows/desktop/ms646942(v=vs.85).aspx

153.6.8 SetDevNames(DriverName as string, DeviceName as string, OutputName as string, flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Sets the strings that identify the driver, device, and output port names for a printer.
Notes: Returns true on success and false on failure.

DriverName: The file name (without the extension) of the device driver. On input, this string is used to determine the printer to display initially in the dialog box.
OutputName: The device name for the physical output medium (output port).
Flags: Indicates whether the strings here identify the default printer. This string is used to verify that the default printer has not changed since the last print operation. If any of the strings do not match, a warning message is displayed informing the user that the document may need to be reformatted. On output, the Flags member is changed only if the Print Setup dialog box was displayed and the user chose the OK button. The DN_DEFAULTPRN flag is used if the default printer was selected. If a specific printer is selected, the flag is not used. All other flags in this member are reserved for internal use by the dialog box procedure for the Print property sheet or Print dialog box.

153.6.9 setPageRange(index as Integer, fromPage as Integer, toPage as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Sets a page range entry.
Notes: Index from 0 to 19.

153.6.10 Properties

153.6.11 Copies as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Contains the initial number of copies for the Copies edit control if DevMode is nil; otherwise, the Copies member of the DEVMODE contains the initial value.
Notes: When PrintDlgEx returns, nCopies contains the actual number of copies the application must print. This value depends on whether the application or the printer driver is responsible for printing multiple copies. If the PD_USEDEVMODECOPIESANDCOLLATE flag is set in the Flags member, nCopies is always 1 on return, and the printer driver is responsible for printing multiple copies. If the flag is not set, the application is responsible for printing the number of copies specified by nCopies. For more information, see the description of the PD_USEDEVMODECOPIESANDCOLLATE flag.
(Read and Write property)

153.6.12 DC as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The device context or an information context, depending on whether the Flags member specifies the PD_RETURNDC or PC_RETURNIC flag.
Notes: If neither flag is specified, the value of this member is undefined. If both flags are specified, PD_RETURNDC has priority.
(Read and Write property)

153.6.13 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The device mode object.
Notes: On input, if an object is specified, the values in the corresponding DEVMODE structure are used to initialize the controls in the dialog box. On output, the dialog box sets DevMode to a new object that contains values specifying the user's selections. If the user's selections are not available, the dialog box sets DevMode to nil.
(Read and Write property)

153.6.14 ExclusionFlags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: A set of bit flags that can exclude items from the printer driver property pages in the Print property sheet.
Notes: This value is used only if the PD_EXCLUSIONFLAGS flag is set in the Flags member. Exclusion flags should be used only if the item to be excluded will be included on either the General page or on an application-defined page in the Print property sheet. This member can specify the following flag.
PD_EXCL_COPIESANDCOLLATE: Excludes the Copies and Collate controls from the printer driver property pages in a Print property sheet. This flag should always be set when the application uses the default Copies and Collate controls provided by the lower portion of the General page of the Print property sheet.
(Read and Write property)

153.6.15 Flags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: A set of bit flags that you can use to initialize the Print property sheet.
Notes: When the PrintDialog function returns, it sets these flags to indicate the user's input. This member can be one or more of the following values.

To ensure that PrintDialog returns the correct values in the Copies and Collate members of the DeviceMode, set PD_RETURNDC = TRUE and PD_USEDEVMODECOPIESANDCOLLATE = TRUE. In so doing, the Copies member of the PRINTDLG structure is always 1 and PD_COLLATE is always false.

To ensure that PrintDialog returns the correct values in nCopies and PD_COLLATE, set PD_RETURNDC = TRUE and PD_USEDEVMODECOPIESANDCOLLATE = FALSE. In so doing, dmCopies is always 1 and dmCollate is always FALSE.
Starting with Windows Vista, when you call PrintDlg or PrintDlgEx with PD_RETURNDC set to TRUE and PD_USEDEVMODECOPIESANDCOLLATE set to FALSE, the PrintDlg or PrintDlgEx function sets the number of copies in the nCopies member of the PRINTDLG structure, and it sets the number of copies in the structure represented by the hDC member of the PRINTDLG structure.
When making calls to GDI, you must ignore the value of nCopies, consider the value as 1, and use the returned hDC to avoid printing duplicate copies.
(Read and Write property)

153.6.16 FromPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The initial value for the starting page edit control.
Notes: When PrintDialog returns, nFromPage is the starting page specified by the user. If the Pages radio button is selected when the user clicks the Okay button, PrintDialog sets the PD_PAGENUMS flag and does not return until the user enters a starting page value that is within the minimum to maximum page range.

If the input value for either FromPage or nToPage is outside the minimum/maximum range, PrintDlg returns an error only if the PD_PAGENUMS flag is specified; otherwise, it displays the dialog box but changes the out-of-range value to the minimum or maximum value.
This is only for PrintDialog, not for PrintDialogEx.
(Read and Write property)

153.6.17 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: Typical errors:
E_OUTOFMEMORY = &h8007000E // Insufficient memory.
E_INVALIDARG = &h80070057 // One or more arguments are invalid.
E_POINTER = &h80000005 // Invalid pointer.
E_HANDLE = &h80000006 // Invalid handle.
E_FAIL = &h80000008 // Unspecified error.
(Read and Write property)

153.6.18 MaxPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The maximum value for the page ranges specified in the Pages edit control.
Notes: If the PD_NOPAGENUMS flag is specified, this value is not valid.
(Read and Write property)

153.6.19 MaxPageRanges as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The size, in array elements, of the PageRanges buffer.
Notes: This value indicates the maximum number of page ranges that can be stored in the array. If the PD_NOPAGENUMS flag is specified, this value is not valid. If the PD_NOPAGENUMS flag is not specified, this value must be greater than zero.
The plugin supports up to 20 page ranges.
(Read and Write property)

153.6.20 MinPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The minimum value for the page ranges specified in the Pages edit control.
Notes: If the PD_NOPAGENUMS flag is specified, this value is not valid.
(Read and Write property)

153.6.21 PageRanges as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: On input, set this member to the initial number of page ranges specified.
Notes: When the PrintDialog function returns, PageRanges indicates the number of user-specified page ranges. If the PD_NOPAGENUMS flag is specified, this value is not valid. Use getPageRange to query page ranges or setPageRange to set them.
(Read and Write property)

153.6.22 Parent as Variant

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The window that owns the dialog box.
Notes: The window that owns the property sheet. This member must be a valid window handle; it cannot be nil.
Can reference a Window or DesktopWindow object.
(Read and Write property)

153.6.23 ResultAction as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: If the PrintDlgEx function returns S_OK (0), ResultAction contains the outcome of the dialog.
Notes: If PrintDialog returns an error, this member should be ignored. The ResultAction member can be one of the following values:

PD_RESULT_APPLY	The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not want to print yet. The PRINTDLGEX structure contains the information specified by the user at the time the Apply button was clicked.
PD_RESULT_CANCEL	The user clicked the Cancel button. The information in the PRINTDLGEX structure is unchanged.
PD_RESULT_PRINT	The user clicked the Print button. The PRINTDLGEX structure contains the information specified by the user.

(Read and Write property)

153.6.24 StartPanel as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The property page that is initially displayed.
Notes: To display the General page, specify START_PAGE_GENERAL. For consistency, it is recommended that the property sheet always be started on the General page.
The plugin sets START_PAGE_GENERAL for default value.
(Read and Write property)

153.6.25 ToPage as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The initial value for the ending page edit control.
Notes: When PrintDialog returns, ToPage is the ending page specified by the user. If the Pages radio button is selected when the use clicks the Okay button, PrintDialog sets the PD_PAGENUMS flag and does not return until the user enters an ending page value that is within the minimum to maximum page range. This is only for PrintDialog, not for PrintDialogEx.
(Read and Write property)

153.6.26 Constants

Constants

Constant	Value	Description
START_PANEL_GENERAL	&hffffffff	Special value for StartPanel property to select general panel.

Flag Constants

Constant	Value	Description
PD_ALLPAGES	0	The default flag that indicates that the All radio button i This flag is used as a placeholder to indicate that the PD_SELECTION, and PD_CURRENTPAGE flags are n
PD_COLLATE	&h00000010	If this flag is set, the Collate check box is selected. If this flag is set when the PrintDlgEx function returns, t simulate collation of multiple copies. For more informatio of the PD_USEDEVMODECOPIESANDCOLLATE flag See PD_NOPAGENUMS.
PD_CURRENTPAGE	&h00400000	If this flag is set, the Current Page radio button is sele PD_PAGENUMS, PD_SELECTION, or PD_CURREN the All radio button is selected.
PD_DISABLEPRINTTOFILE	&h00080000	Disables the Print to File check box.
PD_EXCLUSIONFLAGS	&h01000000	Indicates that the ExclusionFlags member identifies items the printer driver property pages. If this flag is not set, items will be excluded by default fro property pages. The exclusions prevent the duplication General page, any application-specified pages, and the pri
PD_EXCL_COPIESANDCOLLATE	&h00008100	Excludes the Copies and Collate controls from the printer c in a Print property sheet. This flag should always be set w uses the default Copies and Collate controls provided by the General page of the Print property sheet.
PD_HIDEPRINTTOFILE	&h00100000	Hides the Print to File check box.
PD_NOCURRENTPAGE	&h00800000	Disables the Current Page radio button.
PD_NONETWORKBUTTON	&h00200000	Hides and disables the Network button.
PD_NOPAGENUMS	8	Disables the Pages radio button and the associated edit c Also, it causes the Collate check box to appear in the dia
PD_NOSELECTION	4	Disables the Selection radio button.
PD_NOWARNING	&h00000080	Prevents the warning message from being displayed when
PD_PAGENUMS	2	If this flag is set, the Pages radio button is selected. If n GENUMS, PD_SELECTION, or PD_CURRENTPAGE radio button is selected. If this flag is set when the Prin turns, the PageRanges member indicates the page ranges s
PD_PRINTSETUP	&h00000040	Causes the system to display the Print Setup dialog box r dialog box.
PD_PRINTTOFILE	&h00000020	If this flag is set, the Print to File check box is selected. If this flag is set when PrintDialog returns, the Output contains the string "FILE:". When you call the StartD the printing operation, specify this "FILE:" string in th member of the DOCINFO structure. Specifying this str subsystem to query the user for the name of the output fi StartDoc is available in our plugins through StartDocPri dPrintJobMBS class.
PD_RETURNDC	&h00000100	Causes PrintDialog to return a device context matching th made in the property sheet. The device context is returned in DC property.
PD_RETURNDEFAULT	&h00000400	If this flag is set, the PrintDialog function does not displa Instead, it sets the DevNames and DevMode members t system default printer. Both DevNames and DevMode PrintDialog returns an error.
PD_RETURNIC	&h00000200	Similar to the PD_RETURNDC flag, except this flag ret context rather than a device context. If neither PD_RETURNDC nor PD_RETURNIC is spe fined on output.
PD_SELECTION	1	If this flag is set, the Selection radio button is selected. If none of the PD_PAGENUMS, PD_SELECTION, or PD flags is set, the All radio button is selected.
PD_SHOWHELP	&h00000800	Causes the dialog box to display the Help button.
PD_USEDEVMODECOPIES	&h00040000	Same as PD_USEDEVMODECOPIESANDCOLLATE.

Result Constants

Constant	Value	Description
PD_RESULT_APPLY	2	The user clicked the Apply button and later clicked the Cancel button. This indicates that the user wants to apply the changes made in the property sheet, but does not yet want to print. The WindowsPrintDialogMBS contains the information specified by the user at the time the Apply button was clicked.
PD_RESULT_CANCEL	0	The user clicked the Cancel button. The information in the WindowsPrintDialogMBS is unchanged.
PD_RESULT_PRINT	1	The user clicked the Print button. The WindowsPrintDialogMBS contains the information specified by the user.

153.7 class WindowsPrinterInfoMBS

153.7.1 class WindowsPrinterInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for details on printer information.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName
next
```

Notes: This class wraps the PRINTER_INFO_2 structure on windows which you find documented here: http://msdn.microsoft.com/en-us/library/dd162845(VS.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Real Studio Plugins, version 12.1pr6

153.7.2 Methods

153.7.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

153.7.4 LocalPrinters as WindowsPrinterInfoMBS()

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the printers as an array.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName
```

next

Notes: On any error the array will be empty.

153.7.5 OpenPrinter(admin as boolean = false) as WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer so you can operate on it.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
MsgBox p.PrinterName
```

Notes: Admin: whether you want to get permissions to administrate.
Returns nil on any error.

153.7.6 Printers(flags as Integer, Name as Variant = nil) as WindowsPrinterInfoMBS()

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Printers function enumerates available printers, print servers, domains, or print providers.
Notes: If you call this with flags = kPrinterFlagsLocal + kPrinterFlagsConnections and name = nil, you get same as LocalPrinters function.

see also
https://msdn.microsoft.com/en-us/library/windows/desktop/dd162692(v=vs.85).aspx

153.7.7 Properties

153.7.8 AttributeFlags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the printer attributes.
Notes: This member can be one of the following values:

Renamed Attributes parameter to AttributeFlags in plugin version 8.2.

PRINTER_ATTRIBUTE_QUEUED	&h00000001	
PRINTER_ATTRIBUTE_DIRECT	&h00000002	
PRINTER_ATTRIBUTE_DEFAULT	&h00000004	(Windows 95)
PRINTER_ATTRIBUTE_SHARED	&h00000008	
PRINTER_ATTRIBUTE_NETWORK	&h00000010	
PRINTER_ATTRIBUTE_HIDDEN	&h00000020	
PRINTER_ATTRIBUTE_LOCAL	&h00000040	
PRINTER_ATTRIBUTE_ENABLE_DEVQ	&h00000080	
PRINTER_ATTRIBUTE_KEEPPRINTEDJOBS	&h00000100	
PRINTER_ATTRIBUTE_DO_COMPLETE_FIRST	&h00000200	
PRINTER_ATTRIBUTE_WORK_OFFLINE	&h00000400	(Windows 95)
PRINTER_ATTRIBUTE_ENABLE_BIDI	&h00000800	(Windows 95)
PRINTER_ATTRIBUTE_RAW_ONLY	&h00001000	
PRINTER_ATTRIBUTE_PUBLISHED	&h00002000	(Windows 2000) Indicates whether the printer is published in the directory service.

(Read and Write property)

153.7.9 AveragePPM as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the average number of pages per minute that have been printed on the printer.
Notes: (Read and Write property)

153.7.10 Comment as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that provides a brief description of the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName+": "+p.Comment
next
```

Notes: (Read and Write property)

153.7.11 CountJobs as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the number of print jobs that have been queued for the printer.
Notes: (Read and Write property)

153.7.12 Datatype as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the data type used to record the print job.
Notes: (Read and Write property)

153.7.13 DefaultPriority as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the default priority value assigned to each print job.
Notes: (Read and Write property)

153.7.14 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WindowsDeviceModeMBS object that defines default printer data such as the paper orientation and the resolution.
Notes: (Read and Write property)

153.7.15 DriverName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the printer driver.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName+": "+p.DriverName
next
```

Notes: (Read and Write property)

153.7.16 Location as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the physical location of the printer.
Notes: for example, "Bldg. 38, Room 1164".
(Read and Write property)

153.7.17 Parameters as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the default print-processor parameters.
Notes: (Read and Write property)

153.7.18 PortName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that identifies the port(s) used to transmit data to the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName+": "+p.PortName
next
```

Notes: If a printer is connected to more than one port, the names of each port must be separated by commas (for example, "LPT1:,LPT2:,LPT3:").
(Read and Write property)

153.7.19 PrinterName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName
```

next

Notes: (Read and Write property)

153.7.20 PrintProcessor as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the print processor used by the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrintProcessor
next
```

Notes: (Read and Write property)

153.7.21 Priority as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a priority value that the spooler uses to route print jobs.
Notes: Possible values:

NO_PRIORITY	0
MAX_PRIORITY	99
MIN_PRIORITY	1
DEF_PRIORITY	1

(Read and Write property)

153.7.22 SeparatorPageFile as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the name of the file used to create the separator page.
Notes: This page is used to separate print jobs sent to the printer.

(Read and Write property)

153.7.23 ServerName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string identifying the server that controls the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName+": "+p.ServerName
next
```

Notes: If this string is "", the printer is controlled locally.
(Read and Write property)

153.7.24 ShareName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that identifies the sharepoint for the printer.
Example:

```
Var printers(-1) as WindowsPrinterInfoMBS = WindowsPrinterInfoMBS.LocalPrinters

for each p as WindowsPrinterInfoMBS in printers
MsgBox p.PrinterName+": "+p.ShareName
next
```

Notes: This string is used only if the PRINTER_ATTRIBUTE_SHARED constant was set for the Attributes member.
(Read and Write property)

153.7.25 StartTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the earliest time at which the printer will print a job.
Notes: This value is expressed as minutes elapsed since 12:00 A.M. GMT (Greenwich Mean Time).
(Read and Write property)

153.7.26 Status as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the printer status.
Notes: This member can be one of the following values:

PRINTER_STATUS_PAUSED	&h00000001
PRINTER_STATUS_ERROR	&h00000002
PRINTER_STATUS_PENDING_DELETION	&h00000004
PRINTER_STATUS_PAPER_JAM	&h00000008
PRINTER_STATUS_PAPER_OUT	&h00000010
PRINTER_STATUS_MANUAL_FEED	&h00000020
PRINTER_STATUS_PAPER_PROBLEM	&h00000040
PRINTER_STATUS_OFFLINE	&h00000080
PRINTER_STATUS_IO_ACTIVE	&h00000100
PRINTER_STATUS_BUSY	&h00000200
PRINTER_STATUS_PRINTING	&h00000400
PRINTER_STATUS_OUTPUT_BIN_FULL	&h00000800
PRINTER_STATUS_NOT_AVAILABLE	&h00001000
PRINTER_STATUS_WAITING	&h00002000
PRINTER_STATUS_PROCESSING	&h00004000
PRINTER_STATUS_INITIALIZING	&h00008000
PRINTER_STATUS_WARMING_UP	&h00010000
PRINTER_STATUS_TONER_LOW	&h00020000
PRINTER_STATUS_NO_TONER	&h00040000
PRINTER_STATUS_PAGE_PUNT	&h00080000
PRINTER_STATUS_USER_INTERVENTION	&h00100000
PRINTER_STATUS_OUT_OF_MEMORY	&h00200000
PRINTER_STATUS_DOOR_OPEN	&h00400000
PRINTER_STATUS_SERVER_UNKNOWN	&h00800000
PRINTER_STATUS_POWER_SAVE	&h01000000

Windows 95: The PRINTER_STATUS_PAGE_PUNT value specifies that the page is being "punted" (that is, not printed) because it is too complex for the printer to print.
(Read and Write property)

153.7.27 UntilTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the latest time at which the printer will print a job.
Notes: This value is expressed as minutes elapsed since 12:00 A.M. GMT (Greenwich Mean Time).
Status
(Read and Write property)

153.7.28 Constants

Printer Enumeration Flags

Constant	Value	Description
kPrinterFlagsConnections	4	The function enumerates the list of printers to which the user has made previous connections.
kPrinterFlagsDefault	1	Default printer.
kPrinterFlagsLocal	2	If the kPrinterFlagsName flag is not also passed, the function ignores the Name parameter, and enumerates the locally installed printers. If kPrinterFlagsName is also passed, the function enumerates the local printers on Name.
kPrinterFlagsName	8	The function enumerates the printer identified by Name. This can be a server, a domain, or a print provider. If Name is nil, the function enumerates available print providers.
kPrinterFlagsNetwork	64	Network printers?
kPrinterFlagsRemote	16	Remote (non Local) printers?
kPrinterFlagsShared	32	The function enumerates printers that have the shared attribute. Cannot be used in isolation; use an OR operation to combine with another constants.

153.8 class WindowsPrinterJobMBS

153.8.1 class WindowsPrinterJobMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for Windows print job information.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr4

153.8.2 Properties

153.8.3 Datatype as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of data used to record the print job.
Notes: (Read and Write property)

153.8.4 DevMode as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device-initialization and environment data for the printer driver.
Notes: (Read and Write property)

153.8.5 Document as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the user who owns the print job.
Notes: (Read and Write property)

153.8.6 DriverName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the printer driver that should be used to process the print job.
Notes: (Read and Write property)

153.8.7 JobID as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A job identifier value.
Notes: (Read and Write property)

153.8.8 MachineName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the machine that created the print job.
Notes: (Read and Write property)

153.8.9 NotifyName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the user who should be notified when the job has been printed or when an error occurs while printing the job.
Notes: (Read and Write property)

153.8.10 PagesPrinted as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of pages that have printed.
Notes: This value may be zero if the print job does not contain page delimiting information.
(Read and Write property)

153.8.11 Parameters as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Print-processor parameters.
Notes: (Read and Write property)

153.8.12 Position as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The job's position in the print queue.
Notes: (Read and Write property)

153.8.13 PrinterName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the printer for which the job is spooled.
Notes: (Read and Write property)

153.8.14 PrintProcessor as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the print processor that should be used to print the job.
Notes: (Read and Write property)

153.8.15 Priority as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The job priority.
Notes: This member can be one of the following values or in the range between 1 through 99 (kPriorityMin through kPriorityMax).
(Read and Write property)

153.8.16 Size as Int64

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size, in bytes, of the job.
Notes: (Read and Write property)

153.8.17 StartTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The earliest time that the job can be printed.
Notes: (Read and Write property)

153.8.18 Status as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The job status.
Notes: Check kJobStatus* constants for possible values.
(Read and Write property)

153.8.19 StatusString as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The status of the print job.
Notes: This member should be checked prior to Status and, if StatusString is "", the status is defined by the contents of the Status member.
(Read and Write property)

153.8.20 Submitted as Date

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time when the job was submitted.
Notes: This time value is in Universal Time Coordinate (UTC) format.
(Read and Write property)

153.8.21 Time as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The total time, in milliseconds, that has elapsed since the job began printing.
Notes: (Read and Write property)

153.8.22 TotalPages as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of pages required for the job.
Notes: This value may be zero if the print job does not contain page delimiting information.
(Read and Write property)

153.8.23 UntilTime as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The latest time that the job can be printed.
Notes: (Read and Write property)

153.8.24 UserName as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the user who owns the print job.
Notes: (Read and Write property)

153.8.25 Constants

Job Status Constants

Constant	Value	Description
kJobStatusBlockedDeviceQueue	&h200	The driver cannot print the job.
kJobStatusComplete	&h1000	The job is sent to the printer, but may not be printed yet. (Windows XP and later)
kJobStatusDeleted	&h100	Job has been deleted.
kJobStatusDeleting	4	Job is being deleted.
kJobStatusError	2	An error is associated with the job.
kJobStatusOffline	&h20	Printer is offline.
kJobStatusPaperOut	&h40	Printer is out of paper.
kJobStatusPaused	1	Job is paused.
kJobStatusPrinted	&h80	Job has printed.
kJobStatusPrinting	&h10	Job is printing.
kJobStatusRenderingLocally	&h4000	Rendering.
kJobStatusRestart	&h800	Job has been restarted.
kJobStatusRetained	&h2000	The job has been retained in the print queue following printing. (Windows XP and later)
kJobStatusSpooling	8	Job is spooling.
kJobStatusUserIntervention	&h400	Printer has an error that requires the user to do something.

Priority Constants

Constant	Value	Description
kPriorityDefault	1	Default priority.
kPriorityMax	99	Maximum priority.
kPriorityMin	1	Minimum priority.
kPriorityNo	0	No priority.

153.9 class WindowsPrinterMBS

153.9.1 class WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an open connection to a windows printer.
Notes: Objects of this class can operate on printers.
Some operations need administrative permissions. If you don't have them, lasterror is set to 5.

153.9.2 Methods

153.9.3 AddForm(form as WindowsPageFormatMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The AddForm function adds a form to the list of available forms that can be selected for the specified printer.
Example:

```
// query default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

Var form as new WindowsPageFormatMBS

form.Mode = 1
form.Name = "MyTest"
form.DisplayName = "MyTest"
form.Flags = 0
form.SizeHeight = 100000
form.SizeWidth = 100000
form.ImageableAreaLeft = 0
```

```
form.ImageableAreaTop = 0
form.ImageableAreaRight = 100000
form.ImageableAreaBottom = 100000

if w.AddForm(form) then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Form.Mode gives level of the data. Must be either 1 (old version) or 2 (newer version).

Form: The form details.

Returns true if the function succeeds and false if the function fails.

Note: This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

An application can determine which forms are available for a printer by calling the GetPrinterFormats function.
If form points to a Mode 2 form, then AddForm will fail if either a form with the specified name already exists or the Keyword value already exists.

153.9.4 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as DesktopWindow) as integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a printer-configuration dialog box for the specified printer, allowing the user to configure that printer.
Notes: This function is a special case of the DocumentProperties function.

parent: The parent window of the printer-configuration dialog box.

OutputDevMode: The device mode structure that will contain the configuration data specified by the user.
InputDevMode: The device mode structure that contains the configuration data used to initialize the controls of the printer-configuration dialog box.

If the DocumentProperties function with these parameters is successful, the return value of AdvancedDocumentProperties is 1. Otherwise, the return value is zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

This function can only display the printer-configuration dialog box so a user can configure it. For more control, use DocumentProperties.
See also:

- 153.9.5 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as window = nil) as Integer 19798

153.9.5 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as window = nil) as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a printer-configuration dialog box for the specified printer, allowing the user to configure that printer.
Notes: This function is a special case of the DocumentProperties function.

parent: The parent window of the printer-configuration dialog box.

OutputDevMode: The device mode structure that will contain the configuration data specified by the user.
InputDevMode: The device mode structure that contains the configuration data used to initialize the controls of the printer-configuration dialog box.

If the DocumentProperties function with these parameters is successful, the return value of AdvancedDocumentProperties is 1. Otherwise, the return value is zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

This function can only display the printer-configuration dialog box so a user can configure it. For more control, use DocumentProperties.

See also:

- 153.9.4 AdvancedDocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, parent as DesktopWindow) as integer 19797

153.9.6 AllJobs as WindowsPrinterJobMBS()

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all jobs for the printer.
Example:

```
Var w as new WindowsPrinterMBS( WindowsPrinterMBS.GetDefaultPrinter)
Var jobs() as WindowsPrinterJobMBS = w.AllJobs
MsgBox str(UBound(jobs)+1)+" jobs"
```

Notes: PrinterName property must be set, so the function knows which printer.

153.9.7 CanPrinterPassThroughPostScript as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this printer can pass through postscript data.
Notes: Returns true for Postscript printers and false for other printers.

For more information on this function, visit this website:
http://msdn.microsoft.com/en-us/library/dd162831(v=VS.85).aspx

153.9.8 ChangePrinterSettings(value as WindowsDeviceModeMBS, Mode as Integer=2) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Changes printer settings.
Notes: This function opens the printer, queries current settings using GetPrinter, applies all your changes, calls DocumentProperties to verify those settings are valid for the printer and uses SetPrinter to apply the changes.
To indicate which fiels in the WindowsDeviceModeMBS object are set by you, use the fields integer value with a combination of the DM_* constants.
Returns true on success and false on failure.

Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd144911(VS.85).aspx

For more information on the SetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd145082(VS.85).aspx

For more information on the DocumentProperties function, check this website:
http://msdn.microsoft.com/en-us/library/dd183576(VS.85).aspx

Even if you change printer settings, other parts of the application, e.g. Xojo framework may not care.

153.9.9 ConfigurePort(name as string = """, parent as window = nil, PortName as string = """) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays the port-configuration dialog box for a port on the specified server.
Notes: Name: The name of the server on which the specified port exists. If this parameter is "", the port is local.
parent: The parent window of the port-configuration dialog box.
PortName: The name of the port to be configured.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

Before calling the ConfigurePort function, an application should call the EnumPorts function to determine valid port names.
See also:

- 153.9.10 ConfigurePort(name as string, parent as DesktopWindow, PortName as string) as boolean 19800

153.9.10 ConfigurePort(name as string, parent as DesktopWindow, PortName as string) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays the port-configuration dialog box for a port on the specified server.

Notes: Name: The name of the server on which the specified port exists. If this parameter is "", the port is local.
parent: The parent window of the port-configuration dialog box.
PortName: The name of the port to be configured.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

Before calling the ConfigurePort function, an application should call the EnumPorts function to determine valid port names.
See also:

- 153.9.9 ConfigurePort(name as string = "", parent as window = nil, PortName as string = "") as boolean 19800

153.9.11 ConnectToPrinterDialog(parent as DesktopWindow) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that lets users browse and connect to printers on a network.
Notes: If the user selects a printer, the function attempts to create a connection to it; if a suitable driver is not installed on the server, the user is given the option of creating a printer locally.

parent: Specifies the parent window of the dialog box.

If the function succeeds and the user selects a printer, this object points to the new printer and return value is true.
If the function fails, or the user cancels the dialog box without selecting a printer, the return value is true.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The ConnectToPrinterDialog function attempts to create a connection to the selected printer. However, if the server on which the printer resides does not have a suitable driver installed, the function offers the user the option of creating a printer locally.

An application should call DeletePrinter to delete a local printer. An application should call DeletePrinterConnection to delete a connection to a printer.
See also:

- 153.9.12 ConnectToPrinterDialog(parent as window = nil) as boolean 19802

153.9.12 ConnectToPrinterDialog(parent as window = nil) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that lets users browse and connect to printers on a network.
Notes: If the user selects a printer, the function attempts to create a connection to it; if a suitable driver is not installed on the server, the user is given the option of creating a printer locally.

parent: Specifies the parent window of the dialog box.

If the function succeeds and the user selects a printer, this object points to the new printer and return value is true.
If the function fails, or the user cancels the dialog box without selecting a printer, the return value is true.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The ConnectToPrinterDialog function attempts to create a connection to the selected printer. However, if the server on which the printer resides does not have a suitable driver installed, the function offers the user the option of creating a printer locally.

An application should call DeletePrinter to delete a local printer. An application should call DeletePrinterConnection to delete a connection to a printer.
See also:

- 153.9.11 ConnectToPrinterDialog(parent as DesktopWindow) as boolean 19801

153.9.13 Constructor(PrinterName as string, admin as boolean = false)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer so you can operate on it.
Notes: Admin: whether you want to get permissions to administrate.
Raises exception if printer can't be opened. Use OpenPrinter function to avoid exception.

153.9.14 DeleteForm(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DeleteForm function removes a form name from the list of supported forms.
Notes: name: The form name to be removed.

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

DeleteForm can only delete form names that were added by using the AddForm function.

153.9.15 DeleteJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Delete the print job.
Notes: Returns true on success and false on failure.

153.9.16 DeletePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the specified printer object.
Notes: Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

If there are print jobs remaining to be processed for the specified printer, DeletePrinter marks the printer for pending deletion, and then deletes it when all the print jobs have been printed. No print jobs can be added to a printer that is marked for pending deletion.
A printer marked for pending deletion cannot be held, but its print jobs can be held, resumed, and restarted.
If the printer is held and there are jobs for the printer, DeletePrinter fails with ERROR_ACCESS_DENIED.

Lasterror is set.

153.9.17 DeletePrinterConnection(name as string) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes a connection to a printer that was established by a call to AddPrinterConnection or ConnectToPrinterDialog.
Notes: name: The name of the printer connection to delete.
Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

The DeletePrinterConnection function does not delete any printer driver files that were copied to the server to which the printer is attached.

153.9.18 DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean = false, parent as window = nil) as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The DocumentProperties function retrieves or modifies printer initialization information or displays a printer-configuration property sheet for the specified printer.
Example:

```
// get default printer
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(WindowsPrinterMBS.GetDefaultPrinter)

// ask for printer settings
Var s as new WindowsDeviceModeMBS
Var n as Integer = p.DocumentProperties(nil, s, true, window1)
```

Notes: Printername property must be set.

parent: The parent window of the printer-configuration property sheet. Can be nil.
Prompt: Whether to show dialog.

OutputDevMode: Devmode variable that receives the printer configuration data specified by the user.

InputDevMode: Optional input data which the operating system uses to initialize the property sheet controls.
Prompt: Whether the function presents the printer driver's Print Setup property sheet and then changes the settings in the printer's DeviceMode data structure to those values specified by the user.

If you provide object for InputDevMode, the function will read settings from there. If you don't pass an object (nil) or you pass incomplete settings, default settings are used to complete.
If prompt is true, the dialog is shown and user can change settings.
On the end, the current new data is stored in OutputDevMode where you can find it.

If the function displays the property sheet, the return value is either IDOK (1) or IDCANCEL (2), depending on which button the user selects.
If the function does not display the property sheet and is successful, the return value is IDOK (1).
If the function fails, the return value is less than zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation-factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

- 153.9.19 DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean, parent as DesktopWindow) as integer 19805

153.9.19 DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean, parent as DesktopWindow) as integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The DocumentProperties function retrieves or modifies printer initialization information or displays a printer-configuration property sheet for the specified printer.
Example:

```
// get default printer
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(WindowsPrinterMBS.GetDefaultPrinter)

// ask for printer settings
Var s as new WindowsDeviceModeMBS
Var n as Integer = p.DocumentProperties(nil, s, true, window1)
```

Notes: Printername property must be set.

parent: The parent window of the printer-configuration property sheet. Can be nil.
Prompt: Whether to show dialog.

OutputDevMode: Devmode variable that receives the printer configuration data specified by the user.
InputDevMode: Optional input data which the operating system uses to initialize the property sheet controls.
Prompt: Whether the function presents the printer driver's Print Setup property sheet and then changes the settings in the printer's DeviceMode data structure to those values specified by the user.

If you provide object for InputDevMode, the function will read settings from there. If you don't pass an object (nil) or you pass incomplete settings, default settings are used to complete.
If prompt is true, the dialog is shown and user can change settings.
On the end, the current new data is stored in OutputDevMode where you can find it.

If the function displays the property sheet, the return value is either IDOK (1) or IDCANCEL (2), depending on which button the user selects.
If the function does not display the property sheet and is successful, the return value is IDOK (1).
If the function fails, the return value is less than zero.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation-factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

- 153.9.18 DocumentProperties(InputDevMode as WindowsDeviceModeMBS, byref OutputDevMode as WindowsDeviceModeMBS, Prompt as boolean = false, parent as window = nil) as Integer 19804

153.9.20 GetDefaultPrinter as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetDefaultPrinter function retrieves the printer name of the default printer for the current user on the local computer.
Example:

msgbox WindowsPrinterMBS.GetDefaultPrinter

Notes: For more details on the GetDefaultPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd144876(VS.85).aspx

Returns an empty string on any error.

153.9.21 GetForm(name as string) as WindowsPageFormatMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetForm function retrieves information about a specified form.
Example:

```
// query default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

// get a page format
Var f as WindowsPageFormatMBS = w.GetForm("Letter")

// and show details
MsgBox f.DisplayName+" "+str(F.SizeWidth/10000,"0.0")+" x "+str(f.SizeHeight/10000,"0.0")
```

Notes: name: The string that specifies the name of the form. To get the names of the forms supported by the printer, call the GetPrinterFormats function.

On failure returns nil, on success the form details.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

If the caller is remote, and the Form Mode is 2, the StringType value of the returned WindowsPageFormatMBS will always be STRING_LANGPAIR.

153.9.22 GetJob(JobID as Integer) as WindowsPrinterJobMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Query job with given ID from printer.
Notes: Returns nil on any error.
PrinterName property must be set, so the function knows which printer.

153.9.23 GetPrinterFormats as WindowsPageFormatMBS()

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the page formats supported by this printer.
Notes: On failure the array is empty.

This function uses the EnumForms for which you can find more information on this website:
http://msdn.microsoft.com/en-us/library/dd162624(v=VS.85).aspx

153.9.24 GetPrinterSettings(Mode as Integer=2) as WindowsDeviceModeMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries printer settings.
Example:

```
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)
Var dm as WindowsDeviceModeMBS = w.GetPrinterSettings
```

Notes: Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd144911(VS.85).aspx

153.9.25 GetPrinterTechnology as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the printer technology.
Example:

```
Var w as new WindowsPrinterMBS("my printer")
msgbox w.GetPrinterTechnology
```

Notes: Opens the printer, queries the print technology and returns that string.
For postscript printers the string should contain the word "postscript".
Returns an empty string on any error.

For details on this function, check the following website:
http://msdn.microsoft.com/en-us/library/dd144931(VS.85).aspx

153.9.26 OpenPrinter(PrinterName as string, admin as boolean = false) as WindowsPrinterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens the printer so you can operate on it.
Notes: Admin: whether you want to get permissions to administrate.
Returns nil on any error.

153.9.27 PauseJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pause the print job.
Notes: Returns true on success and false on failure.

153.9.28 PausePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses the printer.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)

if p.PausePrinter then
MsgBox "OK"
else
MsgBox "Failed: "+p.LasterrorMessage+" "+str(p.Lasterror)
end if
```

Notes: Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

153.9.29 PrinterProperties(parent as DesktopWindow) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The PrinterProperties function displays a printer-properties property sheet for the specified printer.
Example:

```
// get default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

// open properties dialog
if w.PrinterProperties(window1) then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Returns true on success (dialog shows) or false on error.
Parent is the parent window for the new dialog. Can be nil.
See also:

- 153.9.30 PrinterProperties(parent as window = nil) as boolean 19810

153.9.30 PrinterProperties(parent as window = nil) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop only.

Function: The PrinterProperties function displays a printer-properties property sheet for the specified printer.
Example:

```
// get default printer
Var w as new WindowsPrinterMBS(WindowsPrinterMBS.GetDefaultPrinter)

// open properties dialog
if w.PrinterProperties(window1) then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: Returns true on success (dialog shows) or false on error.
Parent is the parent window for the new dialog. Can be nil.
See also:

- 153.9.29 PrinterProperties(parent as DesktopWindow) as boolean 19809

153.9.31 PurgePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Purges the printer.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)

if p.PurgePrinter then
MsgBox "OK"
else
MsgBox "Failed: "+p.LasterrorMessage+" "+str(p.Lasterror)
end if
```

Notes: Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

153.9.32 ResumeJob(JobID as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resume a paused print job.
Notes: Returns true on success and false on failure.

153.9.33 ResumePrinter as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resumes the printer.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, true)

if p.ResumePrinter then
MsgBox "OK"
else
MsgBox "Failed: "+p.LasterrorMessage+" "+str(p.Lasterror)
end if
```

Notes: Requires application to be run by administrator and printer opened with admin option. Else you get error 5.
Returns true on success and false on failure.

153.9.34 SetDefaultPrinter(PrinterName as string) as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Changes the default printer to the given one.
Example:

```
call WindowsPrinterMBS.SetDefaultPrinter("My Printer")
```

Notes: Returns a Windows error code. (0 for success)

For details on the Windows SetDefaultPrinter method, check here:
http://msdn.microsoft.com/en-us/library/dd162971(VS.85).aspx

153.9.35 SetForm(name as string, form as WindowsPageFormatMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetForm function sets the form information for the specified printer.
Notes: name: The string that specifies the form name for which the form information is set.
Form: The form data. Mode property must be either 1 (older format) or 2 (newer format).

Returns true on success and false on failure.

This is a blocking or synchronous function and might not return immediately. How quickly this function returns depends on run-time factors such as network status, print server configuration, and printer driver implementation—factors that are difficult to predict when writing an application. Calling this function from a thread that manages interaction with the user interface could make the application appear to be unresponsive.

SetForm can be called multiple times for an existing WindowsPageFormatMBS, each call adding additional pairs of DisplayName and LangId values. All languages versions of the form will get the Size and ImageableArea values of the WindowsPageFormatMBS in the most recent call to SetForm.
If the caller is remote and the form's Mode is 2, the StringType value of the WindowsPageFormatMBS cannot be STRING_MUIDLL.

153.9.36 SetJob(JobID as Integer, job as WindowsPrinterJobMBS) as boolean

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets job parameters.
Example:

```
Var w as new WindowsPrinterMBS( WindowsPrinterMBS.GetDefaultPrinter, true)
```

```
Var jobs() as WindowsPrinterJobMBS = w.AllJobs
MsgBox str(UBound(jobs)+1)+" jobs"

// pick first
Var j as WindowsPrinterJobMBS = jobs(0)
j.Document = "Hello World"

// write back values
call w.SetJob(j.JobID, j)

// error?
if w.Lasterror<>0 then
MsgBox w.LasterrorMessage
end if
```

Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd162978(v=vs.85).aspx

153.9.37 SetPrinterSettings(value as WindowsDeviceModeMBS, Mode as Integer=2) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets printer settings.
Example:

```
// switch default printer to A5 landscape paper

Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name, false)
Var d as WindowsDeviceModeMBS = p.GetPrinterSettings(9)

if d = nil then
MsgBox p.LasterrorMessage
else
d.PaperSize = d.DMPAPER_A5
d.Fields = BitwiseOr(d.Fields, d.DM_PAPERSIZE)
d.Orientation = d.DMORIENT_LANDSCAPE
d.Fields = BitwiseOr(d.Fields, d.DM_ORIENTATION)

if p.SetPrinterSettings(d, 9) then
MsgBox "OK"
else
MsgBox "Failed: "+p.LasterrorMessage
end if
end if
```

Notes: Mode can be 2 (general printer information), 8 (global settings) or 9 (user settings).

For more information on the GetPrinter function, check this website:
http://msdn.microsoft.com/en-us/library/dd145082(v=vs.85).aspx

153.9.38 Properties

153.9.39 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle to the printer.
Notes: (Read and Write property)

153.9.40 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last windows error code.
Notes: (Read and Write property)

153.9.41 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text message for the last error code.
Notes: (Read and Write property)

153.9.42 PrinterName as String

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the open printer in this object.
Example:

```
Var name as string = WindowsPrinterMBS.GetDefaultPrinter
Var p as WindowsPrinterMBS = WindowsPrinterMBS.OpenPrinter(name)
MsgBox p.PrinterName
```

Notes: (Read and Write property)

Chapter 154

Process

154.1 class Application

154.1.1 class Application

Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extends the Application class inside Xojo.

154.1.2 Methods

154.1.3 ApplicationCreatorCodeMBS as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns the Creator Code of the application.
Example:

msgbox "Hi. This application has the creator code "+app.ApplicationCreatorCodeMBS

Notes: Only useful on Mac OS.
If you run your app inside the Xojo IDE it will return "RBv2" which is Xojo's Creator code sind Xojo 2.0.
Blog Entries

- MBS Xojo Plugins, version 19.4pr1

154.1.4 ApplicationFileMBS as folderitem

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use ExecutableFile instead.
Function: Gives a folderitem to the applications file.
Example:

msgbox "Hi. The file of this application is named "+app.ApplicationFileMBS.name

Notes: Inside Xojo points to the Xojo application.

This item may go in the future. Please use app.executablefile in new Xojo versions.
Blog Entries

- MBS Xojo Plugins, version 19.4pr1

Xojo Developer Magazine

- 3.1, page 42: Register Document File Types, Fill and Query the Registry by Christian Schmitz

154.1.5 ApplicationNameMBS as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the application.
Example:

msgbox "Hi. This application is named "+app.ApplicationNameMBS

Notes: This may not be the exact same name than the filename.

154.1.6 ArgumentsMBS as String()

MBS Util Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries arguments of process.
Notes: Returns nil in case of any error (low memory).
First entry in result is path to current app.
Other entries are parameters, without any quotes.

154.1.7 BundleFolderMBS as folderitem

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the bundle's mail folder.

154.1.8 BundleLocalizedStringMBS(key as string) as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key from the default table.
Notes: A short version for BundleLocalizedString which uses the default table.
See also:

- 154.1.9 BundleLocalizedStringMBS(key as string,fromtable as string) as string 19819

154.1.9 BundleLocalizedStringMBS(key as string,fromtable as string) as string

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key and table.
Example:

```
// You may make yourself a function to look up for the key and return
// This function was not tested in a real application. May contain a bug.

function Localize(key as string, default as string) as string
Var s as string

s=app.BundleLocalizedStringMBS(key)
if s="" then
s=default // For Mac OS Classic and Windows
elseif s=key then // returns key for not localized items
msgbox "For developer: the key """+key+""" was not localized for any language."
end if

return s
end sub

// use like this
FileOpen.text=Localize("FileOpenLabel", "Open...")
```

Notes: The table parameter is optional to specify which ".strings"-file to use.
without table or table="" the "Localizable.strings" file is used by Mac OS X.

Returns "" (empty string) on Mac OS Classic or Windows.
See also:

- 154.1.8 BundleLocalizedStringMBS(key as string) as string 19819

154.1.10 BundleResourceFolderItemLocalizedMBS(ResourceName as string, ResourceType as string, SubDirectory as string) as folderitem

MBS Util Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: Searches inside the application bundle for a file.
Example:

```
Var f as FolderItem
f=app.BundleResourceFolderItemLocalizedMBS("logo","jpg","")
MsgBox f.NativePath
```

Notes: ResourceName is the filename of the resource file.
ResourceType is the file extension.
SubDirectory is the name of the directory.
This function will take care for localization folders.

154.1.11 BundleResourceFolderMBS as folderitem

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the resource file inside the bundle.
Example:

```
Var f As FolderItem = App.BundleResourceFolderMBS

If f = Nil Then
MsgBox "Failed?"
Else
MsgBox f.NativePath
End If
```

154.1.12 HideMeMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Hides the current application.
Notes: Returns true if the current application was hidden.

154.1.13 HideOthersMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Hides all applications except the current one.
Notes: Returns true if the other applications were hidden.

154.1.14 LaunchTimeMBS as Double

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the the ticks value at launch time.
Example:

```
Var d as date

d=new date
d.totalSeconds=d.totalSeconds-(ticks-app.launchTimeMBS)/60

msgbox d.longdate+" "+d.longtime
```

Notes: This value must be converted to the secondsvalue like in the example.
-1 on Windows.
For Mac OS X see the DarwinResourceUsageMBS class.

154.1.15 MainBundleMBS as CFBundleMBS

MBS MacCF Plugin, Platform: macOS, Targets: Desktop only.

Function: If your application is a bundle, this function returns your own bundle.
Notes: Returns nil on any error.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

154.1.16 NSApplicationMBS as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the shared NSApplication object.
Notes: This method gives easy access to the NSApplicationMBS class.

The plugin makes sure that there is only one application object by returning the same object each time. Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

154.1.17 OverlayApplicationDockTileImageMBS(pic as CGImageMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop only.

Function: Adds a picture on top of the application dock title.
Example:

```
static n as Integer // global property
Var p as picture
Var m as picture
Var g as graphics
Var s as string
Var w,h,x as Integer

n=n+1 // add one
s=str(n)
m=New Picture(128,128,32)
p=New Picture(128,128,32)

g=p.graphics
g.textsize=24
w=g.stringwidth(s)
h=g.stringheight(s,0)
x=125-w-10
g.foreColor=rgb(255,0,0)
g.fillRoundRect x,10,10+w,10+h,20,20
g.foreColor=rgb(0,0,0)
g.drawstring s,x+5,15+g.textascent

g=m.graphics
g.foreColor=rgb(0,0,0)
g.fillRoundRect x,10,10+w,10+h,20,20

if app.OverlayApplicationDockTileImageMBS(CGCreateImageMBS(p,m)) then
end if
```

Notes: Changed in MBS Plugin 2.7 to use CGImages directly.
Added support for 64-bit in plugin version 16.0.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr2

154.1.18 ProcessTimeMBS as Double

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the current CPU time for the process.
Example:

```
msgbox "I got "+format(app.ProcessTimeMBS/100,"0.00")+" seconds CPU time till now."
```

Notes: On Mac OS X, the OS counts how much CPU time in given to the current process.
Returns -1 in case of an error.

You can do this function yourself if you like:

```
Var s as SoftDeclareMBS

s=new SoftDeclareMBS

if s.LoadLibrary("System.Framework") then
if s.LoadFunction("clock") then
if s.Call(0,nil) then
MsgBox "clock: "+str(s.Result)+chr(13)+"app.ProcessTime: "+str(app.ProcessTime)
end if
end if
end if
```

You may need to add Error Checking code.

154.1.19 RestoreApplicationDockTileImageMBS as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop only.

Function: Restores the application dock tile image.
Example:

```
if app.RestoreApplicationDockTileImageMBS then
// ok
end if
```

Notes: Added support for 64-bit in plugin version 16.0.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr2

154.1.20 SetApplicationDockTileImageMBS(pic as CGImageMBS) as boolean

MBS MacCG Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop only.

Function: Sets the application dock tile image.
Example:

```
Var p as CGImageMBS = CGImageMBS.CreateImage(LogoMBS(500))

if app.SetApplicationDockTileImageMBS(p) then
// ok
end if
```

Notes: Changed in MBS Plugin 2.7 to use CGImages directly.
Added support for 64-bit in plugin version 16.0.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.5pr2

154.1.21 Properties

154.1.22 FrontmostMBS as boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the application is frontmost.
Example:

```
app.frontmostmbs=True 'bring app to front
```

Notes: This property is for read and write. Writing to it brings the app to front.
Setting this property to false does nothing.

If you need to make some other application frontmost, you can use app.HideMeMBS or use the ProcessMBS class.

Implemented for Windows in version 19.2. When querying, we check if the front window belongs to our application. When setting the plugin builds a list of all FileMaker windows. Than we activate the top most of them and move all other windows in z order behind.
(Read and Write computed property)

154.2 module CallDelegateCrashSafeMBS

154.2.1 module CallDelegateCrashSafeMBS

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The module to call a delegate and catch a crash.
Example:

```
Try

System.DebugLog "Try the call..."

CallDelegateCrashSafeMBS AddressOf TestMethod

System.DebugLog "Call succeeded!"

Catch c As DelegateCrashExceptionMBS

System.DebugLog "Caught exception!"
System.DebugLog c.Message

End Try
```

Notes: We can catch the following conditions:

- Invalid pointer access
- Invalid instruction
- Floating point exception
- Wrong system call
- Broken pipe
- Bus error

We may crash ourselves on stack corruption and we print the stack trace to stderr for macOS and Linux for debugging.

If a crash is caught, there may be memory leaked as objects allocated in the called method are not freed. The call function can not be used recursively and only on one thread at the time.

154.2.2 Methods

154.2.3 CallDelegateCrashSafeMBS(m as DelegateCrashSafeMBS)

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calls a method that may crash.
Example:

```
Try

System.DebugLog "Try the call..."

CallDelegateCrashSafeMBS AddressOf TestMethod

System.DebugLog "Call succeeded!"

Catch c As DelegateCrashExceptionMBS

System.DebugLog "Caught exception!"
System.DebugLog c.Message

End Try
```

Notes: Raises DelegateCrashExceptionMBS if a crash happens.

The call function can not be used recursively and only on one thread at the time.

154.2.4 PrintBacktraceMBS

MBS Util Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Prints the stack trace.
Notes: Utility function to help debugging.

154.2.5 Properties

154.2.6 CallCounter as Integer

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of calls made.
Notes: (Read only property)

154.2.7 CrashCounter as Integer

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of crashes caught.
Notes: (Read only property)

154.2.8 Delegates

154.2.9 DelegateCrashSafeMBS()

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The delegate definition for a simple method to call.

154.3 module CallDelegatesMBS

154.3.1 module CallDelegatesMBS

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for the call delegate methods.
Notes: Only supported on Xojo 2013r1 and newer.
Blog Entries

154.3.2 Methods

154.3.3 CallDelegateOnMainThreadMBS(m as _delegateMBS)

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a delegate on the main thread.
Example:

```
CallDelegateOnMainThreadMBS AddressOf testString, "Hello"
CallDelegateOnMainThreadMBS AddressOf testNumbers, 5, 6
CallDelegateOnMainThreadMBS AddressOf TestNoParameters
CallDelegateOnMainThreadMBS AddressOf Test, "4th call", 4
```

Notes: We call the delegate on the main thread later with passing a parameter
Our plugin supports various combinations of up to 2 parameters of type string, variant, boolean, double, integer and object.
If you need more, please contact us.
Only supported on Xojo 2013r1 and newer.

If the method you call has optional parameters, you must pass all values or Xojo will throw a compile error.

154.3.4 CallDelegateOnPreemptiveThreadMBS(m as _delegateMBS) as Boolean

MBS Util Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Calls a delegate on a preemptive thread.
Notes: Experimental function to play with preemptive-threads in Xojo apps.

Some rules:

- No objects, no strings, no arrays
- Use Ptr, not Memoryblocks
- Crashes in debugger, so only use in built app
- Use #Pragma BackgroundTasks False
- Use #Pragma BreakOnExceptions False
- Use #Pragma StackOverflowChecking False
- Use #Pragma NilObjectChecking False
- No exceptions
- Delegate must be stored in global variable to avoid it getting freed early.
- You can pass up to one ptr as data parameter.
- Declares may work, but should be pre-used to make sure they don't raise an exception and are loaded.

uses thread pool on iOS, macOS and Windows. Otherwise regular threads.
See also:

- 154.3.5 CallDelegateOnPreemptiveThreadMBS(m as _delegatePtrMBS, data as Ptr) as Boolean 19829

154.3.5 CallDelegateOnPreemptiveThreadMBS(m as _delegatePtrMBS, data as Ptr) as Boolean

MBS Util Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a delegate on a preemptive thread and passes a ptr.
Notes: Experimental function to play with preemptive-threads in Xojo apps.

Some rules:

- No objects, no strings, no arrays
- Use Ptr, not Memoryblocks
- Crashes in debugger, so only use in built app

- Use #Pragma BackgroundTasks False
- Use #Pragma BreakOnExceptions False
- Use #Pragma StackOverflowChecking False
- Use #Pragma NilObjectChecking False
- No exceptions
- Delegate must be stored in global variable to avoid it getting freed early.
- You can pass up to one ptr as data parameter.
- Declares may work, but should be pre-used to make sure they don't raise an exception and are loaded.

uses thread pool on iOS, macOS and Windows. Otherwise regular threads.
See also:

- 154.3.4 CallDelegateOnPreemptiveThreadMBS(m as _delegateMBS) as Boolean 19828

154.4 Globals

154.4.1 CallMethodLaterMBS(target as object, name as string, afterDelay as Double) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread after the given delay in seconds.
Example:

```
if CallMethodLaterMBS(window1, "Test", 5.0) then
msgbox "OK"
else
msgbox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with no parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.

- 154.4.3 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant) as boolean 19832
- 154.4.4 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant, value3 as Variant) as boolean 19833

154.4.2 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread after the given delay in seconds.
Example:

```
if CallMethodLaterMBS(window1, "Test", 4.0, "Hello") then
msgbox "OK"
```

```
else
msgbox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with one variant parameter and no return values.

The method will be called later (Asyncronously) on the main thread after the given delay in seconds. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.
The time given is just a roughly suggestions. Actual time on the method call depends on how busy your application is.

154.4.3 CallMethodLaterMBS(target as object, name as string, afterDelay as Double, value1 as Variant, value2 as Variant) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread after the given delay in seconds.
Example:

```
if CallMethodLaterMBS(window1, "Test", 3.0, "Hello", "World") then
msgbox "OK"
else
msgbox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with two variant parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread after the given delay in seconds.

Returns true on success and false on failure.

154.4.9 CallMethodOnMainThreadMBS(target as object, name as string) as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a method on the target object on the main thread.
Example:

```
if CallMethodOnMainThreadMBS(window1, "Test") then
msgbox "OK"
else
msgbox "Failed"
end if
```

Notes: The method must be declared on the given class for the target object with no parameters and no return values.

The method will be called later (Asyncronously) on the main thread. Useful for performing non thread safe stuff like GUI functions on the main thread.

Returns true on success and false on failure.
Deprecated, please use CallDelegatesMBS.CallDelegateOnMainThreadMBS instead.

154.4.13 GetDarwinVMStatisticsMBS as DarwinVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: Returns information about the current memory status on Mac OS X.
Example:

```
Var d as DarwinVMStatisticsMBS

d=GetDarwinVMStatisticsMBS

if d=nil then
msgBox "No Darwin running :-("
quit
else
Var lines(-1) as string

lines.Append format(d.pageins,"0")+" pageins"
lines.Append format(d.pageouts,"0")+" pageouts"
lines.Append format(d.pagesize,"0")+" pagesize"
lines.Append format(d.freepages,"0")+" freepages"
```

```
lines.Append format(d.activepages,"0")+" activepages"
lines.Append format(d.inactivepages,"0")+" inactivepages"
lines.Append format(d.wiredpages,"0")+" wiredpages"
lines.Append format(d.zerofillpages,"0")+" zerofillpages"
lines.Append format(d.reactivations,"0")+" reactivations"
lines.Append format(d.faults,"0")+" faults"
lines.Append format(d.cowfaults,"0")+" cowfaults"
lines.Append format(d.lookups,"0")+" lookups"
lines.Append format(d.hits,"0")+" hits"

MsgBox Join(lines,EndOfLine)
end if
```

154.4.14 GetDarwinResourceUsageMBS as DarwinResourceUsageMBS

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Get information about resource utilization.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralMaxResidentSetSize)
```

Notes: Returns nil on any error.
For more information type "man getrusage" in the Mac OS X Terminal.

154.4.15 SetThreadNameMBS(name as string)

MBS Util Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the name of current thread.
Example:

```
SetThreadNameMBS "SQL Query Thread"
```

Notes: This is useful to see thread name in crash reports or sample reports.
Blog Entries

- MBS Xojo plug-ins in version 16.0
- Thread Names
- MBS Xojo / Real Studio Plugins, version 15.5pr2

154.4.16 CountProcessesMBS as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Counts how many processes are running.
Notes: Short for this function:

```
function CountProcesses as Integer
Var n as Integer
Var p as ProcessMBS

p=new ProcessMBS
p.getfirstProcess
n=1
while p.getnextProcess
n=n+1
wend

return n
end if
```

154.4.17 GetWindowsVMStatisticsMBS as WindowsVMStatisticsMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns information about the current memory status on Windows.
Example:

```
Var w as WindowsVMStatisticsMBS

w=GetWindowsVMStatisticsMBS
if w<>nil then

list.AddRow format(w.pagesize,"0")
list.AddRow format(w.memoryLoad,"0")
list.AddRow format(w.availablePageFileMemory,"0")
list.AddRow format(w.availablePhysicalMemory,"0")
list.AddRow format(w.availableVirtualMemory,"0")
list.AddRow format(w.totalPageFileMemory,"0")
list.AddRow format(w.totalPhysicalMemory,"0")
list.AddRow format(w.totalVirtualMemory,"0")

else

msgBox "No Windows memory statistics..."
quit
```

```
end if
```

Notes: See also WindowsProcessStatisticsMBS for the application.

154.5 class ConsoleApplication

154.5.1 class ConsoleApplication

Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Console only.

Function: Extends the ConsoleApplication class inside Xojo.

154.5.2 Methods

154.5.3 ArgumentsMBS as String()

MBS Util Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Console only.

Function: Queries arguments of process.
Notes: Returns nil in case of any error (low memory).
First entry in result is path to current app.
Other entries are parameters, without any quotes.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

154.5.4 LaunchTimeMBS as double

MBS Util Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: Returns the the ticks value at launch time.
Example:

```
Var d as date

d=new date
d.totalSeconds=d.totalSeconds-(ticks-app.launchTimeMBS)/60

msgbox d.longdate+" "+d.longtime
```

Notes: This value must be converted to the secondsvalue like in the example.
-1 on Windows.
For Mac OS X see the DarwinResourceUsageMBS class.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

154.5.5 MainBundleMBS as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: If your application is a bundle, this function returns your own bundle.
Notes: Returns nil on any error.
For console application, returns the bundle referencing the console app file.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

154.5.6 NSApplicationMBS as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: Returns the shared NSApplication object.
Notes: This method gives easy access to the NSApplicationMBS class.

The plugin makes sure that there is only one application object by returning the same object each time.
Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

154.5.7 ProcessTimeMBS as double

MBS Util Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Console only.

Function: Returns the current CPU time for the process.
Example:

```
msgbox "I got "+format(app.ProcessTimeMBS/100,"0.00")+" seconds CPU time till now."
```

Notes: On Mac OS X, the OS counts how much CPU time in given to the current process.
On Mac OS 9 you can get this information for any process using the ProcessMBS class.

Returns -1 in case of an error.

You can do this function yourself if you like:

```
Var s as SoftDeclareMBS

s=new SoftDeclareMBS

if s.LoadLibrary("System.Framework") then
if s.LoadFunction("clock") then
if s.Call(0,nil) then
MsgBox "clock: "+str(s.Result)+chr(13)+"app.ProcessTime: "+str(app.ProcessTime)
end if
end if
end if
```

You may need to add Error Checking code.

Works for Console, Desktop and Web projects. Version 19.4 declares this method for ConsoleApplication and Application class.

154.6 class DarwinGroupListMBS

154.6.1 class DarwinGroupListMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The list of Groups on a Mac OS X system.
Example:

```
Var l as new DarwinGroupListMBS
MsgBox str(l.Count)+" groups"
```

154.6.2 Methods

154.6.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var l as new DarwinGroupListMBS
MsgBox str(l.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.6.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var l as new DarwinGroupListMBS
MsgBox "CurrentGroupID: "+str(l.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

154.6.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var l as new DarwinGroupListMBS
MsgBox "CurrentUserID: "+str(l.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.6.6 Group(index as Integer) as DarwinGroupMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Returns the Group with the given index.
Example:

```
Var l as new DarwinGroupListMBS
Var c as Integer = l.Count-1
Var names(-1) as string
for i as Integer = 0 to c
Var g as DarwinGroupMBS = l.Group(i)
names.Append g.Name
next
MsgBox Join(names,EndOfLine)
```

154.6.7 Properties

154.6.8 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The number of Groups on this Mac OS X system.
Example:

```
Var l as new DarwinGroupListMBS
MsgBox str(l.Count)+" groups"
```

Notes: (Read only property)

154.7 class DarwinGroupMBS

154.7.1 class DarwinGroupMBS

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: A class with information about a Group on Mac OS X.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox g.Name
```

Blog Entries

- MBS Xojo Plugins, version 19.4pr1

154.7.2 Methods

154.7.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var g as new DarwinGroupMBS
MsgBox "CurrentEffectiveUserID: "+str(G.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.7.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var g as new DarwinGroupMBS
MsgBox "CurrentGroupID: "+str(G.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

154.7.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var g as new DarwinGroupMBS
MsgBox "CurrentUserID: "+str(G.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.7.6 LoadGroupByID(Groupid as Integer)

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the Group with the given ID.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox g.Name
```

154.7.7 LoadGroupByName(name as string)

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the given Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByName "staff"
MsgBox g.Name
```

154.7.8 UserName(index as Integer) as string

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The Group ID of this Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID

Var c as Integer = g.UserCount-1
for i as Integer = 0 to c
MsgBox g.UserName(i)
next
```

154.7.9 Properties

154.7.10 GroupID as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The group ID of the Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox "GroupID: "+str(G.GroupID)
```

Notes: (Read only property)

154.7.11 Name as string

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The name of the Group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox "Name: "+g.Name
```

Notes: (Read only property)

154.7.12 Password as string

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The password for this group.
Notes: (Read only property)

154.7.13 Ready as Boolean

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: whether the values in this class were filled correctly.
Notes: (Read only property)

154.7.14 UserCount as Integer

MBS MacCF Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: The number of users in this group.
Example:

```
Var g as new DarwinGroupMBS
g.LoadGroupByID g.CurrentGroupID
MsgBox "UserCount: "+str(G.UserCount)
```

Notes: (Read only property)

154.8 class DarwinHostVMStatisticsMBS

154.8.1 class DarwinHostVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Queries memory host statistics for macOS and iOS.
Example:

```
Var d As New DarwinHostVMStatisticsMBS

Var FreeMB As Integer = d.FreeCount * d.Pagesize / 1024 / 1024
Var ActiveMB As Integer = d.ActiveCount * d.Pagesize / 1024 / 1024
Var InactiveMB As Integer = d.InactiveCount * d.Pagesize / 1024 / 1024
Var WiredMB As Integer = d.WireCount * d.Pagesize / 1024 / 1024
Var CompressedMB As Integer = d.CompressorPageCount * d.Pagesize / 1024 / 1024

Var Sum As Integer = FreeMB + ActiveMB + WiredMB + InactiveMB + CompressedMB

MessageBox _
"Free: " + FreeMB.ToString+EndOfLine+_
"Active: " + ActiveMB.ToString+EndOfLine+_
"Inactive: " + InactiveMB.ToString+EndOfLine+_
"Wired: " + WiredMB.ToString+EndOfLine+_
"Compressed: " + CompressedMB.ToString+EndOfLine+_
"Total: "+Sum.ToString
```

- News from the MBS Xojo Plugins Version 24.3
- MonkeyBread Software Releases the MBS Xojo Plugins in version 24.3
- MBS Xojo Plugins, version 24.3pr2

154.8.2 Methods

154.8.3 Constructor

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: The constructor.
Notes: Fills in the values or raises an exception.

154.8.4 Properties

154.8.5 ActiveCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages active
Notes: (Read only property)

154.8.6 Compressions as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages compressed
Notes: (Read only property)

154.8.7 CompressorPageCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages used by the compressed pager to hold all the compressed data
Notes: (Read only property)

154.8.8 CopyOnWriteFaults as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of copy-on-writes.
Notes: If you allocate memory, e.g. for a memoryblock, you get zero fill pages. Which means you get virtual memory, not physical. As soon as you touch a zero fill memory page, it triggers a copy on write to make a private copy for you.
(Read only property)

154.8.9 Decompressions as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages decompressed
Notes: (Read only property)

154.8.10 ExternalPageCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages that are file-backed (non-swap)
Notes: For example application code is paged in.
(Read only property)

154.8.11 Faults as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of faults
Notes: (Read only property)

154.8.12 FreeCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages free.
Example:

```
Var d As New DarwinHostVMStatisticsMBS

MessageBox str(d.FreeCount * d.Pagesize, "0")+" bytes free"
```

Notes: (Read only property)

154.8.13 Hits as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: object cache hits
Notes: (Read only property)

154.8.14 InactiveCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages inactive.
Notes: (Read only property)

154.8.15 InternalPageCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages that are anonymous.
Notes: (Read only property)

154.8.16 Lookups as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: object cache lookups
Notes: (Read only property)

154.8.17 PageIns as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pageins
Notes: (Read only property)

154.8.18 PageOuts as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pageouts
Notes: (Read only property)

154.8.19 Pagesize as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: The size of a page in bytes.
Notes: Page size is different for Intel vs. Apple Silicon.
(Read only property)

154.8.20 PurgeableCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages purgeable.
Notes: (Read only property)

154.8.21 Purges as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages purged.
Notes: (Read only property)

154.8.22 Reactivations as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages reactivated
Notes: (Read only property)

154.8.23 SpeculativeCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages speculative read.
Notes: Speculative pages are already accounted for in FreeCount, so SpeculativeCount is the number of "free" pages that are used to hold data that was read speculatively from disk but haven't actually been used by anyone so far.
(Read only property)

154.8.24 SwapIns as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages swapped in (via compression segments)
Notes: (Read only property)

154.8.25 SwapOuts as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages swapped out (via compression segments)
Notes: (Read only property)

154.8.26 ThrottledCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages throttled
Notes: (Read only property)

154.8.27 TotalUncompressedPagesInCompressor as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages (uncompressed) held within the compressor.
Notes: (Read only property)

154.8.28 WireCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of pages wired down.
Notes: (Read only property)

154.8.29 ZeroFillCount as Integer

MBS MacCF Plugin, Plugin Version: 24.3, Platforms: macOS, iOS, Targets: All.

Function: Number of zero fill pages
Notes: (Read only property)

154.9 class DarwinResourceUsageMBS

154.9.1 class DarwinResourceUsageMBS

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: A class for information about resource utilization.
Example:

Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralMaxResidentSetSize)

Notes: For more information type "man getrusage" in the Mac OS X Terminal.
Blog Entries

- MBS Xojo Plugins, version 17.1pr2
- MBS Xojo / Real Studio Plugins, version 15.3pr4
- MBS REALbasic Plugins, version 10.6pr9
- MBS REALbasic Plugins, version 10.6pr2

154.9.2 Properties

154.9.3 BlockInputOperations as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of block input operations.
Example:

Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.BlockInputOperations)

Notes: (Read only property)

154.9.4 BlockOutputOperations as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of block output operations.
Example:

Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.BlockOutputOperations)

Notes: (Read only property)

154.9.5 IntegralMaxResidentSetSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral max resident set size.
Example:

```
Var u as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
Var t as new DarwinTaskInfoMBS

MsgBox "Application Resident Size: "+str(t.ResidentSize)+EndOfLine+_
"Application Virtual Size: "+str(t.VirtualSize)+EndOfLine+_
"Application Integral Max Resident Size: "+str(u.IntegralMaxResidentSetSize)
```

Notes: Maximum memory usage of this app.
(Read only property)

154.9.6 IntegralSharedTextMemorySize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral shared text memory size.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralSharedTextMemorySize)
```

Notes: (Read only property)

154.9.7 IntegralUnsharedDataSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral unshared data size.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralUnsharedDataSize)
```

Notes: (Read only property)

154.9.8 IntegralUnsharedStackSize as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Integral unshared stack size.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.IntegralUnsharedStackSize)
```

Notes: (Read only property)

154.9.9 InvoluntaryContextSwitches as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of involuntary context switches.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.InvoluntaryContextSwitches)
```

Notes: (Read only property)

154.9.10 MessagesReceived as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of messages received.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.MessagesReceived)
```

Notes: (Read only property)

154.9.11 MessagesSent as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of messages sent.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.MessagesSent)
```

Notes: (Read only property)

154.9.12 PageFaults as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of page faults.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.PageFaults)
```

Notes: (Read only property)

154.9.13 PageReclaims as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of page reclaims.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.PageReclaims)
```

Notes: (Read only property)

154.9.14 SignalsReceived as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of signals received.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.SignalsReceived)
```

Notes: (Read only property)

154.9.15 Swaps as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of swaps.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.Swaps)
```

Notes: (Read only property)

154.9.16 SystemTimeUsed as Double

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Seconds of system time used.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.SystemTimeUsed)
```

Notes: (Read only property)

154.9.17 UserTimeUsed as Double

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Seconds of user time used.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.UserTimeUsed)
```

Notes: (Read only property)

154.9.18 VoluntaryContextSwitches as Int64

MBS MacCF Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Number of voluntary context switches.
Example:

```
Var d as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
MsgBox str(d.VoluntaryContextSwitches)
```

Notes: (Read only property)

154.10 class DarwinTaskInfoMBS

154.10.1 class DarwinTaskInfoMBS

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: A class for your applications memory/resource usage.
Example:

```
Var u as DarwinResourceUsageMBS = GetDarwinResourceUsageMBS
Var t as new DarwinTaskInfoMBS

MsgBox "Application Resident Size: "+str(t.ResidentSize)+EndOfLine+_
"Application Virtual Size: "+str(t.VirtualSize)+EndOfLine+_
"Application Integral Max Resident Size: "+str(u.IntegralMaxResidentSetSize)
```

Xojo Developer Magazine

- 3.6, page 6: News

154.10.2 Methods

154.10.3 Update as boolean

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Updates the values and returns true on success.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.UserTime)
call d.Update
MsgBox str(d.UserTime)
```

Notes: The constructor updates the values on creation of the object.

154.10.4 Properties

154.10.5 ContextSwitches as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of context switches.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.ContextSwitches)
```

Notes: (Read and Write property)

154.10.6 COWFaults as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of copy-on-write faults.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.COWFaults)
```

Notes: (Read and Write property)

154.10.7 Faults as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of page faults.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.Faults)
```

Notes: (Read and Write property)

154.10.8 MessagesReceived as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of messages received.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.MessagesReceived)
```

Notes: (Read and Write property)

154.10.9 MessagesSent as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of messages sent.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.MessagesSent)
```

Notes: (Read and Write property)

154.10.10 PageIns as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of actual pageins.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.PageIns)
```

Notes: (Read and Write property)

154.10.11 ResidentSize as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of resident pages.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS
MsgBox "This application uses "+Format(d.ResidentSize,"0")+" Bytes of physical memory."
```

Notes: (Read and Write property)

154.10.12 SuspendCount as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Suspend count for task.
Example:

```
Var d as new DarwinTaskInfoMBS
MsgBox str(d.SuspendCount)
```

Notes: (Read and Write property)

154.10.13 SystemCallsMach as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of mach system calls.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MsgBox "This application has done so far "+Format(d.SystemCallsMach,"0")+" system calls using the Mach Interface."
```

Notes: (Read and Write property)

154.10.14 SystemCallsUnix as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of unix system calls.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MsgBox "This application has done so far "+Format(d.SystemCallsUnix,"0")+" system calls using the Unix Interface."
```

Notes: (Read and Write property)

154.10.15 SystemTime as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Total system run time.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MsgBox "This application has used so far "+Format(d.SystemTime,"0")+" seconds of CPU time."
```

Notes: (Read and Write property)

154.10.16 UserTime as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Total user run time.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS

MsgBox "This application has used so far "+Format(d.UserTime,"0")+" seconds of CPU time."
```

Notes: (Read and Write property)

154.10.17 VirtualSize as Double

MBS MacCF Plugin, Plugin Version: 5.2, Platform: macOS, Targets: All.

Function: Number of virtual pages.
Example:

```
Var d as DarwinTaskInfoMBS

d=new DarwinTaskInfoMBS
MsgBox "This application uses "+Format(d.VirtualSize,"0")+" Bytes of the 4 GB address space."
```

Notes: (Read and Write property)

154.11 class DarwinUserListMBS

154.11.1 class DarwinUserListMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The list of users on a Mac OS X system.
Example:

```
// find the short user name
Var d as DarwinUserListMBS
Var u as string
Var p as DarwinUserMBS
Var uid,i,c as Integer

// requires MachO target
declare function getuid lib "System" () as Integer

uid=getuid

d=new DarwinUserListMBS

c=d.Count-1
for I=0 to c
p=d.User(i)
if p.UserID=uid then
MsgBox p.Name
end if
next
```

154.11.2 Methods

154.11.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var l as new DarwinUserListMBS
MsgBox "CurrentEffectiveUserID: "+str(l.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.11.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var l as new DarwinUserListMBS
MsgBox "CurrentGroupID: "+str(l.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

154.11.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var l as new DarwinUserListMBS
MsgBox "CurrentUserID: "+str(l.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.11.6 User(index as Integer) as DarwinUserMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Returns the user with the given index.
Example:

```
// find short user name
Var d as DarwinUserListMBS
Var u as string
Var p as DarwinUserMBS
Var uid,i,c as Integer

u=SystemInformationMBS.Username
d=new DarwinUserListMBS

c=d.Count-1
for I=0 to c
p=d.User(i)
```

```
if p.LongName=u then
MsgBox p.Name
end if
next
```

154.11.7 Properties

154.11.8 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The number of users on this Mac OS X system.
Example:

```
Var l as new DarwinUserListMBS
MsgBox "Number of users: "+str(l.Count)
```

Notes: (Read only property)

154.12 class DarwinUserMBS

154.12.1 class DarwinUserMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: A class with information about a user on Mac OS X.
Example:

```
Var l as new DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MsgBox l.Name+": "+l.LongName
```

154.12.2 Methods

154.12.3 CurrentEffectiveUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The effective user ID of the calling process.
Example:

```
Var l as new DarwinUserMBS
MsgBox str(l.CurrentEffectiveUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.12.4 CurrentGroupID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real group ID of the calling process.
Example:

```
Var l as new DarwinUserMBS
MsgBox str(l.CurrentGroupID)
```

Notes: The real group ID is specified at login time.

154.12.5 CurrentUserID as Integer

MBS MacCF Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The real user ID of the calling process.
Example:

```
Var l as new DarwinUserMBS
MsgBox str(l.CurrentUserID)
```

Notes: The real user ID is that of the user who has invoked the program. As the effective user ID gives the process additional permissions during execution of 'set-user-ID' mode processes, getuid() is used to determine the real-user-id of the calling process.

154.12.6 LoadUserByID(userid as Integer)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the user with the given ID.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByID l.CurrentUserID

MsgBox l.Name
```

154.12.7 LoadUserByName(name as string)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: Fills the properties of this class with the values for the given user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByName "cs"

MsgBox l.LongName
```

154.12.8 Properties

154.12.9 AccountExpireTime as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The time when the account will expire.
Notes: (Read only property)

154.12.10 GroupID as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The group ID of the user.
Example:

```
Var l as new DarwinUserMBS
l.LoadUserByID l.CurrentUserID
MsgBox str(l.GroupID)
```

Notes: (Read only property)

154.12.11 HomePath as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The home path of the user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByName "cs"

MsgBox l.HomePath
```

Notes: (Read only property)

154.12.12 LastPasswordChangeTime as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The last time when the user changed the password.

Notes: (Read only property)

154.12.13 LongName as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The long name of the user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByName "cs"

MsgBox l.LongName
```

Notes: (Read only property)

154.12.14 Name as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The short name of the user.
Example:

```
Var l as new DarwinUserListMBS

Var c as Integer = l.Count-1
for i as Integer = 0 to c
Var u as DarwinUserMBS = l.User(i)
if u.UserID = l.CurrentUserID then
MsgBox "our user name: "+u.Name
end if
next
```

Notes: (Read only property)

154.12.15 Ready as Boolean

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: whether the values in this class were filled correctly.
Notes: (Read only property)

154.12.16 Shell as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The path to the default shell for this user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByID l.CurrentUserID

MsgBox l.Shell
```

Notes: (Read only property)

154.12.17 UserID as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: All.

Function: The user ID of this user.
Example:

```
Var l as new DarwinUserMBS

l.LoadUserByID l.CurrentUserID

MsgBox str(l.UserID)
```

Notes: (Read only property)

154.13 class DarwinVMStatisticsMBS

154.13.1 class DarwinVMStatisticsMBS

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: Holds information about the current Mac OS X memory status.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.pageins)+" page ins"
```

Notes: See newer class DarwinHostVMStatisticsMBS.

154.13.2 Properties

154.13.3 ActivePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages currently in use and pageable.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.ActivePages)
```

Notes: (Read only property)

154.13.4 CowFaults as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of faults that caused a page to be copied (generally caused by copy-on-write faults).
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CowFaults)
```

Notes: (Read only property)

154.13.5 CPUTicksIdle as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the Idle process.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUTicksIdle)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

154.13.6 CPUTicksNice as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the task switcher process.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUTicksNice)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

154.13.7 CPUTicksSystem as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the system processes.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUTicksSystem)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

154.13.8 CPUTicksUser as Integer

MBS MacCF Plugin, Plugin Version: 2.7, Platform: macOS, Targets: All.

Function: The number of time slices used by the user application processes.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.CPUTicksUser)
```

Notes: Calculate deltas like in the example to see usage of CPU time.
(Read only property)

154.13.9 Faults as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of times the "vm_fault" routine has been called.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Faults)
```

Notes: (Read only property)

154.13.10 FreePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of free pages in the system.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.FreePages)
```

Notes: (Read only property)

154.13.11 Hits as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The hit count.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Hits)
```

Notes: (Read only property)

154.13.12 InactivePages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages on the inactive list.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.InactivePages)
```

Notes: (Read only property)

154.13.13 Lookups as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The count of lookups.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Lookups)
```

Notes: (Read only property)

154.13.14 PageIns as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of requests for pages from a pager (such as the inode pager).
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.pageins)
```

Notes: (Read only property)

154.13.15 PageOuts as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The number of pages that have been paged out.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.PageOuts)
```

Notes: (Read only property)

154.13.16 Pagesize as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The size of one memory page in memory.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Pagesize)
```

Notes: On PowerPC CPUs, it should be 4096 Bytes.
(Read only property)

154.13.17 Reactivations as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: the total number of pages that have been moved from the inactive list to the active list (reactivated).
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.Reactivations)
```

Notes: (Read only property)

154.13.18 WiredPages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages wired down. That is, pages that cannot be paged out.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.WiredPages)
```

Notes: (Read only property)

154.13.19 ZeroFillPages as Integer

MBS MacCF Plugin, Plugin Version: 2.6, Platform: macOS, Targets: All.

Function: The total number of pages that have been zero-filled on demand.
Example:

```
Var d as DarwinVMStatisticsMBS = GetDarwinVMStatisticsMBS
MsgBox str(d.ZeroFillPages)
```

Notes: (Read only property)

154.14 class DelegateCrashExceptionMBS

154.14.1 class DelegateCrashExceptionMBS

MBS Util Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The exception raised when a delegate call crashes.
Notes: Raised in CallDelegateCrashSafeMBS function.
Message defines what caused the crash and ErrorNumber is the signal number (platform dependent!).

Message contains the reason, e.g.

- Delegate crashed with invalid pointer access.
- Delegate crashed with illegal instruction.
- Delegate crashed with floating point error.
- Delegate crashed with wrong system call.
- Delegate crashed with broken pipe.
- Delegate crashed with memory bus error.

Subclass of the RuntimeException class.

154.15 class DesktopApplication

154.15.1 class DesktopApplication

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extends the Application class inside Xojo.

154.15.2 Methods

154.15.3 ApplicationNameMBS as string

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the application.
Example:

msgbox "Hi. This application is named "+app.ApplicationNameMBS

Notes: This may not be the exact same name than the filename.

154.15.4 ArgumentsMBS as String()

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries arguments of process.
Notes: Returns nil in case of any error (low memory).
First entry in result is path to current app.
Other entries are parameters, without any quotes.

154.15.5 BundleFolderMBS as folderitem

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the bundle's mail folder.
Blog Entries

- MBS Real Studio Plugins, version 13.0pr9

154.15.6 BundleLocalizedStringMBS(key as string) as string

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key from the default table.
Notes: A short version for BundleLocalizedString which uses the default table.
See also:

- 154.15.7 BundleLocalizedStringMBS(key as string,fromtable as string) as string 19884

154.15.7 BundleLocalizedStringMBS(key as string,fromtable as string) as string

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the localized string for the given key and table.
Example:

```
// You may make yourself a function to look up for the key and return
// This function was not tested in a real application. May contain a bug.

function Localize(key as string, default as string) as string
Var s as string

s=app.BundleLocalizedStringMBS(key)
if s="" then
s=default // For Mac OS Classic and Windows
elseif s=key then // returns key for not localized items
msgbox "For developer: the key """+key+""" was not localized for any language."
end if

return s
end sub

// use like this
FileOpen.text=Localize("FileOpenLabel", "Open...")
```

Notes: The table parameter is optional to specify which ".strings"-file to use.
without table or table="" the "Localizable.strings" file is used by Mac OS X.

Returns "" (empty string) on Mac OS Classic or Windows.
See also:

• 154.15.6 BundleLocalizedStringMBS(key as string) as string 19884

154.15.8 BundleResourceFolderItemLocalizedMBS(ResourceName as string, ResourceType as string, SubDirectory as string) as folderitem

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Searches inside the application bundle for a file.
Example:

```
Var f as FolderItem
f=app.BundleResourceFolderItemLocalizedMBS("logo","jpg","")
MsgBox f.NativePath
```

Notes: ResourceName is the filename of the resource file.
ResourceType is the file extension.
SubDirectory is the name of the directory.
This function will take care for localization folders.

154.15.9 BundleResourceFolderMBS as folderitem

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a folderitem to the resource file inside the bundle.
Example:

```
Var f As FolderItem = App.BundleResourceFolderMBS

If f = Nil Then
MsgBox "Failed?"
Else
MsgBox f.NativePath
End If
```

Blog Entries

- MBS Real Studio Plugins, version 13.0pr9

154.15.10 HideMeMBS as boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Hides the current application.
Notes: Returns true if the current application was hidden.

154.15.11 HideOthersMBS as boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Hides all applications except the current one.
Notes: Returns true if the other applications were hidden.

154.15.12 LaunchTimeMBS as double

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the the ticks value at launch time.
Example:

```
Var d as date

d=new date
d.totalSeconds=d.totalSeconds-(ticks-app.launchTimeMBS)/60

msgbox d.longdate+" "+d.longtime
```

Notes: This value must be converted to the secondsvalue like in the example.
-1 on Windows.
For Mac OS X see the DarwinResourceUsageMBS class.

154.15.13 MainBundleMBS as CFBundleMBS

MBS MacCF Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: If your application is a bundle, this function returns your own bundle.
Notes: Returns nil on any error.

Works for Console, Desktop and Web projects.

154.15.14 NSApplicationMBS as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the shared NSApplication object.
Notes: This method gives easy access to the NSApplicationMBS class.

The plugin makes sure that there is only one application object by returning the same object each time.
Works for Console, Desktop and Web projects.

154.15.15 ProcessTimeMBS as double

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the current CPU time for the process.
Example:

msgbox "I got "+format(app.ProcessTimeMBS/100,"0.00")+" seconds CPU time till now."

Notes: On Mac OS X, the OS counts how much CPU time in given to the current process.
Returns -1 in case of an error.

154.15.16 Properties

154.15.17 FrontmostMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the application is frontmost.
Example:

app.frontmostmbs=True 'bring app to front

Notes: This property is for read and write. Writing to it brings the app to front.
Setting this property to false does nothing.

If you need to make some other application frontmost, you can use app.HideMeMBS or use the ProcessMBS class.

Implemented for Windows, too. When querying, we check if the front window belongs to our application. When setting the plugin builds a list of all FileMaker windows. Than we activate the top most of them and move all other windows in z order behind.
(Read and Write computed property)

154.16 class EnvironmentMBS

154.16.1 class EnvironmentMBS

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Allows you to access system wide environment properties.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr3

154.16.2 Methods

154.16.3 Add(name as string,value as string) as boolean

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Add a property to the list.
Example:

```
Var e as EnvironmentMBS

e=new EnvironmentMBS
if e.add("authorname","Christian") then
msgbox "ok"
else
msgbox "fail"
end if
```

Notes: Setting this value to some new value will currently only change this value for your application and all child applications.

154.16.4 Get(name as string) as string

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the value for a named property.
Example:

```
Var e as EnvironmentMBS

e=new EnvironmentMBS
msgbox e.get("windir") // normally c:\windows
```

154.16.5 Lines as string()

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: All.

Function: Returns array of definition lines of environment variables.
Example:

```
Var e as new EnvironmentMBS
msgbox join(e.lines, endofline)
```

Notes: Returned strings are in format "name=value".

154.16.6 Name(Index as Integer) as string

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the name of the environment propertie number n.

154.16.7 Names as string()

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: All.

Function: Returns array of names of environment variables.
Example:

```
Var e as new EnvironmentMBS
msgbox join(e.lines, endofline)
```

154.16.8 Update

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Updates the object to the current environment properties.
Notes: This method is called by the constructor and the methods which change the environment properties.

154.16.9 Properties

154.16.10 Count as Integer

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the number of environment properties.
Example:

```
Var e as EnvironmentMBS

e=new EnvironmentMBS
msgbox str(e.count)
```

Notes: (Read only property)

154.16.11 Value(Index as Integer) as string

MBS Util Plugin, Platform: Windows, Targets: All.

Function: Returns the value of the environment propertie number n.
Notes: Setting this value to some new value will currently only change this value for your application and all child applications.
(Read and Write computed property)

154.17 class MutexMBS

154.17.1 class MutexMBS

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a mutex.
Notes: A mutex is not locked by default.

See also AtomicIntegerMBS class.
Blog Entries

154.17.2 Methods

154.17.3 Lock

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the mutex.
Example:

```
Var m as new MutexMBS

m.Lock
MsgBox "Got mutex."

m.Unlock
MsgBox "Released mutex."
```

Notes: The function returns as soon as it has access to the mutex.

Always use Lock and Unlock in a pair.

154.17.4 TryLock as boolean

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the mutex if possible.
Example:

```
Var m as new MutexMBS

if m.TryLock then
MsgBox "Got mutex."

m.Unlock
else
MsgBox "Failed to get mutex."
end if
```

Notes: Returns true if we got a lock and false if not.
Always use Lock and Unlock in a pair.

154.17.5 Unlock

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unlocks the mutex.
Example:

```
Var m as new MutexMBS

m.Lock
MsgBox "Got mutex."

m.Unlock
MsgBox "Released mutex."
```

Notes: Always use Lock and Unlock in a pair.

154.17.6 Properties

154.17.7 Handle as Integer

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal used reference to the native mutex object.
Example:

```
Var m as new MutexMBS
MsgBox "Handle: "+hex(m.Handle)
```

Notes: Windows Mutex or PThread Mutex.
(Read and Write property)

154.17.8 Tag as Variant

MBS Util Plugin, Plugin Version: 8.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: An object reference for your use.
Notes: Just for convenience.
This property was added so you can use this property for a reference so you won't need to subclass this class and add custom properties.
(Read and Write property)

154.18 class NamedMutexMBS

154.18.1 class NamedMutexMBS

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a named mutex.
Notes: Using a mutex on Windows and a semaphore on MacOS and Linux.

Raises UnsupportedOperationException exceptions if something fails.
See also MutexMBS class.
Blog Entries

154.18.2 Methods

154.18.3 Constructor(Name as string)

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create a new mutex.
Notes: Name should be a simple text, but unique, so we recommend reverse domain notation.
The name should not contain a slash.
If mutex exists already, we open it. The mutex lives until the last application closed it.

If name matches the name of an existing event, semaphore, waitable timer, job, or file-mapping object, the function fails.
Raises an UnsupportedOperationException on failure.

You can open the same mutex twice and get different Xojo objects from the plugin for both.

154.18.4 Lock

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Locks the mutex.
Notes: Blocks until mutex is locked.

Please call Unlock later to unlock.

To avoid you looking up the app, we limit locking to one minute. After that you get a timeout error.

154.18.5 TryLock as boolean

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tries to lock the mutex.
Notes: Returns true if locked or false if the lock can't be set.
If false is returned another app may have a lock currently.
Please call Unlock later to unlock if you get back true.

154.18.6 Unlock

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unlocks the mutex.

154.18.7 Properties

154.18.8 Handle as Integer

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

154.18.9 Locked as Boolean

MBS Util Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the mutex was locked here.
Notes: We keep track whether you call Lock/TryLock here vs. Unlock function.
(Read only property)

154.18.10 Name as String

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the mutex.
Notes: (Read only property)

154.18.11 Tag as Variant

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can use it as you like to store whatever value is needed.
(Read and Write property)

154.19 class NSProcessInfoActivityMBS

154.19.1 class NSProcessInfoActivityMBS

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The class for an activity.
Example:

```
Var Activity as NSProcessInfoActivityMBS // property in your window, control, thread, app
Var AllowAppNap as boolean // allow or not?

Var ProcessInfo as NSProcessInfoMBS = NSProcessInfoMBS.processInfo
if AllowAppNap then
Activity = nil
else
// disable sleep to let us make something...
Activity = ProcessInfo.beginActivity(NSProcessInfoMBS.NSActivityBackground, "Backup running")
end if
```

Notes: For Windows, please check WindowsThreadExecutionStateMBS to prevent system sleep.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

154.19.2 Methods

154.19.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Private constructor.

154.19.4 Destructor

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The destructor.
Notes: If you missed to call endActivity, the destructor will do it.

154.19.5 Properties

154.19.6 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

154.19.7 Options as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The options used to create activity.
Notes: (Read and Write property)

154.19.8 Reason as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The reason used to create the activity.
Notes: (Read and Write property)

154.20 class NSProcessInfoMBS

154.20.1 class NSProcessInfoMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The NSProcessInfo class provides methods to access information about the current process.
Notes: Each process has a single, shared NSProcessInfo object, known as process information agent.

The process information agent can return such information as the arguments, environment variables, host name, or process name. The processInfo class method returns the shared agent for the current process—that is, the process whose object sent the message. For example, the following line returns the NSProcessInfo object, which then provides the name of the current process:

Var processInfo as new NSProcessInfoMBS
Var processName as string = processInfo.processName

The NSProcessInfo class also includes the operatingSystem method, which returns an enum constant identifying the operating system on which the process is executing.

NSProcessInfo objects attempt to interpret environment variables and command-line arguments in the user's default C string encoding if they cannot be converted to Unicode as UTF-8 strings. If neither conversion works, these values are ignored by the NSProcessInfo object.

For Windows, please check WindowsThreadExecutionStateMBS to prevent system sleep.

Xojo Developer Magazine

- 19.5, page 9: News

154.20.2 Methods

154.20.3 argument(index as Integer) as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the command-line argument for the process with the given index.
Example:

```
Var p as new NSProcessInfoMBS

Var i,c as Integer

c=p.argumentCount-1
for i=0 to c
MsgBox p.argument(i)
next
```

154.20.4 arguments as string()

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns the command-line arguments for the process.
Notes: Returns array of strings with the process's command-line arguments.

154.20.5 beginActivity(options as Integer, reason as string) as NSProcessInfoActivityMBS

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Begin an activity using the given options and reason.
Example:

```
Var Activity as NSProcessInfoActivityMBS // property in your window, control, thread, app
Var AllowAppNap as boolean // allow or not?

Var ProcessInfo as NSProcessInfoMBS = NSProcessInfoMBS.processInfo
if AllowAppNap then
Activity = nil
else
// disable sleep to let us make something...
Activity = ProcessInfo.beginActivity(NSProcessInfoMBS.NSActivityBackground, "Backup running")
```

end if

Notes: options: Options for the activity. See constants for possible values.
reason: A string used in debugging to indicate the reason the activity began.

Returns an object token representing the activity.

Indicate completion of the activity by calling endActivity passing the returned object as the argument.
Available in OS X v10.9 and later.

For Windows, please check WindowsThreadExecutionStateMBS to prevent system sleep.

154.20.6 Constructor

MBS MacBase Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The constructor.

154.20.7 disableAutomaticTermination(Reason as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decrement the counter tracking the number of automatic quit opt-out requests.
Notes: When this counter is greater than zero, the app will be considered 'active' and ineligible for automatic termination.
An example of using this would be disabling autoquitting when the user of an instant messaging application signs on, due to it requiring a background connection to be maintained even if the app is otherwise inactive.
Each pair of calls should have a matching "reason" argument, which can be used to easily track why an application is or is not automatically terminable.
A given reason can be used more than once at the same time (for example: two files are transferring over the network, each one disables automatic termination with the reason "file transfer in progress")

154.20.8 disableSuddenTermination

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Disables the application for quickly klling using sudden termination.
Notes: This method increments the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overriden in your application Info.plist. See "Sudden Termination" for more information and debugging suggestions.

Available in Mac OS X v10.6 and later.

154.20.9 enableAutomaticTermination(Reason as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Increment the counter tracking the number of automatic quit opt-out requests.
Notes: When this counter is greater than zero, the app will be considered 'active' and ineligible for automatic termination.
An example of using this would be disabling autoquitting when the user of an instant messaging application signs on, due to it requiring a background connection to be maintained even if the app is otherwise inactive.
Each pair of calls should have a matching "reason" argument, which can be used to easily track why an application is or is not automatically terminable.
A given reason can be used more than once at the same time (for example: two files are transferring over the network, each one disables automatic termination with the reason "file transfer in progress")

154.20.10 enableSuddenTermination

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enables the application for quick killing using sudden termination.
Notes: This method decrements the sudden termination counter. When the termination counter reaches 0 the application allows sudden termination.

By default the sudden termination counter is set to 1. This can be overriden in your application Info.plist. See "Sudden Termination" for more information and debugging suggestions.

Available in Mac OS X v10.6 and later.

154.20.11 endActivity(activity as NSProcessInfoActivityMBS)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Ends the given activity.
Notes: activity: An activity object returned by beginActivity.
Available in OS X v10.9 and later.

154.20.12 NSActivityLatencyCritical as UInt64

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: One of the activity option constants.
Notes: Flag to indicate the activity requires the highest amount of timer and I/O precision available.
Important: Very few applications should need to use this constant.
Available in OS X v10.9 and later.
Value is &hFF00000000.

154.20.13 NSProcessInfoPowerStateDidChangeNotification as String

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: All.

Function: The name of the notification that is posted when the power state of a device changes.
Notes: After your observer receives this notification, query the lowPowerModeEnabled property to determine the current power state of the device. If Low Power Mode is active, take appropriate steps to reduce activity in your app. Otherwise, your app can resume normal operations.
The notification object is an NSProcessInfo instance.

154.20.14 NSProcessInfoThermalStateDidChangeNotification as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The notification name to use with NSNotificationObserverMBS.
Notes: This notification is posted once the thermal state of the system has changed. Once the notification is posted, use the thermalState property to retrieve the current thermal state of the system.

You can use this opportunity to take corrective action in your application to help cool the system down. Work that could be done in the background or at opportunistic times should be using the Quality of Service levels in NSOperation or the NSBackgroundActivityScheduler API.

This notification is posted on the global dispatch queue. Register for it using the default notification center. The object associated with the notification is NSProcessInfoMBS.processInfo.

154.20.15 operationSystemVersion(byref Major as Integer, byref Minor as Integer, byref Patch as Integer)

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries operating system version.
Notes: One call to get all three parts.

154.20.16 processInfo as NSProcessInfoMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns the process information agent for the process.

154.20.17 Properties

154.20.18 activeProcessorCount as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Provides the number of active processing cores available on the computer.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox str(p.activeProcessorCount)
```

Notes: Available in Mac OS X v10.5 and later.
(Read only property)

154.20.19 argumentsCount as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The number of the command-line arguments.
Example:

```
Var p as new NSProcessInfoMBS

Var i,c as Integer

c=p.argumentCount-1
for i=0 to c
MsgBox p.argument(i)
next
```

Notes: (Read only property)

154.20.20 automaticTerminationSupportEnabled as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Marks the calling app as supporting automatic termination.
Notes: Without calling this or setting the equivalent Info.plist key (NSSupportsAutomaticTermination), the above methods (disableAutomaticTermination/enableAutomaticTermination) have no effect, although the counter tracking automatic termination opt-outs is still kept up to date to ensure correctness if this is called later. Currently, passing false has no effect.
This should be called during applicationDidFinishLaunching or earlier.
(Read and Write property)

154.20.21 environment as dictionary

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the variable names and their values in the environment from which the process was launched.
Example:

```
Var p as new NSProcessInfoMBS
Var d as Dictionary = p.environment
MsgBox str(d.Count)
```

Notes: (Read only property)

154.20.22 globallyUniqueString as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a global unique identifier for the process.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox p.globallyUniqueString // shows for example "072EC09A-4825-11DD-BDC0-001D4F46F5E0-18405-00000CA853EB5B46"
```

Notes: Returns the Global ID for the process. The ID includes the host name, process ID, and a time stamp, which ensures that the ID is unique for the network.

This method generates a new string each time it is invoked, so it also uses a counter to guarantee that strings created from the same process are unique.
(Read only property)

154.20.23 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The internal reference to the NSProcessInfo object.
Notes: (Read and Write property)

154.20.24 hostName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the name of the host computer.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox p.hostName // for example "iMac.local"
```

Notes: (Read only property)

154.20.25 isiOSAppOnMac as Boolean

MBS MacBase Plugin, Plugin Version: 21.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the process is an iPhone or iPad app running on a Mac.
Notes: The value of this property is true only when the process is an iOS app running on a Mac. The value of the property is false for all other apps on the Mac, including Mac apps built using Mac Catalyst. The property is also false for processes running on platforms other than macOS.
(Read only property)

154.20.26 isiOSAppOnVision as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the process is an iPhone or iPad app running on visionOS.
Notes: The value of this property is true only when the process is an iOS app running on a visionOS device. The value of the property is false for all other apps on visionOS. The property is also false for processes running on platforms other than visonOS.

Can only return true on macOS 26.1 or newer.
(Read only property)

154.20.27 isLowPowerModeEnabled as Boolean

MBS MacBase Plugin, Plugin Version: 21.3, Platforms: macOS, iOS, Targets: All.

Function: Retrieve the current setting of the system for the low power mode setting.
Notes: On systems where the low power mode is unknown or unsupported, the value returned from the lowPowerModeEnabled property is always false.
Returns true if low power mode is enabled for macOS 12 or iOS 9 and newer.
(Read only property)

154.20.28 operatingSystem as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a constant to indicate the operating system on which the process is executing.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox str(p.operatingSystem) // shows 5 = NSMACHOperatingSystem
```

Notes: Operating system identifier. See "Constants" for a list of possible values. In Mac OS X, it's NSMACHOperatingSystem.
(Read only property)

154.20.29 operatingSystemName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a string containing the name of the operating system on which the process is executing.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox p.operatingSystemName // shows "NSMACHOperatingSystem"
```

Notes: Operating system name. In Mac OS X, it's "NSMACHOperatingSystem"
(Read only property)

154.20.30 operatingSystemVersionString as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns a string containing the version of the operating system on which the process is executing.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox p.operatingSystemVersionString // "Version 10.5.4 (Build 9E17)"
```

Notes: Returns the Operating system version. This string is human readable, localized, and is appropriate for displaying to the user. This string is not appropriate for parsing.
(Read only property)

154.20.31 operationSystemVersionMajor as Integer

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries major OS version.
Notes: (Read only property)

154.20.32 operationSystemVersionMinor as Integer

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries minor OS version.
Notes: (Read only property)

154.20.33 operationSystemVersionPatch as Integer

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Queries OS version patch level.
Notes: (Read only property)

154.20.34 physicalMemory as UInt64

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Provides the amount of physical memory on the computer.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox str(p.physicalMemory)
```

Notes: Available in Mac OS X v10.5 and later.
(Read only property)

154.20.35 processIdentifier as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the identifier of the process.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox str(p.processIdentifier)
```

Notes: (Read only property)

154.20.36 processName as string

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The name of the process.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox p.processName
```

Notes: The process name is used to register application defaults and is used in error messages. It does not uniquely identify the process.

You can assign a new value, but:
User defaults and other aspects of the environment might depend on the process name, so be very careful if you change it. Setting the process name in this manner is not thread safe.
(Read and Write property)

154.20.37 processorCount as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Provides the number of processing cores available on the computer.
Example:

```
Var p as new NSProcessInfoMBS

MsgBox str(p.processorCount)
```

Notes: Available in Mac OS X v10.5 and later.
(Read only property)

154.20.38 systemUptime as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the how long it has been since the computer has been restarted.
Notes: Returns an NSTimeInterval indicating how long system the computer has been restarted.
Available in Mac OS X v10.6 and later.
(Read only property)

154.20.39 thermalState as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Retrieve the current thermal state of the system.
Example:

```
Var n as NSProcessInfoMBS = NSProcessInfoMBS.processInfo

Select case n.thermalState
case n.NSProcessInfoThermalStateNominal
MsgBox "Thermal State: Nominal"
case n.NSProcessInfoThermalStateFair
MsgBox "Thermal State: Fair"
case n.NSProcessInfoThermalStateSerious
MsgBox "Thermal State: Serious"
case n.NSProcessInfoThermalStateCritical
MsgBox "Thermal State: Critical"
else
MsgBox "Thermal State: Unknown"
end Select
```

Notes: On systems where thermal state is unknown or unsupported, the value returned from the thermalState property is always NSProcessInfoThermalStateNominal.

Available in Mac OS X 10.10.3 and newer.
Returns -1 if function is called on older Mac OS X versions, Linux or Windows.
(Read only property)

154.20.40 Constants

Constants

Constant	Value	Description
NSHPUXOperatingSystem	4	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the HP UX operating system.
NSMACHOperatingSystem	5	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Mac OS X operating system.
NSOSF1OperatingSystem	7	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the OSF/1 operating system.
NSSolarisOperatingSystem	3	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Solaris operating system.
NSSunOSOperatingSystem	6	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Sun OS operating system.
NSWindows95OperatingSystem	2	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Windows 95 operating system.
NSWindowsNTOperatingSystem	1	One of the following constants are provided by the NSProcessInfo class as return values for operatingSystem. Indicates the Windows NT operating system.

Activity Options

Constant	Value	Description
NSActivityAutomaticTerminationDisabled	&h8000	Flag to prevent automatic termination. Available in OS X v10.9 and later.
NSActivityBackground	&h000000FF	Flag to indicate the app has initiated some kind of result of user request. Available in OS X v10.9 and later.
NSActivityIdleDisplaySleepDisabled	&h10000000000	Flag to require the screen to stay powered on. Available in OS X v10.9 and later.
NSActivityIdleSystemSleepDisabled	&h100000	Flag to prevent idle sleep. This is included in NSActivityUserInitiatedAllowing Available in OS X v10.9 and later.
NSActivitySuddenTerminationDisabled	&h4000	Flag to prevent sudden termination. This is included in NSActivityUserInitiatedAllowing Available in OS X v10.9 and later.
NSActivityUserInitiated	&h00FFFFFF	Flag to indicate the app is performing a user-reques Available in OS X v10.9 and later.
NSActivityUserInitiatedAllowingIdleSystemSleep	&h00EFFFFF	Flag to indicate the app is performing a user-requ system can sleep on idle. Available in OS X v10.9 and later.

Thermal State Constants

Constant	Value	Description
NSProcessInfoThermalStateCritical	3	System performance is significantly impacted and the Mac needs to cool do Recommendation: reduce application's usage of CPU, GPU, and I/O to minimum level needed to respond to user actions. Consider stopping us camera and other peripherals if your application is using them.
NSProcessInfoThermalStateFair	1	The system has reached a state where fans may become audible.
NSProcessInfoThermalStateNominal	0	No corrective action is needed.
NSProcessInfoThermalStateSerious	2	Fans are running at maximum speed, system performance maybe impac Recommendation: reduce application's usage of CPU, GPU and I/O, if po ble. Switch to lower quality visual effects, reduce frame rates.

154.21 class NSRunningApplicationMBS

154.21.1 class NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: NSRunningApplication is a class to manipulate and provide information for a single instance of an application.
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox n.localizedName
```

Notes: Only user applications are tracked; this does not provide information about every process on the system.
Some properties of an application are fixed, such as the bundle identifier. Other properties may vary over time, such as whether the app is hidden. Properties that vary can be observed with key-value observing, in which case the description comment for the method notes this capability.
Properties that vary over time are inherently race-prone. For example, a hidden app may unhide itself at any time. To ameliorate this, properties persist until the next turn of the main run loop in a common mode. For example, if you repeatedly poll an unhidden app for its hidden property without allowing the run loop to run, it will continue to return false, even if the app hides, until the next turn of the run loop.
NSRunningApplication is thread safe, in that its properties are returned atomically. However, it is still subject to the main run loop policy described above. If you access an instance of NSRunningApplication from a background thread, be aware that its time-varying properties may change from under you as the main run loop runs (or not).
An NSRunningApplication instance remains valid after the application exits. However, most properties lose their significance, and some properties may not be available on a terminated application.

Requires Mac OS X 10.6.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr5
- MBS Real Studio Plugins, version 11.3pr9

154.21.2 Methods

154.21.3 activateWithOptions(options as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to activate the application using the specified options.
Notes: options: The options to use when activating the application. See "NSApplicationActivationOptions"

for the possible values.

Returns true if the application was activated successfully, otherwise false.

This method will return false if the application has quit, or is not a type of application than can be activated.

Available in Mac OS X v10.6 and later.

154.21.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox n.localizedName
```

Notes: Initializes the object with the current application.
Available in Mac OS X v10.6 and later.

154.21.5 currentApplication as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSRunningApplication representing this application.
Example:

```
Var n as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication

MsgBox n.localizedName
```

Notes: Available in Mac OS X v10.6 and later.

154.21.6 forceTerminate as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to force the receiver to quit.
Notes: Returns true if the application successfully terminated, otherwise false.

This method will return false if the application is no longer running when the forceTerminate message is sent to the receiver.

This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Available in Mac OS X v10.6 and later.

154.21.7 hide as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to hide or the application.
Example:

```
Var n as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication

MsgBox str(n.hide) // hide me
```

Notes: The property of this value will be false if the application has already quit, or if of a type that is unable to be hidden.
Available in Mac OS X v10.6 and later.

154.21.8 runningApplications as NSRunningApplicationMBS()

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of NSRunningApplication representing the running applications.
Example:

```
Var n(-1) as NSRunningApplicationMBS = NSRunningApplicationMBS.runningApplications
Var s(-1) as string

for each r as NSRunningApplicationMBS in n
s.Append r.localizedName
next

MsgBox Join(s,EndOfLine)
```

Notes: Returns an array of NSRunningApplication instances.

The order of the array is unspecified, but it is stable, meaning that the relative order of particular applications will not change across multiple calls to runningApplications. See NSRunningApplication Class Reference for more information on NSRunningApplication.
Similar to the NSRunningApplication classes's properties, this property will only change when the main run loop is run in a common mode. Instead of polling, use key-value observing to be notified of changes to this array property.
This property is thread safe, in that it may be called from background threads and the result is returned atomically.

This list is not updated in a tight loop. For receiving updates, you need to have the runloop run (e.g. check regularly in a timer).

154.21.9 runningApplicationsWithBundleIdentifier(bundleID as string) as NSRunningApplicationMBS()

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of currently running applications with the specified bundle identifier.
Example:

```
Var n(-1) as NSRunningApplicationMBS = NSRunningApplicationMBS.runningApplicationsWithBundleIdentifier("com.apple.iTunes")

if UBound(n)>=0 then
MsgBox n(0).localizedName
else
MsgBox "iTunes is not running?"
end if
```

Notes: An array of NSRunningApplications, or an empty array if no applications match the bundle identifier.
Available in Mac OS X v10.6 and later.

154.21.10 runningApplicationWithProcessIdentifier(pid as Integer) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the running application with the given process identifier, or nil if no application has that pid.
Example:

```
Var n as NSRunningApplicationMBS
Var pid as Integer
```

```
while n=nil
pid=pid+1
n=NSRunningApplicationMBS.runningApplicationWithProcessIdentifier(pid)
wend

MsgBox n.localizedName+" has PID "+str(pid)
```

Notes: pid: The process identifier.

Returns an instance of NSRunningApplication for the specified pid, or nil if the application has no process identifier.

Applications that do not have PIDs cannot be returned from this method.
Available in Mac OS X v10.6 and later.

154.21.11 terminate as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to quit the receiver normally.
Notes: Returns true if the application successfully terminated, otherwise false.

This method will return false if the application is no longer running when the terminate message is sent to the receiver.
This method may return before the receiver exits; you should observe the terminated property to determine when the application terminates.

Available in Mac OS X v10.6 and later.

154.21.12 unhide as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to unhide or the application.
Notes: Returns true if the application was successfully shown, otherwise false.

The property of this value will be false if the application has already quit, or if of a type that is unable to be hidden.

Available in Mac OS X v10.6 and later.

154.21.13 Properties

154.21.14 activationPolicy as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the activation policy of the application. (read-only)
Notes: The value returned by this property is usually fixed, but it may change through a call to activateWithOptions.
Available in Mac OS X v10.6 and later.
(Read only property)

154.21.15 active as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the application is currently frontmost. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox str(n.active)
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

154.21.16 bundleIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the CFBundleIdentifier of the application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox n.bundleIdentifier
```

Notes: The value of this property will be nil if the application does not have an Info.plist.
(Read only property)

154.21.17 bundleURL as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the URL to the application's bundle. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox n.bundleURL
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

154.21.18 executableArchitecture as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the URL to the application's executable. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox str(n.executableArchitecture) // shows 7
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

154.21.19 executableURL as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the URL to the application's executable. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox n.executableURL
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

154.21.20 finishedLaunching as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver's process has finished launching, (read-only)
Notes: The value of this property corresponds to the running application having received an NSApplicationDidFinishLaunchingNotification notification internally. Some applications do not post this notification (applications that do not rely on NSApplication) and so are never reported as finished launching.
Available in Mac OS X v10.6 and later.
(Read only property)

154.21.21 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSRunningApplication object.
Notes: (Read and Write property)

154.21.22 hidden as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the application is currently hidden. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox str(n.hidden)
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

154.21.23 icon as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the icon for the receiver's application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

Var i as NSImageMBS = n.icon
```

```
// without this call the size is 32x32 Pixel
i.setSize 512,512

Backdrop = i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.
(Read only property)

154.21.24 launchDate as date

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the date when the application was launched. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox n.launchDate.ShortTime
```

Notes: This property is not available for all applications. Specifically, it is not available for applications that were launched not launched by LaunchServices.
Available in Mac OS X v10.6 and later.
(Read only property)

154.21.25 launchDateTime as DateTime

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the date when the application was launched. (read-only)
Notes: This property is not available for all applications. Specifically, it is not available for applications that were launched not launched by LaunchServices.
Available in Mac OS X v10.6 and later.
(Read only property)

154.21.26 localizedName as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the localized name of the application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS
```

```
MsgBox n.localizedName
```

Notes: The value of this property is dependent on the current localization of the application and is suitable for presentation to the user.
Available in Mac OS X v10.6 and later.
(Read only property)

154.21.27 ownsMenuBar as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the application owns the current menu bar.
Example:

```
// put in a timer...
Var r as NSRunningApplicationMBS = NSRunningApplicationMBS.currentApplication
window1.Title = str(r.ownsMenuBar)
```

Notes: Available in Mac OS X v10.7 and later.
(Read only property)

154.21.28 processIdentifier as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the process identifier (pid) of the application. (read-only)
Example:

```
Var n as new NSRunningApplicationMBS

MsgBox str(n.processIdentifier)
```

Notes: Not all applications have a pid. Applications without a return a value of -1.
Do not rely on this for comparing processes, instead compare NSRunningApplication instances using isEqual:.
Available in Mac OS X v10.6 and later.
(Read only property)

154.21.29 terminated as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates that the receiver's application has terminated. (read-only)
Notes: The value of terminated is true if the receiver's application has terminated, otherwise false.
This property is observable using key-value observing.
Available in Mac OS X v10.6 and later.
(Read only property)

154.21.30 Constants

Constants

Constant	Value	Description
NSApplicationActivateAllWindows	1	One of the flag constants for activateWithOptions. By default, activation brings only the main and key windows forwar specify NSApplicationActivateAllWindows, all of the application's wi brought forward. Available in Mac OS X v10.6 and later.
NSApplicationActivateIgnoringOtherApps	2	One of the flag constants for activateWithOptions. By default, activation deactivates the calling app (assuming it was ac then the new app is activated only if there is no currently active ap This prevents the new app from stealing focus from the user, if the a to activate and the user has switched to a different app in the interim. if you specify NSApplicationActivateIgnoringOtherApps, the applica tivated regardless of the currently active app, potentially stealing fo the user. You should rarely pass this flag because stealing key focus a very bad user experience. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyAccessory	1	One of the constants used for following activation policies. The application does not appear in the Dock and does not have a m but it may be activated programmatically or by clicking on one of its This corresponds to value of the LSUIElement key in the application's being 1. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyProhibited	2	One of the constants used for following activation policies. The application does not appear in the Dock and may not create or be activated. This corresponds to the value of the LSBackgroun in the application's Info.plist being 1. This is also the default for u executables that do not have Info.plists. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyRegular	0	One of the constants used for following activation policies. The application is an ordinary app that appears in the Dock and m user interface. This is the default for bundled apps, unless overrido Info.plist. Available in Mac OS X v10.6 and later.

154.22 class NSXPCConnectionMBS

154.22.1 class NSXPCConnectionMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The NSXPCConnection class provides a bi-directional communication channel between two processes.
Notes: This class is the primary means of creating and configuring the communication mechanism between two processes. Each process has one instance of this class to represent the endpoint in the communication channel.

Requires a setup with info.plist entries, correct permissions and code signing.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr1

154.22.2 Methods

154.22.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.

154.22.4 CallMethod(name as string, tag as Variant, params() as Variant)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calls method and passes parameters.
Notes: Returns array of variant.

154.22.5 Close

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Closes the connection.

154.22.6 Constructor(endpoint as NSXPCListenerEndpointMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Initializes an NSXPCConnection object to connect to an NSXPCListener object in another process, identified by an NSXPCListenerEndpoint object.
Notes: endpoint: The desired listener endpoint for the service.
Available in OS X v10.8 and later.
See also:

- 154.22.7 Constructor(MachOServiceName as string, flags as Integer) 19925
- 154.22.8 Constructor(ServiceName as string) 19925

154.22.7 Constructor(MachOServiceName as string, flags as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an NSXPCConnection object to connect to a LaunchAgent or LaunchDaemon with a name advertised in a launchd.plist.
Notes: For example, if an agent is managed with launchd and has a launchd.plist in textasciitilde /Library/LaunchAgents, this method would create a connection to that agent. The agent should use NSXPCListener to wait for new connections.

If the connection is being made to a process that is running in a privileged Mach bootstrap context (for example, a daemon started by a launchd property list in /Library/LaunchDaemons), then pass the NSXPC-ConnectionPrivileged option.

Available in OS X v10.8 and later.
See also:

- 154.22.6 Constructor(endpoint as NSXPCListenerEndpointMBS) 19924
- 154.22.8 Constructor(ServiceName as string) 19925

154.22.8 Constructor(ServiceName as string)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Initializes an NSXPCConnection object to connect to an NSXPCListener object in an XPC service, identified by a service name.
Notes: XPC services are helper processes that are usually part of your application bundle. The service should use NSXPCListener to wait for new connections.
Available in OS X v10.8 and later.
See also:

- 154.22.6 Constructor(endpoint as NSXPCListenerEndpointMBS) 19924
- 154.22.7 Constructor(MachOServiceName as string, flags as Integer) 19925

154.22.9 Destructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The destructor.

154.22.10 invalidate

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Invalidates the connection.
Notes: When you call this method, all outstanding reply blocks, error handling blocks, and invalidation blocks are called on the message handling queue. The connection must be invalidated before it is deallocated. After a connection is invalidated, no more messages may be sent or received.

154.22.11 resume

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Starts or resumes handling of messages on a connection.
Notes: All connections start suspended. You must resume them before they start processing received messages or sending messages through the remoteObjectProxy object.
Available in OS X v10.8 and later.

154.22.12 suspend

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suspends the connection.
Notes: Suspends and resumes must be balanced before the connection may be invalidated.
Available in OS X v10.8 and later.

154.22.13 Properties

154.22.14 auditSessionIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The BSM audit session identifier for the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.

(Read only property)

154.22.15 effectiveGroupIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The effective group ID (EGID) of the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.
(Read only property)

154.22.16 effectiveUserIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The effective user ID (EUID) of the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.
(Read only property)

154.22.17 endpoint as NSXPCListenerEndpointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: If the connection was created with an NSXPCListenerEndpoint object, returns the endpoint object used.
Notes: (Read only property)

154.22.18 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

154.22.19 processIdentifier as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The process ID (PID) of the connecting process.
Notes: This attribute may be used by the listener delegate to accept or reject connections.
Available in OS X v10.8 and later.

(Read only property)

154.22.20 serviceName as String

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The name of the XPC service that this connection was configured to connect to.
Notes: (Read only property)

154.22.21 Events

154.22.22 CallMethodReturned(name as string, tag as Variant, Parameters() as Variant, Results() as Variant)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The event called when method returns.

154.22.23 ErrorHandler(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The error event for errors happening when calling method.

154.22.24 InterruptionHandler

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The event is called if the remote process exits or crashes.
Notes: It may be possible to re-establish the connection by simply sending another message. The handler is invoked on the same queue as reply messages and other handlers, and it is always executed after any other messages or reply block handlers (except for the invalidation handler).

154.22.25 InvalidationHandler

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: This event is invoked on the same queue as reply messages and other handlers, and is always executed last (after the interruption handler, if required).

Notes: You may not send messages over the connection from within an invalidation handler block.

154.22.26 Constants

Constants

Constant	Value	Description
NSXPCConnectionPrivileged	1	One of the options that you can pass to a connection. Use this option if connecting to a service in the privileged Mach bootstrap (for example, a daemon with a launchd.plist in /Library/LaunchDaemons). Available in OS X v10.8 and later.

154.23 class NSXPCListenerEndpointMBS

154.23.1 class NSXPCListenerEndpointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Class that "names" a specific NSXPCListener object.
Notes: An instance may be retrieved from an NSXPCListener and sent over existing NSXPCConnections. A process may then use it to create a new NSXPCConnection to the original NSXPCListener.

This pattern is useful if you have a service which multiplexes work to other services. The service can act as an intermediate helper. The requesting application does not need to know specifically which service it is connecting to, just that it implements a known NSXPCInterface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

154.23.2 Methods

154.23.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.

154.23.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

154.23.5 Properties

154.23.6 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

154.24 class NSXPCListenerMBS

154.24.1 class NSXPCListenerMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The NSXPCListener class and its delegate are responsible for waiting for new incoming connections, configuring them, and accepting or rejecting them.
Notes: Each XPC service, launchd agent, or launchd daemon typically has at least one NSXPCListener object that listens for connections to a specified service name.
When the listener receives a new connection request, it creates a new NSXPCConnection object, then asks the delegate to inspect, configure, and resume the connection object by calling the delegate's shouldAcceptNewConnection event.

- MBS Xojo / Real Studio Plugins, version 14.2pr1

154.24.2 Methods

154.24.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.

154.24.4 Close

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Closes listener.

154.24.5 Constructor(Anonymous as boolean = false)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new listener connection.
Notes: If Anonymous is true: Initializes with a new anonymous listener connection.
If false: Initializes with the singleton listener used to listen for incoming connections in an XPC service.

see also:
https://developer.apple.com/library/mac/documentation/Foundation/Reference/NSXPCListener_reference/translated_content/NSXPCListener.html
See also:

• 154.24.6 Constructor(Name as string) 19932

154.24.6 Constructor(Name as string)

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a listener in a LaunchAgent or LaunchDaemon which has a name advertised in a launchd.plist file.
Notes: For example, you might use this in an agent launched by launchd with a launchd.plist contained in textasciitilde /Library/LaunchAgents, or a daemon launched by launchd with a launchd.plist contained in /Library/LaunchDaemons.

Available in OS X v10.8 and later.
See also:

• 154.24.5 Constructor(Anonymous as boolean = false) 19931

154.24.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The destructor.

154.24.8 invalidate

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Invalidates the listener.
Notes: After calling this method, no more connections are created. Once a listener is invalidated it may not be resumed or suspended.
Available in OS X v10.8 and later.

154.24.9 resume

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Starts processing of incoming requests.
Notes: All listeners start suspended and must be resumed before they begin processing incoming requests.

If called on the serviceListener object, this method never returns. Therefore, you should call it as the last step inside the XPC service's main function after setting up any desired initial state and configuring the

listener itself.

If called on any other NSXPCListener, the connection is resumed, and the method returns immediately.
Available in OS X v10.8 and later.

154.24.10 suspend

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suspends the listener.
Notes: Suspends and resumes must be balanced before the listener may be invalidated.
Available in OS X v10.8 and later.

154.24.11 Properties

154.24.12 endpoint as NSXPCListenerEndpointMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an endpoint object that may be sent over an existing connection.
Notes: The receiver of the endpoint can use this object to create a new connection to this NSXPCListener object. The resulting NSXPCListenerEndpoint object uniquely names this listener object across connections.
(Read only property)

154.24.13 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

154.24.14 Events

154.24.15 CallMethod(Name as string, Parameters() as Variant) as Variant()

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Called on the listener side when a method was called on the connection.
Notes: Return array of variant for the results.

154.24.16 shouldAcceptNewConnection(newConnection as NSXPCConnection-MBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Accepts or rejects a new connection to the listener.
Notes: To accept the connection, first configure the connection if desired, then call resume on the new connection, then return true.
To reject the connect, return a value of false. This causes the connection object to be invalidated.
In this method, you can also set up properties on the connection object, such as its exported object and interfaces. Be sure to call resume when you are finished configuring the connection object and are ready for it to receive messages.

154.25 class ProcessMBS

154.25.1 class ProcessMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Adds the class ProcessMBS to Xojo to get details about all running applications.
Example:

```
// Shows how to use the processInformationCFDictionary function to
// decide on Mac OS X whether an application is a background only one.

Var myProcess as ProcessMBS
Var myCFDictionary as CFDictionaryMBS
Var myCFBoolean as CFBooleanMBS
Var myCFObject as CFObjectMBS

myProcess=new ProcessMBS
myProcess.GetCurrentProcess
myCFDictionary = CFDictionaryMBS(myProcess.processInformationCFDictionary)
myCFObject = myCFDictionary.Value(newcfstringmbs("LSBackgroundOnly"))
myCFBoolean=CFBooleanMBS(myCFObject)

if myCFBoolean.Value then
MsgBox "is background"
else
MsgBox "is not background"
end if
```

Notes: Requires Windows 95 or Windows 2000 to run on Windows.

To find all windows on Windows, use the WindowsListMBS class.
To find all windows on Mac OS X, use the CGSWindowListMBS class.

For newer code on Mac, please check NSRunningApplicationMBS class.
See also WindowsProcessDiagnosticInfoMBS class for Windows.

154.25.2 Methods

154.25.3 Bundle as folderitem

MBS Util Plugin, Plugin Version: 4.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bundle path.
Notes: Maybe nil if not available.
Returns on Mac OS X the path to the main bundle of the process.

154.25.4 BundleID as string

MBS Util Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bundle identifier.
Notes: Maybe "" if not available.
Returns on Mac OS X the identifier to the main bundle of the process.

154.25.5 CurrentProcessID as Integer

MBS Util Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the process ID of the application.
Example:

MsgBox str(ProcessMBS.CurrentProcessID)

154.25.6 GetCurrentProcess

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Load the current Process' information into the class.
Notes: This should always be your Xojo application.

154.25.7 GetfirstProcess

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Load the first Process into the class.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.GetfirstProcess ' get first
do
msgBox p.name
loop until not p.GetNextProcess ' get next till no more
```

154.25.8 GetFrontProcess

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Load the frontmost Process' information into the class.

154.25.9 GetNextProcess as boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Load the next Process into the class.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.GetfirstProcess ' get first
do
msgBox p.name
loop until not p.GetNextProcess ' get next till no more
```

Notes: Returns true if successfull.

154.25.10 GetProcess(serial as memoryblock)

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Load the process information for the process with the given serial.

154.25.11 KillProcess as Integer

MBS Util Plugin, Plugin Version: 2.7, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Kills a Process on Mac OS X or Windows.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
msgbox str(p.killprocess)
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Sets the lasterror property.

Lasterror codes on Windows:
0 - failed
1 - normal exit
2 - forced exit

If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 154.25.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer 19938
- 154.25.13 KillProcess(timeoutms as Integer) as Integer 19939

154.25.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer

MBS Util Plugin, Plugin Version: 10.3, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Kills a Process on Mac OS X or Windows.
Example:

```
const pid = 12345 // put the PID here
call ProcessMBS.KillProcess pid, 100
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Returns on Windows:
0 - failed
1 - normal exit
2 - forced exit

The timeout is in milliseconds.
If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 154.25.11 KillProcess as Integer 19938
- 154.25.13 KillProcess(timeoutms as Integer) as Integer 19939

154.25.13 KillProcess(timeoutms as Integer) as Integer

MBS Util Plugin, Plugin Version: 4.2, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Kills a Process on Mac OS X or Windows.
Example:

```
Var p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
msgbox str(p.killprocess)
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error".

Sets the lasterror property.

Lasterror codes on Windows:
0 - failed
1 - normal exit
2 - forced exit

The timeout is in milliseconds. If you don't specify a timeout, 1000 ms are used.
If you kill the main process of a task, this can kill the sub processes, too.
See also:

- 154.25.11 KillProcess as Integer 19938
- 154.25.12 KillProcess(ProcessID as Integer, timeout as Integer) as Integer 19938

154.25.14 MacProcessSerial as memoryblock

MBS Util Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the serial number for this process as a memoryblock with binary content.
Notes: On Mac OS every process as its own unique ID. (If you launch one application two times, they may have everything equal except the process serial.)

The serial itself is a 8byte long memoryblock (two integer).

Returns nil on any error.

154.25.15 ProcessInformationCFDictionary as object

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a CFDictionaryMBS object with the properties of the process.
Example:

```
Var p as ProcessMBS
Var d as CFDictionaryMBS

p=new ProcessMBS

p.GetCurrentProcess

d=CFDictionaryMBS(p.ProcessInformationCFDictionary)

if d=nil then
MsgBox "This example works only on Mac OS X 10.2!"
else
// use information in dictionary
end if
```

Notes: Only available on Mac OS X 10.2 or newer.
(And in Mac OS X 10.2 is a bug which may lead into a crash by using this function. Fixed in Mac OS X 10.3)
The function returns a CFDictionaryMBS, but to avoid plugin dependencies, the function is declared as Object, so RB 4.5 don't crash when an application uses the process plugin and dosn't use the CF Plugin.

Result:
An immutable CFDictionary containing these keys and their values. Keys marked with an '*' are optional. Over time more keys may be added.

154.25.16 QuitProcess as Integer

MBS Util Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Quits a Process on Mac OS.
Example:

Key Name	Type
"PSN"	CFNumber, kCFNumberLongLongType
"Flavor"	CFNumber, kCFNumberSInt32
"Attributes"	CFNumber, kCFNumberSInt32
"ParentPSN"	CFNumber, kCFNumberLongLong
"FileType"	CFString, file type
"FileCreator"	CFString, file creator
"pid"	CFNumber, kCFNumberLongType
"LSBackgroundOnly"	CFBoolean
"LSUIElement"	CFBoolean
"IsHiddenAttr"	CFBoolean
"IsCheckedInAttr"	CFBoolean
"RequiresClassic"	CFBoolean
"RequiresCarbon"	CFBoolean
"LSUserQuitOnly"	CFBoolean
"LSUIPresentationMode"	CFNumber, kCFNumberShortType
"BundlePath"	CFString
kIOBundleExecutableKey	CFString
kIOBundleNameKey	CFString
kIOBundleIdentifierKey	CFString

```
Var p as ProcessMBS
p=new ProcessMBS
p.getcurrentprocess
msgbox str(p.QuitProcess)
```

Notes: Returns -1 if function is not available. Else returns a Mac OS error code where 0 equals "no error". Sets the lasterror property.

154.25.17 SameAs(other as ProcessMBS) as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if two ProcessMBS objects have the same Process.

154.25.18 SetFrontProcessWithOptions(options as Integer)

MBS Util Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the current process to the front.
Example:

```
Var p as ProcessMBS
```

```
// move my front window to the front
p=new ProcessMBS
p.GetCurrentProcess
p.SetFrontProcessWithOptions 1
```

Notes: If you pass 0 in the options parameter, the process is activated and all process windows are brought forward.

If you pass kSetFrontProcessFrontWindowOnly (value 1), the process is activated and the frontmost non-floating window is brought forward. (Mac OS X only)

154.25.19 SetServiceMode(ismode as boolean) as boolean

MBS Util Plugin, Plugin Version: 2.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: If an application is a service, it is not listed inside the Windows force quit window.
Notes: Works only on Windows 95, 98 and ME.

154.25.20 TransformProcessType(mode as Integer) as Integer

MBS Util Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the 'type' of the process specified in the psn parameter.
Notes: Given a psn for an application, this call transforms that application into the given type. Foreground applications have a menu bar and appear in the Dock. Background applications do not appear in the Dock, do not have a menu bar (and should not have windows or other user interface). UIElement applications do not have a menu bar, do not appear in the dock, but may in limited circumstances present windows and user interface. If a foreground application is frontmost when transformed into a background application, it is first hidden and another application is made frontmost. A UIElement or background-only application which is transformed into a foreground application is not brought to the front (use SetFrontProcess() after the transform if this is required) nor will it be shown if it is hidden (even if hidden automatically by being transformed into a background-only application), so the caller should use ShowHideProcess() to show the application after it is transformed into a foreground application. Applications can only transform themselves; this call cannot change the type of another application.

Returns error code (0 for success).

154.25.21 TransformToForegroundApplication as Integer

MBS Util Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Transforms a background application to a foreground application.
Notes: Returns a Mac OS error code. Returns -1 if the function is not available. You need to select a process first with Get*Process functions.
Requires Mac OS X 10.3.

You can use this call to transform a background-only application into a foreground application. A foreground application appears in the Dock (and in the Force Quit dialog) and contains a menu bar. This function does not cause the application to be brought to the front; you must set FrontProcess=true to do so.

While available starting in 10.3 "Panther," calling TransformProcessType on a UIElement application in 10.3 or 10.4 will return paramErr (-50), rendering it only usable on a full BackgroundOnly? application. Leopard supports foregrounding both UIElement and BackgroundOnly? applications.

154.25.22 Update

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Updates the classes information.
Notes: Use it if you want the current CPUTime value after some time.

154.25.23 WinFullProcessImagePath as string

MBS Util Plugin, Plugin Version: 9.6, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the full name of the executable image for the specified process.
Notes: Returns empty string on any error like missing permissions.
The path is in the device style "Device\Harddisk0\Partition1\WINNT\System32\test.exe".

Requires Windows Vista or Windows Server 2008 or newer.

154.25.24 WinGetPriorityClass(ProcessID as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the priority class for the specified process.
Notes: You can pass ProcessID -1 to get the current process.
This value, together with the priority value of each thread of the process, determines each thread's base priority level.

If the function succeeds, the return value is the priority class of the specified process.

The process's priority class is one of the following values:

Name	Value	Description
ABOVE_NORMAL_PRIORITY_CLASS	&h00008000	Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.
BELOW_NORMAL_PRIORITY_CLASS	&h00004000	Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.
HIGH_PRIORITY_CLASS	&h00000080	Process that performs time-critical tasks that must be executed immediately for it to run correctly. The threads of a high-priority class process preempt the threads of normal or idle priority class processes. An example is the Task List, which must respond quickly when called by the user, regardless of the load on the operating system. Use extreme care when using the high-priority class, because a high-priority class CPU-bound application can use nearly all available cycles.
IDLE_PRIORITY_CLASS	&h00000040	Process whose threads run only when the system is idle and are preempted by the threads of any process running in a higher priority class. An example is a screen saver. The idle priority class is inherited by child processes.
NORMAL_PRIORITY_CLASS	&h00000020	Process with no special scheduling needs.
REALTIME_PRIORITY_CLASS	&h00000100	Process that has the highest possible priority. The threads of a real-time priority class process preempt the threads of all other processes, including operating system processes performing important tasks. For example, a real-time process that executes for more than a very brief interval can cause disk caches not to flush or cause the mouse to be unresponsive.

Every thread has a base priority level determined by the thread's priority value and the priority class of its process. The operating system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. Threads are scheduled in a round-robin fashion at each priority level, and only when there are no executable threads at a higher level will scheduling of threads at a lower level take place.
For a table that shows the base priority levels for each combination of priority class and thread priority value, see Scheduling Priorities.
Priority class is maintained by the executive, so all processes have a priority class that can be queried.

For Mac and Linux, please use Priority.

154.25.25 WinModulePath as string

MBS Util Plugin, Plugin Version: 9.6, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the path the first code file in this process.
Notes: Returns empty string on any error like missing permissions.
The path is in the typical style "C:\path\name.exe".

154.25.26 WinProcessImagePath as string

MBS Util Plugin, Plugin Version: 9.6, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the executable file for the specified process.

Notes: Returns empty string on any error like missing permissions.
The path is in the device style "Device\Harddisk0\Partition1\WINNT\System32\test.exe".

Requires Windows XP or Windows Server 2003 or newer.

154.25.27 WinSetPriorityClass(ProcessID as Integer, PriorityClass as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the priority class for the specified process.
Notes: You can pass ProcessID -1 to get the current process.
This value together with the priority value of each thread of the process determines each thread's base priority level.

The process's priority class is one of the following values:

Name	Value	Description
ABOVE_NORMAL_PRIORITY_CLASS	&h00008000	Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.
BELOW_NORMAL_PRIORITY_CLASS	&h00004000	Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.
HIGH_PRIORITY_CLASS	&h00000080	Process that performs time-critical tasks that must be executed immediately for it to run correctly. The threads of a high-priority class process preempt the threads of normal or idle priority class processes. An example is the Task List, which must respond quickly when called by the user, regardless of the load on the operating system. Use extreme care when using the high-priority class, because a high-priority class CPU-bound application can use nearly all available cycles.
IDLE_PRIORITY_CLASS	&h00000040	Process whose threads run only when the system is idle and are preempted by the threads of any process running in a higher priority class. An example is a screen saver. The idle priority class is inherited by child processes.
NORMAL_PRIORITY_CLASS	&h00000020	Process with no special scheduling needs.
REALTIME_PRIORITY_CLASS	&h00000100	Process that has the highest possible priority. The threads of a real-time priority class process preempt the threads of all other processes, including operating system processes performing important tasks. For example, a real-time process that executes for more than a very brief interval can cause disk caches not to flush or cause the mouse to be unresponsive.

Every thread has a base priority level determined by the thread's priority value and the priority class of its process. The operating system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. Threads are scheduled in a round-robin fashion at each priority level, and only when there are no executable threads at a higher level will scheduling of threads at a lower level take place.
For a table that shows the base priority levels for each combination of priority class and thread priority value, see Scheduling Priorities.
Priority class is maintained by the executive, so all processes have a priority class that can be queried.

Every thread has a base priority level determined by the thread's priority value and the priority class of its process. The system uses the base priority level of all executable threads to determine which thread gets the next slice of CPU time. The SetThreadPriority function enables setting the base priority level of a thread relative to the priority class of its process. For more information, see Scheduling Priorities.
The *_PRIORITY_CLASS values affect the CPU scheduling priority of the process. For processes that perform background work such as file I/O, network I/O, or data processing, it is not sufficient to adjust the CPU scheduling priority; even an idle CPU priority process can easily interfere with system responsiveness when it uses the disk and memory. Processes that perform background work should use the PROCESS_MODE_BACKGROUND_BEGIN and PROCESS_MODE_BACKGROUND_END values to adjust their resource scheduling priorities; processes that interact with the user should not use PROCESS_MODE_BACKGROUND_BEGIN.
If a process is in background processing mode, the new threads it creates will also be in background processing mode. When a thread is in background processing mode, it should minimize sharing resources such as critical sections, heaps, and handles with other threads in the process, otherwise priority inversions can occur. If there are threads executing at high priority, a thread in background processing mode may not be scheduled promptly, but it will never be starved.
Each thread can enter background processing mode independently using SetThreadPriority. Do not call SetPriorityClass to enter background processing mode after a thread in the process has called SetThreadPriority to enter background processing mode. After a process ends background processing mode, it resets all threads in the process; however, it is not possible for the process to know which threads were already in background processing mode.

On any error the value is zero.
For Mac and Linux, please use Priority.

154.25.28 Properties

154.25.29 CPUTime as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of the ticks this Process did get to calculate.
Notes: Unit is 1/60 of a second.
On Mac OS X this value is not available and normally 0.
(Read only property)

154.25.30 CurrentProcess as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the application is in the current Process.
Notes: This should always be true because you are running Xojo as the current ProcessMBS while you ask for this.
(Read only property)

154.25.31 flags as Integer

MBS Util Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The flags for this process on Mac OS.
Example:

```
Sub Open()
// List all visible processes

Var s as string
Var p as ProcessMBS
Var d As CFDictionaryMBS
Var LSBackgroundOnly, LSUIElement As CFStringMBS
Var b As CFBooleanMBS
Var obj As CFObjectMBS
Var visible as Boolean

const modeOnlyBackground=&h00000400

LSUIElement=NewCFStringMBS("LSUIElement")
LSBackgroundOnly = NewCFStringMBS("LSBackgroundOnly")

p = new ProcessMBS
p.getfirstProcess

do
visible=True

// Mac OS X
d = CFDictionaryMBS(p.ProcessInformationCFDictionary)

if d <>nil Then
obj = d.Value(LSBackgroundOnly)
if obj isa CFBooleanMBS then
b=CFBooleanMBS(obj)

if b.value Then
visible=false
end
end if

obj= d.Value(LSUIElement)
if obj isa CFBooleanMBS then
b=CFBooleanMBS(obj)
```

```
if b.value Then
visible=false
end
end if
end if

// Mac OS 9

if BitwiseAnd(p.Flags,modeOnlyBackground)<>0 then
visible=False
end if

if visible then
ListBox1.AddRow p.Name
end if

loop until not p.GetNextProcess
End Sub
```

Notes: Returns 0 on any error.

Process mode flags. These flags indicate whether the process is an application or desk accessory. For applications, this field also returns information specified in the application's 'SIZE' resource. This information is returned as flags. You can refer to these flags by using these constants:

modeDeskAccessory	&h00020000
modeMultiLaunch	&h00010000
modeNeedSuspendResume	&h00004000
modeCanBackground	&h00001000
modeDoesActivateOnFGSwitch	&h00000800
modeOnlyBackground	&h00000400
modeGetFrontClicks	&h00000200
modeGetAppDiedMsg	&h00000100
mode32BitCompatible	&h00000080
modeHighLevelEventAware	&h00000040
modeLocalAndRemoteHLEvents	&h00000020
modeStationeryAware	&h00000010
modeUseTextEditServices	&h00000008

(Read only property)

154.25.32 FrontProcess as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the application is in the front of all others.
Example:

```
Var p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess=true 'bring app to front
```

Notes: This property is for read and write. Writing to it brings the Process to front.
(Read and Write property)

154.25.33 lasterror as Integer

MBS Util Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: As this property is introduced with MBS Plugin 3.1, only a few functions set it.
0 means no error, -1 means not available and anything else is a Mac OS error code.
(Read and Write property)

154.25.34 LaunchProcess as ProcessMBS

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the application which launched the current one.
Notes: For some applications like the "loginwindow" it is nil, because there was no app to launch it other than the system itself.
(Read only property)

154.25.35 MacCreator as string

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Mac Creator code for the application.
Notes: (Read only property)

154.25.36 MacType as string

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Mac Type code for the application.
Notes: Possible values:

"APPL"	normal application
"appe"	background application (Classic)
"APPC"	Control panel application (Classic)
"APPD"	Desktop Accessory (Classic)
"FNDR"	Finder

others may be possible.
(Read only property)

154.25.37 MemoryFree as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the size of the free space in the Process' memory partition.
Notes: On Mac OS X normally 0.
(Read only property)

154.25.38 MemorySize as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns size of the Process' memory partition.
Notes: On Mac OS X normally 0.
(Read only property)

154.25.39 Name as string

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the name of this application.
Notes: Added Windows support in MBS Plugin 2.7 for this property.
(Read only property)

154.25.40 Path as folderitem

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the path of the Process' executable file.
Notes: Maybe nil if not available.
Use this folderitem to get an icon for the Process.
(and this icon may be nil!)
(Read only property)

154.25.41 ProcessID as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Returns the PID of the process for use in unix command line tools.
Example:

```
Function LoginWindowPID() as Integer
// returns Process ID of Loginwindow on Mac OS X.
// or 0 on error

Var p as ProcessMBS

p=new ProcessMBS
p.GetFirstProcess

do
if p.Name="loginwindow" then
Return p.ProcessID
end if
loop until not p.GetNextProcess
End Function
```

Notes: Works only on Mac OS X.
See the "CPU Focus" application for an example.

Note that this call does not make sense for Classic applications, since they all share a single UNIX process ID.
(Read only property)

154.25.42 Visible as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the application is visible.
Example:

```
// hide iTunes
```

```
Var p as new ProcessMBS

p.GetFirstProcess
do
if p.BundleID="com.apple.iTunes" then
p.Visible=false
exit
end if
loop until not p.GetNextProcess
```

Notes: Works only on Mac OS X.
Returns false if not supported.

Sets the lasterror property.
(Read and Write property)

154.25.43 Priority as Integer

MBS Util Plugin, Plugin Version: 10.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The priority of the process.
Example:

```
Var p as new ProcessMBS

p.GetCurrentProcess

MsgBox str(p.priority) // shows 0

p.priority = 5

MsgBox str(p.priority) // shows 5
```

Notes: 20 (least) to -20 (max). Setting the value may be limited due to permissions.
(Read and Write computed property)
See also:

- 154.25.44 Priority(ProcessID as Integer) as Integer 19952

154.25.44 Priority(ProcessID as Integer) as Integer

MBS Util Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Sets or gets priority for a process on Mac and Linux.
Notes: Value is in the range -20 to 20. The default priority is 0; lower priorities cause more favorable scheduling.
For Windows, please use WinSetPriorityClass and WinGetPriorityClass.
(Read and Write computed property)
See also:

- 154.25.43 Priority as Integer 19952

154.25.45 Constants

Process Transformation Types

Constant	Value	Description
kProcessTransformToBackgroundApplication	2	Turn application in a background application. functional in Mac OS X 10.7 and later
kProcessTransformToForegroundApplication	1	Turn application in a foreground application.
kProcessTransformToUIElementApplication	4	Turn application in a user interface element application. functional in Mac OS X 10.7 and later

154.26 class WindowsProcessMemoryInfoMBS

154.26.1 class WindowsProcessMemoryInfoMBS

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to get information about the memory usage of a process on Windows.
Notes: See also WindowsProcessMemoryUsageReportMBS and WindowsProcessStatisticsMBS classes.
Blog Entries

- MBS Xojo Plugins, version 17.1pr2

154.26.2 Methods

154.26.3 Constructor

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which fills the values into the properties.
Example:

```
Var w as new WindowsProcessMemoryInfoMBS
msgbox "This application uses currently "+str(w.WorkingSetSize)+" Bytes of memory."
```

Notes: Queries the current process memory information.
See also:

- 154.26.4 Constructor(ProcessID as Integer) 19954

154.26.4 Constructor(ProcessID as Integer)

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which fills the values into the properties.
Notes: Queries the process memory information of the process with the given ID.
See also:

- 154.26.3 Constructor 19954

154.26.5 Properties

154.26.6 PageFaultCount as Integer

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of page faults.
Notes: (Read only property)

154.26.7 PagefileUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current space allocated for the pagefile, in bytes. Those pages may or may not be in memory.
Notes: (Read only property)

154.26.8 PeakPagefileUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak space allocated for the pagefile, in bytes.
Notes: (Read only property)

154.26.9 PeakWorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak working set size, in bytes.
Notes: (Read only property)

154.26.10 ProcessID as Integer

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The process ID of the process queried.
Notes: Value is 0 if the query failed.
(Read only property)

154.26.11 QuotaNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak nonpaged pool usage, in bytes.
Notes: (Read only property)

154.26.12 QuotaPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current paged pool usage, in bytes.
Notes: (Read only property)

154.26.13 QuotaPeakNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current nonpaged pool usage, in bytes.
Notes: (Read only property)

154.26.14 QuotaPeakPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak paged pool usage, in bytes.
Notes: (Read only property)

154.26.15 WorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 7.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current working set size, in bytes.
Notes: This is the memory your application uses.
(Read only property)

154.27 class WindowsProcessStatisticsMBS

154.27.1 class WindowsProcessStatisticsMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to get information about process statistics on Windows.
Example:

```
Var c as new WindowsProcessStatisticsMBS
MsgBox str(C.PeakWorkingSetSize)
```

Notes: See also WindowsVMStatisticsMBS for the system memory usage.

See also WindowsProcessMemoryInfoMBS and WindowsProcessMemoryUsageReportMBS classes.

154.27.2 Methods

154.27.3 Constructor(ProcessID as Integer = -1, Mode as Integer = 255)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new object for given process and with given mode.
Example:

```
Var pid as Integer = -1
Var c as new WindowsProcessStatisticsMBS(pid, WindowsProcessStatisticsMBS.ModeMemoryCounters)
MsgBox str(C.PeakWorkingSetSize)
```

Notes: If ProcessID is -1, the current process is queried.
Mode can be a combination of the Mode* constants you want to query. The Mode property will later contain the Mode* constants combination of the values which are valid.

154.27.4 Properties

154.27.5 CreationTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time that receives the creation time of the process.
Notes: Property is valid if Mode contains ModeTimes.
(Read only property)

154.27.6 CycleTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The sum of the cycle time of all threads of the specified process.
Notes: Property is valid if Mode contains ModeTimes.
This value can only be queried on Windows Vista or newer.
(Read only property)

154.27.7 ExitTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time that receives the exit time of the process. If the process has not exited, the content of this structure is undefined.
Notes: Property is valid if Mode contains ModeTimes.
(Read only property)

154.27.8 HandleCount as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of handles in use by the process.
Example:

```
Var w as new WindowsProcessStatisticsMBS
Var n1 as Integer = w.HandleCount

Var x as new window1 // make a new window

w = new WindowsProcessStatisticsMBS
Var n2 as Integer = w.HandleCount
```

MsgBox str(n2)+" handles in used, "+str(n2-n1)+" used by second window"

Notes: Value is -1 on an error.
(Read only property)

154.27.9 KernelTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time structure that receives the amount of time that the process has executed in kernel mode.
Notes: The time that each of the threads of the process has executed in kernel mode is determined, and then all of those times are summed together to obtain this value.
Property is valid if Mode contains ModeTimes.
(Read only property)

154.27.10 Mode as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Which values have been queried.
Notes: This value is a combination of the Mode* constants.
(Read only property)

154.27.11 OtherOperationCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of I/O operations performed, other than read and write operations.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

154.27.12 OtherTransferCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes transferred during operations other than read and write operations.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

154.27.13 PageFaultCount as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of page faults.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.14 PagefileUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current space allocated for the pagefile, in bytes. Those pages may or may not be in memory.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.15 PeakPagefileUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak space allocated for the pagefile, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.16 PeakWorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak working set size, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.17 ProcessID as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The process ID of the process queried.
Notes: (Read only property)

154.27.18 QuotaNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak nonpaged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.19 QuotaPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current paged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.20 QuotaPeakNonPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current nonpaged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.21 QuotaPeakPagedPoolUsage as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak paged pool usage, in bytes.
Notes: Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.22 ReadOperationCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of read operations performed.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

154.27.23 ReadTransferCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes read.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

154.27.24 TotalIdleTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of time that the system has been idle.
Notes: (Read only property)

154.27.25 TotalKernelTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of time that the system has spent executing in Kernel mode (including all threads in all processes, on all processors).
Notes: This time value also includes the amount of time the system has been idle. So you may want to subtract idle time to get real kernel time.
(Read only property)

154.27.26 TotalUserTime as UInt64

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The amount of time that the system has spent executing in User mode (including all threads in all processes, on all processors).
Notes: If you need to know what is the percentage of the CPU time spent for user applications, you need to read this value two times and calculate the delta.
(Read only property)

154.27.27 UserTime as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A file time structure that receives the amount of time that the process has executed in user mode.
Notes: The time that each of the threads of the process has executed in user mode is determined, and then

all of those times are summed together to obtain this value.
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.28 WorkingSetSize as Int64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current working set size, in bytes.
Notes: This is the memory your application uses.
Property is valid if Mode contains ModeMemoryCounters.
(Read only property)

154.27.29 WriteOperationCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of write operations performed.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

154.27.30 WriteTransferCount as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes written.
Notes: Property is valid if Mode contains ModeIOCounters.
(Read only property)

154.27.31 Constants

Constants

Constant	Value	Description
ModeHandles	32	One of the mode constants. Whether to query the handle count.

Mode Constants

Constant	Value	Description
ModeCycleTime	8	Whether to query the cycle time.
ModeIOCounters	2	Whether to query the IOCounters.
ModeMemoryCounters	1	Whether to query the memory counters.
ModeTimes	4	Whether to query the time values.
ModeTotalTime	16	Whether to query the total CPU time values. Requires Windows XP with SP1.

154.28 class WindowsVMStatisticsMBS

154.28.1 class WindowsVMStatisticsMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Holds information about the current Windows memory status.
Notes: See also WindowsProcessStatisticsMBS, WindowsProcessMemoryInfoMBS, WindowsProcessMemoryUsageReportMBS and WindowsSystemMemoryUsageReportMBS classes.
Blog Entries

- MBS Plugins 10.3 Release Notes
- MBS REALbasic Plugins, version 10.3pr7

154.28.2 Methods

154.28.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new statistics object with current values.
Example:

```
// show values in a listbox:
Var w as new WindowsVMStatisticsMBS

list.AddRow "Pagesize: "+format(w.Pagesize,"0")
list.AddRow "MemoryLoad: "+format(w.MemoryLoad,"0")
list.AddRow "AvailablePageFileMemory: "+format(w.AvailablePageFileMemory,"0")
list.AddRow "AvailablePhysicalMemory: "+format(w.AvailablePhysicalMemory,"0")
list.AddRow "AvailableVirtualMemory: "+format(w.AvailableVirtualMemory,"0")
list.AddRow "TotalPageFileMemory: "+format(w.TotalPageFileMemory,"0")
list.AddRow "TotalPhysicalMemory: "+format(w.TotalPhysicalMemory,"0")
list.AddRow "TotalVirtualMemory: "+format(w.TotalVirtualMemory,"0")
```

154.28.4 Properties

154.28.5 AllocationGranularity as Integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The granularity for the starting address at which virtual memory can be allocated.
Notes: Typically 64 KB.

(Read only property)

154.28.6 AvailablePageFileMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the number of bytes available in the paging file.
Notes: (Read only property)

154.28.7 AvailablePhysicalMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the number of bytes of physical memory available.
Notes: (Read only property)

154.28.8 AvailableVirtualMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the number of bytes of unreserved and uncommitted memory in the user mode portion of the virtual address space of the calling process.
Notes: (Read only property)

154.28.9 Memoryload as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a number between 0 and 100 that gives a general idea of current memory utilization, in which 0 indicates no memory use and 100 indicates full memory use.
Notes: (Read only property)

154.28.10 Pagesize as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of one memory page in memory.
Notes: On Intel 80386 or newer CPUs, it should be 4096 Bytes.
(Read only property)

154.28.11 TotalPageFileMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the total number of bytes that can be stored in the paging file. Note that this number does not represent the actual physical size of the paging file on disk.
Notes: (Read only property)

154.28.12 TotalPhysicalMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the total number of bytes of physical memory.
Notes: (Read only property)

154.28.13 TotalVirtualMemory as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the total number of bytes that can be described in the user mode portion of the virtual address space of the calling process.
Notes: Value is 0 on any error.
(Read only property)

Chapter 155

ProgressView

155.1 class ProgressBackgroundViewMBS

155.1.1 class ProgressBackgroundViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The class for a background view.

155.1.2 Methods

155.1.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

155.1.4 Properties

155.1.5 BlurEffectStyle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The blur effect style, when using BackgroundStyleBlur.
Notes: Defaults to UIBlurEffectStyleLight.
(Read and Write property)

155.1.6 Color as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The background color or the blur tint color.
Notes: Defaults to nil on iOS 13 and later and [UIColor colorWithWhite:0.8f alpha:0.6f] on older systems.
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

155.1.7 ColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The background color or the blur tint color.
Example:

```
// set background color for this HUD
Var p as ProgressHUDMBS // your instance
p.backgroundView.ColorValue = &c00FF00
```

Notes: Defaults to nil on iOS 13 and later and [UIColor colorWithWhite:0.8f alpha:0.6f] on older systems.
This is the color as a Xojo color value.
(Read and Write property)

155.1.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

155.1.9 Style as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The background style.
Notes: Defaults to BackgroundStyleBlur.
(Read and Write property)

155.1.10 Constants

Styles

Constant	Value	Description
BackgroundStyleBlur	1	UIVisualEffectView or UIToolbar.layer background view.
BackgroundStyleSolidColor	0	Solid color background

155.2 class ProgressBarProgressViewMBS

155.2.1 class ProgressBarProgressViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A flat bar progress view.

155.2.2 Methods

155.2.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

155.2.4 Properties

155.2.5 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

155.2.6 LineColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar border line color.
Notes: Defaults to white [UIColor whiteColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

155.2.7 LineColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar border line color.
Notes: Defaults to white.

This is the color as a Xojo color value.
(Read and Write property)

155.2.8 Progress as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The Progress (0.0 to 1.0).
Notes: (Read and Write property)

155.2.9 ProgressColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar progress color.
Notes: Defaults to white [UIColor whiteColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

155.2.10 ProgressColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar progress color.
Notes: Defaults to white.
This is the color as a Xojo color value.
(Read and Write property)

155.2.11 ProgressRemainingColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar background color.
Notes: Defaults to clear [UIColor clearColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

155.2.12 ProgressRemainingColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Bar background color.
Notes: Defaults to clear [UIColor clearColor] .
This is the color as a Xojo color value.
(Read and Write property)

155.3 class ProgressHUDMBS

155.3.1 class ProgressHUDMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Displays a simple HUD window containing a progress indicator and two optional labels for short messages.
Notes: This is a simple drop-in class for displaying a progress HUD view similar to Apple's private UIProgressHUD class.
The MBProgressHUD window spans over the entire space given to it by the constructor and catches all user input on this region, thereby preventing the user operations on components below the view.

To still allow touches to pass through the HUD, you can set hud.userInteractionEnabled = false.
MBProgressHUD is a UI class and should therefore only be accessed on the main thread.

Xojo Developer Magazine

- 21.1, page 34: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

155.3.2 Methods

155.3.3 Constructor(Control as MobileControl)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Creates a HUD on top of the control.
See also:

- 155.3.4 Constructor(Screen as MobileScreen) 19976
- 155.3.5 Constructor(ViewHandle as Integer) 19976

155.3.4 Constructor(Screen as MobileScreen)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Creates a HUD on top of the screen.
See also:

- 155.3.3 Constructor(Control as MobileControl) 19975
- 155.3.5 Constructor(ViewHandle as Integer) 19976

155.3.5 Constructor(ViewHandle as Integer)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Creates a HUD on top of the given view handle.
See also:

- 155.3.3 Constructor(Control as MobileControl) 19975
- 155.3.4 Constructor(Screen as MobileScreen) 19976

155.3.6 Destructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The destructor.

155.3.7 hide(animated as boolean = true)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Hides the HUD.
Notes: This still calls the hudWasHidden event. This is the counterpart of the show method. Use it to hide the HUD when your task completes.

animated: If set to true the HUD will disappear using the current animationType. If set to false the HUD will not use animations while disappearing.

You may want to set RemoveFromSuperViewOnHide to false in case you like to show it again later.
See also:

- 155.3.8 hide(animated as boolean, afterDelay as Double) 19977

155.3.8 hide(animated as boolean, afterDelay as Double)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Hides the HUD after a delay.
Notes: This still calls the hudWasHidden event. This is the counterpart of the show method. Use it to hide the HUD when your task completes.

animated: If set to true the HUD will disappear using the current animationType. If set to false the HUD will not use animations while disappearing.
delay: Delay in seconds until the HUD is hidden.
See also:

- 155.3.7 hide(animated as boolean = true) 19976

155.3.9 show(animated as boolean = true)

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Displays the HUD.
Notes: You need to make sure that the main thread completes its run loop soon after this method call so that the user interface can be updated. Call this method when your task is already set up to be executed in a new thread (e.g., when using something like a thread or timer).

Animated: If set to true the HUD will appear using the current animationType. If set to false the HUD will not use animations while appearing.

155.3.10 Properties

155.3.11 AnimationType as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The animation type that should be used when the HUD is shown and hidden.
Notes: (Read and Write property)

155.3.12 backgroundView as ProgressBackgroundViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: View covering the entire HUD area, placed behind bezelView.
Example:

```
// set background color for this HUD
Var p as ProgressHUDMBS // your instance
p.backgroundView.ColorValue = &c00FF00
```

Notes: (Read only property)

155.3.13 bezelView as ProgressBackgroundViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The view containing the labels and indicator (or customView).
Notes: (Read only property)

155.3.14 ButtonTitle as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The title of the button.
Notes: (Read and Write property)

155.3.15 ButtonView as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A button that is placed below the labels.
Notes: Value is NSViewMBS object.
(Read only property)

155.3.16 ContentColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A color that gets forwarded to all labels and supported indicators.
Notes: Also sets the tintColor
for custom views on iOS 7+. Set to nil to manage color individually.
Defaults to semi-translucent black on iOS 7 and later and white on earlier iOS versions.
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

155.3.17 ContentColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A color that gets forwarded to all labels and supported indicators.
Example:

```
Var p as ProgressHUDMBS // your view

// change color to red
p.ContentColorValue = &cFF0000
```

Notes: Also sets the tintColor
for custom views on iOS 7+. Set to nil to manage color individually.
Defaults to semi-translucent black on iOS 7 and later and white on earlier iOS versions.
This is the color as a Xojo color value.
(Read and Write property)

155.3.18 defaultMotionEffectsEnabled as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: When enabled, the bezel center gets slightly affected by the device accelerometer data.
Notes: Defaults to false.

This can cause main thread checker assertions on certain devices. https://github.com/jdg/MBProgressHUD/issues/552
(Read and Write property)

155.3.19 DetailsLabelText as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The text for the details label.
Notes: The details text can span multiple lines.
(Read and Write property)

155.3.20 DetailsLabelView as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A label that holds an optional details message displayed below the labelText message.

Notes: The details text can span multiple lines.
Value is NSViewMBS object.
(Read only property)

155.3.21 graceTime as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function:

Grace period is the time (in seconds) that the invoked method may be run without showing the HUD.
Notes:

If the task finishes before the grace time runs out, the HUD will not be shown at all.
This may be used to prevent HUD display for very short tasks.
Defaults to 0 (no grace time).

The graceTime needs to be set before the hud is shown.
(Read and Write property)

155.3.22 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

155.3.23 Indicator as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The indicator control in use.
Notes: Either ProgressBarProgressViewMBS or ProgressRoundProgressViewMBS object.
(Read only property)

155.3.24 LabelText as String

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The label text.
Notes: The HUD is automatically resized to fit the entire text.

(Read and Write property)

155.3.25 LabelView as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A label that holds an optional short message to be displayed below the activity indicator. #
Notes: The HUD is automatically resized to fit the entire text.
Value is NSViewMBS object.
(Read only property)

155.3.26 margin as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The amount of space between the HUD edge and the HUD elements (labels, indicators or custom views).
Notes: This also represents the minimum bezel distance to the edge of the HUD view.
Defaults to 20.
(Read and Write property)

155.3.27 MinHeight as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The minimum size of the HUD bezel.
Notes: Defaults to zero (no minimum size).
(Read and Write property)

155.3.28 minShowTime as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The minimum time (in seconds) that the HUD is shown.
Notes: This avoids the problem of the HUD being shown and than instantly hidden.
Defaults to 0 (no minimum show time).
(Read and Write property)

155.3.29 MinWidth as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The minimum size of the HUD bezel.
Notes: Defaults to zero (no minimum size).
(Read and Write property)

155.3.30 Mode as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: MBProgressHUD operation mode.
Notes: The default is ModeIndeterminate.
(Read and Write property)

155.3.31 offsetX as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The bezel offset relative to the center of the view.
Notes: You can use MBProgressMaxOffset and -MBProgressMaxOffset to move the HUD all the way to the screen edge in each direction.
E.g., CGPointMake(0, MBProgressMaxOffset) would position the HUD centered on the bottom edge.
(Read and Write property)

155.3.32 offsetY as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The bezel offset relative to the center of the view.
Notes: You can use MBProgressMaxOffset and -MBProgressMaxOffset to move the HUD all the way to the screen edge in each direction.
E.g., CGPointMake(0, MBProgressMaxOffset) would position the HUD centered on the bottom edge.
(Read and Write property)

155.3.33 Progress as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The progress of the progress indicator, from 0.0 to 1.0.
Notes: Defaults to 0.0.

(Read and Write property)

155.3.34 RemoveFromSuperViewOnHide as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Removes the HUD from its parent view when hidden.
Notes: Defaults to false.
(Read and Write property)

155.3.35 Square as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Force the HUD dimensions to be equal if possible.
Notes: (Read and Write property)

155.3.36 userInteractionEnabled as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A Boolean value that determines whether user events are ignored and removed from the event queue.
Notes: When set to false, touch, press, keyboard, and focus events intended for the view are ignored and removed from the event queue. When set to YES, events are delivered to the view normally. The default value of this property is true.

During an animation, user interactions are temporarily disabled for all views involved in the animation, regardless of the value in this property. You can disable this behavior by specifying the UIViewAnimationOptionAllowUserInteraction option when configuring the animation.
(Read and Write property)

155.3.37 View as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The view as NSViewMBS object.
Notes: Value is NSViewMBS object.
(Read only property)

155.3.38 Events

155.3.39 buttonAction

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Called when user taps the button.

155.3.40 hudWasHidden

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Called after the HUD was fully hidden from the screen.

155.3.41 Constants

Constants

Constant	Value	Description
MaxOffset	1000000.0	The max offset constant to move to the other border.

Animations

Constant	Value	Description
AnimationFade	0	Opacity animation
AnimationZoom	1	Opacity + scale animation (zoom in when appearing zoom out when disappearing)
AnimationZoomIn	3	Opacity + scale animation (zoom in style)
AnimationZoomOut	2	Opacity + scale animation (zoom out style)

Modes

Constant	Value	Description
ModeAnnularDeterminate	3	Ring-shaped progress view.
ModeCustomView	4	Shows a custom view.
ModeDeterminate	1	A round, pie-chart like, progress view.
ModeDeterminateHorizontalBar	2	Horizontal progress bar.
ModeIndeterminate	0	A round progress indicator.
ModeText	5	Shows only labels.

155.4 class ProgressRoundProgressViewMBS

155.4.1 class ProgressRoundProgressViewMBS

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: A progress view for showing definite progress by filling up a circle (pie chart).

155.4.2 Methods

155.4.3 Constructor

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The constructor.

155.4.4 Properties

155.4.5 Annular as Boolean

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Display mode.
Notes: False = round or True = annular. Defaults to round.
(Read and Write property)

155.4.6 backgroundTintColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator background (non-progress) color.
Notes: Only applicable on iOS versions older than iOS 7.
Defaults to translucent white (alpha 0.1).
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

155.4.7 backgroundTintColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator background (non-progress) color.
Notes: Only applicable on iOS versions older than iOS 7.
Defaults to translucent white (alpha 0.1).
This is the color as a Xojo color value.
(Read and Write property)

155.4.8 Handle as Integer

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

155.4.9 Progress as Double

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: The Progress (0.0 to 1.0).
Notes: (Read and Write property)

155.4.10 progressTintColor as Variant

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator progress color.
Notes: Defaults to white [UIColor whiteColor] .
This uses NSColorMBS to wrap the UIColor.
(Read and Write property)

155.4.11 progressTintColorValue as Color

MBS iOS Plugin, Plugin Version: 22.5, Platform: iOS, Targets: iOS only.

Function: Indicator progress color.
Notes: Defaults to white.
This is the color as a Xojo color value.
(Read and Write property)

Chapter 156

Python

156.1 class PythonExceptionMBS

156.1.1 class PythonExceptionMBS

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: An exception to report problems in Python code.
Notes: See message property for details.
Subclass of the RuntimeException class.

156.2 class PythonMBS

156.2.1 class PythonMBS

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The class to use Python code in Xojo applications.
Example:

```
Var p As New PythonMBS

Var r As Variant = p.Evaluate("1+2")
Print "Result: "+r

Break
```

Notes: MBS Plugin does some exception handling for you as well as type conversion.
We convert variants to/from python as much as possible, including arrays and dictionaries.

Xojo Developer Magazine

- 23.6, page 10: News

156.2.2 Methods

156.2.3 AddCustomFunction(FunctionName as String)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Adds a custom function to Python.
Example:

```
Var p As New MyPythonMBS

p.AddCustomFunction "Test"
p.AddCustomFunction "UserName"
p.AddCustomFunction "Sum"

Var r1 As Variant = p.Evaluate("Test('test')")
Var r2 As Variant = p.Evaluate("UserName()")
Var r3 As Variant = p.Evaluate("Sum(2,3,6)")

Break
```

Notes: You can define multiple functions all with different names.
Function names are case sensitive.
See also:

- 156.2.4 AddCustomFunction(FunctionName as String, theDelegate as CustomFunctionCalledMBS) 19989

156.2.4 AddCustomFunction(FunctionName as String, theDelegate as CustomFunctionCalledMBS)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Adds a custom function to call the delegate instead of the event.
See also:

- 156.2.3 AddCustomFunction(FunctionName as String) 19988

156.2.5 AddSysPath(Path as String)

MBS Python Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Adds a file path to the system path list.
Notes: This allows you to add the path to the current virtual environment.

156.2.6 Clear

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Clears the variables in the Python environment.
Example:

```
Var p As New PythonMBS

p.Value("Hello") = 123.0
p.Clear

Var check As Boolean = p.HasValue("Hello")

Break
```

156.2.7 Constructor

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The constructor.

156.2.8 DeleteValue(Key as String)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Deletes a variable in the Python environment.
Example:

```
Var p As New PythonMBS

p.Value("Hello") = 123.0
p.DeleteValue "Hello"

Var check As Boolean = p.HasValue("Hello")

Break
```

156.2.9 Evaluate(Expression as String) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Evaluates an expression in Python.
Example:

```
Var p As New PythonMBS

Var r As Variant = p.Evaluate("1+2")
Print "Result: "+r

Break
```

Notes: Pass an expression to evaluate with Python.
Returns the result of the expression.

May raise a PythonExceptionMBS exception.

156.2.10 HasValue(Key as String) as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Checks whether a variable is set for the Python environment.
Example:

```
Var p As New PythonMBS

p.Value("Hello") = 123.0
Var hasIt As Boolean = p.HasValue("Hello")
Var hasNothing As Boolean = p.HasValue("other")

Break
```

Notes: Returns true if variable is set.

156.2.11 Keys as Variant()

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries the list of names for values.

Example:

```
Var p As New MyPythonMBS

p.AddCustomFunction "Test"
p.Value("Other") = 123

For Each key As Variant In p.keys
Print "key: "+key
Next

Break
```

Notes: This includes the registered custom functions.

156.2.12 Load(File as FolderItem) as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Loads the Python library.
Notes: You may need to check what version you have as the paths usually contain version numbers.
See also:

- 156.2.13 Load(Path as String) as Boolean 19992

156.2.13 Load(Path as String) as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Loads the Python library.
Example:

```
const path = "/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework"

Var loaded As Boolean = PythonMBS.Load(path)

Print "Error: "+PythonMBS.LibraryError
Print "Version: "+PythonMBS.LibraryVersion
```

Notes: You may need to check what version you have as the paths usually contain version numbers.

e.g.

MacOS:	/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework
Windows:	C:\Users\cs\AppData\Local\Programs\Python\Python312\python312.dll
Linux:	libpython3.11.so

See also:

- 156.2.12 Load(File as FolderItem) as Boolean 19992

156.2.14 Run(Script as String) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Runs a Python script.
Example:

```
Var p As New MyPythonMBS

// calls print event
Call p.run("print('Hello')")
```

Notes: Pass the script text to run.
Returns the result of the script.

156.2.15 RunFile(File as FolderItem) as Variant

MBS Python Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Runs a Python script file.
Notes: Returns the result of the script.

156.2.16 Properties

156.2.17 ExecPrefix as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the exec-prefix for installed platform-dependent files.
Notes: This is derived through a number of complicated rules from the program name set with Py_SetPro-

gramName() and some environment variables; for example, if the program name is '/usr/local/bin/python', the exec-prefix is '/usr/local'.
The value is available to Python code as sys.exec_prefix. It is only useful on Unix.

Background: The exec-prefix differs from the prefix when platform dependent files (such as executables and shared libraries) are installed in a different directory tree. In a typical installation, platform dependent files may be installed in the /usr/local/plat subtree while platform independent may be installed in /usr/local.

Generally speaking, a platform is a combination of hardware and software families, e.g. Sparc machines running the Solaris 2.x operating system are considered the same platform, but Intel machines running Solaris 2.x are another platform, and Intel machines running Linux are yet another platform. Different major revisions of the same operating system generally also form different platforms. Non-Unix operating systems are a different story; the installation strategies on those systems are so different that the prefix and exec-prefix are meaningless, and set to the empty string. Note that compiled Python bytecode files are platform independent (but not independent from the Python version by which they were compiled!).

System administrators will know how to configure the mount or automount programs to share /usr/local between platforms while having /usr/local/plat be a different filesystem for each platform.
(Read only property)

156.2.18 Handle as Integer

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

156.2.19 LibraryBuildInfo as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return information about the sequence number and build date and time of the current Python interpreter instance.
Example:

MessageBox PythonMBS.LibraryBuildInfo

Notes: The value is available to Python code as part of the variable sys.version.

e.g. returns "main, Dec 3 2024, 17:59:52"

(Read only property)

156.2.20 LibraryCompiler as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return an indication of the compiler used to build the current Python version, in square brackets.
Example:

MessageBox PythonMBS.LibraryCompiler

Notes: The value is available to Python code as part of the variable sys.version.

e.g. returns [Clang 16.0.0 (clang-1600.0.26.4)]
(Read only property)

156.2.21 LibraryCopyright as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the official copyright string for the current Python version.
Example:

MessageBox PythonMBS.LibraryCopyright

Notes: The value is available to Python code as sys.copyright.
(Read only property)

156.2.22 LibraryError as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The error message from Load methods in case of the error.
Notes: (Read only property)

156.2.23 LibraryPlatform as String

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the platform identifier for the current platform.
Example:

MessageBox PythonMBS.LibraryPlatform

Notes: On Unix, this is formed from the ‚Äúofficial‚Äù name of the operating system, converted to lower case, followed by the major revision number; e.g., for Solaris 2.x, which is also known as SunOS 5.x, the value is 'sunos5'. On macOS, it is 'darwin'. On Windows, it is 'win'.
The value is available to Python code as sys.platform.

Value is e.g. "darwin" on macOS.
(Read only property)

156.2.24 LibraryVersion as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries the version text of the Python library.
Notes: Returns e.g. "3.12.3 (main, Apr 9 2024, 08:09:14) [Clang 15.0.0 (clang-1500.3.9.4)] "
(Read only property)

156.2.25 Loaded as Boolean

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries whether Python libraries have been loaded.
Notes: Returns true if loaded or false if not.
(Read only property)

156.2.26 MonotonicTime as Int64

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Read the monotonic clock.

Example:

MessageBox PythonMBS.MonotonicTime.ToString

Notes: e.g. 1221942957636375
(Read only property)

156.2.27 Path as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the default module search path.
Notes: This is computed from the program name (set by assigning ProgramName) and some environment variables. The returned string consists of a series of directory names separated by a platform dependent delimiter character. The delimiter character is ':' on Unix and macOS, ';' on Windows.
The list sys.path is initialized with this value on interpreter startup; it can be (and usually is) modified later to change the search path for loading modules.

e.g.
/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework/Versions/3.12/lib/python312.zip:/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework/Versions/3.12/lib/python3.12:/opt/homebrew/Cellar/python@3.12/3.12.3/Frameworks/Python.framework/Versions/3.12/lib/python3.12/lib-dynload
(Read only property)

156.2.28 Prefix as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the prefix for installed platform-independent files.
Notes: This is derived through a number of complicated rules from the program name set with Py_SetProgramName() and some environment variables; for example, if the program name is '/usr/local/bin/python', the prefix is '/usr/local'.
The value is available to Python code as sys.prefix. It is only useful on Unix.
(Read only property)

156.2.29 ProgramFullPath as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Return the full program name of the Python executable
Notes: This is computed as a side-effect of deriving the default module search path from the program name (set by assignment to ProgramName).
The value is available to Python code as sys.executable.
This is usually the path to your Xojo application.
(Read only property)

156.2.30 ProgramName as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The program name.
Notes: Can be set before initializing Python, otherwise the default will be "python".
(Read and Write property)

156.2.31 PythonHome as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The default "home" path.
Notes: The value is set by a previous with setting PythonHome property, or the value is the value of the PYTHONHOME environment variable if it is set.
(Read and Write property)

156.2.32 RecursionLimit as Integer

MBS Python Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The recursion limit.
Notes: Default is 1000.
(Read and Write property)

156.2.33 Time as Int64

MBS Python Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Read the ‚Äúwall clock‚Äù time.
Example:

MessageBox PythonMBS.Time.ToString

Notes: Return the time in seconds since the epoch as a floating-point number. The handling of leap seconds is platform dependent. On Windows and most Unix systems, the leap seconds are not counted towards the time in seconds since the epoch. This is commonly referred to as Unix time.

e.g. 1743330201673808000
(Read only property)

156.2.34 ValueCount as Integer

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Queries number of variables.
Example:

```
Var p As New PythonMBS

Print "ValueCount: " + p.ValueCount.ToString

p.Value("Hello") = 123.0

Print "ValueCount: " + p.ValueCount.ToString

p.DeleteValue "Hello"

Print "ValueCount: " + p.ValueCount.ToString
```

Notes: See Keys method to get list of names.
(Read only property)

156.2.35 Value(Key as String) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: Get or set a local variable in Python.
Example:

```
Var p As New MyPythonMBS
```

```
p.Value("Hello") = 123.0
Var d As Double = p.Value("Hello")

break
```

Notes: Data types are converted as far as possible.
(Read and Write computed property)

156.2.36 Events

156.2.37 Flush

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The flush event sent when print is done.

156.2.38 FunctionCall(FunctionName as String, Args() as Variant) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The event raised if a custom function is called.
Example:

```
Function FunctionCall(FunctionName as String, Args() as Variant) Handles FunctionCall as Variant
Print CurrentMethodName

Select Case FunctionName
Case "Test"
Return Args(0)
case "UserName"
Return SystemInformationMBS.UserName
Case "Sum"
Var d As Double = 0

For Each v As Double In args
d = d + v
Next

Return d
End Select
```

```
Exception r As RuntimeException
Return Introspection.GetType(r).name+": "+r.message

End Function
```

Notes: Please use try/catch to catch any exceptions in your functions.
Check with the name which function is called.
Function names are case sensitive.

156.2.39 Input(Args() as Variant) as String

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The input event.
Notes: Called when the input function is called in Python.
Please return whatever text to pass back to the Python script.

156.2.40 Print(text as String)

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The event called when print function is used in Python.
Example:

```
Sub Print(text as String) Handles Print
Print CurrentMethodName
Print "received: " + Text
End Sub
```

156.2.41 Delegates

156.2.42 CustomFunctionCalledMBS(Args() as Variant) as Variant

MBS Python Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, iOS, Targets: Desktop, Console & Web.

Function: The delegate for custom functions.

Chapter 157

Quartz Composer

157.1 control DesktopQCViewControlMBS

157.1.1 control DesktopQCViewControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control to host a QCView properly.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 15.1pr2

157.1.2 Properties

157.1.3 View as QCViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The QCView in use by this control.
Notes: Please use this property to access the actual view and make your settings and load the data to render.
(Read only property)

157.1.4 Events

157.1.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

157.1.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

157.1.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

157.1.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

157.1.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

157.1.10 DidStartRendering

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Rendering did start notification.

157.1.11 DidStopRendering

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Rendering did stop notification.

157.1.12 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

157.1.13 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

157.1.14 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

157.1.15 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

157.1.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

157.1.17 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

157.1.18 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

157.1.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

157.1.20 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

157.1.21 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

157.2 class QCCompositionMBS

157.2.1 class QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The composition class.
Notes: The QCComposition class represents a Quartz Composer composition that either:

- comes from the system-wide composition repository (/Library/Compositions and textasciitilde /Library/Compositions) where it can be accessed by any application through the methods of the QCCompositionRepository class
- is created from an arbitrary source (typically a file on disk) using one of its methods

This class cannot be subclassed.

A QCComposition object has the following information associated with it and that you can obtain by using the appropriate method of the QCComposition class:

- Attributes include the name and description of the composition, copyright information, and whether or not its provided by OS X (built-in).
- The protocols that the composition conforms to. A composition protocol defines a set of required and optional input parameters and output results.

Many methods of the QCRenderer, QCCompositionLayer, and QCView classes take a QCComposition object as a parameter.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr2

157.2.2 Methods

157.2.3 compositionWithData(data as MemoryBlock) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with the contents of a Quartz Composer composition file.
Example:

```
Var data as MemoryBlock // composition file content in MemoryBlock variable
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithData(data)
```

Notes: data: The contents of a file created with the Quartz Composer developer tool.

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 157.2.4 compositionWithData(data as string) as QCCompositionMBS 20009

157.2.4 compositionWithData(data as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with the contents of a Quartz Composer composition file.
Example:

```
Var data as string // composition file content in string variable
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithData(data)
```

Notes: data: The contents of a file created with the Quartz Composer developer tool.

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 157.2.3 compositionWithData(data as MemoryBlock) as QCCompositionMBS 20008

157.2.5 compositionWithFile(file as folderitem) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with a Quartz Composer composition file.
Example:

```
Var file as folderitem // your folderitem
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithFile(file)
```

Notes: file: A path to a file created with the Quartz Composer developer tool (.qtz extension).

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 157.2.6 compositionWithFile(path as string) as QCCompositionMBS 20010

157.2.6 compositionWithFile(path as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a composition object initialized with a Quartz Composer composition file.
Example:

```
Var path as string = "/System/Library/Compositions/Rollercoaster.qtz" // your path
Var q as QCCompositionMBS = QCCompositionMBS.compositionWithFile(path)
```

Notes: file: A path to a file created with the Quartz Composer developer tool (.qtz extension).

Returns a Quartz Composer composition object or nil if there is an error.
See also:

- 157.2.5 compositionWithFile(file as folderitem) as QCCompositionMBS 20009

157.2.7 Constructor

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

157.2.8 copy as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the composition.

157.2.9 getAttributes as dictionary

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the attributes of the composition.

157.2.10 inputKeys as string()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array listing the keys that identify the input ports of the root patch of the composition.

157.2.11 outputKeys as string()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array listing the keys that identify the output ports of the root patch of the composition.

157.2.12 protocols as string()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of protocols to which the composition conforms.

157.2.13 QCCompositionAttributeBuiltInKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
Var b as Boolean = d.Value(c.QCCompositionAttributeBuiltInKey)
MsgBox str(b)
```

Notes: The key for the composition origin. The associated value is a Boolean value.
True indicates the composition is built-in (provided by OS X).

157.2.14 QCCompositionAttributeCategoryKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
Var b as string = d.Lookup(c.QCCompositionAttributeCategoryKey, "?")
MsgBox b
```

Notes: The composition category. The associated value is a category constant. See Categories.

157.2.15 QCCompositionAttributeCopyrightKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
Var b as string = d.Value(c.QCCompositionAttributeCopyrightKey)
MsgBox b
```

Notes: The key for composition copyright information.
The associated value is a string.

157.2.16 QCCompositionAttributeDescriptionKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Notes: The key for the composition description.
The associated value is a string.

157.2.17 QCCompositionAttributeHasConsumersKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Notes: The key for a composition that has consumer patches. The associated value is a Boolean value. True indicates that the composition has consumers.

157.2.18 QCCompositionAttributeIsTimeDependentKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Notes: The key for the composition time dependency. The associated value is a Boolean value. True indicates that the composition is time dependent.

157.2.19 QCCompositionAttributeNameKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard attribute names.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
Var d as Dictionary = c.getattributes
MsgBox d.Value(c.QCCompositionAttributeNameKey)
```

Notes: The key for the composition name.
The associated value is a string.

157.2.20 QCCompositionCategoryDistortion as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the category names.
Notes: A composition that produces a distortion effect.

157.2.21 QCCompositionCategoryStylize as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the category names.
Notes: A composition that produces a stylize effect.

157.2.22 QCCompositionCategoryUtility as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the category names.
Notes: A utility composition.

157.2.23 QCCompositionInputAudioPeakKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputAudioPeak. The value must be in the [0,1] range as a mono signal with no decay applied.

157.2.24 QCCompositionInputAudioSpectrumKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A structure input port whose key is inputAudioSpectrum. The structure must contain 16 values in the [0,1] range representing 16 spectrum bands of the mono signal from low to high frequencies with no decay applied.

157.2.25 QCCompositionInputDestinationImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputDestinationImage.

157.2.26 QCCompositionInputImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputImage.

157.2.27 QCCompositionInputPaceKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputPace. The value must be in the [0,1] range.

157.2.28 QCCompositionInputPreviewModeKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A Boolean input port whose key is inputPreviewMode. When the value of this input port is set to TRUE, the composition that provides this port must be able to run in a low-quality mode that produces a preview of the composition.

157.2.29 QCCompositionInputPrimaryColorKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A color input port whose key is inputPrimaryColor.

157.2.30 QCCompositionInputScreenImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputScreenImage.

157.2.31 QCCompositionInputSecondaryColorKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A color input port whose key is inputSecondaryColor.

157.2.32 QCCompositionInputSourceImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: An image input port whose key is inputSourceImage.

157.2.33 QCCompositionInputTrackInfoKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A structure input port whose key is inputTrackInfo. The structure contains optional entries, such as "name", "artist", "album", "duration", "artwork", and so on.

157.2.34 QCCompositionInputTrackPositionKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputTrackPosition. The value must be expressed in seconds.

157.2.35 QCCompositionInputTrackSignalKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A Boolean input port whose key is inputTrackSignal.

157.2.36 QCCompositionInputXKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputX. The value must be normalized to the image width with the origin on the left.

157.2.37 QCCompositionInputYKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard input key names.
Notes: A number input port whose key is inputY. The value must be normalized to the image height with the origin at the bottom.

157.2.38 QCCompositionOutputImageKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard output key names.
Notes: An image output port whose key is outputImage.

157.2.39 QCCompositionOutputWebPageURLKey as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard output key names.
Notes: A string output port whose key is outputWebPageURL.

157.2.40 QCCompositionProtocolGraphicAnimation as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that renders a generic graphical animation. It has the option to use QCCompositionInputPrimaryColorKey for the primary color of the animation, QCCompositionInputSecondaryColorKey for the secondary color of the animation, QCCompositionInputPaceKey for the global pace of the animation, and QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

Available in OS X v10.5 and later.

157.2.41 QCCompositionProtocolGraphicTransition as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that performs a transition between two images, using a transition time in range of 0 to 1. A conforming composition must use the input keys QCCompositionInputSourceImageKey for the starting image and QCCompositionInputDestinationImageKey for the image to transition to. The composition can optionally use QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

157.2.42 QCCompositionProtocolImageFilter as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that applies an effect to a source image. A conforming composition must use the input key QCCompositionInputImageKey for the source image and QCCompositionOutputImageKey for the output image. The composition can optionally use QCCompositionInputXKey to specify the X position of the center point of the effect, QCCompositionInputYKey to specify the Y position of the center point of the

effect, andQCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes.

157.2.43 QCCompositionProtocolMusicVisualizer as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that acts as a visualizer for music. A conforming composition must use the input key QCCompositionInputAudioPeakKey for the instantaneous audio peak and the QCCompositionInputAudioSpectrumKey for the instantaneous audio spectrum. It can optionally use the QCCompositionInputTrackInfoKey to indicate it receives information about the current track and the QCCompositionInputTrackSignalKey to indicate the start of a new track.

Available in OS X v10.5 and later.

157.2.44 QCCompositionProtocolScreenSaver as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the standard protocol names.
Notes: A composition that can be used as a screen saver. The composition has the option to use QCCompositionInputScreenImageKey for a screenshot image of the screen that the screen saver runs on, QCCompositionInputPreviewModeKey to indicate if the animation should run in lower-quality for preview purposes, and QCCompositionOutputWebPageURLKey for a URL to open in the default web browser when screen saver exits (only allowed if screen saver password is disabled).

Available in OS X v10.5 and later.

157.2.45 Properties

157.2.46 Description as String

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The description for the composition.
Notes: (Read only property)

157.2.47 Handle as Integer

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

157.2.48 identifier as String

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The identifier for the composition.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.allCompositions
MsgBox a(0).identifier
```

Notes: The unique identifier for the composition if it comes from the composition repository; "" otherwise. (Read only property)

157.2.49 Name as String

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name for the composition.
Example:

```
Var c as QCCompositionMBS = QCCompositionMBS.compositionWithFile("/System/Library/Compositions/Rollercoaster.qtz")
MsgBox c.name
```

Notes: (Read only property)

157.3 class QCCompositionRepositoryMBS

157.3.1 class QCCompositionRepositoryMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system-wide Quartz Composer composition repository.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.allCompositions
MsgBox str(a.Ubound+1)+" compositions installed"
```

Notes: The QCCompositionRepository class represents a system-wide centralized repository of built-in and installed Quartz Composer compositions (/Library/Compositions and
textasciitilde /Library/Compositions). The QCCompositionRepository class cannot be subclassed.

Compositions in the repository are represented by the QCComposition class. You can use the methods of the QCCompositionRepository class to fetch all compositions or only those that meet specific criteria.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr2

157.3.2 Methods

157.3.3 allCompositions as QCCompositionMBS()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array that contains all compositions currently in the composition repository.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.allCompositions
MsgBox str(a.Ubound+1)+" compositions installed"
```

157.3.4 Compositions(protocols() as String = nil, attributes as Dictionary = nil) as QCCompositionMBS()

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of compositions that match a set of criteria.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var a() As QCCompositionMBS = r.Compositions( array( QCCompositionMBS.QCCompositionProtocolImageFilter))
MsgBox str(a.Ubound+1)+" compositions found"
```

Notes: protocols: The protocols that you want compositions to conform to. Pass nil if you don,Äôt want to filter based on the protocol. You can pass any of these protocols: QCCompositionProtocolAnimation, QCCompositionProtocolImageProducer, QCCompositionProtocolImageFilter, QCCompositionProtocolImageCompositor, QCCompositionProtocolImageTransition, and QCCompositionProtocolScreenSaverRSS.
attributes: A dictionary that contains the attributes, and their associated values, that you want compositions to match. Pass nil if you don,Äôt want to filter based on the attributes. For example, you can pass any of these attributes: QCCompositionAttributeNameKey, QCCompositionAttributeDescriptionKey, QCCompositionAttributeCopyrightKey, QCCompositionAttributeBuiltInKey, and QCCompositionAttributeTimeDependentKey.

Returns an array of QCComposition objects that meet the supplied criteria.

157.3.5 compositionWithIdentifier(identifier as string) as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the composition that corresponds to the identifier.
Example:

```
Var r as QCCompositionRepositoryMBS = QCCompositionRepositoryMBS.sharedCompositionRepository
Var c as QCCompositionMBS = r.compositionWithIdentifier("/swing")
MsgBox c.Name
```

Notes: identifier: A string that uniquely identifies the composition to retrieve.

Returns the composition identified by the provided string, or nil if there is no composition with that identifier in the composition repository.

157.3.6 Constructor

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

157.3.7 loadPlugIn(file as folderitem) as Boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to load a Quartz Composer plug-in from a .plugin bundle at the specified path and returns true on success.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.plugin")
Var r as Boolean = QCCompositionRepositoryMBS.loadPlugIn(f)

if r then
MsgBox "OK"
else
MsgBox "Failed"
end if
```

Notes: This method will do nothing if the plug-in was already loaded.
See also:

- 157.3.8 loadPlugIn(path as string) as Boolean 20022

157.3.8 loadPlugIn(path as string) as Boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Attempts to load a Quartz Composer plug-in from a .plugin bundle at the specified path and returns true on success.
Notes: This method will do nothing if the plug-in was already loaded.
See also:

- 157.3.7 loadPlugIn(file as folderitem) as Boolean 20022

157.3.9 QCCompositionRepositoryDidUpdateNotification as string

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The new of the notification which is posted whenever the list of compositions in the composition repository is updated.

157.3.10 sharedCompositionRepository as QCCompositionRepositoryMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the shared instance of the composition repository.

157.3.11 Properties

157.3.12 Handle as Integer

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

157.4 control QCViewControlMBS

157.4.1 control QCViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The control to host a QCView properly.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 15.1pr2

157.4.2 Properties

157.4.3 View as QCViewMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The QCView in use by this control.
Notes: Please use this property to access the actual view and make your settings and load the data to render.
(Read only property)

157.4.4 Events

157.4.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

157.4.6 Close

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

157.4.7 Closing

Plugin Version: 15.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

157.4.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

157.4.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

157.4.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

157.4.11 DidStartRendering

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Rendering did start notification.

157.4.12 DidStopRendering

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Rendering did stop notification.

157.4.13 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

157.4.14 FocusLost

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

157.4.15 FocusReceived

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

157.4.16 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

157.4.17 GotFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

157.4.18 LostFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

157.4.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

157.4.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

157.4.21 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

157.4.22 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

157.4.23 Open

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

157.4.24 Opening

Plugin Version: 15.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

157.4.25 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

157.4.26 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

157.5 class QCViewMBS

157.5.1 class QCViewMBS

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The QCView class is a custom NSView class that loads, plays, and controls Quartz Composer compositions.
Notes: It is an autonomous view that is driven by an internal timer running on the main thread.

The view can be set to render a composition automatically when it is placed onscreen. The view stops rendering when it is placed offscreen. When not rendering, the view is filled with the current erase color. The rendered composition automatically synchronizes to the vertical retrace of the monitor.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

157.5.2 Methods

157.5.3 Constructor

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new Quartz composer view with size 100/100 and position 0/0
Example:

```
Var t as new QCViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 157.5.4 Constructor(Handle as Integer) 20031
- 157.5.5 Constructor(left as Double, top as Double, width as Double, height as Double) 20031

157.5.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given QCView handle.
Example:

```
Var t as new QCViewMBS(0, 0, 100, 100)
Var v as new QCViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a QCView and the plugin retains this handle.
See also:

- 157.5.3 Constructor 20030
- 157.5.5 Constructor(left as Double, top as Double, width as Double, height as Double) 20031

157.5.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new Quartz composer view with the given size and position.
Example:

```
Var x as new QCViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 157.5.3 Constructor 20030
- 157.5.4 Constructor(Handle as Integer) 20031

157.5.6 erase

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Clears the view using the current erase color.

157.5.7 getAttributes as dictionary

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the attributes of the composition associated with the renderer.
Notes: Returns a dictionary that contains the attributes that describe the composition, including the input and output ports of the root patch.

The dictionary can define any of the attributes that are specified by the composition attribute keys. See QCCompositionAttributeNameKey, QCCompositionAttributeDescriptionKey, and QCCompositionAttributeCopyrightKey.

The dictionary can also contain dictionaries that correspond to the keys that identify the input and output ports of the root patch of the composition. See QCPortAttributeTypeKey, QCPortAttributeNameKey, QCPortAttributeMinimumValueKey, QCPortAttributeMaximumValueKey, and QCPortAttributeMenuItemsKey.

Available in Mac OS X v10.4 and later.

157.5.8 inputKeys as string()

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array that contains the keys that identify the input ports of the root patch of the composition.

157.5.9 loadComposition(composition as QCCompositionMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Loads a QCComposition object into the view.
Notes: Returns true if successful; otherwise false.
If unsuccessful, any composition that's already loaded in the view remains loaded.

157.5.10 loadCompositionFromData(data as MemoryBlock) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition from memoryblock.
Notes: If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:

- 157.5.11 loadCompositionFromData(data as string) as boolean

157.5.11 loadCompositionFromData(data as string) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition from data string.
Notes: If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.
Available in Mac OS X v10.4 and later.
See also:

- 157.5.10 loadCompositionFromData(data as MemoryBlock) as boolean 20032

157.5.12 loadCompositionFromFile(file as folderitem) as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition file located at the specified path.
Notes: file: A folderitem that specifies the location of a Quartz Composer composition file.

If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.

Available in Mac OS X v10.4 and later.
See also:

- 157.5.13 loadCompositionFromFile(filepath as string) as boolean 20033

157.5.13 loadCompositionFromFile(filepath as string) as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Loads the composition file located at the specified path.
Notes: filepath: A string that specifies the location of a Quartz Composer composition file.

If unsuccessful, returns false; any composition that's already loaded in the view remains loaded.

Available in Mac OS X v10.4 and later.
See also:

- 157.5.12 loadCompositionFromFile(file as folderitem) as boolean 20033

157.5.14 outputKeys as string()

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array that contains the keys that identify the output ports of the root patch of the composition.

157.5.15 pauseRendering

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Pauses rendering in the view.
Notes: You can nest calls to this method.
Available in Mac OS X v10.5 and later.

157.5.16 resumeRendering

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Resumes rendering a paused composition.
Notes: You can nest calls to this method.
Available in Mac OS X v10.5 and later.

157.5.17 setValueForInputKey(value as Variant, key as string) as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Sets the value for an input port of a composition.
Notes: value: The value to set for the input port. The input port must be at the root patch of the composition. The data type of the value argument must match the input port.
key: The key associated with the input port of the composition. This method throws an exception if key is invalid.

Returns false if it cannot set the value.
Available in Mac OS X v10.4 and later.

157.5.18 startRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Starts rendering the composition that is in the view.
Notes: Returns false if the composition fails to start rendering; true otherwise.
Available in Mac OS X v10.4 and later.

157.5.19 stopRendering

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Stops rendering the composition that is in the view.
Notes: Available in Mac OS X v10.4 and later.

157.5.20 unloadComposition

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Unloads the composition from the view.
Notes: If necessary, this method calls stopRendering prior to unloading the composition.
Available in Mac OS X v10.5 and later.

157.5.21 valueForInputKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the value for an input port of a composition.
Notes: key: The key associated with an input port for the root patch of a composition. This method throws an exception if key is invalid.

Returns the value. The data type of returned value depends on the type of the input port.
Available in Mac OS X v10.4 and later.

157.5.22 valueForOutputKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the value for an output port of a composition.
Notes: key
The key associated with an output port for the root patch of a composition. This method throws an exception if key is invalid.

Returns the value as Xojo variant. The data type of returned value depends on the type of the output port.

157.5.23 Properties

157.5.24 autostartsRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Whether the composition that is in the view starts rendering automatically when the view is put on the screen.
Notes: Available in Mac OS X v10.4 and later.
(Read and Write property)

157.5.25 eraseColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The color used to erase the view.
Notes: Available in Mac OS X v10.4 and later.
(Read and Write property)

157.5.26 eventForwardingMask as Integer

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The mask used to filter which types of events are forwarded from the view to the composition during rendering.
Notes: mask: An event filtering mask. The mask can be a combination of any of the mask constants listed in Table below (defined in NSEventMBS) or the constant NSAnyEventMask.

(Read and Write property)

157.5.27 isPausedRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether or not the rendering in the view is paused.
Notes: True if the rendering is paused; otherwise false.
Available in Mac OS X v10.5 and later.
(Read only property)

Constant	Description
NSLeftMouseDownMask	The user pressed the left button.
NSLeftMouseDraggedMask	The user moved the mouse with the left button down.
NSLeftMouseUpMask	The user released the left button.
NSRightMouseDownMask	The user pressed the right button.
NSRightMouseDraggedMask	The user moved the mouse with the right button down.
NSRightMouseUpMask	The user released the right button.
NSOtherMouseDownMask	The user pressed the middle button, or some button other than the left or right button.
NSOtherMouseDraggedMask	The user moved the mouse with the middle button down, or some button other than the left or right button.
NSOtherMouseUpMask	The user released the middle button, or some button other than the left or right button.
NSMouseMovedMask	The user moved the mouse without holding down a mouse button.
NSScrollWheelMask	The user moved the mouse scroll wheel.
NSKeyDownMask	The user generated a character or characters by pressing a key.
NSKeyUpMask	The user released a key.
NSFlagsChangedMask	The user pressed or released a modifier key, or toggled the Caps Lock key.

157.5.28 isRendering as boolean

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Checks whether a composition is rendering in the view.
Notes: Returns true if a composition is rendering in the view; false otherwise.
Available in Mac OS X v10.5 and later.
(Read only property)

157.5.29 loadedComposition as QCCompositionMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Returns the composition loaded in the view.
Notes: (Read only property)

157.5.30 maxRenderingFrameRate as Double

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The maximum rendering frame rate.
Notes: Pass 0.0 to specify that there is no limit.
Available in Mac OS X v10.4 and later.
(Read and Write property)

157.5.31 snapshotImage as NSImageMBS

MBS MacControls Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns an NSImage object of the current image in the view.
Notes: Available in Mac OS X v10.5 and later.
(Read only property)

Chapter 158

QuickLook

158.1 control DesktopQLPreviewViewControlMBS

158.1.1 control DesktopQLPreviewViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a QLPreviewViewMBS.
Blog Entries

- News from the MBS Xojo Plugins Version 23.3
- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 15.0pr8

158.1.2 Properties

158.1.3 View as QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view this control shows.
Notes: (Read only property)

158.1.4 Events

158.1.5 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

158.1.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

158.1.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

158.1.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

158.1.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

158.1.10 FocusLost

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

158.1.11 FocusReceived

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

158.1.12 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

158.1.13 MenuBarSelected

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

158.1.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

158.1.15 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

158.1.16 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

158.1.17 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

158.1.18 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

158.1.19 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

158.2 class QLPreviewControllerMBS

158.2.1 class QLPreviewControllerMBS

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: A specialized view controller for previewing an item.
Notes: A QLPreviewController can display previews for many common file types, including the following:

- iWork documents
- Microsoft Office documents
- Rich text format, or RTF, documents
- PDF files
- Images
- Text files with a uniform type identifier that conforms to the public.text type. To learn more, see Uniform type identifiers.
- Comma-separated values, or CSV, files
- 3D models in the USDZ format with both standalone and AR views for viewing the model

The list of supported common file types may change between operating system releases. In addition, you can enable previews for your own file types by implementing your own preview extension.

With editing mode, you get the PDF markup editor right into your Xojo application.

See QLPreviewViewControlMBS for desktop macOS projects.
See WinPreviewControlMBS control for Windows targets.

158.2.2 Methods

158.2.3 AddItem(item as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Adds an item to the list of items to show.
Notes: Please call reloadData if you modify the list of items.
See also:

- 158.2.4 AddItem(item as FolderItem, title as String) 20045

158.2.4 AddItem(item as FolderItem, title as String)

MBS iOS Plugin, Plugin Version: 25.5, Platform: iOS, Targets: iOS only.

Function: Adds an item to the list of items to show.
Notes: This method allows you to add an optional title for the item, which is different to the file name.

Please call reloadData if you modify the list of items.
See also:

- 158.2.3 AddItem(item as FolderItem) 20045

158.2.5 AddItems(items() as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Add multiple years.
Notes: Please call reloadData if you modify the list of items.

158.2.6 canPreviewItem(file as FolderItem) as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Returns a Boolean value that indicates whether the preview controller can display an item.
Notes: If the system can,Äôt display an item, but you still attempt to display it, a Quick Look preview controller displays a generic error. Always check whether you can display an item before choosing to do so.

158.2.7 ClearItems

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Remove all items.

158.2.8 Constructor

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The constructor.

158.2.9 Destructor

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The destructor.

158.2.10 Dismiss

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Dismisses the controller.

158.2.11 Items as FolderItem()

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Queries list of items to show.

158.2.12 Present

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Presents the controller.

158.2.13 refreshCurrentPreviewItem

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Asks the Quick Look preview controller to recompute the display of the current preview item.
Notes: Quick Look recomputes the display regardless of whether the current preview item changes.

158.2.14 reloadData

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Asks the preview controller to reload its data from its data source.
Notes: Quick Look recomputes the displayed data only if the current preview item changes.

158.2.15 SetItems(items() as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Replaces the list of items.
Notes: Please call reloadData if you modify the list of items.

158.2.16 Properties

158.2.17 currentPreviewItem as FolderItem

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The item displaying in the Quick Look preview controller.
Notes: If the preview controller isn,Äôt displaying an item, this property,Äôs value is nil.
(Read only property)

158.2.18 currentPreviewItemIndex as Integer

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The index within the preview item navigation list of the item displaying in the Quick Look preview controller.
Notes: You can change which item the preview controller displays, among those in a navigation list, by setting this property,Äôs value. If the preview controller isn,Äôt displaying an item, this property,Äôs value is -1.

(Read and Write property)

158.2.19 Handle as Integer

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

158.2.20 Events

158.2.21 DidDismiss

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the preview was closed.

158.2.22 didSaveEditedCopyOfPreviewItem(Item as FolderItem, modifiedContentsFile as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the preview item,Äôs edited content was successfully saved to a copy at the given URL.
Notes: The platform invokes this callback with an edited copy of the preview item at modifiedContentsFile. It invokes the callback in the following scenarios:

- The editing mode of the previewItem is EditingModeCreateCopy.
- The editing mode of the previewItem is EditingModeUpdateContents and the system can,Äôt overwrite its previewItemURL. In this case, modifiedContentsURL points to a temporary file on disk containing the edited copy.
- The editing mode of the preview item is EditingModeUpdateContents and its content type doesn,Äôt match the content type of the edited version. This mismatch means that the file type of the file at modifiedContentsURL may be different from the file type of the preview item.

The platform may invoke the callback multiple times consecutively with the successive edited versions of the preview item. It typically invokes the callback once for each time the user saves their edits.

158.2.23 didUpdateContentsOfPreviewItem(Item as FolderItem)

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the content of a preview was updated successfully.
Notes: The platform invokes this callback after the preview controller successfully overwrites the file at the previewItem location with an updated file.

The platform may invoke the callback multiple times consecutively with the successive edited versions of the preview item. It typically invokes the callback once for each time the user saves their edits.

158.2.24 editingModeForPreviewItem(Item as FolderItem) as Integer

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Returns a value that indicates how the preview controller handles edits to the content of the previewed file.
Notes: Return a value that indicates whether the previewed content is editable and how Quick Look saves the edits. If you return EditingModeUpdateContents or EditingModeCreateCopy to allow edits to a preview, make sure to implement the appropriate callbacks.

The platform invokes this callback when the preview controller loads its data. The system calls it for each preview item that it passes to the data source of the preview controller.
By default, a preview controller doesn,Äôt allow edits to a preview. However, you can implement this method to allow the user to edit the previewed document, and specify the behavior for saving changes. The supported set of edits may change over time, but currently includes adding markup to images or PDFs, as well as simple edits to video files.
If you want to update the underlying file in place, return EditingModeUpdateContents, and implement both the didUpdateContentsOfPreviewItem and didSaveEditedCopyOfPreviewItem delegate methods. The Quick Look feature calls didUpdateContentsOfPreviewItem first and updates the preview item,Äôs content. If it can,Äôt update the item directly, it invokes didSaveEditedCopyOfPreviewItem and creates a copy of the preview item,Äôs content that contains the edits.
If you prefer to always save edits to a copy of the preview item,Äôs content, return EditingModeCreateCopy and implement didSaveEditedCopyOfPreviewItem.

158.2.25 shouldOpenURL(URL as String, Item as FolderItem) as Boolean

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Whether the preview controller should open a URL.
Notes: The system invokes this method when the user taps a URL link in a preview. If you return true, the Quick Look preview controller invokes the openURL method on the UIApplication object, sending it the value of the url parameter. If you return false, the system doesn,Äôt invoke the openURL method and you

can do something yourself.

If you don,Äôt implement this method, it defaults to returning true.

158.2.26 WillDismiss

MBS iOS Plugin, Plugin Version: 23.3, Platform: iOS, Targets: iOS only.

Function: Tells you that the preview is about to close.

158.2.27 Constants

Editing Modes

Constant	Value	Description
EditingModeCreateCopy	2	Represents the mode to create a copy of the file and perform the edits on the copy.
EditingModeDisabled	0	Represents the mode to disable edit mode for the file.
EditingModeUpdateContents	1	Represents the mode to update the file directly without creating a copy.

158.3 class QLPreviewPanelMBS

158.3.1 class QLPreviewPanelMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The QLPreviewPanel class implements the Preview Panel - a user interface object that displays the preview of a list of items.
Notes: Every application only has on instance of QLPreviewPanel.

Use QLPreviewControllerMBS to do similar on iOS or WinPreviewControlMBS for previews on Windows.
Subclass of the NSPanelMBS class.
Blog Entries

158.3.2 Methods

158.3.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether this panel is available.
Notes: Returns true on Snow Leopard.

158.3.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new panel.

158.3.5 currentPreviewItem as folderitem

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The currently previewed item in the preview panel or nil if there is none.

158.3.6 enterFullScreenMode(screen as NSScreenMBS)

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Enters full screen mode.
Notes: If panel is not on-screen, the panel will go directly to full screen mode.

158.3.7 exitFullScreenMode

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Exits full screen mode.

158.3.8 refreshCurrentPreviewItem

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview Panel to recompute the preview of the currently previewed item.

158.3.9 reloadData

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview Panel to reload its data from its data source.
Notes: This method does not refresh the visible item if it has not changed.

158.3.10 updateController

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview Panel to update its current controller.
Notes: The Preview Panel automatically updates its controller (by searching the responder chain) whenever the main or key window changes. Invoke updateController if the responder chain changes without explicit notice.

158.3.11 Properties

158.3.12 currentPreviewItemIndex as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The index of the currently previewed item in the preview panel or NSNotFound (-1) if there is none.
Notes: (Read and Write property)

158.3.13 inFullScreenMode as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: True if the panel is currently open and in full screen mode.
Notes: (Read only property)

158.3.14 PreviewView as QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the preview view in the panel.
Notes: (Read only property)

158.3.15 Events

158.3.16 beginPreviewPanel

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the panel begins.

158.3.17 didLoadPreviewItem(file as folderitem)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This event is called after an item has been loaded.

158.3.18 endPreviewPanel

MBS MacFrameworks Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the panel ends.

158.3.19 handleEvent(e as NSEventMBS) as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Invoked by the preview panel when it receives an event it doesn't handle.
Example:

```
Function handleEvent(e as NSEventMBS) Handles handleEvent as boolean
if e.type = NSEventMBS.NSKeyDown then

if e.keyCode = 125 then
System.DebugLog "cursor down pressed"
elseif e.keyCode = 126 then
System.DebugLog "cursor up pressed"
end if

else

if e.keyCode = 125 then
System.DebugLog "cursor down released"
elseif e.keyCode = 126 then
System.DebugLog "cursor up released"
end if

end if

Return false
End Function
```

Notes: Returns true if you did not handle this event.

158.3.20 numberOfPreviewItems as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The event called to ask you for the number of items that the preview panel should preview.

158.3.21 previewItemAtIndex(index as Integer) as folderitem

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The event is called to ask you for the item with the given index.

158.3.22 sourceFrameOnScreenForPreviewItem(file as folderitem) as NSRectMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Invoked when the preview panel opens or closes to provide a zoom effect.
Notes: Return a zero rect if there is no origin point, this will produce a fade of the panel. The coordinates are screen based.

158.3.23 transitionImageForPreviewItem(file as folderitem, byref contentRect as NSRectMBS) as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Called to ask you for the transition image for a given preview item.
Notes: Invoked when the preview panel opens or closes to provide a smooth transition when zooming.

contentRect: The rect within the image that actually represents the content of the document. For example, for icons the actual rect is generally smaller than the icon itself.

Return an image the panel will crossfade with when opening or closing. You can specify the actual "document" content rect in the image in contentRect.

158.3.24 willLoadPreviewItem(file as folderitem)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This event is called before an item is loaded.

158.4 control QLPreviewViewControlMBS

158.4.1 control QLPreviewViewControlMBS

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a QuickLook preview view.
Notes: See QLPreviewViewMBS class.

See QLPreviewControllerMBS for iOS projects.
See WinPreviewControlMBS control for Windows targets.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 15.0pr8

158.4.2 Properties

158.4.3 View as QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view this control shows.
Notes: (Read only property)

158.4.4 Events

158.4.5 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

158.4.6 Close

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

158.4.7 Closing

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

158.4.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

158.4.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

158.4.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

158.4.11 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

158.4.12 FocusLost

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

158.4.13 FocusReceived

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

158.4.14 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

158.4.15 GotFocus

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

158.4.16 LostFocus

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

158.4.17 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

158.4.18 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

158.4.19 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

158.4.20 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

158.4.21 Open

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

158.4.22 Opening

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

158.4.23 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

158.4.24 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

158.5 class QLPreviewViewMBS

158.5.1 class QLPreviewViewMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The class for using a preview view from QuickLook in Xojo.
Notes: If you want to show previews of files in your application, use this view. For example if you not just want to show previews of pictures, but also from Movies, PDF, Office and iWork files.
Requires Mac OS X 10.6 or newer.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.

Use QLPreviewViewControlMBS to have this view as a control.
See WinPreviewControlMBS for something similar on Windows.
Subclass of the NSViewMBS class.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

158.5.2 Methods

158.5.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.6 or newer.

158.5.4 close

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Closes the receiver, releasing the current preview item.
Notes: Once the receiver has closed, it will no longer accept preview items.

The application is required to call close when the receiver is no longer needed if shouldCloseWithWindow is false.
The close method will be called automatically when the window closes if shouldCloseWithWindow is true.

158.5.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new quicklook preview view with size 100/100 and position 0/0
Example:

```
Var t as new QLPreviewViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 158.5.6 Constructor(Handle as Integer) 20063
- 158.5.7 Constructor(left as Double, top as Double, width as Double, height as Double) 20063
- 158.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer) 20064

158.5.6 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given QLPreviewView handle.
Example:

```
Var t as new QLPreviewViewMBS(0, 0, 100, 100)
Var v as new QLPreviewViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a QLPreviewView and the plugin retains this handle.
See also:

- 158.5.5 Constructor 20063
- 158.5.7 Constructor(left as Double, top as Double, width as Double, height as Double) 20063
- 158.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer) 20064

158.5.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new QuickLook preview view with the given size and position.
Example:

```
Var x as new QLPreviewViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 158.5.5 Constructor 20063
- 158.5.6 Constructor(Handle as Integer) 20063
- 158.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer) 20064

158.5.8 Constructor(left as Double, top as Double, width as Double, height as Double, style as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new QuickLook preview view with the given size and position.
Example:

```
Var view as new QLPreviewViewMBS(0, 0, 200, 200, QLPreviewViewMBS.StyleCompact)
```

Notes: On success the handle property is not zero.

On Mac OS X 10.7 or later we use the new style parameter to create a Preview view with the given style.
See also:

- 158.5.5 Constructor 20063
- 158.5.6 Constructor(Handle as Integer) 20063
- 158.5.7 Constructor(left as Double, top as Double, width as Double, height as Double) 20063

158.5.9 refreshPreviewItem

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Asks the Preview view to recompute the preview of the currently previewed item.

158.5.10 Properties

158.5.11 autostarts as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether playback of audio/video files automatically starts.
Notes: (Read and Write computed property)

158.5.12 previewItem as folderitem

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The current visible item in the view.
Notes: (Read and Write computed property)

158.5.13 shouldCloseWithWindow as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Set whether the receiver closes when its window closes.
Notes: See close method.
(Read and Write computed property)

158.5.14 Constants

Preview View Styles

Constant	Value	Description
StyleCompact	1	Use in inspectors.
StyleNormal	0	Use in full previews.

158.6 class QLThumbnailGenerationRequestMBS

158.6.1 class QLThumbnailGenerationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: A request to generate a thumbnail for a file.
Example:

var request as New QLThumbnailGenerationRequestMBS(file, 512, 512, QLThumbnailGenerationRequestMBS.RequestRepresentationTypeIcon)
request.iconMode = True

Blog Entries

- News from the MBS Xojo Plugins Version 24.2
- MBS Xojo Plugins, version 24.2pr4

158.6.2 Methods

158.6.3 Constructor(File as FolderItem, width as Integer = 512, height as Integer = 512, scale as double = 2.0, representationTypes as Integer = &hFF)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a new request for a thumbnail with the specified parameters for a file.
Notes: File: The file for which you want to create a thumbnail.
width and height: The desired size of the thumbnails.
scale: The scale of the thumbnails. This parameter usually represents the scale of the current screen. However, you can pass a screen scale to the initializer that isn,Äôt the current device,Äôs screen scale. For example, you can create thumbnails for different scales and upload them to a server in order to download them later on devices with a different screen scale.
representationTypes: The different thumbnail types. For a list of all possible thumbnail representation types, see constants.

158.6.4 Properties

158.6.5 contentType as String

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The content type of the source file.
Notes: The content type of the file being thumbnailed is used to determine the provider of the thumbnail

and the icon styles applied if iconMode is requested. By default the content type is derived from the file extension. Setting this property will override the derived content type. This is useful for files that don,Äôt have meaningful extensions but for which you may already know the content type.
(Read and Write property)

158.6.6 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

158.6.7 height as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired size of the thumbnails that should be generated.
Notes: (Read only property)

158.6.8 iconMode as Boolean

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Whether to add icon art.
Notes: If set to true, this will generate something appropriate for display as a file icon, meaning that the thumbnail might be embedded in a frame, show a curled corner, draw a background and/or a drop shadow, as appropriate for the platform. If set to NO, this will generate a raw undecorated thumbnail. Defaults to false.
(Read and Write property)

158.6.9 minimumDimension as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The minimum dimenstion.
Notes: Defaults to 0. If set, the thumbnail will have a width and height greater or equal to minimumDimension * scale. If set and it is not possible to generate thumbnails of minimumDimension for any of the requested types, no thumbnail will be provided.
(Read and Write property)

158.6.10 representationTypes as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired successive representations of the thumbnail that should be generated when possible.
Notes: (Read only property)

158.6.11 scale as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired scale of the thumbnails that should be generated.
Notes: This will usually be the scale of the screen.
You can for instance pass a scale different from the one of the screen if you would like to save generated thumbnails to a server to later download them on devices with a different screen scale.
(Read only property)

158.6.12 width as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The desired size of the thumbnails that should be generated.
Notes: (Read only property)

158.6.13 Constants

Representation Types

Constant	Value	Description
RequestRepresentationTypeAll	&hFF	The thumbnail type to generate all possible thumbnail repr
RequestRepresentationTypeIcon	1	A file icon representation of a file.
RequestRepresentationTypeLowQualityThumbnail	2	A faster to generate version of the thumbnail that may s speed.
RequestRepresentationTypeThumbnail	4	A thumbnail representation of a file.

158.7 class QLThumbnailGeneratorMBS

158.7.1 class QLThumbnailGeneratorMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: An object that generates thumbnail images based on provided requirements.
Blog Entries

158.7.2 Methods

158.7.3 cancelRequest(request as QLThumbnailGenerationRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Cancels the generation of a thumbnail for a given request.

158.7.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The constructor.

158.7.5 generateBestRepresentationForRequest(request as QLThumbnailGenerationRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Generates the best possible thumbnail representation for a file and calls a handler upon completion.
Notes: request: The request that contains information about the thumbnail that you want to create.

Calls generateBestRepresentationForRequestCompleted event later.

158.7.6 generateRepresentationsForRequest(request as QLThumbnailGenerationRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Generates various thumbnail representations for a file and calls the update handler for each thumbnail representation.
Notes: request: The request that contains information about the thumbnail that you want to create.

Calls generateRepresentationsForRequestUpdated event later.

158.7.7 saveBestRepresentationForRequest(request as QLThumbnailGenerationRequestMBS, file as FolderItem, contentType as String)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Saves the best representation of thumbnail for a specific request to the specified URL.
Notes: request: The request that you used to generate a thumbnail.
fileURL: The destination to which you save the generated thumbnail.
contentType: The content type of the thumbnail image that you want to save. Use a type that is supported by CGImageDestinationRef, such as kUTTypePNG or kUTTypeJPEG.

158.7.8 sharedGenerator as QLThumbnailGeneratorMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The singleton thumbnail generator instance.

158.7.9 Properties

158.7.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

158.7.11 Events

158.7.12 generateBestRepresentationForRequestCompleted(request as QLThumbnailGenerationRequestMBS, thumbnail as QLThumbnailRepresentationMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The completion event to call when the thumbnail generation completes.
Notes: It is always called when QLThumbnailGenerator finishes the generation of a requested thumbnail.

thumbnail: The most representative version of the requested thumbnail or nil if QLThumbnailGeneratorMBS was unable to generate a thumbnail.
error: An error object that indicates why the thumbnail generation failed, or nil if the thumbnail generation succeeded.

158.7.13 generateRepresentationsForRequestUpdated(request as QLThumbnailGenerationRequestMBS, thumbnail as QLThumbnailRepresentationMBS, type as Integer, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The handler to call successively for each requested representation of a thumbnail.
Notes: QuickLookThumbnailing calls the updateHandler in order of lower quality to higher quality thumbnail types. If a better quality thumbnail becomes available before a lower quality one, the framework may skip the call to the updateHandler for the lower quality thumbnail.

You can rely on QuickLookThumbnailing to call the updateHandler at least once by the time it finishes the creation of thumbnails with either the best requested thumbnail, or an error object.

The handler takes the following parameters:
thumbnail: A thumbnail that is successfully generated or nil if QLThumbnailGenerator is unable to generate a thumbnail.
type: The type of the generated thumbnail representation.
error: An error object that indicates why the thumbnail generation failed, or nil if the thumbnail generation succeeded.

158.7.14 saveBestRepresentationForRequestCompleted(request as QLThumbnailGenerationRequestMBS, error as NSErrorMBS, file as FolderItem)

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The handler to call when saving the thumbnail to disk.
Notes: error: An error object that indicates why saving a thumbnail image failed, or nil if saving the thumbnail succeeded.

158.8 class QLThumbnailRepresentationMBS

158.8.1 class QLThumbnailRepresentationMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: Information about the thumbnail that the thumbnail generator returns.
Notes: QuickLook Thumbnailing is a non-UI framework, so your app doesn,Äôt have to link to either UIKit or AppKit. Quicklook Thumbnailing generates a thumbnail as a Core Graphics image object and makes the thumbnail available as the CGImage property.
If an app links to AppKit or UIKit, the thumbnail is available through the NSImage or UIImage properties.
For more information on the different types of thumbnails that QLThumbnailGenerator can create, see type constants.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 24.2pr4

158.8.2 Methods

158.8.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

158.8.4 Properties

158.8.5 CGImage as Variant

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: A thumbnail in the form of a Core Graphics image object.
Notes: Value is a CGImageMBS object.
(Read only property)

158.8.6 contentRectHeight as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

158.8.7 contentRectLeft as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

158.8.8 contentRectTop as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

158.8.9 contentRectWidth as Double

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The rectangle within the thumbnail image of the document that represents its contents.
Notes: (Read only property)

158.8.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

158.8.11 NSImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: A thumbnail in the form of an image object.
Notes: Contains NSImage on macOS and UIImage on iOS.
(Read only property)

158.8.12 Picture as Picture

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The image as a Xojo picture.
Notes: (Read only property)

158.8.13 Type as Integer

MBS MacFrameworks Plugin, Plugin Version: 24.2, Platforms: macOS, iOS, Targets: All.

Function: The type of thumbnail.
Notes: (Read only property)

158.8.14 Constants

Types

Constant	Value	Description
TypeIcon	0	A file icon representation of an image.
TypeLowQualityThumbnail	1	A cached thumbnail representation of an image.
TypeThumbnail	2	A thumbnail representation of an image.

Chapter 159

QuickTime

159.1 class QTAudioChannelDescriptionMBS

159.1.1 class QTAudioChannelDescriptionMBS

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The description for an audio channel.
Blog Entries

- MBS Xojo Plugins, version 25.6pr2
- MBS Real Studio Plugins, version 11.3pr8

159.1.2 Properties

159.1.3 ChannelFlags as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: Flags that control the interpretation of Coordinates.
Notes: (Read and Write property)

159.1.4 ChannelLabel as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The AudioChannelLabel that describes the channel.
Notes: (Read and Write property)

159.1.5 Coordinates(index as Integer) as Double

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: An ordered triple that specifies a precise speaker location.
Notes: Index from 0 to 2.
(Read and Write computed property)

159.1.6 Constants

Coordinates array Indexes

Constant	Value	Description
kAudioChannelCoordinates_Azimuth	0	For spherical coordinates, 0 is front center, positive is right, negative This is measured in degrees.
kAudioChannelCoordinates_BackFront	1	For rectangulare coordinates, negative is back and positive is front.
kAudioChannelCoordinates_Distance	2	For spherical coordinates, the units are described by flags.
kAudioChannelCoordinates_DownUp	2	For rectangulare coordinates, negative is below ground level, 0 is groun and positive is above ground level.
kAudioChannelCoordinates_Elevation	1	For spherical coordinates, +90 is zenith, 0 is horizontal, -90 is nadir. measured in degrees.
kAudioChannelCoordinates_LeftRight	0	For rectangulare coordinates, negative is left and positive is right.

Channel Coordinate Flags

Constant	Value	Description
kAudioChannelFlags_AllOff	0	All flags off.
kAudioChannelFlags_Meters	4	Set to indicate the units are in meters, clear to indicate the uni to the unit cube or unit sphere.
kAudioChannelFlags_RectangularCoordinates	1	The channel is specified by the cartesioan coordinates of the spe This flag is mutally exclusive with kAudioChannelFlags_Spherica
kAudioChannelFlags_SphericalCoordinates	2	The channel is specified by the spherical coordinates of the spe This flag is mutally exclusive with kAudioChannelFlags_Recta nates.

Channel Label Constants

Constant	Value	Description
kAudioChannelLabel_Ambisonic_W	200	
kAudioChannelLabel_Ambisonic_X	201	
kAudioChannelLabel_Ambisonic_Y	202	
kAudioChannelLabel_Ambisonic_Z	203	
kAudioChannelLabel_Center	3	
kAudioChannelLabel_CenterSurround	9	WAVE: "Back Center" or plain "Rear Surround"
kAudioChannelLabel_CenterSurroundDirect	44	back center, non diffuse
kAudioChannelLabel_ClickTrack	304	
kAudioChannelLabel_DialogCentricMix	43	
kAudioChannelLabel_Discrete	400	
kAudioChannelLabel_Discrete_0	&h10000	
kAudioChannelLabel_Discrete_1	&h10001	
kAudioChannelLabel_Discrete_10	&h1000A	
kAudioChannelLabel_Discrete_11	&h1000B	
kAudioChannelLabel_Discrete_12	&h1000C	
kAudioChannelLabel_Discrete_13	&h1000D	
kAudioChannelLabel_Discrete_14	&h1000E	
kAudioChannelLabel_Discrete_15	&h1000F	
kAudioChannelLabel_Discrete_2	&h10002	
kAudioChannelLabel_Discrete_3	&h10003	
kAudioChannelLabel_Discrete_4	&h10004	
kAudioChannelLabel_Discrete_5	&h10005	
kAudioChannelLabel_Discrete_6	&h10006	
kAudioChannelLabel_Discrete_65535	&h1FFFF	
kAudioChannelLabel_Discrete_7	&h10007	
kAudioChannelLabel_Discrete_8	&h10008	
kAudioChannelLabel_Discrete_9	&h10009	
kAudioChannelLabel_ForeignLanguage	305	
kAudioChannelLabel_Haptic	45	
kAudioChannelLabel_HeadphonesLeft	301	
kAudioChannelLabel_HeadphonesRight	302	
kAudioChannelLabel_HearingImpaired	40	
kAudioChannelLabel_Left	1	
kAudioChannelLabel_LeftCenter	7	
kAudioChannelLabel_LeftSurround	5	WAVE: "Back Left"
kAudioChannelLabel_LeftSurroundDirect	10	WAVE: "Side Left"
kAudioChannelLabel_LeftTotal	38	matrix encoded 4 channels
kAudioChannelLabel_LeftWide	35	
kAudioChannelLabel_LFE2	37	
kAudioChannelLabel_LFEScreen	4	
kAudioChannelLabel_Mono	42	
kAudioChannelLabel_MS_Mid	204	
kAudioChannelLabel_MS_Side	205	
kAudioChannelLabel_Narration	41	
kAudioChannelLabel_RearSurroundLeft	33	
kAudioChannelLabel_RearSurroundRight	34	
kAudioChannelLabel_Right	2	
kAudioChannelLabel_RightCenter	8	
kAudioChannelLabel_RightSurround	6	WAVE: "Back Right"
kAudioChannelLabel_RightSurroundDirect	11	WAVE: "Side Right"
kAudioChannelLabel_RightTotal	39	matrix encoded 4 channels
kAudioChannelLabel_RightWide	36	
kAudioChannelLabel_TopBackCenter	17	
kAudioChannelLabel_TopBackLeft	16	
kAudioChannelLabel_TopBackRight	18	
kAudioChannelLabel_TopCenterSurround	12	
kAudioChannelLabel_Unknown	&hFFFFFFFF	Unknown or unspecified other use.
kAudioChannelLabel_Unused	0	Channel is present, but has no intended use or destinatio

159.2 class QTAudioChannelLayoutMBS

159.2.1 class QTAudioChannelLayoutMBS

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The class is used to specify channel layouts in files and hardware.
Notes: This class does not use QuickTime functions as it only wraps data structures. And it can be used with Mac App Store and AVFoundation.

Some channel abbreviations used for the constants:

- L - left
- R - right
- C - center
- Ls - left surround
- Rs - right surround
- Cs - center surround
- Rls - rear left surround
- Rrs - rear right surround
- Lw - left wide
- Rw - right wide
- Lsd - left surround direct
- Rsd - right surround direct
- Lc - left center
- Rc - right center
- Ts - top surround
- Vhl - vertical height left
- Vhc - vertical height center
- Vhr - vertical height right
- Lt - left matrix total. for matrix encoded stereo.
- Rt - right matrix total. for matrix encoded stereo.

159.2.2 Methods

159.2.3 GetNumberOfChannels(layoutTag as UInt32) as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: Function to get the number of channels out of an AudioChannelLayoutTag.
Notes: The low 16 bits of an AudioChannelLayoutTag gives the number of channels except for kAudioChannelLayoutTag_UseChannelDescriptions and kAudioChannelLayoutTag_UseChannelBitmap.

159.2.4 Memory as Memoryblock

MBS Main Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: All.

Function: Returns the audio channel layout as memoryblock, so you can pass it for declares.

159.2.5 Properties

159.2.6 ChannelBitmap as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: If ChannelLayoutTag is set to kAudioChannelLayoutTag_UseChannelBitmap, this field is the channel usage bitmap.
Notes: (Read and Write property)

159.2.7 ChannelLayoutTag as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The AudioChannelLayoutTag that indicates the layout.
Notes: (Read and Write property)

159.2.8 NumberChannelDescriptions as UInt32

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: The number of items in the ChannelDescriptions array.
Notes: (Read and Write property)

159.2.9 ChannelDescriptions(index as Integer) as QTAudioChannelDescriptionMBS

MBS Main Plugin, Plugin Version: 11.3, Platforms: macOS, Windows, Targets: All.

Function: An array of AudioChannelDescriptions that describe the layout.
Notes: Index from 0 to NumberChannelDescriptions-1.
(Read and Write computed property)

159.2.10 Constants

Channel Bitmap Constants

Constant	Value	Description
kAudioChannelBit_Center	4	
kAudioChannelBit_CenterSurround	256	WAVE: "Back Center"
kAudioChannelBit_Left	1	
kAudioChannelBit_LeftCenter	64	
kAudioChannelBit_LeftSurround	16	WAVE: "Back Left"
kAudioChannelBit_LeftSurroundDirect	512	WAVE: "Side Left"
kAudioChannelBit_LFEScreen	8	
kAudioChannelBit_Right	2	
kAudioChannelBit_RightCenter	128	
kAudioChannelBit_RightSurround	32	WAVE: "Back Right"
kAudioChannelBit_RightSurroundDirect	1024	WAVE: "Side Right"
kAudioChannelBit_TopBackCenter	65536	
kAudioChannelBit_TopBackLeft	32768	
kAudioChannelBit_TopBackRight	131072	
kAudioChannelBit_TopCenterSurround	2048	
kAudioChannelBit_VerticalHeightCenter	8192	WAVE: "Top Front Center"
kAudioChannelBit_VerticalHeightLeft	4096	WAVE: "Top Front Left"
kAudioChannelBit_VerticalHeightRight	16384	WAVE: "Top Front Right"

AAC layout constants

Constant	Value	Description
kAudioChannelLayoutTag_AAC_3_0	&h720003	C L R
kAudioChannelLayoutTag_AAC_4_0	&h740004	C L R Cs
kAudioChannelLayoutTag_AAC_5_0	&h780005	C L R Ls Rs

159.3 class QTSoundStreamMBS

159.3.1 class QTSoundStreamMBS

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: A class for the QTSoundOutput component which outputs sound using a given AudioUnit.
Notes: Not supported for 64 bit targets.
Blog Entries

- MBS Real Studio Plugins, version 11.4pr2

159.3.2 Methods

159.3.3 AttachToAudioUnitComponent(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Attaches the Sound Output component to a given Audio Unit component.
Notes: Returns the error code. (0 for success)
You may call AudioUnitInitialize and AudioOutputUnitStart after this to start the output unit.
See also:

- 159.3.4 AttachToAudioUnitComponent(componenthandle as Integer, element as Integer) as Integer 20087

159.3.4 AttachToAudioUnitComponent(componenthandle as Integer, element as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Attaches the Sound Output component to a given Audio Unit component.
Notes: Returns the error code. (0 for success)
You may call AudioUnitInitialize and AudioOutputUnitStart after this to start the output unit.
See also:

- 159.3.3 AttachToAudioUnitComponent(componenthandle as Integer) as Integer 20087

159.3.5 AudioOutputUnitStart(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Starts the output unit.
Notes: Returns a Mac OS errro code (0 for success).

159.3.6 AudioUnitInitialize(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Initializes the output unit.
Notes: Returns a Mac OS errro code (0 for success).

159.3.7 closeComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Closes the Sound Output component.

159.3.8 InitComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Initializes the sound output component.
Notes: Allocates memory for example.

159.3.9 OpenComponent

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Opens the SoundOutput component.

159.3.10 OpenDefaultAudioUnitOutputComponent as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Opens the default audio unit component and returns the handle.
Notes: Returns 0 on any error.
The component is only available on Mac OS X, so this function will return 0 on all other platforms.

159.3.11 Properties

159.3.12 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: The component handle.
Notes: (Read and Write property)

159.3.13 IsOpen as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Whether the sound output component has been opened yet.
Notes: Returns false on any error.
(Read only property)

159.3.14 IsStreamActive as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: True in case the stream is active.
Notes: Returns false on any error.
(Read only property)

159.3.15 PostsStatusNotifications as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Whether status notificiations should be posted.
Notes: (Read and Write property)

159.3.16 Release as Boolean

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Whether the constructor should release the handle.
Notes: (Read and Write property)

159.3.17 SoundOutputComponentHandle as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: The handle of the used component instance.
Notes: (Read only property)

160.1.2 Methods

160.1.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

160.1.4 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

160.1.5 Properties

160.1.6 AppId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The app-id.
Notes: (Read and Write property)

160.1.7 ClusterId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cluster ID.
Notes: (Read and Write property)

160.1.8 ContentEncoding as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content-encoding.
Notes: (Read and Write property)

160.1.9 ContentType as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content-type.
Notes: (Read and Write property)

160.1.10 CorrelationId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The correlation-id.
Notes: (Read and Write property)

160.1.11 DeliveryMode as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The delivery-mode.
Notes: (Read and Write property)

160.1.12 Expiration as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The expiration.
Notes: (Read and Write property)

160.1.13 Flags as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Bit-mask of set fields.
Notes: (Read and Write property)

160.1.14 HasAppId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagAppId.
Notes: (Read and Write property)

160.1.15 HasClusterId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagClusterId.
Notes: (Read and Write property)

160.1.16 HasContentEncoding as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagContentEncoding.
Notes: (Read and Write property)

160.1.17 HasContentType as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagContentType.
Notes: (Read and Write property)

160.1.18 HasCorrelationId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagCorrelationId.
Notes: (Read and Write property)

160.1.19 HasDeliveryMode as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagDeliveryMode.
Notes: (Read and Write property)

160.1.20 HasExpiration as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagExpiration.
Notes: (Read and Write property)

160.1.21 HasHeaders as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagHeaders.
Notes: (Read and Write property)

160.1.22 HasMessageId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagMessageId.
Notes: (Read and Write property)

160.1.23 HasPriority as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagPriority.
Notes: (Read and Write property)

160.1.24 HasReplyTo as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagReplyTo.
Notes: (Read and Write property)

160.1.25 HasTimestamp as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagTimestamp.
Notes: (Read and Write property)

160.1.26 HasType as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagType.
Notes: (Read and Write property)

160.1.27 HasUserId as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience property to set/get Flags with kFlagUserId.
Notes: (Read and Write property)

160.1.28 Headers as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Dictionary with headers.
Notes: (Read and Write property)

160.1.29 MessageId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The message ID.
Notes: (Read and Write property)

160.1.30 Priority as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The priority.
Notes: (Read and Write property)

160.1.31 ReplyTo as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reply to field.
Notes: (Read and Write property)

160.1.32 Timestamp as UInt64

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The timestamp.
Notes: (Read and Write property)

160.1.33 Type as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type field.
Notes: (Read and Write property)

160.1.34 UserId as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The user id.
Notes: (Read and Write property)

160.1.35 Constants

Delivery modes

Constant	Value	Description
kDeliveryNonPersistent	1	Non-persistent message.
kDeliveryPersistent	2	Persistent message

Field flags

Constant	Value	Description
kFlagAppId	8	AppID field is set.
kFlagClusterId	4	ClusterId field is set.
kFlagContentEncoding	16384	ContentEncoding field is set.
kFlagContentType	32768	ContentType field is set.
kFlagCorrelationId	1024	CorrelationId field is set.
kFlagDeliveryMode	4096	DeliveryMode field is set.
kFlagExpiration	256	Expiration field is set.
kFlagHeaders	8192	Headers field is set.
kFlagMessageId	128	MessageId field is set.
kFlagPriority	2048	Priority field is set.
kFlagReplyTo	512	ReplyTo field is set.
kFlagTimestamp	64	Timestamp field is set.
kFlagType	32	Type field is set.
kFlagUserId	16	UserId field is set.

160.2 class RabbitMQConnectionInfoMBS

160.2.1 class RabbitMQConnectionInfoMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class ot parse an URL.
Blog Entries

- News from the MBS Xojo Plugins Version 21.2
- Bringing RabbitMQ to Xojo

160.2.2 Methods

160.2.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Sets default values for properties.

The default values are:

- user: "guest"
- password: "guest"
- host: "localhost"
- vhost: "/"
- port: 5672

See also:

- 160.2.4 Constructor(URL as String) 20098

160.2.4 Constructor(URL as String)

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse a connection URL.
Notes: An amqp connection url takes the form:

amqp:// [$ USERNAME [:$ PASSWORD] @] $ HOST [:$ PORT] / [$ VHOST]

Examples:
amqp://guest:guest@localhost:5672//
amqp://guest:guest@localhost/myvhost

Any missing parts of the URL will be set to the defaults specified in other Constructor. For amqps: URLs the default port will be set to 5671 instead of 5672 for non-SSL URLs.

We raise UnsupportedOperationException if parsing failes.
See also:

- 160.2.3 Constructor 20098

160.2.5 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

160.2.6 Properties

160.2.7 Host as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The hostname of the broker.
Notes: (Read only property)

160.2.8 Password as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The password to authenticate with the broker.
Notes: default on most brokers is 'guest'
(Read only property)

160.2.9 Port as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The port that the broker is listening on.
Notes: default on most brokers is 5672.
(Read only property)

160.2.10 SSL as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to use SSL.
Notes: (Read only property)

160.2.11 User as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The username to authenticate with the broker.
Notes: default on most broker is 'guest'
(Read only property)

160.2.12 VHost as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The virtual host on the broker to connect to.
Notes: a good default is "/"
(Read only property)

160.3 class RabbitMQConnectionMBS

160.3.1 class RabbitMQConnectionMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a RabbitMQ connection to a server.
Notes: Our plugin converts from dictionary/array/variant to/from the encoded representation used in MQ automatically.

- Bringing RabbitMQ to Xojo

160.3.2 Methods

160.3.3 BasicAck(channel as Integer, deliveryTag as UInt64, multiple as Boolean = false) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Acknowledges a message.
Notes: Does a basic.ack on a received message.

channel: the channel identifier
deliveryTag: the delivery tag of the message to be ack'd.
multiple: if true, ack all messages up to this delivery tag, if false ack only this delivery tag.

Returns error code, 0 on success, 0 >on failing to send the ack to the broker. this will not indicate failure if something goes wrong on the broker.

160.3.4 BasicCancel(channel as Integer, consumerTag as String) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Cancels a channel.

160.3.5 BasicConsume(channel as Integer, queue as String, consumerTag as String, noLocal as Boolean, noAck as Boolean, exclusive as Boolean, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Basic consume.

160.3.6 BasicGet(channel as Integer, queue as String, noAck as Boolean) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do a basic.get.
Notes: Synchronously polls the broker for a message in a queue, and retrieves the message if a message is in the queue.

channel: the channel identifier to use
queue: the queue name to retrieve from
noAck: if true the message is automatically ack'ed if false BasicAck() should be called once the message retrieved has been processed

Returns RabbitMQRPCReplyMBS object indicating success or failure

160.3.7 BasicNAck(channel as Integer, deliveryTag as UInt64, multiple as Boolean = false, requeue as Boolean = false) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do a basic.nack.
Notes: Actively reject a message, this has the same effect as BasicReject() however, BasicNAck() can negatively acknowledge multiple messages with one call much like BasicAck() can acknowledge mutliple messages with
one call.

channel: the channel identifier
deliveryTag the delivery tag of the message to reject
multiple: if set to 1 negatively acknowledge all unacknowledged messages on this channel.
requeue: indicate to the broker whether it should requeue the message or dead-letter it.

Returns error code, kStatusOK on success, an status constant value otherwise.

160.3.8 BasicPublish(channel as Integer, exchange as String, routingKey as String, mandatory as Boolean, immediate as Boolean, properties as RabbitMQBasicPropertiesMBS, body as String) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Publish a message to the broker.
Notes: Publish a message on an exchange with a routing key.

Note that at the AMQ protocol level basic.publish is an async method:
this means error conditions that occur on the broker (such as publishing to
a non-existent exchange) will not be reflected in the return value of this
function.

channel: the channel identifier
exchange: the exchange on the broker to publish to
routingKey: the routing key to use when publishing the message mandatory indicate to the broker that the message MUST be routed to a queue. If the broker cannot do this it should respond with a basic.return method.
immediate: indicate to the broker that the message MUST be delivered to a consumer immediately. If the broker cannot do this it should respond with a basic.return method.
properties: the properties associated with the message
body: the message body

kStatusOK on success, other kStatus values on failure. Note that basic.publish is an async method, the return value from this function only indicates that the message data was successfully transmitted to the broker. It does not indicate failures that occur on the broker, such as publishing to a non-existent exchange.

Possible error values:

- kStatusTimerFailure: system timer facility returned an error the message was not sent.
- kStatusHeartbeatTimeout: connection timed out waiting for a heartbeat from the broker. The message was not sent.
- kStatusNoMemory: memory allocation failed. The message was not sent.
- kStatusTableTooBig: a table in the properties was too large to fit in a single frame. Message was not sent.
- kStatusConnectionClosed: the connection was closed
- kStatusSSLError: a SSL error occurred.
- kStatusTCPError: a TCP error occurred. errno or WSAGetLastError() may provide more information.

160.3.9 BasicQOS(channel as Integer, prefetchSize as Integer, prefetchCount as Integer, isGlobal as boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Basic QOS.

160.3.10 BasicRecover(channel as Integer, requeue as Boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Recover a channel.

160.3.11 BasicReject(channel as Integer, deliveryTag as UInt64, requeue as Boolean = false) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do a basic.reject.
Notes: Actively reject a message that has been delivered

channel: the channel identifier
deliveryTag the delivery tag of the message to reject
requeue: indicate to the broker whether it should requeue the message or just discard it.

Returns error code, 0 on success, 0 >on failing to send the reject method to the broker.
This will not indicate failure if something goes wrong on the broker.

160.3.12 ChannelClose(Channel as Integer, Code as Integer = 200) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Closes an channel.
Notes: channel: the channel identifier
code: the reason for closing the channel, kReplySuccess is a good default.

Returns RabbitMQRPCReplyMBS object indicating success or failure

160.3.13 ChannelFlow(channel as Integer, active as Boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Channel Flow control.

160.3.14 ChannelOpen(Channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Opens a channel.

160.3.15 ConfirmSelect(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Confirm select.

160.3.16 ConnectionClose(Code as Integer = 200) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Closes a connection.

160.3.17 ConstantIsHardError(constantNumber as Integer) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks to see if a constant is a hard error.
Notes: A hard error occurs when something severe enough happens that the connection must be closed.

Returns true if its a hard error, false otherwise.

160.3.18 ConstantName(constantNumber as Integer) as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get constant name string from constant.

160.3.19 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Notes: Allocate and initialize a new connection object.

160.3.20 ConsumeMessage(byref envelope as RabbitMQEnvelopeMBS, timeoutValue as double = 30, flags as Integer = 0) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Wait for and consume a message.
Notes: Waits for a basic.deliver method on any channel, upon receipt of basic.deliver it reads that message, and returns. If any other method is received before basic.deliver, this function will return an RabbitMQRPCReplyMBS with ReplyType = ResponseTypeLibraryException, and Reply.LibraryError = kStatusUnexpectedState. The caller should then call WaitFrame() to read this frame and take appropriate action.

This function should be used after starting a consumer with the BasicConsume() function

Envelope receives new object.
Timeout is in seconds.
flags: pass in 0. Currently unused.

Returns RabbitMQRPCReplyMBS, which may contain error information.
Type of the object is RabbitMQRPCReplyMBS.ResponseTypeNormal on success.

160.3.21 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.
Notes: Closes the entire connection.

Implicitly closes all channels and informs the broker the connection
is being closed, after receiving acknowledgment from the broker it closes
the socket.

160.3.22 ErrorString(ErrorCode as Integer) as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the error string for the given error code.
Notes: Get an error string associated with an error code.

160.3.23 ExchangeBind(channel as Integer, destination as String, source as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Binds an exchange.

160.3.24 ExchangeDeclare(channel as Integer, exchange as String, type as String, passive as Boolean, durable as Boolean, autoDelete as Boolean, internal as Boolean, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Declare an exchange.

160.3.25 ExchangeDelete(channel as Integer, exchange as String, ifUsed as Boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Deletes an exchange.

160.3.26 ExchangeUnbind(channel as Integer, destination as String, source as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Unbinds an exchange.

160.3.27 LoginExternal(vhost as String, channelMax as Integer, frameMax as Integer, heartbeat as Integer, Identity as String, properties as Dictionary = nil) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Login with external SASL.
Notes: Login to the broker passing an optional properties table.

vhost: the virtual host to connect to on the broker. The default on most brokers is "/".
channelMax: the limit for the number of channels for the connection.
0 means no limit, and is a good default (kDefaultMaxChannels) Note that the maximum number of channels the protocol supports is 65535 (2^16, with the 0-channel reserved). The server can set a lower channelMax and then the client will use the lowest of the two.
frameMax: the maximum size of an AMQP frame ont he wire to request of the broker for this connection. 4096 is the minimum size, 2^31-1 is the maximum, a good default is 131072 (128KB), or kDefaultFrameSize.
heartbeat: the number of seconds between heartbeat frame to request of the broker. A value of 0 disables heartbeats. Note rabbitmq-c only has partial support for hearts, as of v0.4.0 heartbeats are only serviced during BasicPublish(), and SimpleWaitFrame() properties a table of properties to send the broker.
sasl_method the SASL method to authenticate with the properties.

Returns error code indicating success or failure via RabbitMQRPCReplyMBS object.

- Reply.Type = kResponseNormal. Login completed successfully
- Reply.Type = kResponseLibraryException. In most cases errors from the broker when logging in will be represented by the broker closing the socket. In this case r.libraryError will be set to kStatusConnectionClosed. This error can represent a number of error conditions including: invalid vhost, authentication failure.
- Reply.Type = kResponseServerException. The broker returned an exception:
- If Reply.MethodId = kChannelCloseMethod a channel exception occurred, check decoded properties to see details of the exception. The client should SendMethod() a kChannelCloseOkMethod. The channel must be re-opened before it can be used again. Any resources associated with the channel (auto-delete exchanges, auto-delete queues, consumers) are invalid and must be recreated before attempting to use them again.
- If Reply.MethodId = kConnectionCloseMethod a connection exception occurred, check decoded properties to see details of the exception. The client SendMethod() a kConnectionCloseOkMethod and disconnect from the broker.

160.3.28 LoginPlain(vhost as String, channelMax as Integer, frameMax as Integer, heartbeat as Integer, Username as String, Password as String, properties as Dictionary = nil) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Login with plain SASL.
Notes: Login to the broker passing an optional properties table.

vhost: the virtual host to connect to on the broker. The default on most brokers is "/".
channelMax: the limit for the number of channels for the connection.
0 means no limit, and is a good default (kDefaultMaxChannels) Note that the maximum number of channels the protocol supports is 65535 (2^16, with the 0-channel reserved). The server can set a lower channelMax and then the client will use the lowest of the two.
frameMax: the maximum size of an AMQP frame ont he wire to request of the broker for this connection. 4096 is the minimum size, 2^31-1 is the maximum, a good default is 131072 (128KB), or kDefaultFrameSize.
heartbeat: the number of seconds between heartbeat frame to request of the broker. A value of 0 disables heartbeats. Note rabbitmq-c only has partial support for hearts, as of v0.4.0 heartbeats are only serviced during BasicPublish(), and SimpleWaitFrame() properties a table of properties to send the broker.
sasl_method the SASL method to authenticate with the properties.

Returns error code indicating success or failure via RabbitMQRPCReplyMBS object.

- Reply.Type = kResponseNormal. Login completed successfully
- Reply.Type = kResponseLibraryException. In most cases errors from the broker when logging in will be represented by the broker closing the socket. In this case r.libraryError will be set to kStatusConnectionClosed. This error can represent a number of error conditions including: invalid vhost, authentication failure.
- Reply.Type = kResponseServerException. The broker returned an exception:
- If Reply.MethodId = kChannelCloseMethod a channel exception occurred, check decoded properties to see details of the exception. The client should SendMethod() a kChannelCloseOkMethod. The channel must be re-opened before it can be used again. Any resources associated with the channel (auto-delete exchanges, auto-delete queues, consumers) are invalid and must be recreated before attempting to use them again.
- If Reply.MethodId = kConnectionCloseMethod a connection exception occurred, check decoded properties to see details of the exception. The client SendMethod() a kConnectionCloseOkMethod and disconnect from the broker.

160.3.29 MaybeReleaseBuffers

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Release connection owned memory.
Notes: Release memory owned by the connection object related to any channel, allowing reuse by the library. Use of any memory returned by the library before this function is called with result in undefined behavior.

Internally rabbitmq-c tries to reuse memory when possible. As a result its possible calling this function may not have a noticeable effect on memory usage.

160.3.30 MaybeReleaseBuffersOnChannel(channel as Integer)

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Release connection owned memory related to a channel.
Notes: Release memory owned by the amqp_connection_state_t object related to the specified channel, allowing reuse by the library. Use of any memory returned the library for a specific channel will result in undefined behavior.

Internally rabbitmq-c tries to reuse memory when possible. As a result its possible calling this function may not have a noticeable effect on memory usage.

160.3.31 MethodHasContent(constantNumber as Integer) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks whether such a method has content.
Notes: Returns true if content is expected.

160.3.32 MethodName(constantNumber as Integer) as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get method name string from method number.
Notes: Returns method name string.

160.3.33 NewTCPSocket(UseSSL as boolean = false) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates new socket.
Notes: Optional uses OpenSSL to create a SSL socket if UseSSL is passed with value true.

Returns true on success.

160.3.34 OpenSocket(Host as String, Port as Integer, TimeOut as Double = 10) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Open a socket connection.
Notes: This function opens a socket connection returned created with NewTCPSocket(). This function should be called after setting socket options.
Returns error code.

host: Connect to this host.
port: Connect on this remote port.
timeout: Max allowed time to spent on opening.

160.3.35 QueueBind(channel as Integer, queue as String, exchange as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Binds an exchange.

160.3.36 QueueDeclare(channel as Integer, queue as String, passive as Boolean, durable as Boolean, exclusive as Boolean, autoDelete as Boolean, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Declare a queue.

160.3.37 QueueDelete(channel as Integer, queue as String, ifUnused as Boolean, ifEmpty as Boolean) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Delete a queue.

160.3.38 QueuePurge(channel as Integer, queue as String) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Purge a queue.

160.3.39 QueueUnbind(channel as Integer, queue as String, exchange as String, routingKey as String, arguments as Dictionary) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Unbind a queue.

160.3.40 ReadMessage(channel as Integer, byref message as RabbitMQMessageMBS, flags as Integer = 0) as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reads the next message on a channel
Notes: Reads a complete message (header + body) on a specified channel. This function is intended to be used with amqp_basic_get() or when an AMQP_BASIC_DELIVERY_METHOD method is received.

channel: the channel on which to read the message from
message: The parameter receiving the message.
flags: currently unused.

Returns RabbitMQRPCReplyMBS, which may contain error information.
Type of the object is RabbitMQRPCReplyMBS.ResponseTypeNormal on success.

160.3.41 SendHeader as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Send initial AMQP header to the broker.
Notes: This is a low level function intended for those who want to interact with the broker at a very low level. Use of this function without understanding what it does will result in AMQP protocol errors.

This function sends the AMQP protocol header to the broker.

Returns error code, kStatusOK on success, a negative value on failure. Possible error codes:

- kStatusConnectionClosed: the connection to the broker was closed.
- kStatusSocketError: a socket error occurred. It is likely the underlying socket has been closed. errno or WSAGetLastError() may provide further information.
- kStatusSSLError: a SSL error occurred. The connection to the broker was closed.

160.3.42 SetCACert(File as FolderItem) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets CACert file with root certificates.
Notes: Returns true on success and false on failure.
See also:

- 160.3.43 SetCACert(Path as String) as Boolean 20113

160.3.43 SetCACert(Path as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets CACert file with root certificates.
Notes: Returns true on success and false on failure.
See also:

- 160.3.42 SetCACert(File as FolderItem) as Boolean 20113

160.3.44 SetKey(CertFile as FolderItem, KeyFile as FolderItem) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file path and key file path.
Notes: Returns true on success and false on failure.
See also:

- 160.3.45 SetKey(CertPath as String, KeyPath as String) as Boolean 20113

160.3.45 SetKey(CertPath as String, KeyPath as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file path and key file path.
Notes: Returns true on success and false on failure.
See also:

- 160.3.44 SetKey(CertFile as FolderItem, KeyFile as FolderItem) as Boolean 20113

160.3.46 SetKeyData(CertFile as FolderItem, KeyData as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file and key data as PEM.
Notes: Returns true on success and false on failure.
See also:

- 160.3.47 SetKeyData(CertPath as String, KeyData as String) as Boolean 20114

160.3.47 SetKeyData(CertPath as String, KeyData as String) as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets SSL key with certificate file and key data as PEM.
Notes: Returns true on success and false on failure.
See also:

- 160.3.46 SetKeyData(CertFile as FolderItem, KeyData as String) as Boolean 20114

160.3.48 SimpleWaitFrame(byref Frame as RabbitMQFrameMBS, timeoutValue as double = 30) as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Read a single frame with a timeout.
Notes: Waits for the next frame to be read from the broker, up to a timespan specified by tv. The function will return kStatusTimeout if the timeout is reached. The tv value is not modified by the function.

The library may buffer frames. When an connection object has frames buffered calling SimpleWaitFrame_noblock() will return an frame without entering a blocking read(). You can test to see if an connection object has frames buffered by calling the FramesEnqueued() function.

The library has a socket read buffer. When there is data in an connection read buffer, SimpleWaitFrame() may return an frame without entering a blocking read(). You can test to see if an connection object has data in its read buffer by calling the DataInBuffer() function.

This function does not return heartbeat frames. When enabled, heartbeating is handed internally internally by the library.

Frame: receives decoded frame the frame
timeoutValue: the maximum time to wait for a frame to be read in seconds. Setting to 0 will do a non-blocking read.

Returns kStatusOK on success. An kStatus value is returned otherwise. Possible errors include:

- kStatusTimeout the timeout was reached while waiting for a frame from the broker.
- kStatusInvalidParameter the tv parameter contains an invalid value.
- kStatusNoMemory failure in allocating memory. The library is likely in an indeterminate state making recovery unlikely. Client should note the error and terminate the application
- kStatusBadAMQPData bad AMQP data was received. The connection should be shutdown immediately
- kStatusUnknownMethod: an unknown method was received from the broker. This is likely a protocol error and the connection should be shutdown immediately
- kStatusUnknownClass: a properties frame with an unknown class was received from the broker. This is likely a protocol error and the connection should be shutdown immediately
- kStatusHeartbeatTimeout: timed out while waiting for heartbeat from the broker. The connection has been closed.
- kStatusTimerFailure: system timer indicated failure.
- kStatusSocketError: a socket error occurred. The connection has been closed
- kStatusSSLError: a SSL socket error occurred. The connection has been closed.

160.3.49 TXCommit(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Commit.

160.3.50 TXRollback(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Rollback.

160.3.51 TXSelect(channel as Integer) as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Select.

160.3.52 Properties

160.3.53 ClientProperties as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the client properties table
Notes: Get the properties that were passed to the broker on connection.
(Read only property)

160.3.54 DataInBuffer as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Check to see if there is data left in the receive buffer.
Notes: Can be used to see if there is data still in the buffer, if so calling SimpleWaitFrame will not immediately enter a blocking read.

Returns true if there is data in the receive buffer, false otherwise.
(Read only property)

160.3.55 FramesEnqueued as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks to see if there are any incoming frames ready to be read.
Notes: Checks to see if there are any frame objects buffered by the connection object. Having one or more frames buffered means that SimpleWaitFrame() will return a frame without potentially blocking on a read() call.

Returns true if there are frames enqueued, false otherwise.
(Read only property)

160.3.56 Handle as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

160.3.57 HandshakeTimeout as Double

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get or set the login handshake timeout.
Notes: Login performs the login handshake with the broker. This function sets the timeout associated with completing this operation from the client side.

The timeout must be set before Login is called to change from the default timeout.

Note that the RabbitMQ broker has a configurable timeout for completing the login handshake, the default is 10 seconds. rabbitmq-c has a default of 12 seconds.
(Read and Write property)

160.3.58 Heartbeat as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the number of seconds between heartbeats of the connection.
Notes: The number of seconds between heartbeats is set when connection negotiation takes place in Login.

Returns the number of seconds between heartbeats.
(Read only property)

160.3.59 MaximumChannel as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the maximum number of channels the connection can handle.
Notes: The maximum number of channels is set when connection negotiation takes place in Login.

Returns the maximum number of channels. 0 if there is no limit.
(Read only property)

160.3.60 MaximumFrameSize as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the maximum size of an frame the connection can handle.
Notes: The maximum size of an frame is set when connection negotiation takes place in Login.

Return the maximum size in bytes of an frame.
(Read only property)

160.3.61 RPCReply as RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the last global RPCReply
Notes: The API methods corresponding to most synchronous AMQP methods return a pointer to the decoded method result. Upon error, they return nil, and we need some way of discovering what, if anything, went wrong. RPCReply() returns the most recent RabbitMQRPCReplyMBS instance corresponding to such an API operation for the given connection.

Only use it for operations that do not themselves return RabbitMQRPCReplyMBS; operations that do return RabbitMQRPCReplyMBS generally do NOT update this per-connection-global RabbitMQRPCReplyMBS instance.

Returns the most recent RabbitMQRPCReplyMBS object:

- Reply.Type = kResponseNormal. Login completed successfully
- Reply.Type = kResponseLibraryException. In most cases errors from the broker when logging in will be represented by the broker closing the socket. In this case r.libraryError will be set to kStatusConnectionClosed. This error can represent a number of error conditions including: invalid vhost, authentication failure.
- Reply.Type = kResponseServerException. The broker returned an exception:
- If Reply.MethodId = kChannelCloseMethod a channel exception occurred, check decoded properties to see details of the exception. The client should SendMethod() a kChannelCloseOkMethod. The channel must be re-opened before it can be used again. Any resources associated with the channel (auto-delete exchanges, auto-delete queues, consumers) are invalid and must be recreated before attempting to use them again.
- If Reply.MethodId = kConnectionCloseMethod a connection exception occurred, check decoded properties to see details of the exception. The client SendMethod() a kConnectionCloseOkMethod and disconnect from the broker.

(Read only property)

160.3.62 RPCTimeout as Double

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The RPC timeout.
Notes: Get or set the RPC timeout.

Sets the timeout for any RPC-style AMQP command (e.g., QueueDeclare).
This timeout may be changed at any time by calling this function with a new timeout. The timeout applies individually to each RPC that is made.

The default value is 0, or an infinite timeout.

When an RPC times out, the function will return an error kStatusTimeout, and the connection will be closed.

RPC-timeouts are an advanced feature intended to be used to detect dead connections quickly when the rabbitmq-c implementation of heartbeats does not work. Do not use RPC timeouts unless you understand the implications of doing so.
(Read and Write property)

160.3.63 ServerProperties as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the broker properties table.
Notes: Returns a dictionary containing the properties advertised by the broker on connection.
(Read only property)

160.3.64 SocketFileDescriptor as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the socket descriptor in use by a socket object.
Notes: Retrieve the underlying socket descriptor. This function can be used to perform low-level socket operations that aren't supported by the socket interface. Use with caution!
(Read only property)

160.3.65 SSLCACertPath as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The CA certificate file path.
Notes: cacert Path to the CA cert file in PEM format.
(Read only property)

160.3.66 SSLCertPath as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The certificate file path.
Notes: Cert file in PEM format.
(Read only property)

160.3.67 SSLKeyData as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The client key.
Notes: A buffer containing client key in PEM format.
(Read only property)

160.3.68 SSLKeyPath as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The file path to the SSL key.
Notes: (Read only property)

160.3.69 SSLMaxVersion as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Maximum allowed SSL version.
Notes: Defaults to latest TLS version.
(Read and Write property)

160.3.70 SSLMinVersion as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Minimum allowed SSL version.
Notes: Defaults to TLS v1.0.
(Read and Write property)

160.3.71 SSLVerifyHostname as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable or disable hostname verification.
Notes: Hostname verification checks the broker cert for a CN or SAN that matches the hostname that OpenSocket() is presented.
Peer verification is controlled by SSLVerifyPeer property.
(Read and Write property)

160.3.72 SSLVerifyPeer as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable or disable peer verification.
Notes: Peer verification validates the certificate chain that is sent by the broker.
Hostname validation is controlled by SSLVerifyHostname.
(Read and Write property)

160.3.73 Version as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries version number of the library.
Notes: Returns the rabbitmq-c version as a string.
(Read only property)

160.3.74 VersionNumber as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries version number of the library.
Notes: Returns the rabbitmq-c version as a packed integer.

first byte is major, second byte minor, third byte patch level and last release counter.
Value = ((((Major * 256) + Minor) * 256 + Patch) * 256 + Release)
(Read only property)

160.3.75 Constants

Constants

Constant	Value	Description
kDefaultFrameSize	131072	Default frame size (128Kb)
kDefaultHeartbeat	0	Default heartbeat interval (0, heartbeat disabled)
kDefaultVHost	"/"	Default RabbitMQ vhost: "/".
kMaxChannels	2047	Default maximum number of channels (2047, RabbitMQ default limit of 2048, minus 1 for channel 0). RabbitMQ set a default limit of 2048 channels per connection in v3.7.5 to prevent broken clients from leaking too many channels.
kProtocolPort	5672	Default AMQP Port.
kProtocolVersionMajor	0	AMQP protocol version major
kProtocolVersionMinor	9	AMQP protocol version minor.
kProtocolVersionRevision	1	AMQP protocol version revision.

Status constants.

Constant	Value	Description
kStatusBadAmqpData	-2	Incorrect or corrupt data was received from the broker. This is a protocol
kStatusBadUrl	-8	malformed AMQP URL
kStatusBrokerUnsupportedSaslMethod	-19	Broker does not support the requested SASL mechanism.
kStatusConnectionClosed	-7	The connection to the broker has been closed.
kStatusHeartbeatTimeout	-15	Timed out waiting for heartbeat.
kStatusHostnameResolutionFailed	-5	Unable to resolve the hostname.
kStatusIncompatibleAmqpVersion	-6	The broker advertised an incompaible AMQP version.
kStatusInvalidParameter	-10	An invalid parameter was passed into the function.
kStatusNoMemory	-1	Memory allocation failed.
kStatusOk	0	Operation successful.
kStatusSocketClosed	-17	Underlying socket is closed.
kStatusSocketError	-9	A socket error occurred.
kStatusSocketInuse	-18	Underlying socket is already open.
kStatusSslConnectionFailed	-515	SSL handshake failed.
kStatusSslError	-512	A generic SSL error occurred.
kStatusSslHostnameVerifyFailed	-513	SSL validation of hostname against peer certificate failed.
kStatusSslPeerVerifyFailed	-514	SSL validation of peer certificate failed.
kStatusTableTooBig	-11	The dictionary object cannot be serialized because the output buffer small.
kStatusTcpError	-256	A generic TCP error occurred.
kStatusTcpSocketlibInitError	-257	An error occurred trying to initialize the socket library
kStatusTimeout	-13	Operation timed out.
kStatusTimerFailure	-14	The underlying system timer facility failed.
kStatusUnexpectedState	-16	Unexpected protocol state
kStatusUnknownClass	-3	An unknown AMQP class was received. This is a protocol error.
kStatusUnknownMethod	-4	An unknown AMQP method was received. This is a protocol error.
kStatusUnsupported	-20	Parameter is unsupported in this version.
kStatusWrongMethod	-12	The wrong method was received.

TLS Version

Constant	Value	Description
kTLSv10	1	TLS v1.0
kTLSv11	2	TLS v1.1
kTLSv12	3	TLS v1.2
kTLSvLatest	65535	Latest TLS version available.

160.4 class RabbitMQEnvelopeMBS

160.4.1 class RabbitMQEnvelopeMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Envelope object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

160.4.2 Methods

160.4.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

160.4.4 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

160.4.5 Properties

160.4.6 Channel as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Channel message was delivered on.
Notes: (Read and Write property)

160.4.7 ConsumerTag as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The consumer tag the message was delivered to .
Notes: (Read and Write property)

160.4.8 DeliveryTag as UInt64

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The messages delivery tag.
Notes: (Read and Write property)

160.4.9 Exchange as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The exchange this message was published to.
Notes: (Read and Write property)

160.4.10 Message as RabbitMQMessageMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The message.
Notes: (Read and Write property)

160.4.11 Redelivered as Boolean

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Flag indicating whether this message is being redelivered.
Notes: (Read and Write property)

160.4.12 RoutingKey as String

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The routing key this message was published with.
Notes: (Read and Write property)

160.5 class RabbitMQFrameMBS

160.5.1 class RabbitMQFrameMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An AMQP frame.

160.5.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

160.5.4 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

160.5.5 Properties

160.5.6 BodyFragment as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The body fragment.
Notes: Only set if FrameType is kFrameBody.
(Read and Write property)

160.5.7 BodyFragmentSize as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The size of the body fragment in bytes.
Notes: Only set if FrameType is kFrameBody.
(Read and Write property)

160.5.8 BodySize as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of the body in bytes.
Notes: Only set if FrameType is kFrameHeader.
(Read and Write property)

160.5.9 Channel as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The channel the frame was received on.
Notes: (Read and Write property)

160.5.10 ClassID as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the properties.
Notes: Only set if FrameType is kFrameHeader.
(Read and Write property)

160.5.11 FrameType as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The frame type.
Notes: See kFrameMethod, kFrameHeader and kFrameBody.
(Read and Write property)

160.5.12 MethodDecoded as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The decoded method content.
Notes: MBS Plugin has code to translate over 60 types of method structures into Xojo dictionary.
Only set if FrameType is kFrameMethod.
(Read and Write property)

160.5.13 MethodID as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The method ID.
Notes: Only set if FrameType is kFrameMethod.
(Read and Write property)

160.5.14 PropertiesDecoded as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The decoded properties.
Notes: MBS Plugin has code to translate over several types of properties structures into Xojo dictionary.
Only set if FrameType is kFrameHeader.
(Read and Write property)

160.5.15 Raw as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Amqp-encoded properties structure.
Notes: Only set if FrameType is kFrameHeader.
(Read and Write property)

160.5.16 RawSize as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The size of the Raw data.
Notes: Only set if FrameType is kFrameHeader.
(Read and Write property)

- Bringing RabbitMQ to Xojo

160.6.2 Methods

160.6.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private construtor.

160.6.4 Properties

160.6.5 Body as MemoryBlock

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The message body.
Notes: (Read only property)

160.6.6 Properties as RabbitMQBasicPropertiesMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The message properties.
Notes: (Read only property)

160.6.7 Constants

Response Types

Constant	Value	Description
ResponseTypeLibraryException	2	Library error, an error occurred in the library, examine the library error.
ResponseTypeNone	0	The library got an EOF from the socket.
ResponseTypeNormal	1	Response normal, the RPC completed successfully.
ResponseTypeServerException	3	Server exception, the broker returned an error, check reply.

160.7 class RabbitMQRPCReplyMBS

160.7.1 class RabbitMQRPCReplyMBS

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reply from a RPC method on the broker.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Bringing RabbitMQ to Xojo

160.7.2 Methods

160.7.3 Constructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

160.7.4 Destructor

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

160.7.5 Properties

160.7.6 LibraryError as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The library error code.
Notes: in case of ResponseTypeLibraryException this field will be set to an error code.
An error string can be retrieved using ErrorString().
(Read only property)

160.7.7 MethodDecoded as Dictionary

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The decoded data for the method.
Notes: MBS Plugin has code to translate over 60 types of method structures into Xojo dictionary.
(Read only property)

160.7.8 MethodId as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The method ID.
Notes: (Read only property)

160.7.9 Type as Integer

MBS MongoDB Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The response type.
Notes: See ResponseTypeLibraryException, ResponseTypeServerException, ResponseTypeNone and ResponseTypeNormal.
(Read only property)

160.7.10 Constants

Error Codes

Constant	Value	Description
kAccessRefused	403	
kChannelError	504	
kCommandInvalid	503	
kConnectionForced	320	
kContentTooLarge	311	
kFrameError	501	
kInternalError	541	
kInvalidPath	402	
kNoConsumers	313	
kNoRoute	312	
kNotAllowed	530	
kNotFound	404	
kNotImplemented	540	
kPreconditionFailed	406	
kReplySuccess	200	Success
kResourceError	506	
kResourceLocked	405	
kSyntaxError	502	
kUnexpectedFrame	505	

Response Types

Constant	Value	Description
ResponseTypeLibraryException	2	The library encountered an error, check the LibraryError field.
ResponseTypeNone	0	Invalid state.
ResponseTypeNormal	1	The RPC completed successfully.
ResponseTypeServerException	3	The broker returned an exception, check the reply field.

Chapter 161

RAMStream

161.1 class RAMStreamMBS

161.1.1 class RAMStreamMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows you to use a memory bases stream.
Notes: If you need to concat lot's of streams, just make a RAMstream and write to it.

In the example folder is a project called "test ramstream speed" which tests the speed on concating 10000 strings which each 1000 bytes in length.

On my G4 Dual 1000 Mhz, I get this result:
String only: 22063 ticks
RAMStream: 18 ticks
Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

161.1.2 Methods

161.1.3 close

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

161.1.4 Constructor(InitialSize as Integer=0)

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new RAMStream.
Example:

```
Var r as RAMStreamMBS
r=new RAMStreamMBS(1000000)
r.write "Hello"
```

Notes: To avoid memory fragmentation the memory grows in 32 KByte chunks.

The parameter you give is the size for the first allocation. So if you only need 2 KByte, you just pass 2048. If you don't know the size, you can pass 0 or a negative number to get the default initial size which is 32 KByte.

You can change the GrowSize property to use a different growing size.
Performance is better if resizing the memory buffer is minimized.

The stream can grow to around 2 GB.
On low memory, the initial resize will fail and length will be 0.

161.1.5 Look(count as Integer) as string

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes, but does not move the current position.
Example:

```
Var r as RamStreamMBS // your stream
Var s as string
s=r.look(100)
```

Notes: Like the lookahead property in a socket.

161.1.6 LookBlock(count as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a memoryblock, but leaves the current position untouched.
Example:

```
Var b as RAMStreamMBS
Var s as memoryblock
'...
s=b.LookBlock(5)
```

161.1.7 LookByte as Integer

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a byte, but leaves the current position untouched.

161.1.8 LookLong as Integer

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an integer, but leaves the current position untouched.

161.1.9 LookShort as Integer

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a short, but leaves the current position untouched.

161.1.10 Read(count as Integer) as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a string.
Example:

```
Var b as RAMStreamMBS
Var s as string
'...
s=b.read(5)
```

161.1.11 ReadBlock(count as Integer) as memoryblock

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads bytes into a memoryblock.
Example:

```
Var b as RAMStreamMBS
Var s as memoryblock
'...
s=b.ReadBlock(5)
```

161.1.12 Readbyte as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an 8bit Byte from the stream.
Example:

```
Var b as RAMStreamMBS
Var i as Integer
'...
i=B.readbyte
```

161.1.13 ReadLong as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a signed 32bit Integer from the stream.
Example:

```
Var b as RAMStreamMBS
Var i as Integer
'...
i=B.readlong
```

Notes: This function is affected by the LittleEndian Setting.

161.1.14 ReadShort as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a signed 16bit Integer from the stream.
Example:

```
Var b as RAMStreamMBS
Var i as Integer
'...
i=B.readshort
```

Notes: This function is affected by the LittleEndian Setting.

161.1.15 Write(data as string)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes bytes from a string to file.

161.1.16 WriteBlock(data as memoryblock,count as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes count bytes from a memoryblock to file.
Example:

```
Var b as RAMStreamMBS
Var m as memoryblock
'...
b.writeblock m,m.size
```

161.1.17 WriteByte(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a byte to file.

161.1.18 WriteLong(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an 32bit integer to file.
Notes: This method is affected by the LittleEndian Setting.

161.1.19 WriteShort(data as Integer)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an 16bit integer to file.
Notes: This method is affected by the LittleEndian Setting.

161.1.20 Properties

161.1.21 EOF as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if you are at the end of the stream.
Notes: (Read only property)

161.1.22 GrowSize as Integer

MBS Util Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size in bytes used to grow the ramstream backbuffer.
Notes: Default is 32 Kilobytes.
If the value is bigger than zero, it will be used as the allocation increase. Else the default value is used.
(Read and Write property)

161.1.23 Length as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current length of the stream.
Notes: You can truncate the stream by setting this property.
(Read and Write property)

161.1.24 LittleEndian as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decides whether to convert integers read or wrote to the file.
Notes: See Xojos binarystream for more details.
For native platform you may set ”littleendian=targetwin32”.

(Read and Write property)

161.1.25 MemoryUsed as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: How much memory is currently used for this Stream.
Notes: (Read and Write property)

161.1.26 Position as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns current position.
Notes: You can set the current file stream position using this property.
(Read and Write property)

161.2 Globals

161.2.1 CreateRamStreamMBS(InitialSize as Integer = 0) as RamStreamMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new RAMStream.
Example:

```
Var r as RAMStreamMBS
r=CreateRamStreamMBS(1000000)
r.write "Hello"
```

Notes: To avoid memory fragmentation the memory grows in 32 KByte chunks.

The parameter you give is the size for the first allocation. So if you only need 2 KByte, you just pass 2048. If you don't know the size, you can pass 0 or a negative number to get the default initial size which is 32 KByte.

You can change the GrowSize property to use a different growing size.
Performance is better if resizing the memory buffer is minimized.

The stream can grow to around 2 GB.
Returns nil on low memory.

Chapter 162

RaspberryPiCamera

162.1 class RaspberryPiCameraFormatDescriptionMBS

162.1.1 class RaspberryPiCameraFormatDescriptionMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class for a format description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

162.1.2 Methods

162.1.3 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The private constructor.

162.1.4 Properties

162.1.5 Description as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The format description.
Notes: (Read only property)

162.1.6 Flags as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The flags.
Notes: Currently can be 1 for compressed and 2 for emulated.
(Read only property)

162.1.7 Index as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Format number.
Notes: (Read only property)

162.1.8 Pixelformat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format.
Notes: (Read only property)

162.1.9 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format as text.
Notes: (Read only property)

162.1.10 Type as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The buffer type.
Notes: Usually 1 for video capture.
(Read only property)

162.2 class RaspberryPiCameraFormatMBS

162.2.1 class RaspberryPiCameraFormatMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class for format settings.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

162.2.2 Methods

162.2.3 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The private constructor.

162.2.4 Properties

162.2.5 BytesPerRow as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The number of bytes per row.
Notes: For padding, zero if unused.
(Read and Write property)

162.2.6 ColorSpace as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The colorspace.
Example:

```
// ITU-R 601 – broadcast NTSC/PAL
const V4L2_COLORSPACE_SMPTE170M = 1

// 1125-Line (US) HDTV
const V4L2_COLORSPACE_SMPTE240M = 2

// HD and modern captures.
```

```
const V4L2_COLORSPACE_REC709 = 3

// broken BT878 extents (601, luma range 16-253 instead of 16-235)
const V4L2_COLORSPACE_BT878 = 4

// These should be useful. Assume 601 extents.
const V4L2_COLORSPACE_470_SYSTEM_M = 5
const V4L2_COLORSPACE_470_SYSTEM_BG = 6

// I know there will be cameras that send this. So, this is
// unspecified chromaticities and full 0-255 on each of the
// Y'CbCr components
const V4L2_COLORSPACE_JPEG = 7

// For RGB colourspaces, this is probably a good start.
const V4L2_COLORSPACE_SRGB = 8
```

Notes: Normally zero for default.
(Read and Write property)

162.2.7 Field as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The field.
Example:

```
const V4L2_FIELD_ANY = 0
// driver can choose from none, top, bottom, interlaced
// depending on whatever it thinks is approximate ...
const V4L2_FIELD_NONE = 1
// this device has no fields ...
const V4L2_FIELD_TOP = 2
// top field only
const V4L2_FIELD_BOTTOM = 3
// bottom field only
const V4L2_FIELD_INTERLACED = 4
// both fields interlaced
const V4L2_FIELD_SEQ_TB = 5
// both fields sequential into one
// buffer, top-bottom order
const V4L2_FIELD_SEQ_BT = 6
// same as above + bottom-top order
const V4L2_FIELD_ALTERNATE = 7
// both fields alternating into separate buffers
const V4L2_FIELD_INTERLACED_TB = 8
```

```
// both fields interlaced, top field
// first and the top field is transmitted first
const V4L2_FIELD_INTERLACED_BT = 9
// both fields interlaced, top field
// first and the bottom field is transmitted first
```

Notes: (Read and Write property)

162.2.8 Height as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The height of image in pixels.
Notes: (Read and Write property)

162.2.9 Pixelformat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format.
Notes: (Read and Write property)

162.2.10 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format as text.
Notes: (Read only property)

162.2.11 SizeImage as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The size of image.
Notes: (Read and Write property)

162.2.12 Type as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The type of data stream.
Notes: With plugin we always use 1 for video capture (V4L2_BUF_TYPE_VIDEO_CAPTURE).
(Read and Write property)

162.2.13 Width as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The width of image in pixels.
Notes: (Read and Write property)

162.3 class RaspberryPiCameraMBS

162.3.1 class RaspberryPiCameraMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The class to get pictures from Raspberry Pi camera and similar Linux cameras.

Videos

- Presentation from London conference about MBS Plugins.

162.3.2 Methods

162.3.3 AvailableFormats as RaspberryPiCameraFormatDescriptionMBS()

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries available formats.
Notes: Lasterror and ErrorMessage are set.
Can return nil in case of error.

162.3.4 Capture(WithPicture as boolean = true) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Captures a new picture.
Notes: If WithPicture is true and pixel format is compatible (RGB 24 or 32bit), we set the picture property.
If capturing JPEG, we copy the JPEG data into the JPEG property.

Returns true on success.
Lasterror and ErrorMessage are set.

162.3.5 Close

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Closes camera device.
Notes: Lasterror and ErrorMessage are set.

162.3.6 Constructor

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The constructor.

162.3.7 CurrentFormat as RaspberryPiCameraFormatMBS

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries current format.
Notes: Returns nil in case of error.
Lasterror and ErrorMessage are set.

162.3.8 InitBuffer as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes buffer.
Notes: This is done automatically if you capture.

Returns true on success.
Lasterror and ErrorMessage are set.

162.3.9 Open(Device as string = "/dev/video0") as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Opens the camera device.
Notes: You need

- a Raspberry Pi computer

- to attach the camera module
- to enable the video camera
- run a command: sudo modprobe bcm2835-v4l2
- to check if you see /dev/video0 in file system.

Returns true on success.
Lasterror and ErrorMessage are set.

162.3.10 SetCurrentFormat(format as RaspberryPiCameraFormatMBS) as boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets current format.
Notes: This allows to use any format, even if we can't transform it to picture for you.

Returns true on success.
Lasterror and ErrorMessage are set.

162.3.11 SetJPEGSize(Width as Integer, Height as Integer) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets size and format to capture.
Notes: Sets JPEG format with given size.

Returns true on success.
Lasterror and ErrorMessage are set.

162.3.12 SetSize(Width as Integer, Height as Integer) as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets size and format to capture.
Notes: Sets to capture RGB picture with given size.

Returns true on success.
Lasterror and ErrorMessage are set.

162.3.13 Properties

162.3.14 AutoExposureBias as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
e.g. 12.
(Read and Write property)

162.3.15 AutoFocusRange as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kAutoFocusRange* constants
(Read and Write property)

162.3.16 AutoFocusStart as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.17 AutoFocusStatus as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kAutoFocusStatus* constants
(Read and Write property)

162.3.18 AutoFocusStop as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.

(Read and Write property)

162.3.19 AutoNPresetWhiteBalance as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kWhiteBalance* constants.
e.g. value is 1 for kWhiteBalanceAuto.
(Read and Write property)

162.3.20 Buffer as Ptr

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pointer to the buffer.
Notes: For the case you want to convert yourself pixel values to a picture.
(Read only property)

162.3.21 BufferLength as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The length of the buffer.
Notes: (Read only property)

162.3.22 BusInfo as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The device bus info.
Notes: e.g. "PCI:test"
(Read only property)

162.3.23 BytesPerRow as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The bytes per row for current image.
Notes: (Read only property)

162.3.24 CanCapture as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether the device can capture video.
Notes: This is queried by checking if bitwiseAnd(capabilities,1) = 1.
(Read only property)

162.3.25 Capabilities as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Device capabilities bitmap.
Notes: (Read only property)

162.3.26 Card as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The name of the card.
Notes: e.g. "Hauppauge WinTV"
(Read only property)

162.3.27 Driver as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The name of the driver.
Notes: e.g. "bttv"
(Read only property)

162.3.28 ErrorMessage as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The error message for lasterror property.
Notes: (Read only property)

162.3.29 ExposureAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
e.g. 1000
(Read and Write property)

162.3.30 ExposureAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kExposure* constants.
Value is e.g. 0 for kExposureAuto.
(Read and Write property)

162.3.31 ExposureAutoPriority as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.32 ExposureMetering as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kExposureMetering* constants
(Read and Write property)

162.3.33 FocusAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable focus on the camera.

(Read and Write property)

162.3.34 FocusAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable focus on the camera.
(Read and Write property)

162.3.35 FocusRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable focus on the camera.
(Read and Write property)

162.3.36 Handle as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The internal file handle.
Notes: (Read only property)

162.3.37 Height as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The height in pixel used for capture.
Notes: (Read only property)

162.3.38 ImageStabilization as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.

(Read and Write property)

162.3.39 IrisAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable iris on the camera.
(Read and Write property)

162.3.40 IrisRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
May not work if you don't have a controllable iris on the camera.
(Read and Write property)

162.3.41 IsoSensitivity as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.42 IsoSensitivityAuto as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kISOSensitivity* constants.
Usually set to kISOSensitivityAuto for auto mode (1).
(Read and Write property)

162.3.43 JPEG as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last JPEG image data block.
Notes: (Read only property)

162.3.44 LastError as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read only property)

162.3.45 Lock3A as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kLock* constants.
(Read and Write property)

162.3.46 Opened as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether device is opened.
Notes: (Read only property)

162.3.47 PanAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.48 PanRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.49 PanReset as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.50 PanSpeed as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.51 Picture as Picture

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last captured picture.
Notes: (Read only property)

162.3.52 PixelFormat as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format.
Notes: (Read only property)

162.3.53 PixelformatString as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The pixel format as text.
Notes: (Read only property)

162.3.54 Privacy as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.55 Recording as Boolean

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether we are recording currently.
Notes: (Read only property)

162.3.56 SceneMode as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: See kSceneMode* constants
(Read and Write property)

162.3.57 TiltAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.58 TiltRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.59 TiltReset as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.60 TiltSpeed as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.61 Version as String

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The version of the driver.
Notes: (Read only property)

162.3.62 WideDynamicRange as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.63 Width as Integer

MBS Linux Plugin, Plugin Version: 16.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: The width in pixel used for capture.
Notes: (Read only property)

162.3.64 ZoomAbsolute as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.65 ZoomContinuous as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.66 ZoomRelative as Integer

MBS Linux Plugin, Plugin Version: 18.0, Platform: Linux, Targets: Desktop, Console & Web.

Function: One of the camera configuration propertires.
Notes: Lasterror is set.
(Read and Write property)

162.3.67 Constants

AutoFocusRange Values

Constant	Value	Description
kAutoFocusRangeAuto	0	
kAutoFocusRangeInfinity	3	
kAutoFocusRangeMacro	2	
kAutoFocusRangeNormal	1	

AutoFocusStatus Values

Constant	Value	Description
kAutoFocusStatusBusy	1	
kAutoFocusStatusFailed	4	
kAutoFocusStatusIdle	0	
kAutoFocusStatusReached	2	

ExposureAuto Values

Constant	Value	Description
kExposureAperturePriority	3	
kExposureAuto	0

kExposureShutterPriority	2	

ExposureMetering Values

Constant	Value	Description
kExposureMeteringAverage	0	
kExposureMeteringCenterWeighted	1	
kExposureMeteringMatrix	3	
kExposureMeteringSpot	2	

IsoSensitivityAuto Values

Constant	Value	Description
kISOSensitivityAuto	1	
kISOSensitivityManual	0	

Lock3A Values

Constant	Value	Description
kLockExposure	1	
kLockFocus	4	
kLockWhiteBalance	2	

ScreenMode Values

Constant	Value	Description
kSceneModeBacklight	1	
kSceneModeBeachSnow	2	
kSceneModeCandleLight	3	
kSceneModeDawnDusk	4	
kSceneModeFallColors	5	
kSceneModeFireworks	6	
kSceneModeLandscape	7	
kSceneModeNight	8	
kSceneModeNone	0	
kSceneModePartyIndoor	9	
kSceneModePortrait	10	
kSceneModeSports	11	
kSceneModeSunset	12	
kSceneModeText	13	

AutoNPresetWhiteBalance Values

Constant	Value	Description
kWhiteBalanceAuto	1	
kWhiteBalanceCloudy	8	
kWhiteBalanceDaylight	6	
kWhiteBalanceFlash	7	
kWhiteBalanceFluorescent	3	
kWhiteBalanceFluorescentH	4	
kWhiteBalanceHorizon	5	
kWhiteBalanceIncandescent	2	
kWhiteBalanceManual	0	
kWhiteBalanceShade	9	

Chapter 163

Registration

163.1 module MBS

163.1.1 module MBS

MBS Main Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module with version details.
Notes: Those constants can be used in #if conditions.

163.1.2 Methods

163.1.3 Target as string

MBS Main Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the target where the plugin was compiled for.
Example:

MsgBox mbs.Target

Notes: Can be Win32, Linux, Carbon, Carbon-PPC or Cocoa.

163.1.4 Constants

Constants

Constant	Value	Description
BuildNumber	21422	The build numb The constant va
CompileDate	”May 1 2026”	The compilation The constant va
CompileTime	”09:04:49”	The compilation The constant va
ComputerName	”MacbookPro-Christian”	The computer t Using this const application itself The constant va
Copyright	”©2026 by Monkeybread Software”	The plugin copy
Day	1	The day of the p The day the plu Can be used in
HasAudioPlugin	true	Whether the Au True if the Main
HasAVFoundationPlugin	true	Whether the AV True if the Main

HasGraphicsMagickPlugin	true	Whether the Gr True if the Main
HasImageMagickPlugin	false	Whether the Im True if the Main

163.2 Globals

163.2.1 LogoMBS(size as Integer = 0, WithAlphaChannel as boolean = false) as Picture

MBS Main Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the MBS logo picture.
Example:

window1.Backdrop = LogoMBS(500)

Notes: Best size is 500 pixel.
This function exists to provide a sample picture for examples.
If WithAlphaChannel is true and alpha channel pictures are supported, the plugin returns a picture with alpha channel. (Cocoa, Windows or Linux target on Xojo 2011r4).

Due to a bug in console runtime from Real Software this function can only produce useful pictures with 500 pixel size in console or web applications.

163.2.2 MBSPluginCompileDate as string

MBS Main Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compilation date of the plugins.
Example:

MsgBox MBSPluginCompileDate

Notes: e.g. "Aug 27 2006"
Actually the compilation date of the Version Plugin part which defines this function.

163.2.3 MBSPluginCompileTime as string

MBS Main Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compilation Time of the plugins.
Example:

MsgBox MBSPluginCompileTime

Notes: e.g. "19:40:16"
Actually the compilation date of the Version Plugin part which defines this function.

163.2.4 MBSPluginVersion as string

MBS Main Plugin, Plugin Version: 3.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a version string from the plugin.
Example:

MsgBox "Build with Xojo "+RBVersionString+" and "+MBSPluginVersion

Notes: You can show that in your about box so your users can tell you which plugin they use.

163.2.5 RegisterMBSPlugin(name as string, product as string, enddate as Integer, serial as string) as boolean

MBS Main Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The function to register the plugins.
Example:

```
const name = "Joe Smith"
const serialnumber = "123456"
const enddate = 200710

if not RegisterMBSPlugin(name, "MBS Complete", enddate, serialnumber) then
msgBox "something wrong with the serial number of the plugins!"
end if
```

Notes: Returns true if name and serial number is accepted.

While you are running your project in Xojo (or Xojo) you don't need to register, but if you compile for any target, you should or nice popup windows will show that the app is not registered.

Register in an application subclass to make registering as early as possible.

In case you get this message: "RegisterMBSPlugin()', giving the message "This
item conflicts with another item of the same name" you have something else in your plugins folder, e.g. a html file.

Possible reasons for this failing:
- The calculations you make on the strings or serial number do not create the same value on every machine (Intel vs. PPC, e.g. endian problems)
- You use MBS functions before calling registration function (e.g. you register in window.open event and use the plugin for a control.)
- You mix different plugin versions in your Xojo folder.

This function works only for 2015 and newer serial numbers.

163.2.6 SetRegistrationMessageMBS(ID as Integer, message as string)

MBS Main Plugin, Plugin Version: 14.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines what messages to show.
Example:

```
SetRegistrationMessageMBS(0, "This application is broken. Please reinstall!")
```

Notes: ID currently can only be 0 and is reserved for future flags.

Currently this changes the message which is shown if plugins of different versions are found.
This typically happens if installers mix old and new libraries in an app and the user should be asked to reinstall the application.

Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr9

163.3 class RegistrationEngineMBS

163.3.1 class RegistrationEngineMBS

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: An engine to add serial number generation to your application.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

MsgBox r.Calc // shows: ICYR-RES4-UXQ1
```

Notes: If you want to add serial numbers to your application, you can use this class to write yourself a serial number generator application.
You can later in your application use this class to verify the serial number.

You may want to design your application that the serial number is written to your preferences file so you can verify it every time your application is launched. But if you do this, also save some computer related value there so you can avoid people cloning the system. For example the MAC ID, the user name, the systemfolder creation date. This way you detect whenever a preferences file is copied to another machine.

For generate and later verify serial numbers the setup of the class must match. So carefully check how your serial number should look like. A format like "MA-1234-5678-9012-V1" can be good. Use a prefix and suffix so make serial numbers from different products and different major versions look different. 12 letters are normally enough for a serial number. Especially if you use alpha numeric characters. You can of course change the alphabet string and use lower case letters.

163.3.2 Methods

163.3.3 Calc as string

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the serial number.

163.3.4 Verify(s as string) as boolean

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Verifies the serial number.
Example:

```
Var r As New RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

Var key As String = r.Calc

If r.Verify(key) Then
MsgBox "OK"
Else
MsgBox "Failed"
End If
```

Notes: If you only use upper case letter for your serial numbers, use a function like uppercase before calling verify. This way you avoid that a serial number "abc" is invalid because it is not "ABC".
Returns true on success and false on failure.

163.3.5 Properties

163.3.6 Alphabet as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The characters to use for serial numbers.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

r.Alphabet="ABC123"
MsgBox r.Calc // shows: A1AC-2312-12CC

r.Alphabet="0123456789"
MsgBox r.Calc // shows: 4308-2905-4013
```

Notes: Must have at least two characters.
Characters must be unique.
Default is "0123456789ABCDEFGHIJKLMNOPQRSTUVWXYZ".
(Read and Write property)

163.3.7 BlockLength as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Length of the blocks in the serial number.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

r.NumberLength=10
r.BlockLength=5
MsgBox r.Calc // shows: ICYRR-ES4UX

r.NumberLength=16
r.BlockLength=4
MsgBox r.Calc // shows: ICYR-RES4-UXQ1
```

Notes: If this value is 0, no delimeters are used.
(Read and Write property)

163.3.8 Delimiter as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The delimiter string to use for separating blocks in the serial number.

Notes: Default is "-".
(Read and Write property)

163.3.9 Mode as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mode of operation.
Notes: Currently always 0.
Set to 1 to use 128bit instead of 64bit number.
(Read and Write property)

163.3.10 NumberLength as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum length of the number.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="MyProduct 2008"

r.NumberLength=10
r.BlockLength=5
MsgBox r.Calc // shows: ICYRR-ES4UX

r.NumberLength=16
r.BlockLength=4
MsgBox r.Calc // shows: ICYR-RES4-UXQ1
```

Notes: (Read and Write property)

163.3.11 Platform as Integer

MBS Util Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: All.

Function: Which platform to use for platform specific keys.
Notes: Value is set in the constructor to current platform, but you can change it if you want to run the key generator on a different platform.

Values are:

1 Mac
2 Windows
3 Linux

All other values behave like PlatformSpecificKeys is false.
This value is only used if PlatformSpecificKeys is true.
(Read and Write property)

163.3.12 PlatformSpecificKeys as Boolean

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you want platform specific keys.
Notes: Set to false if you want to have Windows, Mac OS X and Linux all use the same serial numbers.
Set to true if you want to different serial numbers depending on the platform.

Default is false.
(Read and Write property)

163.3.13 Prefix as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The prefix for the serial number string.
Notes: (Read and Write property)

163.3.14 Seed as Integer

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: A seed value you can set to get your serial number more unique.
Notes: (Read and Write property)

163.3.15 Suffix as String

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The suffix for the serial number string.
Example:

```
Var r as new RegistrationEngineMBS

r.Field(0)="Hello World"
r.Field(1)="Xojo"
r.suffix="-RB600CPFUSA-MAC"

r.BlockLength=8
r.NumberLength=32

MsgBox r.Calc
// shows: EV6GG9P2-DI533EV6-GG9P2DI5-33EV6GG9-RB600CPFUSA-MAC
// looks like a Xojo serial number ;-)
```

Notes: (Read and Write property)

163.3.16 Field(index as Integer) as string

MBS Util Plugin, Plugin Version: 9.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data fields you can use for personalized serial numbers.
Notes: Fill this fields with all the values you want to use for personalized serial numbers. You should use the name of the user, maybe the postal address. You can use hardware values like the MAC address or software values like the system folder creation date.
Also you may have serial numbers different between version 1.x and 2.x of your application. So you pass version information like "1" or "2". Do not pass values like "1.2.3" as this serial number won't work on "1.2.4".

Index is from 0 to 7.
(Read and Write computed property)

Chapter 164

Regular Expressions

164.1 class PCRE2CodeInfoMBS

164.1.1 class PCRE2CodeInfoMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for inspecting callouts.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// pattern with callout
compiler.Pattern = "A(?C3)B"

Var code As PCRE2CodeMBS = Compiler.Compile
Var codeInfo() As PCRE2CodeInfoMBS = code.Infos

break // look into debugger
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

164.1.2 Methods

164.1.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

164.1.4 Properties

164.1.5 CalloutNumber as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number for numbered callouts.
Notes: (Read only property)

164.1.6 CalloutString as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The callout string.
Notes: (Read only property)

164.1.7 CalloutStringLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Length of callout string.
Notes: (Read only property)

164.1.8 CalloutStringOffset as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Offset to string within pattern.
Notes: (Read only property)

164.1.9 NextItemLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Length of next item in pattern.
Notes: (Read only property)

164.1.10 PatternPosition as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Offset to next item in pattern.
Notes: (Read only property)

164.2 class PCRE2CodeMBS

164.2.1 class PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a compiled pattern.
Example:

```
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

MessageBox Str(code.CaptureCount) // shows 2
```

Notes: Please use this class as a chance to compile once and then reuse the compiled pattern several times to search various strings.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

164.2.2 Methods

164.2.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

164.2.4 Copy(withTables as boolean = false) as PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Makes a copy of the memory used for a compiled pattern, excluding any memory used by the JIT compiler.
Notes: Without a subsequent call to JITCompile(), the copy can be used only for non-JIT matching. The pointer to the character tables is copied, not the tables themselves (unless withTables is true).

164.2.5 Infos as PCRE2CodeInfoMBS()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enumerate callouts in a compiled pattern.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// pattern with callout
compiler.Pattern = "A(?C3)B"

Var code As PCRE2CodeMBS = Compiler.Compile
Var codeInfo() As PCRE2CodeInfoMBS = code.Infos

break // look into debugger
```

Notes: Useful to debug the pattern.

164.2.6 JITCompile(Flags as Integer = 1)

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Requests JIT compilation.
Notes: If the just-in-time compiler is available, further processes a compiled pattern into machine code that executes much faster than the Match() interpretive matching function.

164.2.7 Match(Text as String, matchData as PCRE2MatchDataMBS, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Matches a compiled regular expression against a given subject string, using a matching algorithm that is similar to Perl's.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var TotalSubString As String = match.SubString(0)
Var SubString1 As String = match.SubString(1)
Var SubString2 As String = match.SubString(2)

break // see debugger
```

Notes: It returns offsets to what it has matched and to captured substrings via the matchData object. The return from Match() is one more than the highest numbered capturing pair that has been set (for example, 1 if there are no captures), zero if the vector of offsets is too small.
Raises exception in case of error.

A match context is needed only if you want to:

- Set up a callout function
- Set a matching offset limit
- Change the heap memory limit
- Change the backtracking match limit
- Change the backtracking depth limit

- Set custom memory management specifically for the match

StartOffsetCharacters is optional to start at a specific character in the text.
See also:

- 164.2.8 Match(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2MatchDataMBS 20185

164.2.8 Match(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2MatchDataMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience variant of Match function.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
Var code As PCRE2CodeMBS = Compiler.Compile

// now run a match
Var Match1 As PCRE2MatchDataMBS = code.Match("abc") // ->nil as not found
Var Match2 As PCRE2MatchDataMBS = code.Match("T√§st 1234,Ç¨ Case")

MessageBox match2.SubString(0)
```

Notes: Performs match and returns the new PCRE2MatchDataMBS object.
Returns nil in case nothing is found.
See also:

- 164.2.7 Match(Text as String, matchData as PCRE2MatchDataMBS, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as Integer 20184

164.2.9 MatchAll(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2MatchDataMBS()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Matches pattern several times in the text.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d)"
Var code As PCRE2CodeMBS = Compiler.Compile
```

```
// now run a match
Var Matches() As PCRE2MatchDataMBS = code.MatchAll("T√§st 1234,Ç¨ Case")

Var SubString0 As String = matches(0).SubString(0)
Var SubString1 As String = matches(1).SubString(0)
Var SubString2 As String = matches(2).SubString(0)
Var SubString3 As String = matches(3).SubString(0)

// see 4 results in debugger
Break
```

Notes: This does a loop to go over text from start to end to match the pattern as often as it fits.
We try to avoid endless loops.

Returns an array with PCRE2MatchDataMBS objects, one for each match.

164.2.10 Matches(Text as String, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as PCRE2IteratorMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Runs match with an iterator.
Example:

```
Var rx As New PCRE2CompilerMBS
rx.CaseLess = True
rx.DotAll = False
rx.Ungreedy = False
rx.NewLine = rx.kNewLineAnyCRLF
rx.Multiline = True
rx.Pattern = kMarkerPattern

Var code As PCRE2CodeMBS = rx.Compile
Var foundCount as integer

for each MatchData as PCRE2MatchDataMBS in code.Matches(TestString, 0)
foundCount = foundCount + 1
next
```

Notes: Returns the iterator, so you can use it with for each loop.
May raie an error if something goes wrong.

164.2.11 Names as String()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries name table.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(?<AA>\d+)"

Var code As PCRE2CodeMBS = Compiler.Compile
Var names() As String = code.Names

Break // see debugger
```

164.2.12 SerializeDecode(Data as String) as PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Decodes a serialized set of compiled patterns back into a list of individual patterns.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
Var code1 As PCRE2CodeMBS = Compiler.Compile

// store somewhere compiled
Var data As String = code1.SerializeEncode

// later rebuild it
Var code2 As PCRE2CodeMBS = PCRE2CodeMBS.SerializeDecode(data)

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code2)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var Found As Integer = code2.Match(Text, match)

MessageBox match.SubString(0)
```

Notes: This is possible only on a host that is running the same version of PCRE2, with the same code unit width, and the host must also have the same endianness, pointer width and size_t type.

164.2.13 SerializeEncode as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Encodes a compiled pattern into a byte stream that can be saved on disc or elsewhere.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
Var code1 As PCRE2CodeMBS = Compiler.Compile

// store somewhere compiled
Var data As String = code1.SerializeEncode

// later rebuild it
Var code2 As PCRE2CodeMBS = PCRE2CodeMBS.SerializeDecode(data)

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code2)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var Found As Integer = code2.Match(Text, match)

MessageBox match.SubString(0)
```

Notes: Note that this is not an abstract format like Java or .NET. Conversion of the byte stream back into usable compiled patterns can only happen on a host that is running the same version of PCRE2, with the same code unit width, and the host must also have the same endianness, pointer width and size_t type.

164.2.14 Substitute(Text as String, Replacement as String, matchData as PCRE2MatchDataMBS = nil, StartOffsetCharacters as Integer = 0, MatchContext as PCRE2MatchContextMBS = nil) as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Matches a compiled regular expression against a given subject string, using a matching algorithm that is similar to Perl's.
Example:

```
// Compile a pattern
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d)"
Var code As PCRE2CodeMBS = Compiler.Compile
```

```
// replace all
code.SubstituteGlobal = True

// we replace all and duplicate all digits here:
Var newText As String = code.Substitute("T√§st 1234,Ç¨ Case", "$ 1$ 1")

Break // see result in debugger
```

Notes: It then makes a copy of the subject, substituting a replacement string for what was matched.

Text: The subject string
Replacement: the replacement string
matchData: The match data block, or is nil if you don't need the result.
StartOffsetCharacters: Offset in the subject at which to start matching.
MatchContext: A match context, or nil.

A match data block is needed only if you want to inspect the data from the final match that is returned in that block or if SubstituteMatched is set. A match context is needed only if you want to:

- Set up a callout function
- Set a matching offset limit
- Change the backtracking match limit
- Change the backtracking depth limit
- Set custom memory management in the match context

Raises exception in case of error.

The options are controlled via properties:

164.2.15 SubstringNumberFromName(Name as String) as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Finds the number of a named substring capturing parenthesis in a compiled pattern, provided that it is a unique name.
Notes: If the string is not found, you receive a negative value.
For other errors, we raise an exception.

Anchored	Match only at the first position
EndAnchored	Pattern can match only at end of subject
NotBOL	Subject string is not the beginning of a line
NotEOL	Subject string is not the end of a line
NotEmpty	An empty string is not a valid match
NotEmptyAtStart	An empty string at the start of the subject is not a valid match
NoJit	Do not use JIT matching
NoUTFCheck	Do not check the subject for UTF validity (only relevant if UTF was set at compile time)
PartialHard	Return PCRE2_ERROR_PARTIAL (-2) for a partial match even if there is a full match
PartialSoft	Return PCRE2_ERROR_PARTIAL (-2) for a partial match if no full matches are found.

164.2.16 Properties

164.2.17 AllOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Final options after compiling.
Notes: (Read only property)

164.2.18 Anchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Match only at the first position.
Notes: (Read and Write property)

164.2.19 ArgOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Options passed to Compile.
Notes: Should be same as Options value in PCRE2CompilerMBS.
(Read only property)

164.2.20 BackRefMax as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of highest backreference.
Notes: (Read only property)

164.2.21 BSR as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: What \R matches.
Notes: kBSRUnicode: Unicode line endings
kBSRanyCRLF: CR, LF, or CRLF only
(Read only property)

164.2.22 CaptureCount as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of capturing subpatterns.
Example:

```
Var Compiler As New PCRE2CompilerMBS
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

MessageBox Str(code.CaptureCount) // shows 2
```

Notes: (Read only property)

164.2.23 DepthLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Backtracking depth limit if set.
Notes: (Read only property)

164.2.24 EndAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern can match only at end of subject.
Notes: (Read and Write property)

164.2.25 ExtraOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extra options that were passed in the compile context.
Notes: (Read only property)

164.2.26 FirstCodeType as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Type of start-of-match information.
Notes: Value can be:
0 nothing set
1 first code unit is set
2 start of string or after newline
(Read only property)

164.2.27 FirstCodeUnit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: First code unit when type is 1.
Notes: (Read only property)

164.2.28 FrameSize as UInt64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of backtracking frame.
Notes: (Read only property)

164.2.29 HasBackslashC as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return true if pattern contains \C.
Notes: (Read only property)

164.2.30 HasCRorLF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return true if explicit CR or LF matches exist in the pattern.
Notes: (Read only property)

164.2.31 HeapLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Heap memory limit if set.
Notes: (Read only property)

164.2.32 JChanged as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return true if (?J) or (?-J) was used.
Notes: (Read only property)

164.2.33 JITSize as UInt64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of JIT compiled code, or 0.
Notes: (Read only property)

164.2.34 LastCodeType as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Type of must-be-present information.
Notes: Value can be:
0 nothing set
1 code unit is set
(Read only property)

164.2.35 LastCodeUnit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Last code unit when type is 1.
Notes: (Read only property)

164.2.36 MatchEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Value is true if the pattern can match an empty string, false otherwise.
Notes: (Read only property)

164.2.37 MatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Match limit if set.
Notes: (Read only property)

164.2.38 MaxLookBehind as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Length (in characters) of the longest lookbehind assertion.
Notes: (Read only property)

164.2.39 MinLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lower bound length of matching strings.
Notes: (Read only property)

164.2.40 NameCount as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of named subpatterns.
Notes: (Read only property)

164.2.41 NameEntrySize as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of name table entries.
Notes: (Read only property)

164.2.42 NewLine as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Code for the newline sequence.
Notes: See kNewLine* constants.
(Read only property)

164.2.43 NoJit as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not use JIT matching.
Notes: (Read and Write property)

164.2.44 NotBOL as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subject is not the beginning of a line.
Notes: (Read and Write property)

164.2.45 NotEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An empty string is not a valid match.
Notes: (Read and Write property)

164.2.46 NotEmptyAtStart as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An empty string at the start of the subject is not a valid match.
Notes: (Read and Write property)

164.2.47 NotEOL as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subject is not the end of a line.
Notes: (Read and Write property)

164.2.48 NoUTFCheck as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not check the subject or replacement for UTF validity (only relevant if UTF was set at compile time)
Notes: (Read and Write property)

164.2.49 Options as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The option flags.
Notes: You usually set the boolean properties to turn flags here on/off.
(Read and Write property)

164.2.50 PartialHard as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return -2 from Match() for a partial match even if there is a full match.
Notes: (Read and Write property)

164.2.51 PartialSoft as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return -2 from Match() for a partial match if no full matches are found.
Notes: (Read and Write property)

164.2.52 Size as UInt64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Size of compiled pattern.
Notes: (Read only property)

164.2.53 SubstituteExtended as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do extended replacement processing.
Notes: (Read and Write property)

164.2.54 SubstituteGlobal as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replace all occurrences in the subject.
Notes: (Read and Write property)

164.2.55 SubstituteLiteral as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The replacement string is literal.
Notes: (Read and Write property)

164.2.56 SubstituteMatched as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Use pre-existing match data for 1st match.
Notes: (Read and Write property)

164.2.57 SubstituteOverflowLength as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: If overflow, compute needed length.
Notes: (Read and Write property)

164.2.58 SubstituteReplacementOnly as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return only replacement string(s).
Notes: (Read and Write property)

164.2.59 SubstituteUnknownUnset as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Treat unknown group as unset.
Notes: (Read and Write property)

164.2.60 SubstituteUnsetEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Simple unset insert = empty string.
Notes: (Read and Write property)

164.2.61 Constants

Constants

Constant	Value	Description
kJITComplete	1	One of the flags for JIT compilation. Compile code for full matching.
kJITPartialHard	4	One of the flags for JIT compilation. Compile code for hard partial matching.
kJITPartialSoft	2	One of the flags for JIT compilation. Compile code for soft partial matching.

164.3 class PCRE2CompilerMBS

164.3.1 class PCRE2CompilerMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for compiling regular expression patterns into code.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var TotalSubString As String = match.SubString(0)
Var SubString1 As String = match.SubString(1)
Var SubString2 As String = match.SubString(2)

break // see debugger
```

164.3.2 Methods

164.3.3 Compile as PCRE2CodeMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compiles a regular expression pattern into an internal form.
Notes: Please set pattern property before calling this.
Returns the code object or raises an exception.

164.3.4 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

164.3.5 Copy as PCRE2CompilerMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of the object.

164.3.6 Properties

164.3.7 AllocationBytes as Int64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries size of all memory allocations summed up.
Notes: Only valid if MonitorAllocations is true.
(Read only property)

164.3.8 AllocationCount as Int64

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of allocations done.
Notes: Only valid if MonitorAllocations is true.
(Read only property)

164.3.9 AllowEmptyClass as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allow empty classes.
Notes: (Read and Write property)

164.3.10 AllowLookaroundBSK as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allow \K in lookarounds PCRE2_EXTRA_ALLOW_SURROGATE_ESCAPES Allow \x { df800 } to \x { dfff } in UTF-8 and UTF-32 modes.
Notes: (Read and Write property)

164.3.11 AllowSurrogateEscapes as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disables check for surrogates to allow them.
Notes: (Read and Write property)

164.3.12 AltBsux as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative handling of \u, \U, and \x
Notes: (Read and Write property)

164.3.13 AltCircumflex as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative handling of ^in multiline mode.
Notes: (Read and Write property)

164.3.14 AltVerbNames as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Process backslashes in verb names.
Notes: (Read and Write property)

164.3.15 Anchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Force pattern anchoring.
Notes: (Read and Write property)

164.3.16 AutoCallout as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compile automatic callouts.
Notes: (Read and Write property)

164.3.17 BadEscapeIsLiteral as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Treat all invalid escapes as a literal following character.
Notes: (Read and Write property)

164.3.18 BSR as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the convention for processing \R within a compile context.
Notes: Can be kBSRUnicode or kBSRanyCRLF.
(Read and Write property)

164.3.19 Caseless as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do caseless matching.
Notes: Set to true for caseless matching or false for case sensitive.
(Read and Write property)

164.3.20 CompiledWidths as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Which of 8/16/32 support was compiled.
Notes: (Read only property)

164.3.21 DefaultBSR as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Indicates what \R matches by default.
Notes: Either kBSRUnicode or kBSRanyCRLF.
(Read only property)

164.3.22 DefaultDepthLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default backtracking depth limit.
Notes: (Read only property)

164.3.23 DefaultHeapLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default heap memory limit.
Notes: (Read only property)

164.3.24 DefaultMatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default internal resource limit.
Notes: (Read only property)

164.3.25 DefaultNewLine as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Code for the default newline sequence.
Notes: See kNewLine* constants.
(Read only property)

164.3.26 DefaultParensLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default parentheses nesting limit.
Notes: (Read only property)

164.3.27 DollarEndonly as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: $ not to match newline at end.
Notes: (Read and Write property)

164.3.28 DotAll as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: . matches anything including NL
Notes: (Read and Write property)

164.3.29 DupNames as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allow duplicate names for subpatterns.
Notes: (Read and Write property)

164.3.30 EndAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern can match only at end of subject.
Notes: (Read and Write property)

164.3.31 ErrorOffset as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The error offset from Compile failure.
Notes: The error offsets in characters.
(Read and Write property)

164.3.32 EscapedCRIsLF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Interpret \r as \n.
Notes: (Read and Write property)

164.3.33 Extended as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Ignore white space and # comments.
Notes: (Read and Write property)

164.3.34 ExtendedAltBSUX as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extended alternate \u, \U, and \x handling.
Notes: (Read and Write property)

164.3.35 ExtendedMore as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: If set, the same applies, but in addition unescaped space and horizontal tab characters are ignored inside a character class.
Notes: (Read and Write property)

164.3.36 ExtraOptions as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The extra option flags.
Notes: You usually set the boolean properties to turn flags here on/off.
(Read and Write property)

164.3.37 Firstline as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Force matching to be before newline.
Notes: Force matching to be before newline.
(Read and Write property)

164.3.38 Greedy as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Don't invert greediness of quantifiers.
Notes: (Read and Write property)

164.3.39 HasJIT as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Availability of just-in-time compiler support.
Notes: (Read only property)

164.3.40 HasUnicode as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Availability of Unicode support.
Notes: (Read only property)

164.3.41 JITTarget as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Information (a string) about the target architecture for the JIT compiler
Notes: (Read only property)

164.3.42 LinkSize as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Configured internal link size (2, 3, 4)
Notes: (Read only property)

164.3.43 Literal as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern characters are all literal.
Notes: (Read and Write property)

164.3.44 MatchInvalidUTF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable support for matching invalid UTF.
Notes: (Read and Write property)

164.3.45 MatchLine as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern matches whole lines.
Notes: (Read and Write property)

164.3.46 MatchUnsetBackref as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Match unset backreferences.
Notes: (Read and Write property)

164.3.47 MatchWord as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pattern matches "words".
Notes: (Read and Write property)

164.3.48 MaxPatternLength as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The maximum text length (in code units) of the pattern that can be compiled.
Example:

```
Var Compiler As New PCRE2CompilerMBS

compiler.MaxPatternLength = 10
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

// raises exception as pattern is too long
Var code As PCRE2CodeMBS = Compiler.Compile
```

Notes: The default is effectively unlimited.
(Read and Write property)

164.3.49 MonitorAllocations as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to monitor allocations.
Example:

```
PCRE2CompilerMBS.MonitorAllocations = True

Var a1 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b1 As Int64 = PCRE2CompilerMBS.AllocationBytes

Var Compiler As New PCRE2CompilerMBS

Var a2 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b2 As Int64 = PCRE2CompilerMBS.AllocationBytes

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile
Var a3 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b3 As Int64 = PCRE2CompilerMBS.AllocationBytes
```

```
// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)

Var a4 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b4 As Int64 = PCRE2CompilerMBS.AllocationBytes

match = Nil

Var a5 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b5 As Int64 = PCRE2CompilerMBS.AllocationBytes

code = Nil

Var a6 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b6 As Int64 = PCRE2CompilerMBS.AllocationBytes

compiler = Nil

Var a7 As Int64 = PCRE2CompilerMBS.AllocationCount
Var b7 As Int64 = PCRE2CompilerMBS.AllocationBytes
// should be both zero on the end

Break // see debugger
```

Notes: Please turn on if you look for memory leaks with PCRE2.
Otherwise keep off for higher performance.

Set to true, then do a few things, cleanup and check if AllocationBytes is combing back to zero.
(Read and Write property)

164.3.50 Multiline as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: ^and $ match newlines within data.
Notes: (Read and Write property)

164.3.51 NeverBackslashC as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lock out the use of \C in patterns.
Notes: (Read and Write property)

See also:

- 164.3.52 NeverBackslashC as Boolean 20211

164.3.52 NeverBackslashC as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether or not \C is disabled.
Notes: (Read only property)
See also:

- 164.3.51 NeverBackslashC as Boolean 20210

164.3.53 NeverUCP as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lock out PCRE2_UCP, e.g. via (*UCP).
Notes: (Read and Write property)

164.3.54 NeverUTF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Lock out PCRE2_UTF, e.g. via (*UTF).
Notes: (Read and Write property)

164.3.55 NewLine as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the newline convention within a compile context.
Notes: See kNewLine* constants.
(Read and Write property)

164.3.56 NoAutoCapture as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable numbered capturing parentheses (named ones available).
Notes: (Read and Write property)

164.3.57 NoAutoPossess as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable auto-possessification.
Notes: (Read and Write property)

164.3.58 NoDotStarAnchor as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable automatic anchoring for .*
Notes: (Read and Write property)

164.3.59 NoStartOptimize as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Disable match-time start optimizations.
Notes: (Read and Write property)

164.3.60 NoUTFCheck as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not check the pattern for UTF validity (only relevant if UTF is set)
Notes: (Read and Write property)

164.3.61 Options as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The option flags.
Notes: You usually set the boolean properties to turn flags here on/off.
(Read and Write property)

164.3.62 ParensNestLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Default parentheses nesting limit.
Notes: (Read and Write property)

164.3.63 Pattern as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The search pattern.
Notes: (Read and Write property)

164.3.64 PCRE2Version as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The PCRE2 version.
Notes: (Read only property)

164.3.65 UCP as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Use Unicode properties for \d, \w, etc.
Notes: (Read and Write property)

164.3.66 Ungreedy as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Invert greediness of quantifiers.
Notes: (Read and Write property)

164.3.67 UnicodeVersion as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The Unicode version.
Notes: (Read only property)

164.3.68 UseOffsetLimit as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable offset limit for unanchored matching.
Notes: (Read and Write property)

164.3.69 UTF as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Treat pattern and subjects as UTF strings.
Notes: (Read and Write property)

164.3.70 Constants

BSR

Constant	Value	Description
kBSRanyCRLF	2	CR, LF, or CRLF only
kBSRUnicode	1	Unicode line endings

New Line Character

Constant	Value	Description
kNewLineAny	4	Any Unicode newline sequence.
kNewLineAnyCRLF	5	CR, LF or CRLF.
kNewLineCR	1	Carriage return only
kNewLineCRLF	3	CR followed by LF only
kNewLineLF	2	Linefeed only
kNewLineNul	6	The NUL character (binary zero)

164.4 class PCRE2ExceptionMBS

164.4.1 class PCRE2ExceptionMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an error in PCRE2.
Notes: We usually set error message and number.
Check also ErrorOffset in PCRE2CompilerMBS class.
Subclass of the RuntimeException class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

164.4.2 Methods

164.4.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

164.5 class PCRE2IteratorMBS

164.5.1 class PCRE2IteratorMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Our iterator class to match text.
Notes: Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Interfaces: Iterator, Iterable

164.5.2 Methods

164.5.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

164.5.4 Iterator as Iterator

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the iterator.
Notes: Part of the iterable interface.
Returns self.

164.5.5 MoveNext as Boolean

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next position.
Notes: Returns true if we found something or false if we finished or didn't found anything.

164.5.6 Value as Variant

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries current match.
Notes: Returns PCRE2MatchDataMBS object for the match.

To increase performance, the object is cached and reused.
So if you like to keep it, please call Copy method to clone it.

164.6 class PCRE2MatchContextMBS

164.6.1 class PCRE2MatchContextMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a match context.
Example:

```
// we limit offset here
Var context As New PCRE2MatchContextMBS
context.DepthLimit = 100
context.OffsetLimit = 3 // cause error later. 10 works

Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
compiler.UseOffsetLimit = True

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match, 0, context)

// show matched text
MessageBox match.SubString(0)

// The offset_limit parameter limits how far an unanchored search can advance in the subject string. The default value is PCRE2_UNSET. The Match() functions return -1 if a match with a starting point before or at the given offset is not found. The Substitute() function makes no more substitutions.
// For example, if the pattern /abc/ is matched against "123abc" with an offset limit less than 3, the result is -1. A match can never be found if the startoffset argument of Match() or Substitute() is greater than the offset limit set in the match context.
```

Notes: A match context is needed only if you want to:

- Set up a callout function
- Set a matching offset limit
- Change the heap memory limit
- Change the backtracking match limit

- Change the backtracking depth limit
- Set custom memory management specifically for the match

Xojo Developer Magazine

- 21.1, page 28: News from MBS Xojo Plugins, What's up with MonkeyBread Software by Stefanie Juchmes

164.6.2 Methods

164.6.3 Constructor

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a match context.

164.6.4 Copy as PCRE2MatchContextMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of the match context.

164.6.5 SetStackSize(StartSize as UInt32, MaxSize as UInt32)

MBS RegEx Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates and sets a stack for use by the code compiled by the JIT compiler.
Example:

Var matchContext as PCRE2MatchContextMBS

```
matchContext = New PCRE2MatchContextMBS
matchContext.SetStackSize 1024*1024, 8*1024*1024
matchContext.HeapLimit = 1024 * 1024 * 16

// later pass to Match() functions
```

Notes: The two arguments are a starting size for the stack, and a maximum size to which it is allowed to grow.
A maximum stack size of 512KiB to 1MiB should be more than enough for any pattern.

If not set, an internal 32KiB block on the machine stack is used.

164.6.6 Properties

164.6.7 DepthLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the backtracking depth limit field in a match context.
Notes: (Read and Write property)

164.6.8 HeapLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the backtracking heap limit field in a match context.
Notes: (Read and Write property)

164.6.9 MatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the match limit field in a match context.
Notes: (Read and Write property)

164.6.10 OffsetLimit as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the offset limit field in a match context.
Notes: (Read and Write property)

164.7 class PCRE2MatchDataMBS

164.7.1 class PCRE2MatchDataMBS

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a match.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// show matched text
MessageBox match.SubString(0)
```

Notes: The class allows you to reuse the object to hold result of a match, so only create it once and then use it with multiple strings to match.

164.7.2 Methods

164.7.3 Constructor(code as PCRE2CodeMBS)

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new match data block for holding the result of a match.
Notes: The first argument points to a compiled pattern. The number of capturing parentheses within the pattern is used to compute the number of pairs of offsets that are required in the match data block. These form the "output vector" (ovector) within the match data block, and are used to identify the matched string and any captured substrings when matching with Match().

Use this to allocate a match data object for a specific code object.
See also:

- 164.7.4 Constructor(size as Integer) 20223

164.7.4 Constructor(size as Integer)

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new match data block, which is used for holding the result of a match.
Notes: The first argument specifies the number of pairs of offsets that are required. These form the "output vector" (ovector) within the match data block, and are used to identify the matched string and any captured substrings when matching with Match(). There is always one pair of offsets; if size is zero, it is treated as one.

Use this to allocate a match data object with a bigger size to use it with various pattern.
See also:

- 164.7.3 Constructor(code as PCRE2CodeMBS) 20223

164.7.5 OffsetVector(index as Integer) as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the offset in the text for the match.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile
```

```
// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var OVector0 As Integer = match.OffsetVector(2)
Var OVector1 As Integer = match.OffsetVector(3)
Var Len As Integer = OVector1 - OVector0
Var pos As Integer = OVector0
Var OwnSubString As String = Text.Middle(pos, Len)

Break
```

Notes: Values in number of characters and zero based, so maybe use Middle() function on strings.
Range is 0 to OffsetVectorCount*2-1.

OffsetVector(0) and OffsetVector(1) is the total match found.
OffsetVector(2) and OffsetVector(3) is the first captured sub string.
OffsetVector(4) and OffsetVector(5) is the second captured sub string.
...
OffsetVector(OffsetVectorCount*2-2) and OffsetVector(OffsetVectorCount*2-1) is the last captured sub string.

164.7.6 OffsetVectors as Integer()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries array of vector values.
Notes: All the values in an array for faster access.

164.7.7 SubString(Index as Integer) as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries substring by index.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"
```

```
Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)

// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// get result found
Var TotalSubString As String = match.SubString(0)
Var SubString1 As String = match.SubString(1)
Var SubString2 As String = match.SubString(2)

break // see debugger
```

See also:

- 164.7.8 SubString(Name as String) as String 20225

164.7.8 SubString(Name as String) as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries substring by name.
See also:

- 164.7.7 SubString(Index as Integer) as String 20224

164.7.9 SubStrings as String()

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A convenience function for extracting all the captured substrings after a pattern match.
Example:

```
Var Compiler As New PCRE2CompilerMBS

// find numbers
compiler.Pattern = "(\d+)( [ $ ,Ç¨£] ?)"

Var code As PCRE2CodeMBS = Compiler.Compile

// prepare reuable match object
Var Match As New PCRE2MatchDataMBS(code)
```

```
// now run a match
Var Text As String = "T√§st 1234,Ç¨ Case"
Var n As Integer = code.Match(Text, match)

// show matched text
Var subStrings() As String = match.SubStrings
Break
```

164.7.10 Properties

164.7.11 DataSize as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the size, in bytes, of the match data block that is its argument.
Notes: (Read only property)

164.7.12 Mark as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the last (*MARK), (*PRUNE), or (*THEN) name that was encountered during the matching process.
Notes: The name is within the compiled pattern.
(Read only property)

164.7.13 OffsetVectorCount as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of pairs of offsets in the ovector that forms part of the given match data block.
Notes: (Read only property)

164.7.14 StartPosition as Integer

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the position of the character at which the successful match started.
Notes: For a non-partial match, this can be different to the value of CharactersOffsetVector(0) if the pattern contains the \K escape sequence. After a partial match, however, this value is always the same as

CharactersOffsetVector(0) because \K does not affect the result of a partial match.
(Read only property)

164.7.15 Text as String

MBS RegEx Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The text used to match against.
Notes: (Read and Write property)

164.8 class RegExMBS

164.8.1 class RegExMBS

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for fast Regular Expression Search in a perl compatible way.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then

Var s as string="Hello World"

Var start as Integer = 0
while r.Execute(s,start)>0

Var p as Integer = r.OffsetCharacters(0)
Var l as Integer = r.OffsetCharacters(1)-r.OffsetCharacters(0)

MsgBox "Found "+searchString+" on position "+str(p)+" with length "+str(l)+" in """+s+"""

start = r.Offset(1)
wend

else
MsgBox "failed to compile"
end if
```

Notes: uses the PCRE library. You may check the PCRE documentation.

The RegExMBS class has different defaults as the built in RegEx class in Xojo.

You may want to set options like this:

RB: CaseSensitive = false
MBS: CompileOptionCaseLess = true

RB: DotMatchAll = false
MBS: CompileOptionDotAll = false

RB: Greedy = true
MBS: CompileOptionUngreedy = false

RB: LineEndType = 0
MBS: CompileOptionNewLineAnyCRLF = true and ExecuteOptionNewLineAnyCRLF = true

RB: MatchEmpty = true
MBS: ExecuteOptionNotEmpty = false

and you want to set CompileOptionMultiline to true for multi line match.

164.8.2 Methods

164.8.3 Compile(pattern as string) as boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compiles a pattern.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then
msgbox "OK"
else
MsgBox "failed to compile"
end if
```

Notes: Some predefined patterns like \b do not support Unicode well, so you may work around that by using your own pattern.

Returns true on success and false on failure.
ErrorMessage, Lasterror, ErrorOffset and Handle are set.

The following table lists the error codes than may be returned by Compile(), along with the error messages that may be returned by both compiling functions.

164.8.4 CompileMemory(pattern as memoryblock, ByteOffset as Integer) as boolean

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compiles a pattern.
Notes: Same as Compile, but the text is stored in a memoryblock and must be a 0 terminated C string. Be careful to use valid UTF8 input and provide offset in byte units and not in characters.

164.8.5 ConfigBSR as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer whose value indicates what character sequences the \R escape sequence matches by default.
Notes: A value of 0 means that \R matches any Unicode line ending sequence; a value of 1 means that \R matches only CR, LF, or CRLF. The default can be overridden when a pattern is compiled or matched.

164.8.6 ConfigLinkSize as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that contains the number of bytes used for internal linkage in compiled regular

expressions.
Notes: The value is 2, 3, or 4. Larger values allow larger regular expressions to be compiled, at the expense of slower matching. The default value of 2 is sufficient for all but the most massive patterns, since it allows the compiled pattern to be up to 64K in size.

164.8.7 ConfigMallocThreshold as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output is an integer that contains the threshold above which the POSIX interface uses malloc() for output vectors.

164.8.8 ConfigMatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that gives the default limit for the number of internal matching function calls in a Execute execution.

164.8.9 ConfigMatchLimitRecursion as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that gives the default limit for the depth of recursion when calling the internal matching function in a Execute() execution.

164.8.10 ConfigNewLine as Integer

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: What newline character is used as default.
Notes: The output is an integer whose value specifies the default character sequence that is recognized as meaning "newline". The four values that are supported are: 10 for LF, 13 for CR, 3338 for CRLF, -2 for ANYCRLF, and -1 for ANY. Though they are derived from ASCII, the same values are returned in EBCDIC environments. The default should normally correspond to the standard sequence for your operating system.

164.8.11 ConfigStackRecurse as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an integer that is set to one if internal recursion when running Execute() is implemented by recursive function calls that use the stack to remember their state.
Notes: This is the usual way that PCRE is compiled. The output is zero if PCRE was compiled to use blocks of data on the heap instead of recursive function calls. In this case, malloc and free are called to manage memory blocks on the heap, thus avoiding the use of the stack.

164.8.12 ConfigUnicodeProperties as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if unicode properties are available.
Notes: Should be true for the plugin.

164.8.13 ConfigUTF8 as boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether UTF8 is supported.
Notes: If this ever is false, please complain. This plugin is designed to work only on UTF8 strings for best performance.

164.8.14 Constructor(VecSize as Integer = 0)

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: You pass here the internal vector size which limits how many substrings you can find.
For 20 substrings, you need to pass (20+1)*3 for vector size.

164.8.15 Escape(text as string) as string

MBS RegEx Plugin, Plugin Version: 7.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Escapes the string.
Example:

```
Var r as new RegExMBS

Var s as string = "Hello [ ] "
Var e as string = r.Escape(s)
MsgBox e // shows Hello \[ \]
```

```
Var d as string = r.Unescape(e)
MsgBox d // shows original string
```

Notes: The string is converted to UTF8 and all the RegEx special characters are escaped.
Returns "" on low memory.

164.8.16 Execute(start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern again.
Notes: You can use this variant of execute to continue a search in the same string/memoryblock at a new starting offset.
See also:

- 164.8.17 Execute(text as string, start as Integer = 0) as Integer 20233

164.8.17 Execute(text as string, start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Example:

```
Var r as RegExMbs
Var s as string
Var c as Integer

s="123 ABC 456"

r=new RegExMBS
if r.Compile(" \D+ ") then
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 3 8
// 1 for number of results
// 3 for 3 bytes before the matched pattern
// 8 for the 8 bytes before the end of the matched pattern
end if
```

Notes: Returns the number of found offsets.
text must be in UTF-8 text encoding.
Start must be 0 for the first character and the byte offset for other chacters. Do not pass values from OffsetCharacters here!

Return values from Execute:
If Execute() fails, it returns a negative number. The following are defined in the header file:

See also:

- 164.8.16 Execute(start as Integer = 0) as Integer 20233

164.8.18 ExecuteMemory(text as memoryblock, ByteOffset as Integer = 0, ByteLength as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as Execute, but the text is stored in a memoryblock.
Be careful to use valid UTF8 input and provide offset and length in byte units and not in characters.
If ByteLength is zero, we take the length of the memoryblock.

164.8.19 ExecuteMemoryMT(text as memoryblock, ByteOffset as Integer = 0, ByteLength as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as ExecuteMemory, but more thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

164.8.20 ExecuteMT(start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as Execute, but more thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 164.8.21 ExecuteMT(text as string, start as Integer = 0) as Integer 20235

164.8.21 ExecuteMT(text as string, start as Integer = 0) as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a search with the compiled pattern.
Notes: Same as Execute, but more thread friendly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 164.8.20 ExecuteMT(start as Integer = 0) as Integer 20234

164.8.22 InfoNameEntry(Index as Integer) as string

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a name entry in the list of captures.
Notes: Only valid after pattern was compiled.

164.8.23 IsASCIIText(text as string) as boolean

MBS RegEx Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether text in string is only ASCII.
Example:

```
Var s As String = "Hello World"

If RegExMBS.IsASCIIText(s) Then
MessageBox "Only 7 bit ASCII"
Else
MessageBox "Not ASCII. Some 8 bit encoding like ANSI or UTF-8."
End If
```

Notes: Does checks bytes of text, so doesn't look on encoding property.

164.8.24 Match(text as string) as boolean

MBS RegEx Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if current search pattern matches against given text.
Example:

```
Var r as new RegExMBS

if r.Compile("e.l") then

if r.Match("Hello") then
MsgBox "match"
end if

if r.Match("Helro") then
MsgBox "wrong match"
end if
end if
```

Notes: Returns true if text matches.

Does not set properties like Execute, so subString() won't work.
See also:

- 164.8.25 Match(text() as string, inverse as boolean = false) as string() 20236
- 164.8.26 Match(text() as Variant, inverse as boolean = false) as string() 20237

164.8.25 Match(text() as string, inverse as boolean = false) as string()

MBS RegEx Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if current search pattern matches against given text array.
Example:

```
Var r as new RegExMBS

r.CompileOptionCaseLess = true

if r.Compile("e.l") then

Var t() as string = array("Hello", "World", "Xojo", "test")

Var match1() as string = r.Match(t)
Var match2() as string = r.Match(t, true)

MsgBox "Matching: "+Join(match1, ", ")+EndOfLine+"Other: "+Join(match2, ", ")
end if
```

Notes: Returns the list of matching values.
If inverse is set to true, it returns the list of non matching values.
See also:

- 164.8.24 Match(text as string) as boolean 20235
- 164.8.26 Match(text() as Variant, inverse as boolean = false) as string() 20237

164.8.26 Match(text() as Variant, inverse as boolean = false) as string()

MBS RegEx Plugin, Plugin Version: 16.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if current search pattern matches against given variant array.
Example:

```
Var r as new RegExMBS

r.CompileOptionCaseLess = true

if r.Compile("e.l") then

Var dic as new Dictionary
dic.Value("Hello") = 1
dic.Value("World") = 2
dic.Value("Xojo") = 3
dic.Value("Test") = 4

Var match1() as string = r.Match(dic.keys)
Var match2() as string = r.Match(dic.keys, true)

MsgBox "Matching: "+Join(match1, ", ")+EndOfLine+"Other: "+Join(match2, ", ")
end if
```

Notes: The variant array should have entries which convert well to string.
Returns the list of matching values.
If inverse is set to true, it returns the list of non matching values.
See also:

- 164.8.24 Match(text as string) as boolean 20235
- 164.8.25 Match(text() as string, inverse as boolean = false) as string() 20236

164.8.27 Offset(index as Integer) as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the offset in the offset list with given index in bytes.
Example:

```
Var r as RegExMbs
Var s as string
```

```
Var c as Integer

s="123 √§√√º ABC 456"

r=new RegExMBS
if r.Compile(".√.") then
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if

r=new RegExMBS
if r.Compile(".\xF6.") then // finds √ using Unicode codepoint
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if
```

Notes: If you found a pattern in a string you get here:

Invalid indexes return 0.
Count is the number of entries here.

164.8.28 OffsetCharacters(index as Integer) as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the offset in the offset list with given index in characters.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then

Var s as string="√§√√º Hello World"

if r.Execute(s,0)>0 then
Var lines(-1) as string
```

```
lines.Append str(R.Count)+" offset found."
lines.Append "In Bytes:"
lines.Append " Start of matched patern: "+str(R.Offset(0))
lines.Append " End of matched patern: "+str(R.Offset(1))
lines.Append " Length of matched patern: "+str(R.Offset(1)-r.Offset(0))

lines.Append "In Characters:"
lines.Append " Start of matched patern: "+str(R.OffsetCharacters(0))
lines.Append " End of matched patern: "+str(R.OffsetCharacters(1))
lines.Append " Length of matched patern: "+str(R.OffsetCharacters(1)-r.OffsetCharacters(0))

MsgBox Join(lines,EndOfLine)
end if

else
MsgBox "failed to compile"
end if
```

Notes: This function is identical to Offset(), but returns characters instead of bytes.
Works only with valid UTF-8 strings as input.
Value is calculated on each function call based on Offset(index) and current text.

If you found a pattern in a string you get here:

Invalid indexes return 0.
Count is the number of entries here.

Please note that if you just need offsets for calling Mid() function, you can get better performance by using just Offset and MidB function. Than neither Mid and OffsetCharacters need to calculate the character offset.

164.8.29 Replace(NewText as string) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the text on the current found position and returns the complete new text.
Notes: You need to call Execute before.
Lasterror is set.
NewText must have UTF-8 text encoding.

\0 references the whole found pattern, \1 to \15 the subexpressions.
\t is replaced with chr(9), \r and \n with chr(13) and \\with \.

164.8.30 ReplaceAll(Target as string, NewText as string = "") as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Searches the target string for current pattern and replaces all occurrences with the new text.
Notes: You need to call Compile before to initialize the pattern and you should call Study before to optimize the pattern.
Lasterror is set.
Target and NewText must have UTF-8 text encoding.

\0 references the whole found pattern, \1 to \15 the subexpressions.
\t is replaced with chr(9), \r and \n with chr(13) and \\with \.

164.8.31 ReplaceSelection(NewText as string) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the text on the current found position and returns new text for that selection.
Notes: This method is for text editors where you will store result in editfield.seltext to replace the current selection.
Lasterror is set.
You need to call Execute before.
NewText must have UTF-8 text encoding.

\0 references the whole found pattern, \1 to \15 the subexpressions.
\t is replaced with chr(9), \r and \n with chr(13) and \\with \.

164.8.32 StringNumber(name as string) as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This convenience function finds the number of a named substring capturing parenthesis in a compiled pattern.
Notes: name: Name whose number is required
The yield of the function is the number of the parenthesis if the name is found, or PCRE_ERROR_NOSUBSTRING otherwise.

164.8.33 Study as boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: After you compiled a pattern study can optimize it.

Notes: Only useful if you use Execute several times.
In that case you call one time Compile, one time Study and several times Execute.
Errormessage is set.

164.8.34 Substring(index as Integer) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the subexpression found with the given index.
Notes: Returns "" on any error.
Lasterror is set.
See also:

- 164.8.35 Substring(name as string) as string 20241

164.8.35 Substring(name as string) as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the subexpression found with the given name.
Notes: Returns "" on any error.
Lasterror is set.
See also:

- 164.8.34 Substring(index as Integer) as string 20241

164.8.36 Unescape(text as string) as string

MBS RegEx Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unescapes the string.
Example:

```
Var r as new RegExMBS

Var s as string = "Hello [ ] "
Var e as string = r.Escape(s)
MsgBox e // shows Hello \[ \]

Var d as string = r.Unescape(e)
MsgBox d // shows original string
```

Notes: The string is converted to UTF8 and all the RegEx special characters are escaped.
Returns "" on low memory.

164.8.37 Version as string

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the PCRE library as an ASCII string.

164.8.38 Properties

164.8.39 CompileOptionAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Force pattern anchoring
Notes: (Read and Write property)

164.8.40 CompileOptionAutoCallOut as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Compile automatic callouts
Notes: (Read and Write property)

164.8.41 CompileOptionBSRAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and CompileOptionBSRUnicode (which are mutually exclusive) control what the \R escape sequence matches.
Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an option when a compiled pattern is matched.
(Read and Write property)

164.8.42 CompileOptionBSRUnicode as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and CompileOptionBSRAnyCRLF (which are mutually exclusive) control what the \R escape sequence matches.
Example:

```
Var rg As new RegExMBS
rg.CompileOptionUngreedy = false
rg.CompileOptionBSRUnicode = true

Var ts as string = "one" + EndOfLine.UNIX + "test" + chr(&h2028) + "more"

// replace all end lines with #
if rg.Compile("\R+") then

ts = rg.ReplaceAll(ts,"#")

end if

MsgBox ts
```

Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an option when a compiled pattern is matched.
(Read and Write property)

164.8.43 CompileOptionCaseLess as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Do caseless matching
Example:

```
Var r as new RegExMBS
Var searchString as string = "hello"

r.CompileOptionCaseLess=True

if r.Compile(searchString) then

Var s as string="√§√√º Hello World"

if r.Execute(s,0)>0 then
MsgBox "Found: "+mid(s, r.OffsetCharacters(0)+1, r.OffsetCharacters(1)-r.OffsetCharacters(0))
else
MsgBox "nothing found"
end if

else
MsgBox "failed to compile"
end if
```

Notes: (Read and Write property)

164.8.44 CompileOptionDollarEndOnly as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: $ not to match newline at end
Notes: (Read and Write property)

164.8.45 CompileOptionDotAll as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: . matches anything including endofline
Example:

```
Var r as new RegExMBS
Var searchString as string = "<.+>"

r.CompileOptionDotAll = false // finds only if true

if r.Compile(searchString) then

Var s as string="<Step enable=""True""+EndOfLine.unix+"id=""93"" name=""Beep""/>"

if r.Execute(s,0)>0 then
MsgBox "Found: "+mid(s, r.OffsetCharacters(0)+1, r.OffsetCharacters(1)-r.OffsetCharacters(0))
else
MsgBox "nothing found"
end if

else
MsgBox "failed to compile"
end if
```

Notes: (Read and Write property)

164.8.46 CompileOptionDuplicateNames as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If this bit is set, names used to identify capturing subpatterns need not be unique.
Notes: This can be helpful for certain types of pattern when it is known that only one instance of the

named subpattern can ever be matched. There are more details of named subpatterns below; see also the pcrepattern documentation.
(Read and Write property)

164.8.47 CompileOptionExtended as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Ignore whitespace and # comments
Notes: (Read and Write property)

164.8.48 CompileOptionFirstLine as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Force matching to be before newline
Notes: (Read and Write property)

164.8.49 CompileOptionJavaScriptCompat as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If this option is set, PCRE's behaviour is changed in some ways so that it is compatible with JavaScript rather than Perl.
Notes: The changes are as follows:

(1) A lone closing square bracket in a pattern causes a compile-time error, because this is illegal in JavaScript (by default it is treated as a data character). Thus, the pattern AB] CD becomes illegal when this option is set.

(2) At run time, a back reference to an unset subpattern group matches an empty string (by default this causes the current matching alternative to fail). A pattern such as (\1)(a) succeeds when this option is set (assuming it can find an "a" in the subject), whereas it fails by default, for Perl compatibility.
(Read and Write property)

164.8.50 CompileOptionMultiline as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: ^and $ match newlines within data
Example:

```
Var r as RegExMBS
Var n,i,c as Integer
Var s as string

s=ReplaceLineEndings(EditField1.text,EndOfLine.UNIX)

r=new RegExMBS

'r.CompileOptionFirstLine=True
r.CompileOptionMultiline=True

if r.Compile("^....$ ") then
n=0
do
c=r.Execute(s,n)

if c>0 then
MsgBox r.Substring(0)
n=r.Offset(1)
end if

loop until c=0
end if
```

Notes: (Read and Write property)

164.8.51 CompileOptionNewLineAny as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: Setting CompileOptionNewLineCR or CompileOptionNewLineLF specifies that a newline is indicated by a single character (CR or LF, respectively). Setting CompileOptionNewLineCRLF specifies that a newline is indicated by the two-character CRLF sequence. Setting CompileOptionNewLineAnyCRLF specifies that any of the three preceding sequences should be recognized. Setting CompileOptionNewLineAny specifies that any Unicode newline sequence should be recognized. The Unicode newline sequences are the three just mentioned, plus the single characters VT (vertical tab, U+000B), FF (formfeed, U+000C), NEL (next line, U+0085), LS (line separator, U+2028), and PS (paragraph separator, U+2029). The last two are recognized only in UTF-8 mode.
The newline setting in the options word uses three bits that are treated as a number, giving eight possibilities. Currently only six are used (default plus the five values above). This means that if you set more than one newline option, the combination may or may not be sensible. For example, CompileOptionNewLineCR with CompileOptionNewLineLF is equivalent to CompileOptionNewLineCRLF, but other combinations may

yield unused numbers and cause an error.

The only time that a line break in a pattern is specially recognized when compiling is when PCRE_EXTENDED is set. CR and LF are whitespace characters, and so are ignored in this mode. Also, an unescaped # outside a character class indicates a comment that lasts until after the next line break sequence. In other circumstances, line break sequences in patterns are treated as literal data.
(Read and Write property)

164.8.52 CompileOptionNewLineAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

164.8.53 CompileOptionNewLineCR as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

164.8.54 CompileOptionNewLineCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

164.8.55 CompileOptionNewLineLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See CompileOptionNewLineAny for more details.
(Read and Write property)

164.8.56 CompileOptionNoAutoCapture as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Disable numbered capturing parentheses (named ones available)
Notes: (Read and Write property)

164.8.57 CompileOptionNoStartOptimize as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is an option that acts at matching time; that is, it is really an option for Execute.
Notes: If it is set at compile time, it is remembered with the compiled pattern and assumed at matching time.
(Read and Write property)

164.8.58 CompileOptionNoUTF8Check as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Do not check the pattern for UTF-8 validity.
Notes: (Read and Write property)

164.8.59 CompileOptions as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal value of all the compile options.
Notes: You can get and set the bits using the CompileOption* Boolean properties.
(Read and Write property)

164.8.60 CompileOptionUngreedy as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Invert greediness of quantifiers.
Notes: Basicly this is about whether to find the next matching item or the last matching item in the whole string.
Matching the next item is always much faster.
(Read and Write property)

164.8.61 CompileOptionUnicodeCodePoints as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to support unicode code points for character classes.
Notes: This option changes the way PCRE processes \B, \b, \D, \d, \S, \s, \W, \w, and some of the POSIX character classes. By default, only ASCII characters are recognized, but if PCRE_UCP is set, Unicode properties are used instead to classify characters. More details are given in the section on generic character types in the pcrepattern page. If you set PCRE_UCP, matching one of the items it affects takes much longer. The option is available only if PCRE has been compiled with Unicode property support.
(Read and Write property)

164.8.62 CompileOptionUTF8 as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Compile: Run in UTF-8 mode.
Notes: (Read and Write property)

164.8.63 Count as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of offsets found.
Example:

```
Var r as new RegExMBS
Var searchString as string = ".o"

if r.Compile(searchString) then

Var s as string="√§√√º Hello World"

if r.Execute(s,0)>0 then
Var lines(-1) as string

lines.Append str(R.Count)+" offset found."
lines.Append "In Bytes:"
lines.Append " Start of matched patern: "+str(R.Offset(0))
lines.Append " End of matched patern: "+str(R.Offset(1))
lines.Append " Length of matched patern: "+str(R.Offset(1)-r.Offset(0))

lines.Append "In Characters:"
lines.Append " Start of matched patern: "+str(R.OffsetCharacters(0))
lines.Append " End of matched patern: "+str(R.OffsetCharacters(1))
```

```
lines.Append " Length of matched patern: "+str(R.OffsetCharacters(1)-r.OffsetCharacters(0))

MsgBox Join(lines,EndOfLine)
end if

else
MsgBox "failed to compile"
end if
```

Notes: (Read only property)

164.8.64 ErrorMessage as String

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last message reported.
Notes: Set by Study and Compile.
(Read only property)

164.8.65 ErrorOffset as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error offset from the compile function.
Notes: (Read only property)

164.8.66 ExecuteOptionAnchored as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Match only at the first position
Notes: (Read and Write property)

164.8.67 ExecuteOptionBSRAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and ExecuteOptionBSRUnicode (which are mutually exclusive) control what the \R escape sequence matches.
Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an

option when a compiled pattern is matched.
(Read and Write property)

164.8.68 ExecuteOptionBSRUnicode as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option and ExecuteOptionBSRAnyCRLF (which are mutually exclusive) control what the \R escape sequence matches.
Example:

```
Var rg As new RegExMBS
rg.CompileOptionUngreedy = false
rg.ExecuteOptionBSRUnicode = true

Var ts as string = "one" + EndOfLine.UNIX + "test" + chr(&h2028) + "more"

// replace all end lines with #
if rg.Compile("\R+") then

ts = rg.ReplaceAll(ts,"#")

end if

MsgBox ts
```

Notes: The choice is either to match only CR, LF, or CRLF, or to match any Unicode newline sequence. The default is specified when PCRE is built. It can be overridden from within the pattern, or by setting an option when a compiled pattern is matched.
(Read and Write property)

164.8.69 ExecuteOptionNewLineAny as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: Setting ExecuteOptionNewLineCR or ExecuteOptionNewLineLF specifies that a newline is indicated by a single character (CR or LF, respectively). Setting ExecuteOptionNewLineCRLF specifies that a newline is indicated by the two-character CRLF sequence. Setting ExecuteOptionNewLineAnyCRLF specifies that any of the three preceding sequences should be recognized. Setting ExecuteOptionNewLineAny specifies that any Unicode newline sequence should be recognized. The Unicode newline sequences are the three just mentioned, plus the single characters VT (vertical tab, U+000B), FF (formfeed, U+000C), NEL (next line, U+0085), LS (line separator, U+2028), and PS (paragraph separator, U+2029). The last two are recognized only in UTF-8 mode.

The newline setting in the options word uses three bits that are treated as a number, giving eight possibilities. Currently only six are used (default plus the five values above). This means that if you set more than one newline option, the combination may or may not be sensible. For example, ExecuteOptionNewLineCR with ExecuteOptionNewLineLF is equivalent to ExecuteOptionNewLineCRLF, but other combinations may yield unused numbers and cause an error.

The only time that a line break in a pattern is specially recognized when compiling is when PCRE_EXTENDED is set. CR and LF are whitespace characters, and so are ignored in this mode. Also, an unescaped # outside a character class indicates a comment that lasts until after the next line break sequence. In other circumstances, line break sequences in patterns are treated as literal data.
(Read and Write property)

164.8.70 ExecuteOptionNewLineAnyCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

164.8.71 ExecuteOptionNewLineCR as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

164.8.72 ExecuteOptionNewLineCRLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

164.8.73 ExecuteOptionNewLineLF as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option override the default newline definition that was chosen when PCRE was built.
Notes: See ExecuteOptionNewLineAny for more details.
(Read and Write property)

164.8.74 ExecuteOptionNoStartOptimize as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: There are a number of optimizations that Execute uses at the start of a match, in order to speed up the process.
Notes: For example, if it is known that an unanchored match must start with a specific character, it searches the subject for that character, and fails immediately if it cannot find it, without actually running the main matching function. This means that a special item such as (*COMMIT) at the start of a pattern is not considered until after a suitable starting point for the match has been found. When callouts or (*MARK) items are in use, these "start-up" optimizations can cause them to be skipped if the pattern is never actually used. The start-up optimizations are in effect a pre-scan of the subject that takes place before the pattern is run.
The ExecuteOptionNoStartOptimize option disables the start-up optimizations, possibly causing performance to suffer, but ensuring that in cases where the result is "no match", the callouts do occur, and that items such as (*COMMIT) and (*MARK) are considered at every possible starting position in the subject string. If ExecuteOptionNoStartOptimize is set at compile time, it cannot be unset at matching time.

Setting ExecuteOptionNoStartOptimize can change the outcome of a matching operation. Consider the pattern

(*COMMIT)ABC
When this is compiled, PCRE records the fact that a match must start with the character "A". Suppose the subject string is "DEFABC". The start-up optimization scans along the subject, finds "A" and runs the first match attempt from there. The (*COMMIT) item means that the pattern must match the current starting position, which in this case, it does. However, if the same match is run with ExecuteOptionNoStartOptimize set, the initial scan along the subject string does not happen. The first match attempt is run starting from "D" and when this fails, (*COMMIT) prevents any further matches being tried, so the overall result is "no match". If the pattern is studied, more start-up optimizations may be used. For example, a minimum length for the subject may be recorded. Consider the pattern
(*MARK:A)(X | Y)
The minimum length for a match is one character. If the subject is "ABC", there will be attempts to match "ABC", "BC", "C", and then finally an empty string. If the pattern is studied, the final attempt does not take place, because PCRE knows that the subject is too short, and so the (*MARK) is never encountered. In this case, studying the pattern does not affect the overall match result, which is still "no match", but it does affect the auxiliary information that is returned.
(Read and Write property)

164.8.75 ExecuteOptionNotBOL as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Subject is not the beginning of a line
Notes: (Read and Write property)

164.8.76 ExecuteOptionNotEmpty as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: An empty string is not a valid match
Notes: (Read and Write property)

164.8.77 ExecuteOptionNotEmptyAtStart as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the options.
Notes: This is like ExecuteOptionNotEmpty, except that an empty string match that is not at the start of the subject is permitted. If the pattern is anchored, such a match can occur only if the pattern contains \K. Perl has no direct equivalent of ExecuteOptionNotEmpty or ExecuteOptionNotEmptyAtStart, but it does make a special case of a pattern match of the empty string within its split() function, and when using the /g modifier. It is possible to emulate Perl's behaviour after matching a null string by first trying the match again at the same offset with ExecuteOptionNotEmptyAtStart and ExecuteOptionAnchored, and then if that fails, by advancing the starting offset (see below) and trying an ordinary match again. There is some code that demonstrates how to do this in the pcredemo sample program. In the most general case, you have to check to see if the newline convention recognizes CRLF as a newline, and if so, and the current character is CR followed by LF, advance the starting offset by two characters instead of one.
(Read and Write property)

164.8.78 ExecuteOptionNotEOL as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Subject is not the end of a line
Notes: (Read and Write property)

164.8.79 ExecuteOptionNoUTF8Check as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Do not check the subject for UTF-8 validity
Notes: (Read and Write property)

164.8.80 ExecuteOptionPartial as Boolean

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Option for Execute: Return PCRE_ERROR_PARTIAL for a partial match
Notes: (Read and Write property)

164.8.81 ExecuteOptionPartialHard as Boolean

MBS RegEx Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option (and ExecuteOptionPartial) turn on the partial matching feature.
Notes: A partial match occurs if the end of the subject string is reached successfully, but there are not enough subject characters to complete the match. If this happens when ExecuteOptionPartial (but not ExecuteOptionPartialHard) is set, matching continues by testing any remaining alternatives. Only if no complete match can be found is ErrorPartial returned instead of PCRE_ERROR_NOMATCH. In other words, ExecuteOptionPartial says that the caller is prepared to handle a partial match, but only if no complete match can be found.
If ExecuteOptionPartialHard is set, it overrides ExecuteOptionPartial. In this case, if a partial match is found, Execute() immediately returns ErrorPartial, without considering any other alternatives. In other words, when ExecuteOptionPartialHard is set, a partial match is considered to be more important that an alternative complete match.

In both cases, the portion of the string that was inspected when the partial match was found is set as the first matching string. There is a more detailed discussion of partial and multi-segment matching, with examples, in the pcrepartial documentation.
(Read and Write property)

164.8.82 ExecuteOptions as Integer

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal value of all the execute options.
Notes: You can get and set the bits using the CompileOption* Boolean properties.
(Read and Write property)

164.8.83 Handle as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle to the pattern data structure.
Notes: (Read only property)

164.8.84 InfoCaptureCount as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of captures defined in the pattern.
Notes: Only valid after pattern was compiled.
(Read only property)

164.8.85 InfoNameCount as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of names defined in the pattern.
Notes: Only valid after pattern was compiled.
(Read only property)

164.8.86 InfoSize as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the size of the compiled pattern.
Notes: Only valid after pattern was compiled.
(Read only property)

164.8.87 InfoStudySize as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the study details size.
Notes: Only valid after calling Study.
(Read only property)

164.8.88 Lasterror as Integer

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: 0 is no error and -1 is some parameter error.
See Error* constants for other values.
(Read only property)

164.8.89 MatchLimit as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The match limit.
Notes: You can set it to a limit value. If set to zero, the plugin will use the default.

The default value for the limit can be set when PCRE is built; the default default is 10 million, which handles all but the most extreme cases. You can override the default by setting this property.
(Read and Write property)

164.8.90 MatchLimitRecursion as Integer

MBS RegEx Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The limit for recursion.
Notes: The MatchLimitRecursion field is similar to MatchLimit, but instead of limiting the total number of times that match() is called, it limits the depth of recursion. The recursion depth is a smaller number than the total number of calls, because not all calls to match() are recursive. This limit is of use only if it is set smaller than MatchLimit.

Limiting the recursion depth limits the amount of stack that can be used.

The default value for MatchLimitRecursion can be set when PCRE is built; the default default is the same value as the default for MatchLimit. You can override the default by setting this property. If value is zero, the plugin uses the default.
(Read and Write property)

164.8.91 Text as String

MBS RegEx Plugin, Plugin Version: 6.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text used for the last successfull compile call.
Notes: (Read only property)

164.8.92 TextMemory as Memoryblock

MBS RegEx Plugin, Plugin Version: 6.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text used for the last successfull compiletext call.
Notes: (Read only property)

164.8.93 VectorSize as Integer

MBS RegEx Plugin, Plugin Version: 13.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal vector size.
Notes: (Read only property)

164.8.94 Constants

Error Constants

Constant	Value	Description
ErrorBadCount	-15	This error is given if the value of the ovecsize argument is negative.
ErrorBadMagic	-4	PCRE stores a 4-byte "magic number" at the start of the compiled code, to catch the case when it is passed a junk pointer and to detect when a pattern that was compiled in an environment of one endianness is run in an environment with the other endianness. This is the error that PCRE gives when the magic number is not present.
ErrorBadNewLine	-23	An invalid combination of Newline options was given.
ErrorBadOffset	-24	The value of startoffset was negative or greater than the length of the subject, that is, the value in length.
ErrorBadOption	-3	An unrecognized bit was set in the options argument.
ErrorBadPartial	-13	This code is no longer in use. It was formerly returned when the PCRE_PARTIAL option was used with a compiled pattern containing items that were not supported for partial matching. From release 8.00 onwards, there are no restrictions on partial matching.
ErrorBadUTF8	-10	A string that contains an invalid UTF-8 byte sequence was passed as a subject. However, if PCRE_PARTIAL_HARD is set and the problem is a truncated UTF-8 character at the end of the subject, ErrorShortUTF8 is used instead.
ErrorBadUTF8Offset	-11	The UTF-8 byte sequence that was passed as a subject was valid, but the value of startoffset did not point to the beginning of a UTF-8 character or the end of the subject.
ErrorCallOut	-9	
ErrorDFARecurse	-20	
ErrorDFAUCond	-17	
ErrorDFAUItem	-16	
ErrorDFAUMLimit	-18	
ErrorDFAWSSize	-19	
ErrorInternal	-14	An unexpected internal error has occurred. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.
ErrorMatchLimit	-8	The backtracking limit, as specified by the match_limit field in a pcre_extra structure (or defaulted) was reached.
ErrorNoMatch	-1	The subject string did not match the pattern.
ErrorNoSubstring	-7	This error is used by the substring functions.
ErrorNull	-2	Either code or subject was passed as "", or ovector was "" and ovecsize was not zero.
ErrorNullWSLimit	-22	
ErrorPartial	-12	The subject string did not match, but it did match partially.
ErrorPlugin	-99	Generic error for something wrong with the plugin state. Like no current regex object internally or wrong function parameters.
ErrorRecursionLimit	-21	The internal recursion limit, as specified by the match_limit_recursion field in a pcre_extra structure (or defaulted) was reached. See the description above.
ErrorShortUTF8	-25	The subject string ended with an incomplete (truncated) UTF-8 character, and the PCRE_PARTIAL_HARD option was set. Without this option, ErrorBadUTF8 is returned in this situation.
ErrorUnknownNode	-6	
ErrorUnknownOpcode	-5	While running the pattern match, an unknown item was encountered in the compiled pattern. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.

0 no error
1 \at end of pattern
2 \c at end of pattern
3 unrecognized character follows \
4 numbers out of order in { } quantifier
5 number too big in { } quantifier
6 missing terminating] for character class
7 invalid escape sequence in character class
8 range out of order in character class
9 nothing to repeat
10 operand of unlimited repeat could match the empty string
11 internal error: unexpected repeat
12 unrecognized character after (?
13 POSIX named classes are supported only within a class
14 missing)
15 reference to non-existent subpattern
16 erroffset passed as NULL
17 unknown option bit(s) set
18 missing) after comment
19 parentheses nested too deeply
20 regular expression too large
21 failed to get memory
22 unmatched parentheses
23 internal error: code overflow
24 unrecognized character after (?<
25 lookbehind assertion is not fixed length
26 malformed number after (?(
27 conditional group contains more than two branches
28 assertion expected after (?(
29 (?R or (?digits must be followed by)
30 unknown POSIX class name
31 POSIX collating elements are not supported
32 this version of PCRE is not compiled with PCRE_UTF8 support
33 spare error
34 character value in \x { ... } sequence is too large
35 invalid condition (?(0)
36 \C not allowed in lookbehind assertion
37 PCRE does not support \L, \l, \N, \U, or \u
38 number after (?C is >255
39 closing) for (?C expected
40 recursive call could loop indefinitely
41 unrecognized character after (?P
42 syntax error after (?P
43 two named groups have the same name
44 invalid UTF-8 string
45 support for \P, \p, and \X has not been compiled
46 malformed \P or \p sequence
47 unknown property name after \P or \p

PCRE_ERROR_NOMATCH	-1	The subject string did not match the pattern.
PCRE_ERROR_NULL	-2	Either code or subject was passed as "".
PCRE_ERROR_BADOPTION	-3	An unrecognized bit was set in the options argument.
PCRE_ERROR_BADMAGIC	-4	PCRE stores a 4-byte "magic number" at the start of the compiled code, to catch the case when it is passed a junk pointer and to detect when a pattern that was compiled in an environment of one endianness is run in an environment with the other endianness. This is the error that PCRE gives when the magic number is not present.
PCRE_ERROR_UNKNOWN_NODE	-5	While running the pattern match, an unknown item was encountered in the compiled pattern. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.
PCRE_ERROR_NOMEMORY	-6	If a pattern contains back references, but the ovector that is passed to Execute() is not big enough to remember the referenced substrings, PCRE gets a block of memory at the start of matching to use for this purpose. If the call via pcre_malloc() fails, this error is given. The memory is automatically freed at the end of matching.
PCRE_ERROR_MATCHLIMIT	-8	The backtracking limit, as specified by the match_limit field in a pcre_extra structure (or defaulted) was reached.
PCRE_ERROR_RECURSIONLIMIT	-21	The internal recursion limit, as specified by the match_limit_recursion field in a pcre_extra structure (or defaulted) was reached.
PCRE_ERROR_CALLOUT	-9	This error is never generated by Execute() itself. It is provided for use by callout functions that want to yield a distinctive error code. See the pcrecallout documentation for details.
PCRE_ERROR_BADUTF8	-10	A string that contains an invalid UTF-8 byte sequence was passed as a subject.
PCRE_ERROR_BADUTF8_OFFSET	-11	The UTF-8 byte sequence that was passed as a subject was valid, but the value of startoffset did not point to the beginning of a UTF-8 character.
PCRE_ERROR_PARTIAL	-12	The subject string did not match, but it did match partially. See the pcrepartial documentation for details of partial matching.
PCRE_ERROR_BADPARTIAL	-13	The PCRE_PARTIAL option was used with a compiled pattern containing items that are not supported for partial matching. See the pcrepartial documentation for details of partial matching.
PCRE_ERROR_INTERNAL	-14	An unexpected internal error has occurred. This error could be caused by a bug in PCRE or by overwriting of the compiled pattern.
PCRE_ERROR_BADCOUNT	-15	This error is given if the value of the ovecsize argument is negative.

index	offset
0	start of matched pattern
1	end of matched pattern
2	start of subexpression 1
3	end of subexpression 1
2*n	start of subexpression n
2*n+1	end of subexpression n

index	offset
0	start of matched pattern
1	end of matched pattern
2	start of subexpression 1
3	end of subexpression 1
2*n	start of subexpression n
2*n+1	end of subexpression n

Chapter 165

Remote Control

165.1 class GammaFadeMBS

165.1.1 class GammaFadeMBS

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: A class to perform gamma fades on Mac OS X and Windows.
Notes: On Mac OS X a system API is used. On Windows the GammaMBS class is used internally.
Blog Entries

- Cleanup Xojo Plugins
- MonkeyBread Software Releases the MBS REALbasic plug-ins 8.4

165.1.2 Methods

165.1.3 Constructor

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Initializes the gamma fade class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
See also:

- 165.1.4 Constructor(mainwindow as DesktopWindow) 20264

- 165.1.5 Constructor(mainwindow as window) 20264

165.1.4 Constructor(mainwindow as DesktopWindow)

MBS ComputerControl Plugin, Plugin Version: 22.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma fade class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
See also:

- 165.1.3 Constructor 20263
- 165.1.5 Constructor(mainwindow as window) 20264

165.1.5 Constructor(mainwindow as window)

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma fade class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
See also:

- 165.1.3 Constructor 20263
- 165.1.4 Constructor(mainwindow as DesktopWindow) 20264

165.1.6 GammaFadeIn(seconds as Double) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Fades back to the normal screen.
Notes: Seconds is the duration of the fade in seconds. Typical 0.3 seconds.
Returns true on success and false on failure.

165.1.7 GammaFadeOut(seconds as Double) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Fades to a solid color.
Notes: Seconds is the duration of the fade in seconds. Typical 0.5 seconds.
Returns true on success and false on failure.

165.1.8 Properties

165.1.9 Available as Boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Whether the constructor was successful.
Notes: True if the initialization code worked.

On Mac OS X the constructor fails to get access if there is another gamma fade running.
On Windows the access to the gamma controls can fail if you don't provide a window, the hardware can't do gamma fades (e.g. running in VMWare) or DirectX is not available.
(Read and Write property)

165.1.10 FadeColor as Color

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The color to use for the fade.
Example:

```
Var g as new GammaFadeMBS
g.FadeColor=&c0000FF // blue
```

Notes: Default is black.
(Read and Write property)

165.2 class GammaMBS

165.2.1 class GammaMBS

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: A class to change the gamma settings of the display.
Notes: You can use that class to change the gamma table. For example to invert the screen or increase/decrease one of the colors.

Works on Mac OS X and Windows.

Xojo Developer Magazine

- 6.6, page 8: News

165.2.2 Methods

165.2.3 Constructor(mainwindow as DesktopWindow, displayIndex as integer = 0)

MBS ComputerControl Plugin, Plugin Version: 22.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
Added displayIndex parameter in plugin version 14.1 to specify on Mac which display to handle.

If you like to pass nil for the window, please pass a variable, so Xojo knows which constructor to use and you avoid a compiler error.
See also:

- 165.2.4 Constructor(mainwindow as window = nil, displayIndex as Integer = 0)

165.2.4 Constructor(mainwindow as window = nil, displayIndex as Integer = 0)

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: Initializes the gamma class and queries the current gamma values.
Notes: On Windows a window is needed to get the exclusive access to the gamma controls.

The Available property is set to true if the constructor was successful.
Added displayIndex parameter in plugin version 14.1 to specify on Mac which display to handle.

If you like to pass nil for the window, please pass a variable, so Xojo knows which constructor to use and you avoid a compiler error.
See also:

- 165.2.3 Constructor(mainwindow as DesktopWindow, displayIndex as integer = 0) 20266

165.2.5 SetGamma(gammaScale as Double = 1.0) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Sets the gamma values.
Notes: The current table assigned to the main screen.
All values are multiplied with gammaScale

165.2.6 Properties

165.2.7 Available as Boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Whether the constructor was successful.
Notes: True if the initialization code worked.

On Mac OS X the constructor fails to get access if it does not find a display with gamma controls.

On Windows the access to the gamma controls can fail if you don't provide a window, the hardware can't do gamma fades (e.g. running in VMWare) or DirectX is not available.
(Read and Write property)

165.2.8 Lasterror as Integer

MBS ComputerControl Plugin, Plugin Version: 13.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

165.2.9 Size as Integer

MBS ComputerControl Plugin, Plugin Version: 14.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The number of entries in the gamma table.
Notes: Should be 256 for Windows.
And 256 or 1024 for Mac.
(Read only property)

165.2.10 Blue(Index as Integer) as Double

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The blue value with the given index.
Notes: Index is from 0 to 255 and value from 0.0 to 1.0.
(Read and Write computed property)

165.2.11 Green(Index as Integer) as Double

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The green value with the given index.
Notes: Index is from 0 to 255 and value from 0.0 to 1.0.
(Read and Write computed property)

165.2.12 Red(Index as Integer) as Double

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The red value with the given index.
Notes: Index is from 0 to 255 and value from 0.0 to 1.0.
(Read and Write computed property)

165.3 class KeyCodesMBS

165.3.1 class KeyCodesMBS

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: A class for translating between key codes and ASCII characters.
Notes: This class is outdated, please use RemoteControlMBS module.

The list of key codes on a Mac is the same as the one used in the RB documentation for the sprite surface. Some special keys:

Modifier keys	
kVirtualCapsLockKey	&h039
kVirtualShiftKey	&h038
kVirtualControlKey	&h03B
kVirtualOptionKey	&h03A
kVirtualCommandKey	&h037
Editing/utility keys	
kVirtualHelpKey	&h072
kVirtualDeleteKey	&h033
kVirtualTabKey	&h030
kVirtualEnterKey	&h04C
kVirtualReturnKey	&h024
kVirtualEscapeKey	&h035
kVirtualForwardDeleteKey	&h075
Navigation keys	
kVirtualHomeKey	&h073
kVirtualEndKey	&h002
kVirtualPageUpKey	&h074
kVirtualPageDownKey	&h079
kVirtualLeftArrowKey	&h07B
kVirtualRightArrowKey	&h07C
kVirtualUpArrowKey	&h07E
kVirtualDownArrowKey	&h07D

Key codes for Windows:

Blog Entries

- MBS Real Studio Plugins, version 12.0pr6
- MBS Real Studio Plugins, version 11.3pr14

165.3.2 Methods

165.3.3 AsciiToKeyCode(ascii as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the keycode which is needed to be pressed to create this ASCII character.
Notes: You get the main key, not any modifier which may also be pressed.

165.3.4 KeyCodeToAscii(keycode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the ASCII code which matches the key code.
Example:

```
Var k as KeyCodesMBS

k=new KeyCodesMBS

// makes a big A on a german keyboard:
MsgBox chr(k.KeyCodeToAsciiWithSecondKeyCode(0+512))
```

Notes: Note on a Mac:
Bit 0 to 6 are the keycode, bit 7 is 1 if key goes up and 0 if key goes down.
Bit 8 to 15 are modifier keys:

Constants for the modifier keys:

Not available in 64-bit.
See MacTextForKeyCode method in RemoteControlMBS module.

165.3.5 KeyCodeToAsciiWithSecondKeyCode(keycode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 3.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the ASCII code which matches the key code with the current state.
Example:

```
Var k as KeyCodesMBS

k=new KeyCodesMBS

MsgBox str(k.KeyCodeToAscii(&h0A))
```

```
MsgBox chr(k.KeyCodeToAsciiWithSecondKeyCode(0))

// gives √¢ on a German Keyboard
```

Notes: On the first call of KeyCodeToAscii you get the ASCII char, but if you call KeyCodeToAsciiWithSecondKeyCode and the state property is not changed, you can get what the user gets if he presses several keys.
KeyCodeToAscii resets state to 0 before calling.
On Windows, KeyCodeToAscii and KeyCodeToAsciiWithSecondKeyCode are equal.

Note on a Mac:
Bit 0 to 6 are the keycode, bit 7 is 1 if key goes up and 0 if key goes down.
Bit 8 to 15 are modifier keys:

Constants for the modifier keys:

Not available in 64-bit.

165.3.6 TestForAsciiKeyDown(ascii as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the key with the given ascii code is pressed.

165.3.7 TestForKeyDown(keycode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the key with the given key code is pressed.
Example:

```
Var k As New KeyCodesMBS

Const VK_SHIFT = &h10 // for Windows
If k.TestForKeyDown(VK_SHIFT) Then
MsgBox "shift"
Else
MsgBox "no shift"
End If
```

165.3.8 Update

MBS ComputerControl Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Updates the layout so it is the current one.

165.3.9 Properties

165.3.10 LastError as Integer

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: The last error code.
Notes: The last function was successfull if lasterror is 0.
If the last function was not available on this machine, the value is set to -1.
Other values are Mac OS error codes.
(Read and Write property)

165.3.11 Name as String

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop only.

Function: The name for the current keyboard layout.
Notes: On Mac OS 9 e.g. "Deutsch".
On Mac OS X e.g. "German".
On Windows 98 e.g. "00020407".
(Read only property)

165.3.12 State as Integer

MBS ComputerControl Plugin, Plugin Version: 3.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The last state.
Notes: The function KeyCodeToAscii stores a code here which the function KeyCodeToAsciiWithSecondKeyCode will use on further calls.
(Read and Write property)

VK_LBUTTON	&h01
VK_RBUTTON	&h02
VK_CANCEL	&h03
VK_MBUTTON	&h04
VK_XBUTTON1	&h05 (Windows 2000 and newer)
VK_XBUTTON2	&h06 (Windows 2000 and newer)
VK_BACK	&h08
VK_TAB	&h09
VK_CLEAR	&h0C
VK_RETURN	&h0D

165.4 class PresskeyMBS

165.4.1 class PresskeyMBS

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use RemoteControlMBS instead. **Function:** This class allows you to simulate keyboard activity.
Notes: This class is deprecated, please use RemoteControlMBS module.
Blog Entries

- MBS Real Studio Plugins, version 12.0pr6

165.4.2 Methods

165.4.3 clear

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Resets this object.

165.4.4 mouseclick(down as boolean)

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Clicks the mouse button.
Notes: Clicks the mouse at current position.
Left button is used.
If you forget the mouseup you may loose control about a Mac with Mac OS X, but if you have enabled external terminal login you can login via SSH and quit Xojo from outside.

The Mac version sets the lasterror property.
See also:

- 165.4.5 MouseClick(down as boolean, rightdown as boolean) 20276

165.4.5 MouseClick(down as boolean, rightdown as boolean)

MBS ComputerControl Plugin, Plugin Version: 8.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Clicks the mouse with the given buttons.
Notes: Same as MouseClick, but with an additional rightdown parameter.
See also:

• 165.4.4 mouseclick(down as boolean) 20276

165.4.6 MouseMove(globalx as Integer,globaly as Integer)

MBS ComputerControl Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the mouse.
Example:

```
Var x,y as Integer
Var p as PresskeyMBS
p=new PresskeyMBS
x=system.mousex
y=system.mousey+10 // move ten pixels down
p.mousemove x,y
```

Notes: Moves the mouse on screen.
The destination must be specified in global screen coordinates.
Requires Mac OS 8.5 or newer for Mac OS Classic.

165.4.7 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean)

MBS ComputerControl Plugin, Plugin Version: 2.8, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse.
Notes: Moves the mouse on screen and clicks.
The destination must be specified in global screen coordinates.
Requires Mac OS 8.5 or newer for Mac OS Classic.

The Mac version sets the lasterror property.

Mac OS X only:
Based on the values entered, the appropriate mouse-down, mouse-up, mouse-move, or mouse-drag events are generated, by comparing the new state with the current state.
See also:

• 165.4.8 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean, rightdown as boolean) 20278

165.4.8 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean, rightdown as boolean)

MBS ComputerControl Plugin, Plugin Version: 8.1, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse cursor and clicks the mouse with the given buttons.
Notes: Same as MouseMoveClick, but with an additional rightdown parameter.
See also:

- 165.4.7 MouseMoveClick(globalx as Integer,globaly as Integer,down as boolean) 20277

165.4.9 press

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Presses a key.
Example:

```
' example for Mac OS X:
Var p as PresskeyMBS

p=new PresskeyMBS
p.shift=true
p.charcode=asc("H")
p.keycode=4
p.press 'press H
p.shift=false
p.charcode=asc("e")
p.keycode=14
p.press 'press e
p.charcode=asc("l")
p.keycode=37
p.press 'press l
p.press 'press l
p.charcode=asc("o")
p.keycode=31
p.press 'press o

' example for Windows:

editfield1.setfocus 'so we get something in it!

p=new PresskeyMBS
p.shift=true
p.charcode=asc("H")
p.virtualCode=-1 'automatically try to get this code
p.press 'press H
```

```
p.shift=false
p.virtualCode=-1 'after a call you find the virtualCode there
p.charcode=asc("e")
p.press 'press e
p.virtualCode=-1
p.charcode=asc("l")
p.press 'press l
p.press 'press l
p.virtualCode=-1
p.charcode=asc("o")
p.press 'press o
```

Notes: Simulates a keypress and handles the Settings for Shift, Control, Command and Option key.
Command shows no reaction in my tests for Mac OS Classic
On Windows, if you set virtualcode=-1 this method will set it to the code matching the charcode property.

The Mac version sets the lasterror property.

165.4.10 pressraw(down as boolean)

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Presses a key.
Example:

```
' Works perfectly on Mac OS X but Shift can't be done Raw on Mac OS 9:
Var p as PresskeyMBS

p=new PresskeyMBS

p.charcode=0
p.keycode=&h38
p.pressraw true 'shift down

p.charcode=asc("H")
p.keycode=4
p.pressraw true 'press H
p.pressraw false

p.charcode=0
p.keycode=&h38
p.pressraw false 'shift up

p.charcode=asc("e")
p.keycode=14
```

```
p.pressraw true 'press e
p.pressraw false
p.charcode=asc("l")
p.keycode=37
p.pressraw true 'press l
p.pressraw false
p.pressraw true 'press l
p.pressraw false
p.charcode=asc("o")
p.keycode=31
p.pressraw true 'press o
p.pressraw false
```

Notes: Simulates a keypress and doesn't handle the Settings for Shift, Control, Command and Option key. On Windows, if you set virtualcode=-1 this method will set it to the code matching the charcode property.

The Mac version sets the lasterror property.

165.4.11 Properties

165.4.12 Charcode as Integer

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The character you want to press.
Example:

```
Var p as PresskeyMBS

p=new PresskeyMBS
p.charcode=8
p.keycode=&h33
p.press // press backspace on Mac OS
```

Notes: On Mac OS Classic the final printed charcode inside an editfield is the one you pass.
(Read and Write property)

165.4.13 Command as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down command key before and release it after it simulates the key press.

Example:

```
Var p as new PresskeyMBS
p.command=True
```

Notes: It looks like the command key is not working for Mac OS Classic.
On Windows the control key is pressed if control or command properties are true.
(Read and Write property)

165.4.14 Control as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down control key before and release it after it simulates the key press.
Example:

```
Var p as new PresskeyMBS
p.Control=True
```

Notes: On Windows the control key is pressed if control or command properties are true.
(Read and Write property)

165.4.15 Keycode as Integer

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: For Mac OS the number of the key on the keyboard which is pressed.
Example:

```
Var p as PresskeyMBS
p=new PresskeyMBS
p.keycode=2
p.charcode=asc("d")
p.press 'shows a "d" on Mac OS
```

Notes: You find this codes in that nice tables for the codes of the Spritesurface in the Xojo books.
(Read and Write property)

165.4.16 Lasterror as Integer

MBS ComputerControl Plugin, Plugin Version: 3.3, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Not all functions of this class fill this property!
(Read and Write property)

165.4.17 Option as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down option key before and release it after it simulates the key press.
Example:

```
Var p as PresskeyMBS
p.option=True
```

Notes: (Read and Write property)

165.4.18 Shift as boolean

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: Tells the Press method to press down shift before and release it after it simulates the key press.
Example:

```
Var p as PresskeyMBS

p=new PresskeyMBS
p.shift=true
p.charcode=asc("1")
p.keycode=18
p.press 'press !
```

Notes: (Read and Write property)

165.4.19 VirtualCode as Integer

MBS ComputerControl Plugin, Platforms: macOS, Windows, Targets: Desktop, Console & Web.

Function: The virtual keycode to press.
Example:

```
Var p as PresskeyMBS
p=new PresskeyMBS
p.charcode=asc("m")
p.virtualcode=-1
p.press ' makes a "m" on Windows.
```

Notes: If you don't know this code, just pass -1 and this value will be filled automatically using the charcode property.
After you call press or pressraw you'll find the matching virtualcode in this property.
(Read and Write property)

165.5 module RemoteControlMBS

165.5.1 module RemoteControlMBS

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This module collects methods for simulating user input with mouse and keyboard.
Notes: You can use this class for GUI scripting.
Requires libXtst.so.6 on Linux to be installed.

165.5.2 Methods

165.5.3 LinuxConvertCase(keysymbol as Integer, byref lowerSymbol as Integer, byref upperSymbol as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Converts the case of the given keysymbol.
Notes: In lowerSymbol you will receive the key symbol for a lower case key and in upperSymbol the uppercase keys.

So passing in the key symbol of "a" or "A" will both return "a" and "A".

165.5.4 LinuxKeyCodeToKeySymbol(keycode as Integer, index as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns from the keyboard mapping tables the key symbol for the given key code.
Notes: Index is the offset in the tables. 0 for the first key symbol and 1 for the second. If the user presses shift the keyboard driver uses index=1 to access the capital letters.

165.5.5 LinuxKeyNameToKeySymbol(keyname as string) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Searches the key mapping list for the key symbol for a given name.
Notes: Returns 0 on failure.

165.5.6 LinuxKeySymbolToKeyCode(keysymbol as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Searches the hardware dependend key code for the given key symbol.
Notes: Returns 0 on any error.

165.5.7 LinuxKeySymbolToKeyName(keysymbol as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the name of the key symbol.
Notes: Can return "" on an invalide keysymbol value.

165.5.8 LinuxMouseClick(ButtonID as Integer, ButtonDown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simulates a mouse click with the given button.
Notes: ButtonID=1 is the left mouse button.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.

165.5.9 LinuxMousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.10 LinuxMousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.11 LinuxMoveMouse(x as Integer, y as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Moves the mouse to the given position.
Notes: Returns true on success.

165.5.12 LinuxPressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.13 LinuxPressKey(Keycode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the key with the given keycode.
Notes: Performs a key down and a key up event.
Returns true on success.
See also:

• 165.5.14 LinuxPressKey(Keycode as Integer, ButtonDown as boolean) as boolean 20287

165.5.14 LinuxPressKey(Keycode as Integer, ButtonDown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Performs a key event.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

• 165.5.13 LinuxPressKey(Keycode as Integer) as boolean 20286

165.5.15 LinuxPressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the alt key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.16 LinuxPressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.17 LinuxSupported as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Linux, Targets: Desktop, Console & Web.

Function: Whether the functions are available for simulation of keyboard and mouse events.
Notes: Returns true if the Xtest extension is installed.

165.5.18 MacCurrentProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the process ID of your application.
Notes: Returns 0 on any error.

165.5.19 MacCurrentProcessName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the current process.
Example:

msgbox RemoteControlMBS.MacCurrentProcessName

Notes: This is the name of your application.

165.5.20 MacDescriptionForKeyCode(keycode as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Translates a keycode to a string for displaying.
Notes: Keycodes which match a special key like "Return", "F1" or "Backspace" are returned as descriptive strings.

165.5.21 MacDisplayNameForKeyCode(keycode as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Translates a keycode to a string for displaying.
Notes: Same as MacTextForKeyCode(keycode, 4)

165.5.22 MacForegroundProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the process ID of the application in the foreground.
Notes: Returns 0 on any error.

165.5.23 MacFrontProcessName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the front process.
Example:

```
RemoteControlMBS.MacFrontProcessName="iChat" // move iChat to front
```

Notes: (Read and Write computed property)

165.5.24 MacKeyboardLocalizedName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The localized name of the current keyboard layout.
Notes: Returns "" on any error.

165.5.25 MacKeyboardName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the current keyboard layout.
Notes: Returns "" on any error.

Added 64-bit support for version 17.0.

165.5.26 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clicks the mouse buttons on the given position.
Example:

```
// doing a context menu click with control key:

Var x,y as Integer
x=System.MouseX
y=System.MouseY

call RemoteControlMBS.PressControlKey true
call RemoteControlMBS.MacMouseClick x, y, true, true
```

```
call RemoteControlMBS.MacMouseClick x, y, true, false
call RemoteControlMBS.PressControlKey false
```

Notes: Returns true on success.
If updateMouseCursorPosition is true the mouse position is updated on screen.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
See also:

- 165.5.27 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20290
- 165.5.28 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20291

165.5.27 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clicks the mouse buttons on the given position.
Example:

```
// do a right click:

Var x,y as Integer
x=System.MouseX
y=System.MouseY

call RemoteControlMBS.MacMouseClick x, y, true, false, true
call RemoteControlMBS.MacMouseClick x, y, true, false, false
```

Notes: Returns true on success.
If updateMouseCursorPosition is true the mouse position is updated on screen.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
See also:

- 165.5.26 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean) as boolean 20289
- 165.5.28 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20291

165.5.28 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clicks the mouse buttons on the given position.
Notes: Returns true on success.
If updateMouseCursorPosition is true the mouse position is updated on screen.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
See also:

- 165.5.26 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean) as boolean 20289
- 165.5.27 MacMouseClick(x as Double, y as Double, updateMouseCursorPosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20290

165.5.29 MacMousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.30 MacMousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.31 MacMouseWheel(wheel1 as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a wheel event.
Example:

```
call RemoteControlMBS.MacMouseWheel 1
```

Notes: Returns true on success.
A typical value for the wheel changes are in range from -10 to 10.
See also:

• 165.5.32 MacMouseWheel(wheel1 as Integer, wheel2 as Integer) as boolean 20292

165.5.32 MacMouseWheel(wheel1 as Integer, wheel2 as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a wheel event.
Example:

call RemoteControlMBS.MacMouseWheel 10,5

Notes: Returns true on success.
A typical value for the wheel changes are in range from -10 to 10.
See also:

• 165.5.31 MacMouseWheel(wheel1 as Integer) as boolean 20291

165.5.33 MacMoveMouse(x as Double, y as Double) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the mouse to the given position.
Example:

call RemoteControlMBS.MacMoveMouse(100,100)

Notes: Returns true on success.
On Mac does not generate mouse events.

165.5.34 MacPressCommandKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the command key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.35 MacPressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.36 MacPressKey(keychar as Integer, virtualkey as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the given key.
Notes: keychar is the ASCII code of the key you press and virtualkey is the key code.
Returns true on success.
Peforms a key down and a key up event.
See also:

- 165.5.37 MacPressKey(keychar as Integer, virtualkey as Integer, keydown as boolean) as boolean 20293

165.5.37 MacPressKey(keychar as Integer, virtualkey as Integer, keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the given key.
Notes: keychar is the ASCII code of the key you press and virtualkey is the key code.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

- 165.5.36 MacPressKey(keychar as Integer, virtualkey as Integer) as boolean 20293

165.5.38 MacPressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the option key. (labeled with alt)
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.39 MacPressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.40 MacProcessCount as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Counts the high level processes.
Example:

msgBox str(remoteControlMBS.macprocessCount)

165.5.41 MacProcessName(index as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the process with the given index.
Example:

```
Var i,c as Integer

// search iChat and make it visible
c=remoteControlMBS.macprocesscount
for i=0 to c-1
if remoteControlMBS.macprocessname(i)="iChat" then
remoteControlMBS.macprocessVisible(i)=true
end if
next
```

Notes: Index is from 0 to MacProcessCount-1.

165.5.42 MacProcessVisible(index as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether a process is visible or not.
Example:

```
Var i,c as Integer

// search Safari and make it invisible
c=remoteControlMBS.macprocesscount
for i=0 to c-1
if remoteControlMBS.macprocessname(i)="Safari" then
remoteControlMBS.macprocessVisible(i)=false
end if
next
```

Notes: Index is from 0 to MacProcessCount-1.
(Read and Write computed property)

165.5.43 MacTextForKeyCode(keycode as Integer, KeyAction as Integer, ModifierState as Integer) as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Translates a keycode to a string.
Example:

```
// try some keycodes like e, E, ,Ç¨ or √©
Var key as string = "@"

const kCommandKey = 1
const kShift = 2
const kCapsLock = 4
const kOption = 8
const kControl = 16

// with no modifiers
for i as Integer = 0 to 127

Var s as string = RemoteControlMBS.MacTextForKeyCode(i, 3, 0)

if StrComp(key, s, 0) = 0 then
MsgBox "Found with keycode "+str(i)
Return
end if

next

// with shift
```

```
for i as Integer = 0 to 127

Var s as string = RemoteControlMBS.MacTextForKeyCode(i, 3, kShift)

if StrComp(key, s, 0) = 0 then
MsgBox "Found with keycode "+str(i)+" with Shift"
Return
end if

next

// with option
for i as Integer = 0 to 127

Var s as string = RemoteControlMBS.MacTextForKeyCode(i, 3, kOption)

if StrComp(key, s, 0) = 0 then
MsgBox "Found with keycode "+str(i)+" with Option"
Return
end if

next
```

Notes: Works only with Unicode keyboard layouts which need Mac OS X 10.5.

Modifier values:

Command Key	1
Shift	2
CapsLock	4
Option	8
Control	16

Possible constants for the Key Action:

kUCKeyActionDown	0	The user is pressing the key.
kUCKeyActionUp	1	The user is releasing the key.
kUCKeyActionAutoKey	2	The user has the key in an "auto-key" pressed state that is, the user is holding down the key for an extended period of time and is thereby generating multiple key strokes from the single key.
kUCKeyActionDisplay	3	The user is requesting information for key display, as in the Key Caps application.

165.5.44 MouseClick(x as Integer, y as Integer, down as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Performs a mouse click.
Notes: The mouse cursor is moved to the given position and the first mouse button is pressed.
Returns true on success.

165.5.45 MousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.46 MousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.47 MoveMouse(x as Integer, y as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse to the given location.
Notes: Returns true on success.
On Mac does not generate mouse events.

165.5.48 PressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

165.5.49 PressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Presses the option key.
Notes: Returns true on success.

165.5.50 PressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

165.5.51 WinBringProcessToTop(ProcessID as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Brings all windows of process to the front.
Notes: Returns true if function found at least one window.

165.5.52 WinBringWindowToTop(WindowHandle as Integer, SetFocus as boolean = true) as boolean

MBS ComputerControl Plugin, Plugin Version: 13.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Brings a given window to front.
Example:

```
Var h as Integer = RemoteControlMBS.WinFindWindow("", "Calculator")
call RemoteControlMBS.WinBringWindowToTop h
```

Notes: Pass any window handle, including windows from other applications.
If SetFocus is true, we also set the focus.
Returns true on success.

165.5.53 WinCurrentProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the process ID of your application.
Notes: Returns 0 on any error.

165.5.54 WinFindWindow(ClassName as string, WindowName as string) as Integer

MBS ComputerControl Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds a window based on the classname and/or the window name.
Example:

```
Var h as Integer = RemoteControlMBS.WinFindWindow("SciCalc","")
msgbox hex(h)
```

Notes: One of the names can be an empty string so only the other name is used. Normally you should prefer the class name as it is not localized. The WindowsListMBS class can help you finding the class name of a window.
Returns 0 on any error.

165.5.55 WinForegroundProcessID as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the process ID of the application which owns the foreground window.
Notes: Returns 0 on any error.

165.5.56 WinFrontWindowTitle as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The title of the window which has the focus.
Example:

```
title=remoteControlMBS.winfrontWindowTitle
```

Notes: May return "" on any error.

165.5.57 WinIsCapsLock as boolean

MBS ComputerControl Plugin, Plugin Version: 23.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether caps lock is set.
Example:

```
// check state in a timer
if RemoteControlMBS.WinKeyIsCapsLock then
title = "caps lock on"
else
Title = "caps lock off"
end if
```

Notes: User may press the caps lock key to toggle between on and off.

165.5.58 WinIsNumLock as boolean

MBS ComputerControl Plugin, Plugin Version: 23.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether caps lock is set.
Example:

```
// check state in a timer
if RemoteControlMBS.WinIsNumLock then
title = "num lock on"
else
Title = "num lock off"
end if
```

Notes: User may press the num lock key to toggle between on and off.

165.5.59 WinIsScrollLock as boolean

MBS ComputerControl Plugin, Plugin Version: 23.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether scroll lock is set.
Example:

```
// check state in a timer
if RemoteControlMBS.WinIsScrollLock then
title = "scroll lock on"
```

```
else
Title = "scroll lock off"
end if
```

Notes: User may press the scroll lock key to toggle between on and off.
For macOS and Parallels, this key is F14 on the Mac keyboard.

165.5.60 WinIsWindowMinimized(WindowHandle as Integer) as Boolean

MBS ComputerControl Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks whether the specified window is minimized.
Notes: Returns true if minimized.
Use RemoteControlMBS.WinFindWindow if you need to find a window handle.

165.5.61 WinIsWindowVisible(WindowHandle as Integer) as Boolean

MBS ComputerControl Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks the visibility state of the specified window.
Notes: Returns true if visible or false if not.
Use RemoteControlMBS.WinFindWindow if you need to find a window handle.

165.5.62 WinKeyboardName as string

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the current Windows keyboard layout.

165.5.63 WinKeyIsDown(virtualkey as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Tests whether a given key is currently pressed.

165.5.64 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use WinMouseClick with integer parameters instead. **Function:** Peforms a mouse click on the given position.
Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.

- 165.5.67 WinMouseClick(x as integer, y as integer, AbsolutePosition as boolean, MouseButton1 as Integer, MouseButton2 as Integer, MouseButton3 as Integer) as boolean 20303

165.5.65 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use WinMouseClick with integer parameters instead. **Function:** Peforms a mouse click on the given position.
Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.

Deprecated. Please use the version taking integers, so you can click only one button without others.

165.5.66 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use WinMouseClick with integer parameters instead. **Function:** Peforms a mouse click on the given position.
Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.

Deprecated. Please use the version taking integers, so you can click only one button without others.

- 165.5.65 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20302
- 165.5.67 WinMouseClick(x as integer, y as integer, AbsolutePosition as boolean, MouseButton1 as Integer, MouseButton2 as Integer, MouseButton3 as Integer) as boolean 20303

165.5.67 WinMouseClick(x as integer, y as integer, AbsolutePosition as boolean, MouseButton1 as Integer, MouseButton2 as Integer, MouseButton3 as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 21.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Peforms a mouse click on the given position.
Example:

```
Const x = 100
Const y = 100

// press right mouse button

Var success1 As Boolean = RemoteControlMBS.WinMouseClick(x, y, True, -1, 1, -1)

// and up
Var success2 As Boolean = RemoteControlMBS.WinMouseClick(x, y, True, -1, 0, -1)
```

Notes: If AbsolutePosition is false the given coordinates are relative to the current position.
Returns true on success.

Be aware that the user may get into trouble if you forget to release a mouse button you pressed before. So always call this method another time to release the mouse buttons.
Pass 1 to click mouse button down, 0 to release it or -1 to not touch the button.
See also:

- 165.5.64 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean) as boolean 20302
- 165.5.65 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean) as boolean 20302
- 165.5.66 WinMouseClick(x as Integer, y as Integer, AbsolutePosition as boolean, MouseButton1 as boolean, MouseButton2 as boolean, MouseButton3 as boolean) as boolean 20303

165.5.68 WinMousePositionX as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.69 WinMousePositionY as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the current mouse position.

165.5.70 WinMoveMouse(x as Integer, y as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves the mouse cursor to the given position.
Notes: Returns true on success.
Internally the coordinates are converted to normalized absolute coordinates which can lead to have the mouse one pixel off the requested position due to rounding.

165.5.71 WinPressControlKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Presses the ctrl key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.72 WinPressKey(ScanCode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: This methods creates a keydown and a keyup event.
Returns true on success.
See also:

- 165.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean 20305
- 165.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean 20306
- 165.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean 20306

165.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

- 165.5.72 WinPressKey(ScanCode as Integer) as boolean 20305
- 165.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean 20306
- 165.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean 20306

165.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: This methods creates a keydown and a keyup event.
Returns true on success.
See also:

- 165.5.72 WinPressKey(ScanCode as Integer) as boolean 20305
- 165.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean 20305
- 165.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean 20306

165.5.75 WinPressKey(virtualkey as Integer, ScanCode as Integer, keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs a key event with the given data.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.
See also:

- 165.5.72 WinPressKey(ScanCode as Integer) as boolean 20305
- 165.5.73 WinPressKey(ScanCode as Integer, keydown as boolean) as boolean 20305
- 165.5.74 WinPressKey(virtualkey as Integer, ScanCode as Integer) as boolean 20306

165.5.76 WinPressOptionKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Presses the alt key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.77 WinPressShiftKey(keydown as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Presses the shift key.
Notes: Returns true on success.

Be aware that the user may get into trouble if you forget to release a key you pressed before. So always call this method another time to release the key.

165.5.78 WinScanCodeToVirtualKeyCode(ScanCode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Searches the virtual key code for the given scancode.
Notes: Each key has a hardware dependend scan code. For each scancode you can get the virtual key code which is hardware independend.

Returns 0 on failure.

165.5.79 WinSendMessage(Win as DesktopWindow, Msg as integer, lParam as integer, WParam as integer) as integer

MBS ComputerControl Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Sends a Windows message to a given window.
Notes: The result depends on the message command.
See also:

- 165.5.80 WinSendMessage(Win as window, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20307
- 165.5.81 WinSendMessage(WindowHandle as Integer, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20308

165.5.80 WinSendMessage(Win as window, Msg as Integer, lParam as Integer, WParam as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop only.

Function: Sends a Windows message to a given window.
Example:

```
const WM_CLOSE = &h0010

call RemoteControlMBS.WinSendMessage(window1, WM_CLOSE, 0, 0)
```

Notes: The result depends on the message command.
See also:

- 165.5.79 WinSendMessage(Win as DesktopWindow, Msg as integer, lParam as integer, WParam as integer) as integer 20307
- 165.5.81 WinSendMessage(WindowHandle as Integer, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20308

165.5.81 WinSendMessage(WindowHandle as Integer, Msg as Integer, lParam as Integer, WParam as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends a Windows message to a given window.
Example:

```
const WM_CLOSE = &h0010
Var h as Integer = RemoteControlMBS.WinFindWindow("SciCalc","")

call RemoteControlMBS.WinSendMessage(h, WM_CLOSE, 0, 0) // Closes Calc
```

Notes: The result depends on the message command.
See also:

- 165.5.79 WinSendMessage(Win as DesktopWindow, Msg as integer, lParam as integer, WParam as integer) as integer 20307
- 165.5.80 WinSendMessage(Win as window, Msg as Integer, lParam as Integer, WParam as Integer) as Integer 20307

165.5.82 WinShowWindow(WindowHandle as Integer, CmdShow as Integer) as Boolean

MBS ComputerControl Plugin, Plugin Version: 15.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Shows or hides a window.
Notes: CmdShow can be:

0	Hide
1	Show normal
2	Show minimized
3	Maximize
4	Show without activating
5	Show
6	Minimize
7	Show minimized without activating
8	Show normal without activating
9	Restore
10	Show default
11	Force minimized

Use RemoteControlMBS.WinFindWindow if you need to find a window handle.

165.5.83 WinVirtualKeyCodeToCharCode(VirtualKeyCode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the char code for a virtual key code.
Notes: Returns 0 on failure.

165.5.84 WinVirtualKeyCodeToScanCode(VirtualKeyCode as Integer) as Integer

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds the scan code to match the given virtual key code.
Notes: Returns 0 on failure.

165.5.85 WinVirtualKeyForASCII(Character as Integer, byref VirtualKeyCode as Integer, Byref ShiftKey as boolean, byref ControlKey as Boolean, byref AltKey as boolean) as boolean

MBS ComputerControl Plugin, Plugin Version: 8.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns for a given character which combination of key code and modifiers created the character.
Notes: For Character, you should use asc(string), but you may need to convert the string to Windows ANSI text encoding.

Returns 0 on failure.

Chapter 166

Resolution

166.1 class DisplayMBS

166.1.1 class DisplayMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Defines a class for accessing the displays of the screen.
Blog Entries

Xojo Developer Magazine

- 17.5, page 43: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes

166.1.2 Methods

166.1.3 CanDepth(depth as Integer) As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns true if the monitor supports the given color depth at the current ResolutionMBS.
Notes: none.

166.1.4 FadeGamma(intensity as Integer, col As Color)

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Sets the gamma of the DisplayMBS
Notes: Intensity has to be between 0 and 1000. 1000 is normal, when it is 0, the whole DisplayMBS is in the color GammaColor.
Direct color display modes do not use color lookup tables and are usually 16, 24, or 32 bit. Not all direct color video boards support loadable gamma ramps.

See the NativeGamma documentation for more details on Windows Gamma details.

166.1.5 FadeGammaTo(intensity as Integer, col As Color, ticks as Integer)

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Fades the intensity and color of the gamma slowly in the given number of milliseconds.
Notes: Intensity has to be between 0 and 1000. 1000 is normal, when it is 0, the whole display is in the color GammaColor.
Direct color display modes do not use color lookup tables and are usually 16, 24, or 32 bit. Not all direct color video boards support loadable gamma ramps.
See the NativeGamma documentation for more details on Windows Gamma details.

166.1.6 GetBestResolution(width as Integer, height as Integer, depth as Integer, safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the best matching resolution.
Notes: Returns the best resolution which size is not smaller that the dimensions given, which has the given depth and, if safe is true, which is safe. If safe is not true, be sure that the frequency works, if you want to switch to it (for example by asking the user).

On Mac OS X till now no resolution can be called safe.
See also:

- 166.1.7 GetBestResolution(width as Integer, height as Integer, safe As Boolean) As ResolutionMBS 20313

166.1.7 GetBestResolution(width as Integer, height as Integer, safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the best matching resolution.
Notes: Returns the best resolution which size is not smaller that the dimensions given, which has the highest depth and, if safe is true, which is safe. If safe is not true, be sure that the frequency works, if you want to switch to it (for example by asking the user).
On Mac OS X till now no resolution can be called safe.
See also:

- 166.1.6 GetBestResolution(width as Integer, height as Integer, depth as Integer, safe As Boolean) As ResolutionMBS 20312

166.1.8 GetCurrentResolution As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the current resolution.
Notes: Returns the resolution the display is currently set to. This is useful if you want to switch back to the old resolution after you switched to another resolution.

166.1.9 GetLargestResolution(depth as Integer, safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the largest resolution with the given depth.
Notes: The same as GetBestResolution(width, height, depth, safe), the only difference is that it does not search for the smallest resolution but for the biggest one.
On Mac OS X till now no resolution can be called safe.
See also:

- 166.1.10 GetLargestResolution(safe As Boolean) As ResolutionMBS 20314

166.1.10 GetLargestResolution(safe As Boolean) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Searches for the largest resolution.
Notes: If safe is true, this method returns only safe resolutions.
On Mac OS X till now no resolution can be called safe.
See also:

- 166.1.9 GetLargestResolution(depth as Integer, safe As Boolean) As ResolutionMBS 20313

166.1.11 GetResolution(num as Integer) As ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns a resolution.
Notes: Num has to be between 0 and ResolutionCount(safe)-1.

166.1.12 ResolutionCount(depth as Integer, safe As Boolean) as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the number of resolutions for a given depth.
Notes: This method returns the number of resolutions that have the given depth and, if safe is true, which are safe.
On Mac OS X till now no ResolutionMBS can be called safe.
See also:

- 166.1.13 ResolutionCount(safe As Boolean) as Integer 20314

166.1.13 ResolutionCount(safe As Boolean) as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns the number of resolutions.
Notes: This method returns the total number of resolutions this monitor supports and, if safe is true, which are safe. Safe resolutions are resolutions which will always work.
On Mac OS X till now no ResolutionMBS can be called safe.
See also:

- 166.1.12 ResolutionCount(depth as Integer, safe As Boolean) as Integer 20314

166.1.14 SetDepth(depth as Integer) As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Switches the color depth to the depth given. Returns true if attempt was successful.
Notes: none.

166.1.15 SwitchTo(width as Integer, height as Integer, depth as Integer, safe As Boolean) As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Switches to the given ResolutionMBS if possible.
Notes: This method tries to switch directly to the best ResolutionMBS which size is bigger or the same as the given dimensions and which depth is the same as the given parameter. It returnes true if it was successful. Try this function first with safe set to true. If that fails, try again with false, but after that show a dialog asking the user if that ResolutionMBS is okay. If the user presses escape or clicks cancel, you should immediatly switch back to the old ResolutionMBS.
On Mac OS X till now no ResolutionMBS can be called safe.

166.1.16 Update

MBS Util Plugin, Plugin Version: 3.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: Updates the properties in this class.
Notes: Call it whenever you detect a screen resolution change to update the content of this class.
In general you should not keep DisplayMBS classes around too long because the display described may go away (one a Powerbook the external display).

166.1.17 Properties

166.1.18 Depth as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Depth of the DisplayMBS.
Notes: Can be 8, 16 or 32. Other screen depths are not well supported.
(Read only property)

166.1.19 displaynum as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayNum is the number of the DisplayMBS
Notes: The number is always between 0 and DisplayCount-1, where 0 is the main monitor.
(Read only property)

166.1.20 GammaColor as color

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: The color for fading the DisplayMBS.
Notes: This property is read-only. To change it, use the methods of the DisplayMBS class and the Switch method of the ResolutionMBS class.
There is no fading for Windows.
(Read only property)

166.1.21 GammaIntensity as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: GammaIntensity is the intensity of the monitor.
Notes: 1000 is normal, if it is 0, the whole DisplayMBS is in the color GammaColor.
This property is read-only. To change it, use the methods of the DisplayMBS class and the Switch method of the ResolutionMBS class.
There is no fading for Windows.
(Read only property)

166.1.22 Height as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Height of the monitor.
Notes: (Read only property)

166.1.23 hz as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: frequency in Hz of that DisplayMBS
Example:

```
Var d as DisplayMBS

d=GetDisplayMBS(0)

msgBox str(d.Hz)
```

Notes: On Windows:
Sometimes Hz is 0, this is when Windows itself does not know the frequency (at least it is so in my emulation, Virtual PC 3.0 with Win95).
The value should never be greater as the real frequency, so you can just ignore this.
(Read only property)

166.1.24 Left as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative left offset to the other monitors.
Notes: Should be 0 for the main monitor.
(Read only property)

166.1.25 Top as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative top offset to the other monitors.
Notes: Should be 0 for the main monitor.
(Read only property)

166.1.26 Width as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Width of this screen.
Notes: (Read only property)

166.1.27 NativeGamma as memoryblock

MBS Util Plugin, Plugin Version: 3.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: The native gamma values.
Example:

```
Var d as DisplayMBS // your display
d.nativegamma=newmemoryblock(3072) // all black
```

Notes: 3072 bytes big is this array a 256 RGB values saved in 3 single properties.

Some notes for SetDeviceGammaRamp, which is the Windows function used by the plugin:

SetDeviceGammaRamp doesn't allow all gamma ramps. It checks the gamma ramp; if it is too complex, such as the red flash when the player is shot in Quake, it rejects it.
SetDeviceGammaRamp will not currently make use of a gamma calibrator. This may change in future versions of Image Color Management (ICM), but for Windows 2000, only the DirectDraw API supports the gamma calibrators.
The existing gamma entry points is already used by GetDeviceGammaRamp and SetDeviceGammaRamp. Therefore, the display driver doesn't need to do anything special to support this new interface, as long as it already supports the Win32 Get/SetDeviceGammaRamp functions.
In addition to getting and setting gamma ramps, the new DirectDraw interface allows the new gamma ramp to be calibrated—if a gamma calibrator is installed. The mechanism that DirectDraw uses to register and communicate with the gamma calibrator is an interim mechanism that will be changed in future releases.
DirectDraw looks for an installed software calibrator and passes the gamma value to the software calibrator; the software calibrator in turn adjusts the gamma ramp according to the measured response of the monitor. The calibrator passes the gamma ramp back to DirectDraw, which passes it to the SetDeviceGammaRamp device driver interface (DDI). The result is that the game looks as intended.
For DirectDraw to use the gamma calibrator, the calibrator must register itself with DirectDraw using a registry key; DirectDraw will call it if the application wants the gamma ramp to be calibrated.
In the future, both the method by which DirectDraw communicates with the gamma calibrator, through the DDI, and the method gamma calibrators use to register themselves in the registry will change. But every part of the DirectDraw API is permanent.
ICM is the color management system in Windows; all system-level color management should be handled by ICM. For this reason, downloadable gamma ramp support will be rolled into ICM in the future, making current solutions for gamma calibrators obsolete. Until such time, we have provided a method by which applications can take advantage of the installed base of software calibrators and graphics adapters that support downloadable gamma ramps.
(Read and Write computed property)

166.2 Globals

166.2.1 DisplayCountMBS as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayCount returns the number of displays connected.
Example:

```
msgbox "You have "+str(DisplayCountMBS)+" screens."
```

166.2.2 GetDisplayMBS(num as Integer) As DisplayMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Returns an object of class DisplayMBS for the given DisplayMBS.
Example:

```
Var d as DisplayMBS

d=GetDisplayMBS(0)
msgBox str(d.width)+" x "+str(d.height)+" @ "+str(pow(2,d.depth))+" colors"
```

Notes: num must be: 0 <= num <displaycount

166.2.3 ResolutionLibraryPresentMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns true if the DisplayManager library file was found.
Example:

```
if not ResolutionLibraryPresentMBS then
msgbox "I'm missing the shared library 'DisplayManager'."
end if
```

Notes: This library should be present on all Mac OS Classic versions. (It is in the system suitcase.)
Returns always true on Windows.
Blog Entries

- MBS Xojo Plugins, version 20.6pr4

166.2.4 UpdateDisplayCountMBS

MBS Util Plugin, Plugin Version: 8.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: Rebuilds the display list.
Notes: If new displays are attached or removed, this method needs to be called.

166.3 class ResolutionMBS

166.3.1 class ResolutionMBS

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Defines a class for accessing the resolutions a screen.
Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr4

166.3.2 Methods

166.3.3 Switch As Boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: This function switches the DisplayMBS to the ResolutionMBS and returns true if the attempt was successful.
Notes: If IsSafe is false, show a dialog after the switch asking the user if that ResolutionMBS is okay. If the user presses escape or clicks cancel, you should immediatly switch back to the old ResolutionMBS. Especially on VGA-Monitors not all listed frequencies work.
On Mac OS X till now no ResolutionMBS can be called safe.

166.3.4 Properties

166.3.5 Depth as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Depth of the ResolutionMBS.
Notes: Can be 8, 16 or 32. Other screen depths are not well supported.
(Read only property)

166.3.6 displaynum as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayNum is the number of the DisplayMBS
Notes: The number is always between 0 and DisplayCount-1, where 0 is the main monitor.
(Read only property)

166.3.7 Height as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Height of the ResolutionMBS.
Notes: (Read only property)

166.3.8 hz as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: frequency in Hz of that ResolutionMBS
Notes: Sometimes Hz is 0, this is when Windows itself does not know the frequency (at least it is so in my emulation, Virtual PC 3.0 with Win95).
(Read only property)

166.3.9 issafe as boolean

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Is it a safe ResolutionMBS?
Notes: On Mac OS X till now no ResolutionMBS can be called safe.
(Read only property)

166.3.10 Left as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative left offset to that ResolutionMBS.
Notes: Should be 0 for the main monitor.
(Read only property)

166.3.11 ResolutionNum as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: DisplayNum is the number of the DisplayMBS.
Notes: ResolutionNum is the number of the DisplayMBS which always is between 0 and GetDisplayMBS(DisplayNum).ResolutionCount(false)-1.

On Windows: dis.GetCurrentResolution.resolutionNum is sometimes also -1.
(Read only property)

166.3.12 Top as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: The relative top offset to the other monitors.
Notes: Should be 0 for the main monitor.
(Read only property)

166.3.13 Width as Integer

MBS Util Plugin, Platforms: macOS, Windows, Targets: Desktop only.

Function: Width of this ResolutionMBS.
Notes: (Read only property)

Chapter 167

RFC

167.1 class RFCClassDescriptionMBS

167.1.1 class RFCClassDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a class description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.1.2 Methods

167.1.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

167.1.4 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

167.1.5 Properties

167.1.6 AttributesCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries attribute count for class.
Notes: (Read only property)

167.1.7 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection owning this object.
Notes: (Read only property)

167.1.8 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

167.1.9 ImplementedInterfacesCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of implemented interfaces.
Notes: (Read only property)

167.1.10 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the class.
Notes: (Read only property)

167.1.11 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

167.1.12 ParentClassesCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of parent classes.
Notes: (Read only property)

167.2 class RFCConnectionAttributesMBS

167.2.1 class RFCConnectionAttributesMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for information about the partner system on the other side of this RFC connection.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.2.2 Methods

167.2.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

167.2.4 Properties

167.2.5 client as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Client ("Mandant")
Notes: (Read only property)

167.2.6 codepage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Own code page.
Notes: (Read only property)

167.2.7 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection used to get this information.
Notes: (Read only property)

167.2.8 cpicConvId as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: CPI-C Conversation ID.
Notes: (Read only property)

167.2.9 dest as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: RFC destination.
Notes: (Read only property)

167.2.10 host as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Own host name.
Notes: (Read only property)

167.2.11 isoLanguage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: 2-byte ISO-Language
Notes: (Read only property)

167.2.12 kernelRel as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner kernel release.
Notes: (Read only property)

167.2.13 language as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Language.
Notes: (Read only property)

167.2.14 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object for this object.
Notes: (Read only property)

167.2.15 partnerBytesPerChar as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of bytes per character in the backend's current codepage.
Notes: Note this is different from the semantics of the PCS parameter.
(Read only property)

167.2.16 partnerCodepage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner code page.
Notes: (Read only property)

167.2.17 partnerHost as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner host name.
Notes: (Read only property)

167.2.18 partnerIP as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner IP.
Notes: (Read only property)

167.2.19 partnerIPv6 as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner IPv6.
Notes: (Read only property)

167.2.20 partnerRel as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner system release.
Notes: (Read only property)

167.2.21 partnerSystemCodepage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner system code page.
Notes: (Read only property)

167.2.22 partnerType as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Partner type.
Notes: 2/3/E/R: R/2,R/3,Ext,Reg.Ext
(Read only property)

167.2.23 progName as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of the calling APAB program (report, module pool)
Notes: (Read only property)

167.2.24 rel as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: My system release.
Notes: (Read only property)

167.2.25 rfcRole as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The RFC role.
Notes: C/S: RFC Client / RFC Server.
(Read only property)

167.2.26 sysId as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: R/3 system ID.
Notes: (Read only property)

167.2.27 sysNumber as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: R/3 system number.
Notes: (Read only property)

167.2.28 trace as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trace level (0-3)
Notes: (Read only property)

167.2.29 type as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type.
Notes: 2/3/E/R: R/2,R/3,Ext,Reg.Ext
(Read only property)

167.2.30 user as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: User name.
Notes: (Read only property)

167.3 class RFCConnectionMBS

167.3.1 class RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for RFC connection to a SAP system.
Example:

```
// connect code from a sample project:

Var loginParams As New Dictionary
if app.LogOnData.SARouterString.IsEmpty then // LogOn with server (IP-Address)
loginParams.Value("ashost") = app.LogOnData.Anwendungsserver
else // LogOn with Servername and Router-String
loginParams.Value("ashost") = app.LogOnData.SARouterString+"/H/"+app.LogOnData.Anwendungsserver
end if
loginParams.Value("sysnr") = app.LogOnData.InstanzNr.ToText
loginParams.Value("client") = app.LogOnData.Mandant
loginParams.Value("user") = app.LogOnData.SAPBenutzer
loginParams.Value("passwd") = app.LogOnData.SAPPasswort
loginParams.Value("lang") = app.LogOnData.Sprache

app.ConnectionToSAP = New RFCConnectionMBS(loginParams)
```

- Connect Xojo to SAP via RFC

167.3.2 Methods

167.3.3 CachedClassDescription(repositoryID as String, Name as String) as RFCClassDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for a cached class description.
Notes: This API should be used with care and is only for special scenarios, for example: 1. You know for sure, that a class description has already been cached via ClassDescription(), and don't want to open an extra rfcHandle that will never be used. In this case simply use the SAP System ID as the repositoryID. 2. You have created a hard-coded repository via RfcAddClassDesc(), which contains classes that do not exist in the backend's DDIC.

If repositoryID is "", the "default repository" is used.

repositoryID: System ID of R/3 System, for which this class description has been cached, or "" in case you want to look for it in the default repository.
Name: Name of the class.

167.3.4 CachedFunctionDescription(repositoryID as String, Name as String) as RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for a cached function description.
Notes: This API should be used with care and is only for special scenarios, for example: 1. You know for sure, that a function description has already been cached via FunctionDescription(), and don't want to open an extra rfcHandle that will never be used. In this case simply use the SAP System ID as the repositoryID. 2. You have created a hard-coded repository via AddFunctionDesc(), which contains function modules that do not exist in the backend's DDIC.

If repositoryID is "", the "default repository" is used.

167.3.5 CachedTypeDescription(repositoryID as String, Name as String) as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks for a cached structure/table description.
Notes: Similar to TypeDescription(), but it only looks into the cache. Again it should almost never be necessary to get a metadata description of a single structure.

repositoryID: System ID of R/3 System, for which this type description has been cached, or "" in case you want to look for it in the default repository.
Name: Name of the DDIC structure/table.

167.3.6 Cancel

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Cancels the RFC call which is currently being called over the given RFC connection and closes the connection.
Notes: Can be used only on an RFC client connection and needs to be called from a different thread than the one currently executing the RFC call.

167.3.7 ClassDescription(Name as String) as RFCClassDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the class description that is valid for the system to which connection points to.
Notes: If the class description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the rfcHandle. The result from the DDIC lookup will then be placed into the cache for later use.

The RFC Runtime maintains a cache for every R/3 System ID, as the meta data could be different from R/3 release to R/3 release. This is the main API that should be used.

Name: Name of the class to look up.

167.3.8 ClearRepository(repositoryID as String)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all metadata from the repository cache of the specified R/3 System.
Notes: If repositoryID is "", the "default repository" is cleared.

167.3.9 Constructor(LoginParams as Dictionary)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens an RFC client connection for invoking ABAP function modules in an R/3 backend.
Example:

```
Var loginParams As New Dictionary
loginParams.Value("ashost") = "hostname"
loginParams.Value("sysnr") = "05"
loginParams.Value("client") = "800"
loginParams.Value("user") = "user"
loginParams.Value("passwd") = "****"
loginParams.Value("lang") = "EN"

Var connection As New RFCConnectionMBS(loginParams)
```

Notes: Opens a client connection to an SAP System. The connectionParams may contain the following name-value pairs:

client, user, passwd, lang, trace and additionally one of

1. Direct application server logon: ashost, sysnr.
2. Logon with load balancing: mshost, msserv, sysid, group.
msserv is needed only, if the service of the message server is not defined as sapms<SYSID>in /etc/services.

When logging on with SNC, user&passwd are to be replaced by

snc_qop, snc_myname, snc_partnername and optionally snc_lib.
(If snc_lib is not specified, the underlying SNC layer uses the "global" GSS library defined via environment variable SNC_LIB or SNC_LIB_64.)

When logging on with SSO Ticket, you can use mysapsso2 instead of user&passwd. The old SSO format (mysapsso) is no longer supported.

Alternatively the connection parameters can be defined in the config file sapnwrfc.ini. In this case you just pass the parameter dest=... and all parameters that are missing in the sapnwrfc.ini entry into RfcOpenConnection().

For a complete list of logon parameters to be used in connectionParams as well as in the sapnwrfc.ini file, see the sample sapnwrfc.ini file in the SDK's demo folder.

If the logon was ok, constructor returns with a new object, otherwise an exception is raised.

167.3.10 CreateFunction(Name as String) as RFCFunctionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data container that can be used to execute function calls in the backend via Invoke.
Notes: The importing parameters can be set using the Value() properties. After the RfcInvoke call returned successfully, the exporting parameters can be read from this data container via the Value() properties.

167.3.11 CreateTransaction(TransactionID as String, QueueName as String) as RFCTransactionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a container for executing a (multi-step) transactional call.
Notes: TransactionID: trasanction ID used to identify the transaction;
queueName: queue name associated with the transaction. If it is "" or empty, the transaction is for tRfc

167.3.12 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: Closes an RFC connection.

167.3.13 FunctionDescription(Name as String) as RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the function description that is valid for the system to which connection points to.
Example:

```
Var fd As RFCFunctionDescriptionMBS = connection.FunctionDescription("BAPI_COMPANY_GETDETAIL")
```

Notes: If the function description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the connection. The result from the DDIC lookup will then be placed in the cache. The RFC Runtime maintains a cache for every SAP System ID, as the meta data may be different depending on the SAP release. This is the main API that should be used.

167.3.14 isConnected as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if we are connected.
Notes: Same as Ping, but returns boolean and does not raise exception.

167.3.15 Ping

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Ping the remote communication partner through the passed connection handle.
Notes: Sends a ping to the backend in order to check, whether the connection is still alive. Can be used on both, client connections as well as server connections.

167.3.16 ResetServerContext

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the SAP server context ("user context / ABAP session context") associated with the given client connection, but does not close the connection.

167.3.17 TransactionID as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a unique 24-digit transaction ID from the backend.

167.3.18 TypeDescription(Name as String) as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the structure description that is valid for the system to which connection points to.
Notes: If the structure description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the rfcHandle. The result from the DDIC lookup will then be placed into the cache for later use.

The RFC Runtime maintains a cache for every R/3 System ID, as the meta data could be different from R/3 release to R/3 release.

Note
Normally it should not be necessary to lookup separate structure descriptions. They are already looked up as part of the function module, in which they are used.

Name: Name of a DDIC structure or table.

167.3.19 Properties

167.3.20 ConnectionAttributes as RFCConnectionAttributesMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns details about the current client or server connection.
Notes: (Read only property)

167.3.21 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

167.4 class RFCContainerMBS

167.4.1 class RFCContainerMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a container in a RFC connection.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.4.2 Methods

167.4.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

167.4.4 DescribeType as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the metadata description of the given structure or table.

167.4.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

167.4.6 StringLength(Index as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string length for field by index.
See also:

- 167.4.7 StringLength(Name as String) as Integer 20340

167.4.7 StringLength(Name as String) as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string length for field by name.
See also:

- 167.4.6 StringLength(Index as Integer) as Integer 20339

167.4.8 Value(Index as Integer) as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience method to get value as variant.
Notes: When reading, we lookup data type for the property referred by index and return a matching value via variant.

Char, String, Num, Date, Time, BCD, DecF16 and DecF34 are returned as text.
Float is returned as double value.
Long, Second, Minute and Int8 is returned as Int64.
DTDay, DTWeek, DTMonth, TSecond, TMinute, CDeay, Int1, Int2 and Int values are retuned as Integer.
Table is returned as RFCTableMBS object.
Structure is returned as RFCStructureMBS object.
Byte data is returned as MemoryBlock.

For Null, ABAPObject, XMLData, BOX types we return nil.
See also:

- 167.4.9 Value(Name as String) as Variant 20340

167.4.9 Value(Name as String) as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience method to get value as variant.
Notes: When reading, we lookup data type for the property referred by name and return a matching value via variant.

Char, String, Num, Date, Time, BCD, DecF16 and DecF34 are returned as text.
Float is returned as double value.
Long, Second, Minute and Int8 is returned as Int64.
DTDay, DTWeek, DTMonth, TSecond, TMinute, CDeay, Int1, Int2 and Int values are retuned as Integer.
Table is returned as RFCTableMBS object.
Structure is returned as RFCStructureMBS object.

Byte data is returned as MemoryBlock.

For Null, ABAPObject, XMLData, BOX types we return nil.
See also:

- 167.4.8 Value(Index as Integer) as Variant 20340

167.4.10 Properties

167.4.11 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection this object belongs to.
Notes: (Read only property)

167.4.12 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

167.4.13 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object for this container.
Notes: (Read only property)

167.4.14 Values as Dictionary

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience property to see all values in debugger.
Notes: (Read only property)

167.4.15 BytesValue(Index as Integer) as Memoryblock

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set BYTE value with MemoryBlock by index.
Notes: When you get or set, we copy the data.
(Read and Write computed property)
See also:

- 167.4.16 BytesValue(Name as String) as Memoryblock 20342

167.4.16 BytesValue(Name as String) as Memoryblock

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set BYTE value with MemoryBlock by name.
Notes: When you get or set, we copy the data.
(Read and Write computed property)
See also:

- 167.4.15 BytesValue(Index as Integer) as Memoryblock 20341

167.4.17 CharsValue(Index as Integer, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set chars value by name.
Notes: This is for fixed size char values, so you pass in size.
Please use StringValue() to benefit from plugin querying size for you of existing value.
(Read and Write computed property)
See also:

- 167.4.18 CharsValue(Name as String, Size as Integer) as String 20342

167.4.18 CharsValue(Name as String, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set chars value by index.
Notes: This is for fixed size char values, so you pass in size.
Please use StringValue() to benefit from plugin querying size for you of existing value.
(Read and Write computed property)
See also:

- 167.4.17 CharsValue(Index as Integer, Size as Integer) as String 20342

167.4.19 DateValue(Index as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set date value by index.
Notes: Format is always 8 character string with format YYYYMMDD.
(Read and Write computed property)
See also:

- 167.4.20 DateValue(Name as String) as String 20343

167.4.20 DateValue(Name as String) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set date value by name.
Notes: Format is always 8 character string with format YYYYMMDD.
(Read and Write computed property)
See also:

- 167.4.19 DateValue(Index as Integer) as String 20342

167.4.21 FloatValue(Index as Integer) as Double

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set float value by index.
Notes: (Read and Write computed property)
See also:

- 167.4.22 FloatValue(Name as String) as Double 20343

167.4.22 FloatValue(Name as String) as Double

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set float value by name.
Notes: (Read and Write computed property)
See also:

- 167.4.21 FloatValue(Index as Integer) as Double 20343

167.4.23 Int16Value(Index as Integer) as Int16

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt16 value by index.
Notes: (Read and Write computed property)
See also:

- 167.4.24 Int16Value(Name as String) as Int16 20344

167.4.24 Int16Value(Name as String) as Int16

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt16 value by name.
Notes: (Read and Write computed property)
See also:

- 167.4.23 Int16Value(Index as Integer) as Int16 20343

167.4.25 Int32Value(Index as Integer) as Int32

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt32 value by index.
Notes: (Read and Write computed property)
See also:

- 167.4.26 Int32Value(Name as String) as Int32 20344

167.4.26 Int32Value(Name as String) as Int32

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt32 value by name.
Notes: (Read and Write computed property)
See also:

- 167.4.25 Int32Value(Index as Integer) as Int32 20344

167.4.27 Int64Value(Index as Integer) as Int64

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set Int64 value by index.
Notes: (Read and Write computed property)
See also:

- 167.4.28 Int64Value(Name as String) as Int64 20345

167.4.28 Int64Value(Name as String) as Int64

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set Int64 value by name.
Notes: (Read and Write computed property)
See also:

- 167.4.27 Int64Value(Index as Integer) as Int64 20344

167.4.29 NumberValue(Index as Integer, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set numeric value by index.
Notes: The value of the specified field as num-char array (digits only).
Please pass length. If you don't know, please try StringValue/StringLength.
(Read and Write computed property)
See also:

- 167.4.30 NumberValue(Name as String, Size as Integer) as String 20345

167.4.30 NumberValue(Name as String, Size as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set numeric value by name.
Notes: The value of the specified field as num-char array (digits only).
Please pass length. If you don't know, please try StringValue/StringLength.
(Read and Write computed property)
See also:

- 167.4.29 NumberValue(Index as Integer, Size as Integer) as String 20345

167.4.31 StringValue(Index as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set string value by index.
Notes: (Read and Write computed property)
See also:

- 167.4.32 StringValue(Name as String) as String 20346

167.4.32 StringValue(Name as String) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set string value by name.
Example:

```
Var fd As RFCFunctionDescriptionMBS = connection.FunctionDescription("BAPI_COMPANY_GETDETAIL")
Var f As RFCFunctionMBS = fd.CreateFunction

f.StringValue("COMPANYID") = "000007"
f.Invoke

Var s As RFCStructureMBS = f.StructureValue("RETURN")
Var t As String = s.StringValue("MESSAGE")

MsgBox t
```

Notes: (Read and Write computed property)
See also:

- 167.4.31 StringValue(Index as Integer) as String 20345

167.4.33 StructureValue(Index as Integer) as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set structure value with RFCStructureMBS object by index.
Notes: (Read and Write computed property)
See also:

- 167.4.34 StructureValue(Name as String) as RFCStructureMBS 20346

167.4.34 StructureValue(Name as String) as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set structure value with RFCStructureMBS object by name.
Notes: (Read and Write computed property)
See also:

- 167.4.33 StructureValue(Index as Integer) as RFCStructureMBS 20346

167.4.35 TableValue(Index as Integer) as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set table value with RFCTableMBS object by index.
Notes: (Read and Write computed property)
See also:

- 167.4.36 TableValue(Name as String) as RFCTableMBS 20347

167.4.36 TableValue(Name as String) as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set table value with RFCTableMBS object by name.
Notes: (Read and Write computed property)
See also:

- 167.4.35 TableValue(Index as Integer) as RFCTableMBS 20347

167.4.37 TimeValue(Index as Integer) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set time value by index.
Notes: Format is always 6 character string with format HHMMSS.
(Read and Write computed property)
See also:

- 167.4.38 TimeValue(Name as String) as String 20347

167.4.38 TimeValue(Name as String) as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set time value by name.
Notes: Format is always 6 character string with format HHMMSS.
(Read and Write computed property)
See also:

- 167.4.37 TimeValue(Index as Integer) as String 20347

167.4.39 UInt8Value(Index as Integer) as UInt8

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt8 value by index.
Notes: (Read and Write computed property)
See also:

- 167.4.40 UInt8Value(Name as String) as UInt8 20348

167.4.40 UInt8Value(Name as String) as UInt8

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set UInt8 value by name.
Notes: (Read and Write computed property)
See also:

- 167.4.39 UInt8Value(Index as Integer) as UInt8 20347

167.5 class RFCErrorExceptionMBS

167.5.1 class RFCErrorExceptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class to report any error.
Notes: Subclass of the RuntimeException class.

167.6 class RFCExceptionDescriptionMBS

167.6.1 class RFCExceptionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an exception description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.6.2 Methods

167.6.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

167.6.4 Properties

167.6.5 Key as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Exception key
Notes: (Read only property)

167.6.6 Message as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Error message (exception text as defined in SE37)
Notes: (Read only property)

167.7 class RFCFieldDescriptionMBS

167.7.1 class RFCFieldDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a field description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.7.2 Methods

167.7.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

167.7.4 Properties

167.7.5 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection for this field.
Notes: (Read only property)

167.7.6 decimals as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If the field is of type "packed number" (BCD), this member gives the number of decimals.
Notes: (Read only property)

167.7.7 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field name.
Notes: (Read only property)

167.7.8 nucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field length in bytes in a 1-byte-per-SAP_CHAR system.
Notes: (Read only property)

167.7.9 nucOffset as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field offset in bytes in a 1-byte-per-SAP_CHAR system.
Notes: (Read only property)

167.7.10 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

167.7.11 Type as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field data type.
Notes: (Read only property)

167.7.12 TypeDescription as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the type description for this field.
Notes: (Read only property)

167.7.13 TypeString as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type as string.
Notes: Convenience property so you can see type in debugger.
(Read only property)

167.7.14 ucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field length in bytes in a 2-byte-per-SAP_CHAR system.
Notes: (Read only property)

167.7.15 ucOffset as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field offset in bytes in a 2-byte-per-SAP_CHAR system.
Notes: (Read only property)

167.8 class RFCFunctionDescriptionMBS

167.8.1 class RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a function description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.8.2 Methods

167.8.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

167.8.4 CreateFunction as RFCFunctionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data container that can be used to execute function calls in the backend via Invoke.
Notes: The importing parameters can be set using the Value() properties. After the RfcInvoke call returned successfully, the exporting parameters can be read from this data container via the Value() properties.

167.8.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

167.8.6 ExceptionDescription(Index as Integer) as RFCExceptionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception description by index.
See also:

- 167.8.7 ExceptionDescription(Name as String) as RFCExceptionDescriptionMBS

167.8.7 ExceptionDescription(Name as String) as RFCExceptionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception description by name.
See also:

- 167.8.6 ExceptionDescription(Index as Integer) as RFCExceptionDescriptionMBS 20354

167.8.8 ExceptionDescriptions as RFCExceptionDescriptionMBS()

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all exception descriptions.

167.8.9 ParameterDescription(Index as Integer) as RFCParameterDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries parameter description by index.
See also:

- 167.8.10 ParameterDescription(Name as String) as RFCParameterDescriptionMBS 20355

167.8.10 ParameterDescription(Name as String) as RFCParameterDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries parameter description by name.
See also:

- 167.8.9 ParameterDescription(Index as Integer) as RFCParameterDescriptionMBS 20355

167.8.11 ParameterDescriptions as RFCParameterDescriptionMBS()

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameter description as array.

167.8.12 Properties

167.8.13 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent connection.
Notes: (Read only property)

167.8.14 ExceptionCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of exceptions.
Notes: (Read only property)

167.8.15 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

167.8.16 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the function.
Notes: (Read only property)

167.8.17 ParameterCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of parameters for this function.
Notes: (Read only property)

167.8.18 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

167.9 class RFCFunctionMBS

167.9.1 class RFCFunctionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a function in a RFC connection.
Notes: Please use values to set parameters and then call invoke.
Subclass of the RFCContainerMBS class.

167.9.2 Methods

167.9.3 Constructor(typeDescription as RFCFunctionDescriptionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data container that can be used to execute function calls in the backend via Invoke.
Notes: The importing parameters can be set using the Value() properties. After the RfcInvoke call returned successfully, the exporting parameters can be read from this data container via the Value() properties.

167.9.4 DescribeFunction as RFCFunctionDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the function description that is valid for the system to which connection points to.
Notes: If the function description is already in the repository cache for that system ID, it will be returned immediately (from the cache), otherwise it will be looked up in the system's DDIC using the connection. The result from the DDIC lookup will then be placed in the cache. The RFC Runtime maintains a cache for every SAP System ID, as the meta data may be different depending on the SAP release. This is the main API that should be used.

167.9.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

167.9.6 Invoke

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes a function module in the backend system so far.
Example:

```
Var fd As RFCFunctionDescriptionMBS = connection.FunctionDescription("BAPI_COMPANY_GETDETAIL")
Var f As RFCFunctionMBS = fd.CreateFunction

f.StringValue("COMPANYID") = "000007"
f.Invoke

Var s As RFCStructureMBS = f.StructureValue("RETURN")
Var t As String = s.StringValue("MESSAGE")

MsgBox t
```

167.9.7 Properties

167.9.8 ParameterActive(Name as String) as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether a parameter is active.
Notes: This is particularly useful for BAPIs which have many large tables, in which you are not interested. Deactivate those and leave only those tables active, in which you are interested. This reduces network traffic and memory consumption in your application considerably.

This functionality can be used for input and output parameters. If the parameter is an input, no data for that parameter will be sent to the backend. If it's an output, the backend will be informed not to return data for that parameter.
(Read and Write computed property)

167.10 module RFCModuleMBS

167.10.1 module RFCModuleMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for globals in RFC API.
Notes: You can use this module and related classes to connect Xojo to SAP applications and databases.
We support MacOS, Windows and Linux.

You need to get a SAP login (maybe become SAP developer) and download
SAP NetWeaver RFC SDK 7.50.
You need SAP license for user and maybe a developer license yourself.

Please read SAP documentation for various RFC functions to get more details.
MBS Plugin manages memory for you, does reference counting and makes API easier to use for Xojo developers.
Blog Entries

- Connect Xojo to SAP via RFC

167.10.2 Methods

167.10.3 LoadLibrary(file as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the sapnwrfc library.
Example:

```
#If TargetWin32
Const path = "sapnwrfc.dll"
#Else
Var path As FolderItem = GetFolderItem("libsapnwrfc.dylib")
Var LibPath As String = path.parent.NativePath

Call RFCModuleMBS.SetCurrentWorkingDirectory(libPath)
#EndIf

If RFCModuleMBS.LoadLibrary(path) Then
MsgBox "Library loaded."
Else
MsgBox "Failed to load library"+EndOfLine+EndOfLine+RFCModuleMBS.LibraryLoadErrorMessage
quit
End If
```

Notes: Pass path to sapnwrfc.dll on Windows or libsapnwrfc.dylib on MacOS or libsapnwrfc.so on Linux. If file is installed in system path, you may just pass file name.

Returns true on success or false on failure.
The LibraryLoadErrorMessage function returns error message on failure.
See also:

- 167.10.4 LoadLibrary(path as string) as boolean 20361

167.10.4 LoadLibrary(path as string) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the sapnwrfc library.
Notes: Pass path to sapnwrfc.dll on Windows or libsapnwrfc.dylib on MacOS or libsapnwrfc.so on Linux. If file is installed in system path, you may just pass file name.

Returns true on success or false on failure.
The LibraryLoadErrorMessage function returns error message on failure.
See also:

- 167.10.3 LoadLibrary(file as folderitem) as boolean 20360

167.10.5 LocalTransactionID as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a unique 24-digit transaction ID.
Notes: The API will attempt to generate a TID locally using the operating system's UUID.

167.10.6 ReloadIniFile

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the contents of the sapnwrfc.ini file into memory.
Notes: Searches the directory given by IniPath (or the current working directory) for the file sapnwrfc.ini and loads its contents into memory.

167.10.7 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Example:

```
Var path As FolderItem = GetFolderItem("libsapnwrfc.dylib")
Var LibPath As String = path.parent.NativePath

Call RFCModuleMBS.SetCurrentWorkingDirectory(libPath)
```

Notes: This is often useful to make sure the DLLs in that folder are found.
See also:

- 167.10.8 SetCurrentWorkingDirectory(path as String) as boolean 20362

167.10.8 SetCurrentWorkingDirectory(path as String) as boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is often useful to make sure the DLLs in that folder are found.
See also:

- 167.10.7 SetCurrentWorkingDirectory(path as folderitem) as boolean 20361

167.10.9 Properties

167.10.10 IniPath as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The directory in which to search for the sapnwrfc.ini file.
Notes: By default the sapnwrfc library searches for the sapnwrfc.ini in the current working directory of the process. If you want to keep it in a different directory, use this function to tell the sapnwrfc library about the new path.

Note
After you have changed the directory, the NW RFC lib automatically loads the contents of the new sapnwrfc.ini file from that directory.

Pass the full (absolute) path of the directory, in which the sapnwrfc library should look for the sapnwrfc.ini file. A path relative to the current working directory of the process also works.
(Read and Write property)

167.10.11 LibraryLoadError as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The load error code.
Notes: (Read only property)

167.10.12 LibraryLoadErrorMessage as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The load error message.
Notes: (Read only property)

167.10.13 Loaded as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library is loaded.
Notes: Returns true if the library contains the required functions.
(Read only property)

167.10.14 MajorVersion as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Major version, e.g. 7500.
(Read only property)

167.10.15 MinorVersion as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Minor version.
(Read only property)

167.10.16 PatchLevel as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Patch level of the version.
(Read only property)

167.10.17 TraceDir as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the directory where the NW RFC lib should write trace files.
Notes: This function has the same effect as the sapnwrfc.ini parameter RFC_TRACE_DIR. See the documentation of that parameter in the sample ini file contained in the /demo directory of the NW RFC SDK.

Note
This API call affects only new trace files that will be opened after the call. The directory of already existing trace files is not changed in order to prevent confusion and garbage data...

Pass the new directory. Can be an absolute or relative path name. The directory needs to exist prior to calling this API. The NW RFC lib will not attempt to create non-existing directories.
(Read and Write property)

167.10.18 TraceEncoding as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the character encoding to be used in trace files.
Notes: This function has the same effect as the sapnwrfc.ini parameter RFC_TRACE_ENCODING. See the documentation of that parameter in the sample ini file contained in the /demo directory of the NW RFC SDK.

Note
This API call affects only new trace files that will be opened after the call. The character encoding of already existing trace files is not changed in order to prevent confusion and garbage data...

Pass the new encoding. Possible values are "UTF-16", "UTF-8" and "DEFAULT". On Windows UTF-16 is recommended for faster performance. "DEFAULT" corresponds to the operating system's default character encoding, which is CP1252 or ISO-8859-1 on most Windows systems and UTF-8 on most Linux systems.
(Read and Write property)

167.10.19 TraceType as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the way the NW RFC lib writes trace files.
Notes: This function has the same effect as the sapnwrfc.ini parameter RFC_TRACE_TYPE. See the documentation of that parameter in the sample ini file contained in the /demo directory of the NW RFC SDK.

Note
This API call closes currently open trace files and then changes to "one file per process" or one "file per thread". If the NW RFC lib is already using the given trace type, it does nothing.

Must be either "PROCESS" or "THREAD".
(Read and Write property)

167.10.20 Version as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get information about currently loaded sapnwrfc library.
Notes: Version as text to show to user.
(Read only property)

167.10.21 Constants

Errors

Constant	Value	Description
kErrorAbapClassException	27	The called function module raised a class based exception
kErrorAbapException	5	The called function module raised an Exception (RAISE or MESSAGE . RAISING)
kErrorAbapMessage	4	The called function module raised an E-, A- or X-Message
kErrorAbapRuntimeFailure	3	SAP system runtime error (SYSTEM_FAILURE): Shortdump on the backen side
kErrorAuthorizationFailure	29	Authorization check error
kErrorBufferTooSmall	23	The given buffer was to small to hold the entire parameter. Data has bee truncated.
kErrorCanceled	7	No longer used
kErrorClosed	6	Connection closed by the other side
kErrorCodepageConversionFailure	21	Codepage conversion error
kErrorCommunicationFailure	1	Error in Network & Communication layer
kErrorConversionFailure	22	Error while converting a parameter to the correct data type
kErrorExecuted	16	Inbound tRFC Call already executed (needs to be returned fro RFC_ON_CHECK_TRANSACTION in case the TID is already known an successfully processed before.)
kErrorExternalFailure	15	Error in external custom code. (E.g. in the function handlers or tRFC ha dlers.) Results in SYSTEM_FAILURE
kErrorIllegalState	19	The operation is not supported on that handle at the current point of tim (e.g. trying a callback on a server handle, while not in a call)
kErrorInvalidHandle	13	An invalid handle was passed to an API call
kErrorInvalidParameter	20	An invalid parameter was passed to an API call, (e.g. invalid name, type c length)
kErrorInvalidProtocol	11	The received data has an unsupported format
kErrorLogonFailure	2	Unable to logon to SAP system. Invalid password, user locked, etc.
kErrorMemoryInsufficient	9	Memory insufficient
kErrorNotFound	17	Function or structure definition not found (Metadata API)
kErrorNotSupported	18	The operation is not supported on that handle
kErrorOk	0	Everything O.K. Used by every function. (no exception)
kErrorRetry	14	ListenAndDispatch did not receive an RFC request during the timeout perio
kErrorSerializationFailure	12	A problem while serializing or deserializing RFM parameters
kErrorStartSapguiFailure	26	Failed to start and attach SAPGUI to the RFC connection.
kErrorTableMoveBof	24	Trying to move the current position before the first row of the table.
kErrorTableMoveEof	25	Trying to move the current position after the last row of the table.
kErrorTimeout	8	Time out
kErrorUnknownError	28	”Something” went wrong, but I don’t know what...
kErrorVersionMismatch	10	Version mismatch

167.11 class RFCParameterDescriptionMBS

167.11.1 class RFCParameterDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a parameter description.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.11.2 Methods

167.11.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor

167.11.4 Properties

167.11.5 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent connection.
Notes: (Read only property)

167.11.6 decimals as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gives the number of decimals in case of a packed number (BCD)
Notes: (Read only property)

167.11.7 defaultValue as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default value as defined in SE37.
Notes: (Read only property)

167.11.8 Direction as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies whether the parameter is an input, output or bi-directional parameter.
Notes: (Read only property)

167.11.9 isOptional as Boolean

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies whether this parameter is defined as optional in SE37.
Notes: True is optional, false non-optional.
(Read only property)

167.11.10 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter name.
Notes: (Read only property)

167.11.11 nucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter length in bytes in a 1-byte-per-SAP_CHAR system.
Notes: (Read only property)

167.11.12 parameterText as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Description text of the parameter as defined in SE37.
Notes: (Read only property)

167.11.13 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

167.11.14 Type as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter data type.
Notes: (Read only property)

167.11.15 TypeDescription as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The structure definition in case this parameter is a structure or table.
Notes: May be nil for other parameter types.
(Read only property)

167.11.16 TypeString as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type as string.
Notes: Convenience property so you can see type in debugger.
(Read only property)

167.11.17 ucLength as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameter length in bytes in a 2-byte-per-SAP_CHAR system.
Notes: (Read only property)

167.11.18 Constants

Direction Modes

Constant	Value	Description
kDirectionChanging	3	Import and export parameter. This corresponds to ABAP CHANGING parameter.
kDirectionExport	2	Export parameter. This corresponds to ABAP EXPORTING parameter.
kDirectionImport	1	Import parameter. This corresponds to ABAP IMPORTING parameter.
kDirectionTable	7	Table parameter. This corresponds to ABAP TABLES parameter.

167.12 class RFCStructureMBS

167.12.1 class RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a structure in a RFC connection.
Notes: Subclass of the RFCContainerMBS class.

167.12.2 Methods

167.12.3 Clone as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the given structure and returns the handle to the new object.

167.12.4 Constructor(typeDescription as RFCTypeDescriptionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an internal structure data object and returns the handle to the structure object.

167.12.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

167.13 class RFCTableMBS

167.13.1 class RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a table in a RFC connection.
Notes: Subclass of the RFCContainerMBS class.

167.13.2 Methods

167.13.3 AppendNewRow as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new row and appends it at the end of the table.

167.13.4 AppendNewRows(numRows as Integer)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a set of new empty rows at the end of the table and moves the table cursor to the first new row.

167.13.5 AppendRow(row as RFCStructureMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends the given structure at the end of the table.

167.13.6 Clone as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the given table and returns the handle to the new table.

167.13.7 Constructor(TypeDescription as RFCTypeDescriptionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a internal table object and returns the handle to the table.

167.13.8 CurrentRow as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the structure handle to the current row.

167.13.9 DeleteAllRows

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes all rows from the table.

167.13.10 DeleteCurrentRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes the current row from the table.

167.13.11 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

167.13.12 InsertNewRow as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new row and inserts it at the current position of the table cursor.

167.13.13 InsertRow(row as RFCStructureMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts the given structure at the current position of the table cursor.

167.13.14 MoveTo(row as Integer)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the cursor from the current position to the position specified by the index.

167.13.15 MoveToFirstRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the current position to the first row of the table.

167.13.16 MoveToLastRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the current position to the last row of the table.

167.13.17 MoveToNextRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the cursor from the current position to the next row.

167.13.18 MoveToPreviousRow

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the cursor from the current position to the previours row.

167.13.19 ReserveCapacity(numRows as Integer)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reserves memory without changing the size of a table so that new rows can be appended without new memory allocation.

167.13.20 Properties

167.13.21 RowCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of the rows contained in the table.
Notes: (Read only property)

167.13.22 RowType as RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the type descriptor of the table rows.
Notes: (Read only property)

167.14 class RFCTransactionMBS

167.14.1 class RFCTransactionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a transaction.

167.14.2 Methods

167.14.3 ConfirmTransaction

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: After SubmitTransaction has finally succeeded, ConfirmTransaction cleans up the transaction handling table in the backend.
Notes: Caution:
After this call the backend is no longer protected against this TID. So another SubmitTransaction would result in a duplicate.

167.14.4 Constructor(connection as RFCConnectionMBS, TransactionID as String, QueueName as String)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a container for executing a (multi-step) transactional call.
Notes: TransactionID: trasanction ID used to identify the transaction;
queueName: queue name associated with the transaction. If it is "" or empty, the transaction is for tRfc

167.14.5 Destructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

167.14.6 InvokeInTransaction(funcHandle as RFCFunctionMBS)

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Puts a tRfc or qRfc call into the given transaction.
Notes: Can be used multiple times within one transaction handle.

funcHandle: function handle that identifies the Rfc function;

167.14.7 SubmitTransaction

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes all function modules in the backend system, that have accumulated in the transaction so far.
Notes: This step can be repeated until it finally succeeds (RFC_OK). The transaction handling in the backend system protects against duplicates.

167.14.8 Properties

167.14.9 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

167.14.10 TransactionID as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a unique 24-digit transaction ID from the SAP backend system.
Notes: (Read only property)

167.15 class RFCTypeDescriptionMBS

167.15.1 class RFCTypeDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a type definition.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

167.15.2 Methods

167.15.3 Constructor

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

167.15.4 CreateStructure as RFCStructureMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an internal structure data object and returns the handle to the structure object.

167.15.5 CreateTable as RFCTableMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a internal table object and returns the handle to the table.

167.15.6 FieldDescription(Index as Integer) as RFCFieldDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the field description of the structure's indexth field.
See also:

- 167.15.7 FieldDescription(Name as String) as RFCFieldDescriptionMBS

167.15.7 FieldDescription(Name as String) as RFCFieldDescriptionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the field description of a field given by name.
See also:

- 167.15.6 FieldDescription(Index as Integer) as RFCFieldDescriptionMBS 20378

167.15.8 FieldDescriptions as RFCFieldDescriptionMBS()

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads all the field descriptions.

167.15.9 Properties

167.15.10 Connection as RFCConnectionMBS

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The connection owning this object.
Notes: (Read only property)

167.15.11 FieldCount as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of fields for this type.
Notes: (Read only property)

167.15.12 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

167.15.13 Name as String

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the type.
Notes: (Read only property)

167.15.14 Parent as Variant

MBS Tools Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

Chapter 168

SATSolver

168.1 class LGLAbortedExceptionMBS

168.1.1 class LGLAbortedExceptionMBS

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The exception used to report fatal errors in SAT Solver.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo Plugins, version 21.3pr6

168.2 class LGLMBS

168.2.1 class LGLMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the SAT Solver from lingeling.
Notes: Based on lingeling project here:
https://github.com/arminbiere/lingeling
and
http://fmv.jku.at/lingeling/

168.2.2 Methods

168.2.3 Add(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value.

168.2.4 Assume(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assume single units.

168.2.5 CAssume(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assume clause (at most one)

168.2.6 Clone as LGLMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the object.
Notes: Both 'Cloning' and 'Forking' can be used to implement 'Push & Pop', but the asymmetric forking is more similar to the classical way of implementing it, needs less resources since for instance eliminated variables do not occupy any memory in the children, but requires lifting back satisfying assignments explicitly (through the whole parent chain). If these full satisfying assignments are really needed actually cloning could be more space efficient too. Assume you want to split the solver into two instances, one with a literal set to false, the other one to true. Then cloning allows you to produce two independent branches, while for forking you need three, since the root / top solver still has to be kept for lifting back a potential assignment.

168.2.7 Constructor

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Creates new empty object.

168.2.8 DefaultOption(Name as String) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries default value for an option.

168.2.9 Deref(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries value.
Notes: neg=false, pos=true
Returns -1 if lit is bigger then MaxVar.

168.2.10 Failed(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks failed flag for given item.
Notes: neg=false, pos=true
for assumptions.

168.2.11 Fixate

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add assumptions as units

168.2.12 Fixed(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks fixed flag.
Notes: neg=false, pos=true
Toplevel

168.2.13 FlushCache

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush all learned clauses.

168.2.14 FlushTimers

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flush timers.

168.2.15 Fork as LGLMBS

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Forks the object.
Notes: 'Forking' copies only irredundant clauses and also uses internal variable indices of the parent as

external variable indices. Thus 'parent' and the forked off 'child' do neither exactly work the same way, nor do they use from the API point of view the same set of variables. They are satisfiability equivalent. If the child becomes unsatisfiable the parent can be assumed to be unsatisfiable too and thus 'join' would just add the empty clause to the parent. If the child produces a satisfying assignment, this assignment is turned into an assignment of the parent by 'join'. Parents can be forked multiple times. A child has exactly one parent. Parents and children can be released independently. Between 'Fork' and 'Join' no other operations but further 'Fork' are allowed. The effect ot multiple 'Join' with the same parent is unclear at this point. The same memory manager is use for the child and the parent. Options, prefix, output file and the callbacks for 'getime' and 'Abort' are copied too (if set).

Both 'Cloning' and 'Forking' can be used to implement 'Push & Pop', but the asymmetric forking is more similar to the classical way of implementing it, needs less resources since for instance eliminated variables do not occupy any memory in the children, but requires lifting back satisfying assignments explicitly (through the whole parent chain). If these full satisfying assignments are really needed actually cloning could be more space efficient too. Assume you want to split the solver into two instances, one with a literal set to false, the other one to true. Then cloning allows you to produce two independent branches, while for forking you need three, since the root / top solver still has to be kept for lifting back a potential assignment.

168.2.16 Freeze(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Freezes the given item.

168.2.17 Frozen(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries frozen state.

168.2.18 GetOptionMinMax(Name as String, byref min as Integer, byref max as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current value, minimum and maximum values.

168.2.19 HasOption(Name as String) as Boolean

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if the given option is set.

168.2.20 IncVar as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Increases variables by one.

168.2.21 Join(Child as LGLMBS) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Joins back forked child.

168.2.22 LibVersion as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries library version.
Example:

Print "LGL "+LGLMBS.LibVersion

168.2.23 Lookahead as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a good look ahead literal or zero if all potential literals have been eliminated or have been used as blocking literals in blocked clause elimination.
Notes: Zero is also returned if the formula is already inconsistent. The lookahead literal is made usable again, for instance if it was not frozen during a previous SAT call and thus implicitly became melted. Therefore it can be added in a unit clause.

168.2.24 Melt(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Melts a literal.

168.2.25 MeltAll

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Melt all literals.

168.2.26 ParseFile(File as FolderItem, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.
See also:

- 168.2.27 ParseFile(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20387

168.2.27 ParseFile(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.
See also:

- 168.2.26 ParseFile(File as FolderItem, force as boolean = false) as String 20387

168.2.28 ParseFileMT(File as FolderItem, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 168.2.29 ParseFileMT(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20388

168.2.29 ParseFileMT(File as FolderItem, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file.
Notes: Returns empty text on success or error message from parser.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 168.2.28 ParseFileMT(File as FolderItem, force as boolean = false) as String 20387

168.2.30 ParsePath(Path as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

See also:

- 168.2.31 ParsePath(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20388

168.2.31 ParsePath(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

See also:

- 168.2.30 ParsePath(Path as String, force as boolean = false) as String 20388

168.2.32 ParsePathMT(Path as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 168.2.33 ParsePathMT(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20390

168.2.33 ParsePathMT(Path as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given by path.
Notes: Returns empty text on success or error message from parser.

On MacOS and Linux, if file has the following extensions, the file will be decompressed with command line tool and then parsed:

.gz	gzip
.xz	xz
.bz2	bzip2
.zip	unzip
.7z	7x

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 168.2.32 ParsePathMT(Path as String, force as boolean = false) as String 20389

168.2.34 ParseString(Data as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.
See also:

- 168.2.35 ParseString(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20390

168.2.35 ParseString(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.
See also:

- 168.2.34 ParseString(Data as String, force as boolean = false) as String 20390

168.2.36 ParseStringMT(Data as String, force as boolean = false) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 168.2.37 ParseStringMT(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String 20391

168.2.37 ParseStringMT(Data as String, force as boolean, byref LineNo as Integer, byref Max as Integer) as String

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses data file given it as text.
Notes: Returns empty text on success or error message from parser.
Please pass text with data separated with unix line endings (endofline.unix), so you may need to use ReplaceLineEndings function.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 168.2.36 ParseStringMT(Data as String, force as boolean = false) as String 20391

168.2.38 Print(File as FolderItem = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print system to file or stdout.
Notes: Pass nil to use stdout.
Remaining in DIMACS format

168.2.39 PrintAll(File as FolderItem = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints all values.
Notes: Including units & equivs.
Pass nil to use stdout.

168.2.40 PrintBanner(Name as String, Prefix as String, File as FolderItem = nil)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints banner including version of library.
Notes: Pass nil to use stdout.

see lglbnr function.

168.2.41 PrintOptions(prefix as string, IgnoreSome as boolean)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print all options to stdout.

168.2.42 PrintPCS(mixed as boolean)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints PCS file.

168.2.43 PrintRangeOptions

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print range options to stdout.

168.2.44 PrintSizes

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints data structure sizes.

168.2.45 PrintStats

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prints statistics to stdout.

168.2.46 PrintUsage

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print usage "-h".

168.2.47 ReadOptionFile(File as FolderItem) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the option file.

168.2.48 Reconstk(byref Start as Ptr, byref Top as Ptr)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set Start and Top to the 'start' and 'top' of the reconstruction stack, which is used in BCE, BVE and CCE for reconstructing a solution after eliminating variables or clauses.
Notes: These pointers are only valid until the next Sat or Simp call.

168.2.49 ReduceCache

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reset cache size.

168.2.50 Representative(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return representative from equivalence class if literal is not top-level assigned nor eliminated.

168.2.51 ResetPhase(lit as integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set default phase of a literal.
Notes: Stop forcing phase in decisions.

168.2.52 Reusable(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if item can be reused.
Notes: If a literal was not frozen at the last call to Sat (or Simp) it becomes 'unusable' after the next call even though it might not have been used as blocking literal etc.

168.2.53 Reuse(lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reuses an item.
Notes: If a literal was not frozen at the last call to Sat (or Simp) it becomes 'unusable' after the next call even though it might not have been used as blocking literal etc.

168.2.54 Sat as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the system.
Notes: May output messages to stdout.

168.2.55 SatMT as Integer

MBS Tools Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the system.
Notes: May output messages to stdout.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

168.2.56 SetAPITraceFile(File as FolderItem)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a text file and let the library output to this file.
Notes: Logs API calls to the library.

168.2.57 SetID(tid as Integer, tids as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set individual ids for logging and statistics.

168.2.58 SetImportant(lit as integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Prefer decisions on 'important' variables.

168.2.59 SetOutputFile(File as FolderItem)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an output file and let the library output to this file.
Notes: Sets output file for report.

168.2.60 SetPhase(lit as integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set default phase of a literal.
Notes: Any decision on this literal will always try this phase. Note, that this function does not have any effect on eliminated variables. Further equivalent variables share the same forced phase and thus if they are set to different default phases, only the last set operation will be kept.

168.2.61 SetPhases

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the phases.
Notes: Assume the solver is in the SATISFIABLE state (after Sat or Simp), then calling SetPhases will copy the current assignment as default phases.

168.2.62 SetTraceFile(File as FolderItem)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a text file and let the library output to this file.
Notes: Set trace output file.
Logs trace calls to the library.

168.2.63 Simp(iterations as integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the system.
Notes: Iterations must be >= 0.

168.2.64 TraverseAllClauses

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over all clauses and calls TraverseAllClauses event for each.
Notes: Internally calls TraverseUnits, TraverseEquivalences and TraverseRemainingClauses.
See also:

- 168.2.90 TraverseAllClauses(Lit as Integer) 20401

168.2.65 TraverseEquivalences

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over equivalences and calls TraverseEquivalences event for each.
See also:

- 168.2.91 TraverseEquivalences(Lit as Integer, Representation as Integer) 20401

168.2.66 TraverseRemainingClauses

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over remaining clauses and calls TraverseRemainingClauses event for each.
See also:

- 168.2.92 TraverseRemainingClauses(Lit as Integer) 20401

168.2.67 TraverseUnits

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loops over units and calls TraverseUnits event for each.
See also:

- 168.2.93 TraverseUnits(Unit as Integer) 20402

168.2.68 Unclone(Child as LGLMBS) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unclones the object.

168.2.69 Usable(lit as Integer) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an item is usable.
Notes: If a literal was not frozen at the last call to Sat (or Simp) it becomes 'unusable' after the next call even though it might not have been used as blocking literal etc.

168.2.70 Properties

168.2.71 Aborted as Boolean

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The aborted status.
Notes: We set this to true when the processing is aborted due to an error.
See AbortMessage property for the message.
(Read and Write property)
See also:

- 168.2.89 Aborted 20401

168.2.72 AbortMessage as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The abort reason message.
Notes: (Read only property)

168.2.73 Bytes as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current size in bytes.
Notes: (Read only property)

168.2.74 Changed as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Model changed.
Notes: (Read only property)

168.2.75 Confs as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of conflicts.
Notes: (Read only property)

168.2.76 Decs as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of decisions.
Notes: (Read only property)

168.2.77 Handle as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

168.2.78 Inconsistent as Boolean

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Contains empty clause?
Notes: (Read only property)

168.2.79 MaxMegaBytes as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum memory usage in megabytes.
Notes: (Read only property)

168.2.80 MaxVar as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries maximum index of variables.
Notes: (Read only property)

168.2.81 MegaBytes as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current size in memory as megabytes.
Notes: (Read only property)

168.2.82 Options as Dictionary

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all options with values.
Notes: (Read only property)

168.2.83 Prefix as String

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The prefix for messages.
Notes: (Read and Write property)

168.2.84 ProcessTime as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries CPU usage time used.
Notes: Value is -1 on Windows as we don't have the unix functions there.
(Read only property)

168.2.85 Props as Int64

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of propagations.
Notes: (Read only property)

168.2.86 Seconds as Double

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns time needed.
Notes: (Read only property)

168.2.87 Option(Name as String) as Integer

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or sets option value.
Notes: (Read and Write computed property)

168.2.88 Events

168.2.89 Aborted

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called when processing is aborted due to an error.
Notes: Errors are printed to stdout.
See AbortMessage property for the message.
See also:

- 168.2.71 Aborted as Boolean 20398

168.2.90 TraverseAllClauses(Lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseAllClauses method.
See also:

- 168.2.64 TraverseAllClauses 20396

168.2.91 TraverseEquivalences(Lit as Integer, Representation as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseEquivalences method.
See also:

- 168.2.65 TraverseEquivalences 20397

168.2.92 TraverseRemainingClauses(Lit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseRemainingClauses method.
See also:

- 168.2.66 TraverseRemainingClauses 20397

168.2.93 TraverseUnits(Unit as Integer)

MBS Tools Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called for TraverseUnits method.
See also:

- 168.2.67 TraverseUnits 20397

168.2.94 Constants

SAT Results

Constant	Value	Description
LGL_SATISFIABLE	10	The system is satisfiable.
LGL_UNKNOWN	0	It is not known whether it is satisfiable.
LGL_UNSATISFIABLE	20	The system is not satisfiable.

Chapter 169

Saxon

169.1 class DocumentBuilderMBS

169.1.1 class DocumentBuilderMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for building documents.
Notes: A document builder holds properties controlling how a Saxon document treeshould be built, and provides methods to invoke the tree construction.

This class has no public constructor. To construct a DocumentBuilder,use the factory method SaxonProcessor.newDocumentBuilder().

All documents used in a single Saxon query, transformation, or validationepisode must be built with the same Configuration. However, there is no requirement that they should use the same DocumentBuilder.

Sharing of a DocumentBuilder across multiple threads is not recommended. However, in the current implementation sharing aDocumentBuilder (once initialized) will only cause problems if aSchemaValidator is used.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

169.1.2 Methods

169.1.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

169.1.4 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.1.5 parseXmlFromFile(File as FolderItem) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from a file.
Notes: Build a document from a supplied XML file.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

169.1.6 parseXmlFromPath(Path as String) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from a file.
Notes: Build a document from a supplied XML file.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

169.1.7 parseXmlFromString(content as String, encoding as String = "") as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from a string.
Notes: Load an XML document, to create a tree representation of the document in memory.

content: the XML document as a serialized string @param encoding of the source string argument. If not specified then platform default encoding is used.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

169.1.8 parseXmlFromUri(source as String) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses an XML document from an URI.
Notes: Build a document from a supplied URI source.

Returns an XdmNode. This will be the document node at the root of the tree of the resulting in-memory document.

If any failure occurs retrieving or parsing the document the exception methods will provide more information.

169.1.9 Properties

169.1.10 BaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base URI of a document loaded using this DocumentBuilder.
Notes: This is used for resolving any relative URIs appearing within the document, for example in references to DTDs and external entities.

This information is required when the document is loaded from a source that does not provide an intrinsic URI, notably when loading from a Stream or a DOMSource. The value is ignored when loading from a source that does have an intrinsic base URI.

Value is the base URI of documents loaded using this DocumentBuilder. This must be an absolute URI.
(Read and Write property)

169.1.11 DTDValidation as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set whether DTD validation should be applied to documents loaded using this DocumentBuilder.
Example:

```
Var s As New SaxonProcessorMBS
Var d As DocumentBuilderMBS = s.NewDocumentBuilder

d.DTDValidation = True
```

Notes: By default, no DTD validation takes place.

Set to true if DTD validation is to be applied to the document.
(Read and Write property)

169.1.12 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

169.1.13 LineNumbering as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to keep ine numbers
Example:

```
Var s As New SaxonProcessorMBS
Var d As DocumentBuilderMBS = s.NewDocumentBuilder

d.LineNumbering = True
```

Notes: Get or set whether line and column numbering and is to be enabled for documents constructed using this DocumentBuilder. This has the effect that the line and column number in the original source document is maintained in the constructed tree, for each element node (and only for elements). The line and column number in question are generally the position at which the closing ">" of the element start tag appears.
By default, line and column numbers are not maintained.

Errors relating to document parsing and validation will generally contain line numbers whether or not this

option is set, because such errors are detected during document construction.

Line numbering is not available for all kinds of source: for example, it is not available when loading from an existing DOM Document.
(Read and Write property)

169.1.14 SchemaValidator as SchemaValidatorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SchemaValidator used to validate documents loaded using this DocumentBuilder.
Notes: This determines whether schema validation is applied to an input document and whether type annotations in a supplied document are retained. If no schemaValidator is supplied, then schema validation does not take place.
This option requires the schema-aware version of the Saxon product (Saxon-EE).

Since a SchemaValidator is serially reusable but not thread-safe, using this method is not appropriate when the DocumentBuilder is shared between threads.
(Read and Write property)

169.2 class SaxonExceptionMBS

169.2.1 class SaxonExceptionMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception for errors in Saxon.
Notes: Subclass of the RuntimeException class.
Blog Entries

- Validate electronic invoices with Saxon in Xojo

169.3 module SaxonMBS

169.3.1 module SaxonMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for globals.
Notes: Requires an additional Saxon license from Monkeybread Software to use in Xojo.
Blog Entries

- MBS Xojo Plugins, version 26.2pr1
- Validate electronic invoices with Saxon in Xojo
- Saxon Visualize electronic Invoices in Xojo
- MBS Xojo Plugins, version 25.6pr5

- MBS Xojo Plugins, version 25.1pr1

169.3.2 Methods

169.3.3 ClearLicense

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the license.

169.3.4 LoadLibrary(file as folderitem) as boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the library.
Notes: You point to the right file:

File name	Platform
libsaxon-pec-12.5.0.so	Linux
libsaxon-pec-12.5.0.dylib	macOS
libsaxon-pec-12.5.0.dll	Windows

Sets the LoadErrorString and LoadError properties.
See also:

- 169.3.5 LoadLibrary(path as string) as boolean 20410

169.3.5 LoadLibrary(path as string) as boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the library.
Example:

```
Var path As String = "/Users/cs/saxon/Libs/libsaxon-pec-12.5.0.dylib"
Var b As Boolean = SaxonMBS.LoadLibrary(path)

If b Then
// okay
Else
Print SaxonMBS.LoadErrorString
End If
```

Notes: You point to the right file:

File name	Platform
libsaxon-pec-12.5.0.so	Linux
libsaxon-pec-12.5.0.dylib	macOS
libsaxon-pec-12.5.0.dll	Windows

Sets the LoadErrorString and LoadError properties.
See also:

- 169.3.4 LoadLibrary(file as folderitem) as boolean 20409

169.3.6 SetLicenseCode(Name as String, Product as String, enddate as integer, value as integer)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Not yet used.

169.3.7 Validate(xml as String, schema as String, Lax as boolean = false, Parameters as Dictionary = nil, Properties as Dictionary = nil) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML given a schema.
Notes: This is a convenience function. You can do the same with more options using SchemaValidatorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

169.3.8 XPathQuery(xml as String, query as String, Parameters as Dictionary = nil, Properties as Dictionary = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs a XPath query.
Notes: This is a convenience function. You can do the same with more options using XPathProcessorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

169.3.9 XQuery(xml as String, query as String, Parameters as Dictionary = nil, Properties as Dictionary = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs a XML Query.
Notes: This is a convenience function. You can do the same with more options using XQueryProcessorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

169.3.10 XSLT(xml as String, stylesheet as String, Parameters as Dictionary = nil, Properties as Dictionary = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Runs a XML stylesheet transformation.
Notes: This is a convenience function. You can do the same with more options using Xslt30ProcessorMBS class.

If Parameters is not nil, we use the values in the dictionary to set parameters. Same for properties dictionary.

169.3.11 Properties

169.3.12 BaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the base URI for queries.
Notes: (Read and Write property)

169.3.13 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

169.3.14 Debug as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables debug output for Saxon.
Notes: (Read and Write property)

169.3.15 IsLoaded as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library has been loaded.
Notes: Returns true if loaded or false if not yet loaded.
(Read only property)

169.3.16 LanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The language version to use for queries.
Example:

SaxonMBS.LanguageVersion = "3.1"

Notes: e.g. set to "3.1".
(Read and Write property)

169.3.17 License as String

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries which license is set.
Notes: Returns "Saxon-EE", "Saxon-PE" or empty text.
(Read only property)

169.3.18 LoadError as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code for the library loading.
Notes: Zero on success.
(Read only property)

169.3.19 LoadErrorString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message for loading the library.
Notes: (Read only property)

169.3.20 ValidationReport as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The validation report from Validate() function as XML.
Notes: (Read and Write property)

169.3.21 Version as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version of the Saxon library.
Notes: Returns version or empty text.

(Read only property)

169.3.22 XSDVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XSD version to use.
Notes: (Read and Write property)

169.3.23 XslMessages as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the XLS Messages from last XSLT call.
Notes: (Read only property)

169.4 class SaxonProcessorMBS

169.4.1 class SaxonProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SaxonProcessor class acts as a factory for generating XQuery, XPath, Schema and XSLT compilers.
Example:

Var Processor As New SaxonProcessorMBS
MessageBox Processor.Version

Notes: The SaxonProcessor class not only generates XQuery, XPath, Schema and XSLT Processors, but is used to create Xdm objects from primitive types.

Lot of functions take file paths as string. That can be an absolute file path for the operating system (e.g. FolderItem.NativePath), a simple file name in the current working directory or a relative file specification, e.g. "../data/test.xml".
Blog Entries

- News from the MBS Xojo Plugins in Version 25.1

169.4.2 Methods

169.4.3 clarkNameToEQName(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert clark name string to EQName notation.
Notes: The expanded name, as a string using the notation defined by the EQName production in XPath 3.0. If the name is in a namespace, the resulting string takes the form Q { uri } local. Otherwise, the value is the local part of the name.

Name: The URI in Clark notation: { uri } local if the name is in a namespace, or simply local if not.

Returns the expanded name, as a string using the notation defined by the EQName production in XPath 3.0.

169.4.4 clearConfigurationProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear configuration properties specific to the processor in use.

169.4.5 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A default constructor.
Notes: Create Saxon Processor.
See also:

- 169.4.6 Constructor(other as SaxonProcessorMBS) 20416

169.4.6 Constructor(other as SaxonProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.4.5 Constructor 20416

169.4.7 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.4.8 EQNameToClarkName(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert EQName string to clark name notation.
Notes: name: The URI in EQName notation: Q { uri } local if the name is in a namespace. For a name in no namespace, either of the forms Q { } local or simply local are accepted.

Returns the URI in the clark notation.

169.4.9 makeArray(input() as Variant) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array from variants.
Example:

```
Var Processor As New SaxonProcessorMBS
Var values() As Variant
values.add 123
values.add "Hello"
values.add True
values.add Array(1,2,3)
Var a As XdmArrayMBS = Processor.makeArray(values)
Var t As String = a.toString
Break // shows [ 123,"Hello",true(), [ 1,2,3 ] ]
```

Notes: Uses makeValue internally to convert variant values to XdmValue.

169.4.10 makeArrayValues(input() as XdmValueMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are of type XdmValue.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As XdmValueMBS
v.Add Processor.makeInt32Value(123)
v.Add Processor.makeDoubleValue(123)
v.Add Processor.makeStringValue("Hello")
Var a As XdmValueMBS = Processor.makeArrayValues(v)
// shows [ 123,1.23e2,"Hello" ]
MessageBox a.toString
```

Notes: input: the input array of XdmValue pointers

Returns an XdmArray whose members are XdmValue values corresponding one-to-one with the input.

169.4.11 makeAtomicValue(type as String, value as String) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: ate an Xdm Atomic value from string representation.
Example:

```
Var Processor As New SaxonProcessorMBS
```

```
Var v As Variant = 1234.56
Var a As XdmAtomicValueMBS = Processor.makeAtomicValue(v)
MessageBox a.toString
```

Notes: type: Local name of a type in the XML Schema namespace.
value: The value given in a string form.

In the case of a QName the value supplied must be in clark notation. { uri } local

Returns XdmValueMBS object.
See also:

- 169.4.12 makeAtomicValue(value as Variant) as XdmAtomicValueMBS 20418

169.4.12 makeAtomicValue(value as Variant) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an atomic value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v As Variant = "Hello"
Var a As XdmAtomicValueMBS = Processor.makeAtomicValue(v)
Var t As String = a.toString
Break // shows Hello
```

Notes: Converts values to Atomic value. Supports string, text, date/datetime, UInt32, UInt64, Int64, Int32, Integer, Color, Boolean, Single and Double.
See also:

- 169.4.11 makeAtomicValue(type as String, value as String) as XdmAtomicValueMBS 20417

169.4.13 makeBooleanArray(input() as Boolean) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:boolean values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var values() As Boolean = array(true, false, true)
Var a As XdmArrayMBS = Processor.makeBooleanArray(values)
Var t As String = a.toString
```

```
Break // shows [ true(),false(),true() ]
```

Notes: input: the input array of boolean values

Returns an XdmArrayMBS whose members are xs:boolean values corresponding one-to-one with the input.

169.4.14 makeBooleanValue(value as Boolean) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to make a boolean value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeBooleanValue(True)
Var t As String = a.toString
Break // shows true
```

Notes: Makes a XdmAtomicValue representing a boolean Value.

169.4.15 makeDoubleArray(input() as Double) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:float values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Double
v.Add 0.1
v.Add 2.2
v.Add 99
Var a As XdmValueMBS = Processor.makeDoubleArray(v)
// shows [ 1.0e-1,2.2e0,9.9e1 ]
MessageBox a.toString
```

Notes: input: the input array of single values.

Returns an XdmArray whose members are xs:float values corresponding one-to-one with the input.

169.4.16 makeDoubleValue(value as Double) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to create a double.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeDoubleValue(123)
MessageBox a.toString
```

Notes: Make an XdmAtomicValue from a primitive double value

169.4.17 makeInt16Array(input() as Int16) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:short values
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Int16
v.Add 1
v.Add 2
v.Add -3
Var a As XdmValueMBS = Processor.makeInt16Array(v)
MessageBox a.toString // shows [ 1,2,-3 ]
```

Notes: input: the input array of short values

Returns an XdmArray whose members are xs:boolean values corresponding one-to-one with the input.

169.4.18 makeInt32Array(input() as Int32) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:int values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Int32
v.Add 1
v.Add 2
v.Add 3
```

```
Var a As XdmValueMBS = Processor.makeInt32Array(v)
MessageBox a.toString // shows [ 1,2,3 ]
```

Notes: input: the input array of int values.

Returns an XdmArray whose members are xs:int values corresponding one-to-one with the input.

169.4.19 makeInt32Value(value as Int32) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to make an integer.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As Int32 = 123
Var a As XdmAtomicValueMBS = Processor.makeInt32Value(s)
Var t As String = a.toString
Break // shows 123
```

169.4.20 makeInt64Array(input() as Int64) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:long values
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Int64 = Array(1,2,3,4)
Var a As XdmValueMBS = Processor.makeInt64Array(v)
MessageBox a.toString // shows [ 1,2,3,4 ]
```

Notes: input: the input array of long values

Returns an XdmArray whose members are xs:long values corresponding one-to-one with the input.

169.4.21 makeInt64Value(value as Int64) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Ractory method to make a Int64 value.

Example:

```
Var Processor As New SaxonProcessorMBS
Var s As XdmAtomicValueMBS = Processor.makeInt64Value(123)
Var t As String = s.StringValue
Var v As Variant = s.Value
Var i As Int64 = s.LongValue
Break
```

Notes: makes either an Int64Value or a BigIntegerValue depending on the value supplied.

169.4.22 makeIntegerArray(input() as Integer) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:long or xs:int values
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Integer = Array(1,2,3,4)
Var a As XdmValueMBS = Processor.makeIntegerArray(v)
MessageBox a.toString // shows [ 1,2,3,4 ]
```

Notes: input: the input array of integer values

Either uses makeInt64Array or makeInt32Array internally depending on whether this is 32-bit or 64-bit application.

169.4.23 makeIntegerValue(value as Integer) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Makes an integer value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As Int32 = 123
Var a As XdmAtomicValueMBS = Processor.makeIntegerValue(s)
Var t As String = a.toString
Break // shows 123
```

Notes: Internally uses makeInt32Value or makeInt64Value depending on whether the application is 32-bit or 64-bit.

169.4.24 makeMap(dataMap as Dictionary) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmMap whose argument is a map from the dictionary.
Example:

```
Var Processor As New SaxonProcessorMBS
Var map As New Dictionary
map.Value("test") = Processor.makeStringValue("Hello")
map.Value("other") = "World"
map.Value(Processor.makeIntegerValue(123)) = True
Var m As XdmMapMBS = Processor.makeMap(map)
Var s As String = m.toString
Break // map { "other":"World","test":"Hello",123:true() }
```

Notes: dataMap: is dictionary, which consists of keys as XdmAtomicValueMBS and value is XdmValueMBS.

Returns an XdmMap whose members are key, value pair given as (XdmAtomicValue, XdmValue)

For your convenience we convert various data types to XdmAtomicValueMBS automatically using makeAtomicValue method.

Also for your convenience any value in the dictionary not being a XdmValueMBS is converted to XdmValueMBS using makeValue() function.

169.4.25 makeMap2(dataMap as Dictionary) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmMap whose argument is a map from the standard template library.
Example:

```
Var Processor As New SaxonProcessorMBS
Var map As New Dictionary
map.Value("test") = Processor.makeStringValue("Hello")
map.Value("other") = Processor.makeIntegerValue(123)
Var m As XdmMapMBS = SaxonProcessorMBS.makeMap2(map)
Var s As String = m.toString
Break // map { "other":123,"test":"Hello" }
```

Notes: dataMap: is dictionary, which consists of keys as string and value is XdmValueMBS.
Keys are converted to XdmAtomicValue objects

Returns an XdmMap whose members are key, value pair given as (XdmAtomicValue, XdmValue)

169.4.26 makeObjectArray(input() as Object) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array from an array of objects.
Example:

```
Var Processor As New SaxonProcessorMBS
Var values() As Object
values.add Processor.makeValue(123)
values.add Processor.makeValue("Hello")
values.add Processor.makeValue(True)
values.add Processor.makeValue(Array(1,2,3))
Var a As XdmArrayMBS = Processor.makeObjectArray(values)
var t as string = a.toString
Break // shows [ 123,"Hello",true(), [ 1,2,3 ] ]
```

Notes: Uses makeValue internally to convert variant values to XdmValue.

169.4.27 makeQNameValue(value as String) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an QName Xdm value from string representation in clark notation
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeQNameValue("Hello")
Var s As String = a.toString
Break // s is Hello
```

Notes: value: The value given in a string form in clark notation. { uri } local

Returns XdmAtomicValueMBS object.

169.4.28 makeSingleArray(input() as Single) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:double values.
Example:

```
Var Processor As New SaxonProcessorMBS
Var v() As Single
v.Add 0.1
v.Add 2.2
v.Add 99
Var a As XdmValueMBS = Processor.makeSingleArray(v)
// shows [ xs:float("0.1"),xs:float("2.2"),xs:float("99") ]
MessageBox a.toString
Break
```

Notes: input: the input array of double values.

Returns an XdmArray whose members are xs:double values corresponding one-to-one with the input.

169.4.29 makeSingleValue(value as Single) as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to make a float value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As Single = 123.45
Var a As XdmAtomicValueMBS = Processor.makeSingleValue(s)
Var t As String = a.toString
Break // shows 123.45
```

Notes: Make an XdmAtomicValue from a primitive float value.

169.4.30 makeStringArray(input() as String) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make an XdmArray whose members are xs:string values
Example:

```
Var Processor As New SaxonProcessorMBS
```

```
Var v() As String
v.Add "Hello"
v.add "World"
Var a As XdmValueMBS = Processor.makeStringArray(v)
// shows [ "Hello","World" ]
MessageBox a.toString
Break
```

Notes: input: the input array of string values

Returns an XdmArray whose members are xs:string values corresponding one-to-one with the input.

169.4.31 makeStringValue(value as String, encoding as String = "") as XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Factory method to create string.
Example:

```
Var Processor As New SaxonProcessorMBS
Var s As XdmAtomicValueMBS = Processor.makeStringValue("Hello")
Var t As String = s.StringValue
Break
```

Notes: Unlike the constructor, this avoids creating a new StringValue in the case of a zero-length string (and potentially other strings, in future)

value: the String value.
encoding: the encoding of the string. If not specified then the platform default encoding is used.

169.4.32 makeValue(value as Variant) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a value.
Example:

```
Var Processor As New SaxonProcessorMBS

Var v As Variant = 123.45
Var a As XdmValueMBS = Processor.makeValue(v)
Var t As String = a.toString
```

Break

Notes: Converts values to XdmValueMBS internally:

- nil value
- Array of String
- Array of Boolean
- Array of Int32, Int64 or Integer
- Array of Single/Double
- Array of Object/Variant
- String, OSType, Date, DateTime, Text
- Int32
- Int64, UInt32, Color
- Single
- Double, Currency, UInt64
- Boolean
- Object: Dictionary or XdmValueMBS

Raises exception for unsupported types. We could add more types if needed.

169.4.33 NewDocumentBuilder as DocumentBuilderMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a DocumentBuilder.
Notes: A DocumentBuilder is used to load source XML documents.

169.4.34 NewSchemaValidator as SchemaValidatorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a SchemaValidator which can be used to validate instance documents against the schema held by this SchemaManager.
Notes: Returns nil, if license doesn't allow the validator.

169.4.35 NewXPathProcessor as XPathProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an XPathProcessor.
Notes: An XPathProcessor is used to compile XPath expressions.

169.4.36 NewXQueryProcessor as XQueryProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an XQueryProcessor.
Notes: An XQueryProcessor is used to compile XQuery queries.

169.4.37 NewXslt30Processor as Xslt30ProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an Xslt30Processor.
Notes: An Xslt30Processor is used to compile XSLT30 stylesheets.

169.4.38 parseJsonFromFile(File as FolderItem) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source JSON file and return it as an XdmValue.
Example:

```
Const Path = "/Users/cs/test.json"
Var n As XdmValueMBS = s.parseJsonFromFile(Path)
Var x As String = n.toString

Break
```

Notes: File: The full path to the file.

Returns an XdmValueMBS.

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

169.4.39 parseJsonFromPath(Path as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source JSON file and return it as an XdmValue.
Example:

```
Const Path = "/Users/cs/test.json"
Var n As XdmValueMBS = s.parseJsonFromFile(Path)
Var x As String = n.toString

Break
```

Notes: Path: the filename of the JSON. This is a full path filename or a URI.

Returns an XdmValueMBS.

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

169.4.40 parseJsonFromString(content as String, encoding as String = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a lexical representation of the JSON and return it as an XdmValue.
Example:

```
Var Processor As New SaxonProcessorMBS
Var n As XdmValueMBS = Processor.parseJsonFromString(" [ 1,2,3 ] ")
Var s As String = n.toString
Break
// shows [ 1.0e0,2.0e0,3.0e0 ]
```

Notes: source: the JSON as a lexical string
encoding: the encoding of the source argument. Argument can be omitted and "" accepted to use the default platform encoding.

Returns an XdmValueMBS.

Raises SaxonExceptionMBS if there is a failure in the parsing of the JSON.

169.4.41 parseXmlFromFile(File as FolderItem, validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source document file and return it as an XdmNode.
Notes: source: the filename of the source document
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

169.4.42 parseXmlFromPath(Path as String, validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source document file and return it as an XdmNode.
Example:

```
Var s As New SaxonProcessorMBS

Const XMLPath = "/Users/cs/test.xml"
Var n As XdmNodeMBS = s.parseXmlFromPath(XMLPath)
Var x As String = n.toString

Break
```

Notes: source: the filename of the source document
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS

Throws a SaxonExceptionMBS if there ia a failure in the parsing of the XML file.

169.4.43 parseXmlFromString(content as String, encoding as String = "", validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a lexical representation of the source document and return it as an XdmNodeMBS.

Notes: source: the source document as a lexical string
encoding: the encoding used to decode the source string. If not specified then platform default encoding is used.
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS

Throws a SaxonExceptionMBS if there is a failure in the parsing of the XML document

169.4.44 parseXmlFromUri(URI as String, validator as SchemaValidatorMBS = nil) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parse a source document available by URI and return it as an XdmNode.
Notes: source: the URI of the source document
validator: can be used to supply a SchemaValidator to validate the document. Default is nil.

Returns an XdmNodeMBS.

Raises SaxonExceptionMBS if there ia failure in the parsing of the XML file

169.4.45 setCatalog(catalogFile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set catalog to be used in Saxon.
Notes: catalogFile: file name to the catalog

169.4.46 setCatalogFiles(catalogFiles() as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The catalog files to be used in Saxon.
Notes: catalogFiles: the catalog file names array to the catalog

169.4.47 StringValue(item as XdmItemMBS) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the string representation of the XdmValue.

169.4.48 SystemFunction(name as String, arity as Integer) as XdmFunctionItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a system function.
Example:

```
Var processor As New SaxonProcessorMBS
Var func As XdmFunctionItemMBS = processor.SystemFunction(" { http://www.w3.org/2005/xpath-functions
} parse-json", 1)
Break
```

Notes: This can be any function defined in XPath 3.1 functions and operators, including functions in the math, map, and array namespaces. It can also be a Saxon extension function, provided a licensed Processor is used.

processor: The Saxon Processor object required to get the system function.
name: the name of the function
arity: the number of arguments in the function

Returns the requested function, or null if there is no such function. Note that some functions (those with particular context dependencies) may be unsuitable for dynamic calling.

169.4.49 Properties

169.4.50 ConfigurationProperties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all configuration properties.
Notes: (Read only property)

169.4.51 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory.
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

169.4.52 isLicensed as Boolean

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether as license was set.
Notes: (Read only property)

169.4.53 isSchemaAwareProcessor as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Test whether this processor is schema-aware.
Notes: True if this this processor is licensed for schema processing, false otherwise.
(Read only property)

169.4.54 ResourcesDirectory as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The saxon resources directory.
Notes: (Read and Write property)

169.4.55 Version as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version of Saxonica library.
Example:

```
Var s As New SaxonProcessorMBS
MessageBox s.Version
```

Notes: e.g. "SaxonC-HE 12.5 from Saxonica"

(Read only property)

169.4.56 ConfigurationProperty(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A configuration property specific to the processor in use.
Notes: Properties specified here are common across all the processors.
Example 'l': enable line number has the value 'on' or 'off'
(Read and Write computed property)

169.5 class SchemaValidatorMBS

169.5.1 class SchemaValidatorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A SchemaValidator represents a factory for validating instance documents against a schema.
Example:

```
Var processor As New SaxonProcessorMBS
Var validator As SchemaValidatorMBS = processor.NewSchemaValidator

// parse XML
Var InputXML As String = _
"<?xml version=""1.0"" encoding=""UTF-8""?>" + EndOfLine + _
"<request>" + EndOfLine + _
" <a/>" + EndOfLine + _
" <!–comment–>" + EndOfLine + _
"</request>"

Var SchemaXML As String = _
"<?xml version=""1.0"" encoding=""UTF-8""?>" + EndOfLine + _
"<xs:schema xmlns:xs=""http://www.w3.org/2001/XMLSchema"" elementFormDefault=""qualified"" at-
tributeFormDefault=""unqualified"">" + EndOfLine + _
" <xs:element name=""request"">" + EndOfLine + _
" <xs:complexType>" + EndOfLine + _
" <xs:sequence>" + EndOfLine + _
" <xs:element name=""a"" type=""xs:string""/>" + EndOfLine + _
" <xs:element name=""b"" type=""xs:string""/>" + EndOfLine + _
" </xs:sequence>" + EndOfLine + _
" <xs:assert test=""count(child::node()) = 3""/>" + EndOfLine + _
" </xs:complexType>" + EndOfLine + _
" </xs:element>" + EndOfLine + _
"</xs:schema>"

Var Input As XdmNodeMBS = processor.parseXmlFromString(InputXML)

validator.PropertyValue("report-node") = "true"
validator.registerSchemaFromString SchemaXML
validator.SourceNode = input

Var ErrorMessage As String
Try
validator.validate
MessageBox "OK"
Catch s As SaxonExceptionMBS

MessageBox s.Message
```

```
Var report As XdmNodeMBS = validator.ValidationReport
Var reportXML As String = report.toString
Var reportText As String = report.StringValue

Break
End Try
```

- Validate electronic invoices with Saxon in Xojo

169.5.2 Methods

169.5.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

169.5.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

169.5.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

169.5.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

169.5.7 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
See also:

- 169.5.8 Constructor(other as SchemaValidatorMBS) 20437
- 169.5.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20437

169.5.8 Constructor(other as SchemaValidatorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.5.7 Constructor 20437
- 169.5.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20437

169.5.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constructor with a SaxonProcessor.
Notes: The supplied processor should have license flag set to true for the Schema Validator to operate.

SaxonProcessor: the SaxonProcessor
cwd: set the current working directory
See also:

- 169.5.7 Constructor 20437
- 169.5.8 Constructor(other as SchemaValidatorMBS) 20437

169.5.10 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.5.11 exportSchema(File as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Export a precompiled Schema Component Model containing all the components (except built-in components) that have been loaded by using the register methods.
See also:

- 169.5.12 exportSchema(Path as String) 20438

169.5.12 exportSchema(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Export a precompiled Schema Component Model containing all the components (except built-in components) that have been loaded by using the register methods.
Notes: Path: The file name where the exported schema will be stored
See also:

- 169.5.11 exportSchema(File as FolderItem) 20438

169.5.13 registerSchemaFromFile(File as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema from file name.
Notes: The schema components derived from this schema document are added to the cache of schema components maintained by this SchemaManager.

Raises exception if parsing schema fails.

169.5.14 registerSchemaFromNode(node as XdmNodeMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema supplied as an XDM Node Object.
Notes: node: The schema document supplied as an XdmNode object

Raises exception if parsing schema fails.

169.5.15 registerSchemaFromPath(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema from file name.
Notes: The schema components derived from this schema document are added to the cache of schema components maintained by this SchemaManager.

Path: File name of the schema relative to the cwd or full path if cwd is "". The document may be either a schema document in source XSD format, or a compiled schema in Saxon-defined SCM format (as produced using the method exportSchema)

Raises exception if parsing schema fails.

169.5.16 registerSchemaFromString(schemaStr as String, systemID as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register the schema supplied as a string.
Example:

```
Var processor As New SaxonProcessorMBS
Var validator As SchemaValidatorMBS = processor.NewSchemaValidator

Var SchemaXML As String = _
"<?xml version=""1.0"" encoding=""UTF-8""?>" + EndOfLine + _
"<xs:schema xmlns:xs=""http://www.w3.org/2001/XMLSchema"" elementFormDefault=""qualified"" at-
tributeFormDefault=""unqualified"">" + EndOfLine + _
" <xs:element name=""request"">" + EndOfLine + _
" <xs:complexType>" + EndOfLine + _
" <xs:sequence>" + EndOfLine + _
" <xs:element name=""a"" type=""xs:string""/>" + EndOfLine + _
" <xs:element name=""b"" type=""xs:string""/>" + EndOfLine + _
" </xs:sequence>" + EndOfLine + _
" <xs:assert test=""count(child::node()) = 3""/>" + EndOfLine + _
" </xs:complexType>" + EndOfLine + _
" </xs:element>" + EndOfLine + _
"</xs:schema>"

validator.registerSchemaFromString SchemaXML
```

Notes: schemaStr: The schema document supplied as a string.
systemID: The system ID of the document supplied as a string.

Raises exception if parsing schema fails.

169.5.17 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

169.5.18 validate

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document by a registered schema.
Notes: Source must be provided with SourceNode property or other way.
See also:

- 169.5.19 validate(sourceFile as FolderItem) 20440
- 169.5.20 validate(sourcePath as String) 20440

169.5.19 validate(sourceFile as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document by a registered schema.
Notes: sourceFile: Name of the file to be validated.
Allows nil when source document is supplied with other method.
See also:

- 169.5.18 validate 20440
- 169.5.20 validate(sourcePath as String) 20440

169.5.20 validate(sourcePath as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document by a registered schema.
Notes: sourcePath: Name of the file to be validated.
Allows "" when source document is supplied with other method.
See also:

- 169.5.18 validate 20440
- 169.5.19 validate(sourceFile as FolderItem) 20440

169.5.21 validateToNode(sourceFile as String = "") as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate an instance document supplied as a Source object.
Notes: sourceFile: The name of the file to be validated. Default is "".

Returns the validated document returned to the calling program as XdmNodeMBS.

169.5.22 ValidationReport as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the Validation report.
Example:

```
Var processor As New SaxonProcessorMBS
Var validator As SchemaValidatorMBS = processor.NewSchemaValidator

// enable reporting of errors.
validator.PropertyValue("report-node") = "true"

// validate something here

Var report As XdmNodeMBS = validator.ValidationReport
Var reportXML As String = report.toString
Var reportText As String = report.StringValue
break // see in debugger
```

Notes: The validation-report option must have been set to true in the properties to use this feature.

Returns nil if validation reporting feature has not been enabled.

169.5.23 Properties

169.5.24 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Current working Directory.
Notes: Set the current working directory for the Schema Validator.

The path must end with a slash (or a backslash on Windows).
(Read and Write property)

169.5.25 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

169.5.26 hasLicense as Boolean

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether as license was set.
Notes: (Read only property)

169.5.27 Lax as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The validation mode may be either strict or lax.
Notes: The default is strict; this method may be called to indicate that lax validation is required. With strict validation, validation fails if no element declaration can be located for the outermost element. With lax validation, the absence of an element declaration results in the content being considered valid.

Value is true if validation is to be lax, false if it is to be strict.
(Read and Write property)

169.5.28 OutputFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the output file that will be used by the validator.
Notes: (Read and Write property)

169.5.29 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

169.5.30 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

169.5.31 SourceNode as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source node for validation.
Notes: The source document supplied as an XdmNode, which will be used to validate against the schema using the validate methods.
The deletion of allocated memory associated with the source node is the document is the responsbility of the caller.
(Read and Write property)

169.5.32 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

169.5.33 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Example:

```
var s as SchemaValidatorMBS // your validator

// enable reporting of errors.
s.PropertyValue("report-node") = "true"
```

Notes: Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

169.6 class XdmArrayMBS

169.6.1 class XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An array in the XDM data model. An array is a list of zero or more members, each of which is an arbitrary XDM value.
Example:

```
Var processor As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
Var a As XdmArrayMBS = processor.makeArray(values)
MessageBox a.toString // shows [ 1,2,3 ]
```

Notes: The array itself is an XDM item.

An XdmArray is immutable. And an XdmArray is also a function with one argument, the index.
Subclass of the XdmFunctionItemMBS class.

169.6.2 Methods

169.6.3 addMember(value as XdmValueMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Append a new member to an array.
Notes: value: the new member Returns a new array, one item longer than the original.

If the value is lazily evaluated, and evaluation fails then return null.

169.6.4 concat(values as XdmArrayMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Concatenate another array.
Example:

```
Var processor As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
Var a As XdmArrayMBS = processor.makeArray(values)
```

```
Var b As XdmArrayMBS = processor.makeArray(values)
Var c As XdmArrayMBS = a.concat(b)

Break // check in debugger
```

Notes: value: the other array

Returns a new array, containing the members of this array followed by the members of the other array.

169.6.5 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
Notes: Create an empty XdmArray
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.
See also:

- 169.6.6 Constructor(other as XdmArrayMBS) 20446

169.6.6 Constructor(other as XdmArrayMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.6.5 Constructor 20446

169.6.7 PutValue(Index as Integer, value as XdmValueMBS) as XdmArrayMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new array in which one member is replaced with a new value.
Notes: n the position of the member that is to be replaced, counting the first member in the array as member zero
value: is the new member for the the new array Returns a new array, the same length as the original, with one member replaced by a new value.

If n is less than zero or greater than or equal to the number of members in the array then return nil.

169.6.8 Value(Index as Integer) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the n'th member in the array, counting from zero.
Example:

```
Var processor As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
Var a As XdmArrayMBS = processor.makeArray(values)
// pick second element
Var v As XdmValueMBS = a.Value(1)
// unpack the item to look into the atomic value inside:
Var h As XdmAtomicValueMBS = XdmAtomicValueMBS(v.Head)
// and get our integer
Var n As Integer = h.LongValue

Break
```

Notes: n the member that is required, counting the first member in the array as member zero

Returns the n'th member in the sequence making up the array, counting from zero

Raises OutOfBoundsException if index is out of bounds.

169.6.9 values as XdmValueMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the members of the array in the form of an array.

169.6.10 Properties

169.6.11 Length as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of members in the array.
Example:

```
Var s As New SaxonProcessorMBS

Var values() As Integer = Array(1,2,3)
```

```
Var a As XdmArrayMBS = s.makeArray(values)
Var Length As Integer = a.Length

Break
```

Notes: Returns the number of members in the array.
(Note that the size() method returns 1 (one), because an XDM array is an item.)
(Read only property)

169.7 class XdmAtomicValueMBS

169.7.1 class XdmAtomicValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class XdmAtomicValue represents an item in an XPath sequence that is an atomic value.
Notes: The value may belong to any of the 19 primitive types defined in XML Schema, or to a type derived from these primitive types, or the XPath type xs:untypedAtomic. The type may be either a built-in type or a user-defined type.
An XdmAtomicValue is immutable.
Subclass of the XdmItemMBS class.

169.7.2 Methods

169.7.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A default Constructor.
Notes: Create a empty atomic value.
See also:

- 169.7.4 Constructor(other as XdmAtomicValueMBS) 20449

169.7.4 Constructor(other as XdmAtomicValueMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.7.3 Constructor 20449

169.7.5 Properties

169.7.6 BooleanValue as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the value converted to a boolean using the XPath casting rules
Example:

Var Processor As New SaxonProcessorMBS

```
Var a As XdmAtomicValueMBS = Processor.makeBooleanValue(True)
Var d As Boolean = a.BooleanValue
Var t As Variant = a.Value

Break
```

Notes: Returns the result of converting to a boolean (Note: this is not the same as the effective boolean value).
false if the value cannot be cast to a boolean.
(Read only property)

169.7.7 DoubleValue as Double

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the value converted to a double using the XPath casting rules.
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeSingleValue(12.34)
Var d as Double = a.DoubleValue
Var t As Variant = a.Value

Break
```

Notes: If the value is a string, the XSD 1.1 rules are used, which means that the string "+INF" is recognised.

Returns the result of converting to a double.
zero if the value cannot be cast to a double.
(Read only property)

169.7.8 HashCode as Int32

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a hashcode that reflects the rules for equality matching.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeStringValue("Hello")
Var HashCode As Int32 = a.HashCode
```

Break

Notes: Returns a suitable hashcode.
(Read only property)

169.7.9 LongValue as Int64

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the value converted to an integer using the XPath casting rules
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeInt64Value(1234)
Var d As Int64 = a.LongValue
Var t As Variant = a.Value

Break
```

Notes: Returns the result of converting to an integer.
zero if the value cannot be cast to an integer.
(Read only property)

169.7.10 PrimitiveTypeName as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the primitive type of this atomic value, as a QName.
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeBooleanValue(True)
Var t As String = a.PrimitiveTypeName

Break
```

Notes: The primitive types for this purpose are the 19 primitive types of XML Schema, plus xs:integer, xs:dayTimeDuration and xs:yearMonthDuration, and xs:untypedAtomic. For external objects, the result is xs:anyAtomicType. Returns a string of the QName naming the primitive type of this atomic value. This will always be an atomic type.
(Read and Write property)

169.7.11 Value as Variant

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the value as variant.
Example:

```
Var Processor As New SaxonProcessorMBS

Var a As XdmAtomicValueMBS = Processor.makeSingleValue(12.34)
Var t As Variant = a.Value

Break
```

Notes: Supports string, double, Int32 and Int64.
(Read only property)

169.8 class XdmFunctionItemMBS

169.8.1 class XdmFunctionItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class XdmFunctionItem represents a function item.
Notes: Subclass of the XdmItemMBS class.

169.8.2 Methods

169.8.3 callFunction(processor as SaxonProcessorMBS, arguments() as XdmValueMBS) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call the function
Example:

```
Var processor As New SaxonProcessorMBS
// load a fucntion
Var func As XdmFunctionItemMBS = XdmFunctionItemMBS.SystemFunction(processor, " { http://www.w3.org/2005/xpatl
functions } lower-case", 1)

// let's build arguments
Var s As XdmValueMBS = processor.makeStringValue("Hello")
Var arguments() As XdmValueMBS
arguments.Add s

// now call it
Var result As XdmValueMBS = func.callFunction(processor, arguments)

// check result in debugger
Var resultString As String = Result.toString
Break
```

Notes: processor: the SaxonProcessor object required in the call of the function.
arguments: the values to be supplied as arguments to the function.
The "function conversion rules" will be applied to convert the arguments to the required type when necessary.

Returns the result of calling the function.

169.8.4 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor for XdmFunctionItem.
Notes: Create an empty XdmFunctionItem
See also:

- 169.8.5 Constructor(other as XdmFunctionItemMBS) 20454

169.8.5 Constructor(other as XdmFunctionItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.8.4 Constructor 20454

169.8.6 SystemFunction(processor as SaxonProcessorMBS, name as String, arity as Integer) as XdmFunctionItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a system function.
Example:

```
Var processor As New SaxonProcessorMBS
Var func As XdmFunctionItemMBS = XdmFunctionItemMBS.SystemFunction(processor, " { http://www.w3.org/2005/xpath
functions } parse-json", 1)
Break
```

Notes: This can be any function defined in XPath 3.1 functions and operators, including functions in the math, map, and array namespaces. It can also be a Saxon extension function, provided a licensed Processor is used.

processor: The Saxon Processor object required to get the system function.
name: the name of the function
arity: the number of arguments in the function

Returns the requested function, or null if there is no such function. Note that some functions (those with particular context dependencies) may be unsuitable for dynamic calling.

169.8.7 Properties

169.8.8 Arity as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the arity of the function.
Notes: The arity of the function, that is, the number of arguments in the function's signature.
(Read only property)

169.8.9 Name as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the name of the function as EQName.
Notes: The expanded name, as a string using the notation devised by EQName.
If the name is in a namespace, the resulting string takes the form <code>Q { uri } local</code>. Otherwise, the value is the local part of the name.

Returns the function name as a string in the EQName notation, or nil for an anonymous inline function item.
(Read only property)

169.9 class XdmItemMBS

169.9.1 class XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class XdmItem represents an item in a sequence, as defined by the XDM data model.
Notes: An item is either an atomic value, a node, or a function item.

An item is a member of a sequence, but it can also be considered as a sequence (of length one) in its own right. XdmItem</ is a subtype of XdmValue</ because every Item in the XDM data model is also a value.

It cannot be assumed that every sequence of length one will be represented by an XdmItem</. It is quite possible for an XdmValue</ that is not an XdmItem</ to hold a singleton sequence.

Saxon provides two concrete subclasses of XdmItem, namely XdmNode and XdmAtomicValue. Users must not attempt to create additional subclasses.
Subclass of the XdmValueMBS class.

169.9.2 Methods

169.9.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create an empty XdmItem.
See also:

- 169.9.4 Constructor(other as XdmItemMBS) 20456

169.9.4 Constructor(other as XdmItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.9.3 Constructor 20456

169.9.5 Properties

169.9.6 isArray as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is an Array or some other type of item.
Notes: Returns true if the item is a Xdm Array item, false if it is some other value.
(Read only property)

169.9.7 isAtomic as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is an atomic value or some other type of item.
Notes: Returns true if the item is an atomic value, false if it is a node or a function (including maps and arrays)
(Read only property)

169.9.8 isFunction as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is a function or some other type of item.
Notes: Returns true if the item is a Xdm function item, false if it is an atomic value or a function (including maps and arrays)
(Read only property)

169.9.9 isMap as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is a map or some other type of item.
Notes: Returns true if the item is a Xdm map item, false if it is some other value.
(Read only property)

169.9.10 isNode as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the item is a node or some other type of item.

Notes: Returns true if the item is a node, false if it is an atomic value or a function (including maps and arrays)
(Read only property)

169.9.11 StringValue as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the string value of the item.
Notes: For a node, this gets the string value of the node.

For an atomic value, it has the same effect as casting the value to a string. In all cases the result is the same as applying the XPath string() function.
For atomic values, the result is the same as the result of calling toString. This is not the case for nodes, where toString returns an XML serialization of the node.

Returns the result of converting the item to a string.
(Read only property)

169.10 class XdmMapMBS

169.10.1 class XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A map in the XDM data model.
Example:

```
Var Processor As New SaxonProcessorMBS
Var d As New Dictionary
d.Value("Hello") = "World"
Var v As XdmMapMBS = Processor.makeMap(d)

Break // inspect in debugger
```

Notes: A map is a list of zero or more entries, each of which is a pair comprising a key (which is an atomic value) and a value (which is an arbitrary value). The map itself is an XDM item.
An XdmMapMBS is immutable.
Subclass of the XdmFunctionItemMBS class.

169.10.2 Methods

169.10.3 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Default constructor.
Notes: Create an empty XdmMapMBS.
See also:

- 169.10.4 Constructor(other as XdmMapMBS) 20459

169.10.4 Constructor(other as XdmMapMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.10.3 Constructor 20459

169.10.5 containsKey(Key as XdmAtomicValueMBS) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if this map contains a mapping for the specified.
Notes: More formally, returns true if and only if this map contains a mapping for a key k such that (key==nil ? k==null : key.equals(k)).
(There can be at most one such mapping.)
key: key whose presence in this map is to be tested.

Returns true if this map contains a mapping for the specified key.

169.10.6 KeySet as XdmAtomicValueMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the keys present in the map in the form of an unordered array.

169.10.7 Put(Key as XdmAtomicValueMBS, Value as XdmValueMBS) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new map containing an additional (key, value) pair.
Notes: If there is an entry with the same key, it is removed.

Returns a new map containing the additional entry. The original map is unchanged.

169.10.8 Remove(Key as XdmAtomicValueMBS) as XdmMapMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new map in which the entry for a given key has been removed.
Notes: If there is no entry with the same key, the new map has the same content as the old (it may or may not be the same Java object)

key: The key to be removed given as an XdmAtomicValueMBS

Returns a map without the specified entry. The original map is unchanged.

169.10.9 ValueByDouble(Index as Double) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified double-valued key is mapped, or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the double to an XdmAtomicValue.

key: the key whose associated value is to be returned. This is treated as an instance of xs:double (which will also match entries whose key belongs to another numeric type)

Returns the value to which the specified key is mapped, or NULL if this map contains no mapping for the key.

169.10.10 ValueByInteger(Index as Int32) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified integer-valued key is mapped or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the integer to an XdmAtomicValue.

key: the key whose associated value is to be returned. This is treated as an instance of xs:integer (which will also match entries whose key belongs to another numeric type)

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

169.10.11 ValueByKey(Key as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified string-valued key is mapped, or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the String to an XdmAtomicValue.
key the key whose associated value is to be returned. This is treated as an instance of xs:string (which will also match entries whose key is xs:untypedAtomic or xs:anyURI)

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

169.10.12 ValueByLong(Index as Int64) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified integer-valued key is mapped or nil if this map contains no mapping for the key.
Notes: This is a convenience method to save the trouble of converting the integer to an XdmAtomicValue.

key: the key whose associated value is to be returned. This is treated as an instance of xs:integer (which will also match entries whose key belongs to another numeric type)

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

169.10.13 ValueByValue(Key as XdmAtomicValueMBS) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.
Notes: key: the key whose associated value is to be returned.

Returns the value to which the specified key is mapped, or nil if this map contains no mapping for the key.

169.10.14 Values as XdmValueMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a array containing the values found in this map, that is, the value parts of the key-value pairs.
Notes: The result may contain duplicates, and the ordering of the collection is unpredictable.

169.10.15 Properties

169.10.16 isEmpty as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if this map contains no key-value mappings.
Notes: (Read only property)

169.10.17 MapSize as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of entries in the map.
Notes: the number of entries in the map. (Note that the size() method returns 1 (one), because an XDM map is an item.)
(Read only property)

169.11 class XdmNodeMBS

169.11.1 class XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class represents a node in the XDM data model.
Notes: A Node is an XdmItemMBS, and is therefore an XdmValueMBS in its own right, and may also participate as one item within a sequence value.

The XdmNodeMBS interface exposes basic properties of the node, such as its name, its string value, and its typed value.

Note that node identity cannot be inferred from object identity. The same node may be represented by different XdmNodeMBS instances at different times, or even at the same time.
Subclass of the XdmItemMBS class.

169.11.2 Methods

169.11.3 AttributeNodes as XdmNodeMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get array of attribute nodes of this element
Notes: Returns nil if this node is not an element.

169.11.4 AttributeValue(Key as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the string value of a named attribute (in no namespace) of this element
Notes: Key: the name of the required attribute, interpreted as a no-namespace name.

Returns "" if this node is not an element, or if this element has no attribute with the specified name. Otherwise return the string value of the selected attribute node.

169.11.5 axisNodes(Axis as Integer) as XdmNodeMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the array of nodes reachable from this node via a given axis.
Notes: axis: identifies which axis is to be navigated.

See Axis constants.

Returns an array of nodes on the specified axis, starting from this node as the context node.
The nodes are returned in axis order, that is, in document order for a forwards axis and in reverse document order for a reverse axis.

169.11.6 Child(Index as Integer) as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the ith child nodes from the current parent node

169.11.7 Children as XdmNodeMBS()

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get all the child nodes from the current parent node.

169.11.8 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
See also:

- 169.11.9 Constructor(other as XdmNodeMBS) 20465

169.11.9 Constructor(other as XdmNodeMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.11.8 Constructor 20465

169.11.10 Properties

169.11.11 AttributeCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of attribute node for this current node.
Notes: Returns returns the number of attributes on this node, other return zero if this node has no attributes or is not an element.
(Read only property)

169.11.12 BaseUri as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the base URI of this node
Notes: Returns the base URI, as defined in the XDM model. The value may be "" if no base URI is known for the node, for example if the tree was built from a StreamSource with no associated URI, or if the node has no parent.
(Read only property)

169.11.13 ChildCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the count of child nodes from the current node.
Notes: Returns int for the count of child nodes
(Read only property)

169.11.14 ColumnNumber as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the column number of the node in a source document.
Notes: Returns the column number of the node, or -1 if not available.
(Read only property)

169.11.15 LineNumber as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the line number of the node in a source document.
Notes: Returns the line number of the node, or -1 if not available.
(Read only property)

169.11.16 LocalName as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the local name of the node.
Notes: Returns the name of the node.
In the case of unnamed nodes (for example, text and comment nodes) return "".
(Read only property)

169.11.17 NodeKind as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the kind of node.
Notes: Returns the kind of node, for example KindElement or KindAttribute.
(Read only property)

169.11.18 NodeName as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the name of the node, as a string in the form of a EQName.
Notes: Returns the name of the node.
In the case of unnamed nodes (for example, text and comment nodes) return "".
(Read only property)

169.11.19 Parent as XdmNodeMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the parent of this node.
Notes: Returns the parent of this node (a document or element node), or nil if this node has no parent.
(Read only property)

169.11.20 TypedValue as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the typed value of this node, as defined in XDM
Notes: Returns the typed value. If the typed value is a single atomic value, this will be returned as an instance of XdmAtomicValueMBS.
(Read only property)

169.11.21 Constants

Axis

Constant	Value	Description
AxisAncestor	0	Ancestor
AxisAncestorOrSelf	1	Ancestor Or Self
AxisAttribute	2	Attribut
AxisChild	3	Child
AxisDescendant	4	Descendant
AxisDescendantOrSelf	5	Descendant or Self
AxisFollowing	6	Following
AxisFollowingSibling	7	Following Sibling
AxisNamespace	8	Namespace
AxisParent	9	Parent
AxisPreceding	10	Preceding
AxisPrecedingSibling	11	Preceding Sibling
AxisSelf	12	Self

Node Kinds

Constant	Value	Description
KindAttribute	2	Attribute node
KindComment	8	Comment node
KindDocument	9	Document node
KindElement	1	Regular element
KindNamespace	13	Namespace node
KindProcessingInstruction	7	Processing Instruction
KindText	3	Text node
KindUnknown	0	Unknown or not yet set.

169.12 class XdmValueMBS

169.12.1 class XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XdmValue represents a value in the XDM data model.
Example:

```
Var path As String = "/Users/cs/Documents/Development/Libs/saxon/SaxonLibraries/MacOS Universal/libsaxon-eec-12.5.0.dylib"
Var bb As Boolean = SaxonMBS.LoadLibrary(path)

If bb Then
// okay
Else
Print SaxonMBS.LoadErrorString
End If

Var Processor As New SaxonProcessorMBS
Var v As XdmValueMBS = Processor.makeStringValue("Hello")

Break // inspect in debugger
```

Notes: A value is a sequence of zero or more items, each item being an atomic value, a node, or a function item.

169.12.2 Methods

169.12.3 addXdmItem(value as XdmItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add an XdmItem to the sequence.

169.12.4 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor to create an empty value.
See also:

- 169.12.5 Constructor(other as XdmValueMBS) 20470

169.12.5 Constructor(other as XdmValueMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.12.4 Constructor 20469

169.12.6 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.12.7 Item(Index as Integer) as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the n'th item in the value, counting from zero.
Notes: index: the item that is required, counting the first item in the sequence as item zero

Returns the n'th item in the sequence making up the value, counting from zero return

Raises OutOfBoundsException if index is out of bound.

169.12.8 Properties

169.12.9 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

169.12.10 Head as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the first item in the sequence.
Notes: XdmItem or nil if sequence is empty.

(Read only property)

169.12.11 ObjectCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object count.
Notes: To help debug if objects leak.
(Read only property)

169.12.12 Parent as Variant

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object if any.
Notes: A reference to the parent needed for memory management.
(Read and Write property)

169.12.13 RefCount as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries internal reference count.
Notes: (Read only property)

169.12.14 SequenceSize as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of items in the sequence.
Notes: (Read only property)

169.12.15 toString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a string representation of the value.
Example:

```
Var Processor As New SaxonProcessorMBS
Var a As XdmAtomicValueMBS = Processor.makeStringValue("Hello")
Var s As String = a.toString

Break
```

Notes: The is the result of serializing the value using the adaptive serialization method.
(Read only property)

169.12.16 Type as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the type of the object.
Notes: (Read only property)

169.12.17 Constants

Types

Constant	Value	Description
TypeArray	3	An array of values.
TypeAtomicValue	1	An atomic value.
TypeEmpty	6	An empty value.
TypeFunctionItem	5	A function item.
TypeItem	7	An item.
TypeMap	4	A map (dictionary in Xojo).
TypeNode	2	A node in the XML document.
TypeValue	0	A value.

169.13 class XPathProcessorMBS

169.13.1 class XPathProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XPathProcessor represents a factory to compile, load and execute XPath expressions.
Example:

```
Var Processor As New SaxonProcessorMBS
Var xpathProc As XPathProcessorMBS = processor.newXPathProcessor

// parse XML
Var Input As XdmNodeMBS = processor.parseXmlFromString("<out><person>text1</person><person>text2</person><person>text3</person></out>")
xpathProc.ContextItem = Input

Var result As XdmItemMBS = xpathProc.evaluateSingle("//person [ 1 ] ")
Var message As String = result.StringValue
Break // shows text1
```

Notes: XPath 3.1 Basic

Provides all XPath 3.1 features which do not require schema-awareness or higher-order functions. This includes an implementation of maps and arrays, and support for JSON, as well as language constructs retained from earlier XPath versions.

XPath 3.1 Higher-Order

Provides higher-order functions: specifically, the ability to use functions as values, including dynamic function calls, inline functions, partial function application, and a library of built-in higher-order functions.

XPath 3.1 Schema Aware with EE-V license

Provides schema-awareness: specifically, any use of source documents with type annotations, and any use of XPath expressions that contain the names of schema components such as element declarations and types, other than the built-in types.

169.13.2 Methods

169.13.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

169.13.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

169.13.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

169.13.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

169.13.7 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
Notes: Creates a Saxon-HE XPath product
See also:

- 169.13.8 Constructor(other as XPathProcessorMBS) 20475
- 169.13.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20475

169.13.8 Constructor(other as XPathProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.13.7 Constructor 20474
- 169.13.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20475

169.13.9 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor with the SaxonProcessor supplied.
Notes: SaxonProcessor: The SaxonProcessor object
CWD: The current working directory
See also:

- 169.13.7 Constructor 20474
- 169.13.8 Constructor(other as XPathProcessorMBS) 20475

169.13.10 declareNamespace(prefix as String, uri as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Declare a namespace binding as part of the static context for XPath.
Notes: prefix: The namespace prefix. If the value is a zero-length string, this method sets the default namespace for elements and types.
uri: The namespace URI. It is possible to specify a zero-length string to "undeclare" a namespace; in this case the prefix will not be available for use, except in the case where the prefix is also a zero length string, in which case the absence of a prefix implies that the name is in no namespace. Assume the prefix or uri is "".

169.13.11 declareVariable(name as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Declare a variable as part of the static context for XPath expressions.
Notes: compiled using this XPathCompiler.
It is an error for the XPath expression to refer to a variable unless it has been declared. This method declares the existence of the variable, but it does not bind any value to the variable; that is done later, when the XPath expression is evaluated. The variable is allowed to have any type (that is, the required type is item()*).

name: The name of the variable, expressions as a clark name string

169.13.12 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.13.13 effectiveBooleanValue(xpathStr as String, encoding as string = "") as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Evaluate the XPath expression, returning the effective boolean value of the result.
Notes: xpathStr: supplied as a character string
encoding: the encoding of the string.

If not specified then the platform default encoding is used.

169.13.14 evaluate(xpathStr as String, encoding as string = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile and evaluate an XPath expression
Notes: xpathStr: supplied as a character string
encoding: the encoding of the string. If not specified then the platform default encoding is used.

Returns a XdmValueMBS representing the results of the expression.

169.13.15 evaluateSingle(xpathStr as String, encoding as string = "") as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile and evaluate an XPath expression.
Example:

```
Var processor As New SaxonProcessorMBS
Var xpathProc As XPathProcessorMBS = processor.newXPathProcessor
```

```
// parse XML
Var Input As XdmNodeMBS = processor.parseXmlFromString("<out><person>text1</person><person>text2</person><person>text3</person></out>")
xpathProc.ContextItem = Input

Var result As XdmItemMBS = xpathProc.evaluateSingle("//person [ 1 ] ")
Var message As String = result.StringValue

MessageBox message // shows text1
```

Notes: The result is expected to be a single XdmItem or nil.

xpathStr: supplied as a character string
encoding: the encoding of the string. If not specified then the platform default encoding is used.

Returns a XdmItemMBS object or nullptr if the expression returns an empty sequence. If the expression returns a sequence of more than one item, any items after the first are ignored.

169.13.16 importSchemaNamespace(URI as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Import a schema namespace.
Notes: Here we add the element and attribute declarations and type definitions contained in a given namespace to the static context for the XPath expression.

This method will not cause the schema to be loaded. This method will not fail if the schema has not been loaded (but in that case the set of declarations and definitions made available to the XPath expression is empty). The schema document for the specified namespace may be loaded before or after this method is called.

This method does not bind a prefix to the namespace. That must be done separately, using the declareNamespace(String, String) method.

uri: The schema namespace to be imported. To import declarations in a no-namespace schema, supply a zero-length string.

169.13.17 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

169.13.18 Properties

169.13.19 BackwardsCompatible as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether XPath 1.0 backwards compatibility mode is to be used
Notes: In backwards compatibility mode, more implicit type conversions are allowed in XPath expressions, for example it is possible to compare a number with a string. The default is false (backwards compatibility mode is off).

Value is true if XPath 1.0 backwards compatibility is to be enabled, false if it is to be disabled.
(Read and Write property)

169.13.20 BaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The static base URI for XPath expressions compiled using this
Notes: The base URI is part of the static context, and is used to resolve any relative URIs appearing within an XPath expression, for example a relative URI passed as an argument to the doc() function. If no static base URI is supplied, then the current working directory is used.
(Read and Write property)

169.13.21 Caching as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether the compiler should maintain a cache of compiled expressions.
Notes: Caching if set to true, caching of compiled expressions is enabled.

If set to false, any existing cache is cleared, and future compiled expressions will not be cached until caching is re-enabled. The cache is also cleared (but without disabling future caching) if any method is called that changes the static context for compiling expressions, for example declareVariable(QName) or declareNamespace(String, String).
(Read and Write property)

169.13.22 ContextFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The context item from file.
Notes: Set either ContextFile or ContextItem.
(Read and Write property)

169.13.23 ContextItem as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The context item.
Notes: Set either ContextFile or ContextItem.
(Read and Write property)

169.13.24 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory.
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

169.13.25 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

169.13.26 LanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether an XPath 2.0, XPath 3.0, XPath 3.1 or XPath 4.0 processor is required.
Notes: Set the language version for the XPath compiler.

One of the values 1.0, 2.0, 3.0, 3.05, 3.1, 4.0.

Setting the option to 1.0 requests an XPath 2.0 processor running in 1.0 compatibility mode; this is equivalent to setting the language version to 2.0 and backwards compatibility mode to true. Requesting "3.05" gives XPath 3.0 plus the extensions defined in the XSLT 3.0 specification (map types and map constructors).
(Read and Write property)

169.13.27 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

169.13.28 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

169.13.29 UnprefixedElementMatchingPolicy as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The policy for matching unprefixed element names in XPath expressions.
Notes: (Read and Write property)

169.13.30 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

169.13.31 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

169.13.32 Constants

Unprefixed element matching policy

Constant	Value	Description
UnprefixedElementMatchingPolicyAnyNamespace	1	Under this policy, unprefixed element names mat element with this local name is matched regardle it can have any namespace, or none)
UnprefixedElementMatchingPolicyDefaultNamespace	0	The standard W3C policy, whereby element nam the default namespace for elements and types, as context. In XSLT this can be set using the [xsl attribute.
UnprefixedElementMatchingPolicyDefaultNamespaceOrNone	2	Under this policy, unprefixed element names matc part of the name matches, and (b) the namespac equal to the default namespace for elements and t This policy is provided primarily for use with H predictable whether HTML elements are in the X namespace. It is also useful with other vocabulari times in a namespace and sometimes not. The special rules defined in the HTML5 specification, names are treated as matching names in the XHT item for a step is "a node in an HTML DOM", an names otherwise; since in the XDM data model it tinction between different kinds of DOM, this po names both when matching elements in the XH matching no-namespace elements

169.14 class XQueryProcessorMBS

169.14.1 class XQueryProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XQueryProcessor represents a factory to compile, load and execute queries.
Example:

```
Var Processor As New SaxonProcessorMBS
Var query As XQueryProcessorMBS = processor.NewXQueryProcessor

// parse XML
Var Input As XdmNodeMBS = processor.parseXmlFromString("<out><person>text1</person><person>text2</person><person>text3</person></out>")
query.ContextItem = Input

// set our query
query.QueryContent = "<out>{ count(/out/person) } </out>"

// and run it
Var result As String = query.runQueryToString
Print "Result: "+result
// shows <?xml version="1.0" encoding="UTF-8"?><out>3</out>
```

Notes: XQuery includes:

- XQuery 3.1 Minimal Conformance: Provides Minimal Conformance (including try/catch and "group-by", as well as language features retained from earlier XQuery versions) as defined in section 5 of the XQuery 3.1 specification.
- XQuery 3.1 Modules: Provides the Module feature, which allows a query to be made up of multiple modules.
- XQuery 3.1 Serialization: Provides the Serialization feature. This allows the output of a query to be serialized as lexical XML, or in other formats including HTML, JSON, and plain text, under the control of serialization parameters contained either in the query itself, or supplied externally.
- XQuery 3.1 Higher-Order: Provides the Higher-Order Function feature. This provides the ability to use functions as values, including dynamic function calls, inline functions, partial function application, and a library of built-in higher-order functions.
- Streaming with EE license: Provides saxon:stream(), an extension function to allow large documents to be processed without holding the whole document in memory.

169.14.2 Methods

169.14.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

169.14.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

169.14.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

169.14.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear property values set.

169.14.7 Clone as XQueryProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a cop of the processor.

169.14.8 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
See also:

- 169.14.9 Constructor(other as XQueryProcessorMBS) 20484
- 169.14.10 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20484

169.14.9 Constructor(other as XQueryProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.14.8 Constructor 20484
- 169.14.10 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20484

169.14.10 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor with the SaxonProcessor supplied.
Notes: Pass the SaxonProcessor object to use.

cwd: set the current working directory. Default is the empty string
See also:

- 169.14.8 Constructor 20484
- 169.14.9 Constructor(other as XQueryProcessorMBS) 20484

169.14.11 declareNamespace(prefix as String, uri as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Declare a namespace binding.
Notes: Declare a namespace binding as part of the static context for queries compiled using this XQueryCompiler. This binding may be overridden by a binding that appears in the query prolog. The namespace binding will form part of the static context of the query, but it will not be copied into result trees unless the prefix is

actually used in an element or attribute name.

Prefix: The namespace prefix. If the value is a zero-length string, this method sets the default namespace for elements and types.
uri: The namespace URI. It is possible to specify a zero-length string to "undeclare" a namespace; in this case the prefix will not be available for use, except in the case where the prefix is also a zero length string, in which case the absence of a prefix implies that the name is in no namespace. Assume the prefix or uri is "".

169.14.12 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.14.13 executeQueryToFile(infilename as String, ofilename as string, query as String, encoding as string = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the Query to file.
Notes: The result is is saved to file
infilename: The file name of the source document
ofilename: The file name of where result will be stored
query: The query as string representation.
encoding: The encoding of the query string. If not specified then the platform default encoding is used.

169.14.14 executeQueryToString(infilename as String, query as String, encoding as string = "") as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the Query to a string representation.
Notes: infilename: The file name of the source document
query: The query as string representation
encoding: the encoding of the query string. If not specified then the platform default encoding is used.

Returns result of as a string.

169.14.15 executeQueryToValue(infilename as String, query as String, encoding as string = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform the Query to a XdmValue representation.
Notes: infilename: The file name of the source document
query: The query as string representation
encoding: the encoding of the query string. If not specified then the platform default encoding is used.

Returns result of the the query as a XdmValueMBS.

169.14.16 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

169.14.17 runQueryToFile

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute the Query cached to file.
Notes: The use of the context item would have had to be set in advance Assume the output filename has been set in advance.

169.14.18 runQueryToString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute the Query cached.
Notes: The use of the context item would have had to be set in advance.
Result as a string.

169.14.19 runQueryToValue as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute the Query cached.
Notes: The use of the context item would have had to be set in advance

Returns XdmValueMBS of the result.

169.14.20 Properties

169.14.21 ContextItem as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial context item for the query.
Notes: The initial context item, or nil if there is to be no initial context item.
Please use either ContextItemFromFile, ContextItem or setContextItemFromFile.
(Read and Write property)

169.14.22 ContextItemFromFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The source from file for the query.
Notes: Please use either ContextItemFromFile, ContextItem or setContextItemFromFile.
(Read and Write property)

169.14.23 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory
Notes: The path must end with a slash (or a backslash on Windows).
(Read and Write property)

169.14.24 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

169.14.25 hasLicense as Boolean

MBS XML Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether as license was set.
Notes: (Read only property)

169.14.26 LanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XQuery language version.
Notes: Say which version of XQuery should be used version "3.1" or "4.0" in the current Saxon release.
(Read and Write property)

169.14.27 OutputFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output file where the result is sent
Notes: (Read and Write property)

169.14.28 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

169.14.29 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

169.14.30 QueryBaseURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base URI for the query.
Notes: the static base URI; or "" to indicate that no base URI is available.
(Read and Write property)

169.14.31 QueryContent as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a query supplied as a string.
Notes: The supplied query is cached for later execution.
Please set either QueryContent or QueryFile.
(Read and Write property)

169.14.32 QueryFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a query supplied as a file name.
Notes: The supplied query is cached for later execution.
Please set either QueryContent or QueryFile.
(Read and Write property)

169.14.33 Streaming as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the streaming option has been set.
Notes: Say whether the query should be compiled and evaluated to use streaming.

This affects subsequent calls on the compile() methods. This option requires Saxon-EE. option if true, the compiler will attempt to compile a query to be capable of executing in streaming mode. If the query cannot be streamed, a compile-time exception is reported. In streaming mode, the source document is supplied as a stream, and no tree is built in memory. The default is false. When streaming = true is specified, this has the additional side-effect of setting the required context item type to "document-node()".

Requires Saxon-EET license.
(Read and Write property)

169.14.34 Updating as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether the query is allowed to be updating.
Notes: XQuery update syntax will be rejected during query compilation unless this flag is set. XQuery Update is supported only under Saxon-EE. updating - true if the query is allowed to use the XQuery Update facility (requires Saxon-EE). If set to false, the query must not be an updating query. If set to true, it may be either an updating or a non-updating query.
(Read and Write property)

169.14.35 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

169.14.36 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: XQueryProcessor: set serialization properties
(names start with '!' i.e. name "!method" ->"xml")
'o':outfile name,
's': source as file name
'q': query file name,
'q': current by name,
'qs': string form of the query,
'base': set the base URI of the query,
'dtd': set DTD validation 'on' or
'off' name of the property value of the property

Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

169.15 class Xslt30ProcessorMBS

169.15.1 class Xslt30ProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An Xslt30Processor represents a factory to compile, load and execute stylesheets.
Example:

```
Var processor As New SaxonProcessorMBS
Var proc As Xslt30ProcessorMBS = processor.NewXslt30Processor

Var Input As String = "<xsl:stylesheet version='2.0' xmlns:xsl='http://www.w3.org/1999/XSL/Transform'>" +_
"<xsl:template name='go'><a/></xsl:template>" +_
"</xsl:stylesheet>"

Var executable As XsltExecutableMBS = proc.compileFromString(Input)

Var result As XdmValueMBS = executable.callTemplateReturningValue("go")

Print "Result: "+result.toString
```

Notes: It is possible to cache the context and the stylesheet in the Xslt30Processor.

XSLT (Transformation Processing) includes:

- XSLT 3.0 Basic Processor: Provides all mandatory features from the XSLT 3.0 specification (including try/ catch, iterate, accumulators, maps, named modes, content value templates, and extended patterns, as well as features retained from XSLT 2.0).
- XSLT 3.0 Serialization: Provides the serialization feature: specifically, the ability to convert the result trees produced as output of an XSLT transformation to lexical XML, or other formats including HTML, JSON, and plain text, under the control of serialization parameters defined in the stylesheet or via an external API.
- XSLT 3.0 Compatibility: Provides XSLT 1.0 compatibility mode as defined in the XSLT 3.0 specification. If a stylesheet specifies version="1.0", this causes certain constructs to behave in a way that retains the XSLT 1.0 behavior.
- XSLT 3.0 Dynamic Evaluation: Provides use of the XSLT 3.0 instruction xsl:evaluate, which allows dynamic evaluation of XPath expressions.
- XSLT 3.0 XPath 3.1 Feature: Provides full use of XPath 3.1 features, including XPath 3.1 functions, and maps and arrays.,Ä®Note: Saxon supports XPath 3.1 unconditionally in XSLT 3.0 stylesheets, it does not offer a processing mode in which XPath is restricted to version 3.0.

- XSLT 3.0 Higher-Order Functions: Provides higher-order functions: specifically, the ability to use functions as values, including dynamic function calls, inline functions, partial function application, and the standard higher-order functions defined in the XPath 3.1 function library.

169.15.2 Methods

169.15.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

169.15.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

169.15.5 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

169.15.6 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

169.15.7 compileFromAssociatedFile(sourceFile as String) as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the stylesheet associated
Notes: via the xml-stylesheet processing instruction (see http://www.w3.org/TR/xml-stylesheet/) with the document specified in the source parameter, and that match the given criteria. If there are several suitable xml-stylesheet processing instructions, then the returned Source will identify a synthesized stylesheet module that imports all the referenced stylesheet module.

Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked.

sourceFile - The file name of the XML document. Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently. @throws SaxonApiException if the compilation of the stylesheet fails

169.15.8 compileFromFile(stylesheetPath as String) as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet file.
Notes: Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked. stylesheet - The file name of the stylesheet document. Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently.

169.15.9 compileFromFileAndSave(xslFilename as String, filename as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: compile a stylesheet received as a file and save to an exported file (SEF).
Notes: The compiled stylesheet is saved as SEF to file store

xslFilename: file name of the stylesheet
filename: the file to which the compiled package should be saved.

169.15.10 compileFromString(stylesheet as String, encoding as String = "") as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as a string.
Notes: Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked.

stylesheet: the stylesheet as a lexical string representation
encoding: the encoding of the stylesheet string. If not specified then the platform default encoding is used. Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently. @throws SaxonApiException if the compilation of the stylesheet fails.

169.15.11 compileFromStringAndSave(stylesheet as String, filename as String, Encoding as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as a string and save to an exported file (SEF).
Notes: The compiled stylesheet is saved as SEF to file store

stylesheet: the stylesheet as a lexical string representation
filename: the file to which the compiled package should be saved
encoding: the string encoding of the filename. Defaults to JVM default

169.15.12 compileFromXdmNode(mode as XdmNodeMBS) as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as an XdmNode.
Notes: Note: the term "compile" here indicates that the stylesheet is converted into an executable form. The compilation uses a snapshot of the properties of the Xslt30Processor at the time this method is invoked.

node: the XdmNode object for the stylesheet Returns an XsltExecutable, which represents the compiled stylesheet. The XsltExecutable is immutable and thread-safe; it may be used to run multiple transformations, in series or concurrently. @throws SaxonApiException if the compilation of the stylesheet fails

169.15.13 compileFromXdmNodeAndSave(mode as XdmNodeMBS, filename as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compile a stylesheet received as an XdmNode.
Notes: The compiled stylesheet is cached and available for execution later.

node: the XdmNode object for the stylesheet
filename: the file to which the compiled package should be saved

169.15.14 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor.
Notes: Creates a Saxon-HE product.
See also:

- 169.15.15 Constructor(other as Xslt30ProcessorMBS) 20495
- 169.15.16 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20495

169.15.15 Constructor(other as Xslt30ProcessorMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copy constructor.
See also:

- 169.15.14 Constructor 20495
- 169.15.16 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "") 20495

169.15.16 Constructor(SaxonProcessor as SaxonProcessorMBS, CWD as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor with the SaxonProcessor supplied.
Notes: SaxonProcessor: the SaxonProcessor object to use.
cwd: The current working directory.
See also:

- 169.15.14 Constructor 20495

• 169.15.15 Constructor(other as Xslt30ProcessorMBS) 20495

169.15.17 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.15.18 importPackage(packageFile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Import a library package.
Notes: Calling this method makes the supplied package available for reference in the xsl:use-package declarations of subsequent compilations performed using this Xslt30Processor.

packageFile: the file name of the package to be imported, which should be supplied as an SEF. If relative, the file name of the SEF is resolved against the cwd, which is set using setcwd().

169.15.19 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

169.15.20 transformFileToFile(sourceFile as String, stylesheetFile as String, outputFile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is stored in the supplied outputfile.

sourcefile: The file name of the source document
stylesheetfile: The file name of the stylesheet document.
outputfile: The file name where results will be stored

169.15.21 transformFileToString(sourceFile as String, stylesheetFile as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as a string.

sourcefile: The file name of the source document
stylesheetfile: The file name of the stylesheet document. Returns char array - result of the transformation.

169.15.22 transformFileToValue(sourceFile as String, stylesheetFile as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as an XdmValue.

sourcefile: The file name of the source document
stylesheetfile: The file name of the stylesheet document. Returns XdmValue - result of the transformation

169.15.23 Properties

169.15.24 BaseOutputURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base output URI.
Notes: The base output URI is used for resolving relative URIs in the href attribute of the xsl:result-document instruction; it is accessible to XSLT stylesheet code using the XPath current-output-uri() function. (Read and Write property)

169.15.25 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory (cwd).
Notes: This method also applies to the static base URI for XSLT stylesheets when supplied as lexical string. The cwd is used to set the base URI is part of the static context, and is used to resolve any relative URIs appearing within XSLT.

cwd - Current working directory

The path must end with a slash (or a backslash on Windows).
(Read and Write property)

169.15.26 FastCompilation as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request fast compilation.
Notes: Fast compilation will generally be achieved at the expense of run-time performance and quality of diagnostics. Fast compilation is a good trade-off if (a) the stylesheet is known to be correct, and (b) once compiled, it is only executed once against a document of modest size.
Fast compilation may result in static errors going unreported, especially if they occur in code that is never executed.

The current implementation is equivalent to switching off all optimizations other than just-in-time compilation of template rules. Setting this option, however, indicates an intent rather than a mechanism, and the implementation details may change in future to reflect the intent.

fast - set to true to request fast compilation; set to false to revert to the optimization options defined in the Configuration.
(Read and Write property)

169.15.27 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

169.15.28 JustInTimeCompilation as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Say whether just-in-time compilation of template rules should be used.
Notes: Recommendation: disable this option unless you are confident that the stylesheet you are compiling is error-free.

jit - true if just-in-time compilation is to be enabled. With this option enabled, static analysis of a template rule is deferred until the first time that the template is matched. This can improve performance when many

template rules are rarely used during the course of a particular transformation; however, it means that static errors in the stylesheet will not necessarily cause the compile(Source) method to throw an exception (errors in code that is actually executed will still be notified to the registered ErrorListener or ErrorList, but this may happen after the compile(Source) method returns).

This option is enabled by default in Saxon-EE, and is not available in Saxon-HE or Saxon-PE.
(Read and Write property)

169.15.29 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

169.15.30 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

169.15.31 Relocatable as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Indicate package deployable to a different location.
Notes: Say whether any package produced by this compiler can be deployed to a different location, with a different base URI

relocatable - if true then static-base-uri() represents the deployed location of the package, rather than its compile time location
(Read and Write property)

169.15.32 SaxonProcessor as SaxonProcessorMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the SaxonProcessor object.
Notes: (Read only property)

169.15.33 TargetEdition as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The target edition.
Notes: Set the target edition under which the stylesheet will be executed.
edition - the Saxon edition for the run-time environment.
One of "EE", "PE", "HE", or "JS", "JS2", or "JS3".
(Read and Write property)

169.15.34 XsltLanguageVersion as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the XSLT (and XPath) language level to be supported by the processor.
Notes: Set the value to "4.0" to enable support for experimental features defined in the XSLT 4.0 proposal (which is likely to change before it stabilizes).

Value is the language level to be supported. The values "3.0" and "4.0" are recognized
(Read and Write property)

169.15.35 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

169.15.36 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: Some of the properties on this class may just internally set/get a property.
(Read and Write computed property)

169.16 class XsltExecutableMBS

169.16.1 class XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An XsltExecutable represents the compiled form of a stylesheet.
Notes: An XsltExecutable is created by using one of the compile methods on the Xslt30Processor class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

169.16.2 Methods

169.16.3 AddParameters(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets parameters given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys to XdmAtomicValue and values XdmValue objects internally and set parameters.

169.16.4 AddProperties(values as Dictionary)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets properties given values in the dictionary.
Notes: This is a convenience function.
We loop over the entries in the dictionary, convert keys and values to string and set properties.

169.16.5 applyTemplatesReturningFile(outfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke the stylesheet by applying templates to a supplied input sequence, saving the results to file.
Notes: The initial match selection must be set using one of the two methods setInitialMatchSelection or setInitialMatchSelectionFile. The result is stored in the supplied output file.

outfile: The file name where results will be stored.

169.16.6 applyTemplatesReturningString as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke the compiled stylesheet by applying templates to a supplied input.
Notes: The initial match selection must be set using one of the two methods setInitialMatchSelection or setInitialMatchSelectionFile.

169.16.7 applyTemplatesReturningValue as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke the compiled stylesheet by applying templates to a supplied input sequence, Saving the results as an XdmValueMBS.
Notes: The initial match selection must be set using one of the two methods setInitialMatchSelection or setInitialMatchSelectionFile.

169.16.8 callFunctionReturningFile(functionName as String, arguments() as XdmValueMBS, outfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call a public user-defined function in the already compiled stylesheet.
Notes: Here we wrap the result in an XML document, and sending this document to a specified file.

functionName: The name of the function to be called
arguments: Array of XdmValue object - he values of the arguments to be supplied to the function. These will be converted if necessary to the type as defined in the function signature, using the function conversion rules.
outfile: The file name where results will be stored.

169.16.9 callFunctionReturningString(functionName as String, arguments() as XdmValueMBS) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call a public user-defined function in the compiled stylesheet.
Notes: Here we wrap the result in an XML document, and serialized this document to string value.

functionName: The name of the function to be called
arguments: Array of XdmValueMBS object - he values of the arguments to be supplied to the function. These will be converted if necessary to the type as defined in the function signature, using the function

conversion rules.

169.16.10 callFunctionReturningValue(functionName as String, arguments() as XdmValueMBS) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Call a public user-defined function in the already compiled stylesheet.
Notes: Here we wrap the result in an XML document, and return the document as an XdmValueMBS

functionName: The name of the function to be called
arguments: Array of XdmValue object - he values of the arguments to be supplied to the function. These will be converted if necessary to the type as defined in the function signature, using the function conversion rules.

169.16.11 callTemplateReturningFile(templateName as String, outputfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke a transformation by calling a named template and save result to file.
Notes: The results of calling the template are wrapped in a document node, which is then sent to the specified file destination. If setInitialTemplateParameters(std::Map, boolean) has been called, then the parameters supplied are made available to the called template (no error occurs if parameters are supplied that are not used).

templateName: The name of the initial template. This must match the name of a public named template in the stylesheet. If the value is nullptr, the clark name for xsl:initial-template is used.
outfile: The file name where results will be stored.

169.16.12 callTemplateReturningString(templateName as String = "") as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke a transformation by calling a named template and return result as a string.
Example:

```
Var processor As New SaxonProcessorMBS
Var proc As Xslt30ProcessorMBS = processor.NewXslt30Processor

Var Input As String = "<xsl:stylesheet version='2.0' xmlns:xsl='http://www.w3.org/1999/XSL/Transform'>" +_
"<xsl:template name='go'><a/></xsl:template>" +_
"</xsl:stylesheet>"
```

```
Var executable As XsltExecutableMBS = proc.compileFromString(Input)

Var result As XdmValueMBS = executable.callTemplateReturningValue("go")

Print "Result: "+result.toString
```

Notes: The results of calling the template are wrapped in a document node, which is then serialized as a string. If setInitialTemplateParameters(std::Map, boolean) has been called, then the parameters supplied are made available to the called template (no error occurs if parameters are supplied that are not used).

templateName: the name of the initial template. This must match the name of a public named template in the stylesheet. If the value is nullptr, the clark name for xsl:initial-template is used.

169.16.13 callTemplateReturningValue(templateName as String = "") as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invoke a transformation by calling a named template and return result as an XdmValue.
Notes: The results of calling the template are wrapped in a document node, which is then returned as an XdmValue. If setInitialTemplateParameters(std::Map, boolean) has been called, then the parameters supplied are made available to the called template (no error occurs if parameters are supplied that are not used).

templateName: the name of the initial template. This must match the name of a public named template in the stylesheet. If the value is nullptr, the clark name for xsl:initial-template is used.

169.16.14 clearParameters

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear parameter values set.

169.16.15 clearProperties

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all properties.

169.16.16 clearXslMessages

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear xsl:message data that are held in the Processor.
Notes: If the save to file has been enabled then clearXslMessages does not take affect.

169.16.17 Clone as XsltExecutableMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a clone object of this XsltExecutable object.
Notes: Returns XsltExecutableMBS, a new copy of this object

169.16.18 Constructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

169.16.19 Destructor

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

169.16.20 exportStylesheet(filename as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Produce a representation of the compiled stylesheet.
Notes: The representation of the compiled stylesheet is in an XML form, suitable for distribution and reloading. If the configuration under which the export takes place is suitably licensed, then license information will be included in the export file allowing execution of the stylesheet without any additional license.

The detailed form of the output representation is not documented.

filename: the destination for the XML document containing the diagnostic representation of the compiled stylesheet. The stream will be closed when writing has finished.

169.16.21 removeParameter(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a parameter (name, value) pair.
Notes: Please pass the name of the parameter.
Returns outcome of the removal, true if found.

169.16.22 removeProperty(name as String) as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove a property (name, value) pair from the executable.
Notes: name: the name of the property to be removed.

Returns bool, the outcome of the removal.

169.16.23 setCaptureResultDocuments(flag as Boolean, rawResults as Boolean = false)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable the capture of the result-document output into a Dictionary.
Notes: This overrides the default mechanism.

If this option is enabled, then any document created using xsl:result-document is saved (as an XdmNode) in an std::map object where it is accessible using the URI as a key. After the execution of the transformation a call on the getResultDocuments() method is required to get access to the result-documents in the map.

flag: true causes secondary result documents from the transformation to be saved in a map; false disables this option.
rawResults: true enables the handling of raw destination for resultsDocuments. If not supplied this can also be set on the setResultAsRawValue method. The setResultAsRawValue method has higher priority to this flag

169.16.24 setGlobalContextFromFile(File as FolderItem)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source from file for the transformation.

file: the item to be used as the context item within the initializers of global variables and parameters.

169.16.25 setGlobalContextFromPath(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source from file for the transformation.
Path: the item to be used as the context item within the initializers of global variables and parameters.

169.16.26 SetGlobalContextItem(Item as XdmItemMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source document from an XdmNode for the transformation.

Pass the item to be used as the context item within the initializers of global variables and parameters. Given as a XdmItemMBS object.

169.16.27 setInitialMatchSelection(selection as XdmValueMBS)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial value to which templates are to be applied (equivalent to the select attribute of xsl:apply-templates)
Notes: selection: The value to which the templates are to be applied

169.16.28 setInitialMatchSelectionAsFile(Path as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial filename to which templates are to be applied (equivalent to the select attribute of xsl:apply-templates).
Notes: The file is parsed internally.
filename: The file name to which the templates are to be applied

169.16.29 setInitialTemplateParameters(values as Dictionary, tunnel as Boolean)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set parameters to be passed to the initial template.
Notes: These are used whether the transformation is invoked by applying templates to an initial source item, or by invoking a named template. The parameters in question are the xsl:param elements appearing as children of the xsl:template element.
The parameters are supplied in the form of a map; the key is a QName given as a string which must match the name of the parameter; the associated value is an XdmValue containing the value to be used for the parameter. If the initial template defines any required parameters, the map must include a corresponding value. If the initial template defines any parameters that are not present in the map, the default value is used. If the map contains any parameters that are not defined in the initial template, these values are silently ignored.

The supplied values are converted to the required type using the function conversion rules. If conversion is not possible, a run-time error occurs (not now, but later, when the transformation is actually run).

The XsltTransformer retains a reference to the supplied map, so parameters can be added or changed until the point where the transformation is run.

The XSLT 3.0 specification makes provision for supplying parameters to the initial template, as well as global stylesheet parameters. Although there is no similar provision in the XSLT 1.0 or 2.0 specifications, this method works for all stylesheets, regardless whether XSLT 3.0 is enabled or not.

parameters: the parameters to be used for the initial template
tunnel: true if these values are to be used for setting tunnel parameters; false if they are to be used for non-tunnel parameters

169.16.30 setSaveXslMessage(show as Boolean, filename as String = "")

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method gives users the option to switch on or off the xsl:message feature.
Notes: It is also possible to send the xsl:message outputs to file given by file name.
show - boolean to indicate if xsl:message should be outputted. Default is on.

filename: If the filename argument is present then the xsl:message output is appended to the given filename with location cwd+filename

169.16.31 transformFileToFile(sourcefile as String, outputfile as String)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is stored in the supplied outputfile.

sourcefile: The file name of the source document
outputfile: The file name where results will be stored.

169.16.32 transformFileToString(filename as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as a string

sourcefile: The file name of the source document Returns char array - result of the transformation.

169.16.33 transformFileToValue(filename as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a one shot transformation.
Notes: The result is returned as an XdmValueMBS.

sourcefile: The file name of the source document Returns XdmValue - result of the transformation.

169.16.34 transformToFile(source as XdmNodeMBS = nil)

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute transformation to file. Properties supplied in advance.
Notes: Perform the transformation based upon a compiled stylesheet and source document. Assume the output file has been set in advance

source: source document supplied as an XdmNodeMBS object. nil accepted if source document has been set already.

169.16.35 transformToString(source as XdmNodeMBS = nil) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute transformation to string. Properties supplied in advance.
Notes: Perform the transformation based upon what has been cached.
source - source document supplied as an XdmNode object. nullptr accepted if source document has been set already.

Result returned as a string.

169.16.36 transformToValue(source as XdmNodeMBS = nil) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute transformation to Xdm Value.
Notes: Properties supplied in advance.

Perform the transformation based upon cached stylesheet and any source document.

source: source document supplied as an XdmNode object. nil accepted if source document has been set already. Returns as an XdmValueMBS.

169.16.37 XslMessages as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the messages written using the xsl:message instruction.
Notes: Returns nil if the user has not enabled capturing of xsl:messages via setSaveXslMessage() Returns XdmValueMBS, the sequence of xsl:messages as an XdmValue

169.16.38 Properties

169.16.39 BaseOutputURI as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base output URI.
Notes: The base output URI is used for resolving relative URIs in the href attribute of the xsl:result-document instruction; it is accessible to XSLT stylesheet code using the XPath current-output-uri() function.

(Read and Write property)

169.16.40 CWD as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current working directory (cwd).
Notes: This method also applies to the static base URI for XSLT stylesheets when supplied as lexical string.

The cwd is used to set the base URI is part of the static context, and is used to resolve any relative URIs appearing within XSLT.

cwd: Current working directory

The path must end with a slash (or a backslash on Windows).
(Read and Write property)

169.16.41 GlobalContextItem as XdmItemMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supply the context item to be used when evaluating global variables and parameters.
Notes: Set the source document from an XdmNode for the transformation.

Pass the item to be used as the context item within the initializers of global variables and parameters. Given as a XdmItemMBS object.
(Read and Write property)

169.16.42 Handle as Integer

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

169.16.43 InitialMode as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The initial mode for the transformation.
Notes: modeName the EQName of the initial mode. Two special values are recognized, in the reserved XSLT namespace: xsl:unnamed to indicate the mode with no name, and xsl:default to indicate the mode defined in the stylesheet header as the default mode. The value null also indicates the default mode (which defaults to the unnamed mode, but can be set differently in an XSLT 3.0 stylesheet).
(Read and Write property)

169.16.44 OutputFile as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output file of where the transformation result is sent.
Notes: (Read and Write property)

169.16.45 Parameters as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all parameters.
Notes: Great for viewing them in the debugger.
(Read only property)

169.16.46 Properties as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties.
Notes: Great for viewing them in the debugger.
(Read only property)

169.16.47 ResultAsRawValue as Boolean

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to provide result as raw value.
Notes: true if the return type of callTemplate, applyTemplates and transform methods is to return XdmValue, otherwise return XdmNode object with root.

Value is true if return raw result, i.e. XdmValueMBS, otherwise return XdmNodeMBS.
(Read and Write property)

169.16.48 ResultDocuments as Dictionary

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the result-documents resulting from the execution of the stylesheet.
Notes: Nil is returned if the user has not enabled this feature via the method setCaptureResultDocuments()

Returns dictionary - the map is indexed by the absolute URI of the result document, and the corresponding value is an XdmNode containing the result document (as an in-memory tree, without serialization)
(Read only property)

169.16.49 ParameterValue(name as String) as XdmValueMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set a parameter.
Notes: Name: The name of the parameter, as a string.
For namespaced parameter use the JAXP solution i.e. " { uri } name" value of the query parameter.
Assign "" to clear a previously set value.

Some of the properties on this class may just internally set/get a parameter.
(Read and Write computed property)

169.16.50 PropertyValue(name as String) as String

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property specific to the processor in use.
Notes: Some of the properties on this class may just internally set/get a property.

Set or geta property specific to the processor in use. XsltProcessor: set serialization properties (names start with '!' i.e. name "!method" ->"xml") 'o':outfile name, 'it': initial template, 'im': initial mode, 's': source as file name 'm': switch on message listener for xsl:message instructions.
(Read and Write computed property)

Chapter 170

SceneKit

170.1 control DesktopSCNControlMBS

170.1.1 control DesktopSCNControlMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a SCNViewMBS.
Notes: This control embeds a special SCNView subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

To learn about rendering events, please check here:

170.1.2 Properties

170.1.3 View as SCNViewMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

170.1.4 Events

170.1.5 BoundsChanged

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

170.1.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

170.1.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

170.1.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

170.1.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

170.1.10 FocusLost

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

170.1.11 FocusReceived

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

170.1.12 FrameChanged

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

170.1.13 MenuBarSelected

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

170.1.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown.
If you return False, the system handles the MouseDown so the above event handlers do not get called.

170.1.15 MouseDrag(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

170.1.16 MouseUp(x As Integer, y As Integer)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's

boundaries.

170.1.17 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

170.1.18 rendererDidApplyAnimations(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur after actions and animations are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this method to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ‚Äúbatch‚Äù your changes).

170.1.19 rendererDidApplyConstraints(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked on the control once the scene renderer did apply the constraints.
Notes: time The time at which the constraints were simulated.

All modifications done within this method don't go through the transaction model, they are directly applied on the presentation tree.

170.1.20 rendererDidRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control that the renderer has rendered the scene.
Notes: scene: The scene object that was rendered.
time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this method to perform custom drawing after SceneKit has rendered a scene—for example, to draw overlay content on top of SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this method—the results of modifying SceneKit objects in this method are undefined.

- To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
- To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this method. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

170.1.21 rendererDidSimulatePhysics(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur after physics simulations are performed.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this event exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

This event is the last opportunity SceneKit provides for you to change the scene graph before rendering.

170.1.22 rendererUpdate(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur before actions, animations, and physics are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

170.1.23 rendererWillRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the control that the renderer has cleared the viewport and is about to render the scene.
Notes: scene: The SCNSceneMBS object to be rendered.
time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this event to perform custom drawing before SceneKit renders a scene—for example, to draw backdrop content underneath SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this event—the results of modifying SceneKit objects during this event are undefined.

To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this event. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

170.1.24 ScaleFactorChanged(NewFactor as double)

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

170.1.25 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

170.2 class SCNAccelerationConstraintMBS

170.2.1 class SCNAccelerationConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNAccelerationConstraint caps the acceleration and velocity of a node.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.2.2 Methods

170.2.3 accelerationConstraint as SCNAccelerationConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAccelerationConstraint object.

170.2.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAccelerationConstraint object.

170.2.5 Properties

170.2.6 damping as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the damping factor of the receiver.
Notes: Optionally reduce the body's linear velocity each frame to simulate fluid/air friction. Value should be zero or greater. Defaults to 0.1. Animatable.
(Read and Write property)

170.2.7 decelerationDistance as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Controls the distance at which the node should start decelerating.
Notes: Defaults to 0. Animatable.
(Read and Write property)

170.2.8 maximumLinearAcceleration as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Controls the maximum linear acceleration. Defaults to MAXFLOAT. Animatable.
Notes: The maximum linear acceleration is in m.s^-2
(Read and Write property)

170.2.9 maximumLinearVelocity as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Controls the maximum linear velocity. Defaults to MAXFLOAT. Animatable.
Notes: The maximum linear velocity is in m.s
(Read and Write property)

170.3 class SCNActionMBS

170.3.1 class SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A simple, reusable animation that changes attributes of any node you attach it to.
Notes: You use actions most often to change the structure and content of the SCNNodeMBS object to which they are attached, but you can also use actions make other changes to the scene. In SceneKit, actions provide an easy way to implement animated behaviors that frequently change in response to user input.

see also
https://developer.apple.com/documentation/scenekit/scnaction
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

170.3.2 Methods

170.3.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

170.3.4 copy as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the action.

170.3.5 fadeIn(duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that changes the opacity of the node to 1.0.
Notes: duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates from its current value to 1.0.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.fadeOut(Duration)

170.3.6 fadeOpacityBy(factor as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that adjusts the opacity of a node by a relative value.
Notes: factor: The amount to change the node,Äôs opacity by.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates to its new value.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.fadeOpacityBy(-factor, duration)

170.3.7 fadeOpacityTo(opacity as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that adjusts the opacity of a node to a new value.
Notes: opacity: The new opacity value of the node.

duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates to its new value.
This action is not reversible; the reverse of this action has the same duration but does not change anything.

170.3.8 fadeOut(duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that changes the opacity of the node to 0.0.
Notes: duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs opacity property animates from its current value to 0.0.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.fadeIn(duration)

170.3.9 group(actions() as SCNActionMBS) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that runs a collection of actions in parallel.
Notes: actions: An array of SCNActionMBS objects.

Returns a new group action object.

When the action executes, the actions that make up the group all start immediately and run in parallel. The duration of the group action is the longest duration among the collection of actions. If an action in the group has a duration less than the group,Äôs duration, the action completes and then idles until the group completes the remaining actions. This matters most when creating a repeating action that repeats a group. This action is reversible; it creates a new group action that contains the reverse of each action specified in the group.

170.3.10 hide as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that hides a node.
Notes: When the action executes, the node,Äôs hidden property is set to true.
This action is reversible; the reverse is equivalent to the unhide action.

170.3.11 javaScriptActionWithScript(script as string, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that executes a JavaScript script periodically over a specified duration.
Notes: script: A string containing JavaScript source code.
seconds: The duration of the action, in seconds.

SceneKit exposes its classes, methods, and functions in the JavaScript context that runs the script—see the SCNJavaScript.h header file for details.

When the action executes, SceneKit runs the script repeatedly until the action,Äôs duration expires. Each time SceneKit runs the script, it computes the elapsed time since the action began executing (as a fraction of the action,Äôs duration between 0.0 and 1.0) and makes it available to the script as a variable named elapsedTime. The script can also reference the SCNNode object running the action as a variable named node.
This action is not reversible; the reverse action executes the same script.

170.3.12 moveBy(delta as SCNVector3MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that moves a node relative to its current position.
Notes: delta: A vector that describes the change to be applied to the node,Äôs position.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs position property animates from its current position to its new position.
This action is reversible; the reverse is created as if the following code had been executed:

Var reverseDelta as SCNVector3MBS = SCNVector3MBS.Vector(-delta.x, -delta.y, -delta.z)
SCNActionMBS.moveBy(reverseDelta, duration)
See also:

- 170.3.13 moveBy(deltaX as double, deltaY as double, deltaZ as double, duration as double) as SCNActionMBS 20529

170.3.13 moveBy(deltaX as double, deltaY as double, deltaZ as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that moves a node relative to its current position.
Notes: deltaX: The distance to move the node in the X direction of its parent node,Äôs local coordinate space.
deltaY: The distance to move the node in the Y direction of its parent node,Äôs local coordinate space.
deltaZ: The distance to move the node in the Z direction of its parent node,Äôs local coordinate space.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs position property animates from its current position to its new position.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.moveBy(-deltaX, -deltaY, -deltaZ, duration)
See also:

- 170.3.12 moveBy(delta as SCNVector3MBS, duration as double) as SCNActionMBS 20528

170.3.14 moveTo(location as SCNVector3MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that moves a node to a new position.
Notes: location: The coordinates for the node,Äôs new position in its parent node,Äôs local coordinate space.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs position property animates from its current position to its new

position.
This action is not reversible; the reverse of this action has the same duration but does not move the node.

170.3.15 removeFromParentNode as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that removes the node from its parent.
Notes: When the action executes, the node is immediately removed from its parent.
This action is not reversible; the reverse of this action is the same action.

170.3.16 repeatAction(action as SCNActionMBS, count as integer) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that repeats another action a specified number of times.
Notes: action: The action to be executed.
count: The number of times to execute the action.

Returns a new action object.

When the action executes, the associated action runs to completion and then repeats, until the count is reached.
This action is reversible; it creates a new action that is the reverse of the specified action and then repeats it the same number of times.

170.3.17 repeatActionForever(action as SCNActionMBS) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that repeats another action forever.
Notes: action: The action to execute.

Returns a new action object.

When the action executes, the associated action runs to completion and then repeats.
This action is reversible; it creates a new action that is the reverse of the specified action and then repeats it forever.
Note

The action to be repeated must have a non-instantaneous duration.

170.3.18 reversedAction as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that reverses the behavior of another action.
Notes: This method always returns an action object; however, not all actions are reversible. When reversed, some actions return an object that either does nothing or performs the same action as the original action. For details on how an action is reversed, see the description of the class method used to create that action.

170.3.19 rotateBy(xAngle as double, yAngle as double, zAngle as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node in each of the three principal axes by angles relative to its current orientation.
Notes: xAngle: The amount to rotate the node counterclockwise around the x-axis of its local coordinate space, in radians.
yAngle: The amount to rotate the node counterclockwise around the y-axis of its local coordinate space, in radians.
zAngle: The amount to rotate the node counterclockwise around the z-axis of its local coordinate space, in radians.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.rotateBy(-xAngle, -yAngle, -zAngle, duration)

170.3.20 rotateByAngle(angle as double, axis as SCNVector3MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node by an angle around a specified axis.
Notes: angle: The amount to rotate the node counterclockwise around the specified axis, in radians.
axis: A vector in the node,Äôs local coordinate space whose direction specifies the axis of rotation.

duration: The duration, in seconds, of the animation.

Return a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.rotateByAngle(-angle, axis, duration)

170.3.21 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node to absolute angles in each of the three principal axes.
Notes: xAngle: The amount to rotate the node counterclockwise around the x-axis of its local coordinate space, in radians.
yAngle: The amount to rotate the node counterclockwise around the y-axis of its local coordinate space, in radians.
zAngle: The amount to rotate the node counterclockwise around the z-axis of its local coordinate space, in radians.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle. Calling this method is equivalent to calling rotateTo() and passing false for the shortestUnitArc parameter.
This action is not reversible; the reverse of this action has the same duration but does not change anything.
See also:

- 170.3.22 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double, shortestUnitArc as boolean) as SCNActionMBS 20532

170.3.22 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double, shortestUnitArc as boolean) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node to absolute angles in each of the three principal axes.
Notes: xAngle: The amount to rotate the node counterclockwise around the x-axis of its local coordinate space, in radians.
yAngle: The amount to rotate the node counterclockwise around the y-axis of its local coordinate space, in

radians.
zAngle: The amount to rotate the node counterclockwise around the z-axis of its local coordinate space, in radians.
duration: The duration, in seconds, of the animation.
shortestUnitArc: If false (the default), the animation interpolates each component of the node,Äôs rotation between its current value and the new value. If true, the animation makes the most direct rotation possible from the node,Äôs current orientation to the new orientation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.
This action is not reversible; the reverse of this action has the same duration but does not change anything.
See also:

- 170.3.21 rotateTo(xAngle as double, yAngle as double, zAngle as double, duration as double) as SCNActionMBS 20532

170.3.23 rotateToAxisAngle(axisAngle as SCNVector4MBS, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that rotates the node to an absolute angle around a specified axis.
Notes: axisAngle: A four-component vector whose first three components are a vector in the node,Äôs local coordinate space specifying an axis and whose fourth component is the amount to rotate the node counterclockwise around that axis, in radians.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs rotation property animates to the new angle.
This action is not reversible; the reverse of this action has the same duration but does not change anything.

170.3.24 runBlock(del as SCNActionRunBlockMBS, tag as variant = nil) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that executes run the given method.
Notes: When the action executes, SceneKit calls the delegate method. This action takes place instantaneously.
This action is not reversible; the reverse action executes the same delegate method.

170.3.25 scaleBy(scale as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that uniformly changes the scale factor of a node by a relative value.
Notes: scale: The amount of change to make to all three components of the node,Äôs scale.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs scale property animates to the new value.
This action is reversible; the reverse is created as if the following code had been executed:

SCNActionMBS.scaleBy(-scale, duration)

170.3.26 scaleTo(scale as double, duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that uniformly changes the scale factor of a node to an absolute value.
Notes: scale: The new value for all three components of the node,Äôs scale.
duration: The duration, in seconds, of the animation.

Returns a new action object.

When the action executes, the node,Äôs scale property animates to the new value.
This action is not reversible; the reverse of this action has the same duration but does not change anything.

170.3.27 sequence(actions() as SCNActionMBS) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that runs a collection of actions sequentially.
Notes: actions: An array of SCNActionMBS objects.
Returns a new sequence action object.

When the action executes, the first action in the sequence starts and runs to completion. Subsequent actions in the sequence run in a similar fashion until all of the actions in the sequence have executed. The duration of the sequence action is the sum of the durations of the actions in the sequence.

This action is reversible; it creates a new sequence action that reverses the order of the actions. Each action

in the reversed sequence is itself reversed.

170.3.28 unhide as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that ensures a node is not hidden.
Notes: When the action executes, the node,Äôs hidden property is set to false.
This action is reversible; the reverse is equivalent to the hide action.

170.3.29 wait(duration as double) as SCNActionMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an action that idles for a specified period of time.
Notes: When the action executes, the action waits for the specified amount of time and then ends. This is typically used as part of a sequence of actions to insert a delay between two other actions. You might also use it in conjunction with the runAction method to trigger code that needs to run at a later time.
This action is not reversible; the reverse of this action is the same action.

170.3.30 Properties

170.3.31 duration as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The duration required to complete an action.
Notes: This is the expected duration of an action,Äôs animation. The actual time an action takes to complete is modified by the action,Äôs timingMode property.
(Read and Write property)

170.3.32 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object references.
Notes: (Read and Write property)

170.3.33 speed as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A speed factor that modifies how fast an action runs.
Notes: The speed factor adjusts how fast an action,Äôs animation runs. For example, a speed factor of 2.0 means the animation runs twice as fast.
(Read and Write property)

170.3.34 timingMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The timing mode used to execute an action.
Notes: For possible values, see TimingMode constants. The default value is TimingModeLinear.
(Read and Write property)

170.3.35 Constants

Timing Modes

Constant	Value	Description
TimingModeEaseIn	1	Ease-in pacing. The animation begins slowly, and then speeds up as it progresses.
TimingModeEaseInEaseOut	3	Ease-in ease-out pacing. The animation begins slowly, accelerates through the middle of its duration, and then slows again before completing.
TimingModeEaseOut	2	Ease-out pacing. The animation begins quickly, and then slows as it completes.
TimingModeLinear	0	Linear pacing. The animation progresses evenly throughout its duration.

170.3.36 Delegates

170.3.37 SCNActionRunBlockMBS(node as SCNNodeMBS, tag as variant)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate for the runBlock method.

170.4 class SCNAudioPlayerMBS

170.4.1 class SCNAudioPlayerMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A controller for playback of a positional audio source in a SceneKit scene.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("Laser.wav")
audioSource = New SCNAudioSourceMBS(file)
audioPlayer = New MySCNAudioPlayerMBS(audioSource)
audioSource.Volume = 1.0
audioSource.Loops = true
audioSource.load

// now build your nodes
Var someNode as SCNNodeMBS

// show scene
MyView.scene = MyScene
MyView.play

// and add player to plays
someNode.addAudioPlayer(audioPlayer)
```

Notes: An SCNAudioPlayerMBS object controls playback of a positional audio source in a SceneKit scene. To use positional audio, first create a reusable SCNAudioSourceMBS or AVAudioNodeMBS object to provide an audio stream. Then, create an audio player to control the playback of that audio source. Finally, attach the audio player to an SCNNodeMBS object for spatialized 3D audio playback based on the position of that node relative to the scene,Äôs audioListener node.

170.4.2 Methods

170.4.3 audioPlayerWithAVAudioNode(audioNode as Variant) as SCNAudioPlayerMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns an audio player (creating one if necessary) to play an audio node.
Notes: Please pass a AVAudioNodeMBS class.

Creating an audio player from an audio node does not attach that node to an AVAudioEngine object for mixing and playback—instead, this option allows you to build your own audio node graph for custom effects before manually adding it to the audioEngine object of the view (or other SceneKit renderer) displaying the scene. Then, after you attach the audio player to an SCNNodeMBS object, SceneKit continually updates the audio node,Äôs 3D mixing parameters to match the position of the scene node.

When you use this method, SceneKit creates an audio player for the specified AVAudioNodeMBS object or, if an audio player for that node already exists and is not in use, SceneKit reuses the existing player object.

170.4.4 audioPlayerWithSource(audioSource as SCNAudioSourceMBS) as SCNAudioPlayerMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns an audio player (creating one if necessary) to play a simple audio source.
Notes: An SCNAudioSourceMBS object represents a distinct source of audio (for example, a sound file) that can be reused and shared by many player objects. Use this method to create an audio player from such a source. When you use this method, SceneKit creates an audio player for the specified SCNAudioSourceMBS object or, if an audio player for that source already exists and is not in use, SceneKit reuses the existing player object.

If instead you want to attach a more complex audio setup to a position in your scene—such as a mixer that varies several audio inputs in response to user input—build that setup using AVAudioNodeMBS objects and create a player for it with the audioPlayerWithAVAudioNode() method.

170.4.5 Constructor(audioSource as SCNAudioSourceMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initializes an audio player for playing the specified simple audio source.
Notes: Using this initializer is typically not necessary. Instead, call the audioPlayerWithSource() method, which returns a cached audio player object if one for the specified audio source has already been created and is available for use.

170.4.6 Properties

170.4.7 audioNode as Variant

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The audio node SceneKit uses for mixing audio from this player.
Notes: Value is a AVAudioNodeMBS. We use variant to reduce dependency to other plugins.
(Read only property)

170.4.8 audioSource as SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The source of audio played by this player.
Notes: An SCNAudioSourceMBS object represents a distinct source of audio—for example, a sound file—that can be reused and shared by many player objects. Use a player,Äôs audio source to configure the default values for playback parameters such as volume and reverb. To vary those parameters in real time during playback, use the audioNode property to work with the underlying AVAudioNodeMBS object.
If the player was created with the audioPlayerWithAVAudioNode() method, this property,Äôs value is nil.
(Read only property)

170.4.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.4.10 Events

170.4.11 DidFinishPlayback

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An event called by SceneKit when playback of the player,Äôs audio source has completed.
Notes: The block takes no parameters and returns no value. Use this block to perform actions when a sound finishes playing. For example, after a line of spoken character dialogue finishes playing, you might start playing another line of dialogue.

170.4.12 WillStartPlayback

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An event called by SceneKit when playback of the player,Äôs audio source is about to begin.

170.5 class SCNAudioSourceMBS

170.5.1 class SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A simple, reusable audio source—music or sound effects loaded from a file—for use in positional audio playback.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("Laser.wav")
audioSource = New SCNAudioSourceMBS(file)
audioSource.Volume = 1.0
audioSource.Loops = true
audioSource.load

// now use for SCNAudioPlayerMBS class
```

Notes: To create positional audio effects, create an SCNAudioPlayerMBS object from the audio source to control playback, and add that player object to an SCNNodeMBS object in your scene. SceneKit then automatically spatializes 3D audio effects based on the position of that node relative to the scene,Äôs audioListener node.

170.5.2 Methods

170.5.3 audioSourceNamed(Name as String) as SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the audio source associated with the specified filename.
Notes: fileName: The name of an audio file. If this filename has not been previously requested, the method looks for an audio file with the specified name in the application,Äôs main bundle.

This method looks in the system caches for an audio source with the specified name and returns that object if it exists. If a matching audio source is not already in the cache, this method locates the audio file with the specified name in the application,Äôs main bundle, then creates a new audio source and caches it for reuse.

170.5.4 Constructor(File as FolderItem)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initializes an audio source from the specified audio file.
See also:

- 170.5.5 Constructor(URL as String) 20542

170.5.5 Constructor(URL as String)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Initializes an audio source from the specified audio file.
See also:

- 170.5.4 Constructor(File as FolderItem) 20542

170.5.6 copy as SCNAudioSourceMBS

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Creates a copy of the audio source object.

170.5.7 Load

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Loads audio data from the source and prepares it for playing.
Notes: This method reads audio data from the source file (specified when initializing the audio source) and performs any decompression necessary to prepare for playing audio. Use this method to control when your app or game incurs the run-time performance cost of such work—for example, you can load all audio source before starting a game level, instead of suffering a frame rate drop upon playing a new audio source during gameplay.
This method has no effect if the shouldStream property,Äôs value is true.

170.5.8 Properties

170.5.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.5.10 Loops as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the audio source should play repeatedly.
Notes: If this value is true, audio players using this source automatically begin playing again after playback has finished. If this value is false (the default), the audio source plays exactly once.
(Read and Write property)

170.5.11 Positional as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether audio from this source uses 3D positional mixing.
Notes: If this value is YES (the default), SceneKit mixes audio from the source based on its position relative to the scene,Äôs audioListener node—that is, the audio source,Äôs volume, reverb, and other parameters automatically change depending on the distance to the listener and other objects in the scene. (To position an audio source in a scene, create an SCNAudioPlayerMBS player from the source and attach that player to an SCNNodeMBS object.)
If you set this property to NO, the source,Äôs audio plays with the same volume (and other mixing parameters) regardless of the listener,Äôs position.
(Read and Write property)

170.5.12 Rate as Single

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The default playback rate for the audio source.
Notes: This property determines the default rate for when a source begins playing. To vary the rate during playback through an SCNAudioPlayerMBS object, use the player,Äôs audioNode property to access real-time audio controls.
(Read and Write property)

170.5.13 ReverbBlend as Single

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The default blend of blend of unmodified and reverb-processed (also called dry and wet) audio

for playback of the audio source.
Notes: This property determines the default reverb blend for when a source begins playing. To vary the reverb blend during playback through an SCNAudioPlayerMBS object, use the player,Äôs audioNode property to access real-time audio controls.
(Read and Write property)

170.5.14 ShouldStream as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the audio source should stream content from its source URL when playing.
Notes: If this value is true, audio players using this source do not preload audio buffer data, instead reading directly from the source file while playing audio. If this value is false, SceneKit loads audio buffer data upon playing audio from the source.
(Read and Write property)

170.5.15 Volume as Single

MBS Mac64bit Plugin, Plugin Version: 22.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The default playback volume for the audio source.
Notes: This property determines the default volume for when a source begins playing. To vary the volume during playback through an SCNAudioPlayerMBS object, use the player,Äôs audioNode property to access real-time audio controls.
(Read and Write property)

170.6 class SCNAvoidOccluderConstraintMBS

170.6.1 class SCNAvoidOccluderConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNAvoidOccluderConstraint constraints place the receiver at a position that prevent nodes with the specified category to occlude the target.
Notes: The target node and it's children are ignored as potential occluders.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.6.2 Methods

170.6.3 avoidOccluderConstraintWithTarget(target as SCNNodeMBS) as SCNAvoidOccluderConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAvoidOccluderConstraint object.

170.6.4 Constructor(target as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNAvoidOccluderConstraint object.

170.6.5 Properties

170.6.6 bias as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the bias the apply after moving the receiver to avoid occluders.
Notes: Defaults to 10e-5.
A positive bias will move the receiver closer to the target.
(Read and Write property)

170.6.7 occluderCategoryBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the category of node to consider as occluder.
Notes: Defaults to 1.
(Read and Write property)

170.6.8 target as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the target node.
Notes: (Read and Write property)

170.7 class SCNBillboardConstraintMBS

170.7.1 class SCNBillboardConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A constraint that orients a node to always point toward the current camera.
Notes: An SCNBillboardConstraint object automatically adjusts a node,Äôs orientation so that its local z-axis always points toward the pointOfView node currently being used to render the scene. For example, you can use a billboard constraint to efficiently render parts of a scene using two-dimensional sprite images instead of three-dimensional geometry—by mapping sprites onto planes affected by a billboard constraint, the sprites maintain their orientation with respect to the viewer. To attach constraints to an SCNNodeMBS object, use its constraints property.
Subclass of the SCNConstraintMBS class.

- MBS Xojo Plugins, version 19.1pr1

170.7.2 Methods

170.7.3 billboardConstraint as SCNBillboardConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNBillboardConstraint constraint.
Notes: A billboard constraint forces the receiver to look into the direction of the current point of view.

170.7.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNBillboardConstraint constraint.
Notes: A billboard constraint forces the receiver to look into the direction of the current point of view.

170.7.5 Properties

170.7.6 freeAxes as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the axes on which the billboarding orientation operates. Defaults to SCNBillboardAxisAll.

Notes: (Read and Write property)

170.7.7 Constants

Axes

Constant	Value	Description
SCNBillboardAxisAll	7	Align an affected node such that its orientation always matches that of the view. This is the default option for newly created billboard constraints.
SCNBillboardAxisX	1	Align an affected node such that its x-axis is always parallel to that of the view, leaving it free to rotate otherwise.
SCNBillboardAxisY	2	Align an affected node such that its y-axis is always parallel to that of the view, leaving it free to rotate otherwise.
SCNBillboardAxisZ	4	Align an affected node such that its z-axis is always perpendicular to the viewing plane, leaving it free to rotate otherwise.

170.8 class SCNBoxMBS

170.8.1 class SCNBoxMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNBox represents a box with rectangular sides and optional chamfers.
Notes: Subclass of the SCNGeometryMBS class.

170.8.2 Methods

170.8.3 box(width as double, height as double, length as double, chamferRadius as double) as SCNBoxMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a box with given width, height, length and chamfer radius.
Notes: width: The width of the box.
height: The height of the box.
length: The length of the box.
chamferRadius: The chamfer radius of the box.

170.8.4 Constructor(width as double, height as double, length as double, chamferRadius as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a box with given width, height, length and chamfer radius.
Notes: width: The width of the box.
height: The height of the box.
length: The length of the box.
chamferRadius: The chamfer radius of the box.

170.8.5 Properties

170.8.6 chamferRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The chamfer radius. Animatable.
Notes: If the value is strictly less than 0, the geometry is empty. The default value is 0.
(Read and Write property)

170.8.7 chamferSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of chamfer subdivisions. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 10.
(Read and Write property)

170.8.8 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the box. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.8.9 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.8.10 length as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The length of the box. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.8.11 lengthSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Z axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.8.12 width as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the box. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.8.13 widthSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the X axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.9 class SCNCameraControllerMBS

170.9.1 class SCNCameraControllerMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a camera controller.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.5pr3

170.9.2 Methods

170.9.3 clearRoll

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Clear the camera roll if any.

170.9.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

170.9.5 dollyToTarget(delta as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Zoom by moving the camera along the axis from the camera position to the target.

170.9.6 rollAroundTarget(delta as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Rotate the camera around the axis from the camera position to the target.
Notes: Delta is in degrees.

170.9.7 rotate(deltaX as double, deltaY as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Rotate delta is in degrees.

170.9.8 stopInertia

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Stop current inertia.

170.9.9 translateInCameraSpace(x as double, y as double, z as double)

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Translate the camera along the local X/Y/Z axis.

170.9.10 Properties

170.9.11 automaticTarget as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Automatically update the target in beginInteraction.
Notes: Defaults to false.
(Read and Write property)

170.9.12 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.9.13 inertiaEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Set to true to enable inertia on endInteraction.
Notes: Defaults to false.
(Read and Write property)

170.9.14 inertiaFriction as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The friction coefficient applied to the inertia.
Notes: Defaults to 0.05.
(Read and Write property)

170.9.15 inertiaRunning as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Returns true if inertia is running.
Notes: (Read only property)

170.9.16 maximumHorizontalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum horizontal view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both horizontal angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.
Angles are in world space and within the range [-180, 180] .
Defaults to 0.0.
(Read and Write property)

170.9.17 maximumVerticalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum vertical view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both vertical angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.

Angles are in world space and within the range [-90, 90] .
Defaults to 0.0.
For example: set to minimum to 0 and maximum to 90 to only allow orbit around the top hemisphere.
(Read and Write property)

170.9.18 minimumHorizontalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum horizontal view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both horizontal angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.
Angles are in world space and within the range [-180, 180] .
Defaults to 0.0.
(Read and Write property)

170.9.19 minimumVerticalAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Minimum and maximum vertical view angles in degrees for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable.
Notes: The angle constraints is not enforced if both vertical angle properties values are set to 0.
The angle constraints will not be enforced if the initial orientation is outside the given range.
The minimum angle must be inferior to the maximum angle.
Angles are in world space and within the range [-90, 90] .
Defaults to 0.0.
For example: set to minimum to 0 and maximum to 90 to only allow orbit around the top hemisphere.
(Read and Write property)

170.9.20 pointOfView as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The node describing the point of view.
Notes: (Read and Write property)

170.9.21 target as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The camera target in world space for orbit rotation.
Notes: (Read and Write property)

170.9.22 worldUp as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The up vector in world space used as reference for SCNInteractionModeFly and SCNInteractionModeOrbitTurntable camera modes.
Notes: Defaults to (0, 1, 0).
(Read and Write property)

170.10 class SCNCameraMBS

170.10.1 class SCNCameraMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A set of camera attributes that can be attached to a node to provide a point of view for displaying the scene.
Notes: To display a scene, you must designate a node whose camera property contains a camera object as the point of view.

The SCNNode object containing a camera defines a point of view—that is, the position and orientation of the camera. A camera,Äôs direction of view is always along the negative z-axis of the node,Äôs local coordinate system. To point the camera at different parts of your scene, use the position, rotation, or transform property of the node containing it. (Alternatively, to ensure that a camera always points at a particular element of your scene even when that element moves, attach a SCNLookAtConstraint object to the node containing the camera.)

An SCNCamera object itself defines the shape and, in part, the appearance of the rendered scene as seen from its point of view. By default, a camera defines a perspective projection, whose field of view (FOV) and near and far visibility limits you control using the properties listed in Adjusting Camera Perspective and illustrated below.

170.10.2 Methods

170.10.3 camera as SCNCameraMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new camera object.
Notes: To use the camera to display a scene, attach it to the camera property of a node and then select that node using the pointOfView property of the view (or layer or renderer) rendering the scene.

170.10.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new camera object.
Notes: To use the camera to display a scene, attach it to the camera property of a node and then select that node using the pointOfView property of the view (or layer or renderer) rendering the scene.

170.10.5 copy as SCNCameraMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the camera.

170.10.6 Properties

170.10.7 ApertureBladeCount as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The number of physical camera aperture blades simulated by SceneKit for depth-of-field effects.
Notes: When the wantsDepthOfField setting is enabled, SceneKit renders scenes using the camera with a depth-of-field blur (also called bokeh) effect modeled after those created by a real-world physical camera. One feature of real-world camera bokeh effects is the tendency of distant bright points to blur into larger shapes based on the shape of the aperture between the camera's lens and its imaging plane (film or sensor). Physical cameras control aperture using a mechanism that moves several flat blades in or out to create a smaller or larger opening, so the natural bokeh effect in traditional photography produces polygon-shaped blur effects.
This property controls the number of blades in the simulated camera aperture, and thus the polygon shape seen in the resulting bokeh effect. For example, a blade count of 6 (the default) causes distant bright points to blur into hexagon shapes. Increasingly large blade counts result in the bokeh effect appearing more circular, as shown below.
(Read and Write property)

170.10.8 AutomaticallyAdjustsZRange as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the camera automatically adjusts its zNear and zFar depth limits.
Notes: The default value of this property is false, specifying that the camera,Äôs zNear and zFar properties control its depth limits. If you change this property,Äôs value to true, SceneKit automatically adjusts the depth limits at render time to fit the bounding box of the scene. Changing the values of the zNear and zFar properties automatically resets this property,Äôs value to false.
(Read and Write property)

170.10.9 averageGray as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The luminance level to use as the midpoint of a tone mapping curve.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with this property which serves as a constant estimate of scene luminance.
The default value is 0.18. By setting this property to a higher or lower value, you can compensate for scenes with darker or brighter content. Alternatively, by setting the wantsExposureAdaptation property, you can allow SceneKit to automatically adjust exposure as the visible contents of the scene change.
This property has no effect if the wantsHDR value is false. If the exposureAdaptationDarkeningSpeedFactor value is true, SceneKit ignores this property, and instead computes the average luminance currently visible to the camera during rendering.
(Read and Write property)

170.10.10 bloomBlurRadius as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The radius, in pixels, for the blurring portion of the bloom effect applied to highlights in the rendered scene. Animatable.
Notes: A bloom effect adds a soft glow to highlights (areas of bright color) in the rendered scene, simulating the way bright highlights appear to the human eye or a physical camera in a real-world scene. The bloom effect combines selective brightening and blurring effects; this property controls the blur portion of the effect. A value of zero effectively disables the bloom effect, and higher values result in a broader, softer glow. The default value is 4.0 pixels.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

170.10.11 bloomIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The magnitude of bloom effect to apply to highlights in the rendered scene. Animatable.
Notes: A bloom effect adds a soft glow to highlights (areas of bright color) in the rendered scene, simulating the way bright highlights appear to the human eye or a physical camera in a real-world scene. This property controls the strength of the bloom effect; lower values result in a subtle effect, and higher values create very bright glow. The default value is 0.0, resulting in no bloom effect.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

170.10.12 bloomThreshold as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The brightness threshold at which to apply a bloom effect to highlights in the rendered scene. Animatable.
Notes: A bloom effect adds a soft glow to highlights (areas of bright color) in the rendered scene, simulating the way bright highlights appear to the human eye or a physical camera in a real-world scene. This property controls the brightness level required to trigger the bloom effect; lower values apply the effect to more of the scene, and higher values apply the effect only to the brightest white areas. The default value is 1.0.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

170.10.13 colorFringeIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The blend factor for fading the color fringing effect applied to the rendered scene.
Notes: Color fringing applies an effect that separately blurs the color components of each rendered pixel, adding subtle rainbow edge effects to the rendered scene that simulate the effects of chromatic aberration in a physical camera. Higher values for this property result in brighter, more vivid color fringing, and lower values create a subtler effect. The default value of 1.0 leaves the color fringing effect at its most vivid.
This property controls a fade between the color fringing effect and the otherwise-normally-rendered image. The colorFringeStrength property controls the breadth of the color fringing effect.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

170.10.14 colorFringeStrength as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The magnitude of color fringing effect to apply to the rendered scene.
Notes: Color fringing applies an effect that separately blurs the color components of each rendered pixel, adding subtle rainbow edge effects to the rendered scene that simulate the effects of chromatic aberration in a physical camera. Higher values create a more pronounced color shift, creating wider rainbow fringes; lower values spread colors across shorter distances, creating a subtler effect. The default value of 0.0 disables the color fringing effect entirely.
This property controls the breadth of color fringing. The colorFringeIntensity property controls the blend factor between the color-fringed and the otherwise-normally-rendered image.
To enable this behavior, you must first enable the wantsHDR setting.

(Read and Write property)

170.10.15 colorGrading as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A texture for applying color grading effects to the entire rendered scene.
Notes: The contents value for this material property must be a 3D color lookup table, or a 2D texture image that represents such a table arranged in a horizontal strip.

see also
https://developer.apple.com/documentation/scenekit/scncamera/1644114-colorgrading
(Read only property)

170.10.16 contrast as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: An adjustment factor to apply to the overall visual contrast of the rendered scene.
Notes: A value of 0.0 (the default) leaves the rendered scene unchanged. Positive values increase contrast between bright and dark areas, and negative values reduce contrast, shifting the rendered scene towards a uniform gray.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

170.10.17 exposureAdaptationBrighteningSpeedFactor as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The relative duration of automatically animated exposure transitions from dark to bright areas.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. When the wantsExposureAdaptation property is enabled, SceneKit automatically adjusts the tone mapping curve based on the average luminance currently visible to the camera, and creates automatic transitions between exposure levels.
SceneKit automatically determines the overall duration of exposure-level animations based on the values of this property and the exposureAdaptationDarkeningSpeedFactor property. The default value is 0.4, resulting in brightening animations that are slightly faster than darkening animations.
This property has no effect if either of the wantsHDR or wantsExposureAdaptation values is false.
(Read and Write property)

170.10.18 exposureAdaptationDarkeningSpeedFactor as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The relative duration of automatically animated exposure transitions from bright to dark areas.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. When the wantsExposureAdaptation property is enabled, SceneKit automatically adjusts the tone mapping curve based on the average luminance currently visible to the camera, and creates automatic transitions between exposure levels.
SceneKit automatically determines the overall duration of exposure-level animations based on the values of this property and the exposureAdaptationDarkeningSpeedFactor property. The default value is 0.6, resulting in darkening animations that are slightly faster than brighting animations.
This property has no effect if either of the wantsHDR or wantsExposureAdaptation values is false.
(Read and Write property)

170.10.19 exposureOffset as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A logarithmic bias that adjusts the results of SceneKit,Äôs tone mapping operation, brightening or darkening the visible scene.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with a measure of scene luminance.
Use this property to bias the tone mapping curve. The default exposure offset is zero, specifying no bias. Positive values result in a brighter scene, and negative values result in a darker scene.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

170.10.20 FieldOfView as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The vertical or horizontal viewing angle of the camera.
Notes: The projectionDirection property determines whether this fieldOfView property measures the camera's vertical or horizontal viewing angle, and SceneKit automatically calculates the viewing angle in the other direction to match the aspect ratio of the view displaying the scene. For example, a fieldOfView of 60 and the default SCNCameraProjectionDirectionVertical projection, presented fullscreen on a 16:9 display in portrait orientation, results in a vertical viewing angle of 60¬∞ and a horizontal viewing angle of 33.75¬∞.
You can choose to specify viewing angle either directly, using this fieldOfView property, or in terms that model a physical camera, using the sensorHeight and focalLength properties. Setting the fieldOfView property causes SceneKit to automatically recalculate the focalLength value, and setting the sensorHeight or focalLength property recalculates fieldOfView.

(Read and Write property)

170.10.21 FocalBlurSampleCount as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The number of pixel samples SceneKit uses to create depth-of-field blur effects.
Notes: When the wantsDepthOfField setting is enabled, SceneKit renders depth-of-field blur (also called bokeh) effects using a blur filter that samples multiple points in the image. Sampling a larger number of points produces a higher quality visual effect at a higher performance cost, and vice versa. The default sample count is 25.
(Read and Write property)

170.10.22 FocalLength as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The camera's focal length, in millimeters.
Notes: The sensorHeight and focalLength properties determine the camera's horizontal and vertical viewing angles using terms that model physical camera devices. (Alternatively, you can work with viewing angle directly though the fieldOfView property.) For example, with the default sensor height of 24 mm and default focal length of 50 mm, the vertical field of view is 60¬∞.
Setting the fieldOfView property causes SceneKit to automatically recalculate the focalLength value, and setting the sensorHeight or focalLength property recalculates fieldOfView.
(Read and Write property)

170.10.23 focusDistance as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The distance from the camera at which objects appear in sharp focus. Animatable.
Notes: Objects at this distance from the camera appear perfectly focused. Objects nearer to or farther from the camera than this distance appear increasingly blurred, with the behavior of the blur effect depending on the fStop, apertureBladeCount and focalBlurSampleCount properties. The default focus distance is 2.5.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.10.24 fStop as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The physical camera aperture simulated by SceneKit for depth-of-field effects. Animatable.
Notes: F-stop numbers describe the light-gathering area of a physical camera's imaging system, and are typically expressed as the denominator of a ratio including the camera's focal length í, such as í/2 or í/5.6. A larger denominator indicates a smaller aperture, allowing less light to pass from the camera's lens through to the imaging plane (sensor or film), and a smaller denominator indicates a larger aperture that lets more light through.
SceneKit uses aperture measurements to simulate depth-of-field blur effects (also called bokeh) approximating those produced by a physical camera. A larger fStop number (or aperture denominator) causes most of the scene to appear in focus, with extremely close or far depths showing slight blurring; a smaller number results in only a narrow range of depths appearing in focus, and a more pronounced blur effect for the rest of the scene. The default fStop value is 5.6.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.10.25 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.10.26 maximumExposure as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum exposure value to use in tone mapping.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with a measure of scene luminance.
Exposure values are exponential: a value of 1.0 doubles brightness, a value of 2.0 quadruples brightness, a value of -1.0 halves brightness, and so on. The default value is 15.0. Decreasing the value causes brighter portions of the scene to become over-exposed (uniformly white, losing definition). Increasing the value adds more dynamic range for brighter portions of the scene; however, a greater breadth of difference between the minimum and maximum exposures decreases contrast.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

170.10.27 minimumExposure as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum exposure value to use in tone mapping.

Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with a measure of scene luminance.
Exposure values are exponential: a value of 1.0 doubles brightness, a value of 2.0 quadruples brightness, a value of -1.0 halves brightness, and so on. The default value is -15.0. Increasing the value causes darker portions of the scene to become under-exposed (uniformly black, losing definition). Decreasing the value adds more dynamic range for darker portions of the scene; however, a greater breadth of difference between the minimum and maximum exposures decreases contrast.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

170.10.28 motionBlurIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A factor that determines the intensity of motion blur effects. Animatable.
Notes: The default intensity of zero results in no motion blur effect. Higher values (toward a maximum of 1.0) create more pronounced motion blur effects.
Motion blur is not supported when wide-gamut color rendering is enabled. Wide-gamut rendering is enabled by default on supported devices; to opt out, set the SCNDisableWideGamut key in your app's Info.plist file.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.10.29 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A name associated with the camera object.
Notes: You can provide a descriptive name for a camera object to make managing your scene graph easier. Cameras loaded from a scene file may have names assigned by an artist using a 3D authoring tool. Use the SCNSceneSourceMBS class to examine cameras in a scene file without loading its scene graph.
(Read and Write property)

170.10.30 orthographicScale as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the camera,Äôs magnification factor when using an orthographic projection.
Notes: In an orthographic projection, equally sized objects appear equally sized regardless of their distance from the camera. To switch between orthographic and perspective projections, see the usesOrthographicProjection property.

(Read and Write property)

170.10.31 ProjectionDirection as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The axis used to determine field of view or orthographic scale.
Notes: The fieldOfView property measures view angle in a single primary direction, determined by this projectionDirection property. For the other direction, SceneKit automatically adjusts field of view depending on the aspect ratio of the view presenting the scene.
For example, with the default projection direction of SCNCameraProjectionDirectionVertical, setting fieldOfView to 60 results in a vertical view angle of 60¬∞. If the scene appears on a display with a 4:3 aspect ratio, the horizontal view angle is 80¬∞. However, if the scene appears on a 16:9 display, the horizontal view angle is 106¬∞.
This property has a similar effect on scaling for orthographic projections. The orthographicScale property measures the scale factor in the direction of the projectionDirection property, and SceneKit automatically calculates scale factor in the other direction according to aspect ratio.
(Read and Write property)

170.10.32 projectionTransform as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The camera,Äôs projection transformation.
Notes: This transformation expresses the combination of all the camera,Äôs geometric properties: projection type (perspective or orthographic), field of view, depth limits, and orthographic scale (if applicable). SceneKit uses this transformation to convert points in the camera node,Äôs coordinate space to the renderer,Äôs 2D space when rendering and processing events.
You can use this transformation directly if your app needs to convert between view and renderer coordinates for other purposes. Alternatively, if you compute your own projection transform matrix, you can set this property to override the transformation synthesized from the camera,Äôs geometric properties.
(Read and Write property)

170.10.33 saturation as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: An adjustment factor to apply to the overall color saturation of the rendered scene.
Notes: A value of 1.0 (the default) leaves scene colors unchanged. Greater values result in oversaturated colors, and a value of 0.0 makes the rendered scene entirely grayscale.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

170.10.34 screenSpaceAmbientOcclusionBias as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: An offset for modulating ambient occlusion effects.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
This screenSpaceAmbientOcclusionBias value is used in an intermediate stage of calculating the SSAO effect, and measures a distance in scene units. Increasing or decreasing this value from its default of 0.03 can help to offset unrealistic effects produced by changing other SSAO settings.
(Read and Write property)

170.10.35 screenSpaceAmbientOcclusionDepthThreshold as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum depth difference, in units of scene space, at which to apply ambient occlusion effects.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
This screenSpaceAmbientOcclusionDepthThreshold property controls the effect of relative distance from the camera on SSAO effects. Higher values create more shadowing effects between foreground and background elements of the scene, but this can result in unrealistic dark halos around foreground elements that are far from the background. Lower values avoid dark halo effects, but create less visual separation between scene elements at different distances from the camera. The default value is 0.2 units.
(Read and Write property)

170.10.36 screenSpaceAmbientOcclusionIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The intensity of the screen-space ambient occlusion effect applied in camera rendering.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
The default value of this property is zero, disabling SSAO effects. Increasing the intensity value creates deeper, bolder shadows.

(Read and Write property)

170.10.37 screenSpaceAmbientOcclusionNormalThreshold as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The magnitude of the blur effect applied to create ambient occlusion shadows.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
SSAO shadowing includes a blur effect to realistically soften differences in shadow between adjacent pixels, which depends on both the smoothness of scene geometry and this factor. Larger blur factors create a softer, more spread-out blur; smaller factors create coarser shadowing effects.
(Read and Write property)

170.10.38 screenSpaceAmbientOcclusionRadius as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The distance, in units of scene space, at which ambient occlusion takes effect.
Notes: Ambient occlusion is an effect that improves material shading by calculating the amounts of ambient light that reach various parts of a surface, creating shadows on parts of a geometry where incoming light is obscured by other parts of the geometry. (You can provide pre-rendered ambient occlusion effects for a material using its ambientOcclusion property.) Screen-space ambient occlusion (SSAO) provides a real-time approximation of this effect for the entire scene viewed through the camera.
SSAO effects work by storing relevant scene geometry information for each pixel, and using that information to produce per-pixel shading effects. This screenSpaceAmbientOcclusionRadius property determines the area in scene space to consider around each pixel for determining the amount of incoming ambient light blocked by surrounding geometry (and thus the amount of shadow effect to apply). The default value is 5; smaller values cause SSAO effects to apply only to finer geometry details, while larger values affect coarser details.
(Read and Write property)

170.10.39 SensorHeight as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The vertical size of the camera's imaging plane, in millimeters.
Notes: The sensorHeight and focalLength properties determine the camera's horizontal and vertical viewing angles using terms that model physical camera devices. (Alternatively, you can work with viewing angle directly though the fieldOfView property.) For example, with the default sensor height of 24 mm and default

focal length of 50 mm, the vertical field of view is 60¬∞.
Setting the fieldOfView property causes SceneKit to automatically recalculate the focalLength value, and setting the sensorHeight or focalLength property recalculates fieldOfView.
(Read and Write property)

170.10.40 UsesOrthographicProjection as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the camera uses an orthographic projection.
Notes: The default value of this property is false, specifying a perspective projection. In a perspective projection, equally sized objects nearer to the camera appear larger than those farther away.
Set the value of this property to true to specify an orthographic projection. In an orthographic projection, equally sized objects appear equally sized regardless of distance from the camera.
To control the magnification factor of an orthographic camera, use its orthographicScale property.
(Read and Write property)

170.10.41 vignettingIntensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The magnitude of vignette (darkening around edges) effect to apply to the rendered scene.
Notes: A vignette effect darkens the edges and corners of the rendered scene, simulating the effect of lens and barrel shape on the image produced by a physical camera. Higher values result in more darkening, and lower values result in a subtler effect. The default value of 0.0 results in no vignetting effect.
This property controls the level of darkening applied; the vignettingPower property controls the area of the rendered image to be darkened.
To enable this behavior, you must first enable the wantsHDR setting.
(Read and Write property)

170.10.42 vignettingPower as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The amount of the rendered scene to darken with a vignette effect.
Notes: A vignette effect darkens the edges and corners of the rendered scene, simulating the effect of lens and barrel shape on the image produced by a physical camera. Higher values result apply the darkening effect to a broader area around the edges of the rendered image, and lower values apply the effect to a smaller area, leaving more of the rendered image at full brightness. The default value of 0.0 results in no vignetting effect.
This property controls the area of the rendered image to be darkened; the vignettingIntensity property controls the level of darkening applied to those areas.
To enable this behavior, you must first enable the wantsHDR setting.

(Read and Write property)

170.10.43 WantsDepthOfField as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit renders depth-of-field blur effects for the camera.
Notes: This value is false by default, disabling depth-of-field effects.
Enabling this property causes SceneKit to render blur effects that model those created by a physical camera device (also known as bokeh). That is, objects in the scene appear more or less blurry depending on their distance from the camera and the camera's focusDistance, and the intensity and style of the blur effect depend on the fStop and apertureBladeCount properties.

Note
For best results, also enable the wantsHDR property when using depth-of-field effects. High Dynamic Range rendering provides high contrast for distant bright points in the scene, creating more pronounced bokeh effects.
(Read and Write property)

170.10.44 WantsExposureAdaptation as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit automatically adjusts the exposure level.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. One measure of tone mapping is the exposure value, whose effect on the output is similar to that of the shutter speed (or exposure time) of a real-world camera—lower exposure values result in a darker image, and higher exposures result in a brighter image. You cannot adjust exposure value directly—instead, SceneKit determines a tone mapping curve (including the exposure level) from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties along with a measure of scene luminance.

If this property,Äôs value is true (the default), SceneKit automatically measures the current luminance visible to the camera during rendering, and adjusts the exposure level accordingly. Additionally, when the scene luminance changes, SceneKit automatically animates a transition to the new exposure level (see the exposureAdaptationBrighteningSpeedFactor and exposureAdaptationDarkeningSpeedFactor properties).

Note
The visual effect of automatic exposure is similar to how human visual perception adjusts to changes in environmental lighting. For example, consider a game scene where the player moves from a darkened area into full daylight. At first, the exposure value is low, allowing for visible detail in the darkened area, but

no detail in the white daylight outside. As the player moves into the daylight, the entire view becomes blindingly bright, but over a brief time the player,Äôs vision adapts: detail becomes visible in the bright area, and the darkened area loses detail.

If this property,Äôs value is false, SceneKit,Äôs tone mapping effect is constant. Instead of responding to scene luminance, SceneKit uses the averageGray property to determine the tone mapping curve.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

170.10.45 WantsHDR as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit applies High Dynamic Range (HDR) post-processing effects to a scene.
Notes: When this property,Äôs value is false (the default), SceneKit performs lighting calculations in a color space whose brightness range is similar to that of the output display. This approach limits the ability to perform realistic rendering of scenes with fine details in brightness levels.
When you enable HDR rendering for a camera, SceneKit calculates lighting in a much deeper color space, preserving fine details in contrast regardless of brightness, then applies a post-processing effect called tone mapping to translate luminance values from that space to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve (including the exposure level) from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties along with a measure of scene luminance. The wantsExposureAdaptation property determines whether tone mapping effects are static or dynamically respond when the luminance visible to the camera changes.
The default value is false.
(Read and Write property)

170.10.46 whitePoint as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The luminance level to use as the upper end of a tone mapping curve.
Notes: When using a High Dynamic Range (HDR) camera, SceneKit applies a process called tone mapping to translate the wide range of luminance values in the visible scene to the narrower range of brightness values that can be shown on a display. SceneKit determines a tone mapping curve from the minimumExposure, maximumExposure, exposureOffset, and whitePoint properties, along with a measure of scene luminance.
The default value is 1.0. By setting this property to a higher or lower value, you can produce more gradual or more abrupt transitions between shadows and highlights.
This property has no effect if the wantsHDR value is false.
(Read and Write property)

170.10.47 zFar as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The camera,Äôs far depth limit. Animatable.
Notes: The far value determines the maximal distance between the camera and a visible surface. If a surface is farther from the camera than this distance, the surface is clipped and does not appear. The default far value is 100.0.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.10.48 zNear as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The camera's near depth limit. Animatable.
Notes: The near value determines the minimal distance between the camera and a visible surface. If a surface is closer to the camera than this distance, the surface is clipped and does not appear. The near value must not be zero. The default near value is 1.0.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.10.49 Constants

Orthographic Projection

Constant	Value	Description
kProjectionDirectionHorizontal	1	The camera's field of view or orthographic scale are measured horizontally.
kProjectionDirectionVertical	0	The camera's field of view or orthographic scale are measured vertically.

170.11 class SCNCapsuleMBS

170.11.1 class SCNCapsuleMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNCapsule represents a capsule with controllable height and cap radius.
Notes: Subclass of the SCNGeometryMBS class.

170.11.2 Methods

170.11.3 capsule(capRadius as double, height as double) as SCNCapsuleMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a capsule with given radius and height.
Notes: capRadius: The radius of the capsule.
height: The height of the capsule.

170.11.4 Constructor(capRadius as double, height as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a capsule with given radius and height.
Notes: capRadius: The radius of the capsule.
height: The height of the capsule.

170.11.5 Properties

170.11.6 capRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The cap radius of the capsule. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 0.5.
(Read and Write property)

170.11.7 capSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions in the cap. Animatable.
Notes: If the value is less than 2, the behavior is undefined. The default value is 24.
(Read and Write property)

170.11.8 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the capsule. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 2.
(Read and Write property)

170.11.9 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.11.10 radialSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the radial coordinate. Animatable.
Notes: If the value is less than 3, the behavior is undefined. The default value is 48.

(Read and Write property)

170.12 class SCNConeMBS

170.12.1 class SCNConeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNCone represents a cone with controllable height, top radius and bottom radius.
Notes: Subclass of the SCNGeometryMBS class.

170.12.2 Methods

170.12.3 cone(topRadius as double, bottomRadius as double, height as double) as SCNConeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a cone with given top radius, bottom radius and height.
Notes: topRadius: The radius at the top of the cone.
bottomRadius: The radius at the bottom of the cone.
height: The height of the cone.

170.12.4 Constructor(topRadius as double, bottomRadius as double, height as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a cone with given top radius, bottom radius and height.
Notes: topRadius: The radius at the top of the cone.

bottomRadius: The radius at the bottom of the cone.
height: The height of the cone.

170.12.5 Properties

170.12.6 bottomRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The radius at the bottom of the cone. Animatable.
Notes: If the value is less than 0, the geometry is empty. The default value is 0.5.
(Read and Write property)

170.12.7 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the cone. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.12.8 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.12.9 radialSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the radial coordinate. Animatable.
Notes: If the value is less than 3, the behavior is undefined. The default value is 48.
(Read and Write property)

170.12.10 topRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The radius at the top of the cone. Animatable.
Notes: If the value is less than 0, the geometry is empty. The default value is 0.
(Read and Write property)

170.13 class SCNConstraintMBS

170.13.1 class SCNConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The abstract superclass for objects that automatically adjust the position, rotation, or scale of a node based on specified rules.
Notes: To control the transform (position, rotation, and scale) of one or more SCNNodeMBS objects with constraints, create and configure instances of the SCNConstraint subclass that provides the behavior you want, then add those constraint objects to each node's constraints array.

When SceneKit prepares to render a scene, it examines the list of constraints attached to each node to determine the transform for that node, then applies the new transformation before displaying the scene.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.13.2 Methods

170.13.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

170.13.4 copy as SCNConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the constraint object.

170.13.5 Properties

170.13.6 Enabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines whether the constraint is enabled or not.
Notes: Defaults to true.
(Read and Write property)

170.13.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.13.8 Incremental as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies whether or not the contraint should applies incrementally and have it's effect being cumulated over the rendered frames.
Notes: Defaults to true on macOS 10.13, iOS 11, tvOS 11 and watchOS 4. Defaults to false in earlier versions.
(Read and Write property)

170.13.9 influenceFactor as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The influence of the constraint on the node,Äôs transformation.
Notes: Use this property to relax the effect of a constraint on the nodes it applies to. For example, consider a node containing a spotlight, constrained by an SCNLookAtConstraintMBS object to point toward another node containing a moving game character. If the constraint,Äôs influence factor is 1.0, SceneKit adjusts the spotlight node to point directly at the game character each time it renders a frame. If you reduce the influence factor to 0.5, each time SceneKit renders a frame it moves the spotlight halfway from its current orientation to the target orientation. As a result, the spotlight continues to follow the moving character, but with a slight lag.

The default influence factor is 1.0, specifying that SceneKit apply the full effect of the constraint every frame. An influence factor of 0.0 means the constraint has no effect.

This property has no effect on SCNTransformConstraintMBS objects.
(Read and Write property)

170.14 control SCNControlMBS

170.14.1 control SCNControlMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a SCNViewMBS.
Notes: This control embeds a special SCNView subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

To learn about rendering events, please check here:
https://developer.apple.com/documentation/scenekit/scnscenerendererdelegate?language=objc

You can set PreferLowPowerDevice and PreferredRenderingAPI properties before initializing a view.

170.14.2 Properties

170.14.3 View as SCNViewMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

170.14.4 Events

170.14.5 BoundsChanged

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

170.14.6 Close

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

170.14.7 Closing

Plugin Version: 18.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

170.14.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Mac64bit Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

170.14.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

170.14.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

170.14.11 EnableMenuItems

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

170.14.12 FocusLost

Plugin Version: 18.4, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

170.14.13 FocusReceived

Plugin Version: 18.4, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

170.14.14 FrameChanged

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

170.14.15 GotFocus

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

170.14.16 LostFocus

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

170.14.17 MenuBarSelected

Plugin Version: 18.4, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

170.14.18 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown.
If you return False, the system handles the MouseDown so the above event handlers do not get called.

170.14.19 MouseDrag(x as Integer, y as Integer)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

170.14.20 MouseUp(x As Integer, y As Integer)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

170.14.21 Open

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

170.14.22 Opening

Plugin Version: 18.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

170.14.23 rendererDidApplyAnimations(time as double)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur after actions and animations are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this method to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

170.14.24 rendererDidApplyConstraints(time as double)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Invoked on the control once the scene renderer did apply the constraints.
Notes: time The time at which the constraints were simulated.

All modifications done within this method don't go through the transaction model, they are directly applied on the presentation tree.

170.14.25 rendererDidRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Tells the control that the renderer has rendered the scene.
Notes: scene: The scene object that was rendered.
time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this method to perform custom drawing after SceneKit has rendered a scene—for example, to draw overlay content on top of SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this method—the results of modifying SceneKit objects in this method are undefined.

- To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
- To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this method. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

170.14.26 rendererDidSimulatePhysics(time as double)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur after physics simulations are performed.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this event exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

This event is the last opportunity SceneKit provides for you to change the scene graph before rendering.

170.14.27 rendererUpdate(time as double)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Tells the control to perform any updates that need to occur before actions, animations, and physics are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

170.14.28 rendererWillRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Tells the control that the renderer has cleared the viewport and is about to render the scene.
Notes: scene: The SCNSceneMBS object to be rendered.
time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this event to perform custom drawing before SceneKit renders a scene—for example, to draw backdrop content underneath SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this event—the results of modifying SceneKit objects during this event are undefined.

To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this event. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

170.14.29 ScaleFactorChanged(NewFactor as double)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

170.14.30 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

170.15 class SCNCylinderMBS

170.15.1 class SCNCylinderMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNCylinder represents a cylinder with controllable height and radius.
Notes: Subclass of the SCNGeometryMBS class.

170.15.2 Methods

170.15.3 Constructor(radius as double, height as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a cylinder with given radius and height.

170.15.4 cylinder(radius as double, height as double) as SCNCylinderMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a cylinder with given radius and height.

170.15.5 Properties

170.15.6 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the cylinder. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.15.7 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.15.8 radialSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the radial coordinate. Animatable.
Notes: If the value is less than 3, the behavior is undefined. The default value is 48.
(Read and Write property)

170.15.9 radius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The radius of the cylinder. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 0.5.
(Read and Write property)

170.16 class SCNDistanceConstraintMBS

170.16.1 class SCNDistanceConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNDistanceConstraint ensure a minimum/maximum distance with a target node.
Notes: Subclass of the SCNConstraintMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.16.2 Methods

170.16.3 Constructor(target as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNDistanceConstraint constraint.

170.16.4 distanceConstraintWithTarget(target as SCNNodeMBS) as SCNDistanceConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNDistanceConstraint constraint.

170.16.5 Properties

170.16.6 maximumDistance as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum distance.
Notes: Defaults to MAXFLOAT. Animatable.
(Read and Write property)

170.16.7 minimumDistance as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum distance.
Notes: Defaults to 0. Animatable.
(Read and Write property)

170.16.8 target as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the target node to keep distance with.
Notes: (Read and Write property)

170.17 class SCNFloorMBS

170.17.1 class SCNFloorMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNFloor represents an infinite plane geometry.
Notes: Subclass of the SCNGeometryMBS class.

170.17.2 Methods

170.17.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a floor.
Notes: A floor is an infinite plane.

170.17.4 floor as SCNFloorMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a floor.
Notes: A floor is an infinite plane.

170.17.5 Properties

170.17.6 length as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The floor extent along the Z axis. Animatable.
Notes: If the value is equal to 0, the floor is infinite on the Z axis. The default value is 0.
(Read and Write property)

170.17.7 reflectionCategoryBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines the node categories to reflect. Defaults to all bits set.
Notes: (Read and Write property)

170.17.8 reflectionFalloffEnd as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the distance from the floor where the falloff finishes. Animatable.
Notes: If the value is 0 then there is no falloff. The default value is 0.
(Read and Write property)

170.17.9 reflectionFalloffStart as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the distance from the floor where the falloff begins. Animatable.
Notes: The default value is 0.
(Read and Write property)

170.17.10 reflectionResolutionScaleFactor as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the resolution scale factor of the buffer used to render the reflection.
Notes: Defaults to 1.0.
(Read and Write property)

170.17.11 reflectivity as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the reflectivity of the floor. Animatable.
Notes: If the value is greater than zero then the surface will reflect other objects in the scene. The default value is 0.25.
(Read and Write property)

170.17.12 width as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The floor extent along the X axis. Animatable.
Notes: If the value is equal to 0, the floor is infinite on the X axis. The default value is 0.
(Read and Write property)

170.18 class SCNGeometryElementMBS

170.18.1 class SCNGeometryElementMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: A container for index data describing how vertices connect to define a three-dimensional object, or geometry.
Notes: You use geometry elements together with SCNGeometrySourceMBS objects to define custom SCNGeometryMBS objects or to inspect the data that composes an existing geometry. You create a custom geometry using a three-step process:

1. Create one or more SCNGeometrySource objects, each of which defines per-vertex information such as position, surface normal, or texture coordinates for all vertices in the geometry.
2. Create at least one SCNGeometryElement object, containing an array of indices identifying vertices in the geometry sources and describing the drawing primitive that SceneKit uses to connect the vertices when rendering the geometry.
3. Create an SCNGeometry instance from the geometry sources and geometry elements.

When SceneKit renders a geometry, each geometry element corresponds to a drawing command sent to the GPU. Because different rendering states require separate drawing commands, you can define a geometry using multiple geometry elements. For example, the teapot geometry shown below has four geometry elements, so you can assign up to four SCNMaterial objects in order to render each element with a different appearance. But because each drawing command incurs a CPU time overhead when rendering, minimizing the number of elements in a custom geometry can improve rendering performance.

- MBS Xojo Plugins, version 19.3pr5

170.18.2 Methods

170.18.3 Constructor(data as MemoryBlock, PrimitiveType as Integer, primitiveCount as Integer, bytesPerIndex as Integer)

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a geometry element from the specified data and options.
Notes: data: The data describing the element.
primitiveType: The drawing primitive that connects vertices when rendering the geometry element. For possible values, see SCNGeometryPrimitiveType.
primitiveCount: The number of primitives in the element.
bytesPerIndex: The number of bytes that represent a single index value in the data.

Returns a new geometry element object.

An element,Äôs data is an array of index values identifying vertices in a geometry source. SceneKit interprets the data as an array of unsigned integers (whose size is specified by the bytesPerIndex parameter), and then connects the vertices in the order specified by this array, arranged according to the primitiveType parameter. To create a custom SCNGeometryMBS object from the geometry element, use the geometryWithSources() method.

170.18.4 geometryElementWithData(data as MemoryBlock, PrimitiveType as Integer, primitiveCount as Integer, bytesPerIndex as Integer) as SCNGeometryElementMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a geometry element from the specified data and options.
Notes: data: The data describing the element.
primitiveType: The drawing primitive that connects vertices when rendering the geometry element. For possible values, see SCNGeometryPrimitiveType.
primitiveCount: The number of primitives in the element.
bytesPerIndex: The number of bytes that represent a single index value in the data.

Returns a new geometry element object.

An element,Äôs data is an array of index values identifying vertices in a geometry source. SceneKit interprets the data as an array of unsigned integers (whose size is specified by the bytesPerIndex parameter), and then connects the vertices in the order specified by this array, arranged according to the primitiveType parameter. To create a custom SCNGeometryMBS object from the geometry element, use the geometryWithSources() method.

170.18.5 Properties

170.18.6 bytesPerIndex as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The number of bytes that represent each index value in the element,Äôs data.
Notes: An element,Äôs data property holds an array of index values identifying vertices in a geometry source. SceneKit interprets the data as an array of unsigned integers, whose size is specified by the bytesPerIndex property.
(Read only property)

170.18.7 Data as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The data describing the geometry element.
Notes: An element,Äôs data is an array of index values identifying vertices in a geometry source. SceneKit interprets the data as an array of unsigned integers, whose size is specified by the bytesPerIndex property.
(Read only property)

170.18.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.18.9 maximumPointScreenSpaceRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The largest radius, measured in screen points, at which to render any point in the geometry element.
Notes: Some visual effects call for rendering a geometry as a collection of individual points—that is, a point cloud, not a solid surface or wireframe mesh. When you use this option, SceneKit can render each point as a small 2D surface that always faces the camera. By applying a texture or custom shader to that surface, you can efficiently render many small objects at once.
To render a geometry element as a point cloud, you must set three properties: pointSize, minimumPointScreenSpaceRadius, and maximumPointScreenSpaceRadius. Use pointSize to determine how large each point appears in world space, so that points farther away appear as smaller 2D surfaces. Use the minimum and maximum radius properties to ensure that the on-screen rendering of each point fits within a certain range of pixel sizes.
For example, to render a point cloud where each point is always one pixel wide (like a field of stars), set both the minimum and maximum sizes to one pixel. To render a group of objects whose screen sizes vary with perspective (like a set of images representing planets), set the minimum size to one pixel and the maximum size to a much larger value.
(Read and Write property)

170.18.10 minimumPointScreenSpaceRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The smallest radius, measured in screen points, at which to render any point in the geometry element.

Notes: Some visual effects call for rendering a geometry as a collection of individual points—that is, a point cloud, not a solid surface or wireframe mesh. When you use this option, SceneKit can render each point as a small 2D surface that always faces the camera. By applying a texture or custom shader to that surface, you can efficiently render many small objects at once.
To render a geometry element as a point cloud, you must set three properties: pointSize, minimumPointScreenSpaceRadius, and maximumPointScreenSpaceRadius. Use pointSize to determine how large each point appears in world space, so that points farther away appear as smaller 2D surfaces. Use the minimum and maximum radius properties to ensure that the on-screen rendering of each point fits within a certain range of pixel sizes.
For example, to render a point cloud where each point is always one pixel wide (like a field of stars), set both the minimum and maximum sizes to one pixel. To render a group of objects whose screen sizes vary with perspective (like a set of images representing planets), set the minimum size to one pixel and the maximum size to a much larger value.
(Read and Write property)

170.18.11 pointSize as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The width of each point in the geometry element, as measured in the geometry's local 3D coordinate space.
Notes: Some visual effects call for rendering a geometry as a collection of individual points—that is, a point cloud, not a solid surface or wireframe mesh. When you use this option, SceneKit can render each point as a small 2D surface that always faces the camera. By applying a texture or custom shader to that surface, you can efficiently render many small objects at once.
To render a geometry element as a point cloud, you must set three properties: pointSize, minimumPointScreenSpaceRadius, and maximumPointScreenSpaceRadius. Use pointSize to determine how large each point appears in world space, so that points farther away appear as smaller 2D surfaces. Use the minimum and maximum radius properties to ensure that the on-screen rendering of each point fits within a certain range of pixel sizes.
(Read and Write property)

170.18.12 primitiveCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The number of primitives in the element.
Notes: (Read only property)

170.18.13 primitiveRange as NSRangeMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The range of primitives from the geometry element to render.
Notes: The default value for this property is an NSRangeMBS whose location is NSNotFound (-1) and length is zero, indicating that, by default, SceneKit renders the entire set of primitives specified by a geometry element's data buffer.
You can change a geometry without redefining it by choosing to render only a subset of the primitives specified by a geometry element. To do so, set this property to a subrange of primitive indexes.
(Read and Write property)

170.18.14 primitiveType as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The drawing primitive that connects vertices when rendering the geometry element.
Notes: (Read only property)

170.18.15 Constants

Primitive Types

Constant	Value	Description
PrimitiveTypeLine	2	The geometry element,Äôs data is a sequence of line segments, with each line segment described by two new vertices.
PrimitiveTypePoint	3	The geometry element,Äôs data is a sequence of unconnected points.
PrimitiveTypePolygon	4	The geometry element,Äôs data is a sequence of arbitrary polygons. see https://developer.apple.com/documentation/scenekit/scngeometryprimitivetype/scngeometryprimitivetypepolygon?language=objc
PrimitiveTypeTriangles	0	The geometry element,Äôs data is a sequence of triangles, with each triangle described by three new vertices.
PrimitiveTypeTriangleStrip	1	The geometry element,Äôs data is a sequence of triangles, with each triangle described by one new vertex and two vertices from the previous triangle.

170.19 class SCNGeometryMBS

170.19.1 class SCNGeometryMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A three-dimensional shape (also called a model or mesh) that can be displayed in a scene, with attached materials that define its appearance.
Notes: In SceneKit, geometries attached to SCNNode objects form the visible elements of a scene, and SCNMaterial objects attached to a geometry determine its appearance.

Working with Geometry Objects

You control a geometry,Äôs appearance in a scene with nodes and materials. A geometry object provides only the form of a visible object rendered by SceneKit. You specify color and texture for a geometry,Äôs surface, control how it responds to light, and add special effects by attaching materials (for details, see the methods in Managing a Geometry,Äôs Materials). You position and orient a geometry in a scene by attaching it to an SCNNode object. Multiple nodes can reference the same geometry object, allowing it to appear at different positions in a scene.

You can easily copy geometries and change their materials. A geometry object manages the association between immutable vertex data and a mutable assignment of materials. To make a geometry appear more than once in the same scene with a different set of materials, use its inherited copy method. The copy shares the underlying vertex data of the original, but can be assigned materials independently. You can thus make many copies of a geometry without incurring a significant cost to rendering performance.

You can animate a geometry object. The vertex data associated with a geometry is immutable, but SceneKit provides several ways to animate geometry. You can use a SCNMorpher or SCNSkinner object to deform a geometry,Äôs surface, or run animations created in an external 3D authoring tool and loaded from a scene file. You can also use methods in the SCNShadable protocol to add custom GLSL shader programs that alter SceneKit,Äôs rendering of a geometry.

Obtaining a Geometry Object

SceneKit provides several ways to introduce geometry objects to your app:

Action	For further information
Load from a scene file created using external 3D authoring tools	SCNScene, SCNSceneSource
Use and customize SceneKit,Äôs built-in primitive shapes	SCNPlane, SCNBox, SCNSphere, SCNPyramid, SCNCone, SCNCylinder, SCNCapsule, SCNTube, and SCNTorus
Create 3D geometry from 2D text or B√©zier curves	SCNText, SCNShape
Create a custom geometry from vertex data	SCNGeometrySource, SCNGeometryElement, geometryWithSources.

170.19.2 Methods

170.19.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new geometry object with no content (or default content).
Notes: This method creates a geometry with no visible content. You can use an empty geometry with another geometry,Äôs levelsOfDetail property to make the geometry disappear when it is too far away from the camera to usefully render.
SceneKit,Äôs SCNGeometryMBS subclasses use this method to create geometry instances with default contents. For example, if you call this method on the SCNSphereMBS class, it creates a sphere geometry whose radius property has the default value of 0.5.
You cannot add geometry sources or elements to a geometry object after creating it. To create a custom geometry from your own source and element data, use the geometryWithSources method.

170.19.4 copy as SCNGeometryMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the geometry.

170.19.5 geometry as SCNGeometryMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new geometry object with no content (or default content).
Notes: This method creates a geometry with no visible content. You can use an empty geometry with another geometry,Äôs levelsOfDetail property to make the geometry disappear when it is too far away from the camera to usefully render.
SceneKit,Äôs SCNGeometryMBS subclasses use this method to create geometry instances with default contents. For example, if you call this method on the SCNSphereMBS class, it creates a sphere geometry whose

radius property has the default value of 0.5.
You cannot add geometry sources or elements to a geometry object after creating it. To create a custom geometry from your own source and element data, use the geometryWithSources method.

170.19.6 geometryElementAtIndex(index as Integer) as SCNGeometryElementMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the geometry element at a specified index.
Notes: Each SCNGeometryElementMBS object describes how vertices from the geometry,Äôs sources are combined into polygons to create the geometry,Äôs shape. Visible geometries contain at least one element.

170.19.7 geometryElements as SCNGeometryElementMBS()

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of geometry elements that describe the geometry,Äôs shape.
Notes: Each SCNGeometryElementMBS object describes how vertices from the geometry,Äôs sources are combined into polygons to create the geometry,Äôs shape. Visible geometries contain at least one element. For geometries with multiple elements, you can use the materials property to attach different materials to each element.

170.19.8 geometrySources as SCNGeometrySourceMBS()

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of geometry sources that provide vertex data for the geometry.
Notes: Each SCNGeometrySourceMBS object describes an attribute of all vertices in the geometry (such as vertex position, surface normal vector, color, or texture mapping coordinates) identified by the source,Äôs semantic property. A geometry always has at least one source (for the SCNGeometrySourceSemanticVertex semantic), typically has additional sources for use in lighting and shading, and may have other sources for skeletal animation or surface subdivision information.

170.19.9 geometrySourcesForSemantic(semantic as String) as SCNGeometrySourceMBS()

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the geometry sources for a specified semantic.
Notes: semantic: A constant identifying a semantic for which to return geometry sources. See Geometry Semantic Identifiers for possible values.

Returns an array of SCNGeometrySource objects, or nil if the geometry has no source for the specified semantic.

Each SCNGeometrySourceMBS object describes an attribute of all vertices in the geometry (such as vertex position, surface normal vector, color, or texture mapping coordinates) identified by the source,Äôs semantic property. A geometry always has at least one source, for the SCNGeometrySourceSemanticVertex semantic, typically has additional sources for use in lighting and shading, and may have other sources for skeletal animation or surface subdivision information.
The vertex, normal, and color semantics each refer to at most one source. A geometry may have multiple sources for the SCNGeometrySourceSemanticTexcoord semantic—in this case, indices in the returned array correspond to values for the mappingChannel property used when attaching textures to materials.

170.19.10 geometryWithSources(sources() as SCNGeometrySourceMBS, elements() as SCNGeometryElementMBS) as SCNGeometryMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new geometry built from the specified geometry sources and elements.
Notes: sources: An array of SCNGeometrySourceMBS objects describing vertices in the geometry and their attributes.
elements: An array of SCNGeometryElementMBS objects describing how to connect the geometry,Äôs vertices.

A geometry,Äôs visible content comes from the combination of geometry sources, which contain data describing its vertices, with geometry elements, which contain data describing how the vertices connect to form a surface.
Each SCNGeometrySourceMBS object describes an attribute of all vertices in the geometry (vertex position, surface normal vector, color, or texture mapping coordinates) identified by the source,Äôs semantic property. To create a custom geometry you must provide at least one source, for the SCNGeometrySourceSemanticVertex semantic. Typically, you also provide sources for normals and texture coordinates for use in lighting and shading.
Sources for the vertex, normal, and color semantics must be unique—if multiple objects in the sources array have the same semantic, SceneKit uses only the first. A geometry may have multiple sources for the SCNGeometrySourceSemanticTexcoord semantic—the order of texture coordinate sources in the sources array determines the value to use for the mappingChannel property when attaching materials.
Each SCNGeometryElementMBS object describes how vertices from the geometry sources are combined into polygons to create the geometry,Äôs shape. Creating a custom geometry requires at least one element. If the elements array contains multiple objects, their order determines the arrangement of the geometry,Äôs materials—for details, see the discussion of the materials property.

170.19.11 insertMaterial(Material as SCNMaterialMBS, Index as Integer)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Insert a material in the materials array at the specified index.
Notes: material: The material to insert.
index: Index in the materials array to insert the new material.

170.19.12 levelsOfDetail as SCNLevelOfDetailMBS()

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: An array of SCNLevelOfDetail objects for managing the geometry,Äôs appearance when viewed from far away.
Notes: Because rendering a complex geometry incurs a performance cost, you can use level-of-detail objects to substitute simpler geometries in its place as its distance from the point of view camera increases (or its apparent size decreases). For details, see SCNLevelOfDetailMBS.

170.19.13 materials as SCNMaterialMBS()

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the receiver's materials array.
Notes: Each geometry element can be rendered using a different material. The index of the material used for a geometry element is equal to the index of that element modulo the number of materials.

170.19.14 materialWithName(name as string) as SCNMaterialMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Return the first material from the materials array of the receiver with the specified name.
Notes: name: The name of the material to retrieve.

170.19.15 removeMaterial(Index as Integer)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Remove the material at the specified index from the materials array.
Notes: index: The index of the material to remove from the 'materials' array.

170.19.16 replaceMaterial(Index as Integer, Material as SCNMaterialMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Remove the material at the index 'index' from the materials array of the receiver and insert 'material' in its position.
Notes: index: The index of the material to replace in the materials array.
material: The new material that will replace the previous one.

170.19.17 setLevelsOfDetail(LevelsOfDetails() as SCNLevelOfDetailMBS = nil)

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Sets an array of SCNLevelOfDetail objects for managing the geometry,Äôs appearance when viewed from far away.
Notes: Value can be nil to clear it.

170.19.18 setMaterials(materials() as SCNMaterialMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the materials.

170.19.19 Properties

170.19.20 edgeCreasesElement as SCNGeometryElementMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The geometry element identifying which edges of the geometry,Äôs surface should remain sharp after subdivision.
Notes: This geometry element,Äôs primitiveType value must be SCNGeometryPrimitiveTypeLine. The geometry element,Äôs data is an array of vertex indices, each pair of which defines a line segment identifying an edge to be treated as a crease during subdivision. Use the edgeCreasesSource property to specify the smoothness or sharpness of each crease.
(Read and Write property)

170.19.21 edgeCreasesSource as SCNGeometrySourceMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The geometry source specifying the smoothness or sharpness of edges after surface subdivision.
Notes: This geometry source,Äôs semantic value must be SCNGeometrySourceSemanticEdgeCrease. Its data is an array of scalar values (that is, the source,Äôs componentsPerVector value is 1). The value at an index in the geometry source determines the smoothness or sharpness of the edge identified by the primitive

at the corresponding index in the edgeCreasesElement geometry element: a value of 0.0 specifies a completely smoothed edge, and a value of 10.0 or greater specifies an infinitely sharp edge.
(Read and Write property)

170.19.22 firstMaterial as SCNMaterialMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines the first material of the geometry. Returns nil if the geometry has no material.
Notes: This method is here for convenience. It is equivalent to the first object in the "materials" array above.
(Read and Write property)

170.19.23 geometryElementCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the number of geometry elements owned by the geometry.
Notes: (Read only property)

170.19.24 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.19.25 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A name associated with the geometry object.
Notes: You can provide a descriptive name for a geometry object to make managing your scene graph easier. Geometries loaded from a scene file may have names assigned by an artist using a 3D authoring tool. Use the SCNSceneSourceMBS class to examine geometries in a scene file without loading its scene graph.

Geometry names are saved when you export a scene to a file using its writeToURL method. They also appear in the Xcode scene editor.
(Read and Write property)

170.19.26 shaderModifiers as Dictionary

MBS Mac64bit Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop & iOS.

Function: A dictionary of GLSL source code snippets for customizing the shader programs provided by SceneKit.
Notes: The dictionary,Äôs keys must be from the set of constants described in Shader Modifier Entry Point Keys. Each key represents a possible entry point in SceneKit,Äôs shader programs, whose corresponding value is a string containing a shader source code snippet to be included in the shader program at that entry point.

See Use Shader Modifiers to Extend SceneKit Shading in the protocol overview for a complete discussion of shader modifiers.
https://developer.apple.com/documentation/scenekit/scnshadable#1654834
(Read and Write property)

170.19.27 subdivisionLevel as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the subdivision level of the receiver.
Notes: Defaults to 0.
A subdivision level of 0 means no subdivision. When the ‘tessellator‘ property of the receiver is not nil, the refinement is done on the GPU.
(Read and Write property)

170.19.28 tessellator as SCNGeometryTessellatorMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies how the geometry should be tessellated at render time on the GPU.
Notes: Defaults to nil.
(Read and Write property)

170.19.29 wantsAdaptiveSubdivision as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies if the subdivision is adaptive or uniform.
Notes: Defaults to true.
Adaptive subdivision requires that the ‘tessellator‘ property of the receiver is not nil.
(Read and Write property)

170.20 class SCNGeometrySourceMBS

170.20.1 class SCNGeometrySourceMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: A container for vertex data forming part of the definition for a three-dimensional object, or geometry.
Notes: You use geometry sources together with SCNGeometryElement objects to define custom SCNGeometry objects or to inspect the data that composes an existing geometry.

see
https://developer.apple.com/documentation/scenekit/scngeometrysource

- MBS Xojo Plugins, version 19.3pr5

170.20.2 Methods

170.20.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

170.20.4 geometrySourceWithData(data as MemoryBlock, Semantic as String, vectorCount as Integer, floatComponents as boolean, componentsPerVector as Integer, bytesPerComponent as Integer, dataOffset as Integer, dataStride as Integer) as SCNGeometrySourceMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a geometry source from the specified data and options.
Notes: data: The data for the geometry source.
semantic: The semantic value (or attribute) that the geometry source describes for each vertex. See Geometry Semantic Identifiers for available values.
vectorCount: The number of geometry source vectors.
floatComponents: A Boolean value that indicates whether vector components are floating-point values. Specify true for floating-point values, or false for integer values.
componentsPerVector: The number of scalar components in each vector.

bytesPerComponent: The size, in bytes, of each vector component.
offset: The offset, in bytes, from the beginning of the data to the first vector component to be used in the geometry source.
stride: The number of bytes from each vector to the next in the data.

Returns a new geometry source object.

sA geometry source,Äôs data is an array of vectors, each of which represents a particular attribute (or semantic) of a vertex in the geometry. The other parameters determine how SceneKit interprets this data. For example, an array of vertex positions may have three 32-bit floating-point components per vector, but an array of texture coordinates may have two 8-bit integer coponents per vector. You can use the offset and stride parameters together to interleave data for multiple geometry sources in the same array, improving rendering performance. See SCNGeometrySourceMBS for details.
To create a custom SCNGeometryMBS object from the geometry source, use the geometryWithSources method.

170.20.5 geometrySourceWithNormals(Normals() as SCNVector3MBS) as SCNGeometrySourceMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a geometry source from an array of normal vectors.
Notes: normals: An array of three-component vectors, each of which represents a surface normal for the geometry source.

A new geometry source whose SCNGeometrySource property is SCNGeometrySourceSemanticNormal.

SceneKit converts this data to its own format to optimize rendering performance. To read the converted data, examine the properties of the created SCNGeometrySourceMBS object.
To create a custom SCNGeometryMBS object from the geometry source, use the geometryWithSources method.
See also:

- 170.20.6 geometrySourceWithNormals(texcoord() as CGPointMBS) as SCNGeometrySourceMBS 20611

170.20.6 geometrySourceWithNormals(texcoord() as CGPointMBS) as SCNGeometrySourceMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a geometry source from an array of texture coordinate points.
Notes: texcoord: An array of points, each of which represents a texture coordinate pair for the geometry

source.

A new geometry source whose SCNGeometrySource property is SCNGeometrySourceSemanticTexcoord.

SceneKit converts this data to its own format to optimize rendering performance. To read the converted data, examine the properties of the created SCNGeometrySourceMBS object.
To create a custom SCNGeometryMBS object from the geometry source, use the geometryWithSources:elements: method.
See also:

- 170.20.5 geometrySourceWithNormals(Normals() as SCNVector3MBS) as SCNGeometrySourceMBS 20611

170.20.7 geometrySourceWithVertices(vertices() as SCNVector3MBS) as SCNGeometrySourceMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a geometry source from an array of vertex positions.
Notes: vertices: An array of three-component vectors, each of which represents a vertex position for the geometry source.

Returns a new geometry source whose SCNGeometrySource property is SCNGeometrySourceSemanticVertex.

SceneKit converts this data to its own format to optimize rendering performance. To read the converted data, examine the properties of the created SCNGeometrySourceMBS object.
To create a custom SCNGeometryMBS object from the geometry source, use the geometryWithSources method.

170.20.8 SCNGeometrySourceSemanticBoneIndices as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for bone index data, used for skeletal animation of skinned surfaces.
Notes: For a geometry source, this semantic identifies data containing skeletal animation data for each vertex in the geometry. SceneKit uses this information to determine which bone nodes in the skeleton affect the behavior of each vertex.
For a custom shader program, you use this semantic to bind SceneKit,Äôs bone index data to an input attribute of the shader.
For details on skeletal animation, see SCNSkinnerMBS.

170.20.9 SCNGeometrySourceSemanticBoneWeights as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for bone weight data, used for skeletal animation of skinned surfaces.
Notes: For a geometry source, this semantic identifies data containing skeletal animation data for each vertex in the geometry. SceneKit uses this information to determine how much a vertex,Äôs position is influenced by the positions of bone nodes in the skeleton.
For a custom shader program, you use this semantic to bind SceneKit,Äôs bone weight data to an input attribute of the shader.
For details on skeletal animation, see SCNSkinnerMBS.

170.20.10 SCNGeometrySourceSemanticColor as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for per-vertex color data.
Notes: For a geometry source, this semantic identifies data containing a color for each vertex in the geometry. SceneKit interpolates per-vertex colors across a surface to produce smooth shading. Per-vertex colors modulate those produced by lighting and a geometry,Äôs materials, if applicable.
For a custom shader program, you use this semantic to bind SceneKit,Äôs vertex color data to an input attribute of the shader.
Vertex color data is typically an array of three- or four-component vectors.

170.20.11 SCNGeometrySourceSemanticEdgeCrease as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for edge crease data, used for subdividing surfaces.
Notes: For a geometry source, this semantic identifies data containing crease data for each vertex in the geometry. SceneKit uses this information to determine the sharpness of edges and smoothness of surfaces when you change a geometry,Äôs subdivisionLevel property.
For a custom shader program, you use this semantic to bind SceneKit,Äôs edge crease data to an input attribute of the shader.
Edge crease data is an array of scalar floating-point values, where each value determines the smoothness or sharpness of the edge identified by the primitive at the corresponding index in the geometry,Äôs SceneKit Constants geometry element: A value of 0.0 specifies a completely smoothed edge, and a value of 10.0 or greater specifies an infinitely sharp edge.

170.20.12 SCNGeometrySourceSemanticNormal as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for surface normal data.
Notes: For a geometry source, this semantic identifies data containing the surface normal vector at each vertex in the geometry. SceneKit uses this information to compute lighting effects on the surface.
For a custom shader program, you use this semantic to bind SceneKit,Äôs vertex normal data to an input attribute of the shader.
Vertex normal data is typically an array of three- or four-component vectors.

170.20.13 SCNGeometrySourceSemanticTangent as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for surface tangent vector data.
Notes: For a geometry source, this semantic identifies data containing the surface tangent vector at each vertex in the geometry. SceneKit uses this information to compute advanced lighting effects on the surface.
For a custom shader program, you use this semantic to bind SceneKit,Äôs vertex tangent data to an input attribute of the shader.
Vertex tangent data is typically an array of three- or four-component vectors.

170.20.14 SCNGeometrySourceSemanticTexcoord as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for texture coordinate data.
Notes: For a geometry source, this semantic identifies data containing texture mapping coordinates for each vertex in the geometry. Unlike other semantics, a geometry may contain multiple sources for texture coordinates—each corresponds to a separate mappingChannel number that you can use when associating textured materials.
For a custom shader program, you use this semantic to bind SceneKit,Äôs texture coordinate data to one or more input attributes of the shader.
Texture coordinate data is typically an array of two-component vectors.

170.20.15 SCNGeometrySourceSemanticVertex as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for vertex position data.
Notes: For a geometry source, this semantic identifies data containing the positions of each vertex in the geometry. If you create a custom geometry using the geometryWithSources method, you must provide a geometry source for this semantic.
For a custom shader program, you use this semantic to bind SceneKit,Äôs vertex position data to an input attribute of the shader.
Vertex position data is typically an array of three- or four-component vectors.

170.20.16 SCNGeometrySourceSemanticVertexCrease as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic for vertex crease data, used for subdividing surfaces.
Notes: For a geometry source, this semantic identifies data containing crease data for each vertex in the geometry. SceneKit uses this information to determine the sharpness of corners and smoothness of surfaces when you change a geometry,Äôs subdivisionLevel property.
For a custom shader program, you use this semantic to bind SceneKit,Äôs vertex crease data to an input attribute of the shader.
Vertex crease data is an array of scalar floating-point values, where each value determines the smoothness or sharpness of the corresponding vertex: A value of 0.0 specifies a completely smoothed corner, and a value of 10.0 or greater specifies an infinitely sharp point.

170.20.17 Properties

170.20.18 bytesPerComponent as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The size, in bytes, of each vector component.
Notes: (Read only property)

170.20.19 componentsPerVector as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The number of scalar components in each vector.
Notes: (Read only property)

170.20.20 Data as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The data for the geometry source.
Notes: A geometry source,Äôs data is an array of vectors, each of which represents a particular attribute (or semantic) of a vertex in the geometry. The other properties of the geometry source determine how SceneKit interprets this data. For example, an array of vertex positions may have three 32-bit floating-point components per vector, but an array of texture coordinates may have two 8-bit integer coponents per vector.
(Read only property)

170.20.21 dataOffset as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The offset, in bytes, from the beginning of the data to the first vector component to be used in the geometry source.
Notes: You can use the dataOffset and dataStride parameters can be used together to interleave data for multiple geometry sources in the same array, improving rendering performance. See SCNGeometrySourceMBS for details.
(Read only property)

170.20.22 dataStride as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The number of bytes from a vector to the next one in the data.
Notes: You can use the dataOffset and dataStride parameters can be used together to interleave data for multiple geometry sources in the same array, improving rendering performance. See SCNGeometrySourceMBS for details.
(Read only property)

170.20.23 floatComponents as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether vector components are floating-point values.
Notes: If true, SceneKit interprets the geometry source,Äôs data as an array of vectors whose components are floating-point values. The type of floating-point value is determined by the SCNGeometrySourceMBS property: 4 bytes for float values or 8 bytes for double values.
If false, SceneKit interprets the geometry source,Äôs data as an array of vectors whose components are integer values. The type of integer value is determined by the SCNGeometrySourceMBS property; for example, 2 bytes for unsigned short values or 4 bytes for unsigned int values.
(Read only property)

170.20.24 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.20.25 semantic as String

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The semantic value (or attribute) the geometry source describes for each vertex.
Notes: A semantic describes an attribute for each vertex, such as position, color, surface normal vector, or texture coordinates.
See Geometry Semantic Identifiers for available values.
(Read only property)

170.20.26 vectorCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The number of vectors in the data.
Notes: (Read only property)

170.21 class SCNGeometryTessellatorMBS

170.21.1 class SCNGeometryTessellatorMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: A geometry tessellator describes how a more detailed surface is calculated from the geometry's initial surface.
Blog Entries

- MBS Xojo Plugins, version 19.3pr5

170.21.2 Methods

170.21.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

170.21.4 copy as SCNGeometryTessellatorMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

170.21.5 Properties

170.21.6 Adaptive as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies if the tessellation should be uniform or adaptive.
Notes: Defaults to false.
(Read and Write property)

170.21.7 edgeTessellationFactor as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the edge tessellation factor.
Notes: Defaults to 1.
This has no effect for adaptive subdivision.
(Read and Write property)

170.21.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.21.9 insideTessellationFactor as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the inside tessellation factor.
Notes: Defaults to 1.
This has no effect for adaptive subdivision
(Read and Write property)

170.21.10 maximumEdgeLength as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the maximum edge length.
Notes: Defaults to 1.
This has no effect for non-adaptive subdivision
(Read and Write property)

170.21.11 ScreenSpace as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies if the level of tessellation should be adapted in screenSpace.
Notes: Defaults to false.
(Read and Write property)

170.21.12 smoothingMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The smoothing mode.
Notes: Defaults to SmoothingModeNone.
(Read and Write property)

170.21.13 tessellationFactorScale as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the scale factor applied to the per-patch tessellation factors.
Notes: Defaults to 1.
(Read and Write property)

170.21.14 tessellationPartitionMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the tessellation partition mode.
Notes: Defaults to TessellationPartitionModeInteger.

see also
https://developer.apple.com/documentation/metal/mtltessellationpartitionmode?language=objc
(Read and Write property)

170.21.15 Constants

Smoothing Modes

Constant	Value	Description
SmoothingModeNone	0	
SmoothingModePhong	2	
SmoothingModePNTriangles	1	

Tessellation Partition Modes

Constant	Value	Description
TessellationPartitionModeFractionalEven	3	A fractional even partitioning mode.
TessellationPartitionModeFractionalOdd	2	A fractional odd partitioning mode.
TessellationPartitionModeInteger	1	An integer partitioning mode.
TessellationPartitionModePow2	0	A power of two partitioning mode.

170.22 class SCNHitTestResultMBS

170.22.1 class SCNHitTestResultMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Information about the result of a scene-space or view-space search for scene elements.
Notes: Hit-testing is the process of finding elements of a scene located at a specified point, or along a specified line segment (or ray). An SCNHitTestResult object provides details about one result from a hit-test search. There are three ways to perform a hit-test search. Use the hitTest method of an SCNViewMBS object (or other scene renderer), the hitTestWithSegment method of a node, or the rayTestWithSegment method of your scene,Äôs physics world.

When you perform a hit-test search, SceneKit looks for SCNGeometryMBS objects along the ray you specify. For each intersection between the ray and and a geometry, SceneKit creates a hit-test result to provide information about both the SCNNodeMBS object containing the geometry and the location of the intersection on the geometry,Äôs surface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

170.22.2 Methods

170.22.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

170.22.4 SCNHitTestBackFaceCullingKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option to ignore faces not oriented toward the camera.
Notes: The value for this key is a Boolean value. The default value is true, specifying that back-facing polygons will not be returned as hit-test results.

170.22.5 SCNHitTestBoundingBoxOnlyKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option to search for objects by bounding box only.
Notes: The value for this key is a Boolean value. The default value is false, specifying that hit-testing searches should test against node geometry. Specifying true for this option increases search performance at the expense of geometric accuracy.

170.22.6 SCNHitTestClipToZRangeKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option to search for objects only within the depth range of the current point of view.
Notes: The value for this key is a Boolean value. The default value is true, specifying that hit-testing searches only objects between the zNear and zFar distances of the pointOfView camera. Specify false to include objects outside this depth range in the search.
This option is valid only when hit-testing in the screen space of an SCNSceneRenderer object with the hitTest method.

170.22.7 SCNHitTestIgnoreChildNodesKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option to ignore child nodes when searching.
Notes: The value for this key is a Boolean value. The default value is false, specifying that hit-testing may return objects from any portion of the node hierarchy. Specify true to search only the node specified by the SCNHitTestRootNodeKey key.

170.22.8 SCNHitTestIgnoreHiddenNodesKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option to ignore hidden nodes when searching.
Notes: The value for this key is a Boolean value. The default value is true, specifying that hit-testing should not return nodes whose hidden property value is true. Specify false to search nodes regardless of their visibility.

170.22.9 SCNHitTestOptionCategoryBitMask as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option to search only for objects matching a specified bitmask.
Notes: The value for this key is an integer value. If present, the search will return only nodes that both satisfy the hit test and have a categoryBitMask value overlapping this bitmask.

170.22.10 SCNHitTestOptionSearchMode as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option for the number and order of hit test results to provide.
Notes: The value for this key is an raw integer value of an SCNHitTestSearchMode constant.

170.22.11 SCNHitTestRootNodeKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The root of the node hierarchy to be searched.
Notes: The value for this key is an SCNNodeMBS object. Hit-testing searches only the child node hierarchy under this node. When hit-testing takes place in the screen space of an SCNSceneRenderer object with the hitTest() method, the default value is the presented scene,Äôs root node. When hit-testing is in a node using its hitTestWithSegment(), the default value is the node.

170.22.12 Properties

170.22.13 boneNode as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The hit bone.
Notes: Only available if the node hit has a SCNSkinnerMBS attached.
(Read only property)

170.22.14 faceIndex as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The index of the primitive in the geometry element intersected by the search ray.
Notes: (Read only property)

170.22.15 geometryIndex as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The index of the geometry element whose surface the search ray intersects.
Notes: Every SCNGeometryMBS object contains one or more SCNGeometryElementMBS objects that define how its vertices connect to form a surface. This property provides the index of the geometry element intersecting the search ray. For more information about that geometry element, use the geometry,Äôs geometryElementAtIndex method.
(Read only property)

170.22.16 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.22.17 localCoordinates as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point of intersection between the geometry and the search ray, in the local coordinate system of the node containing the geometry.
Notes: (Read only property)

170.22.18 localNormal as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The surface normal vector at the point of intersection, in the local coordinate system of the node containing the geometry intersected by the search ray.
Notes: (Read only property)

170.22.19 modelTransform as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The world transform matrix of the node containing the intersection.
Notes: Use this matrix to transform vectors from the local coordinate space of the node whose geometry is intersected by the search ray to the scene,Äôs world coordinate system.

(Read only property)

170.22.20 node as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The node whose geometry intersects the search ray.
Notes: (Read only property)

170.22.21 worldCoordinates as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point of intersection between the geometry and the search ray, in the scene,Äôs world coordinate system.
Notes: (Read only property)

170.22.22 worldNormal as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The surface normal vector at the point of intersection, in the scene,Äôs world coordinate system.
Notes: (Read only property)

170.22.23 Constants

Hit Test Search Modes

Constant	Value	Description
SCNHitTestSearchModeAll	1	The hit test should return all possible results, sorted from nearest to farthest.
SCNHitTestSearchModeAny	2	The hit test should return only the first object found, regardless of distance.
SCNHitTestSearchModeClosest	0	The hit test should return only the closes object found.

170.23 class SCNIKConstraintMBS

170.23.1 class SCNIKConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A constraint that applies inverse kinematics to make a chain of nodes ,Äúreach,Äù toward a target point.
Notes: see also
https://developer.apple.com/documentation/scenekit/scnikconstraint
Subclass of the SCNConstraintMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.23.2 Methods

170.23.3 Constructor(chainRootNode as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNIKConstraint object with the specified parameter.
Notes: chainRootNode The root node of the kinematic chain.
"chainRootNode" must be an ancestor of the node on which the constraint is applied.

170.23.4 inverseKinematicsConstraintWithChainRootNode(chainRootNode as SCNNodeMBS) as SCNIKConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNIKConstraint object with the specified parameter.
Notes: chainRootNode The root node of the kinematic chain.
"chainRootNode" must be an ancestor of the node on which the constraint is applied.

170.23.5 Properties

170.23.6 chainRootNode as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the root node of the kinematic chain.
Notes: (Read only property)

170.23.7 targetPosition as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the target position (in world space coordinates) of the end joint (i.e the node that owns the IK constraint).
Notes: Defaults to (0,0,0). Animatable.
(Read and Write property)

170.24 control SCNIOSControlMBS

170.24.1 control SCNIOSControlMBS

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: iOS only.

Function: The Xojo control for a SCNViewMBS.
Notes: This control embeds a special SCNView subclass.
Designed for Xojo 2020r2 and newer.
Please use view property to access the underlaying object and set properties.

To learn about rendering events, please check here:
https://developer.apple.com/documentation/scenekit/scnscenerendererdelegate?language=objc

You can set PreferLowPowerDevice and PreferredRenderingAPI properties before initializing a view.

170.24.2 Properties

170.24.3 View as SCNViewMBS

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: iOS only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

170.24.4 Events

170.24.5 Close

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to close.

170.24.6 GotFocus

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

170.24.7 LostFocus

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

170.24.8 Open

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to was created and you can initialize it.

170.24.9 rendererDidApplyAnimations(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the control to perform any updates that need to occur after actions and animations are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this method to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ,Äúbatch,Äù your changes).

170.24.10 rendererDidApplyConstraints(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: Invoked on the control once the scene renderer did apply the constraints.
Notes: time The time at which the constraints were simulated.

All modifications done within this method don't go through the transaction model, they are directly applied on the presentation tree.

170.24.11 rendererDidRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the control that the renderer has cleared the viewport and is about to render the scene.
Notes: scene: The SCNSceneMBS object to be rendered.
time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this event to perform custom drawing before SceneKit renders a scene—for example, to draw backdrop content underneath SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this event—the results of modifying SceneKit objects during this event are undefined.

To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this event. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

170.24.12 rendererDidSimulatePhysics(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the control to perform any updates that need to occur after physics simulations are performed.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this event exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ‚Äúbatch‚Äù your changes).

This event is the last opportunity SceneKit provides for you to change the scene graph before rendering.

170.24.13 rendererUpdate(time as double)

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the control to perform any updates that need to occur before actions, animations, and physics are evaluated.
Notes: time: The current system time, in seconds. Use this parameter for any time-based elements of your game logic.

SceneKit calls this method exactly once per frame, so long as the SCNViewMBS object (or other SCNSceneRenderer object) displaying the scene is not paused.

Implement this event to add game logic to the rendering loop. Any changes you make to the scene graph during this method are immediately reflected in the displayed scene. That is, SceneKit immediately updates the hierarchy of presentation nodes it uses to render the scene (instead of using the SCNTransactionMBS class to ‚Äúbatch‚Äù your changes).

170.24.14 rendererWillRenderScene(scene as SCNSceneMBS, time as double)

MBS Mac64bit Plugin, Plugin Version: 21.0, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the control that the renderer has rendered the scene.
Notes: scene: The scene object that was rendered.

time: The current system time, in seconds. If your custom rendering involves animation, use this parameter to compute your own animation state.

Implement this method to perform custom drawing after SceneKit has rendered a scene—for example, to draw overlay content on top of SceneKit content. You should only execute Metal or OpenGL drawing commands (and any setup required to perform them) in this method—the results of modifying SceneKit objects in this method are undefined.

- To render using Metal, use the renderer parameter to retrieve the scene renderer,Äôs currentRenderCommandEncoder object and encode your own drawing commands. If you need to reference other Metal state, see the properties listed in SCNSceneRenderer.
- To render using OpenGL, simply call the relevant OpenGL drawing commands—SceneKit automatically makes its OpenGL context the current context before calling this method. If you need to reference the OpenGL context being rendered into, examine the context property of the renderer parameter.

You must draw using the appropriate graphics technology for the view currently being rendered. Use the renderingAPI property of the renderer object to determine whether Metal or OpenGL is in use.

170.24.15 touchesBegan(e as NSEventMBS, touches() as NSTouchMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 23.5, Platform: iOS, Targets: Desktop & iOS.

Function: Tells this object that one or more new touches occurred in a view or window.
Notes: e: The event to which the touches belong.

UIKit calls this method when a new touch is detected in a view or window. Many UIKit classes override this method and use it to handle the corresponding touch events. The default implementation of this method forwards the message up the responder chain.

Return true if you handled it as otherwise we pass it on.

170.24.16 touchesCancelled(e as NSEventMBS, touches() as NSTouchMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 23.5, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the responder when a system event (such as a system alert) cancels a touch sequence.
Notes: e: The event to which the touches belong.

UIKit calls this method when it receives a system interruption requiring cancellation of the touch sequence. An interruption is anything that causes the application to become inactive or causes the view handling the touch events to be removed from its window. Your implementation of this method should clean up any state associated with handling the touch sequence.

Return true if you handled it as otherwise we pass it on.

170.24.17 touchesEnded(e as NSEventMBS, touches() as NSTouchMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 23.5, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the responder when one or more fingers are raised from a view or window.
Notes: e: The event to which the touches belong.

UIKit calls this method when a finger or Apple Pencil is no longer touching the screen. Many UIKit classes override this method and use it to clean up state involved in the handling of the corresponding touch events. The default implementation of this method forwards the message up the responder chain.

Return true if you handled it as otherwise we pass it on.

170.24.18 touchesMoved(e as NSEventMBS, touches() as NSTouchMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 23.5, Platform: iOS, Targets: Desktop & iOS.

Function: Tells the responder when one or more touches associated with an event changed.
Notes: e: The event to which the touches belong.

UIKit calls this method when the location or force of a touch changes. Many UIKit classes override this method and use it to handle the corresponding touch events. The default implementation of this method forwards the message up the responder chain.

Return true if you handled it as otherwise we pass it on.

170.25 class SCNLevelOfDetailMBS

170.25.1 class SCNLevelOfDetailMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: An alternate resolution for a geometry that SceneKit automatically substitutes to improve rendering performance.
Notes: You use level-of-detail objects when you have a detailed geometry that appears at several apparent sizes in a scene. For example, the teapot model on the the left in the figure below has 256 polygons, the model at center has 1024 polygons, and the model on the right has 14,400 polygons. If all three models appear close to the camera, filling most of the rendered view, the difference in detail between them is clearly visible—but if they appear far away, taking up a small area of the view, the difference is much less obvious. Rendering higher-resolution geometries incurs a higher performance cost.

When you associate one or more level-of-detail objects with a SCNGeometryMBS object using its levelsOfDetail property, SceneKit automatically substitutes alternate geometries when appropriate. For example, the two lower-resolution teapot models seen above can be added as levels of detail for the high-resolution model. For each level of detail, you specify either a world-space distance or a screen-space radius. The measure you specify determines the threshold where SceneKit automatically renders that level of detail,Äôs alternate geometry instead of the original geometry. If you specify a distance, the alternate geometry appears when the node containing the geometry is moved that distance away from the camera. If you specify a radius, the alternate geometry appears when the pixel area covered by the rendered by the geometry is smaller than a circle of that radius.
The geometries associated with lower levels of detail need not share all attributes of the original geometry. For example, you can use different materials for levels of detail that only appear when far away from the camera, disabling expensive features such as per-pixel lighting, reflection mapping, or custom shader programs.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 19.3pr5

170.25.2 Methods

170.25.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

170.25.4 copy as SCNLevelOfDetailMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the object.

170.25.5 levelOfDetailWithGeometryAndScreenSpaceRadius(geo as SCNGeometryMBS, screenSpaceRadius as Double) as SCNLevelOfDetailMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a level of detail with the specified geometry and threshold pixel radius.
Notes: geometry: The geometry to render for this level of detail.
radius: The maximum radius (in pixels) of the geometry,Äôs bounding sphere for this level of detail to appear.

Returns a level-of-detail object. You associate levels of detail with a SCNGeometry object using its levelsOfDetail property.

When rendering a geometry with associated levels of detail, SceneKit calculates the radius in pixels of the circle covered by a geometry,Äôs bounding sphere, then renders the geometry for the SCNLevelOfDetail object with the largest radius parameter smaller than that circle.
If you pass nil for the geometry parameter, SceneKit renders no geometry for the level of detail. Creating a level-of-detail object with no geometry allows you to skip rendering costs entirely for an object when it would appear very far away or very small.

170.25.6 levelOfDetailWithGeometryAndWorldSpaceDistance(geo as SCNGeometryMBS, worldSpaceDistance as Double) as SCNLevelOfDetailMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a level of detail with the specified geometry and threshold camera distance.
Notes: geometry: The geometry to render for this level of detail, or nil if SceneKit should render no geometry at this level of detail.
distance: The minimum distance from the current point of view for this level of detail to appear.

Returns a level-of-detail object. You associate levels of detail with a SCNGeometry object using its levelsOfDetail property.

When rendering a geometry with associated levels of detail, SceneKit calculates the distance from the current point of view to the geometry,Äôs parent node, then renders the geometry for the SCNLevelOfDetail object with the smallest distance parameter greater than that distance.
If you pass nil for the geometry parameter, SceneKit renders no geometry for the level of detail. Creating a level-of-detail object with no geometry allows you to skip rendering costs entirely for an object when it would appear very far away or very small.

170.25.7 Properties

170.25.8 geometry as SCNGeometryMBS

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The geometry associated with this level of detail.
Notes: SceneKit renders this geometry instead of the original geometry when the level of detail is appropriate. Generally, levels of detail with larger worldSpaceDistance values or smaller screenSpaceRadius values should contain less complex geometries.
If the value of this property is nil, SceneKit renders no geometry at this level of detail.
(Read only property)

170.25.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object handle.
Notes: (Read and Write property)

170.25.10 screenSpaceRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum radius (in pixels) of the geometry,Äôs bounding sphere for this level of detail to appear.
Notes: When rendering a geometry with associated levels of detail, SceneKit calculates the radius in pixels of the circle covered by a geometry,Äôs bounding sphere, then renders the geometry for the SCNLevelOfDetail object with the smallest radius parameter larger than that circle.
(Read only property)

170.25.11 worldSpaceDistance as Double

MBS Mac64bit Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum distance from the current point of view for this level of detail to appear.
Notes: When rendering a geometry with associated levels of detail, SceneKit calculates the distance from the current point of view to the geometry,Äôs parent node, then renders the geometry for the SCNLevelOfDetailMBS object with the largest distance parameter less than that distance.
(Read only property)

170.26 class SCNLightMBS

170.26.1 class SCNLightMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A light source that can be attached to a node to illuminate the scene.
Notes: You illuminate your scene by attaching lights to SCNNode objects using their light property.

You set a light,Äôs type using its type property. Depending on a light,Äôs type, its position and direction may affect its behavior—you control the light,Äôs position and direction through the node that the light is attached to. The direction of a light, if applicable to its type, is along the negative z-axis of its node,Äôs local coordinate system.

A light,Äôs other properties affect how it illuminates a scene. All lights have a color property, which interacts with SCNMaterial objects to produce the pixel colors in a rendered scene. Other properties, such as attenuation, shadowing, and spot angle, can affect the behavior of certain types of lights.

The number and type of lights in a scene is a key factor in SceneKit,Äôs rendering performance. For efficient rendering, follow these tips:

- Use SceneKit lights only for dynamic light sources or lights that affect moving objects. For statically lit portions of your scene, create a light map texture in an external 3D authoring tool (also known as baked lighting) and apply it to objects in the scene using the multiply material property.
- Minimize the number of lights on each element of the scene. You can achieve most common lighting effects using no more than three lights, and you only need a single ambient light source. SceneKit only uses up to eight light sources per node when rendering, ignoring any additional lights. If you set the attenuationEndDistance property on a spotlight or omnidirectional light to limit its area of effect, SceneKit ignores the light (and its performance cost) when rendering objects outside that area. You can also use the categoryBitMask property to choose which nodes are illuminated by a light.

Requires MacOS 10.8 or newer.

170.26.2 Methods

170.26.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new light object.

170.26.4 copy as SCNLightMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the light.

170.26.5 light as SCNLightMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new light object.

170.26.6 SCNLightTypeAmbient as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A light that illuminates all objects in the scene from all directions.
Notes: Because the intensity of light from an ambient source is the same everywhere in the scene, its position and direction have no effect. Attenuation, spotlight angle, and shadow attributes do not apply to ambient lights.

170.26.7 SCNLightTypeDirectional as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A light source with a uniform direction and constant intensity.
Notes: Because a directional light illuminates all objects in the scene from the same direction and with the same intensity, so the position of the node containing the light has no effect. Attenuation and spotlight angle attributes do not apply to directional lights.

170.26.8 SCNLightTypeIES as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A light source whose shape, direction, and intensity of illumination is determined by a photometric profile.
Notes: The intensity of a photometric light varies in different directions from the light source, much like the illumination from a real-world light source. The position of the containing node determines the location of the light source, and the orientation of the node determines the relative directions specified by the photometric profile. Spotlight angle attributes do not apply to photometric lights.
For more information about photometric lights, see the IESProfileURL property.

170.26.9 SCNLightTypeOmni as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: An omnidirectional light, also known as a point light.
Notes: Because an omnidirectional light casts equal illumination in all directions, the orientation of the node containing the light has no effect. Spotlight angle and shadow attributes do not apply to directional lights.

170.26.10 SCNLightTypeProbe as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A sample of the environment around a point in a scene to be used in environment-based lighting.
Notes: A light probe describes a point in a scene in terms of the variations in color and intensity of the illumination it receives from all directions. This information can then be used in shading of materials based on their location in the scene. For example, a white object placed near blue and red walls will appear bluish on surfaces facing the blue wall and reddish on surfaces facing the red wall.
You can place light probes in a scene and generate their lighting contributions using the Xcode scene editor, or import light probes from scene file formats that support them. Lighting-related properties of the SCNLight class do not apply to light probes; their contribution to scene rendering depends entirely on the light probe content generated in Xcode.

170.26.11 SCNLightTypeSpot as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A light source that illuminates a cone-shaped area.
Notes: The position and orientation of the node containing the light determines the area lit by the spotlight, and all lighting attributes affect its appearance.

170.26.12 Properties

170.26.13 attenuationEndDistance as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The distance from the light at which its intensity is completely diminished. Animatable.
Notes: You can apply attenuation to omnidirectional lights and spotlights, causing their intensity to diminish over a specified range of distances. At distances less than the start distance, the light,Äôs illumination is at full intensity. At distances greater than the end distance, the light provides no illumination. At distances in between the start and end distance, the attenuationFalloffExponent property defines the transition from full illumination to no illumination.
The default value is 0.0, specifying no attenuation (the light,Äôs intensity is the same at all distances).
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.14 attenuationFalloffExponent as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The transition curve for the light,Äôs intensity between its attenuation start and end distances. Animatable.
Notes: You can apply attenuation to omnidirectional lights and spotlights, causing their intensity to diminish over a specified range of distances. At distances in between the start and end distance, the light,Äôs intensity transitions from full to no illumination according to the value of this property.
A value of 0.0 specifies no attenuation—the light,Äôs intensity is the same at all distances. A value of 1.0 specifies a linear transition, and a value of 2.0 (the default) specifies a quadratic transition curve. Higher values have little visible effect.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.15 attenuationStartDistance as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The distance from the light at which its intensity begins to diminish. Animatable.
Notes: You can apply attenuation to omnidirectional lights and spotlights, causing their intensity to diminish over a specified range of distances. At distances less than the start distance, the light,Äôs illumination is at full intensity. At distances greater than the end distance, the light provides no illumination. At distances in between the start and end distance, the attenuationFalloffExponent property defines the transition from full illumination to no illumination.
The default value is 0.0, specifying no attenuation (the light,Äôs intensity is the same at all distances).
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.16 automaticallyAdjustsShadowProjection as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies if the shadow map projection should be done automatically or manually by the user.
Notes: Defaults to true.
(Read and Write property)

170.26.17 CastsShadow as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the light casts shadows.
Notes: Geometries illuminated by the light cast shadows only if the value of this property is true and the type property of the light is SCNLightTypeSpot or SCNLightTypeDirectional. The default value is false.
(Read and Write property)

170.26.18 Color as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The color of the light. Animatable.
Notes: The value of this property is an NSColorMBS object. The default color is white.
You can animate changes to this property,Äôs value.

See Animating SceneKit Content:
https://developer.apple.com/documentation/scenekit/animation/animating_scenekit_content
(Read and Write property)

170.26.19 ForcesBackFaceCasters as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.26.20 gobo as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An image or other visual content affecting the shape and color of a light,Äôs illuminated area.
Notes: In photographic and stage lighting terminology, a gobo (also known as a flag or cookie) is a stencil, gel, or other object placed just in front of a light source, shaping or coloring the beam of light.
You alter the appearance of a spotlight by changing the contents property of the object permanently assigned to this property. As with other material properties, you can use a color or image, or a Core Animation layer containing animated content, as a lighting gobo.
This property applies only to lights whose type property is spot.
(Read only property)

170.26.21 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.26.22 Intensity as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The luminous flux, in lumens, or total brightness of the light. Animatable.
Notes: When working with photometric lights (see the IESProfileURL property) or physically-based rendering (see SCNLightingModelPhysicallyBased), you can leave the color property at its default white color and use the intensity and temperature to control the light using realistic parameters. When working with physically-based materials, this value the luminous flux of the light source. The default value is 1000 lumens. When not using physically-based rendering, this value (divided by 1000) serves as a multiplier for the the color property. The default value of of 1000 leaves the light color unmodulated; you can use higher values, for example, to brighten a light whose color is already the maximum red value.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.23 maximumShadowDistance as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the maximum distance from the viewpoint from which the shadows for the receiver light won't be computed.
Notes: Defaults to 100.0.
(Read and Write property)

170.26.24 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A name associated with the light.
Notes: You can provide a descriptive name for a light to make managing your scene graph easier. Lights loaded from a scene file may have names assigned by an artist using a 3D authoring tool. To examine lights in a scene file without loading its scene graph, use the SCNSceneSourceMBS class.
(Read and Write property)

170.26.25 OrthographicScale as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The orthographic scale SceneKit uses when rendering the shadow map for a directional light.
Notes: SceneKit draws a shadow map image by rendering the scene from the point of view of the node containing the light. Directional lights ignore the position property of the node containing them because their light has a constant direction. Therefore, rendering a shadow map for a directional light requires an orthographic projection. Like the orthographicScale property of a camera object, this property specifies the extent of the scene ,Äúvisible to,Äù the light when rendering the shadow map.
This property applies only if the light,Äôs type property is SCNLightTypeDirectional.
(Read and Write property)

170.26.26 SampleDistributedShadowMaps as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Use the sample distribution of the main rendering to better fit the shadow frusta.
Notes: Defaults to false.
(Read and Write property)

170.26.27 ShadowBias as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The amount of correction to apply to the shadow to prevent rendering artifacts.
Notes: Rendering shadows from a shadow map can result in artifacts where the shadow color does not appear on all pixels in a shadowed surface as intended. (This effect is typically called shadow acne.) This property specifies the error margin SceneKit uses to correct such artifacts.
The default value is 1.0.
(Read and Write property)

170.26.28 ShadowCascadeCount as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the number of distinct shadow maps that will be computed for the receiver light.
Notes: Defaults to 1. Maximum is 4.
(Read and Write property)

170.26.29 ShadowCascadeSplittingFactor as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies a factor to interpolate between linear splitting (0) and logarithmic splitting (1).
Notes: Defaults to 0.15.
(Read and Write property)

170.26.30 shadowColor as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The color of shadows cast by the light. Animatable.
Notes: The value of this property is an NSColorMBS object. SceneKit blends the light,Äôs color with other colors in the rendered image to produce a shadow effect. The color,Äôs opacity (alpha value) determines the intensity of the shadows. The default shadow color is black with 50% opacity.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.31 ShadowMode as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The mode SceneKit uses to render shadows.
Notes: The default mode is SCNShadowModeForward in iOS and in macOS 10.10 or later. In OS X v10.9 or earlier, the default mode is SCNShadowModeDeferred.
(Read and Write property)

170.26.32 ShadowRadius as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A number that specifies the amount of blurring around the edges of shadows cast by the light. Animatable.

Notes: SceneKit produces soft-edged shadows by rendering the silhouettes of geometry into a 2D shadow map and then using several weighted samples from the shadow map to determine the strength of the shadow at each pixel in the rendered scene. This property controls the radius of shadow map sampling. Lower numbers result in shadows with sharply defined, pixelated edges; higher numbers result in blurry shadows.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.33 ShadowSampleCount as Integer

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The number of samples from the shadow map that SceneKit uses to render each pixel.
Notes: SceneKit produces soft-edged shadows by rendering the silhouettes of scene geometry into a 2D shadow map and then using several weighted samples from the shadow map to determine the strength of the shadow at each pixel in the rendered scene. This property controls the number of samples from the shadow map used to render each pixel. Higher numbers result in smoother edges; lower numbers increase rendering performance.
The default value is 16 in macOS and 1 on iOS.
(Read and Write property)

170.26.34 spotInnerAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The angle, in degrees, of the area fully lit by a spotlight. Animatable.
Notes: You define the cone-shaped illuminated area of a spotlight with a position and direction (from the node containing the light) and an angle specifying the cone,Äôs width. Additionally, the illuminated area can smoothly transition from full illumination to no illumination. This property determines the width of the fully illuminated area.
The default value is 0.0, specifying that only the center of the area illuminated by the spotlight is lit at full intensity.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.35 spotOuterAngle as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The angle, in degrees, of the area partially lit by a spotlight. Animatable.
Notes: You define the cone-shaped illuminated area of a spotlight with a position and direction (from the node containing the light) and with an angle specifying the cone,Äôs width. Additionally, the illuminated area can smoothly transition from full illumination to no illumination. This property determines the width of the transition area.

The default value is 45.0.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.36 Temperature as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The color temperature, in degrees Kelvin, of the light source. Animatable.
Notes: SceneKit determines the actual color of the light by multiplying the color value by a color corresponding to the light,Äôs temperature. The default value of 6500 K represents a pure white light (leaving the color unmodulated); lower values (down to a minimum of zero) add a ,Äúwarmer,Äù yellow or orange effect to the light source, and higher values (up to a maximum of 40000) add a ,Äúcooler,Äù blue effect.
This property affects all light types, but is especially useful when working with photometric lights (see the IESProfileURL property) or physically-based rendering (see SCNLightingModelPhysicallyBased). You can leave the color property at its default white color and use the intensity and temperature properties to control the light using realistic parameters.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.37 Type as String

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: A constant identifying the general behavior of the light.
Notes: A light,Äôs type determines the shape and directionality of illumination provided by the light, as well as the set of attributes available for modifying the light,Äôs behavior. For example, light types include omnidirectional lights and spotlights. See Light Types for the full set of types and their behaviors.

see also
https://developer.apple.com/documentation/scenekit/scnlighttype
(Read and Write property)

170.26.38 zFar as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum distance between the light and a visible surface for casting shadows.
Notes: A spotlight casts shadows if its castsShadow property is true. If a surface is farther from the light than this distance, shadows are not cast against the surface.
The default value is 100.0.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.

(Read and Write property)

170.26.39 zNear as Double

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum distance between the light and a visible surface for casting shadows. Animatable.
Notes: A spotlight casts shadows if its castsShadow property is true. If a surface is closer to the light than this distance, shadows are not cast against the surface.
The default value is 1.0.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.26.40 Constants

Shadow Modes

Constant	Value	Description
kShadowModeDeferred	1	SceneKit renders shadows in a postprocessing pass. In the mode, SceneKit blends shadows into the final image after the main rendering pass, so shadows can be of any color.
kShadowModeForward	0	SceneKit renders shadows during lighting computations. In this mode, the color components of the light,Äôs shadowColor property do not apply. The color,Äôs alpha component determines the intensity of shadows.
kShadowModeModulated	2	SceneKit renders shadows by projecting the light,Äôs gobo image. The light does not illuminate the scene. Typically, you use this mode to create a low-accuracy, high-performance shadow under a game character or similar scene element: Use an image of a radial gradient (black to white) for the light,Äôs gobo property, and use categoryBitMask properties to prevent the shadow image from appearing on the character.

170.27 class SCNLookAtConstraintMBS

170.27.1 class SCNLookAtConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNLookAtConstraint applies on a node's orientation so that it always look at another node.
Notes: Subclass of the SCNConstraintMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.27.2 Methods

170.27.3 Constructor(target as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNLookAtConstraint object with the specified target.
Notes: target: The target node to look at.

170.27.4 lookAtConstraintWithTarget(target as SCNNodeMBS) as SCNLookAtConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNLookAtConstraint object with the specified target.
Notes: target: The target node to look at.

170.27.5 Properties

170.27.6 gimbalLockEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies whether the receiver enables the gimbal lock. Defaults to false.
Notes: Enabling the gimbal lock prevents the receiver from rotating the constrained node around to roll axis.
(Read and Write property)

170.27.7 localFront as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Front direction in the constraint owner local space. Defaults to - [SCNNode localFront] . Animatable
Notes: (Read and Write property)

170.27.8 target as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the target node to look at.
Notes: (Read and Write property)

170.27.9 targetOffset as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Offset look at position in target space. Defaults to zero. Animatable
Notes: (Read and Write property)

170.27.10 worldUp as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Up reference direction in world space. Defaults to - [SCNNode localUp] . Animatable
Notes: (Read and Write property)

170.28 class SCNMaterialMBS

170.28.1 class SCNMaterialMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A set of shading attributes that define the appearance of a geometry's surface when rendered.
Notes: When you create a material, you define a collection of visual attributes and their options, which you can then reuse for multiple geometries in a scene.

A material has several visual properties, each of which defines a different part of SceneKit,Äôs lighting and shading process. Each visual property is an instance of the SCNMaterialPropertyMBS class that provides a solid color, texture, or other 2D content for that aspect of SceneKit,Äôs rendering. The material,Äôs lightingModelName property then determines the formula SceneKit uses to combine the visual properties with the lights in the scene to produce the final color for each pixel in the rendered scene. For more details on the rendering process, see SCNLightingModelMBS.

You attach one or more materials to an instance of the SCNGeometryMBS class using its firstMaterial or materials property. Multiple geometries can reference the same material. In this case, changing the attributes of the material changes the appearance of every geometry that uses it.

170.28.2 Methods

170.28.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material.

170.28.4 copy as SCNMaterialMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the material.

170.28.5 material as SCNMaterialMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material object.
Notes: A newly created material contains an SCNMaterialPropertyMBS object for each of its eight visual properties. You change a material,Äôs appearance by setting the contents of each visual property. For information on each visual property,Äôs default contents and how it affects a material,Äôs appearance, see Visual Properties for Special Effects.

170.28.6 SCNLightingModelBlinn as string

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Shading that incorporates ambient, diffuse, and specular properties, where specular highlights are calculated using the Blinn-Phong formula.
Notes: see
https://developer.apple.com/documentation/scenekit/scnlightingmodelblinn

170.28.7 SCNLightingModelConstant as string

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Uniform shading that incorporates ambient lighting only.
Notes: see also
https://developer.apple.com/documentation/scenekit/scnlightingmodelconstant

170.28.8 SCNLightingModelLambert as string

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Shading that incorporates ambient and diffuse properties only.
Notes: see also
https://developer.apple.com/documentation/scenekit/scnlightingmodellambert

170.28.9 SCNLightingModelPhong as string

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Shading that incorporates ambient, diffuse, and specular properties, where specular highlights are calculated using the Phong formula.
Notes: see also
https://developer.apple.com/documentation/scenekit/scnlightingmodelphong

170.28.10 SCNLightingModelPhysicallyBased as string

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Shading based on a realistic abstraction of physical lights and materials.
Notes: see also
https://developer.apple.com/documentation/scenekit/scnlightingmodelphysicallybased

170.28.11 Properties

170.28.12 ambient as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that manages the material,Äôs response to ambient lighting.
Notes: The ambient property specifies the amount of ambient light to reflect. This property has no visual impact on scenes that have no ambient light. Setting the ambient has no effect if locksAmbientWithDiffuse is set to true.
(Read only property)

170.28.13 ambientOcclusion as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that provides color values to be multiplied with the ambient light affecting the material.
Notes: Use this property to assign an ambient occlusion texture map to a surface. This property has no effect if there is no ambient light in the scene. If this property is not nil, SceneKit ignores the ambient property.
When using physically-based shading (see SCNLightingModelPhysicallyBased), ambient occlusion approximates large-scale surface details that obscure global illumination.
(Read only property)

170.28.14 blendMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The mode that determines how pixel colors rendered using this material blend with other pixel colors in the rendering target.
Notes: With the default blend mode of SCNBlendModeAlpha, materials blend according to their alpha (opacity) values—a pixel rendered with a higher alpha value appears more opaque than one with a lower alpha value. Change this property to create special effects. For example, the SCNBlendModeAdd mode can make objects appear to glow.
(Read and Write property)

170.28.15 colorBufferWriteMask as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines whether the receiver writes to the color buffer when rendered.
Notes: Defaults to SCNColorMaskAll.
(Read and Write property)

170.28.16 cullMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The mode determining which faces of a surface SceneKit renders. Animatable.
Notes: The vertex data and normal vectors in a geometry designate which side of each polygon is to be considered its front face, and the geometry,Äôs orientation with respect to the camera determines which front surfaces are currently visible. Typically, back-facing surfaces are found only on the interior of a closed geometry, obscured by front-facing surfaces, so rendering these surfaces has a performance cost but no visible effect.
This property,Äôs default value is SCNCullBack, specifying that SceneKit should cull, or not render, back-facing surfaces. You can change this property,Äôs value to cause SceneKit to render only the back surfaces of a material instead. See SCNCullMode for available values.
You can animate changes to this property,Äôs value. See Animating SceneKit Content. Animating this property fades between the results of rendering with each state
(Read and Write property)

170.28.17 diffuse as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that manages the material,Äôs diffuse response to lighting.
Notes: see also

https://developer.apple.com/documentation/scenekit/scnmaterial/1462589-diffuse
(Read only property)

170.28.18 displacement as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The displacement property specifies how vertex are translated in tangent space.
Notes: Pass a grayscale image for a simple 'elevation' or rgb image for a vector displacement.
(Read only property)

170.28.19 DoubleSided as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit should render both front and back faces of a surface. Animatable.
Notes: When this property,Äôs value is false (the default), SceneKit renders a surface using the material from one side. The vertex data and normal vectors in a geometry designate which side of each polygon is to be considered its front face, and the geometry,Äôs orientation with respect to the camera determines which front surfaces are currently visible.
If you change this property,Äôs value to true, SceneKit renders both the front and back surfaces of every polygon. SceneKit assumes the surface normals a back face to be the negative of the front face,Äôs normal vector.
You can animate changes to this property,Äôs value. See Animating SceneKit Content. Animating this property fades between the results of rendering with each state
(Read and Write property)

170.28.20 emission as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that defines the color emitted by each point on a surface.
Notes: The emission property specifies the amount of light the material emits. This emission does not light up other surfaces in the scene.
(Read only property)

170.28.21 fillMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines of to how to rasterize the receiver's primitives.
Notes: Defaults to SCNFillModeFill.
(Read and Write property)

170.28.22 fresnelExponent as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A factor affecting the material,Äôs reflectivity. Animatable.
Notes: The Fresnel exponent of a material interacts with its reflective property to determine the intensity of reflections in a surface based on its angle relative to the viewer. A higher Fresnel exponent increases the visibility of reflections when the material is viewed from a shallow angle.
(Read and Write property)

170.28.23 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.28.24 lightingModelName as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The lighting formula that SceneKit uses to render the material.
Notes: SceneKit provides several different lighting models, each of which combines information from a material,Äôs visual properties with the lights and other contents of a scene. For details on how each lighting model affects rendering, see Lighting Models. For details on the contribution from each visual property, see Visual Properties for Special Effects.
(Read and Write property)

170.28.25 LitPerPixel as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit performs lighting calculations per vertex or per pixel. Animatable.
Notes: When this property,Äôs value is true (the default), SceneKit performs lighting calculations independently for each rendered pixel. This approach provides better rendering quality, but can adversely impact rendering performance.

If you change this property,Äôs value to false, SceneKit performs lighting calculations for each vertex in a geometry, and allows the GPU to interpolate lighting results across the pixels in between vertices. Depending on the shape and vertex count of a geometry,Äôs surface and the material properties being rendered, this approach may improve rendering performance without much noticeable impact on visual quality.
You can animate changes to this property,Äôs value. See Animating SceneKit Content. Animating this property fades between the results of rendering with each state.
(Read and Write property)

170.28.26 locksAmbientWithDiffuse as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the material responds identically to both ambient and diffuse lighting. Animatable.
Notes: Makes the ambient property automatically match the diffuse property. Defaults to false on 10.9 and before, defaults to true otherwise. Animatable.
(Read and Write property)

170.28.27 metalness as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that provides color values to determine how metallic the material,Äôs surface appears.
Notes: This property measures only the total intensity of color values; texture contents are best defined in grayscale.
This property generally approximates aspects of a physical surface—such as index of refraction, tendency to produce sharp reflections, and tendency to produce Fresnel reflections at grazing angles—that together produce an overall metallic or nonmetallic (also called dielectric) appearance. Lower values (darker colors) cause the material to appear more like a dielectric surface. Higher values (brighter colors) cause the surface to appear more metallic.
This property applies only when the material,Äôs lightingModelName value is SCNLightingModelPhysically-Based.
(Read only property)

170.28.28 multiply as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that provides color values that are multiplied with pixels in a material after all other shading is complete.
Notes: The multiply property specifies a color or an image used to multiply the output fragments with. The computed fragments are multiplied with the multiply value to produce the final fragments. This property may be used for shadow maps, to fade out or tint 3d objects.

(Read only property)

170.28.29 name as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A name associated with the material.
Notes: You can provide a descriptive name for a material to make managing your scene graph easier. Materials loaded from a scene file may have names assigned by an artist using a 3D authoring tool. Use the SCNSceneSourceMBS class to examine materials in a scene file without loading its scene graph.

Material names are saved when you export a scene to a file using its writeToURL method, and appear in the Xcode scene editor.
(Read and Write property)

170.28.30 normal as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that defines the nominal orientation of the surface at each point for use in lighting.
Notes: see also
https://developer.apple.com/documentation/scenekit/scnmaterial/1462542-normal
(Read only property)

170.28.31 readsFromDepthBuffer as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines whether the receiver reads from the depth buffer when rendered.
Notes: Defaults to true.
(Read and Write property)

170.28.32 reflective as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that defines the reflected color for each point on a surface.
Notes: The reflective property specifies the reflectivity of the surface. The surface will not actually reflect other objects in the scene. This property may be used as a sphere mapping to reflect a precomputed environment.

(Read only property)

170.28.33 roughness as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that provides color values to determine the apparent smoothness of the surface.
Notes: This property measures only the total intensity of color values; texture contents are best defined in grayscale.
This property approximates the level of microscopic detail—for example tiny bumps and cracks—in a surface. By approximating these ‚Äúmicrofacets‚Äù as a single term, this property helps produce lighting calculations that resemble the energy-conserving laws of real-world physics, resulting in more realistic variation between matte and shiny surfaces. Lower values (darker colors) cause the material to appear shiny, with well-defined specular highlights. Higher values (brighter colors) cause specular highlights to spread out and the diffuse color of the material to become more retroreflective.
This property applies only when the material‚Äôs lightingModelName value is SCNLightingModelPhysicallyBased.
(Read only property)

170.28.34 selfIllumination as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that provides color values representing the global illumination of the surface.
Notes: Self-illumination applies to all materials, but is especially useful for those using physically-based shading (see SCNLightingModelPhysicallyBased). Physically-based materials work best with environment-based lighting (see the SCNSceneMBS property lightingEnvironment), but for some materials it can be useful to let a surface itself define part of its lighting—for example, an object whose position obscures it from the ‚Äúsky‚Äù that provides the main lighting environment. When you assign contents to this property, they override the environmental lighting contribution to diffuse shading, but environmental lighting still contributes to specular effects.
(Read only property)

170.28.35 shaderModifiers as Dictionary

MBS Mac64bit Plugin, Plugin Version: 24.4, Platform: macOS, Targets: Desktop & iOS.

Function: A dictionary of GLSL source code snippets for customizing the shader programs provided by SceneKit.
Notes: The dictionary‚Äôs keys must be from the set of constants described in Shader Modifier Entry Point Keys. Each key represents a possible entry point in SceneKit‚Äôs shader programs, whose corresponding value is a string containing a shader source code snippet to be included in the shader program at that entry

point.

See Use Shader Modifiers to Extend SceneKit Shading in the protocol overview for a complete discussion of shader modifiers.
https://developer.apple.com/documentation/scenekit/scnshadable#1654834
(Read and Write property)

170.28.36 shininess as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The sharpness of specular highlights. Animatable.
Notes: The shininess of a material interacts with its specular property and the lighting in a scene to produce bright highlights on a surface. A higher value produces more sharply defined highlights, making a surface appear more smooth and glossy.
(Read and Write property)

170.28.37 specular as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that manages the material,Äôs specular response to lighting.
Notes: The specular property specifies the amount of light to reflect in a mirror-like manner. The specular intensity increases when the point of view lines up with the direction of the reflected light.
(Read only property)

170.28.38 transparency as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The uniform transparency of the material. Animatable.
Notes: SceneKit determines the total opacity of each rendered pixel in a surface by multiplying the color from the material,Äôs transparent property by the value of this property. Then, the material,Äôs transparencyMode property determines how pixels from the material are blended into the scene.
You can also uniformly adjust the opacity of all content attached to a node using its opacity property.
(Read and Write property)

170.28.39 transparencyMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The mode SceneKit uses to calculate transparency for the material.
Notes: The default transparency mode is SCNTransparencyModeAOne. See SCNTransparencyMode for available values and their effects.
(Read and Write property)

170.28.40 transparent as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: An object that determines the opacity of each point in a material.
Notes: The transparent property specifies the transparent areas of the material.
(Read only property)

170.28.41 writesToDepthBuffer as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit produces depth information when rendering the material.
Notes: Determines whether the receiver writes to the depth buffer when rendered. Defaults to true.
(Read and Write property)

170.28.42 Constants

Constants

Constant	Value	Description
SCNTransparencyModeAOne	0	One of the constants for the modes SceneKit uses to calculate the opacity pixels rendered with a material, used by the transparencyMode property. SceneKit derives transparency information from the alpha channel of colo The value 1.0 is opaque.
SCNTransparencyModeDefault	0	One of the constants for the modes SceneKit uses to calculate the opacity pixels rendered with a material, used by the transparencyMode property. Default
SCNTransparencyModeDualLayer	3	One of the constants for the modes SceneKit uses to calculate the opacity pixels rendered with a material, used by the transparencyMode property. Dual layer.
SCNTransparencyModeRGBZero	1	One of the constants for the modes SceneKit uses to calculate the opacity pixels rendered with a material, used by the transparencyMode property. SceneKit derives transparency information from the luminance of colors. T value 0.0 is opaque. When using this mode, SceneKit ignores the alpha value of colors in the m terial,Äôs transparent property. SceneKit calculates the luminance of a co from its red, green, and blue channels and uses the resulting value to determi the material,Äôs opacity.
SCNTransparencyModeSingleLayer	2	One of the constants for the modes SceneKit uses to calculate the opacity pixels rendered with a material, used by the transparencyMode property. Single layer.

Blend Modes

Constant	Value	Description
SCNBlendModeAdd	1	Blend by adding the source color to the destination color. This mode results in a brightening effect that can be useful for making objects appear to glow relative to their surroundings.
SCNBlendModeAlpha	0	Blend by multiplying source and destination color values by their corresponding alpha values. This mode is the default value of the blendMode property.
SCNBlendModeMax	6	Max
SCNBlendModeMultiply	3	Blend by multiplying the source color with the background color. This mode results in colors that are at least as dark as either of the two contributing colors.
SCNBlendModeReplace	5	Blend by replacing the destination color with the source color, ignoring alpha.
SCNBlendModeScreen	4	Blend by multiplying the inverse of the source color with the inverse of the destination color. This mode results in colors that are at least as light as either of the two contributing colors.
SCNBlendModeSubtract	2	Blend by subtracting the source color from the destination color.

Cull Modes

Constant	Value	Description
SCNCullModeBack	0	The mode for culling back-facing polygons (and rendering only front-facing polygons).
SCNCullModeFront	1	The mode for culling front-facing polygons (and rendering only back-facing polygons).

Fill Modes

Constant	Value	Description
SCNFillModeFill	0	Fill
SCNFillModeLines	1	Lines

170.29 class SCNMaterialPropertyMBS

170.29.1 class SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A container for the color or texture of one of a material,Äôs visual properties.
Notes: A material has several visual properties that together determine its appearance under lighting and shading. SceneKit renders each pixel in the scene by combining the information from material properties with the locations, intensities, and colors of lights.
A material property,Äôs contents can be either a color, which provides a uniform effect across the surface of a material, or a texture, which SceneKit maps across the surface of a material using texture coordinates provided by the geometry object the material is attached to. A texture, in turn, can come from any of several sources, such as an image object, a URL to an image file, a specially formatted image or set of images for use as a cube map, or even animated content provided by Core Animation, SpriteKit, or AVFoundation—for the full set of options, see the contents property.

Blog Entries

- MBS Xojo Plugins, version 19.1pr1

Xojo Developer Magazine

- 23.2, page 73: Playing Tennis (Part 1), Playing Tennis with Xojo and MBS by Stefanie Juchmes-Simonis

170.29.2 Methods

170.29.3 Constructor(content as Variant)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material property with given content.

170.29.4 materialPropertyWithColor(color as NSColorMBS) as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material property object with the specified color.

170.29.5 materialPropertyWithContents(content as Variant) as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material property object with the specified contents.
Notes: contents: The visual contents of the material property—a color, image, or source of animated content. For details, see the discussion of the contents property.

Returns a new material property object.

Newly created SCNMaterialMBS objects contain SCNMaterialPropertyMBS instances for all of their visual properties. To change a material,Äôs visual properties, you modify those instances rather than creating new material property objects.
You create new SCNMaterialPropertyMBS instances to provide textures for use with custom GLSL shaders—for details, see SCNShadableMBS.

170.29.6 materialPropertyWithImage(image as NSImageMBS) as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material property object with the specified image.

170.29.7 materialPropertyWithLayer(layer as CALayerMBS) as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material property object with the specified layer.

170.29.8 materialPropertyWithPicture(picture as Picture) as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new material property object with the specified picture.

170.29.9 Properties

170.29.10 borderColor as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A color used to fill in areas of a material,Äôs surface not covered by the material property,Äôs image contents.
Notes: When the material property,Äôs contents are a texture image and its texture wrapping properties are set to SCNWrapModeClampToBorder, the border color appears in areas of a textured geometry not covered by the texture image, as shown in .
(Read and Write property)

170.29.11 contents as Variant

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The visual contents of the material property—a color, image, or source of animated content. Animatable.
Notes: see also
https://developer.apple.com/documentation/scenekit/scnmaterialproperty/1395372-contents
(Read and Write property)

170.29.12 contentsTransform as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The transformation applied to the material property,Äôs visual contents. Animatable.
Notes: SceneKit applies this transformation to the texture coordinates provided by the geometry object the material is attached to, then uses the resulting coordinates to map the material property,Äôs contents across the surface of the material. (This transformation has no effect if the material property,Äôs contents object is a constant color.)
(Read and Write property)

170.29.13 intensity as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A number between 0.0 and 1.0 that modulates the effect of the material property. Animatable.
Notes: The default intensity is 1.0. Reducing the intensity fades out the contents of the material property, causing different effects depending on which visual property of an SCNMaterialMBS object it represents:

- For the normal property, intensity varies the apparent roughness of the normal-mapped surface. Reducing intensity makes the surface appear more smooth.
- For the multiply property, reducing intensity blends the material property,Äôs colors with white, effectively reducing the strength of the color multiplication effect.
- For all other properties, reducing intensity dims the material property,Äôs contents.

(Read and Write property)

170.29.14 magnificationFilter as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Texture filtering for rendering the material property,Äôs image contents at a size larger than that of the original image.
Notes: Texture filtering determines the appearance of a material property,Äôs contents when portions of the material surface appear larger or smaller than the original texture image. For example, the texture coordinates at a point near the camera may correspond to a small fraction of a pixel in the texture image. SceneKit uses the magnification filter to determine the color of the sampled texel at that point.
The default magnification filter is SCNFilterModeLinear.
(Read and Write property)

170.29.15 mappingChannel as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The source of texture coordinates for mapping the material property,Äôs image contents.
Notes: A geometry can have multiple independent sources of texture coordinates, each of which defines a unique mapping channel number. You can use these channels to map different visual properties of a material in different ways. For example, a geometry representing a picture frame might use one set of texture coordinates for mapping the materials of the frame itself, and another set of texture coordinates for placing a picture into the frame.
For information about creating geometries with multiple texture mapping channels, see SCNGeometryMBS.
(Read and Write property)

170.29.16 maxAnisotropy as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The amount of anisotropic texture filtering to be used when rendering the material property,Äôs image contents.
Notes: see

https://developer.apple.com/documentation/scenekit/scnmaterialproperty/1395402-maxanisotropy
(Read and Write property)

170.29.17 minificationFilter as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Texture filtering for rendering the material property,Äôs image contents at a size smaller than that of the original image.
Notes: Texture filtering determines the appearance of a material property,Äôs contents when portions of the material surface appear larger or smaller than the original texture image. For example, the texture coordinates at a point far from the camera may correspond to an area of several pixels in the texture image. SceneKit uses the minification filter to determine the color of the sampled texel at that point.
The default minification filter is SCNFilterModeLinear. See constants for available modes and their effects.
(Read and Write property)

170.29.18 mipFilter as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Texture filtering for using mipmaps to render the material property,Äôs image contents at a size smaller than that of the original image.
Notes: see
https://developer.apple.com/documentation/scenekit/scnmaterialproperty/1395398-mipfilter
(Read and Write property)

170.29.19 wrapS as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The wrapping behavior for the S texture coordinate.
Notes: Wrapping modes determine texture mapping behavior for cases where a material,Äôs texture coordinates extend outside the range from 0.0 to 1.0. For example, if you use the contentsTransform property to shrink a texture relative to the surface of a geometry, you use the wrap mode properties to determine whether the texture repeats across the surface.
The S texture coordinate measures the horizontal axis of a texture image, increasing from 0.0 at the left edge of the image to 1.0 at the right edge.
The default wrap mode is SCNWrapModeClamp. See constants for available modes and their effects.
(Read and Write property)

170.29.20 wrapT as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The wrapping behavior for the T texture coordinate.
Notes: Wrapping modes determine texture mapping behavior for cases where a material,Äôs texture coordinates extend outside the range from 0.0 to 1.0. For example, if you use the contentsTransform property to shrink a texture relative to the surface of a geometry, you use the wrap mode properties to determine whether the texture repeats across the surface.
The T texture coordinate measures the vertical axis of a texture image, increasing from 0.0 at the bottom of the image to 1.0 at the top.
The default wrap mode is SCNWrapModeClamp.
(Read and Write property)

170.29.21 Constants

Filter Modes

Constant	Value	Description
SCNFilterModeLinear	2	Texture filtering sample texels from the neighborhood of the coordinates being sampled and linearly interpolates their colors.
SCNFilterModeNearest	1	Texture filtering returns the color from only one texel, whose location is nearest to the coordinates being sampled.
SCNFilterModeNone	0	No texture filtering is applied. Only valid for the mipFilter property, specifying that SceneKit should not use mip mapping.

Wrap Modes

Constant	Value	Description
SCNWrapModeClamp	1	Texture coordinates are clamped to the range from 0.0 to 1.0, inclusive. Texture sampling in areas whose texture coordinates would fall outside this range produces texel colors from the nearest edge of the texture image.
SCNWrapModeClampToBorder	3	Texture sampling uses texture colors for coordinates in the range from 0.0 to 1.0 (inclusive) and the material property,Äôs borderColor value otherwise. Texture sampling in areas whose texture coordinates would fall outside this range uses the borderColor property instead of texel colors from the texture image.
SCNWrapModeMirror	4	Texture sampling of texture coordinates outside range from 0.0 to 1.0 should behave as if the range reverses before repeating. Texture sampling in areas of the material whose texture coordinates would fall outside from 0.0 to 1.0 results in tiling both texture image and its mirror image across the surface using the material.
SCNWrapModeRepeat	2	Texture sampling uses only the fractional part of texture coordinates, passing through the range from 0.0 to (but not including) 1.0. Texture sampling in areas of the material whose texture coordinates would fall outside from 0.0 to 1.0 results in tiling the texture image across the surface using the material.

170.30 class SCNMatrix4MBS

170.30.1 class SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A representation of a 4 x 4 matrix.
Notes: SceneKit uses matrices to represent coordinate space transformations, which in turn can represent the combined position, rotation or orientation, and scale of an object in three-dimensional space.
Blog Entries

- MBS Xojo Plugins, version 23.5pr6
- MBS Xojo Plugins, version 19.1pr1

170.30.2 Methods

170.30.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
Notes: Initializes all values with zero.

170.30.4 copy as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the matrix.

170.30.5 equals(other as SCNMatrix4MBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value that indicates whether the corresponding elements of two matrices are equal.
Notes: self: The first matrix to be compared.
other: The first matrix to be compared.

Returns true if each element in self is exactly equal to the corresponding element in other.

This function performs a numeric (not bitwise) comparison of each pair of elements.

170.30.6 Identity as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The 4 x 4 identity matrix.
Notes: Elements on the diagonal of this matrix are 1.0; all other elements are 0.0. Multiplying another matrix by the identity matrix or multiplying the identity matrix by another matrix yields the other matrix.

170.30.7 Invert as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the inverse of the specified matrix.
Notes: The inverse matrix of the specified matrix, or the original matrix if it is not invertible.

170.30.8 Multiply(other as SCNMatrix4MBS) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the product of two matrices.
Notes: self: The multiplicand, or left operand of matrix multiplication.
other: The multiplier, or right operand of matrix multiplication.

Returns the matrix product of the self and other parameters.

Matrix multiplication is not commutative. As a transformation, the result of multiplying a matrix A by a matrix B is the transformation represented by B followed by the transformation represented by A.

170.30.9 Null as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The null matrix.
Notes: All values are zero.

170.30.10 Rotate(angle as double, sx as double, sy as double, sz as double) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new matrix created by concatenating the specified matrix with a rotation transformation.
Notes: mat: The matrix to be combined with a rotation.
angle: The amount of rotation, in radians, measured counterclockwise around the rotation axis.
sx: The x-component of the rotation axis.
sy: The y-component of the rotation axis.
sz: The z-component of the rotation axis.

Returns a new matrix.

The resulting transformation consists of the specified rotation followed by the transformation represented by the mat parameter.

170.30.11 Rotation(angle as double, x as double, y as double, z as double) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a matrix describing a rotation transformation.
Notes: angle: The amount of rotation, in radians, measured counterclockwise around the rotation axis.
x: The x-component of the rotation axis.
y: The y-component of the rotation axis.
z: The z-component of the rotation axis.

Returns a new rotation matrix.

170.30.12 Scale(sx as double, sy as double, sz as double) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new matrix created by concatenating the specified matrix with a scale transformation.
Example:

```
Var i As SCNMatrix4MBS = SCNMatrix4MBS.Identity
Var m As SCNMatrix4MBS = i.Scale(1.0, 2.0, 3.0)
Break
```

Notes: self: The matrix to be combined with a translation.
sx: The scale factor in the x-axis direction.
sy: The scale factor in the y-axis direction.
sz: The scale factor in the z-axis direction.

Returns a new matrix.

The resulting transformation consists of the specified scale followed by the transformation represented by the mat parameter.

170.30.13 Scaling(sx as double, sy as double, sz as double) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a matrix describing a scale transformation.
Example:

```
Var m As SCNMatrix4MBS = SCNMatrix4MBS.Scaling(1.0, 2.0, 3.0)
Break
```

Notes: sx: The scale factor in the x-axis direction.
sy: The scale factor in the y-axis direction.
sz: The scale factor in the z-axis direction.

Returns a new scale matrix.

170.30.14 Translate(tx as double, ty as double, tz as double) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new matrix created by concatenating the specified matrix with a translation transformation.
Notes: self: The matrix to be combined with a translation.
tx: The translation distance in the x-axis direction.
ty: The translation distance in the y-axis direction.
tz: The translation distance in the z-axis direction.

Returns a new matrix.

The resulting transformation consists of the specified translation followed by the transformation represented by the mat parameter.

170.30.15 Translation(tx as double, ty as double, tz as double) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a matrix describing a translation transformation.
Notes: tx: The translation distance in the x-axis direction.
ty: The translation distance in the y-axis direction.
tz: The translation distance in the z-axis direction.

Returns a new translation matrix.

170.30.16 Properties

170.30.17 IsIdentity as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value that indicates whether the specified matrix is equal to the identity matrix.
Notes: Returns true if the elements on the matrix,Äôs diagonal are 1.0 and all other elements are 0.0.
(Read only property)

170.30.18 m11 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 1/1.
Notes: (Read and Write property)

170.30.19 m12 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 1/2.
Notes: (Read and Write property)

170.30.20 m13 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 1/3.
Notes: (Read and Write property)

170.30.21 m14 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 1/4.
Notes: (Read and Write property)

170.30.22 m21 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 2/1.
Notes: (Read and Write property)

170.30.23 m22 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 2/2.
Notes: (Read and Write property)

170.30.24 m23 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 2/3.
Notes: (Read and Write property)

170.30.25 m24 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 2/4.
Notes: (Read and Write property)

170.30.26 m31 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 3/1.
Notes: (Read and Write property)

170.30.27 m32 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 3/2.
Notes: (Read and Write property)

170.30.28 m33 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 3/3.
Notes: (Read and Write property)

170.30.29 m34 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 3/4.
Notes: (Read and Write property)

170.30.30 m41 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 4/1.
Notes: (Read and Write property)

170.30.31 m42 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 4/2.
Notes: (Read and Write property)

170.30.32 m43 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 4/3.
Notes: (Read and Write property)

170.30.33 m44 as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The value at 4/4.
Notes: (Read and Write property)

170.31 class SCNNodeMBS

170.31.1 class SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A structural element of a scene graph, representing a position and transform in a 3D coordinate space, to which you can attach geometry, lights, cameras, or other displayable content.

170.31.2 Methods

170.31.3 addAudioPlayer(player as SCNAudioPlayerMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop & iOS.

Function: Adds the specified auto player to the node and begins playback.
Notes: player: An audio player object.

Positional audio effects from a player attached to a node are based on that node,Äôs position relative to the audioListener position in the scene.
After playback has completed, SceneKit automatically removes the audio player from the node.

You may need to have the scene/view in play mode to hear something.

170.31.4 addChildNode(node as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a node to the node,Äôs array of children.
Notes: child: The node to be added.

Calling this method appends the node to the end of the childNodes array.

170.31.5 audioPlayers as SCNAudioPlayerMBS()

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop & iOS.

Function: The audio players currently attached to the node.
Notes: Positional audio effects from a player attached to a node are based on that node,Äôs position relative to the audioListener position in the scene.
After an audio player completes playback, SceneKit automatically removes it from the node. Therefore, this array always contains audio players that are currently playing back audio.

170.31.6 childNodes as SCNNodeMBS()

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: An array of the node,Äôs children in the scene graph hierarchy.

170.31.7 childNodeWithName(Name as String, recursively as Boolean = false) as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the first node in the node,Äôs child node subtree with the specified name.
Notes: name: The name of the node to search for.
recursively: True to search the entire child node subtree, or false to search only the node,Äôs immediate children.

If the recursive parameter is true, SceneKit uses a preorder traversal to search the child node subtree—that is, the block searches a node before it searches each of the node,Äôs children, and it searches all children of a node before searching any of that node,Äôs sibling nodes. Otherwise, SceneKit searches only those nodes in the node,Äôs childNodes array.

170.31.8 clearGeometry

MBS Mac64bit Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop & iOS.

Function: Clears geometry property.
Example:

```
if MyScene <>nil then
// clear geometry for all nodes in this Scene
MyScene.rootNode.clearGeometry
end if
```

Notes: Recursively walks over child nodes to also clear geometry by assigning nil.
Calling this method can help to mitigate problems where textures would not unload properly due to bugs in SceneKit framework.

170.31.9 clone as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the node and its children.
Notes: This method recursively copies the node and its child nodes. For a nonrecursive copy, use the inherited copy method, which creates a copy of the node without any child nodes.
Cloning or copying a node creates a duplicate of the node object, but not the geometries, lights, cameras, and other SceneKit objects attached to it—instead, each copied node shares references to these objects.

This behavior means that you can use cloning to, for example, place the same geometry at several locations within a scene without maintaining multiple copies of the geometry and its materials. However, it also means

that changes to the objects attached to one node will affect other nodes that share the same attachments. For example, to render two copies of a node using different materials, you must copy both the node and its geometry before assigning a new material.

Multiple copies of an SCNGeometryMBS object efficiently share the same vertex data, so you can copy geometries without a significant performance penalty.

170.31.10 constraints as SCNConstraintMBS()

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A list of constraints affecting the node,Äôs transformation.
Notes: An array of constraint objects. Before rendering, SceneKit evaluates all constraints attached to a node hierarchy and adjusts node transformations appropriately.
Use the SCNLookAtConstraintMBS class to make a node always point toward another node even as both are moved, or the SCNTransformConstraintMBS class to apply arbitrary transformations at constraint evaluation time.

170.31.11 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a new node object.
See also:

- 170.31.12 Constructor(geometry as SCNGeometryMBS) 20682

170.31.12 Constructor(geometry as SCNGeometryMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a node object with the specified geometry attached.
Notes: geometry: The geometry to be attached.

Returns a new node object with the geometry attached, or nil if initialization is not successful.
See also:

- 170.31.11 Constructor 20682

170.31.13 convertPositionFromNode(position as SCNVector3MBS, node as SCNNodeMBS) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a position to the node,Äôs local coordinate space from that of another node.
Notes: position: A position in the local coordinate space defined by the other node.
node: Another node in the same scene graph as the node, or nil to convert from the scene,Äôs world coordinate space.

Returns a position in the node,Äôs local coordinate space.

170.31.14 convertPositionToNode(position as SCNVector3MBS, node as SCNNodeMBS) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a position from the node,Äôs local coordinate space to that of another node.
Notes: position: A position in the node,Äôs local coordinate space.
node: Another node in the same scene graph as the node, or nil to convert to the scene,Äôs world coordinate space.

Returns a position in the local coordinate space defined by the other node.

170.31.15 convertTransformFromNode(position as SCNMatrix4MBS, node as SCNNodeMBS) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a transform to the node,Äôs local coordinate space from that of another node.
Notes: transform: A transform relative to the local coordinate space defined by the other node.
node: Another node in the same scene graph as the node, or nil to convert from the scene,Äôs world coordinate space.

Returns a transform relative to the node,Äôs coordinate space.

170.31.16 convertTransformToNode(position as SCNMatrix4MBS, node as SCNNodeMBS) as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a transform from the node,Äôs local coordinate space to that of another node.
Notes: transform: A transform relative to the node,Äôs coordinate space.
node: Another node in the same scene graph as the node, or nil to convert to the scene,Äôs world coordinate space.

Returns a transform relative to the local coordinate space defined by the other node.

170.31.17 convertVectorFromNode(position as SCNVector3MBS, node as SCNNodeMBS) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a direction vector to the node,Äôs local coordinate space from that of another node.
Notes: vector: A direction vector in the local coordinate space defined by the other node.
node: Another node in the same scene graph as the node, or nil to convert from the scene,Äôs world coordinate space.

Returns a direction vector in the node,Äôs local coordinate space.

Unlike the convertPositionFromNode method, this method ignores the translational aspect of both nodes' transforms. As such, this method is more appropriate for use with vectors that represent only directional information, such as velocity or facing.

170.31.18 convertVectorToNode(position as SCNVector3MBS, node as SCNNodeMBS) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a direction vector from the node,Äôs local coordinate space to that of another node.
Notes: vector: A direction vector in the node,Äôs local coordinate space.
node: Another node in the same scene graph as the node, or nil to convert to the scene,Äôs world coordinate space.

Returns a direction vector in the local coordinate space defined by the other node.

Unlike the convertPositionToNode method, this method ignores the translational aspect of both nodes' transforms. As such, this method is more appropriate for use with vectors that represent only directional information, such as velocity or facing.

170.31.19 copy as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the node.

170.31.20 flattenedClone as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an optimized copy of the node and its children.
Notes: A new single node containing the combined geometries and materials of the node and its child node subtree.

Rendering complex node hierarchies can incur a performance cost. Each geometry and material requires a separate draw command to be sent to the GPU, and each draw command comes with a performance overhead. If you plan for a portion of your scene,Äôs node hierarchy to remain static (with respect to itself, if not the rest of the scene), use this method to create a single node containing all elements of that node hierarchy that SceneKit can render using fewer draw commands.

170.31.21 hitTestWithSegment(PointA as SCNVector3MBS, PointB as SCNVector3MBS, Options as Dictionary = nil) as SCNHitTestResultMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Searches the node,Äôs child node subtree for objects intersecting a line segment between two specified points.
Notes: pointA: An endpoint of the line segment to search along, specified in the node,Äôs local coordinate system.
pointB: The other endpoint of the line segment to search along, specified in the node,Äôs local coordinate system.
options: A dictionary of options affecting the search. See Key shared methods in SCNHitTestResultMBS class for acceptable values.

Returns an array of SCNHitTestResultMBS objects representing search results.

Hit-testing is the process of finding elements of a scene located along a specified line segment in the scene,Äôs coordinate space (or that of a particular node in the scene). For example, you can use this method to determine whether a projectile launched by a game character will hit its target.

To search for the scene element corresponding to a two-dimensional point in the rendered image, use the renderer,Äôs hitTest method instead.

170.31.22 insertChildNode(newNode as SCNNodeMBS, atIndex as Integer)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a node to the node,Äôs array of children at a specified index.

170.31.23 localRotateBy(rotation as SCNVector4MBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the node's orientation relative to its current orientation.
Notes: rotation: The axis and angle of rotation to apply, in node-local space, expressed as a quaternion.

This method rotates the node according to its pivot transform.
The effects of this method are animatable; that is, calling this method during an implicit-animation transaction animates the rotation effect.

Available in macOS 10.13 or later.

170.31.24 localTranslateBy(translation as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the node's position relative to its current position.
Notes: translation: The distance, in node-local space, by which to move the node.

The effects of this method are animatable; that is, calling this method during an implicit-animation transaction animates the move.

Available in macOS 10.13 or later.

170.31.25 lookAt(worldTarget as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the node's orientation so that its local forward vector points toward the specified location.

Notes: worldTarget: The point, in world space, to face the node toward.

Using this method is equivalent to calling the other lookAt method and passing the node's worldUp and localFront vectors for the corresponding parameters.
The effects of this method are animatable; that is, calling this method during an implicit-animation transaction animates the rotation effect.

Available in macOS 10.13 or later.
See also:

- 170.31.26 lookAt(worldTarget as SCNVector3MBS, worldUp as SCNVector3MBS, localFront as SCNVector3MBS) 20687

170.31.26 lookAt(worldTarget as SCNVector3MBS, worldUp as SCNVector3MBS, localFront as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the node's orientation so that the specified forward vector points toward the specified location.
Notes: worldTarget: The point, in world space, to face the node toward.
worldUp: The direction vector, in world space, that should appear as "up" from the rotated node's point of view.
localFront: The direction vector, in the node's local space, that should orient toward the target point.

The effects of this method are animatable; that is, calling this method during an implicit-animation transaction animates the rotation effect.

Available in macOS 10.13 or later.
See also:

- 170.31.25 lookAt(worldTarget as SCNVector3MBS) 20686

170.31.27 node as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a node object.
Notes: Returns a new node object, or nil if initialization is not successful.

170.31.28 nodeWithGeometry(geometry as SCNGeometryMBS) as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a node object with the specified geometry attached.
Notes: Returns a new node object with the geometry attached, or nil if initialization is not successful.

170.31.29 removeAllActions

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Ends and removes all actions from the node.
Notes: When SceneKit removes an action from a node, it skips any remaining animation the action would perform. However, any changes the action has already made to the node,Äôs state remain in effect.

170.31.30 removeAllAudioPlayers

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes all audio players attached to the node, stopping playback.

170.31.31 removeAudioPlayer(player as SCNAudioPlayerMBS)

MBS Mac64bit Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the specified audio player from the node, stopping playback.
Notes: player: An audio player attached to the node.

This method has no effect if the player parameter does not reference an audio player directly attached to the node.

170.31.32 removeFromParentNode

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the node from its parent,Äôs array of child nodes.
Notes: Removing nodes from the node hierarchy serves two purposes. Nodes own their contents (child nodes or attached lights, geometries, and other objects), so deallocating unneeded nodes can reduce memory usage. Additionally, SceneKit does more work at rendering time with a large, complex node hierarchy, so removing nodes whose contents you don,Äôt need to display can improve rendering performance.

170.31.33 replaceChildNode(oldNode as SCNNodeMBS, newNode as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Removes a child from the node,Äôs array of children and inserts another node in its place.
Notes: oldNode: The existing child node to be replaced.
newNode: The node with which to replace the child node.

If both the oldNode and newNode nodes are children of the node, calling this method swaps their positions in the array. Note that removing a node from the node hierarchy may result in it being deallocated.
Calling this method results in undefined behavior if the child parameter does not refer to a child of this node.

170.31.34 rotateBy(worldRotation as SCNVector4MBS, worldTarget as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Changes the node's position and orientation, relative to its current transform, through a rotation around the specified point in scene space.
Notes: worldRotation: The axis and angle of rotation to apply, in scene space, expressed as a quaternion.
worldTarget: The center point, in scene space, about which to rotate.

The effects of this method are animatable; that is, calling this method during an implicit-animation transaction animates the rotation effect.

Available in macOS 10.13 or later.

170.31.35 runAction(action as SCNActionMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an action to the list of actions executed by the node.
Notes: action: The action to be performed.

SceneKit begins running a newly added action when it prepares to render the next frame.
See also:

- 170.31.36 runAction(action as SCNActionMBS, del as SCNNodeRunActionCompletedMBS, tag as variant = nil) 20690
- 170.31.37 runAction(action as SCNActionMBS, key as string) 20690

- 170.31.38 runAction(action as SCNActionMBS, key as string, del as SCNNodeRunActionCompletedMBS, tag as variant = nil) 20691

170.31.36 runAction(action as SCNActionMBS, del as SCNNodeRunActionCompletedMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an action to the list of actions executed by the node. SceneKit calls the specified block when the action completes.
Notes: action: The action to be performed.
del: The method that SceneKit calls when the action completes.
tag: The tag is passed through to delegate method.

The new action is processed the next time SceneKit prepares to render a frame.
SceneKit calls your method after the action,Äôs duration is complete. For example, in a game you could use this method to show a Game Over message after performing a fade-out action on a node that displays a player character.
See also:

- 170.31.35 runAction(action as SCNActionMBS) 20689
- 170.31.37 runAction(action as SCNActionMBS, key as string) 20690
- 170.31.38 runAction(action as SCNActionMBS, key as string, del as SCNNodeRunActionCompletedMBS, tag as variant = nil) 20691

170.31.37 runAction(action as SCNActionMBS, key as string)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an identifiable action to the list of actions executed by the node.
Notes: action: The action to be performed.
key: A unique key used to identify the action.

This method is identical to runAction, but the action is stored and identified so that you can retrieve or cancel it later. If an action using the same key is already running, SceneKit removes it before adding the new action.
See also:

- 170.31.35 runAction(action as SCNActionMBS) 20689
- 170.31.36 runAction(action as SCNActionMBS, del as SCNNodeRunActionCompletedMBS, tag as variant = nil) 20690
- 170.31.38 runAction(action as SCNActionMBS, key as string, del as SCNNodeRunActionCompletedMBS, tag as variant = nil) 20691

170.31.38 runAction(action as SCNActionMBS, key as string, del as SCNNodeRunActionCompletedMBS, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Adds an identifiable action to the list of actions executed by the node.
Notes: SceneKit calls the specified block when the action completes.

action: The action to be performed.
key: A unique key used to identify the action.
del: A completion block called when the action completes.
tag: The tag is passed through to delegate method.

This method is identical to runAction, but the action is stored and identified so that you can retrieve or cancel it later. If an action using the same key is already running, SceneKit removes it before adding the new action.
SceneKit calls your method after the action,Äôs duration is complete. For example, you can use this method with a wait action to execute some code after a timed delay. If during the delay period you need to prevent the code from running, use the removeActionForKey method to cancel it.
See also:

- 170.31.35 runAction(action as SCNActionMBS) 20689
- 170.31.36 runAction(action as SCNActionMBS, del as SCNNodeRunActionCompletedMBS, tag as variant = nil) 20690
- 170.31.37 runAction(action as SCNActionMBS, key as string) 20690

170.31.39 SCNModelTransform as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys are used for the 'semantic' argument of SCNProgramMBS.setSemantic method.
Notes: Transforms are SCNMatrix4 wrapped in NSValue objects.
A 4 x 4 matrix for transforming coordinates from model space to scene (or world) space.

170.31.40 SCNModelViewProjectionTransform as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys are used for the 'semantic' argument of SCNProgramMBS.setSemantic method.
Notes: Transforms are SCNMatrix4 wrapped in NSValue objects.
A 4 x 4 matrix containing the concatenation of the Model, View, and Projection transformations.

170.31.41 SCNModelViewTransform as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys are used for the 'semantic' argument of SCNProgramMBS.setSemantic method.
Notes: Transforms are SCNMatrix4 wrapped in NSValue objects.
A 4 x 4 matrix containing the concatenation of the Model and View transformations.

170.31.42 SCNNormalTransform as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys are used for the 'semantic' argument of SCNProgramMBS.setSemantic method.
Notes: Transforms are SCNMatrix4 wrapped in NSValue objects.
A 4 x 4 matrix for transforming surface normal vectors from model space to view (or eye) space.

170.31.43 SCNProjectionTransform as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys are used for the 'semantic' argument of SCNProgramMBS.setSemantic method.
Notes: Transforms are SCNMatrix4 wrapped in NSValue objects.
A 4 x 4 matrix for transforming coordinates from view (or eye) space to clip space.

170.31.44 SCNViewTransform as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the keys are used for the 'semantic' argument of SCNProgramMBS.setSemantic method.
Notes: Transforms are SCNMatrix4 wrapped in NSValue objects.
A 4 x 4 matrix for transforming coordinates from scene (or world) space to view (or eye) space.

170.31.45 setConstraints(constraints() as SCNConstraintMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the list of constraints affecting the node,Äôs transformation.
Notes: An array of constraint objects. Before rendering, SceneKit evaluates all constraints attached to a node hierarchy and adjusts node transformations appropriately.
Use the SCNLookAtConstraintMBS class to make a node always point toward another node even as both are moved, or the SCNTransformConstraintMBS class to apply arbitrary transformations at constraint eval-

uation time.

170.31.46 Properties

170.31.47 Camera as SCNCameraMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The camera attached to the node.
Notes: To use a camera for displaying a scene, set the the pointOfView property of the view (or layer or renderer) displaying the scene to the node containing the camera. A camera looks in the direction of the node,Äôs negative z-axis, so you aim the camera by changing the position and orientation of the node containing it. You control geometric and optical parameters of the camera—projection, field of view, and depth of field—using the attached SCNCameraMBS object.
(Read and Write property)

170.31.48 CastsShadow as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit renders the node,Äôs contents into shadow maps.
Notes: SceneKit renders shadows by rendering a shadow map image containing silhouettes of the scene,Äôs contents, and then projecting that image onto the scene. SceneKit performs this process once for each SCNLight object in the scene whose castsShadow property is true. Because shadow map rendering re-renders portions of the scene, it incurs a performance cost. To minimize this performance cost, exclude nodes from shadow map rendering by setting the node,Äôs castsShadow property to false.

For more details on shadow rendering, see SCNLight.
(Read and Write property)

170.31.49 categoryBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A mask that defines which categories the node belongs to.
Notes: You can assign each node in a scene to one or more categories, where each category corresponds to a bit in the bit mask. You define the mask values used in your app. When SceneKit renders a scene, it compares the each node,Äôs categoryBitMask property with the category bit masks of every other object that participates in the rendering process—lights, cameras, and techniques—using a bitwise AND operation. If the result is a nonzero value, SceneKit includes the node when rendering. The default category bit mask is 1.

Use a node,Äôs category bit mask together with:

- An SCNLightMBS object,Äôs categoryBitMask property to exclude the node from that light,Äôs illumination
- An SCNCameraMBS object,Äôs categoryBitMask property to make the node invisible to that camera
- The category bit masks in an SCNTechniqueMBS object,Äôs definition dictionary to include or exclude the node from phases of a multipass rendering technique

This property does not affect SceneKit,Äôs physics simulation. To include or exclude a node from physics interactions, use the categoryBitMask property of the node,Äôs physicsBody and physicsField objects.
(Read and Write property)

170.31.50 EulerAngles as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The node,Äôs orientation, expressed as pitch, yaw, and roll angles in radians. Animatable.
Notes: The order of components in this vector matches the axes of rotation:

- Pitch (the x component) is the rotation about the node,Äôs x-axis.
- Yaw (the y component) is the rotation about the node,Äôs y-axis.
- Roll (the z component) is the rotation about the node,Äôs z-axis.

SceneKit applies these rotations relative to the node,Äôs pivot property in the reverse order of the components: first roll, then yaw, then pitch. The rotation, eulerAngles, and orientation properties all affect the rotational aspect of the node,Äôs transform property. Any change to one of these properties is reflected in the others.
You can animate changes to this property,Äôs value. See Animating SceneKit Content.
(Read and Write property)

170.31.51 focusBehavior as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The focus behavior for a node.
Notes: (Read and Write property)

170.31.52 Geometry as SCNGeometryMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The geometry attached to the node.
Notes: A node can have only one geometry attached to it. To combine geometries so they can be controlled or animated together, create a node with no geometry and add other nodes to it.
Animating the node,Äôs geometric properties can move, rotate, stretch and scale its geometry. For more advanced animations of a node,Äôs geometry, use its morpher and skinner objects.
(Read and Write property)

170.31.53 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

170.31.54 Hidden as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines the visibility of the node,Äôs contents. Animatable.
Notes: The default value of this property is false, specifying that SceneKit should render geometries and use lights attached to the node or its children. Change this property,Äôs value to true to exclude attached geometries and lights from rendering. (Cameras attached to the node or its children are not affected by this property.) Hiding a node also hides its child nodes recursively.

You can animate changes to this property,Äôs value. See Animating SceneKit Content. Hiding or showing a node in an animation results in a fade-in or fade-out effect.
(Read and Write property)

170.31.55 Light as SCNLightMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The light attached to the node..
Notes: A node can have only one light attached to it. To combine lights so they can be controlled or animated together, create a node with no light and add other nodes to it.
(Read and Write property)

170.31.56 localFront as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The unit vector SceneKit treats as "forward" in local space for all nodes.
Notes: The "forward" direction of a node affects cameras and directional lighting attached to a node, as well as relative orientation and movement effects such as lookAt, SCNLookAtConstraint, and SCNBillboardConstraint.
This vector is always (0, 0, -1) for all nodes, but you can use this class property when it's convenient to refer to directions symbolically.

Available in macOS 10.13 or later.
(Read only property)

170.31.57 localRight as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The direction SceneKit treats as "right" in local space for all nodes.
Notes: No SceneKit features depend directly on this direction's definition—it's simply a natural consequence of recognizing "forward" and "up" directions for use with cameras, directional lighting, and relative orientation operations.
This vector is always (1, 0, 0) for all nodes, but you can use this class property when it's convenient to refer to directions symbolically.

Available in macOS 10.13 or later.
(Read only property)

170.31.58 localUp as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The direction SceneKit treats as "up" in local space for all nodes.
Notes: The "up" direction of a node affects cameras attached to a node, as well as relative orientation and movement effects such as lookAt, SCNLookAtConstraint, and SCNBillboardConstraint.
This vector is always (0, 1, 0) for all nodes, but you can use this class property when it's convenient to refer to directions symbolically.

Available in macOS 10.13 or later.
(Read only property)

170.31.59 movabilityHint as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A value that indicates how SceneKit should handle the node when rendering movement-related effects.
Notes: This property controls how the node contributes to various motion-related effects during rendering. The default value is SCNMovabilityHintFixed. If the movability hint is SCNMovabilityHintMovable:

- The node,Äôs content is not affected by motion blur effects. (See the motionBlurIntensity camera property, which applies motion blur effects for camera movement but not subject movement.)
- The node does not contribute to environmental lighting of other objects. Environmental lighting is an aspect of physically based rendering (see SCNLightingModelPhysicallyBased), in which surfaces tend to pick up the color of other scene content around them. SceneKit performs environmental lighting by rendering light probes—small, omnidirectional snapshots of the scene,Äôs contents, as visible from at various points around the scene. Light probes are static, so nodes that are expected to move should not contribute to the lighting environment for other surfaces.

This value is merely a hint that communicates to SceneKit,Äôs rendering system about how you want to move content in your scene; it does not affect your ability to change the node,Äôs position or add animations or physics to the node.
(Read and Write property)

170.31.60 Name as String

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A name associated with the node.
Notes: You can provide a descriptive name for a node to make managing your scene graph easier. Nodes loaded from a scene file may have names assigned by an artist using a 3D authoring tool. Use the childNodeWithName or childNodesPassingTest method to retrieve a node from a scene graph by its name, or the SCNSceneSource class to examine nodes in a scene file without loading its scene graph.

The names of nodes and their attached objects are saved when you export a scene to a file using its writeToURL method, and appear in the Xcode scene editor. The SceneKit statistics view (see showsStatistics) also shows the names of nodes with attached cameras.
(Read and Write property)

170.31.61 Opacity as Double

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The opacity value of the node. Animatable.
Notes: Possible values are between 0.0 (fully transparent) and 1.0 (fully opaque). The default is 1.0.
You can animate changes to this property,Äôs value.
(Read and Write property)

170.31.62 orientation as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The node,Äôs orientation, expressed as a quaternion. Animatable.
Notes: The rotation, eulerAngles, and orientation properties all affect the rotational aspect of the node,Äôs transform property. Any change to one of these properties is reflected in the others.
You can animate changes to this property,Äôs value.
(Read and Write property)

170.31.63 parentNode as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The node,Äôs parent in the scene graph hierarchy.
Notes: For a scene,Äôs rootNode object, the value of this property is nil.
(Read only property)

170.31.64 Paused as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether to run actions and animations attached to the node and its child nodes.
Notes: The default value of this property is false, specifying that SceneKit should continuously update the node,Äôs contents. Pausing a node pauses any running animations or actions. This property applies to the actions and animations attached to the node itself and those attached to any of its child or descendant nodes.
(Read and Write property)

170.31.65 physicsBody as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics body associated with the node.
Notes: The default value is nil, specifying that the node does not participate in the physics simulation at all. If you provide a physics body, SceneKit updates the node,Äôs position and orientation each time

it processes a step of its physics simulation. For more information on SceneKit,Äôs physics system, see SCNPhysicsWorldMBS.
(Read and Write property)

170.31.66 physicsField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics field associated with the node.
Notes: Physics fields apply forces to other physics bodies in a specified area around their node. For example, a SCNPhysicsDragField field slows all physics bodies that pass through its area. For a full list of field types and their effects, see SCNPhysicsFieldMBS.

A node can contain both a physics body that defines collision behavior and a physics field that defines forces in its area. For example, two nodes containing physics bodies and radial gravity fields will be attracted to one another, but will bounce off each other when they collide.
(Read and Write property)

170.31.67 pivot as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The pivot point for the node,Äôs position, rotation, and scale. Animatable.
Notes: A node,Äôs pivot is the transformation between its coordinate space and that used by its position, rotation, and scale properties. The default pivot is SCNMatrix4MBS.Identity, specifying that the node,Äôs position locates the origin of its coordinate system, its rotation is about an axis through its center, and its scale is also relative to that center point.
Changing the pivot transform alters these behaviors in many useful ways. You can:

- Offset the node,Äôs contents relative to its position. For example, by setting the pivot to a translation transform you can position a node containing a sphere geometry relative to where the sphere would rest on a floor instead of relative to its center.
- Move the node,Äôs axis of rotation. For example, with a translation transform you can cause a node to revolve around a faraway point instead of rotating around its center, and with a rotation transform you can tilt the axis of rotation.
- Adjust the center point and direction for scaling the node. For example, with a translation transform you can cause a node to grow or shrink relative to a corner instead of to its center.

You can animate changes to this property,Äôs value.
(Read and Write property)

170.31.68 Position as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The translation applied to the node. Animatable.
Notes: The node,Äôs position locates it within the coordinate system of its parent, as modified by the node,Äôs pivot property. The default position is the zero vector, indicating that the node is placed at the origin of the parent node,Äôs coordinate system.

See also presentationNode.Position for current position on screen.
(Read and Write property)

170.31.69 presentationNode as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A node object representing the state of the node as it currently appears onscreen.
Notes: When you use implicit animation (see SCNTransaction) to change a node,Äôs properties, those node properties are set immediately to their target values, even though the animated node content appears to transition from the old property values to the new. During the animation SceneKit maintains a copy of the node, called the presentation node, whose properties reflect the transitory values determined by any in-flight animations currently affecting the node. The presentation node,Äôs properties provide a close approximation to the version of the node that is currently displayed. SceneKit also uses the presentation node when computing the results of explicit animations, physics, and constraints.

Do not modify the properties of the presentation node. (Attempting to do so results in undefined behavior.) Instead, you use the presentation node to read current animation values—for example, to create a new animation starting at those values.

The presentation node has no parent or child nodes. To access animated properties of related nodes, use the node,Äôs own parentNode and childNodes properties and the presentationNode property of each related node.
(Read only property)

170.31.70 RenderingOrder as Integer

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The order the node,Äôs content is drawn in relative to that of other nodes.
Notes: Nodes with greater rendering orders are rendered last. Defaults to zero.
(Read and Write property)

170.31.71 Rotation as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The node,Äôs orientation, expressed as a rotation angle about an axis. Animatable.
Notes: The four-component rotation vector specifies the direction of the rotation axis in the first three components and the angle of rotation (in radians) in the fourth. The default rotation is the zero vector, specifying no rotation. Rotation is applied relative to the node,Äôs pivot property.
The rotation, eulerAngles, and orientation properties all affect the rotational aspect of the node,Äôs transform property. Any change to one of these properties is reflected in the others.
(Read and Write property)

170.31.72 Scale as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The scale factor applied to the node. Animatable.
Notes: Each component of the scale vector multiplies the corresponding dimension of the node,Äôs geometry. The default scale is 1.0 in all three dimensions. For example, applying a scale of (2.0, 0.5, 2.0) to a node containing a cube geometry reduces its height and increases its width and depth. Scaling is applied relative to the node,Äôs pivot property.
(Read and Write property)

170.31.73 transform as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The transform applied to the node relative to its parent. Animatable.
Notes: The transformation is the combination of the node,Äôs rotation, position, and scale properties. The default transformation is SCNMatrix4MBS.Identity.

When you set the value of this property, the node,Äôs rotation, orientation, eulerAngles, position, and scale properties automatically change to match the new transform, and vice versa. SceneKit can perform this conversion only if the transform you provide is a combination of rotation, translation, and scale operations. If you set the value of this property to a skew transformation or to a nonaffine transformation, the values of these properties become undefined. Setting a new value for any of these properties causes SceneKit to compute a new transformation, discarding any skew or nonaffine operations in the original transformation.

You can animate changes to this property,Äôs value.
(Read and Write property)

170.31.74 WorldFront as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The "forward" (-Z) direction vector relative to the node, expressed in world space.
Notes: Reading this property is equivalent to reading the localFront class property and using the convertVectorToNode or convertVectorFromNode method to convert that vector from the node's local coordinate space to the scene's world coordinate space.

Available in macOS 10.13 or later.
(Read only property)

170.31.75 worldOrientation as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The node's orientation relative to the scene's world coordinate space.
Notes: This quaternion isolates the rotational aspect of the node's worldTransform matrix, which in turn is the conversion of the node's transform from local space to the scene's world coordinate space. That is, it expresses the difference in axis and angle of rotation between the node and the scene's rootNode.
(Read and Write property)

170.31.76 WorldPosition as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The node's position relative to the scene's world coordinate space.
Notes: This vector isolates the translational aspect of the node's worldTransform matrix, which in turn is the conversion of the node's transform from local space to the scene's world coordinate space. That is, it expresses the x, y, and z offsets of the node's position from that of the scene's rootNode, and is equivalent to reading the node's position vector and converting it to world space with the convertPositionFromNode or convertPositionToNode method.
(Read and Write property)

170.31.77 WorldRight as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The "right" (+X) direction vector relative to the node, expressed in world space.
Notes: Reading this property is equivalent to reading the localRight class property and using the convertVectorToNode or convertVectorFromNode method to convert that vector from the node's local coordinate space to the scene's world coordinate space.

Available in macOS 10.13 or later.
(Read only property)

170.31.78 worldTransform as SCNMatrix4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The world transform applied to the node.
Notes: A world transform is the node,Äôs coordinate space transform relative to the scene,Äôs coordinate space. This transform is the concatenation of the node,Äôs transform property with that of its parent node, the parent,Äôs parent, and so on up to the rootNode object of the scene.
(Read and Write property)

170.31.79 WorldUp as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The "up" (+Y) direction vector relative to the node, expressed in world space.
Notes: Reading this property is equivalent to reading the localUp class property and using the convertVectorToNode or convertVectorFromNode method to convert that vector from the node's local coordinate space to the scene's world coordinate space.

Available in macOS 10.13 or later.
(Read only property)

170.31.80 Constants

Movability Hint

Constant	Value	Description
SCNMovabilityHintFixed	0	The node is not expected to move over time.
SCNMovabilityHintMovable	1	The node is expected to move over time.

Focus Behavior Options

Constant	Value	Description
SCNNodeFocusBehaviorFocusable	2	Node is focusable and prevents nodes that it visually obscures from becomin focusable.
SCNNodeFocusBehaviorNone	0	Node is not focusable.
SCNNodeFocusBehaviorOccluding	1	Node is not focusable and prevents nodes that it visually obscures from becom ing focusable.

170.31.81 Delegates

170.31.82 SCNNodeRunActionCompletedMBS(node as SCNNodeMBS, action as SCNActionMBS, key as string, tag as variant)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The delegate for the runAction method.

170.32 class SCNPhysicsBallSocketJointMBS

170.32.1 class SCNPhysicsBallSocketJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A physics behavior that connects two physics bodies and allows them to pivot around each other in any direction.
Notes: A ball and socket joint has three rotational degrees of freedom and zero translational degrees of freedom. You can also use a ball and socket joint to pin a body to a specific location in the coordinate space of the node containing it while allowing it to rotate freely.

Available in MacOS 10.10.
Subclass of the SCNPhysicsBehaviorMBS class.

170.32.2 Methods

170.32.3 Constructor(body as SCNPhysicsBodyMBS, anchor as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a ball and socket joint that anchors a single physics body in space and allows it to rotate freely around an anchor point.
Notes: body: The physics body to be controlled by the joint.
anchor: The point the body pivots around, relative to the node containing it.

Returns a new ball-and-socket-joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.32.4 Constructor(bodyA as SCNPhysicsBodyMBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, anchorB as SCNVector3MBS) 20705

170.32.4 Constructor(bodyA as SCNPhysicsBodyMBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, anchorB as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a ball and socket joint connecting two physics bodies.
Notes: bodyA: The first physics body to be connected by the joint.

anchorA: The point at which the joint connects, relative to the node containing the first body.
bodyB: The second physics body to be connected by the joint.
anchorB: The point at which the joint connects, relative to the node containing the second body.

Returns a new ball-and-socket-joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior: method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.32.3 Constructor(body as SCNPhysicsBodyMBS, anchor as SCNVector3MBS) 20705

170.32.5 jointWithBody(body as SCNPhysicsBodyMBS, anchor as SCNVector3MBS) as SCNPhysicsBallSocketJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a ball and socket joint that anchors a single physics body in space and allows it to rotate freely around an anchor point.
Notes: body: The physics body to be controlled by the joint.
anchor: The point the body pivots around, relative to the node containing it.

Returns a new ball-and-socket-joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.32.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, anchorB as SCNVector3MBS) as SCNPhysicsBallSocketJointMBS 20706

170.32.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, anchorB as SCNVector3MBS) as SCNPhysicsBallSocketJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a ball and socket joint connecting two physics bodies.
Notes: bodyA: The first physics body to be connected by the joint.
anchorA: The point at which the joint connects, relative to the node containing the first body.
bodyB: The second physics body to be connected by the joint.

anchorB: The point at which the joint connects, relative to the node containing the second body.

Returns a new ball-and-socket-joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior: method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.32.5 jointWithBody(body as SCNPhysicsBodyMBS, anchor as SCNVector3MBS) as SCNPhysicsBallSocketJointMBS 20706

170.32.7 Properties

170.32.8 anchorA as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point at which the joint connects, relative to the node containing the first body.
Notes: (Read and Write property)

170.32.9 anchorB as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point at which the joint connects, relative to the node containing the second body.
Notes: (Read and Write property)

170.32.10 bodyA as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The first physics body connected by the joint.
Notes: (Read only property)

170.32.11 bodyB as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The second physics body connected by the joint.
Notes: This property,Äôs value is nil if the joint was created using the Constructor without bodyB param-

eter.
(Read only property)

170.33 class SCNPhysicsBehaviorMBS

170.33.1 class SCNPhysicsBehaviorMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The abstract superclass for joints, vehicle simulations, and other high-level behaviors that incorporate multiple physics bodies.
Notes: An SCNPhysicsBehavior object defines a high-level behavior for one or more physics bodies, modifying the results of the physics simulation. Behaviors include joints that connect multiple bodies so they move together and vehicle definitions that cause a body to roll like a car. You never use this class directly; instead, you instantiate one of the subclasses that defines the kind of behavior you want to add to your physics world.Table 1 describes the kinds of behaviors you can create in SceneKit.

Behavior classes implemented by SceneKit

Class Name	Description
SCNPhysicsHingeJointMBS	Connects two bodies and allows them to pivot around each other on a single axis.
SCNPhysicsBallSocketJointMBS	Connects two bodies and allows them to pivot around each other in any direction.
SCNPhysicsSliderJointMBS	Connects two bodies and allows them to slide or rotate relative to one another. Slider joints can also work as motors, applying a force or torque between the two bodies.
SCNPhysicsVehicleMBS	Simulates a physics body as the chassis of a car or other wheeled vehicle. You control a vehicle in terms of steering, braking, and acceleration, and use SCNPhysicsVehicleWheelMBS objects to define the appearance and physical properties of each of its wheels.

To use a physics behavior, you follow these steps:
1. Create SCNPhysicsBodyMBS objects and attach them to each node that participates in the behavior.
2. Create and configure a behavior object using one of the subclasses listed in above.
3. Add the behavior to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

170.33.2 Methods

170.33.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

170.33.4 Properties

170.33.5 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

170.34 class SCNPhysicsBodyMBS

170.34.1 class SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics simulation attributes attached to a scene graph node.
Notes: Overview
When SceneKit prepares to render a new frame, it performs physics calculations on physics bodies attached to nodes in the scene. These calculations include gravity, friction, and collisions with other bodies. You can also apply your own forces and impulses to a body. After SceneKit completes these calculations, it updates the positions and orientations of the node objects before rendering the frame.

To add physics to a node, create and configure an SCNPhysicsBody object and then assign it to the physicsBody property of the SCNNode object. A physics body must be associated with a node object before you apply forces or impulses to it.

A Body,Äôs Physical Characteristics
The SCNPhysicsBody class defines the physical characteristics for the body when it is simulated by the scene. Three properties are most important for physics simulation:

- The type property, which determines how the body interacts with forces and other bodies in the simulation. Static bodies are unaffected by forces and collisions and cannot move. Dynamic bodies are affected by forces and collisions with other body types. Kinematic bodies are not affected by forces or collisions, but by moving them directly you can cause collisions that affect dynamic bodies.
- The physicsShape property, which defines the three-dimensional form of the body for collision detection purposes. Physics simulations run faster when using simple shapes instead of the fine detail of a node,Äôs visible geometry. Typically, you set a body,Äôs physics shape to a bounding box, sphere, or primitive shape that roughly matches its node,Äôs visible content. For details on creating physics shapes, see SCNPhysicsShape.
- The kinematicBody property. Applying a force or torque to a dynamic body results in an acceleration (or angular acceleration) proportional to its mass.

All values in SceneKit,Äôs physics simulation use the International System of Units (SI): The unit of mass is the kilogram; the units of force, impulse, and torque are the newton, newton-second, and newton-meter; and the unit of distance for node positions and sizes is the meter. Note that you need not attempt to provide realistic values for physical quantities—use whatever values produce the behavior or gameplay you,Äôre looking for.
For a dynamic body, you can control how the body is affected by forces or collisions. See Defining How Forces Affect a Physics Body.

Defining a Body,Äôs Category and Collisions
When you design a game that uses physics, you define the different categories of physics objects that appear

in the scene. You define different categories of physics bodies for the behaviors your want for your app. A body can be assigned to as many of these categories as you want. In addition to declaring its own categories, a physics body also declares which categories of bodies it interacts with.
Use the categoryBitMask and collisionBitMask properties to define an object,Äôs collision behavior. The constants listed in SCNPhysicsCollisionCategory provide default values for these properties. In addition, with the contactTestBitMask property you can define interactions where a pair of bodies generates contact messages (see the SCNPhysicsContactDelegate protocol) without the bodies being affected by the collision.

Related Physics Classes
Physics fields create forces that affect all bodies in an area, such as vortices and gravitational attraction. For details and a list of available field types, see SCNPhysicsField.
You can add higher-level behaviors that control interactions between multiple bodies, such as joints and wheeled vehicles. For details and a list of available behaviors, see SCNPhysicsBehavior.
A scene,Äôs physicsWorld property holds an SCNPhysicsWorld object that manages physics characteristics that affect the entire scene.

Physics and the Rendering Loop
SceneKit evaluates its physics simulation as part of the rendering loop described in SCNSceneRendererDelegate. On each pass through this loop, SceneKit determines the state of all nodes with attached physics bodies, and simulates the effects of physics on those bodies for one time step—for example, by updating the position or rotation of a body based on its velocity and angular velocity. After simulating physics, SceneKit applies the results of the physics simulation to the scene for display.

Because you can animate SceneKit content not only through physics, but also through actions and implicitly and explicitly defined animations, SceneKit applies the results of physics simulation not to the SCNNode objects in your scene, but to each node,Äôs presentationNode object that represents its currently displayed state. As such, changing properties of a node that are affected by physics requires special consideration.

If you change the transform value—or any of the other properties that are components of the transform, such as position and rotation—of a node affected by physics, SceneKit resets the physics simulation for that node. If you want to change only one component of the transform, while leaving the others at their physics-simulated values, copy the presentation node,Äôs transform before making changes.

170.34.2 Methods

170.34.3 applyForce(direction as SCNVector3MBS, atPosition as SCNVector3MBS, impulse as Boolean)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Applies a force or impulse to the body at a specific point.
Notes: direction: The direction and magnitude of the force (in newtons) or of the impulse (in newton-seconds).
position: The point on the body where the force or impulse should be applied, in the local coordinate system of the SCNNodeMBS object containing the physics body.
impulse: True to apply an instantaneous change in momentum; false to apply a force that affects the body at the end of the simulation step.

Applying a force or impulse to a body at a position other than its center of mass may impart both linear and angular acceleration, depending on how the body is situated in the physics world and the other forces acting upon it.
The impulse parameter determines how this method contributes to the physics simulation:

- If you specify true, SceneKit treats the direction parameter as an impulse, measured in newton-seconds, and accelerates the physics body immediately. Use this option to simulate instantaneous effects such as launching a projectile.

- If you specify false, SceneKit treats the direction parameter as a force, measured in newtons. At the end of each simulation step (by default, a step occurs once for each frame in the rendering loop), SceneKit sums all forces applied to the physics body during that step and accelerates the body according to the net effect of those forces. Use this option when you want to simulate continuous forces on the body by calling applyForce on each simulation step.

Note
The impulse parameter effectively changes the unit of magnitude. A value that results in a certain acceleration when applied continuously on each frame of the simulation results in much less acceleration if applied only during a single frame.

As with all physical quantities in SceneKit, you need not use realistic force measurements in your app—the effects of the physics simulation depend on the relative differences between forces, not on their absolute values. You may use whatever values produce the behavior or gameplay you,Äôre looking for as long as you use them consistently.

- 170.34.4 applyForce(direction as SCNVector3MBS, impulse as Boolean) 20714

170.34.4 applyForce(direction as SCNVector3MBS, impulse as Boolean)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Applies a force or impulse to the body at its center of mass.
Notes: direction: The direction and magnitude of the force (in newtons) or of the impulse (in newton-seconds).
impulse: True to apply an instantaneous change in momentum; false to apply a force that affects the body at the end of the simulation step.

Applying a force or impulse to a body imparts a linear acceleration proportional to its mass.
The impulse parameter determines how this method contributes to the physics simulation:

- If you specify true, SceneKit treats the direction parameter as an impulse, measured in newton-seconds, and accelerates the physics body immediately. Use this option to simulate instantaneous effects such as launching a projectile.
- If you specify false, SceneKit treats the direction parameter as a force, measured in newtons. At the end of each simulation step (by default, a step occurs once for each frame in the rendering loop), SceneKit sums all forces applied to the physics body during that step and accelerates the body according to the net effect of those forces. Use this option when you want to simulate continuous forces on the body by calling applyForce:impulse: on each simulation step.

Note
The impulse parameter effectively changes the unit of magnitude. A value that results in a certain acceleration when applied continuously on each frame of the simulation results in much less acceleration if applied only during a single frame.

As with all physical quantities in SceneKit, you need not use realistic force measurements in your app—the effects of the physics simulation depend on the relative differences between forces, not on their absolute values. You may use whatever values produce the behavior or gameplay you,Äôre looking for as long as you use them consistently.
See also:

- 170.34.3 applyForce(direction as SCNVector3MBS, atPosition as SCNVector3MBS, impulse as Boolean) 20713

170.34.5 applyTorque(torque as SCNVector4MBS, impulse as Boolean)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Applies a net torque or a change in angular momentum to the body.
Notes: torque: The direction and magnitude of the torque (in newton-meters) or of the change of angular momentum (in newton-meter-seconds), relative to the world coordinate space of the scene.
impulse: True to apply an instantaneous change in angular momentum; false to apply a torque that affects

the body at the end of the simulation step.

Applying a torque to a body changes its angular velocity by an amount related to its mass and shape, rotating it without affecting its linear acceleration. Each component of the torque vector relates to rotation about the corresponding axis in the local coordinate system of the SCNNode object containing the physics body. For example, applying a torque of { 0.0, 0.0, 1.0 } causes a node to spin counterclockwise around the world-space z-axis.
The impulse parameter determines how this method contributes to the physics simulation:

- If you specify true, SceneKit treats the direction parameter as an instantaneous change in angular momentum, measured in newton-meter-seconds.
- If you specify false, SceneKit treats the direction parameter as a torque, measured in newton-meters. At the end of each simulation step (by default, a step occurs once for each frame in the rendering loop), SceneKit sums all forces and torques applied to the physics body during that step and accelerates the body according to the net effect of those forces and torques. Use this option when you want to simulate gradual acceleration by calling applyTorque:impulse: on each simulation step.

Note
The impulse parameter effectively changes the unit of magnitude. A value that results in a certain acceleration when applied continuously on each frame of the simulation results in much less acceleration if applied only during a single frame.

As with all physical quantities in SceneKit, you need not use realistic force and torque measurements in your app—the effects of the physics simulation depend on the relative differences between forces, not on their absolute values. You may use whatever values produce the behavior or gameplay you,Äôre looking for as long as you use them consistently.

170.34.6 body(type as Integer, shape as SCNPhysicsShapeMBS) as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics body with the specified type and shape.
Notes: type: A constant that determines how a body responds to forces and collisions. See SCNPhysicsBodyType.
shape: A physics shape defining the volume of the body for collision detection purposes.

Returns a new physics body object.

For the body to participate in collision detection or respond to forces, you must attach it to the physicsBody property of an SCNNode object in a scene.
If you pass nil for the shape parameter, SceneKit automatically creates a physics shape for the body when

you attach it to a node, based on that node,Äôs geometry property. To create a physics shape that,Äôs based on the geometries of a node and its hierarchy of children, or to control the level of detail in a physics shape, create the physics shape manually using an SCNPhysicsShape class method.

Note
For nodes containing custom geometry, the physics shape SceneKit automatically creates is a rough approximation of the geometry. This approximation, or convex hull, provides a compromise between accuracy and performance in collision detection. For the best collision detection performance, create an SCNPhysicsShape instance based on a basic geometry class (SCNBox, SCNSphere, SCNPyramid, SCNCone, SCNCylinder, or SCNCapsule).

170.34.7 clearAllForces

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Cancels all continuous forces and torques acting on the physics body during the current simulation step.
Notes: When you pass false for the impulse parameter in the applyForce, applyForce:atPosition, or applyTorque method, SceneKit waits until the end of the current simulation step before applying its effect. At that time, SceneKit sums all forces and torques applied during that simulation step and changes the velocity or angular velocity of the body according to the net effect of those forces and torques.
Call clearAllForces to cancel any forces and torques previously applied during the current simulation step.

170.34.8 Constructor(type as Integer, shape as SCNPhysicsShapeMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics body with the specified type and shape.
Notes: type: A constant that determines how a body responds to forces and collisions. See SCNPhysicsBodyType.
shape: A physics shape defining the volume of the body for collision detection purposes.

Returns a new physics body object.

For the body to participate in collision detection or respond to forces, you must attach it to the physicsBody property of an SCNNode object in a scene.
If you pass nil for the shape parameter, SceneKit automatically creates a physics shape for the body when you attach it to a node, based on that node,Äôs geometry property. To create a physics shape that,Äôs based on the geometries of a node and its hierarchy of children, or to control the level of detail in a physics shape, create the physics shape manually using an SCNPhysicsShape class method.

Note

For nodes containing custom geometry, the physics shape SceneKit automatically creates is a rough approximation of the geometry. This approximation, or convex hull, provides a compromise between accuracy and performance in collision detection. For the best collision detection performance, create an SCNPhysicsShape instance based on a basic geometry class (SCNBox, SCNSphere, SCNPyramid, SCNCone, SCNCylinder, or SCNCapsule).

170.34.9 copy as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the body.

170.34.10 dynamicBody as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics body that can be affected by forces and collisions.
Notes: Use dynamic bodies for the elements of your scene that are moved by the physics simulation.
For the body to participate in collision detection or respond to forces, you must attach it to the physicsBody property of an SCNNode object in a scene.
SceneKit automatically creates a physics shape for the body when you attach it to a node, based on that node,Äôs geometry property. To create a physics shape that,Äôs based on the geometries of a node and its hierarchy of children, or to control the level of detail in a physics shape, create the physics shape manually using an SCNPhysicsShape class method.

Note
For nodes containing custom geometry, the physics shape SceneKit automatically creates is a rough approximation of the geometry. This approximation, or convex hull, provides a compromise between accuracy and performance in collision detection. For the best collision detection performance, create an SCNPhysicsShape instance based on a basic geometry class (SCNBox, SCNSphere, SCNPyramid, SCNCone, SCNCylinder, or SCNCapsule).

170.34.11 kinematicBody as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics body that is unaffected by forces or collisions but that can cause collisions affecting other bodies when moved.
Notes: Return a new physics body object.

Use kinematic bodies for scene elements that you want to control directly but whose movement manipulates other elements. For example, to allow the user to push objects around with a finger, you might create a

kinematic body and attach it to an invisible node that you move follow touch events. (In macOS, use the same technique to allow the user to move objects with the mouse pointer.)

For the body to participate in collision detection or respond to forces, you must attach it to the physicsBody property of an SCNNode object in a scene.
SceneKit automatically creates a physics shape for the body when you attach it to a node, based on that node,Äôs geometry property. To create a physics shape that,Äôs based on the geometries of a node and its hierarchy of children, or to control the level of detail in a physics shape, create the physics shape manually using an SCNPhysicsShape class method.
Note
For nodes containing custom geometry, the physics shape SceneKit automatically creates is a rough approximation of the geometry. This approximation, or convex hull, provides a compromise between accuracy and performance in collision detection. For the best collision detection performance, create an SCNPhysicsShape instance based on a basic geometry class (SCNBox, SCNSphere, SCNPyramid, SCNCone, SCNCylinder, or SCNCapsule).

170.34.12 resetTransform

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Updates the position and orientation of a body in the physics simulation to match that of the node to which the body is attached.
Notes: If you change the position or orientation of a node with an attached static or dynamic physics body, call this method afterward to ensure that the physics simulation incorporates the change. You need not call this method for kinematic bodies.
Note that dynamic and physics bodies are designed to be moved only by the physics simulation or not at all. You may use this method to move them regardless of this restriction, but at a cost to performance.

170.34.13 staticBody as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics body that is unaffected by forces or collisions and that cannot move.
Notes: Use static bodies to construct fixtures in your scene that other bodies need to collide with but that do not themselves move, such as floors, walls, and terrain.
For the body to participate in collision detection or respond to forces, you must attach it to the physicsBody property of an SCNNode object in a scene.
SceneKit automatically creates a physics shape for the body when you attach it to a node, based on that node,Äôs geometry property. To create a physics shape that,Äôs based on the geometries of a node and its hierarchy of children, or to control the level of detail in a physics shape, create the physics shape manually using an SCNPhysicsShape class method.

Note

For nodes containing custom geometry, the physics shape SceneKit automatically creates is a rough approximation of the geometry. This approximation, or convex hull, provides a compromise between accuracy and performance in collision detection. For the best collision detection performance, create an SCNPhysicsShape instance based on a basic geometry class (SCNBox, SCNSphere, SCNPyramid, SCNCone, SCNCylinder, or SCNCapsule).

170.34.14 Properties

170.34.15 AffectedByGravity as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the constant gravity of a scene accelerates the body.
Notes: If this property is true (the default), and the type of the body is SCNPhysicsBodyTypeDynamic, the gravity property of the scene,Äôs physicsWorld object causes the body to accelerate.
If this property is false, the body is not affected by scene gravity. This option can be useful when making physics bodies whose behavior should be governed by SCNPhysicsFieldMBS objects instead of a constant global acceleration.
(Read and Write property)

170.34.16 allowsResting as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that specifies whether SceneKit can automatically mark the physics body at rest.
Notes: If true (the default), SceneKit keeps track of whether the body is moving or affected by forces, automatically setting its Resting property to true when it is ,Äúat rest.,Äù The physics simulation runs faster when simulating fewer bodies, so treating a body as resting temporarily removes it from the simulation to improve performance.

SceneKit automatically returns a resting body to the simulation if another body collides with it, if you change its position or velocity, or if you apply a force to it. However, SceneKit uses a faster, less accurate simulation when deciding whether to change a body,Äôs isResting property back to false. If testing your app reveals unexpected physics behaviors involving resting bodies, changing those bodies,Äô allowsResting property to false may improve simulation accuracy.
(Read and Write property)

170.34.17 angularDamping as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A factor that reduces the body,Äôs angular velocity.
Notes: This property simulates the effect of rotational friction on a body. A damping factor of 0.0 specifies no loss in angular velocity, and a damping factor of 1.0 prevents the body from rotating. The default damping factor is 0.1.
(Read and Write property)

170.34.18 angularVelocity as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A vector describing both the current rotation axis and rotational speed (in radians per second) of the physics body.
Notes: A positive rotational speed indicates counterclockwise rotation (when viewed from the direction the rotation axis points in).
SceneKit,Äôs physics simulation determines the angular velocity (and corresponding change in rotation) of each dynamic physics body in the scene. You can also set a body,Äôs velocity directly to set the physics simulation in motion or influence its behavior.

The effect of reading or setting this property,Äôs value changes based on the current context:

- When invoked within a rendering loop method (any of the events), or from any other code invoked from within such a method, reading the property returns the current result of the physics simulation, and setting the property immediately applies the change.
- When invoked at any other time, reading the property returns the last value set for the property, and setting the property does not take effect until the next pass through the rendering loop.

(Read and Write property)

170.34.19 angularVelocityFactor as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A multiplier affecting how SceneKit applies rotations computed by the physics simulation to the node containing the physics body.
Notes: Use this property to constrain or restrict the effect of physics simulation on the node containing the physics body. For example, you can force a body to rotate in only one axis by setting its angular velocity factor to { 0.0, 1.0, 0.0 } .
(Read and Write property)

170.34.20 categoryBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A mask that defines which categories this physics body belongs to.
Notes: Every physics body in a scene can be assigned to one or more categories, each corresponding to a bit in the bit mask. You define the mask values used in your game. Use this property together with the physicsShape and contactTestBitMask properties to define which physics bodies interact with each other and when your game is notified of interactions.
The default value is SCNPhysicsCollisionCategoryStatic for static bodies and SCNPhysicsCollisionCategoryDefault for dynamic and kinematic bodies.
(Read and Write property)

170.34.21 charge as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The electric charge of the body, in coulombs.
Notes: A body,Äôs charge determines its behavior when affected by an electric or magnetic field. Use the SCNPhysicsFieldMBS class to add these fields to your scene. Bodies with positive or negative charges behave differently when affected by electric or magnetic fields. The default electric charge on a physics body is 0.0, causing it to be unaffected by electric and magnetic fields.

Note that you need not use realistic measurements for the bodies in your app—the effects of the physics simulation depend on the relative masses of different bodies, not the absolute values. You may use whatever values produce the behavior or gameplay you,Äôre looking for as long as you use them consistently.
(Read and Write property)

170.34.22 collisionBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A mask that defines which categories of physics bodies can collide with this physics body.
Notes: When two physics bodies contact each other, a collision may occur. SceneKit compares the body,Äôs collision mask to the other body,Äôs category mask by performing a bitwise AND operation. If the result is a nonzero value, then the body is affected by the collision. Each body independently chooses whether it wants to be affected by the other body. For example, you might choose to avoid collision calculations that would make negligible changes to a body,Äôs velocity.

The default value is SCNPhysicsCollisionCategoryAll (a bit mask whose every bit is enabled), specifying that the body will collide with bodies of all other categories.
(Read and Write property)

170.34.23 contactTestBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A mask that defines which categories of bodies cause intersection notifications with this physics body.
Notes: When two physics bodies overlap, a contact may occur. SceneKit compares the body,Äôs contact mask to the other body,Äôs category mask by performing a bitwise AND operation. If the result is a nonzero value, SceneKit creates an SCNPhysicsContactMBS object describing the contact and sends messages to the contactDelegate object of the scene,Äôs physics world. For best performance, only set bits in the contact mask for interactions you are interested in.

For applications running in OS X v10.10 or iOS 8, this property,Äôs value matches that of the collisionBitMask property—that is, SceneKit sends contact messages if and only if a collision occurs. For applications running in OS X v10.11 or iOS 9 or later, this property,Äôs value defaults to zero and need not match the collision mask—that is, a pair of bodies generates contact messages whenever the bodies intersect, regardless of whether they collide or pass through one another.
(Read and Write property)

170.34.24 damping as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A factor that reduces the body,Äôs linear velocity.
Notes: This property simulates the effect of fluid friction or air resistance on a body. A damping factor of 0.0 specifies no loss in velocity, and a damping factor of 1.0 prevents the body from moving. The default damping factor is 0.1.
(Read and Write property)

170.34.25 friction as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The body,Äôs resistance to sliding motion.
Notes: This property simulates the roughness of the body,Äôs surface. When two bodies are in contact and a force is applied that would cause them to slide against one another, the friction values for both bodies determine their resistance to motion. If both bodies,Äô friction value is 0.0, they slide freely against each other. If both bodies,Äô friction value is 1.0, they do not slide at all. The default friction is 0.5.
(Read and Write property)

170.34.26 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

170.34.27 isResting as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the physics body is at rest.
Notes: This property,Äôs default value is false, but SceneKit,Äôs physics simulation may automatically set it to true if the body is not moving and not affected by any forces. A resting body does not participate in the simulation until another body collides with it or you change its position or velocity or apply a force to it.
(Read only property)

170.34.28 mass as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The mass of the body, in kilograms.
Notes: The mass of a body affects its momentum and how it responds to forces. The default mass for dynamic bodies is 1.0. The default mass for static and kinematic bodies is 0.0, but these bodies are unaffected by mass.

Note that you need not use realistic measurements for the bodies in your app—the effects of the physics simulation depend on the relative masses of different bodies, not the absolute values. You may use whatever values produce the behavior or gameplay you,Äôre looking for as long as you use them consistently.
(Read and Write property)

170.34.29 momentOfInertia as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The body,Äôs moment of inertia, expressed in the local coordinate system of the node that contains the body.
Notes: A body,Äôs moment of inertia determines how it responds to torques (that is, forces with a rotational component). Each component of this vector is the moment of inertia for the corresponding principal axis (in the coordinate system containing the physics body). For example, if the x-component value of the moment vector is less than the y-component value, the body rotates more freely about its x-axis than its

y-axis.

By default, SceneKit automatically determines the body,Äôs moment of inertia based on its shape and mass. Use this property to define a custom moment of inertia (for example, to model an object of non-uniform density). Using a custom moment of inertia requires setting the usesDefaultMomentOfInertia property to false.
(Read and Write property)

170.34.30 physicsShape as SCNPhysicsShapeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object that defines the solid volume of the physics body for use in collision detection.
Notes: The physics simulation does not use a node,Äôs visible geometry for collision detection—the simulation can run faster when using simple shapes, and it can also be useful to design your app or game using invisible collision shapes for some elements. Typically, you set a body,Äôs physics shape to a bounding box or primitive shape that roughly matches its node,Äôs visible content, but you can use a more detailed shape for more precise collision detection at a cost to performance.
For details on creating physics shapes, see SCNPhysicsShapeMBS.
(Read and Write property)

170.34.31 restitution as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A factor that determines how much kinetic energy the body loses or gains in collisions.
Notes: This property simulates the ,Äúbounciness,Äù of a body. A restitution of 1.0 means that the body loses no energy in a collision—for example, a ball dropped onto a flat surface will bounce back to the height it fell from. A restitution of 0.0 means the body does not bounce after a collision. A restitution of greater than 1.0 causes the body to gain energy in collisions. The default restitution is 0.5.
(Read and Write property)

170.34.32 rollingFriction as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The body,Äôs resistance to rolling motion.
Notes: This property simulates the traction between a rounded body and bodies it might roll against. A rolling friction of 0.0 (the default) means that a body induced to roll (for example, by being placed on an inclined surface) will continue to roll without slowing down unless otherwise acted upon, and a rolling friction of 1.0 prevents the body from rolling.
(Read and Write property)

170.34.33 type as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A constant that determines how the physics body responds to forces and collisions.
Notes: (Read and Write property)

170.34.34 usesDefaultMomentOfInertia as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit automatically calculates the body,Äôs moment of inertia or allows setting a custom value.
Notes: A body,Äôs moment of inertia determines how it responds to torques (that is, forces with a rotational component).
If this property is true (the default), SceneKit automatically determines the body,Äôs moment of inertia based on its shape and mass. Set this property to false and use the momentOfInertia property to define a custom moment of inertia (for example, to model an object of non-uniform density).
(Read and Write property)

170.34.35 velocity as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A vector describing both the current speed (in meters per second) and direction of motion of the physics body.
Notes: SceneKit,Äôs physics simulation determines the velocity (and corresponding change in position) of each dynamic physics body in the scene. You can also set a body,Äôs velocity directly to set the physics simulation in motion or influence its behavior.
The effect of reading or setting this property,Äôs value changes based on the current context:

- When invoked within a rendering loop method (any of the events), or from any other code invoked from within such a method, reading the property returns the current result of the physics simulation, and setting the property immediately applies the change.
- When invoked at any other time, reading the property returns the last value set for the property, and setting the property does not take effect until the next pass through the rendering loop.

(Read and Write property)

170.34.36 velocityFactor as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A multiplier affecting how SceneKit applies translations computed by the physics simulation to the node containing the physics body.
Notes: Use this property to constrain or restrict the effect of physics simulation on the node containing the physics body. For example, you can force a body to move in only two dimensions by setting its velocity factor to { 1.0, 1.0, 0.0 } .
(Read and Write property)

170.34.37 Constants

Collision Categories

Constant	Value	Description
kPhysicsCollisionCategoryAll	-1	This is the default value for a physics body,Äôs collisionBitMask property. With this collision mask, a physics body can collide with all other physic bodies.
kPhysicsCollisionCategoryDefault	1	The default categoryBitMask value for dynamic and kinematic bodies.
kPhysicsCollisionCategoryStatic	2	The default categoryBitMask value for static bodies.

Body Types

Constant	Value	Description
kTypeDynamic	1	A physics body that can be affected by forces and collisions. Use dynamic bodies for the elements of your scene that are moved by the physics simulation.
kTypeKinematic	2	A physics body that is unaffected by forces or collisions but that can cause collisions affecting other bodies when moved. Use kinematic bodies for scene elements that you want to control directly directly but whose movement manipulates other elements. For example, to allow the user to push objects around with a finger, you might create a kinematic body and attach it to an invisible node that you move to follow touch events. (In macOS, use the same technique to allow the user to move objects with the mouse pointer.)
kTypeStatic	0	A physics body that is unaffected by forces or collisions and cannot move. Use static bodies to construct fixtures in your scene that other bodies need to collide with but that do not themselves move, such as floors, walls, and terrain.

170.35 class SCNPhysicsConeTwistJointMBS

170.35.1 class SCNPhysicsConeTwistJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The class for a cone twist join.
Notes: Subclass of the SCNPhysicsBehaviorMBS class.

170.35.2 Methods

170.35.3 Constructor(body as SCNPhysicsBodyMBS, frame as SCNMatrix4MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a physics cone-twist joint.
Notes: The joint attaches "body" to the 3d location specified by "frame" and relative to the node that owns the body.
See also:

- 170.35.4 Constructor(bodyA as SCNPhysicsBodyMBS, frameA as SCNMatrix4MBS, bodyB as SCNPhysicsBodyMBS, frameB as SCNMatrix4MBS) 20727

170.35.4 Constructor(bodyA as SCNPhysicsBodyMBS, frameA as SCNMatrix4MBS, bodyB as SCNPhysicsBodyMBS, frameB as SCNMatrix4MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a physics cone-twist joint.
Notes: The joint attaches bodyA and bodyB on frameA and frameB respectively.
See also:

- 170.35.3 Constructor(body as SCNPhysicsBodyMBS, frame as SCNMatrix4MBS) 20727

170.35.5 jointWithBody(body as SCNPhysicsBodyMBS, frame as SCNMatrix4MBS) as SCNPhysicsConeTwistJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a physics cone-twist joint.
Notes: The joint attaches "body" to the 3d location specified by "frame" and relative to the node that owns the body.
See also:

- 170.35.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, frameA as SCNMatrix4MBS, bodyB as SCNPhysicsBodyMBS, frameB as SCNMatrix4MBS) as SCNPhysicsConeTwistJointMBS 20728

170.35.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, frameA as SCNMatrix4MBS, bodyB as SCNPhysicsBodyMBS, frameB as SCNMatrix4MBS) as SCNPhysicsConeTwistJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Initializes and returns a physics cone-twist joint.
Notes: The joint attaches bodyA and bodyB on frameA and frameB respectively.
See also:

- 170.35.5 jointWithBody(body as SCNPhysicsBodyMBS, frame as SCNMatrix4MBS) as SCNPhysicsConeTwistJointMBS 20727

170.35.7 Properties

170.35.8 bodyA as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The first body attached to the slider joint.
Notes: (Read only property)

170.35.9 bodyB as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The second body attached to the slider joint.
Notes: (Read only property)

170.35.10 frameA as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Frame for bodyA.
Notes: (Read and Write property)

170.35.11 frameB as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Frame for bodyB.
Notes: (Read and Write property)

170.35.12 maximumAngularLimit1 as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum angular limits in radians in each cone tangent directions
Notes: (Read and Write property)

170.35.13 maximumAngularLimit2 as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum angular limits in radians in each cone tangent directions
Notes: (Read and Write property)

170.35.14 maximumTwistAngle as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Maximum twist angle alon the cone axis.
Notes: (Read and Write property)

170.36 class SCNPhysicsContactMBS

170.36.1 class SCNPhysicsContactMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Detailed information about a contact between two physics bodies in a scene,Äôs physics simulation.
Notes: You don't create SCNPhysicsContact instances directly; SceneKit automatically creates these objects whenever contacts occur.
To receive contact messages, implement events in your of your scene,Äôs SCNPhysicsWorld object. Next, for each physics body in your scene, set the categoryBitMask and collisionBitMask properties to define which interactions should generate contact messages.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

170.36.2 Methods

170.36.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

170.36.4 Properties

170.36.5 collisionImpulse as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The force over time of the collision, in newton-seconds.
Notes: This property,Äôs value tells you how hard the bodies struck each other in a collision. For example, in a game you might allow a character to proceed unhindered after a minor collision, but take damage when struck with sufficient force.
(Read only property)

170.36.6 contactNormal as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The normal vector at the contact point between the two physics bodies, in scene coordinates.
Notes: This vector tells you which direction the bodies were moving relative to one another at the time of the collision. For example, in a game you can examine this vector to have enemy characters take damage

when struck from above by the player character but damage the player character instead when they collide side-to-side.
(Read only property)

170.36.7 contactPoint as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The contact point between the two physics bodies, in scene coordinates.
Notes: (Read only property)

170.36.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

170.36.9 nodeA as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The node containing the first body in the contact.
Notes: Use the node,Äôs physicsBody property to examine physics characteristics of the node.
(Read only property)

170.36.10 nodeB as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The node containing the second body in the contact.
Notes: Use the node,Äôs physicsBody property to examine physics characteristics of the node.
(Read only property)

170.36.11 penetrationDistance as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The distance of overlap, in units of scene coordinate space, between the two physics bodies.
Notes: (Read only property)

170.36.12 sweepTestFraction as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Value between 0 and 1 giving the relative position of the physic shape when performing a convex sweep test.
Notes: (Read only property)

170.37 class SCNPhysicsFieldMBS

170.37.1 class SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An object that applies forces, such as gravitation, electromagnetism, and turbulence, to physics bodies within a certain area of effect.
Notes: You can create many types of field effects, such as gravitation, electromagnetism, and turbulence. To add a field effect to a scene, you create a physics field of the type you want to use and then attach it to the physicsField property of a node in the scene.
Physics fields can affect both SCNPhysicsBodyMBS objects and the particles spawned by SCNParticleSystemMBS objects.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

170.37.2 Methods

170.37.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

170.37.4 copy as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the field.

170.37.5 customField(FieldForceEvaluator as SCNFieldForceEvaluatorMBS, tag as variant = nil) as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that runs the specified block to determine the force a field applies to each object in its area of effect.
Notes: delegate: A method that SceneKit runs for each object in the field,Äôs area of effect.

Returns a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNodeMBS object.

For custom physics fields, SceneKit ignores the direction, strength, falloffExponent, and minimumDistance properties. Instead, SceneKit calls your block to determine the direction and magnitude of force to apply to each physics body or particle in the field,Äôs area of effect.

Due to the dispatching of the delegate to main thread, this is not very efficient.

170.37.6 dragField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that slows any object in its area of effect with a force proportional to the object,Äôs velocity.
Notes: Returns a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

Like the damping and angularDamping properties of a physics body, drag fields can simulate effects such as fluid friction or air resistance. Unlike those properties, drag fields can simulate different intensities of fluid friction in different areas of your scene. For example, you can use a drag field to represent underwater areas. The default falloffExponent value for a drag field is 0.0, indicating that the field,Äôs effect is constant throughout its area of effect.

170.37.7 electricField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that attracts or repels objects based on their electrical charge and on their distance from the field,Äôs center.
Notes: Returns a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

Use this field type to make objects behave differently from one another when they enter a region, or to make an object's behavior different from its mass-based behavior. An electric field behaves according to the first part of the Lorentz force equation modeling real-world electromagnetic forces—the field applies a force whose magnitude is proportional to electric charge and distance.
By default, physics bodies and particle systems have no electric charge, so they are unaffected by electric and magnetic fields. Use the charge property of a physics body or the particleCharge property of a particle system to add charge-based behavior.
When the field,Äôs strength value is positive (the default), it attracts bodies whose charge is negative and repels bodies whose charge is positive. To reverse this behavior, set the field,Äôs strength property to a negative value.
The default falloffExponent value for an electric field is 2.0, indicating that the field,Äôs effect diminishes with the square of its distance from its center.

170.37.8 linearGravityField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that accelerates objects in a specific direction.
Notes: Returns a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

Because the force of gravity on an object is proportional to the object,Äôs mass, this force accelerates all objects in the field,Äôs area of affect by the same amount. The field,Äôs strength property measures this acceleration in meters per second per second.
By default, a linear gravity field accelerates objects in along its direction vector. To make it accelerate objects in the opposite direction, set the field,Äôs strength property to a negative value.
The default falloffExponent value for a linear gravity field is 0.0, indicating that the field,Äôs effect is constant throughout its area of effect.

170.37.9 magneticField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that attracts or repels objects based on their electrical charge, velocity, and distance from the field,Äôs axis.
Notes: A physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

Use this field type to make objects behave differently from one another when they enter a region, or to make an object's behavior different from its mass based behavior. A magnetic field behaves according to the second part of the Lorentz force equation modeling real-world electromagnetic forces—the field applies a force determined by the cross product of an object,Äôs velocity vector and the magnetic field vector at the object,Äôs location, with magnitude proportional to the object,Äôs electric charge.
By default, physics bodies and particle systems have no electric charge, so they are unaffected by electric and magnetic fields. Use the charge property of a physics body or the particleCharge property of a particle system to add charge-based behavior.
When the field,Äôs strength value is positive (the default), the magnetic field vectors circulate counterclockwise relative to the field,Äôs direction vector. (That is, the magnetic field models a real-world magnetic field created by current in a wire oriented in the field,Äôs direction.) To make field vectors circulate clockwise, set the field,Äôs strength property to a negative value.

This SCNPhysicsField option models the real-world physics effect of magnetic fields on moving, electrically charged bodies, not the behavior of permanent magnets or electromagnets. To make objects in your scene simply attract or repel one another, use a different field type. For example, a field created by the radialGravityField method attracts or repels all dynamic bodies near it according to its strength property, and a field created by the electricField method selectively attracts or repels bodies according to their electric charge.
The default falloffExponent value for a magnetic field is 2.0, indicating that the field,Äôs effect diminishes with the square of distance from its center.

170.37.10 noiseField(smoothness as double, animationSpeed as double) as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that applies random forces to objects in its area of effect.
Notes: smoothness: The amount of randomness in the field. A value of 0.0 specifies maximum noise, and a value of 1.0 specifies no noise at all.
speed: The field,Äôs variation over time. Specify 0.0 for a static field.

Returns a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

Use this field type to simulate effects involving random motion, such as fireflies or gently falling snow.
In calculating the direction and strength of the field,Äôs effect on an object, SceneKit uses a Perlin simplex noise function. This function produces a velocity field that varies over time.
The default falloffExponent value for a noise field is 0.0, indicating that the field,Äôs effect is constant throughout its area of effect. This field type ignores the field,Äôs direction property.

170.37.11 radialGravityField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that accelerates objects toward its center.
Notes: Returns a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

Because the force of gravity on an object is proportional to the object,Äôs mass, this force accelerates all objects at the same distance from the field,Äôs center by the same amount. The field,Äôs strength property measures this acceleration in meters per second per second.
By default, a radial gravity field attracts objects toward its center. To make it repel objects instead, set the field,Äôs strength property to a negative value.
The default falloffExponent value for a radial gravity field is 2.0, indicating that the field,Äôs effect diminishes with the square of distance from its center.

170.37.12 springField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that pulls objects toward its center with a spring-like force.

Notes: Returns a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

The force a spring field applies to objects in its area of effect is linearly proportional to the distance from the object to the center of the field. (That is, the field behaves according to Hooke,Äôs Law of real-world spring forces.) An object placed at the center of the field and moved away will oscillate around the center, with a period of oscillation that is proportional to the object,Äôs mass. The field,Äôs strength property scales the magnitude of the spring effect—a larger strength simulates a stiffer spring.

The default falloffExponent value for a spring field is 1.0, indicating that the field,Äôs effect diminishes linearly with distance from its center.

170.37.13 turbulenceField(smoothness as double, animationSpeed as double) as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field that applies random forces to objects in its area of effect, with magnitudes proportional to those objects,Äô velocities.
Notes: smoothness: The amount of randomness in the field. A value of 0.0 specifies maximum noise, and a value of 1.0 specifies no noise at all.
speed: The field,Äôs variation over time. Specify 0.0 for a static field.

Return a physics field object. To use the field in a scene, attach it to the physicsField property of an SCNNode object.

Like a noise field, a turbulence field applies forces in random directions to the objects that it affects. Unlike a noise field, a turbulence field applies a force whose magnitude is proportional to the speed of each affected object. For example, an object passing through a noise field shakes as it travels through the field, but an object passing through a turbulence field shakes more violently the faster it travels. The field,Äôs strength property scales the magnitude of the turbulence effect.

The default falloffExponent value for a turbulence field is 0.0, indicating that the field,Äôs effect is constant throughout its area of effect.

170.37.14 vortexField as SCNPhysicsFieldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a field whose forces circulate around an axis.
Notes: Returns a physics field object. To use the field in a scene, attach it to the physicsField property of

an SCNNode object.

The force on an object in a vortex field is tangential to the line from the object,Äôs position to the field,Äôs axis and proportional to the object,Äôs mass. (The field,Äôs axis is a line that is parallel to its direction vector and that passes through its center. For details, see the offset property.) For example, when a vortex field,Äôs area of effect contains many objects, the resulting scene resembles a tornado: The objects simultaneously revolve around and fly away from the field,Äôs center.
By default, a vortex circulates counterclockwise relative to its direction vector. To make it circulate clockwise, set the field,Äôs strength property to a negative value.
The default falloffExponent value for a vortex field is 0.0, indicating that the field,Äôs effect is constant throughout its area of effect.

170.37.15 Properties

170.37.16 Active as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the field,Äôs effect is enabled.
Notes: If this value is fasle, the field does not apply forces to physics bodies in its area of effect. The default value is true.
Use this property, for example, to switch fields on and off as a gameplay mechanic.
(Read and Write property)

170.37.17 CategoryBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A mask that defines which categories this physics field belongs to.
Notes: To determine whether a field affects a physics body, SceneKit performs a bitwise AND operation on the field,Äôs category bit mask and the body,Äôs categoryBitMask property. If the result is a nonzero value, SceneKit computes and applies the force of the field on the body. To determine whether a field affects the particles spawned by an SCNParticleSystemMBS object, SceneKit performs the same check using the categoryBitMask property of the node containing the particle system.
Use this property to create fields which affect only certain bodies in your scene. Reducing the number of bodies affected by fields can also improve simulation performance.
(Read and Write property)

170.37.18 direction as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The field,Äôs directional axis.
Notes: Some types of fields apply forces whose direction or magnitude is relative to an axis. (For details on each type of field, see the methods listed in Creating Physics Fields.) Changing the direction changes the effects of these field types.

The default direction is the vector { 0, -1, 0 } . With this direction, for example, linear gravity fields whose strength is positive cause objects to fall in the ,Äúdown,Äù direction of scene space.
(Read and Write property)

170.37.19 Exclusive as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the field overrides other fields whose areas of effect it overlaps.
Notes: If this value is true and a physics body is within this field,Äôs region, SceneKit ignores the effects of all other fields that might otherwise affect the body. The default value is false.
If you set this property to true on multiple fields in a scene, their regions should not overlap. If they do, the results are undefined.
(Read and Write property)

170.37.20 falloffExponent as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An exponent that determines how the field,Äôs strength diminishes with distance.
Notes: When SceneKit calculates the force to be applied by a field, it attenuates the field,Äôs effect by multiplying with the expression pow(distance - minRadius, -falloff). If the falloff exponent is greater than zero, the field,Äôs effect is stronger on nearby bodies than on bodies farther away from its location.
The default falloff exponent varies by field type. For details, see the methods listed in Creating Physics Fields.
(Read and Write property)

170.37.21 halfExtent as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A location marking the end of the field,Äôs area of effect.
Notes: To define a field,Äôs area of effect, use the position property of the node that contains the field and the field,Äôs halfExtent property. The center of the area of effect is the node,Äôs position. The half-extent, a position vector in the local coordinate space of the node containing the field, marks one corner of a box, and the negative of the half-extent vector marks the opposite corner of the box. For example, if a node,Äôs

position is the vector { 2.0, 2.0, 2.0 } and it contains a physics field whose half-extent is the vector { 0.5, 0.5, 0.5 } , the field,Äôs area of effect is the box extending from 1.5 to 2.5 along each axis of the scene,Äôs coordinate system.
By default, a field,Äôs area of effect is the interior of this box shape. Use the usesEllipsoidalExtent property to instead make the area of effect an ellipsoid bounded by this box. Use the scope property to choose whether the area of effect is the interior or exterior of the box (or ellipsoid).
The default half-extent is the vector { INFINITY, INFINITY, INFINITY } , specifying that the field affects bodies located anywhere in the scene.
(Read and Write property)

170.37.22 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

170.37.23 minimumDistance as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum value for distance-based effects.
Notes: This property determines the beginning of the field,Äôs falloff area. At distances less than the minimum, the field,Äôs effect is at full strength. At greater distances, the field,Äôs effect diminishes based on the value of the falloffExponent property. The default minimum distance is a very small (but nonzero) value.
(Read and Write property)

170.37.24 offset as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The offset of the field,Äôs center within its area of effect.
Notes: Some types of fields apply forces whose magnitude is relative to the distance between an object and the field,Äôs center. (For details on each type of field, see the methods listed in Creating Physics Fields.) Changing the offset changes the effects of these field types.

With the default offset vector { 0, 0, 0 } , the center of a field is the center of its area of effect.
(Read and Write property)

170.37.25 Scope as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The area affected by the field, either inside or outside its region.
Notes: First, define a field,Äôs region using its halfExtent property and the position property of the node containing the field. Then, use the scope property to choose whether the field,Äôs area of effect is the interior of the region (the default) or all space outside the region.
(Read and Write property)

170.37.26 strength as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A multiplier for the force that the field applies to objects in its area of effect.
Notes: Each type of physics field defines its own behavior for strength values. For details, see the methods listed in Creating Physics Fields.
(Read and Write property)

170.37.27 usesEllipsoidalExtent as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the field,Äôs area of effect is shaped like a box or ellipsoid.
Notes: If this value is false (the default), the field,Äôs area of effect is the box-shaped region of space defined by its halfExtent property and the position property of the node containing the field.

If this value is true, the field,Äôs area of effect is the ellipsoid bounded by this box-shaped region. That is, if all components of the half-extent vector are equal, the field has a spherical area of effect.
(Read and Write property)

170.37.28 Constants

Scopes

Constant	Value	Description
kScopeInsideExtent	0	The field,Äôs effect applies only to objects within the region of space defined by its position and extent.
kScopeOutsideExtent	1	The field,Äôs effect applies only to objects outside the region of space defined by its position and extent.

170.37.29 Delegates

170.37.30 SCNFieldForceEvaluatorMBS(position as SCNVector3MBS, velocity as SCNVector3MBS, mass as single, charge as single, time as double, Tag as Variant) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The signature for a delegate that SceneKit calls to determine the effect of a custom field on an object.
Notes: You use this type of delegate to create a custom physics field with the customFieldWithEvaluationBlock: method. SceneKit calls your delegate once for each object in the field,Äôs area of effect, on each step of the physics simulation.

Note
By default, one simulation step occurs for each frame rendered. For example, if your view renders at 60 frames per second and three bodies are in the field,Äôs area of effect, SceneKit runs your delegate 180 times per second. To avoid reduced rendering performance, take care not to perform extensive computation in this delegate.
The delegate takes the following parameters:

position: The position of the object affected by the field, in the local coordinate space of the node containing the field.
velocity: The velocity of the object affected by the field, relative to the local coordinate space of the node containing the field.
mass: The mass of the object affected by the field. (See the mass property for physics bodies and the particleMass property for particle systems.)
charge: The electrical charge of the object affected by the field. (See the charge property for physics bodies and the particleCharge property for particle systems.)
time: The elapsed time, in seconds, since the last simulation step.

Your delegate uses these parameters to compute and return an SCNVector3 force vector, which SceneKit then applies to the object affected by the field.

170.38 class SCNPhysicsHingeJointMBS

170.38.1 class SCNPhysicsHingeJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A physics behavior that connects two bodies and allows them to pivot around each other on a single axis.
Notes: A hinge has a single degree of freedom (rotation). You can also use a hinge joint to pin a body so that it can only move by rotating around a specific axis in the coordinate space of the node containing it.

Available in MacOS 10.10 or newer.
Subclass of the SCNPhysicsBehaviorMBS class.

170.38.2 Methods

170.38.3 Constructor(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a hinge joint that anchors a single physics body in space and lets it rotate around a specific axis.
Notes: body: The physics body to be controlled by the hinge joint.
axis: The direction of the axis that the body pivots around, relative to the node containing the body.
anchor: The location of the axis in the node containing the body.

Returns a new hinge joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.38.4 Constructor(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS) 20744

170.38.4 Constructor(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a hinge joint connecting two physics bodies.
Notes: bodyA: The first physics body to be connected by the joint.
axisA: The axis that the hinge pivots around, relative to the node containing the first body.
anchorA: The point at which the hinge connects, relative to the node containing the first body.
bodyB: The second physics body to be connected by the joint.
axisB: The axis that the hinge pivots around, relative to the node containing the second body.
anchorB: The point at which the hinge connects, relative to the node containing the second body.

Returns a new hinge joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.38.3 Constructor(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS) 20743

170.38.5 jointWithBody(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS) as SCNPhysicsHingeJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a hinge joint that anchors a single physics body in space and lets it rotate around a specific axis.
Notes: body: The physics body to be controlled by the hinge joint.
axis: The direction of the axis that the body pivots around, relative to the node containing the body.
anchor: The location of the axis in the node containing the body.

Returns a new hinge joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.38.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS) as SCNPhysicsHingeJointMBS 20745

170.38.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS) as SCNPhysicsHingeJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a hinge joint connecting two physics bodies.
Notes: bodyA: The first physics body to be connected by the joint.
axisA: The axis that the hinge pivots around, relative to the node containing the first body.
anchorA: The point at which the hinge connects, relative to the node containing the first body.
bodyB: The second physics body to be connected by the joint.
axisB: The axis that the hinge pivots around, relative to the node containing the second body.
anchorB: The point at which the hinge connects, relative to the node containing the second body.

Returns a new hinge joint behavior.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.

- 170.38.5 jointWithBody(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS) as SCNPhysicsHingeJointMBS 20744

170.38.7 Properties

170.38.8 anchorA as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point at which the hinge connects, relative to the node containing the first body.
Notes: (Read and Write property)

170.38.9 anchorB as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point at which the hinge connects, relative to the node containing the second body.
Notes: (Read and Write property)

170.38.10 axisA as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The axis that the hinge pivots around, relative to the node containing the first body.
Notes: (Read and Write property)

170.38.11 axisB as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The axis that the hinge pivots around, relative to the node containing the second body.
Notes: (Read and Write property)

170.38.12 bodyA as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The first physics body connected by the joint.
Notes: (Read only property)

170.38.13 bodyB as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The second physics body connected by the joint.
Notes: This property,Äôs value is nil if the joint was created using the Constructor without bodyB parameter.
(Read only property)

170.39 class SCNPhysicsShapeMBS

170.39.1 class SCNPhysicsShapeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An abstraction of a physics body,Äôs solid volume for tuning collision detection.
Notes: When SceneKit performs contact detection and other simulations for the SCNPhysicsBodyMBS objects in your scene, it uses physics shapes instead of the rendered geometry of visible objects. This approach both improves simulation performance and allows you to more easily design your gameplay around scene elements the player can interact with.

Simple Versus Complex Shapes
When you allow SceneKit to automatically create a physics shape, it uses the simplest possible shape roughly matching the geometry of the node the physics body is attached to. This approach maximizes simulation performance but can lead to unrealistic physics behavior for some objects.

You can make the simulation behave more realistically by defining physics shapes that more closely follow the visible geometry in your scene. This approach comes at a cost to performance, so you want to limit the amount of detail in your physics shapes. Use the highest levels of detail only on bodies for which precise collision detection is important for your app.
If you create a physics shape using one of the basic geometry classes (SCNBoxMBS, SCNSphereMBS, SCNPyramidMBS, SCNConeMBS, SCNCylinderMBS, or SCNCapsuleMBS), SceneKit uses an idealized form of that geometry for the physics shape instead of using the geometry,Äôs vertex data to simulate collisions. For example, if you create a physics shape from an SCNSphere object, SceneKit simulates collisions for any object that passes within the sphere,Äôs radius.

Because the idealized forms of simple geometries are computationally much simpler than the vertex data needed for displaying them, using basic geometries for physics shapes (or compound shapes created from basic geometries with the shapeWithShapes method) often provides the best balance between simulation accuracy and performance.

Changing a Physics Body,Äôs Shape
Physics shapes are immutable, but you can change the shape associated with a physics body by creating a new SCNPhysicsShape instance and assigning it to the body,Äôs physicsShape property.

170.39.2 Methods

170.39.3 Constructor(geometry as SCNGeometryMBS, Options as Dictionary = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics shape based on a geometry object.
Notes: geometry: A geometry object.
options: A dictionary of options affecting the level of detail of the physics shape, or nil to use default options. For applicable keys and their possible values, see Shape Creation Options Keys.

Returns a new physics shape object.

If you create a physics shape using one of the basic geometry classes (SCNBoxMBS, SCNSphereMBS, SCNPyramidMBS, SCNConeMBS, SCNCylinderMBS, or SCNCapsuleMBS), SceneKit uses an idealized form of that geometry for the physics shape instead of using the geometry,Äôs vertex data to simulate collisions. For example, if you create a physics shape from an SCNSphere object, SceneKit simulates collisions for any object that passes within the sphere,Äôs radius.

Because the idealized forms of simple geometries are computationally much simpler than the vertex data needed for displaying them, using basic geometries for physics shapes (or compound shapes created from basic geometries with the shapeWithShapes method) often provides the best balance between simulation accuracy and performance.

To use the newly created physics shape, create a physics body with the the bodyWithType method, or assign the shape to the physicsShape property of an existing body.

- 170.39.4 Constructor(node as SCNNodeMBS, Options as Dictionary = nil) 20748

170.39.4 Constructor(node as SCNNodeMBS, Options as Dictionary = nil)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics shape from a node or hierarchy of nodes.
Notes: node: A node object. The node must contain an SCNGeometryMBS object in its geometry property or have one or more child (or descendant) nodes that contain geometry.
options: A dictionary of options affecting the level of detail of the physics shape, or nil to use default options. For applicable keys and their possible values, see Shape Creation Options Keys.

Returns a new physics shape object.

To use the newly created physics shape, create a physics body with the the bodyWithType method, or assign the shape to the physicsShape property of an existing body.

The node used to create the physics shape need not be the same as the node whose physics body you attach the shape to—or even be in the scene whose physics world you use the shape in. For example, you can create a physics body for a complex object by building a hierarchy of nodes containing simple geometries (using the SCNBoxMBS and SCNSphereMBS classes), and then creating a physics shape from those nodes. The resulting physics shape, a compound of bounding boxes or convex hulls, provides a rough approximation of the complex object without a high cost to simulation performance.
See also:

- 170.39.3 Constructor(geometry as SCNGeometryMBS, Options as Dictionary = nil) 20748

170.39.5 copy as SCNPhysicsShapeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the shape.

170.39.6 SCNPhysicsShapeKeepAsCompoundKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option for selecting whether to create a group of independent shapes or combine them into a single shape.
Notes: The value for this key is a boolean value. The default value is true, specifying that SceneKit convert separate geometries into separate shapes and join the resulting shapes. If false, SceneKit creates a single shape approximating the combined form of the geometries.

170.39.7 SCNPhysicsShapeOptionCollisionMargin as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Collision margin of the physics shape (as a number)

170.39.8 SCNPhysicsShapeScaleKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option for selecting the scale factor of the shape relative to the local coordinate space of the node containing it.
Notes: The value for this key is a SCNVector3MBS object , whose components describe the scale factor in

each of the x-, y- and z-axis directions. The default value is the vector { 1.0, 1.0, 1.0 } , specifying no change of scale.
SceneKit,Äôs physics simulation ignores the scale property of nodes containing physics bodies when simulating collisions. Instead, use this option to provide a scale factor when creating custom physics shapes. (If you create a physics body for a node without specifying a custom shape, SceneKit uses the node,Äôs scale property to infer this scale factor at creation time.)

170.39.9 SCNPhysicsShapeTypeBoundingBox as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics shape is the smallest box containing the geometry.
Notes: This option provides the lowest level of detail and the fastest simulation performance. Use it for generally box-shaped physics bodies or when constructing a compound physics shape.

170.39.10 SCNPhysicsShapeTypeConcavePolyhedron as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics shape is a concave polyhedron closely following the surface of the geometry.
Notes: This option provides the highest level of detail, at a high cost to simulation performance. Use it only for irregularly shaped bodies where precise collision behavior is crucial to your app,Äôs design.
This shape type may only be used for static physics bodies (that is, those whose type property is SCNPhysicsBodyTypeStatic).

170.39.11 SCNPhysicsShapeTypeConvexHull as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics shape is a convex polyhedron roughly enclosing the geometry.
Notes: This option provides a moderate level of detail and simulation performance. Use it for rounded or irregularly shaped physics bodies.

170.39.12 SCNPhysicsShapeTypeKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An option for selecting the level of detail at which to create shapes from geometry.
Notes: The value for this key is one of the constants listed in Shape Types. The default type is SCNPhysicsShapeTypeConvexHull.

170.39.13 shapeWithGeometry(geometry as SCNGeometryMBS, Options as Dictionary = nil) as SCNPhysicsShapeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics shape based on a geometry object.
Notes: geometry: A geometry object.
options: A dictionary of options affecting the level of detail of the physics shape, or nil to use default options. For applicable keys and their possible values, see Shape Creation Options Keys.

Returns a new physics shape object.

If you create a physics shape using one of the basic geometry classes (SCNBoxMBS, SCNSphereMBS, SCNPyramidMBS, SCNConeMBS, SCNCylinderMBS, or SCNCapsuleMBS), SceneKit uses an idealized form of that geometry for the physics shape instead of using the geometry,Äôs vertex data to simulate collisions. For example, if you create a physics shape from an SCNSphere object, SceneKit simulates collisions for any object that passes within the sphere,Äôs radius.

Because the idealized forms of simple geometries are computationally much simpler than the vertex data needed for displaying them, using basic geometries for physics shapes (or compound shapes created from basic geometries with the shapeWithShapes method) often provides the best balance between simulation accuracy and performance.

To use the newly created physics shape, create a physics body with the the bodyWithType method, or assign the shape to the physicsShape property of an existing body.

170.39.14 shapeWithNode(node as SCNNodeMBS, Options as Dictionary = nil) as SCNPhysicsShapeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a physics shape from a node or hierarchy of nodes.
Notes: node: A node object. The node must contain an SCNGeometryMBS object in its geometry property or have one or more child (or descendant) nodes that contain geometry.
options: A dictionary of options affecting the level of detail of the physics shape, or nil to use default options. For applicable keys and their possible values, see Shape Creation Options Keys.

Returns a new physics shape object.

To use the newly created physics shape, create a physics body with the the bodyWithType method, or assign the shape to the physicsShape property of an existing body.

The node used to create the physics shape need not be the same as the node whose physics body you attach the shape to—or even be in the scene whose physics world you use the shape in. For example, you can create a physics body for a complex object by building a hierarchy of nodes containing simple geometries (using the SCNBoxMBS and SCNSphereMBS classes), and then creating a physics shape from those nodes. The resulting physics shape, a compound of bounding boxes or convex hulls, provides a rough approximation of the complex object without a high cost to simulation performance.

170.39.15 shapeWithShapes(shapes() as SCNPhysicsShapeMBS, transforms() as SCNMatrix4MBS = nil) as SCNPhysicsShapeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new physics shape by combining others.
Notes: shapes: An array of SCNPhysicsShapeMBS objects.
transforms: An array SCNMatrix4MBS values, each of which is a transform for the physics shape at the corresponding index in the shapes parameter.

Returns a new physics shape object.

An individual physics shape is defined in its own local coordinate space. Therefore, to describe the positions and orientations of multiple shapes relative to one another, you must use coordinate transformations.

170.39.16 sourceObject as Variant

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The object that was used to create the shape.
Notes: This property, along with the transforms and options properties, provides the information that was used to create the shape. You can use this information, for example, to draw editing or debugging UI in your scene.

- If the shape was created with the shapeWithGeometry method, the source object is an SCNGeometryMBS object, and the options property contains the options affecting the shape,Äôs construction from that geometry.
- If the shape was created with the shapeWithNode method, the source object is an SCNNodeMBS object, and the options property contains the options affecting the shape,Äôs construction from that node.
- If the shape was created with the shapeWithShapes method, the source object is an array of SCNPhysicsShapeMBS objects and the transforms property describes how those shapes combine to form a compound shape.

170.39.17 transforms as SCNMatrix4MBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The array of transforms that was used to create a compound shape.
Notes: You provide this array of SCNMatrix4MBS values, in the shapeWithShapes method to create a compound shape. Use this array along with the sourceObject property to recover the information that was used to create the shape.

If the shape was created with the shapeWithGeometry or shapeWithNode method, this property,Äôs value is nil.

170.39.18 Properties

170.39.19 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

170.39.20 options as Dictionary

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The options dictionary that was used to create the shape.
Notes: You provide this dictionary in the shapeWithGeometry or shapeWithNode method. Use this dictionary along with the sourceObject property to recover the information that was used to create the shape. If the shape was created with the shapeWithShapes method, this property,Äôs value is nil.
(Read only property)

170.40 class SCNPhysicsSliderJointMBS

170.40.1 class SCNPhysicsSliderJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A physics behavior that connects two bodies and allows them to slide against each other and rotate around their connecting points.
Notes: A slider joint can have zero, one, or two degrees of freedom depending on whether you allow it to slide or rotate. You can also use a slider joint to pin a body so that it can move only by sliding a specific axis in the coordinate space of the node containing it. You can also use a slider joint as a motor, applying a force or torque to the bodies it connects.
Subclass of the SCNPhysicsBehaviorMBS class.

170.40.2 Methods

170.40.3 Constructor(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a slider joint that anchors a single physics body in space and allows it to slide along a specific axis.
Notes: body: The physics body to be controlled by the joint.
axis: The axis along which the first body can slide, relative to the node containing it.
anchor: The point at which the body is pinned, in the local coordinate system of the node containing it.

Returns a new slider joint behavior.

This method defines the location where the body is anchored in the coordinate system of the node containing it. To define its sliding or rotation motion relative to that point, use the properties listed in Limiting the Motion of a Slider Joint.
For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.40.4 Constructor(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS)

170.40.4 Constructor(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a slider joint connecting two physics bodies.
Notes: bodyA: The first physics body to be connected by the joint.
axisA: The axis along which the first body can slide, relative to the node containing it.
anchorA: The point at which the joint connects, relative to the node containing the first body.
bodyB: The second physics body to be connected by the joint.
axisB: The axis along which the second body can slide, relative to the node containing it.
anchorB: The point at which the joint connects, relative to the node containing the second body.

Returns a new slider joint behavior.

This method defines the location where the bodies are pinned together. To define their sliding or rotation motion relative to that point, use the properties listed in Limiting the Motion of a Slider Joint.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.40.3 Constructor(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS) 20754

170.40.5 jointWithBody(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS) as SCNPhysicsSliderJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a slider joint that anchors a single physics body in space and allows it to slide along a specific axis.
Notes: body: The physics body to be controlled by the joint.
axis: The axis along which the first body can slide, relative to the node containing it.
anchor: The point at which the body is pinned, in the local coordinate system of the node containing it.

Returns a new slider joint behavior.

This method defines the location where the body is anchored in the coordinate system of the node containing it. To define its sliding or rotation motion relative to that point, use the properties listed in Limiting the Motion of a Slider Joint.
For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your

scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.40.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS) as SCNPhysicsSliderJointMBS 20756

170.40.6 jointWithBody(bodyA as SCNPhysicsBodyMBS, axisA as SCNVector3MBS, anchorA as SCNVector3MBS, bodyB as SCNPhysicsBodyMBS, axisB as SCNVector3MBS, anchorB as SCNVector3MBS) as SCNPhysicsSliderJointMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a slider joint connecting two physics bodies.
Notes: bodyA: The first physics body to be connected by the joint.
axisA: The axis along which the first body can slide, relative to the node containing it.
anchorA: The point at which the joint connects, relative to the node containing the first body.
bodyB: The second physics body to be connected by the joint.
axisB: The axis along which the second body can slide, relative to the node containing it.
anchorB: The point at which the joint connects, relative to the node containing the second body.

Returns a new slider joint behavior.

This method defines the location where the bodies are pinned together. To define their sliding or rotation motion relative to that point, use the properties listed in Limiting the Motion of a Slider Joint.

For a behavior to take effect, add it to the physics simulation by calling the addBehavior method on your scene,Äôs SCNPhysicsWorldMBS object. The physics bodies constrained by the joint must be attached to nodes in the scene.
See also:

- 170.40.5 jointWithBody(body as SCNPhysicsBodyMBS, axis as SCNVector3MBS, anchor as SCNVector3MBS) as SCNPhysicsSliderJointMBS 20755

170.40.7 Properties

170.40.8 anchorA as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point at which the joint connects, relative to the node containing the first body.
Notes: (Read and Write property)

170.40.9 anchorB as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The point at which the joint connects, relative to the node containing the second body.
Notes: (Read and Write property)

170.40.10 axisA as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The axis along which the first body can slide, relative to the node containing it.
Notes: (Read and Write property)

170.40.11 axisB as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The axis along which the second body can slide, relative to the node containing it.
Notes: (Read and Write property)

170.40.12 bodyA as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The first physics body connected by the joint.
Notes: (Read only property)

170.40.13 bodyB as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The second physics body connected by the joint.
Notes: This property,Äôs value is nil if the joint was created using the jointWithBody method.
(Read only property)

170.40.14 maximumAngularLimit as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum rotation angle between the two bodies, measured in radians relative to their initial orientations.
Notes: The default (and maximum) value of this property is M_PI. With this value, the joint can spin counterclockwise (relative to the first body) with no limit.
Set both this property and the maximumAngularLimit property to the same value to prevent the bodies from rotating around their anchor points. (Set both properties to 0.0 to fix the bodies in their initial orientations.) Bodies whose orientation is fixed by a sliding joint may still slide, depending on the values of the minimumLinearLimit and maximumLinearLimit properties.
(Read and Write property)

170.40.15 maximumLinearLimit as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum distance between the anchor points of the two bodies, relative to their initial positions.
Notes: The default value of this property is INFINITY. With this value, the joint can slide forever in the direction of the slider axis.
Set both this property and the minimumLinearLimit property to the same value to pin the bodies together at their anchor points. (Set both properties to 0.0 to pin the bodies together at their initial positions.) Bodies pinned together by a sliding joint may still rotate, depending on the values of the minimumAngularLimit and maximumAngularLimit properties.
(Read and Write property)

170.40.16 minimumAngularLimit as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum rotation angle between the two bodies, measured in radians relative to their initial orientations.
Notes: The default (and minimum) value of this property is -M_PI. With this value, the joint can spin clockwise (relative to the first body) with no limit.
Set both this property and the maximumAngularLimit property to the same value to prevent the bodies from rotating around their anchor points. (Set both properties to 0.0 to fix the bodies in their initial orientations.) Bodies whose orientation is fixed by a sliding joint may still slide, depending on the values of the minimumLinearLimit and maximumLinearLimit properties.
(Read and Write property)

170.40.17 minimumLinearLimit as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum distance between the anchor points of the two bodies, relative to their initial positions.
Notes: The default value of this property is -INFINITY. With this value, the joint can slide forever in the direction opposite the slider axis.
Set both this property and the maximumLinearLimit property to the same value to pin the bodies together at their anchor points. (Set both properties to 0.0 to pin the bodies together at their initial positions.) Bodies pinned together by a sliding joint may still rotate, depending on the values of the minimumAngularLimit and maximumAngularLimit properties.
(Read and Write property)

170.40.18 motorMaximumForce as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum linear force that the joint can apply to its connected bodies, in newtons.
Notes: When you change the value of the motorTargetLinearVelocity property, the joint continuously applies a force of no greater than this magnitude until the bodies are moving at the target velocity. The default value is 1.0.
(Read and Write property)

170.40.19 motorMaximumTorque as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum torque that the joint can apply to its connected bodies, in newton-meters.
Notes: When you change the value of the motorTargetAngularVelocity property, the joint continuously applies a force of no greater than this magnitude until the bodies are rotating around the joint at the target angular velocity. The default value is 1.0.
(Read and Write property)

170.40.20 motorTargetAngularVelocity as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The angular velocity at which the joint,Äôs connected bodies should rotate around it.
Notes: At the default value of 0.0, the joint moves only when an external force acts on one of its connected bodies. Changing this value causes the joint to act as a rotary motor, continuously applying a torque (specified by the motorMaximumTorque property) until its connected bodies are rotating around the joint at the new angular velocity.

(Read and Write property)

170.40.21 motorTargetLinearVelocity as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The velocity at which the joint,Äôs connected bodies should slide.
Notes: At the default value of 0.0, the joint moves only when an external force acts on one of its connected bodies. Changing this value causes the joint to act as a linear motor, continuously applying a force (specified by the motorMaximumForce property) until its connected bodies are moving along the sliding axis of the joint at the new velocity.
(Read and Write property)

170.41 class SCNPhysicsVehicleMBS

170.41.1 class SCNPhysicsVehicleMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A physics behavior that modifies a physics body to behave like a car, motorcycle, or other wheeled vehicle.
Notes: To build a vehicle, designate an SCNPhysicsBodyMBS object as its chassis and an array of SCNPhysicsVehicleWheelMBS objects as its wheels. For each wheel, you define physical characteristics such as suspension and traction, and associate a node in your scene to provide the wheel,Äôs size and visual representation. After you construct a vehicle, you can control it in terms of acceleration, braking, and steering.

Although it,Äôs also possible to use a set of physics bodies and joints to collectively simulate a wheeled vehicle, the SCNPhysicsVehicleMBS class implements a higher-level simulation that provides realistic vehicle behavior with more efficient simulation performance.
Subclass of the SCNPhysicsBehaviorMBS class.

170.41.2 Methods

170.41.3 applyBrakingForce(value as double, index as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Applies a force between the specified wheel and the ground under the vehicle.
Notes: value: The magnitude of the torque, in newton-meters.
index: The index of the wheel applying the force.

Applying a braking force causes the wheel to slow down regardless of the direction it,Äôs currently spinning in.

As with all physical quantities in SceneKit, you need not use realistic force measurements in your app—the effects of the physics simulation depend on the relative differences between forces, not on their absolute values. You may use whatever values produce the behavior or gameplay you,Äôre looking for as long as you use them consistently.

Calling this method applies a braking force for one step (or frame) of the physics simulation. To continuously decelerate a vehicle, call this method again on subequent simulation steps (for example, from your scene renderer delegate,Äôs renderer method) until the vehicle stops or reaches your desired speed.

170.41.4 applyEngineForce(value as double, index as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Applies a force between the specified wheel and the ground under the vehicle.
Notes: value: The magnitude of the force, in newtons.
index: The index of the wheel applying the force.

Applying a positive force turns the wheel in a direction that would move the vehicle forward; applying a negative force moves the vehicle in reverse.

As with all physical quantities in SceneKit, you need not use realistic force measurements in your app—the effects of the physics simulation depend on the relative differences between forces, not on their absolute values. You may use whatever values produce the behavior or gameplay you,Äôre looking for as long as you use them consistently.

Calling this method applies a force for one step (or frame) of the physics simulation. To continuously accelerate a vehicle, call this method again on subequent simulation steps (for example, from your scene renderer delegate,Äôs renderer method) until the vehicle reaches your desired speed.

170.41.5 Constructor(chassisBody as SCNPhysicsBodyMBS, wheels() as SCNPhysicsVehicleWheelMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a vehicle behavior.
Notes: chassisBody: A physics body to serve as the vehicle,Äôs chassis.
wheels: An array of SCNPhysicsVehicleWheel objects representing the vehicle,Äôs wheels. A vehicle must have at least one wheel.

Returns a new vehicle behavior.

Each object in the wheels array associates a node with the wheel to serve as its visual representation and defines properties for the wheel,Äôs physical characteristics. Each wheel object must reference a unique node, which should be a child of the node containing the physics body used for the vehicle,Äôs chassis. Typically, you load a node hierarchy representing the vehicle and all of its wheels from a scene file and then designate which nodes serve as the body and wheels.

For a behavior to take effect, you must add it to the physics simulation by calling the addBehavior: method on your scene,Äôs SCNPhysicsWorldMBS object.

170.41.6 setSteeringAngle(value as double, index as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Pivots the specified wheel around its steering axis.
Notes: value: The angle to set the wheel at relative to its steering axis, in radians.
index: The index, in the vehicle,Äôs wheels array, of the wheel to be pivoted.

Steering angles are relative to the wheel,Äôs steeringAxis vector. With the default steering axis of { 0.0, -1.0, 0.0 } , a steering angle of 0.0 represents neutral steering, positive values steer the vehicle to the right, and negative values steer to the left.

170.41.7 vehicleWithChassisBody(chassisBody as SCNPhysicsBodyMBS, wheels() as SCNPhysicsVehicleWheelMBS) as SCNPhysicsVehicleMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a vehicle behavior.
Notes: chassisBody: A physics body to serve as the vehicle,Äôs chassis.
wheels: An array of SCNPhysicsVehicleWheel objects representing the vehicle,Äôs wheels. A vehicle must have at least one wheel.

Returns a new vehicle behavior.

Each object in the wheels array associates a node with the wheel to serve as its visual representation and defines properties for the wheel,Äôs physical characteristics. Each wheel object must reference a unique node, which should be a child of the node containing the physics body used for the vehicle,Äôs chassis. Typically, you load a node hierarchy representing the vehicle and all of its wheels from a scene file and then designate which nodes serve as the body and wheels.

For a behavior to take effect, you must add it to the physics simulation by calling the addBehavior: method on your scene,Äôs SCNPhysicsWorldMBS object.

170.41.8 wheels as SCNPhysicsVehicleWheelMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: An array of SCNPhysicsVehicleWheelMBS objects representing the vehicle,Äôs wheels.
Notes: You can dynamically change the suspension and traction properties of a wheel connected to the vehicle by using the corresponding SCNPhysicsVehicleWheelMBS object.

170.41.9 Properties

170.41.10 chassisBody as SCNPhysicsBodyMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics body representing the vehicle,Äôs chassis.
Notes: The vehicle,Äôs chassis must be a dynamic body.
(Read only property)

170.41.11 speedInKilometersPerHour as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The vehicle,Äôs ground speed, in kilometers per hour.
Notes: (Read only property)

170.42 class SCNPhysicsVehicleWheelMBS

170.42.1 class SCNPhysicsVehicleWheelMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The appearance and physical characteristics of an individual wheel associated with an physics vehicle behavior.
Notes: To use wheels in a vehicle simulation, include them when creating an SCNPhysicsVehicle object with the vehicleWithChassisBody / Constructro initializer, then add the vehicle object to your scene,Äôs physics world using the physics world,Äôs addBehavior method.

Creating a Wheel
You create a wheel with an SCNNodeMBS object whose contents provide the wheel,Äôs visual representation—a geometry that rotates when the simulated vehicle rolls along a surface. The node representing a wheel must be a child of the node containing the physics body that serves as the vehicle,Äôs chassis, and each wheel in a vehicle must reference a unique node. Typically, you load a scene file that contains a node hierarchy representing the vehicle and all of its wheels. Next, you designate which nodes serve as the body and wheels.
Because the SCNPhysicsVehicleMBS behavior that a wheel is attached to manages its participation in the physics simulation, you don,Äôt need to attach a physics body to the SCNNodeMBS object representing a wheel.

Changing a Wheel,Äôs Physical Properties
The properties of a wheel define the geometry of its connection to the vehicle and simulate its size, traction, and suspension. You can change these properties after the wheel and the vehicle containing it have been added to the physics world. In this way, you can simulate effects such as variable suspension and flat tires.

Note
Vehicles and their wheels have several properties measured in real-world units (meters, centimeters, and newtons) with default values that produce realistic behavior for vehicles of size similar to an average automobile. If you design your scene on a different scale, proportionally change the values of these properties to fit the desired behavior of your app or game.

170.42.2 Methods

170.42.3 Constructor(node as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a wheel object.
Notes: node: The node whose contents provide the wheel,Äôs visual representation.

Returns a new wheel object.

The node representing a wheel must be a child of the node whose physics body serves as the chassis of the SCNPhysicsVehicleMBS behavior the wheel is attached to. Each wheel object must reference a unique node. To use the wheel, add it to the vehicle behavior using the addWheel method.
SceneKit uses the node,Äôs bounding box to determine the wheel,Äôs initial size, and it uses the node,Äôs position to determine the where the wheel connects to the vehicle,Äôs chassis. You can change attributes using the radius and connectionPosition properties.

170.42.4 copy as SCNPhysicsVehicleWheelMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the wheel.

170.42.5 wheelWithNode(node as SCNNodeMBS) as SCNPhysicsVehicleWheelMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a wheel object.
Notes: node: The node whose contents provide the wheel,Äôs visual representation.

Returns a new wheel object.

The node representing a wheel must be a child of the node whose physics body serves as the chassis of the SCNPhysicsVehicleMBS behavior the wheel is attached to. Each wheel object must reference a unique node. To use the wheel, add it to the vehicle behavior using the addWheel method.
SceneKit uses the node,Äôs bounding box to determine the wheel,Äôs initial size, and it uses the node,Äôs position to determine the where the wheel connects to the vehicle,Äôs chassis. You can change attributes using the radius and connectionPosition properties.

170.42.6 Properties

170.42.7 Axle as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The direction of the axis that the wheel spins around to move the vehicle.
Notes: This vector is expressed in the coordinate space of the node containing the vehicle,Äôs chassis. The default axle direction is { -1.0, 0.0, 0.0 } .

(Read and Write property)

170.42.8 ConnectionPosition as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The position of the wheel,Äôs connection to the vehicle,Äôs chassis.
Notes: This vector is expressed in the coordinate space of the node containing the vehicle,Äôs chassis. When you create a wheel from a node, SceneKit uses the node,Äôs position property as the wheel,Äôs connection point.
(Read and Write property)

170.42.9 FrictionSlip as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The traction between the wheel and any surface in contact with it.
Notes: The default value of this property is 1.0. Lower values result in better traction, and higher values make the wheel more likely to slip (causing it to spin freely instead of moving the vehicle).
(Read and Write property)

170.42.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

170.42.11 MaximumSuspensionForce as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum force of the suspension between the vehicle and the wheel, in newtons.
Notes: The physics simulation applies a force of no greater than this magnitude when contact with the ground causes the wheel to move relative to the vehicle. The default maximum suspension force is 6000.0.
(Read and Write property)

170.42.12 MaximumSuspensionTravel as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum distance that the wheel is allowed to move up or down relative to its connection point, in centimeters.
Notes: Travel is the total distance a wheel is allowed to move (in both directions), in the coordinate system of the node containing the vehicle,Äôs chassis. The default suspension travel is 500.0.
(Read and Write property)

170.42.13 Node as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The node providing the wheel,Äôs visual representation.
Notes: SceneKit automatically rotates and repositions this node in response to the physics simulation.
(Read only property)

170.42.14 Radius as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The radius of the wheel.
Notes: When you create a wheel from a node, its default radius is half of the largest dimension of the node,Äôs bounding box. (A wheel is always circular, even if the content of the node representing it is not.)
(Read and Write property)

170.42.15 SteeringAxis as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The direction of the axis that the wheel pivots around to steer the vehicle.
Notes: This vector is expressed in the coordinate space of the node containing the vehicle,Äôs chassis. The default steering axis is { 0.0, -1.0, 0.0 } .
When you steer a wheel using the vehicle,Äôs setSteeringAngle() method, the wheel pivots relative to this axis. For example, you can implement a vehicle whose rear wheels steer opposite its front wheels by reversing this vector,Äôs direction for the rear wheels and then applying the same steering angle to all wheels.
(Read and Write property)

170.42.16 SuspensionCompression as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The coefficient that limits the speed of the suspension returning to its rest length when compressed.
Notes: The default suspension coefficient is 4.4. Lower values cause the wheel to return to its natural position more quickly.
(Read and Write property)

170.42.17 SuspensionDamping as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The damping ratio that limits oscillation in the vehicle,Äôs suspension.
Notes: Damping ratio measures the tendency of the suspension to oscillate after a shock—in other words, for the vehicle to bounce up and down after running over a bump. The default damping ratio of 2.3 causes the wheel to return to its neutral position quickly after a shock. Values lower than 1.0 result in more oscillation.
(Read and Write property)

170.42.18 SuspensionRestLength as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The resting length of the suspension, in meters.
Notes: This property measures the length of the simulated spring between the vehicle and its wheel when the spring is not stressed by the weight of either body. When the wheel receives a shock (for example, when the vehicle runs over a bump), SceneKit adds the difference between the wheel,Äôs current position and its connection position to this rest length and then applies a force between the wheel and vehicle proportional to the total.
(Read and Write property)

170.42.19 SuspensionStiffness as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The spring coefficient of the suspension between the vehicle and the wheel.
Notes: The spring coefficient determines both how quickly the wheel returns to its natural position after a shock (for example, when the vehicle runs over a bump) and how much force from the shock it transmits to the vehicle. The default spring coefficient is 2.0.
(Read and Write property)

170.43 class SCNPhysicsWorldMBS

170.43.1 class SCNPhysicsWorldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The global simulation of collisions, gravity, joints, and other physics effects in a scene.
Notes: You do not create SCNPhysicsWorldMBS objects directly; instead, read the physicsWorld property of an SCNSceneMBS object. Use physics world object to perform the following tasks:

- Manage global properties of the simulation, such as its speed and constant gravity. (For more precise control of gravity and similar effects, see the SCNPhysicsFieldMBS class.)
- Register behaviors that modify interactions between the scene,Äôs physics bodies, such as joints and vehicles. For more details, see SCNPhysicsBehaviorMBS.
- Specify a delegate object to receive messages when two physics bodies contact each other
- Perform specific contact tests, and search for physics bodies in the scene using ray and sweep tests.

170.43.2 Methods

170.43.3 addBehavior(behavior as SCNPhysicsBehaviorMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a behavior to the physics world.
Notes: behavior: The behavior to be added.

Physics behaviors constrain or modify the effects of the physics simulation on sets of physics bodies. For example, the SCNPhysicsHingeJointMBS behavior causes two bodies to move as if connected by a hinge that pivots around a specific axis, and the SCNPhysicsVehicleMBS behavior causes a body to roll like a car or other wheeled vehicle.

To use a behavior in your scene, follow these steps:
1. Create SCNPhysicsBody objects and attach them to each node that participates in the behavior.

2. Create and configure a behavior object joining the physics bodies. See SCNPhysicsBehaviorMBS for a list of behavior classes.
3. Call addBehavior on your scene,Äôs physics world object to add the behavior to the physics simulation.

170.43.4 allBehaviors as SCNPhysicsBehaviorMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The list of behaviors affecting bodies in the physics world.

170.43.5 Constructor(fireContactEvents as Boolean = false)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.
Notes: If fireContactEvents is true or you call EnableContactsEvents, we enable the contact events.

A contact is created when two physics bodies overlap and one of the physics bodies has a collisionBitMask property that overlaps with the other body,Äôs categoryBitMask property.

170.43.6 contactTest(body as SCNPhysicsBodyMBS, options as Dictionary = nil) as SCNPhysicsContactMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks for contacts between one physics body and any other bodies in the physics world.
Notes: body: The body to test for contact.
options: A dictionary of options affecting the test, or nil to use default options. For applicable keys and the possible values, see Physics Test Options Keys.

Returns an array of SCNPhysicsContactMBS objects describing contacts between the specified body and any others, or nil if the body is not in contact with any other bodies.

SceneKit sends messages to the physics world,Äôs contactdelegate object only when collisions occur between bodies whose collisionBitMask and categoryBitMask properties overlap, and only for collisions between certain types of bodies. (For details, see SCNPhysicsBodyType.) Use this method to directly test for all contacts between one body and any other bodies at a time of your choosing. For example, to implement a game with a ,Äúwall jump,Äù effect, you could call this method when the player presses the jump button to see if the player character is in contact with any walls.
See also:

- 170.43.7 contactTest(bodyA as SCNPhysicsBodyMBS, bodyB as SCNPhysicsBodyMBS, options as Dictionary = nil) as SCNPhysicsContactMBS() 20772

170.43.7 contactTest(bodyA as SCNPhysicsBodyMBS, bodyB as SCNPhysicsBodyMBS, options as Dictionary = nil) as SCNPhysicsContactMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Checks for contacts between two physics bodies.
Notes: bodyA: The first body (to test for contact with the second).
bodyB: The second body (to test for contact with the first).
options: A dictionary of options affecting the test, or nil to use default options. For applicable keys and the possible values, see Physics Test Options Keys.

Returns an array of SCNPhysicsContactMBS objects describing contacts between the two bodies, or nil if the bodies are not in contact.

SceneKit sends messages to the physics world,Äôs contactDelegate object only when collisions occur between bodies whose collisionBitMask and categoryBitMask properties overlap, and only for collisions between certain types of bodies. (For details, see SCNPhysicsBodyType.) Use this method to directly test for contacts between any two bodies at a time of your choosing. For example, to implement a game where the player character can pick up an item, you might call this method when the player presses the ,Äúpick up,Äù button to see if the player character is in contact with the item to be picked up.
See also:

- 170.43.6 contactTest(body as SCNPhysicsBodyMBS, options as Dictionary = nil) as SCNPhysicsContactMBS() 20771

170.43.8 convexSweepTest(shape as SCNPhysicsShapeMBS, fromTransform as SCNMatrix4MBS, toTransform as SCNMatrix4MBS, options as Dictionary = nil) as SCNPhysicsContactMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Searches for physics bodies in the space formed by moving a convex shape through the physics world.
Notes: shape: A physics shape. This shape must enclose a convex volume. For details on creating shapes that satisfy this requirement, see SCNPhysicsShapeMBS.
from: A transform matrix representing the initial position and orientation of the shape.
to: A transform matrix representing the final position and orientation of the shape.
options: A dictionary of options affecting the test, or nil to use default options. For applicable keys and the possible values, see Physics Test Options Keys.

Returns an array of SCNPhysicsContactMBS objects describing any contacts that would occur when moving

the physics shape through the physics world.

Use this method when it,Äôs important to plan for (or avoid) collisions ahead of the physics simulation. For example, in a game you might plan maneuvers for a flying character to fit through the gaps between static bodies in the physics world

170.43.9 EnableContactsEvents

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Enables contact events.
Notes: If you connect the contact events via AddHandler, please call this method once to connect the events internally.

170.43.10 rayTestWithSegment(origin as SCNVector3MBS, dest as SCNVector3MBS, options as Dictionary = nil) as SCNPhysicsBehaviorMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Searches for physics bodies along a line segment between two points in the physics world.
Notes: origin: An endpoint of the line segment to search, specified in the scene,Äôs world coordinate system.
dest: The other endpoint of the line segment to search, specified in the scene,Äôs world coordinate system.
options: A dictionary of options affecting the test, or nil to use default options. For applicable keys and the possible values, see Physics Test Options Keys.

Returns an array of SCNHitTestResultMBS objects describing search results.

Use this method to implement concepts such as line of sight in your app. For example, in a game you might implement behavior for an enemy character by searching for physics bodies along a line between the enemy character,Äôs position and the player character,Äôs position

170.43.11 removeAllBehaviors

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes all behaviors affecting bodies in the physics world.

170.43.12 removeBehavior(behavior as SCNPhysicsBehaviorMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes a behavior from the physics world.

170.43.13 SCNPhysicsTestBackfaceCullingKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The key for choosing whether to ignore back-facing polygons in physics shapes when searching for contacts.
Notes: The value for this key is a Boolean value. The default value is true, specifying that the search should only return contacts with the exterior surfaces of any physics shapes. Change the value to false to consider contacts with both interior and exterior surfaces.

This key applies only to ray and convex sweep tests, and only to physics shapes created using the SCNPhysicsShapeTypeConcavePolyhedron option.

170.43.14 SCNPhysicsTestCollisionBitMaskKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The key for selecting which categories of physics bodies that SceneKit should test for contacts.
Notes: The value for this key is an unsigned Integer value. SceneKit tests for contacts only with physics bodies whose categoryBitMask property overlaps with this bit mask. The default value is SCNPhysicsCollisionCategoryAll, specifying that searches should test all physics bodies regardless of their category.

170.43.15 SCNPhysicsTestSearchModeAll as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the option values for SCNPhysicsTestSearchModeKey key.
Notes: Searches should return all contacts matching the search parameters.

170.43.16 SCNPhysicsTestSearchModeAny as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the option values for SCNPhysicsTestSearchModeKey key.
Notes: Searches should return only the first contact found regardless of its position relative to the search

parameters.

170.43.17 SCNPhysicsTestSearchModeClosest as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the option values for SCNPhysicsTestSearchModeKey key.
Notes: Searches should return only the closest contact to the beginning of the search.

170.43.18 SCNPhysicsTestSearchModeKey as String

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The key for selecting the number and order of contacts to be tested.
Notes: See Physics Test Search Modes for possible values. The default value is SCNPhysicsTestSearchModeAny.
This key applies only to ray and convex sweep tests.

170.43.19 updateCollisionPairs

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Forces the physics engine to reevaluate possible collisions between physics bodies.
Notes: By default, SceneKit checks for collisions between physics bodies only once per simulation step. If you directly change the positions of any physics bodies outside of a event, call the updateCollisionPairs method before using any of the methods listed in Searching for Physics Bodies Detecting Contacts Between Physics Bodies.

170.43.20 Properties

170.43.21 gravity as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A vector that specifies the gravitational acceleration applied to physics bodies in the physics world.
Notes: The components of this vector are measured in meters per second per second. The default value is (0.0,-9.8,0.0).
This property applies a constant acceleration to all physics bodies in the world, simulating the effect of gravity near the surface of the Earth. For more sophisticated gravity effects, including limited areas of effect and strength proportional to distance, use the SCNPhysicsFieldMBS class. When using fields, you may want

to set this property to the zero vector so that fields provide all gravity effects in the physics world.
(Read and Write property)

170.43.22 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Internal object reference.
Notes: (Read and Write property)

170.43.23 speed as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The rate at which the simulation executes.
Notes: The default value is 1.0, which means that the simulation runs at normal speed. A value other than the default changes the rate at which time passes in the physics simulation. For example, a speed value of 2.0 indicates that time in the physics simulation passes twice as fast as the scene,Äôs simulation time. A value of 0.0 pauses the physics simulation.

Note:
Increasing the speed of the physics simulation reduces its accuracy.
(Read and Write property)

170.43.24 timeStep as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The time interval between updates to the physics simulation.
Notes: SceneKit processes the physics simulation and updates the state of all physics bodies once per the time interval specified by this property. The default value is 1/60 second (a rate of 60 Hz).
A faster simulation rate provides more accuracy in simulation results—such as collisions between fast-moving objects—but at a higher cost in CPU time (which may in turn slow down your app,Äôs rendering frame rate). Typically, you should set this property to match your target rendering frame rate (as defined by the preferredFramesPerSecond property of the SCNViewMBS object rendering your scene).
(Read and Write property)

170.43.25 Events

170.43.26 didBeginContact(contact as SCNPhysicsContactMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Tells the class that two bodies have come into contact.
Notes: contact: An object that describes the contact.

170.43.27 didEndContact(contact as SCNPhysicsContactMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Tells the class that a contact has ended.
Notes: contact: An object that describes the contact.

170.43.28 didUpdateContact(contact as SCNPhysicsContactMBS)

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Tells the class that new information is available about an ongoing contact.
Notes: contact: An object that describes the contact.

SceneKit calls this method on each step of the physics simulation (see the timeStep property) if information about the contact changes—for example, if two bodies are sliding against one another.

170.44 class SCNPlaneMBS

170.44.1 class SCNPlaneMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNPlaneMBS represents a rectangle with controllable width and height. The plane has one visible side.
Notes: Subclass of the SCNGeometryMBS class.

170.44.2 Methods

170.44.3 Constructor(Width as Double, Height as Double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a plane with given width and height.

170.44.4 plane(Width as Double, Height as Double) as SCNPlaneMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a plane with given width and height.

170.44.5 Properties

170.44.6 cornerRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The corner radius. Animatable.
Notes: If the value is strictly less than 0, the geometry is empty. The default value is 0.
(Read and Write property)

170.44.7 cornerSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions for the rounded corners. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 10.
(Read and Write property)

170.44.8 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The plane extent along the Y axis. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.44.9 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. The default value is 1. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.44.10 width as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The plane extent along the X axis. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.44.11 widthSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the X axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.45 class SCNPyramidMBS

170.45.1 class SCNPyramidMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNPyramid represents a right pyramid with a rectangular base.
Notes: Subclass of the SCNGeometryMBS class.

170.45.2 Methods

170.45.3 Constructor(width as double, height as double, length as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a pyramid with given width, height, and length.
Notes: width: The width of the pyramid.
height: The height of the pyramid.
length: The length of the pyramid.

170.45.4 pyramid(width as double, height as double, length as double) as SCNPyramidMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a pyramid with given width, height, and length.
Notes: width: The width of the pyramid.
height: The height of the pyramid.
length: The length of the pyramid.

170.45.5 Properties

170.45.6 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the pyramid. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.45.7 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.45.8 length as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The length of the pyramid base. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.45.9 lengthSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Z axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.45.10 width as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the pyramid base. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.

(Read and Write property)

170.45.11 widthSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the X axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.46 class SCNReplicatorConstraintMBS

170.46.1 class SCNReplicatorConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNReplicatorConstraint replicates the position/orientation/scale of a target node
Notes: Subclass of the SCNConstraintMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.46.2 Methods

170.46.3 Constructor(target as SCNNodeMBS)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNReplicatorConstraint constraint.

170.46.4 replicatorConstraintWithTarget(target as SCNNodeMBS) as SCNReplicatorConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNReplicatorConstraint constraint.

170.46.5 Properties

170.46.6 orientationOffset as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines an addition orientation offset.
Notes: Defaults to no offset. Animatable.
(Read and Write property)

170.46.7 positionOffset as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines an addition orientation offset.
Notes: Defaults to no offset. Animatable.
(Read and Write property)

170.46.8 replicatesOrientation as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines whether or not the constraint should replicate the target orientation.
Notes: Defaults to true.
(Read and Write property)

170.46.9 replicatesPosition as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines whether or not the constraint should replicate the target position.
Notes: Defaults to true.
(Read and Write property)

170.46.10 replicatesScale as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines whether or not the constraint should replicate the target scale.
Notes: Defaults to true.
(Read and Write property)

170.46.11 scaleOffset as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines an addition scale offset.
Notes: Defaults to no offset. Animatable.
(Read and Write property)

170.46.12 target as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the target node to replicate.
Notes: (Read and Write property)

170.47 class SCNSceneMBS

170.47.1 class SCNSceneMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A container for the node hierarchy and global properties that together form a displayable 3D scene.
Notes: To display 3D content with SceneKit, you create a scene containing a hierarchy of the nodes and attributes that together represent your visual elements. Typically, you build your assets in a 3D visual editor, then assemble them into a scene using Xcode,Äôs SceneKit Scene Editor, ready for SceneKit to render.

The simplest way to create a scene is through Xcode,Äôs SceneKit Scene Editor. Start by importing one or more assets from a 3D editor, such as Blender. Then you adjust the positions and attributes of the assets, and set global scene properties, such as lighting environment, to compose your scene. The scene editor creates a .scn file, which you save to a .scnassets folder in the app bundle. When you build your project, Xcode optimizes the scene file for your target platform.

- 18.1, pages 26 to 27: On the Scene, Getting Started with SceneKit by Stefanie Juchmes

170.47.2 Methods

170.47.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an empty scene.

170.47.4 scene as SCNSceneMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns an empty scene.
Notes: An empty scene contains only a root SCNNode object with no contents. To populate the scene, add children to the root node.

170.47.5 sceneNamed(name as string) as SCNSceneMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Loads a scene from a file with the specified name in the app,Äôs main bundle.
Notes: name: The name of a scene file in the app bundle,Äôs resources directory.

Returns a new scene object, or nil if no scene could be loaded.

This method provides a convenient way to load a complete scene from a file in the app,Äôs main bundle. Calling this method is equivalent to using the NSBundle class to locate the scene file and passing the resulting URL to the sceneWithURL method, specifying no options and no error handling.

For more detailed options or to load only part of a file,Äôs scene graph, use the SCNSceneSource class.

When creating a scene using Xcode's Scene Editor or an external tool, you should copy your scene file into a directory with the .scnassets extension inside your app bundle. You should also place any image files referenced as textures from that scene in an Asset Catalog. Xcode will optimize the scene and texture resources for best performance on each target device, and prepare your texture resources for delivery features such as App Thinning and On-Demand Resources.
See also:

- 170.47.6 sceneNamed(name as string, folder as folderItem, options as Dictionary = nil) as SCNSceneMBS 20788

170.47.6 sceneNamed(name as string, folder as folderItem, options as Dictionary = nil) as SCNSceneMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Loads a scene from a file with the specified name in a specific subdirectory of the app,Äôs main bundle.
Notes: name: The name of a scene file in the app bundle.
directory: The path to the subdirectory of the bundle,Äôs resources directory containing the scene file.
options: A dictionary of options affecting scene loading, or nil for default options. For available keys, see Scene Loading Options.

Returns a new scene object, or nil if no scene could be loaded.

This method provides a convenient way to load a complete scene from a file in the app,Äôs main bundle. Calling this method is equivalent to using the NSBundle class to locate the scene file and passing the resulting URL to the sceneWithURL method.

For more detailed options or to load only part of a file,Äôs scene graph, use the SCNSceneSource class.

When creating a scene using Xcode's Scene Editor or an external tool, you should copy your scene file into a directory with the .scnassets extension inside your app bundle. You should also place any image files referenced as textures from that scene in an Asset Catalog. Xcode will optimize the scene and texture resources for best performance on each target device, and prepare your texture resources for delivery features such as App Thinning and On-Demand Resources.
See also:

- 170.47.5 sceneNamed(name as string) as SCNSceneMBS 20788

170.47.7 sceneWithFile(file as folderItem, options as Dictionary = nil, byref Error as NSErrorMBS) as SCNSceneMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Loads a scene from the specified file.
Notes: file: The scene file to load.
options: A dictionary of options affecting scene loading, or nil for default options. For available keys, see Scene Loading Options.
error: If an error occurs, this pointer is set to an NSError object describing the error. If you do not want error information, pass in nil.

Returns a new scene object, or nil if no scene could be loaded.

This method provides a convenient way to load a complete scene from a file at an arbitrary URL. For more detailed options or to load only part of a file,Äôs scene graph, use the SCNSceneSource class.

When creating a scene using Xcode's Scene Editor or an external tool, you should copy your scene file into a directory with the .scnassets extension inside your app bundle. You should also place any image files referenced as textures from that scene in an Asset Catalog. Xcode will optimize the scene and texture resources for best performance on each target device, and prepare your texture resources for delivery features such as App Thinning and On-Demand Resources.

170.47.8 sceneWithURL(FileURL as string, options as Dictionary = nil, byref Error as NSErrorMBS) as SCNSceneMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Loads a scene from the specified URL.
Notes: url: The URL to the scene file to load.
options: A dictionary of options affecting scene loading, or nil for default options. For available keys, see Scene Loading Options.
error: If an error occurs, this pointer is set to an NSError object describing the error. If you do not want error information, pass in nil.

Returns a new scene object, or nil if no scene could be loaded.

This method provides a convenient way to load a complete scene from a file at an arbitrary URL. For more detailed options or to load only part of a file,Äôs scene graph, use the SCNSceneSource class.

When creating a scene using Xcode's Scene Editor or an external tool, you should copy your scene file into a directory with the .scnassets extension inside your app bundle. You should also place any image files referenced as textures from that scene in an Asset Catalog. Xcode will optimize the scene and texture resources for best performance on each target device, and prepare your texture resources for delivery features such as App Thinning and On-Demand Resources.

170.47.9 SCNSceneEndTimeAttributeKey as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the constant name for the attributes.
Notes: A floating-point value for the end time of the scene.

170.47.10 SCNSceneExportDestinationURL as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The final destination URL (an NSURLMBS object) for the exported scene file.
Notes: Use this option if you export a scene to a temporary directory and then move it to a final location. You must specify a final destination URL if your scene references external resources, such as image files for textures. SceneKit uses this URL to construct appropriate paths for external resources when writing the scene file.

170.47.11 SCNSceneFrameRateAttributeKey as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the constant name for the attributes.
Notes: A floating-point value (in an NSNumber object) for the frame rate of the scene.

This value may be present in scenes loaded from scene files produced using external tools, but has no effect on SceneKit,Äôs rendering of the scene.

170.47.12 SCNSceneStartTimeAttributeKey as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the constant name for the attributes.
Notes: A floating-point value for the start time of the scene.

170.47.13 SCNSceneUpAxisAttributeKey as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: One of the constant name for the attributes.
Notes: An SCNVector3MBS object (in an NSValueMBS object) specifying the orientation of the scene.

This value may be present in scenes loaded from scene files produced using external tools, but has no effect on SceneKit,Äôs processing of the scene. Use this vector when combining elements from different scenes so that they appear in their expected orientation.

170.47.14 Properties

170.47.15 background as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A background to be rendered before the rest of the scene.
Notes: If the material property,Äôs contents object is nil, SceneKit does not draw any background before drawing the rest of the scene. (If the scene is presented in an SCNView instance, the view,Äôs background color is visible behind the contents of the scene.)
If you specify a cube map texture for the material property (see the discussion of the contents property), SceneKit renders the background as a skybox.
(Read only property)

170.47.16 fogColor as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The color of the fog effect to be rendered with the scene. Animatable.
Notes: The default fog color is white.

You can animate changes to this property,Äôs value.
(Read and Write property)

170.47.17 fogDensityExponent as Double

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The transition curve for the fog,Äôs intensity between its start and end distances. Animatable.
Notes: A fog effect fades out the contents of the scene with increasing distance from the pointOfView location, replacing them with increasing intensities of the fogColor color. The fogDensityExponent property determines the smoothness or abruptness of this transition.

A value of 0.0 (the default) specifies no attenuation—the fog,Äôs intensity is the same at all distances . A value of 1.0 specifies a linear transition, and a value of 2.0 specifies a quadratic transition curve. Higher values have little visible effect.

You can animate changes to this property,Äôs value.
(Read and Write property)

170.47.18 fogEndDistance as Double

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The distance from a point of view at which the scene,Äôs contents are completely obscured by fog. Animatable.
Notes: A fog effect causes scene contents to become less visible the farther they are from the pointOfView node currently used for rendering. At distances less than the value of the fogStartDistance property, scene contents are fully visible. At greater distances, SceneKit blends the rendered scene contents with a constant color (specified by the fogColor property). At distances greater than the fogEndDistance property, the scene contents fade away completely and only the fog color is visible. Use fog to add atmospheric effects to your app or game, or to improve rendering performance by hiding parts of the scene that are far away from the current point of view.

The default end distance of 0.0 disables the fog effect. Change this property,Äôs value to enable fog.

You can animate changes to this property,Äôs value.
(Read and Write property)

170.47.19 fogStartDistance as Double

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The distance from a point of view at which the scene,Äôs contents begin to be obscured by fog. Animatable.
Notes: A fog effect causes scene contents to become less visible the farther they are from the pointOfView node currently used for rendering. At distances less than the value of the fogStartDistance property, scene contents are fully visible. At greater distances, SceneKit blends the rendered scene contents with a constant color (specified by the fogColor property). At distances greater than the fogEndDistance property, the scene contents fade away completely and only the fog color is visible. Use fog to add atmospheric effects to your app or game, or to improve rendering performance by hiding parts of the scene that are far away from the current point of view.

The default start distance is 0.0.

You can animate changes to this property,Äôs value.
(Read and Write property)

170.47.20 lightingEnvironment as SCNMaterialPropertyMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A cube map texture that depicts the environment surrounding the scene,Äôs contents, used for advanced lighting effects.
Notes: When rendering materials with the physicallyBased lighting model, SceneKit illuminates surfaces differently according to the environment that surrounds them. For example, with physically based shading, even a diffuse surface takes on some color from the sky above it and the ground below it.

Tip: For realistic results, reuse the same contents for both the lighting environment and the background property.

For information about defining cube maps, see the discussion of the contents property.
(Read only property)

170.47.21 paused as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether to run actions, animations, particle systems, and physics simulations in the scene graph.
Notes: If false (the default), SceneKit continuously updates and renders the contents of the scene. Pausing

a scene pauses any running animations or actions attached to the scene graph, and suspends updates of the scene,Äôs physics simulation and any particle systems in the scene.
(Read and Write property)

170.47.22 physicsWorld as SCNPhysicsWorldMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The physics simulation associated with the scene.
Notes: Every scene automatically creates a physics world object to simulate physics on nodes in the scene. You use this property to access the scene,Äôs global physics properties, such as gravity, and to manage physics interactions between nodes. To make a node in the scene participate in the physics simulation, use either or both of its physicsBodyMBS and physicsFieldMBS properties.
(Read only property)

170.47.23 rootNode as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The root node of the scene graph.
Notes: All scene content—nodes, geometries and their materials, lights, cameras, and related objects—is organized in a node hierarchy with a single common root node.

Some scene files created using external tools may describe node hierarchies containing multiple root nodes. When SceneKit imports such files, their separate root nodes will be made children of a new, unique root node.

Each child node,Äôs coordinate system is defined relative to the transformation of its parent node. You should not modify the transform property of the root node.
(Read only property)

170.47.24 attributeForKey(key as String) as Variant

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns or sets the scene attribute for the specified key.
Notes: key: One of the constants described in Scene Attributes that identifies the attribute to be written.
(Read and Write computed property)

170.48 class SCNShapeMBS

170.48.1 class SCNShapeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNShape represents a 2D shape (cubic Bezier spline) than can be extruded.
Notes: Subclass of the SCNGeometryMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.48.2 Methods

170.48.3 Constructor(path as NSBezierPathMBS, extrusionDepth as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a 3D representation of the given shape with the given extrusion depth.
Notes: path: The cubic Bezier spline to extrude.
extrusionDepth: The extrusion depth.

170.48.4 shape(path as NSBezierPathMBS, extrusionDepth as double) as SCNShapeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a 3D representation of the given shape with the given extrusion depth.
Notes: path: The cubic Bezier spline to extrude.
extrusionDepth: The extrusion depth.

170.48.5 Properties

170.48.6 chamferMode as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The sides of the text that are chamfered.
Notes: The default value is ChamferModeBoth.
(Read and Write property)

170.48.7 chamferProfile as NSBezierPathMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Describes the profile used to when "chamferRadius" is not nil.
Notes: When "chamferProfile" is nil we fallback on a path representing a quadrant.
The profile should be a 2D curve beginning at (0,1) and ending at (1,0). The "flatness" property is also used to flatten this path. The default value is nil.
(Read and Write property)

170.48.8 chamferRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The chamfer radius. Animatable.
Notes: Values are clamped to the range [0, extrusionDepth / 2] . The default value is 0.
(Read and Write property)

170.48.9 extrusionDepth as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The extrusion depth. Animatable.
Notes: If the value is 0, we get a mono-sided, 2D version of the shape.
(Read and Write property)

170.48.10 path as NSBezierPathMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The path defining the shape to be rendered.
Notes: The path defines the outline of the shape. The path is filled using the even-odd rule. If the path is self-intersecting, the behavior is undefined.
(Read and Write property)

170.48.11 Constants

Chamfer Mode

Constant	Value	Description
ChamferModeBack	2	Apply a chamfer to only the back edge of the extruded shape.
ChamferModeBoth	0	Apply a chamfer to both front and back edges of the extruded shape.
ChamferModeFront	1	Apply a chamfer to only the front edge of the extruded shape.

170.49 class SCNSliderConstraintMBS

170.49.1 class SCNSliderConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNSliderConstraint constraint makes a node to collide and slide against a category of nodes
Notes: Subclass of the SCNConstraintMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.1pr1

170.49.2 Methods

170.49.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNSliderConstraint object.

170.49.4 sliderConstraint as SCNSliderConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a SCNSliderConstraint object.

170.49.5 Properties

170.49.6 collisionCategoryBitMask as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the category of node to collide against. Defaults to 0.
Notes: (Read and Write property)

170.49.7 offset as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the offset of the slider.
Notes: Defaults to (0,0,0).

(Read and Write property)

170.49.8 Radius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Defines the radius of the slider. Defaults to 1.
Notes: (Read and Write property)

170.50 class SCNSphereMBS

170.50.1 class SCNSphereMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNSphere represents a sphere with controllable radius.
Notes: Subclass of the SCNGeometryMBS class.

170.50.2 Methods

170.50.3 Constructor(radius as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a sphere with given radius.
Notes: radius: The radius of the sphere.

170.50.4 sphere(radius as double) as SCNSphereMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a sphere with given radius.
Notes: radius: The radius of the sphere.

170.50.5 Properties

170.50.6 geodesic as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Indicate if the geometry is a geosphere.
Notes: The default value is false.
(Read and Write property)

170.50.7 radius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The sphere radius. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 0.5.
(Read and Write property)

170.50.8 segmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of segments along both spherical coordinates. Animatable.
Notes: If the value is less than 3, the behavior is undefined. The default value is 48.
(Read and Write property)

170.51 class SCNTextMBS

170.51.1 class SCNTextMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNText represents a block of text that has been extruded
Notes: Subclass of the SCNGeometryMBS class.

170.51.2 Methods

170.51.3 Constructor(text as string, extrusionDepth as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a 3D representation of given text with given extrusion depth.
Notes: string: The text to be represented.
extrusionDepth: The extrusion depth.

170.51.4 text(text as string, extrusionDepth as double) as SCNTextMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a 3D representation of given text with given extrusion depth.
Notes: string: The text to be represented.
extrusionDepth: The extrusion depth.
See also:

- 170.51.15 text as String

170.51.5 Properties

170.51.6 alignmentMode as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines how individual lines of text are horizontally aligned within the bounds.
Notes: For the text to be aligned you first need to set its bounds, otherwise the text is not aligned. The default value is kCAAlignmentNatural.
(Read and Write property)

170.51.7 attributedString as NSAttributedStringMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The text to be represented.
Notes: The text can be string or NSAttributedStringMBS.
(Read and Write property)

170.51.8 chamferProfile as NSBezierPathMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Describes the profile used to when "chamferRadius" is not nil.
Notes: When "chamferProfile" is nil we fallback on a path representing a quadrant.
The profile should be a 2D curve beginning at (0,1) and ending at (1,0). The "flatness" property is also used to flatten this path. The default value is nil.
(Read and Write property)

170.51.9 chamferRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The chamfer radius. Animatable.
Notes: Values are clamped to the range [0, extrusionDepth / 2] . The actual chamfer radius might be different to the one here specified: large values are clipped to a per-glyph max value. The default value is 0.
(Read and Write property)

170.51.10 chamferSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: The number of chamfer subdivisions. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 10.
(Read and Write property)

170.51.11 containerFrame as CGRectMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A container within which the text may be wrapped or truncated.
Notes: The text will start at the top-left corner of the rect. You need to set this property for text truncation or alignment to work. Getting this property when it has never been set returns CGRectMBS with all values zero.
(Read and Write property)

170.51.12 extrusionDepth as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The extrusion depth. Animatable.
Notes: If the value is 0, we get a mono-sided, 2D version of the text.
(Read and Write property)

170.51.13 flatness as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the accuracy (or smoothness) with which fonts are rendered.
Notes: Smaller numbers give smoother curves at the expense of more computation and heavier geometries in terms of vertices. The default value is 0.6, which yields smooth curves.
(Read and Write property)

170.51.14 font as NSFontMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The font used to represent the text.
Notes: The font property is only used when the string property is not an NSAttributedString. Defaults to the system font (12 point).
(Read and Write property)

170.51.15 text as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The text to be represented.
Notes: The text can be string or NSAttributedStringMBS.
(Read and Write property)
See also:

- 170.51.4 text(text as string, extrusionDepth as double) as SCNTextMBS 20802

170.51.16 textSize as CGSizeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop only.

Function: Returns the bounding box size the receiver occupies.
Notes: (Read only property)

170.51.17 truncationMode as String

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Describes how the text is truncated to fit within the bounds.
Notes: For the text to be truncated you first need to set its bounds, otherwise the text is not truncated. The default value is kCATruncationNone.
(Read and Write property)

170.51.18 Wrapped as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Determines whether the text is wrapped to fit within the bounds.
Notes: For the text to be wrapped you first need to set its bounds, otherwise the text is not wrapped. The default value is false.
(Read and Write property)

170.52 class SCNTorusMBS

170.52.1 class SCNTorusMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: SCNTorus represents a torus with controllable ring radius and pipe radius.
Notes: Subclass of the SCNGeometryMBS class.

170.52.2 Methods

170.52.3 Constructor(ringRadius as double, pipeRadius as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a torus with given ring radius and pipe radius.
Notes: ringRadius: The radius of the ring.
pipeRadius: The radius of the pipe.

170.52.4 torus(ringRadius as double, pipeRadius as double) as SCNTorusMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a torus with given ring radius and pipe radius.
Notes: ringRadius: The radius of the ring.
pipeRadius: The radius of the pipe.

170.52.5 Properties

170.52.6 pipeRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The radius of the torus pipe. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 0.25.
(Read and Write property)

170.52.7 pipeSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions of the pipe. Animatable.
Notes: If the value is less than 3, the behavior is undefined. The default value is 24.
(Read and Write property)

170.52.8 ringRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The radius of the torus ring. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 0.5.
(Read and Write property)

170.52.9 ringSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions of the ring. Animatable.
Notes: If the value is less than 3, the behavior is undefined. The default value is 48.
(Read and Write property)

170.53 class SCNTransformConstraintMBS

170.53.1 class SCNTransformConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A SCNTransformConstraint applies on the transform of a node via a custom block.
Notes: Subclass of the SCNConstraintMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- 18.2, page 22: On the Scene Again (Part 2), Getting Started with SceneKit by Stefanie Juchmes

170.54.2 Methods

170.54.3 Constructor(InnerRadius as double, outerRadius as double, height as double)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a tube with given inner radius, outer radius and height.
Notes: innerRadius: The inner radius of the tube.
outerRadius: The outer radius of the tube.
height: The height of the tube.

170.54.4 tube(InnerRadius as double, outerRadius as double, height as double) as SCNTubeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates and returns a tube with given inner radius, outer radius and height.
Notes: innerRadius: The inner radius of the tube.
outerRadius: The outer radius of the tube.
height: The height of the tube.

170.54.5 Properties

170.54.6 height as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the tube. Animatable.
Notes: If the value is less than or equal to 0, the geometry is empty. The default value is 1.
(Read and Write property)

170.54.7 heightSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the Y axis. Animatable.
Notes: If the value is less than 1, the behavior is undefined. The default value is 1.
(Read and Write property)

170.54.8 innerRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The inner radius of the tube. Animatable.
Notes: If the value is less than or equal to 0, or if it is greater than or equal to the outer radius, then the geometry is empty. The default value is 0.25.
(Read and Write property)

170.54.9 outerRadius as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The outer radius of the tube. Animatable.
Notes: If the value is less than or equal to 0, or if it is less than or equal to the inner radius, then the geometry is empty. The default value is 0.5.
(Read and Write property)

170.54.10 radialSegmentCount as Integer

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The number of subdivisions along the radial coordinate. Animatable.

Notes: If the value is less than 3, the behavior is undefined. The default value is 48.
(Read and Write property)

170.55 class SCNVector3MBS

170.55.1 class SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A representation of a three-component vector.
Notes: SceneKit uses three-component vectors for a variety of purposes, such as describing node or vertex positions, surface normals, and scale or translation transforms. The different vector components should be interpreted based on the context in which the vector is being used.

170.55.2 Methods

170.55.3 Constructor(x as double = 0.0, y as double = 0.0, z as double = 0.0)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

170.55.4 copy as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the vector.

170.55.5 equals(other as SCNVector3MBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Compares two vectors.
Notes: Returns true if both are equal.

170.55.6 Null as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns vector with all values zero.

170.55.7 Vector(x as double, y as double, z as double) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new vector.

170.55.8 Properties

170.55.9 x as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The first component in the vector.
Notes: (Read and Write property)

170.55.10 y as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The second component in the vector.
Notes: (Read and Write property)

170.55.11 z as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The third component in the vector.
Notes: (Read and Write property)

170.56 class SCNVector4MBS

170.56.1 class SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A representation of a four-component vector.
Notes: SceneKit uses four-component vectors to represent multiple kinds of data:

- Axis-angle rotation or torque. The x, y, and z fields contain the normalized x-, y-, and z-components of the rotation axis, and the w field contains the rotation angle, in radians, or torque magnitude, in newton-meters.
- Color value (or range). The x, y, z, and w fields contain the red, green, blue, and alpha components of the color, or the width of the color variation range in each component.

170.56.2 Methods

170.56.3 Constructor(x as double = 0.0, y as double = 0.0, z as double = 0.0, w as double = 0.0)

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor.

170.56.4 copy as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a copy of the vector.

170.56.5 equals(other as SCNVector4MBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Compares two vectors.
Notes: Returns true if equal.

170.56.6 Null as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns vector with all values zero.

170.56.7 Vector(x as double, y as double, z as double, w as double) as SCNVector4MBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the vector with given values.

170.56.8 Properties

170.56.9 w as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The fourth component in the vector.
Notes: (Read and Write property)

170.56.10 x as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The first component in the vector.
Notes: (Read and Write property)

170.56.11 y as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The second component in the vector.
Notes: (Read and Write property)

170.56.12 z as Double

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The third component in the vector.
Notes: (Read and Write property)

170.57 class SCNViewMBS

170.57.1 class SCNViewMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A view for displaying 3D SceneKit content.
Notes: In macOS, SCNView is a subclass of NSView. As part of the operating system,Äôs view hierarchy, an SCNView object provides a place for SceneKit content in your app,Äôs user interface. You can create a SceneKit view by using its Constructor method. To provide content for a SceneKit view, assign an SCNSceneMBS object to its scene property.

For additional important methods and properties for working with SceneKit views, see the SCNSceneRenderer protocol. (You can also render SceneKit content into an arbitrary Metal command queue or OpenGL context using the SCNRenderer class, or into a Core Animation layer on macOS using the SCNLayer class. The SCNSceneRenderer protocol defines functionality common to all three SceneKit rendering classes.)

see
https://developer.apple.com/documentation/scenekit/scnview

Requires 64bit app on macOS 10.8 or newer
Subclass of the NSViewMBS class.

170.57.2 Methods

170.57.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
Var x as new SCNViewMBS
```

Notes: On success the handle property is not zero.

You can set PreferLowPowerDevice and PreferredRenderingAPI properties before initializing a view.
See also:

- 170.57.4 Constructor(Handle as Integer) 20819
- 170.57.5 Constructor(left as double, top as double, width as double, height as double) 20819

170.57.4 Constructor(Handle as Integer)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an object based on the given NSView handle.
Example:

```
Var t as new SCNViewMBS(0, 0, 100, 100)
Var v as new SCNViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a SCNView and the plugin retains this handle.
See also:

- 170.57.3 Constructor 20819
- 170.57.5 Constructor(left as double, top as double, width as double, height as double) 20819

170.57.5 Constructor(left as double, top as double, width as double, height as double)

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new control with the given size and position.
Example:

```
Var left,top,width,height as Integer
// define rectangle
Var x as new SCNViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.

You can set PreferLowPowerDevice and PreferredRenderingAPI properties before initializing a view.
See also:

- 170.57.3 Constructor 20819
- 170.57.4 Constructor(Handle as Integer) 20819

170.57.6 hitTest(Point as CGPointMBS, Options as Dictionary = nil) as SCNHitTestResultMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Searches the renderer,Äôs scene for objects corresponding to a point in the rendered image.
Notes: Point: A point in the screen-space (view, layer, or GPU viewport) coordinate system of the scene renderer.
options: A dictionary of options affecting the search. See Hit Testing Options Keys for acceptable values.

Returns an array of SCNHitTestResultMBS objects representing search results.

A 2D point in the rendered screen coordinate space can refer to any point along a line segment in the 3D scene coordinate space. Hit-testing is the process of finding elements of a scene located along this line segment. For example, you can use this method to find the geometry corresponding to a click event in a SceneKit view.

170.57.7 isNodeInsideFrustum(node as SCNNodeMBS, pointOfView as SCNNodeMBS) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a Boolean value indicating whether a node might be visible from a specified point of view.
Notes: node: The node whose visibility is to be tested.
pointOfView: A node defining a point of view, as used by the pointOfView property.

Returns true if the bounding box of the tested node intersects the view frustum defined by the pointOfView node; otherwise, false.

Any node containing a camera or spotlight may serve as a point of view (see the pointOfView property for details). Such a node defines a viewing frustum—a portion of the scene,Äôs coordinate space, shaped like a truncated pyramid, that encloses all points visible from that point of view.

Use this method to test whether a node lies within the viewing frustum defined by another node (which may or may not be the scene renderer,Äôs current pointOfView node). For example, in a game scene containing multiple camera nodes, you could use this method to determine which camera is currently best for viewing a moving player character.

Note that this method does not perform occlusion testing. That is, it returns true if the tested node lies within the specified viewing frustum regardless of whether that node,Äôs contents are obscured by other geometry.

170.57.8 nodesInsideFrustumWithPointOfView(pointOfView as SCNNodeMBS) as SCNNodeMBS()

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns all nodes that might be visible from a specified point of view.
Notes: pointOfView: A node defining a point of view, as used by the pointOfView property.

Returns an array of nodes whose bounding boxes intersect the view frustum defined by the pointOfView node. If the array is empty, no nodes lie within the specified frustum.

Any node containing a camera or spotlight may serve as a point of view (see the pointOfView property for details). Such a node defines a viewing frustum—a portion of the scene,Äôs coordinate space, shaped like a truncated pyramid, that encloses all points visible from that point of view.
Use this method find all nodes whose content lies within the viewing frustum defined by another node (which may or may not be the scene renderer,Äôs current pointOfView node).
Note that this method does not perform occlusion testing. That is, the returned array includes any node that lies within the specified viewing frustum regardless of whether that node,Äôs contents are obscured by other geometry.

170.57.9 pause

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Pauses playback of the view,Äôs scene.
Notes: This method has no effect if the scene is already paused.

170.57.10 play

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Resumes playback of the view,Äôs scene.
Notes: This method has no effect if the scene is not paused.

170.57.11 projectPoint(Point as SCNVector3MBS) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Projects a point from the 3D world coordinate system of the scene to the 2D pixel coordinate system of the renderer.
Notes: point: A point in the world coordinate system of the renderer,Äôs scene.

Returns the corresponding point in the screen-space (view, layer, or GPU viewport) coordinate system of the scene renderer.

The z-coordinate of the returned point describes the depth of the projected point relative to the near and far clipping planes of the renderer,Äôs viewing frustum (defined by its pointOfView node). Projecting a point on the near clipping plane returns a point whose z-coordinate is 0.0; projecting a point on the far clipping plane returns a point whose z-coordinate is 1.0.

170.57.12 snapshot as NSImageMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Renders the view,Äôs scene into a new image object.

170.57.13 stop

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Stops playback of the view,Äôs scene and resets the scene time to its start time.

170.57.14 unprojectPoint(Point as SCNVector3MBS) as SCNVector3MBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Unprojects a point from the 2D pixel coordinate system of the renderer to the 3D world coordinate system of the scene.
Notes: point: A point in the screen-space (view, layer, or GPU viewport) coordinate system of the scene renderer.

Returns the corresponding point in the world coordinate system of the renderer,Äôs scene.

The z-coordinate of the point parameter describes the depth at which to unproject the point relative to the near and far clipping planes of the renderer,Äôs viewing frustum (defined by its pointOfView node). Unprojecting a point whose z-coordinate is 0.0 returns a point on the near clipping plane; unprojecting a point whose z-coordinate is 1.0 returns a point on the far clipping plane.

A 2D point in the rendered screen coordinate space can refer to any point along a line segment in the 3D scene coordinate space. To test for scene contents along this line—for example, to find the geometry corresponding to the location of a click event in a view—use the hitTest method.

170.57.15 Properties

170.57.16 allowsCameraControl as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the user can manipulate the current point of view that is used to render the scene.
Notes: If you set this property to true, SceneKit creates a camera node and handles mouse or touch events to allow the user to pan, zoom, and rotate their view of the scene. (Enabling user camera control does not modify camera objects already existing in the scene graph or the nodes containing them.)

When you enable user camera control, the defaultCameraController object handles input events and drives camera behavior. You can use that object's methods and properties to change the style of user camera interaction, and use the cameraControlConfiguration property to adjust control sensitivity.

In the default configuration, SceneKit provides the following controls:

- Pan with one finger to rotate the camera around the scene
- Pan with two fingers to translate the camera on its local xy-plane
- Pan with three fingers vertically to move the the camera forward backward
- Double-tap to switch to the next camera in the scene
- Rotate with two fingers to roll the camera (rotate on the camera node's z-axis)

Pinch to zoom in or zoom out (change the camera's fieldOfView)
The default value of this property is false. Use this option if you intend to control the camera programmatically.
(Read and Write property)

170.57.17 audioListener as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The node representing the listener,Äôs position in the scene for use with positional audio effects.
Notes: When you use the SCNAudioPlayerMBS class to play sound, the resulting effect depends on the position of each audio source in the scene relative to the listener. For example, changes in relative position can cause a sound to be localized to the left or right channel for stereo headphone output.

This property determines the listener,Äôs position. If the value is nil (the default), the listener position is always the same as that of the pointOfView node. By providing a different node for this property, you can separate the listener position from the point of view—this produces an effect similar to that of a boom microphone in video production. For example, in a third-person game where the camera floats high in the sky above the player character, you might use the player character as the listener node so that sounds from positions nearest the player are loudest.
To place an audio source in the scene, use the addAudioPlayer method on an SCNNode object.
(Read and Write property)

170.57.18 autoenablesDefaultLighting as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit automatically adds lights to a scene.
Notes: If this property,Äôs value is false (the default), the only light sources SceneKit uses for rendering a scene are those contained in the scene graph. If you change the value to true, SceneKit automatically adds and places an omnidirectional light source when rendering scenes that contain no lights or only contain ambient lights.
(Read and Write property)

170.57.19 backgroundColor as NSColorMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The background color of the view.
Notes: SceneKit displays this color behind the contents of the rendered scene. If the scene contents fill the view or if the scene provides its own background using the background property, the view,Äôs background color may not be visible.

This property,Äôs value must be a color that can be represented using RGBA components.
(Read and Write property)

170.57.20 debugOptions as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: Options for drawing overlay content in a scene that can aid debugging.
Notes: Use these options to display overlays that show otherwise-invisible scene content—such as node bounding boxes and the extents of physics fields—for use in debugging and profiling your app. For example:

- To visualize how well each object,Äôs physics representation corresponds to its visible geometry, show the shape of each SCNPhysicsBodyMBS object in the scene with the SCNDebugOptionShowPhysicsShapes option.
- To improve rendering performance in a scene with multiple SCNLightMBS objects, show each light,Äôs area of effect with the SCNDebugOptionShowLightExtents option and ensure that each object in the scene is affected by no more than three lights.

Debug options are bit mask patterns. To display multiple debugging overlays, combine options using the bitwise OR operator.
(Read and Write property)

170.57.21 defaultCameraController as SCNCameraControllerMBS

MBS Mac64bit Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop & iOS.

Function: The default camera controller for this view.
Notes: (Read only property)

170.57.22 jitteringEnabled as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit applies jittering to reduce aliasing artifacts.
Notes: Jittering is a process that SceneKit uses to improve the visual quality of a rendered scene. While the scene,Äôs content is still, SceneKit moves the pointOfView location very slightly (by less than a pixel in projected screen space). It then composites images rendered after several such moves to create the final rendered scene, creating an antialiasing effect that smooths the edges of rendered geometry.

By default, the value of this property is false, specifying that SceneKit should not perform jittering. Change the value to true to enable jittering.

Because the SCNViewMBS and SCNLayerMBS classes perform jittering automatically and asynchronously, enabling jittering for these classes has minimal impact on rendering performance. The SCNRenderer class performs jittering synchronously, incurring a high performance cost. With this class, jittering is suitable for rendering single frames on demand, but not for real-time rendering.
(Read and Write property)

170.57.23 loops as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit restarts the scene time after all animations in the scene have played.
Notes: If the value of this property is true (the default), SceneKit returns the scene time to zero after all animations associated with the scene have played, causing those animations to repeat. Otherwise, SceneKit stops playing the scene when all animations have completed.
(Read and Write property)

170.57.24 Playing as Boolean

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the scene is playing.
Notes: If the value of this property is false (the default), SceneKit does not increment the scene time, so animations associated with the scene do not play. Change this property,Äôs value to true to start animating the scene.
(Read and Write property)

170.57.25 pointOfView as SCNNodeMBS

MBS Mac64bit Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop & iOS.

Function: The node from which the scene,Äôs contents are viewed for rendering.
Notes: Use a node with an SCNCameraMBS instance assigned to its camera property to view a scene. The node provides the position and direction of a virtual camera, and the camera object provides rendering parameters such as field of view and focus.
For debugging lights and shadows, you can also designate a spotlight (an SCNLightMBS object whose type property is spot) as a point of view. In this case, the light,Äôs spotInnerAngle property determines the field of view, and its zNear and zFar properties determine the near and far extents of the region that is visible onscreen (also known as the viewing frustum).

In either case, the direction of view is along the negative z-axis of the node,Äôs local coordinate space.
(Read and Write property)

170.57.26 PreferLowPowerDevice as Integer

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop & iOS.

Function: An option for whether to select low-power-usage devices for Metal rendering.
Notes: SceneKit uses this option when automatically selecting a Metal device on systems with multiple GPUs. If the value is 1, SceneKit uses a device with low power usage requirements—for example, the integrated GPU on a MacBook Pro with both integrated and discrete graphics hardware.
Leaving this key unspecified is equivalent to setting its value to 0. In this case, SceneKit chooses the most capable available Metal device.

Can be set before you create a new SCNViewMBS, SCNIOSControlMBS or SCNControlMBS.
Value is -1 if not set.
(Read and Write property)

170.57.27 preferredFramesPerSecond as Integer

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The animation frame rate that the view uses to render its scene.
Notes: SceneKit chooses an actual frame rate that is as close as possible to your preferred frame rate based on the capabilities of the screen the view is displayed on. The actual frame rate is usually a factor of the maximum refresh rate of the screen to provide a consistent frame rate. For example, if the maximum refresh rate of the screen is 60 frames per second, that is also the highest frame rate the view sets as the actual frame rate. However, if you ask for a lower frame rate, SceneKit might choose 30, 20, 15 or some other factor to be the actual frame rate. For this reason, you want to choose a frame rate that your app can consistently maintain.
The default value is 60 frames per second.
(Read and Write property)

170.57.28 PreferredRenderingAPI as Integer

MBS Mac64bit Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop & iOS.

Function: The rendering API to use for rendering the view (for example, Metal or OpenGL).
Notes: The value for is one of the SCNRenderingAPI constants.

SceneKit attempts to initialize a view using the preferred API you specify in the SCNView initializer; if the current device does not support the preferred API, SceneKit automatically falls back to a supported API.

After initialization, use the renderingAPI property to find out whether a fallback occurred. For example, if you specify the SCNRenderingAPIMetal option when initializing a view on an iOS device that does not support Metal, SceneKit defaults to the SCNRenderingAPIOpenGLES2 option instead.

Can be set before you create a new SCNViewMBS, SCNIOSControlMBS or SCNControlMBS.
Value is -1 if not set.
(Read and Write property)

170.57.29 renderingAPI as Integer

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The graphics technology SceneKit uses to render the scene.
Notes: You choose a graphics technology when initializing a scene renderer:

- When initializing a SCNViewMBS object, use the Constructor initializer and the SCNPreferredRenderingAPIKey key. Alternatively, create a view in Interface Builder and use the Rendering API control in the inspector. During initialization, the view will attempt to use the preferred API, but will fall back to a different API if the preferred one is not supported on the current hardware.
- To create a SCNRendererMBS object that renders into your own OpenGL contect, use the rendererWithContext initializer. To create a renderer for use in your own Metal workflow, use the rendererWithDevice initializer.
- The rendering technology used by a SCNLayer object is determined by Core Animation.

After initializing a renderer, this property reflects the rendering technology in use.
(Read only property)

170.57.30 rendersContinuously as Boolean

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether the view always renders at its preferred frame rate or only when its visible content changes.
Notes: When this value is false (the default), the view redraws its contents only when something in its scene graph change or animates. Use this option to maximize energy efficiency.

If you change this value to true, the view redraws itself continually, at the rate specified by the preferredFramesPerSecond property, regardless of whether content is changing or animating.
(Read and Write property)

170.57.31 scene as SCNSceneMBS

MBS Mac64bit Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The scene to be displayed in the view.
Notes: (Read and Write property)

170.57.32 sceneTime as Double

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: The current scene time.
Notes: This timestamp determines how running animations behave, which is similar to how the playhead time in a video player application determines which frame of a movie to display. Scene time applies only to animations whose usesSceneTimeBase property is true, including those loaded from a scene source using the SCNSceneSourceAnimationImportPolicyPlayUsingSceneTimeBase option.

Use this property, together with the above animation options, when you want to directly control (or allow the user to directly control) the playback of animations. For example, if you,Äôre building an authoring tool for 3D assets, you might bind this property,Äôs value to a slider control for scrubbing through playback of animations in a scene file.
(Read and Write property)

170.57.33 showsStatistics as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether SceneKit displays rendering performance statistics in an accessory view.
Notes: The SceneKit statistics view displays various information about scene rendering performance and GPU resource usage, including a frames-per-second (fps) counter. In macOS, click the gear button in the statistics view to show a panel with additional controls for adjusting SceneKit,Äôs rendering of the scene.
(Read and Write property)

170.57.34 Constants

Antialiasing Modes

Constant	Value	Description
kAntialiasingModeMultisampling16X	4	Multisampling 16x
kAntialiasingModeMultisampling2X	1	Multisampling 2x
kAntialiasingModeMultisampling4X	2	Multisampling 4x
kAntialiasingModeMultisampling8X	3	Multisampling 8x
kAntialiasingModeNone	0	No antialiasing.

Debug Options

Constant	Value	Description
kDebugOptionNone	0	Disable all debugging overlays.
kDebugOptionRenderAsWireframe	64	Display only wireframe placeholders for geometries in the scene. Unlike the SCNDebugOptionShowWireframe option, this option disables n mal surface rendering, displaying only the wireframe for each geometry.
kDebugOptionShowBoundingBoxes	2	Display the bounding boxes for any nodes with content.
kDebugOptionShowCameras	1024	Display visualizations for nodes in the scene with attached cameras and th fields of view.
kDebugOptionShowConstraints	512	Display visualizations of the constraint objects acting on nodes in the scene
kDebugOptionShowCreases	256	Display nonsmoothed crease regions for geometries affected by surface sub vision.
kDebugOptionShowLightExtents	8	Display the regions affected by each SCNLightMBS object in the scene. Only lights whose type is SCNLightTypeOmni or SCNLightTypeSpot have area of effect; directional and ambient lights affect the entire scene.
kDebugOptionShowLightInfluences	4	Display the locations of each SCNLightMBS object in the scene.
kDebugOptionShowPhysicsFields	16	Display the regions affected by each SCNPhysicsFieldMBS object in the sce
kDebugOptionShowPhysicsShapes	1	Display the physics shapes for any nodes with attached SCNPhysicsBodyM objects.
kDebugOptionShowSkeletons	128	Display visualizations of the skeletal animation parameters for relevant geom tries.
kDebugOptionShowWireframe	32	Display geometries in the scene with wireframe rendering. When this option is enabled, SceneKit still renders scene geometry with associated materials, then overlays a wireframe rendering of the same geomet You can use this option, for example, to debug material rendering issues.

Rendering API

Constant	Value	Description
kRenderingAPIMetal	0	Use the Metal framework for SceneKit rendering. Metal provides improved graphics performance on supported devices, allows you to integrate GPU-compute tasks into a rendering workflow, and provides the same API in both iOS and macOS. Used by the renderingAPI property and the SCNPreferredRenderingAPIKey option when initializing an SCNViewMBS object.
kRenderingAPIOpenGLCore32	2	Use the OpenGL 3.2 Core Profile API for SceneKit rendering in macOS. Used by the renderingAPI property and the SCNPreferredRenderingAPIKey option when initializing an SCNViewMBS object.
kRenderingAPIOpenGLCore41	3	Use the OpenGL 4.1 Core Profile API for SceneKit rendering in macOS. Used by the renderingAPI property and the SCNPreferredRenderingAPIKey option when initializing an SCNViewMBS object.
kRenderingAPIOpenGLLegacy	1	Use the Legacy OpenGL API for SceneKit rendering in macOS. This option is available on all macOS systems supporting SceneKit. If you request the Metal rendering API for an SCNViewMBS object on a system that does not support Metal, SceneKit falls back to the Legacy OpenGL API. Used by the renderingAPI property and the SCNPreferredRenderingAPIKey option when initializing an SCNViewMBS object.

Chapter 171

Scintilla

171.1 control DesktopScintillaControlMBS

171.1.1 control DesktopScintillaControlMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Xojo control to host Scintilla editor.

171.1.2 Methods

171.1.3 AddSelection(caret as Integer, anchor as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Add a new selection from anchor to caret as the main selection retaining all other selections as additional selections.
Notes: Since there is always at least one selection, to set a list of selections, the first selection should be added with SetSelection() and later selections added with AddSelection().

171.1.4 AddStyledText(StyledText as MemoryBlock)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This behaves just like AddText, but inserts styled text.
Notes: See GetStyledText function.

171.1.5 AddTabStop(line as Integer, x as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds an explicit tabstop at the specified distance from the left (in pixels).
Notes: Changing tab stops produces a ChangeTabStops event.

171.1.6 AddText(Text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This inserts the first length characters from the string text at the current position.
Notes: This will include any 0's in the string that you might have expected to stop the insert operation. The current position is set at the end of the inserted text, but it is not scrolled into view.

171.1.7 AddUndoAction(token as Integer, UndoFlags as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds an undo action.
Notes: The container can add its own actions into the undo stack by calling AddUndoAction and an Modify event will be sent to the container with the KModificationFlagsContainer flag when it is time to undo (PerformedUndo) or redo (PerformedRedo) the action. The token argument supplied is returned in the token field of the notification.
For example, if the container wanted to allow undo and redo of a 'toggle bookmark' command then it could call AddUndoAction(line, 0) each time the command is performed. Then when it receives a notification to undo or redo it toggles a bookmark on the line given by the token field. If there are different types of commands or parameters that need to be stored into the undo stack then the container should maintain a stack of its own for the document and use the current position in that stack as the argument to AddUndoAction(line). AddUndoAction commands are not combined together into a single undo transaction unless grouped with BeginUndoAction and EndUndoAction.

The flags argument can be KUndoFlagsMayCoalesce (1) if the container action may be coalesced along with any insertion and deletion actions into a single compound action, otherwise kUndoFlagsNone (0). Coalescing treats coalescible container actions as transparent so will still only group together insertions that look like typing or deletions that look like multiple uses of the Backspace or Delete keys.

171.1.8 AllocateBytes(bytes as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Allocate a document buffer large enough to store a given number of bytes.
Notes: The document will not be made smaller than its current contents.

171.1.9 AllocateLineCharacterIndex(lineCharacterIndex as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Allocate one or more indexes.
Notes: Most Scintilla APIs use byte positions but some applications want to use positions based on counting (UTF-32) characters or (UTF-16) code units or need to communicate with other code written in terms of characters or code units. With only byte positions, this may require examining many bytes to count characters or code units in the document but this may be sped up in some cases by indexing the line starts by character or code unit.

Different aspects of an application may need indexes for different periods and should allocate for those periods. Indexes use additional memory so releasing them can help minimize memory but they also take time to recalculate. Scintilla may also allocate indexes to support features like accessibility or input method editors.

Only one index of each type is created for a document at a time.

171.1.10 AllocateLines(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Allocate line indices to match the lines argument.
Notes: This is an optimization that can prevent multiple reallocations of the indices as text is inserted if the application can estimate the number of lines in the document. The number of lines will not be reduced by this call.

171.1.11 AnnotationClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears all annotations.
Notes: All the lines can be cleared of annotations with AnnotationClearAll which is equivalent to clearing each line (setting to "") and then deleting other memory used for this feature.

171.1.12 AnnotationLines(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The number of lines annotating a line can be retrieved with AnnotationLines.

171.1.13 AppendText(Text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This adds the text to the end of the document.
Notes: This will include any 0's in the string that you might have expected to stop the operation. The current selection is not changed and the new text is not scrolled into view.

171.1.14 AssignCmdKey(keyDefinition as Integer, sciCommand as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This assigns the given key definition to a Scintilla command identified by sciCommand.
Notes: sciCommand can be any SCI_* command that has no arguments.

There is a default binding of keys to commands that is defined in the Scintilla library. You can change the mapping to suit your own requirements.

keyDefinition
: a key definition contains the key code in the low 16-bits and the key modifiers in the high 16-bits. To combine keyCode and keyMod set:

keyDefinition = keyCode + Bitwise.ShiftLeft(keyMod, 16)

The key code is a visible or control character or a key from the kKeys* enumeration, which contains:

kKeysAdd, kKeysBack, kKeysDelete, kKeysDivide, kKeysDown, kKeysEnd, kKeysEscape, kKeysHome, kKeysInsert, kKeysLeft, kKeysMenu, kKeysNext (Page Down), kKeysPrior (Page Up), kKeysReturn, kKeysRight, kKeysRWin, kKeysSubtract, kKeysTab, kKeysUp, and kKeysWin.

The modifiers are a combination of zero or more of kKeyModAlt, kKeyModCtrl, kKeyModShift, kKeyModMeta, and kKeyModSuper. On OS X, the Command key is mapped to kKeyModCtrl and the Control key to kKeyModMeta. kKeyModSuper is only available on GTK which is commonly the Windows key. If you are building a table, you might want to use kKeyModNorm, which has the value 0, to mean no modifiers.

On Win32, the numeric keypad with Alt pressed can be used to enter characters by number. This can produce unexpected results in non-numlock mode when function keys are assigned so potentially problematic keys are ignored. For example, setting kKeyModAlt, kKeysUP will only be active for the Up key on the main cursor keys, not the numeric keypad.

171.1.15 AutoComplete

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method triggers autocompletion.
Notes: This has the same effect as the tab key.

171.1.16 AutoCompleteCancel

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cancels any displayed auto completion list.
Notes: When in auto completion mode, the list should disappear when the user types a character that can not be part of the auto completion, such as '.', '(' or ' [' when typing an identifier. A set of characters that will cancel autocompletion can be specified with AutoCompleteStops.

171.1.17 AutoCompletePosStart as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the value of the current position when AutoCompleteShow started display of the list.

171.1.18 AutoCompleteSelect(Value as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method selects an item in the autocompletion list.
Notes: It searches the list of words for the first that matches select. By default, comparisons are case sensitive, but you can change this with AutoCIgnoreCase. The match is character by character for the length of the select string. That is, if select is "Fred" it will match "Frederick" if this is the first item in the list that begins with "Fred". If an item is found, it is selected. If the item is not found, the autocompletion list closes if auto-hide is true (see AutoCAutoHide).
The current selection index can be retrieved with AutoCompleteCurrent.

171.1.19 AutoCompleteSetFillUps(characterSet as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If a fillup character is typed with an auto completion list active, the currently selected item in the list is added into the document, then the fillup character is added.
Notes: Common fillup characters are '(', ' [' and '.' but others are possible depending on the language. By default, no fillup characters are set.

171.1.20 AutoCompleteShow(lengthEntered as Integer, itemList as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method causes a list to be displayed.
Notes: lengthEntered is the number of characters of the word already entered and itemList is the list of words separated by separator characters. The initial separator character is a space but this can be set or got with AutoCompleteSeparator property.

With default settings, the list of words should be in sorted order. If set to ignore case mode with AutoCompleteIgnoreCase, then strings are matched after being converted to upper case. One result of this is that the list should be sorted with the punctuation characters ' [', '\', '] ', '^', '_', and '`' sorted after letters. Alternative handling of list order may be specified with AutoCompleteOrder property.

171.1.21 AutoCompleteStops(characterSet as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The characterSet argument is a string containing a list of characters that will automatically cancel the auto completion list.
Notes: When you start the editor, this list is empty.

171.1.22 BackTab

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.23 BeginUndoAction

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Starts a composed undo action.
Notes: Call BeginUndoAction to mark the beginning and EndUndoAction to end of a set of operations that you want to undo all as one operation but that you have to generate as several operations. Alternatively, you can use these to mark a set of operations that you do not want to have combined with the preceding or following operations if they are undone.

171.1.24 BraceBadLight(pos as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Shows bad brace highlight.
Notes: If there is no matching brace then the brace badlighting style, style kStylesCommonBraceBad (35), can be used to show the brace that is unmatched. Using a position of kInvalidPosition (-1) removes the highlight.

171.1.25 BraceBadLightIndicator(useSetting as Boolean, indicator as ScintillaIndicatorMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Use specified indicator to highlight non matching brace instead of changing its style

171.1.26 BraceHighlight(posA as Integer, posB as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Up to two characters can be highlighted in a 'brace highlighting style', which is defined as style number BraceHighlight (34).
Notes: If you have enabled indent guides, you may also wish to highlight the indent that corresponds with the brace. You can locate the column with Column() and highlight the indent with HighlightGuide.

171.1.27 BraceHighlightIndicator(useSetting as Boolean, indicator as ScintillaIndicatorMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Use specified indicator to highlight matching braces instead of changing their style.

171.1.28 BraceMatch(pos as Integer, maxReStyle as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The BraceMatch method finds a corresponding matching brace given pos, the position of one brace.
Notes: The brace characters handled are '(', ')', ' [', '] ', ' { ', ' } ', '<', and '>'. The search is forwards from an opening brace and backwards from a closing brace. If the character at position is not a brace character, or a matching brace cannot be found, the return value is -1. Otherwise, the return value is the position of the matching brace.
A match only occurs if the style of the matching brace is the same as the starting brace or the matching brace is beyond the end of styling. Nested braces are handled correctly. The maxReStyle parameter must currently be 0 - it may be used in the future to limit the length of brace searches.

171.1.29 BraceMatchNext(pos as Integer, startPos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Similar to BraceMatch, but matching starts at the explicit start position startPos instead of the implicitly next position pos ¬± 1.

171.1.30 CallTipCancel

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method cancels any displayed call tip.
Notes: Scintilla will also cancel call tips for you if you use any keyboard commands that are not compatible with editing the argument list of a function. Call tips are cancelled if you delete back past the position where the caret was when the tip was triggered.

171.1.31 CallTipSetBackColor(backColor as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The background colour of call tips can be set with this property;
Notes: The default colour is white. It is not a good idea to set a dark colour as the background as the default colour for normal calltip text is mid grey and the default colour for highlighted text is dark blue. This also sets the background colour of kStylesCommonCallTip.

171.1.32 CallTipSetForeColor(foreColor as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour of call tip text can be set with this method.
Notes: The default colour is mid grey.
This also sets the foreground colour of kStylesCommonCallTip.

171.1.33 CallTipSetForeColorHighlight(foreColor as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour of highlighted call tip text can be set with this method.
Notes: The default colour is dark blue.

171.1.34 CallTipSetHighlight(highlightStart as Integer, highlightEnd as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This sets the region of the call tips text to display in a highlighted style.
Notes: highlightStart is the zero-based index into the string of the first character to highlight and highlightEnd is the index of the first character after the highlight. highlightEnd must be greater than highlightStart; highlightEnd-highlightStart is the number of characters to highlight. Highlights can extend over line ends if this is required.
Unhighlighted text is drawn in a mid grey. Selected text is drawn in a dark blue. The background is white.

These can be changed with CallTipSetBackColor, CallTipSetForeColor, and CallTipSetForeColorHighlight.

171.1.35 CallTipSetPosition(above as Boolean)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: By default the calltip is displayed below the text, setting above to true will display it above the text.

171.1.36 CallTipShow(pos as Integer, definition as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method starts the process by displaying the call tip window.
Notes: If a call tip is already active, this has no effect.

pos is the position in the document at which to align the call tip. The call tip text is aligned to start 1 line below this character unless you have included up and/or down arrows in the call tip text in which case the tip is aligned to the right-hand edge of the rightmost arrow. The assumption is that you will start the text with something like "\001 1 of 3 \002".

definition is the call tip text. This can contain multiple lines separated by '\n' (Line Feed, ASCII code 10) characters. Do not include Carriage Return (ASCII code 13), as this will most likely print as an empty box. Tab (ASCII code 9) is supported if you set a tabsize with CallTipUseStyle.

The position of the caret is remembered here so that the call tip can be cancelled automatically if subsequent deletion moves the caret before this position.

Call tips are small windows displaying the arguments to a function and are displayed after the user has typed the name of the function. They normally display characters using the font facename, size and character set defined by kStylesCommonDefault. You can choose to use kStylesCommonCallTip to define the facename, size, foreground and background colours and character set with CallTipUseStyle. This also enables support for Tab characters. There is some interaction between call tips and autocompletion lists in that showing a call tip cancels any active autocompletion list, and vice versa.

Call tips can highlight part of the text within them. You could use this to highlight the current argument to a function by counting the number of commas (or whatever separator your language uses).

The mouse may be clicked on call tips and this causes a CallTipClick event to be sent to the container. Small up and down arrows may be displayed within a call tip by, respectively, including the characters '\001', or '\002'. This is useful for showing that there are overloaded variants of one function name and that the user

can click on the arrows to cycle through the overloads.
Alternatively, call tips can be displayed when you leave the mouse pointer for a while over a word in response to the DWellStart event and cancelled in response to DWellEnd. This method could be used in a debugger to give the value of a variable, or during editing to give information about the word under the pointer.

171.1.37 CallTipUseStyle(tabSize as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method changes the style used for call tips from KStylesCommonDefault to KStylesCommoCallTip and sets a tab size in screen pixels.
Notes: If tabsize is less than 1, Tab characters are not treated specially. Once this call has been used, the call tip foreground and background colours are also taken from the style.

171.1.38 Cancel

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cancels autocompletion and calltip display and drops any additional selections.

171.1.39 ChangeInsertion(text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Changes insert.
Notes: This may only be called from a kModificationFlagsInsertCheck in Modify event handler and will change the text being inserted to that provided.

171.1.40 ChangeLastUndoActionText(action as Integer, text as String)

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the text for the undo action.

171.1.41 ChangeLexerState(start as Integer, ende as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Indicate that the internal state of a lexer has changed over a range and therefore there may be a need to redraw.

171.1.42 ChangeSelectionMode(SelectionMode as Integer)

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Changes the selection mode.
Notes: Can be stream (kSelectionModeStream=0) or rectangular (kSelectionModeRectangle=1) or by lines (kSelectionModeLines=2) or thin rectangular (kSelectionModeThin=3). When set in these modes, regular caret moves will extend or reduce the selection, until the mode is cancelled by a call with same value or with Cancel. The get function returns the current mode even if the selection was made by mouse or with regular extended moves. SC_SEL_THIN is the mode after a rectangular selection has been typed into and ensures that no characters are selected.

171.1.43 Character(position as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the character at pos in the document or 0 if pos is negative or past the end of the document.

171.1.44 CharacterString(position as Integer, byref Length as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This queries character at given position.
Notes: If the position has a multi byte UTF-8 character, we take multiple characters and return length in bytes via Length parameter.
Otherwise character is returned for 1 byte and then length is set to 1.

See also Character() to get individual bytes.

171.1.45 CharLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.46 CharLeftExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.47 CharLeftRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.48 CharPositionFromPoint(x as Integer, y as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Finds the closest character to a point.

171.1.49 CharPositionFromPointClose(x as Integer, y as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Finds the closest character to a point.
Notes: Returns -1 if the point is outside the window or not close to any characters. This is similar to the previous CharPositionFromPoint method but finds characters rather than inter-character positions.

171.1.50 CharRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.51 CharRightExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.52 CharRightRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.53 ChooseCaretX

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Scintilla remembers the x value of the last position horizontally moved to explicitly by the user and this value is then used when moving vertically such as by using the up and down keys.
Notes: This message sets the current x position of the caret as the remembered value.

171.1.54 Clear

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears text from current selection.

171.1.55 ClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Unless the document is read-only, this deletes all the text.

171.1.56 ClearAllCmdKeys

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This command removes all keyboard command mapping by setting an empty mapping table.

171.1.57 ClearAllRepresentations

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reset representations to defaults.

171.1.58 ClearCmdKey(keyDefinition as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This makes the given key definition do nothing by assigning the action Null to it.
Example:

```
Var c as DesktopScintillaControlMBS
// disable tab key for editor
c.ClearCmdKey c.kKeysTab
```

171.1.59 ClearDocumentStyle

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When wanting to completely restyle the document, for example after choosing a lexer, the ClearDocumentStyle method can be used to clear all styling information and reset the folding state.

171.1.60 ClearRegisteredImages

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears all registered images.

171.1.61 ClearRepresentation(encodedCharacter as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reset this representation to default.

171.1.62 ClearSelections

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set a single empty selection at 0 as the only selection.

171.1.63 ClearTabStops(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears explicit tabstops on a line.
Notes: Changing tab stops produces a ChangeTabStops event.

171.1.64 Colourise(start as Integer, ende as Integer = -1)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This requests the current lexer or the container (if the lexer is set to nil) to style the document between start and end.
Notes: If end is -1, the document is styled from start to the end. If the "fold" property is set to "1" and your lexer or container supports folding, fold levels are also set. This method causes a redraw.

171.1.65 ColouriseAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This requests the current lexer or the container (if the lexer is set to nil) to style the document.
Notes: If the "fold" property is set to "1" and your lexer or container supports folding, fold levels are also set. This method causes a redraw.

171.1.66 Column(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method returns the column number of a position pos within the document taking the width of tabs into account.
Notes: This returns the column number of the last tab on the line before pos, plus the number of characters between the last tab and pos. If there are no tab characters on the line, the return value is the number of characters up to the position on the line. In both cases, double byte characters count as a single character. This is probably only useful with monospaced fonts.

171.1.67 ContractedFoldNext(lineStart as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Search efficiently for lines that are contracted fold headers.
Notes: This is useful when saving the user's folding when switching documents or saving folding with a file. The search starts at line number lineStart and continues forwards to the end of the file. lineStart is returned if it is a contracted fold header otherwise the next contracted fold header is returned. If there are no more contracted fold headers then -1 is returned.

171.1.68 ConvertEOLs(EndOfLineMode as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Converts end of line characters for the document.
Notes: Scintilla can handle the major line end conventions and, depending on settings and the current lexer also support additional Unicode line ends.
Scintilla can interpret any of the Macintosh (CR), Unix (LF) and Windows (CR+LF) line ends. When the user presses the Enter key, one of these line end strings is inserted into the buffer. The default is CRL+LF in Windows and LF in Unix, but this can be changed with the EOLMode proeprty. You can also convert the entire document to one of these line endings with ConvertEOLs. Finally, you can choose to display the line endings with ViewEOL.

For the UTF-8 encoding, three additional Unicode line ends, Next Line (NEL=U+0085), Line Separator (LS=U+2028), and Paragraph Separator (PS=U+2029) may optionally be interpreted when Unicode line ends is turned on and the current lexer also supports Unicode line ends.

171.1.69 Copy

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copy current text selection and puts text on the clipboard.

171.1.70 CopyAllowLine

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Works the same as Copy() except that if the selection is empty then the current line is copied.
Notes: On Windows, an extra "MSDEVLineSelect" marker is added to the clipboard which is then used in SCI_PASTE to paste the whole line before the current line.

171.1.71 CopyRange(RangeStart as Integer, RangeEnd as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copies a range of text from the document to the system clipboard.

171.1.72 CopyText(Text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copies a supplied piece of text to the system clipboard.

171.1.73 CountCharacters(start as Integer, ende as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the number of whole characters between two positions.

171.1.74 CountCodeUnits(start as Integer, ende as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the number of whole characters between two positions.
Notes: This counts in UTF-16 code units.

171.1.75 CreateLoader(bytes as Integer = 1000000, documentOptions as Integer = 0) as ScintillaLoaderMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a loader object.
Notes: An application can load all of a file into a buffer it allocates on a background thread and then add the data in that buffer into a Scintilla document on the user interface thread. That technique uses extra memory to store a complete copy of the file and also means that the time that Scintilla takes to perform initial line end discovery blocks the user interface.

To avoid these issues, a loader object may be created and used to load the file.
Returns an object that supports the ScintillaLoaderMBS interface which can be used to load data and then be turned into a Scintilla document object for attachment to a view object. The bytes argument determines the initial memory allocation for the document as it is more efficient to allocate once rather than rely on the

buffer growing as data is added. If CreateLoader fails then nil is returned.

See kDocumentOption* constants.

171.1.76 Cut

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cuts current text selection and puts text on the clipboard.

171.1.77 CutAllowLine

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The same as Cut except that if the selection is empty then the current line is cut.
Notes: On Windows, an extra "MSDEVLineSelect" marker is added to the clipboard which is then used in Paste to paste the whole line before the current line.

171.1.78 DeleteBack

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.79 DeleteBackNotLine

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.80 DeleteRange(start as Integer, lengthDelete as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Deletes a range of text in the document.

171.1.81 DelLineLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.82 DelLineRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.83 DelWordLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.84 DelWordRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.85 DelWordRightEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The *End methods move between word ends instead of word starts.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.86 DescribeProperty(Key as String) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Information may be retrieved about the properties that can be set for the current lexer.

171.1.87 DocLineFromVisible(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When some lines are hidden and/or annotations are displayed, then a particular line in the document may be displayed at a different position to its document position.
Notes: This method returns the document line number that corresponds to a display line (counting the display line of the first line in the document as 0). If displayLine is less than or equal to 0, the result is 0. If displayLine is greater than or equal to the number of displayed lines, the result is the number of lines in the document.

171.1.88 DocumentEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.89 DocumentEndExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.90 DocumentStart

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.91 DocumentStartExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.92 DropSelectionN(selection as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If there are multiple selections, remove the indicated selection.
Notes: If this was the main selection then make the previous selection the main and if it was the first then the last selection becomes main. If there is only one selection, or there is no selection selection, then there is no effect.

171.1.93 EditToggleOvertype

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.94 ElementAllowsTranslucent(element as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns true when the element currently allows translucent drawing when an alpha component is included.
Notes: This may change based on circumstances - different platforms or graphics technologies may implement translucency and newer versions of Scintilla may implement translucency for elements that did not previously support it.

171.1.95 ElementBaseColour(element as Integer) as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the default colour of an element.
Notes: This may be a value defined by Scintilla or it may be derived from the operating system or platform. Which values are set from the operating system may differ between operating systems and operating system versions. When undefined the return value is 0 which is equivalent to completely transparent black. These colours may be useful when defining styles with similarities such as synthesizing dark mode styles that use the same colours as the system.

On Win32, autocompletion list colours like kElementList are currently provided by the platform layer and on Cocoa, selection background colours like kElementSelectionBack are provided.

171.1.96 ElementIsSet(element as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns true when an element colour has been set.
Notes: When false indicates that a default colour or set of colours is displayed.

171.1.97 EmptyUndoBuffer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This command tells Scintilla to forget any saved undo or redo history.
Notes: It also sets the save point to the start of the undo buffer, so the document will appear to be unmodified. This does not cause the SavePointReached event to be sent to the container.

171.1.98 EndStyled as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: End styling.
Notes: Scintilla keeps a record of the last character that is likely to be styled correctly. This is moved forwards when characters after it are styled and moved backwards if changes are made to the text of the document before it. Before drawing text, this position is checked to see if any styling is needed and, if so, a StyleNeeded event is sent to the container. The container can send EndStyled to work out where it needs to start styling. Scintilla will always ask to style whole lines.

171.1.99 EndUndoAction

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Ends a composed undo action.
Notes: Call BeginUndoAction to mark the beginning and EndUndoAction to end of a set of operations that you want to undo all as one operation but that you have to generate as several operations. Alternatively, you can use these to mark a set of operations that you do not want to have combined with the preceding or following operations if they are undone.

171.1.100 EnsureVisible(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A line may be hidden because more than one of its parent lines is contracted.
Notes: Both these message travels up the fold hierarchy, expanding any contracted folds until they reach

the top level. The line will then be visible. If you use EnsureVisibleEnforcePolicy(), the vertical caret policy set by VisiblePolicy() is then applied.

171.1.101 EnsureVisibleEnforcePolicy(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A line may be hidden because more than one of its parent lines is contracted.
Notes: Both these message travels up the fold hierarchy, expanding any contracted folds until they reach the top level. The line will then be visible. If you use EnsureVisibleEnforcePolicy(), the vertical caret policy set by VisiblePolicy() is then applied.

171.1.102 EOLAnnotationClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears all EOL annotations.
Notes: All the lines can be cleared of end of line annotations with EOLAnnotationClearAll which is equivalent to clearing each line (setting to 0) and then deleting other memory used for this feature.

171.1.103 ExpandChildren(Line as Integer, FoldLevel as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This is used to respond to a change to a line causing its fold level or whether it is a header to change, perhaps when adding or removing a ' { '.
Notes: By the time the container has received the notification that the line has changed, the fold level has already been set, so the container has to use the previous level in this call so that any range hidden underneath this line can be shown.

171.1.104 FindColumn(line as Integer, column as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the position of a column on a line taking the width of tabs into account.
Notes: It treats a multi-byte character as a single column. Column numbers, like lines start at 0.

171.1.105 FindIndicatorFlash(start as Integer, ende as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Show and animate the find indicator.
Notes: The indicator remains visible with FindIndicatorShow and fades out after showing for half a second with FindIndicatorFlash. FindIndicatorShow behaves similarly to the OS X TextEdit and Safari applications and is best suited to editing documentation where the search target is often a word. FindIndicatorFlash is similar to Xcode and is suited to editing source code where the match will often be located next to operators which would otherwise be hidden under the indicator's padding.

171.1.106 FindIndicatorHide

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Hides the find indicator.

171.1.107 FindIndicatorShow(start as Integer, ende as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Show and animate the find indicator.
Notes: The indicator remains visible with FindIndicatorShow and fades out after showing for half a second with FindIndicatorFlash. FindIndicatorShow behaves similarly to the OS X TextEdit and Safari applications and is best suited to editing documentation where the search target is often a word. FindIndicatorFlash is

similar to Xcode and is suited to editing source code where the match will often be located next to operators which would otherwise be hidden under the indicator's padding.

171.1.108 FindText(searchFlags as Integer, Text as String, byref RangeStart as Integer, byref RangeEnd as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Searches for text in the document.
Notes: It does not use or move the current selection. The searchFlags argument controls the search type, which includes regular expression searches.
See kFindOption* constants.

You can search backwards to find the previous occurrence of a search string by setting the end of the search range before the start.

RangeStart and RangeEnd provide the range of positions in the document to search. You can search backwards by setting RangeEnd less than RangeStart. The text parameter holds the search pattern. If your language makes the use of _TextToFind difficult, you should consider using SearchInTarget instead.

The return value is -1 if the search fails or the position of the start of the found text if it succeeds. The RangeStart and RangeEnd parameters of TextToFind are filled in with the start and end positions of the found text.

171.1.109 FoldAll(FoldAction as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Contracts, expands or toggles all lines.
Notes: Provides a higher-level approach to folding instead of setting expanded flags and showing or hiding individual lines.

An individual fold can be contracted/expanded/toggled with FoldLine(). To affect all child folds as well call FoldChildren().

To affect the entire document call FoldAll(). With kFoldActionToggle the first fold header in the document is examined to decide whether to expand or contract.

171.1.110 FoldChildren(Line as Integer, FoldAction as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Contracts, expands or toggles children.
Notes: Provides a higher-level approach to folding instead of setting expanded flags and showing or hiding individual lines.

An individual fold can be contracted/expanded/toggled with FoldLine(). To affect all child folds as well call FoldChildren().

To affect the entire document call FoldAll(). With kFoldActionToggle the first fold header in the document is examined to decide whether to expand or contract.

171.1.111 FoldLine(Line as Integer, FoldAction as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Contracts, expands or toggles one line.
Notes: Provides a higher-level approach to folding instead of setting expanded flags and showing or hiding individual lines.

An individual fold can be contracted/expanded/toggled with FoldLine(). To affect all child folds as well call FoldChildren().

To affect the entire document call FoldAll(). With kFoldActionToggle the first fold header in the document is examined to decide whether to expand or contract.

171.1.112 FoldParent(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method returns the line number of the first line before line that is marked as a fold point with kFoldLevelHeaderFlag and has a fold level less than the line.
Notes: If no line is found, or if the header flags and fold levels are inconsistent, the return value is -1.

171.1.113 FormatRange(draw as boolean, range as ScintillaRangeToFormatMBS) as Integer

MBS Scintilla Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: FormatRange can be used to draw the text onto a display surface which can include a printer display surface.
Notes: Printed output shows text styling as on the screen, but it hides all margins except a line number margin. Markers do not appear in a margin but will change line background colour. The selection and caret are hidden.

Different platforms use different display surface ID types to print on. On Windows, these are HDCs., on GTK 3.x cairo_t *, and on Cocoa CGContextRef is used.

For macOS use Integer(g.Handle(Graphics.HandleTypes.CGContextRef)), for windows use Integer(g.Handle(Graphics.HandleTypes.HDC)), for Linux use Integer(g.Handle(Graphics.HandleTypes.CairoContext)) to get the handle.

This call renders a range of text into a device context. If you use this for printing, you will probably want to arrange a page header and footer; Scintilla does not do this for you. Each use of this message renders a range of text into a rectangular area and returns the position in the document of the next character to print.

The draw parameter controls if any output is done. Set this to false if you are paginating.

On Windows, hdc and hdcTarget should both be set to the device context handle of the output device (usually a printer). If you print to a metafile these will not be the same as Windows metafiles (unlike extended metafiles) do not implement the full API for returning information. In this case, set hdcTarget to the screen DC.

Page* properties define the rectangle { 0, 0, maxX, maxY } where maxX+1 and maxY+1 are the number of physically printable pixels in x and y.
Area* properties define the rectangle to render the text in (which will, of course, fit within the rectangle defined by Page*).
CharacterRangePosition and CharacterRangeEnd define the start position and maximum position of characters to output. All of each line within this character range is drawn.

On Cocoa, the surface IDs for printing (draw=1) should be the graphics port of the current context (CGContextRef) when the view's drawRect method is called. The Surface IDs are not really used for measurement (draw=0) but can be set to a bitmap context to avoid runtime warnings.

On GTK, the surface IDs to use can be found from the printing context.

CharacterRangePosition and CharacterRangeEnd define the start position and maximum position of characters to output. All of each line within this character range is drawn.

When printing, the most tedious part is always working out what the margins should be to allow for the non-printable area of the paper and printing a header and footer. If you look at the printing code in SciTE,

you will find that most of it is taken up with this. The loop that causes Scintilla to render text is quite simple if you strip out all the margin, non-printable area, header and footer code.

171.1.114 FormFeed

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.115 GetLineSelEndPosition(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Retrieve the position of the end of the selection at the given line with -1 returned if no selection on this line.

171.1.116 GetLineSelStartPosition(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Retrieve the position of the start of the selection at the given line with -1 returned if no selection on this line.

171.1.117 GetNextTabStop(line as Integer, x as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets the next explicit tabstop position set after the given x position, or zero if there aren't any.

171.1.118 GetStyledText(RangeStart as Integer, RangeEnd as Integer, byref Styledtext as MemoryBlock) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This collects styled text into a buffer using two bytes for each cell, with the character at the lower address of each pair and the style byte at the upper address.
Notes: Characters between the positions RangeStart and RangeEnd are copied to new MemoryBlock and put into Styledtext.

Positions outside the document return character codes and style bytes of 0.

171.1.119 GetTextRange(RangeStart as Integer, RangeEnd as Integer, byref Text as String) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This collects the text between the positions RangeStart and RangeEnd and returns it in Text parameter.
Notes: If RangeEnd is -1, text is returned to the end of the document.
The return value is the length of the returned text.

171.1.120 GotoLine(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This removes any selection and sets the caret at the start of line number line and scrolls the view (if needed) to make it visible.
Notes: The anchor position is set the same as the current position. If line is outside the lines in the document (first line is 0), the line set is the first or last.

171.1.121 GotoPos(pos as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This removes any selection, sets the caret at caret and scrolls the view to make the caret visible, if necessary.
Notes: It is equivalent to SetSel(caret, caret). The anchor position is set the same as the current position.

171.1.122 GrabFocus

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Scintilla can be told to grab the focus with GrabFocus.
Notes: This is needed more on GTK where focus handling is more complicated than on Windows.

171.1.123 HideLines(lineStart as Integer, lineEnd as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Marks a range of lines as invisible and then redraw the display.
Notes: If kElementHiddenLine is set then a horizontal line is drawn in that colour to indicate that there are hidden lines.
A fold line drawn in that position overrides the hidden line indicator.

171.1.124 HideSelection(hide as Boolean)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The normal state is to make the selection visible by drawing it as set by SetSelForeColor and SetSelBackColor.
Notes: However, if you hide the selection, it is drawn as normal text.

171.1.125 Home

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.126 HomeDisplay

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.127 HomeDisplayExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.128 HomeExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.129 HomeRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.130 HomeWrap

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.131 HomeWrapExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.132 IndexPositionFromLine(line as Integer, lineCharacterIndex as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries position from line via index.
Notes: The document line of a particular character or code unit may be found by calling LineFromIndexPosition with one of kLineCharacterIndexTypeUtf32 (1) or kLineCharacterIndexTypeUtf16 (2). The inverse action, finds the starting position of a document line either in characters or code units from the document start by calling IndexPositionFromLine with the same lineCharacterIndex argument.

171.1.133 Indicator(index as Integer) as ScintillaIndicatorMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries indicator with given index.
Notes: Index is from 0 to 35.

171.1.134 IndicatorAllOnFor(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Retrieve a bitmap value representing which indicators are non-zero at a position.
Notes: Only the first 32 indicators are represented in the result so no IME indicators are included.

171.1.135 IndicatorClearRange(start as Integer, lengthClear as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears a range for the current indicator.

171.1.136 IndicatorFillRange(start as Integer, lengthFill as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Fills a range with the current indicator.
Notes: See IndicatorValue property.

171.1.137 InitializeLexer(Lexer as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Initializes the lexer.
Notes: To style files in different languages, different 'lexers' are used. These are objects that are called by Scintilla with a range of text and some context information and which then set styles and folding information for that range. Lexers for Scintilla are now provided by the Lexilla project.

Current list of buit-in lexers is:

a68k, abaqus, ada, apdl, as, asm, asn1, asy, au3, ave, avs, baan, bash, batch, bib, blitzbasic, bullant, caml, cil, clarion, clarionnocase, cmake, COBOL, coffeescript, conf, cpp, cppnocase, csound, css, d, dataflex, diff, DMAP, DMIS, ecl, edifact, eiffel, eiffelkw, erlang, errorlist, escript, f77, flagship, forth, fortran, freebasic, fsharp, gap, gui4cli, haskell, hollywood, hypertext, ihex, indent, inno, json, julia, kix, kvirc, latex, lisp, literatehaskell, lot, lout, lua, magiksf, makefile, markdown, matlab, maxima, metapost, mmixal, modula, mssql, mysql, nim, nimrod, nncrontab, nsis, null, octave, opal, oscript, pascal, powerbasic, perl, phpscript, PL/M, po, pov, powerpro, powershell, abl, props, ps, purebasic, python, r, raku, rebol, registry, ruby, rust, sas, scriptol, smalltalk, SML, sorcins, specman, spice, sql, srec, stata, fcST, TACL, tads3, TAL, tcl, tcmd, tehex, tex, txt2tags, vb, vbscript, verilog, vhdl, visualprolog, x12, xml, yaml, xojo

171.1.138 InsertText(Text as String, atPosition as Integer = -1)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This inserts the text string at position pos or at the current position if pos is -1.
Notes: If the current position is after the insertion point then it is moved along with its surrounding text but no scrolling is performed.

171.1.139 IsRangeWord(start as Integer, ende as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Is the range start..end a word or set of words?
Notes: This message checks that start is at a word start transition and that end is at a word end transition. It does not check whether there are any spaces inside the range.

171.1.140 LastChild(line as Integer, level as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Searches last child.
Notes: Searches for the next line after line, that has a folding level that is less than or equal to level and then returns the previous line number. If you set level to -1, level is set to the folding level of line line. If from is a fold point, LastChild(from, -1) returns the last line that would be in made visible or hidden by toggling the fold state.

171.1.141 LexerNameFromID(ID as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries name of lexer with given ID.
Example:

```
// constants in LexerConstants.txt in our examples folder
Const SCLEX_HTML = 4

Var s As String = DesktopScintillaControlMBS.LexerNameFromID(SCLEX_HTML)
MessageBox s
```

171.1.142 LexerNames as String()

MBS Scintilla Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries list of built-in lexers.
Notes: Current list is:

a68k, abaqus, ada, apdl, as, asm, asn1, asy, au3, ave, avs, baan, bash, batch, bib, blitzbasic, bullant, caml, cil, clarion, clarionnocase, cmake, COBOL, coffeescript, conf, cpp, cppnocase, csound, css, d, dataflex, diff, DMAP, DMIS, ecl, edifact, eiffel, eiffelkw, erlang, errorlist, escript, f77, flagship, forth, fortran, freebasic, fsharp, gap, gui4cli, haskell, hollywood, hypertext, ihex, indent, inno, json, julia, kix, kvirc, latex, lisp, literatehaskell, lot, lout, lua, magiksf, makefile, markdown, matlab, maxima, metapost, mmixal, modula, mssql, mysql, nim, nimrod, nncrontab, nsis, null, octave, opal, oscript, pascal, powerbasic, perl, phpscript, PL/M, po, pov, powerpro, powershell, abl, props, ps, purebasic, python, r, raku, rebol, registry, ruby, rust, sas, scriptol, smalltalk, SML, sorcins, specman, spice, sql, srec, stata, fcST, TACL, tads3, TAL, tcl, tcmd, tehex, tex, txt2tags, vb, vbscript, verilog, vhdl, visualprolog, x12, xml, yaml, xojo.

171.1.143 lexillaLibraryLoaded as boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the lexilla library got loaded.
Notes: Returns true if you loaded lexilla dylib/dll/so file.

171.1.144 Line(line as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries text of a line.
Notes: Index is zero based.

171.1.145 LineCopy

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.146 LineCut

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.147 LineDedent

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Like back tab but force the multiline behaviour.

171.1.148 LineDelete

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.149 LineDown

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.150 LineDownExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.151 LineDownRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.152 LineDuplicate

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.153 LineEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.
See also:

- 171.1.154 LineEnd(line as Integer) as Integer 20869

171.1.154 LineEnd(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries line end position for the given line.
See also:

- 171.1.153 LineEnd 20869

171.1.155 LineEndDisplay

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.156 LineEndDisplayExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.157 LineEndExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.158 LineEndPosition(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the position at the end of the line, before any line end characters.
Notes: If line is the last line in the document (which does not have any end of line characters) or greater, the result is the size of the document. If line is negative the result is undefined.

171.1.159 LineEndRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.160 LineEndWrap

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.161 LineEndWrapExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.162 LineFromIndexPosition(pos as Integer, lineCharacterIndex as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries line from position via index.
Notes: The document line of a particular character or code unit may be found by calling LineFromIndexPosition with one of kLineCharacterIndexTypeUtf32 (1) or kLineCharacterIndexTypeUtf16 (2). The inverse action, finds the starting position of a document line either in characters or code units from the document start by calling IndexPositionFromLine with the same lineCharacterIndex argument.

171.1.163 LineFromPosition(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method returns the line that contains the position pos in the document.
Notes: The return value is 0 if pos <= 0.
The return value is the last line if pos is beyond the end of the document.

171.1.164 LineIndent

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Like tab but force the multiline behaviour.

171.1.165 LineIndentPosition(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The position at the end of indentation of a line.

171.1.166 LineLength(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the length of the line, including any line end characters.
Notes: If line is negative or beyond the last line in the document, the result is 0. If you want the length of the line not including any end of line characters, use LineEndPosition(line) - PositionFromLine(line).

171.1.167 LineReverse

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.168 LineScroll(columns as Integer, lines as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This will attempt to scroll the display by the number of columns and lines that you specify.
Notes: Positive line values increase the line number at the top of the screen (i.e. they move the text upwards as far as the user is concerned), Negative line values do the reverse.
The column measure is the width of a space in the default style. Positive values increase the column at the left edge of the view (i.e. they move the text leftwards as far as the user is concerned). Negative values do the reverse.

171.1.169 LineScrollDown

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.170 LineScrollUp

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.171 LinesJoin

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Join a range of lines indicated by the target into one line by removing line end characters.
Notes: Where this would lead to no space between words, an extra space is inserted.

171.1.172 LinesSplit(pixelWidth as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Split a range of lines indicated by the target into lines that are at most pixelWidth wide.
Notes: Splitting occurs on word boundaries wherever possible in a similar manner to line wrapping. When pixelWidth is 0 then the width of the window is used.

171.1.173 LineStart(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries line start position for the given line.

171.1.174 LineTranspose

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.175 LineUp

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.176 LineUpExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.177 LineUpRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.178 LineVisible(line as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reports on the visible state of a line and returns true if it is visible and false if it is not visible.
Notes: This method has no effect on fold levels or fold flags.

171.1.179 LoadFramework(path as folderitem) as boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Loads the framework.
Notes: You can load Scintilla framework on macOS.
Returns true on success.

171.1.180 LoadLibrary(path as folderitem) as boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Loads the library.
Notes: You can load lexer and scintilla libraries here.
Returns true on success.

171.1.181 LowerCase

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.182 Margin(index as Integer) as ScintillaMarginMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries margin with given index.
Notes: Index ranges from 0 to 5.

171.1.183 MarginTextClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears all texts for margin.

171.1.184 Marker(index as Integer) as ScintillaMarkerMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries marker with given index.
Notes: Index ranges from 0 to 35.

171.1.185 MarkerAdd(Line as Integer, markerNumber as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This function searches the document for the marker with this handle and deletes the marker if it is found.
Notes: The markerHandle argument is an identifier for a marker returned by MarkerAdd.

171.1.186 MarkerAddSet(line as Integer, markerSet as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Add one or more markers to a line with a single call.
Notes: Add one or more markers to a line with a single call, specified in the same "one-bit-per-marker" 32-bit integer format returned by Marker() (and used by the mask-based marker search functions MarkerNext() and MarkerPrevious()). As with MarkerAdd, no check is made to see if any of the markers are already present on the targeted line.

171.1.187 MarkerDefineRGBAImage(markerNumber as Integer, Width as Integer, Height as Integer, ScalePercent as Integer = 100, Pixels as MemoryBlock)

MBS Scintilla Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set a translucent pixmap to be used to draw the marker.
Example:

```
Var c as DesktopScintillaControlMBS // your control

// define red dot for breakpoints
Const size = 18

Var r As New Picture(size, size) // red dot
Var m As New Picture(size, size) // mask, a white dot on black, black is transparent
Var rg As Graphics = r.Graphics
Var mg As Graphics = m.Graphics

// we draw the image and the mask one
rg.DrawingColor = &c000000
rg.FillRectangle 0, 0, size, size
```

```
rg.DrawingColor = &cFF0000
rg.FillOval 0, 0, size, size
mg.DrawingColor = &c000000
mg.FillRectangle 0, 0, size, size
mg.DrawingColor = &cFFFFFF
mg.FillOval 0, 0, size, size

// now we convert to memoryblock
Var rr As RGBSurface = r.RGBSurface
Var mr As RGBSurface = m.RGBSurface

Var pixels As New MemoryBlock(size * size * 4)
Var PixelPtr As ptr = pixels
Var o As Integer = 0
For y As Integer = 0 To size-1
For x As Integer = 0 To size-1
Var mc As Color = mr.Pixel(x,y)
Var rc As Color = rr.Pixel(x,y)
PixelPtr.UInt8(o+0) = rc.Red
PixelPtr.UInt8(o+1) = rc.Green
PixelPtr.UInt8(o+2) = rc.Blue
PixelPtr.UInt8(o+3) = mc.Green
o = o + 4
Next
Next

// and define the marker
c.Marker(1).Symbol = ScintillaMarkerMBS.kMarkerSymbolPixmap
c.MarkerDefineRGBAImage(1, size, size, 100, pixels)
```

Notes: Please pass the marker number, the size of the picture, it's scale in percent and the pixels memoryblock.

171.1.188 MarkerDelete(Line as Integer, markerNumber as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This searches the given line number for the given marker number and deletes it if it is present.
Notes: If you added the same marker more than once to the line, this will delete one copy each time it is used. If you pass in a marker number of -1, all markers are deleted from the line.

171.1.189 MarkerDeleteAll(markerNumber as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This removes markers of the given number from all lines.
Notes: If markerNumber is -1, it deletes all markers from all lines.

171.1.190 MarkerDeleteHandle(markerHandle as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Deletes a marker.
Notes: The markerHandle argument is an identifier for a marker returned by MarkerAdd.
This function searches the document for the marker with this handle and deletes the marker if it is found.

171.1.191 MarkerEnableHighlight(enabled as Boolean)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method allows to enable/disable the highlight folding block when it is selected.
Notes: (i.e. block that contains the caret)

171.1.192 MarkerGet(Line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns a 32-bit integer that indicates which markers were present on the line.
Notes: Bit 0 is set if marker 0 is present, bit 1 for marker 1 and so on.

171.1.193 MarkerHandleFromLine(line as Integer, which as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the Nth marker handle in a given line.
Notes: Handles are returned by MarkerAdd. If which is greater or equal to the number of markers on a line, this returns -1;

171.1.194 MarkerLineFromHandle(markerHandle as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This function searches the document for the marker with this handle and returns the line number that contains it or -1 if it is not found.

Notes: The markerHandle argument is an identifier for a marker returned by MarkerAdd.

171.1.195 MarkerNext(lineStart as Integer, markerMask as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Search efficiently for lines that include a given set of markers.
Notes: The search starts at line number lineStart and continues forwards to the end of the file (MarkerNext) or backwards to the start of the file (MarkerPrevious).
The markerMask argument should have one bit set for each marker you wish to find. Set bit 0 to find marker 0, bit 1 for marker 1 and so on. The message returns the line number of the first line that contains one of the markers in markerMask or -1 if no marker is found.

171.1.196 MarkerNumberFromLine(line as Integer, which as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the Nth marker number in a given line.
Notes: Handles are returned by MarkerAdd. If which is greater or equal to the number of markers on a line, this returns -1;

171.1.197 MarkerPrevious(lineStart as Integer, markerMask as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Search efficiently for lines that include a given set of markers.
Notes: The search starts at line number lineStart and continues forwards to the end of the file (MarkerNext) or backwards to the start of the file (MarkerPrevious).
The markerMask argument should have one bit set for each marker you wish to find. Set bit 0 to find marker 0, bit 1 for marker 1 and so on. The message returns the line number of the first line that contains one of the markers in markerMask or -1 if no marker is found.

171.1.198 MarkerSymbolDefined(markerNumber as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the symbol defined for a markerNumber.
Notes: Returns the symbol defined for a markerNumber with MarkerSymbolDefined or SC_MARK_PIXMAP if defined with kMarkerSymbolPixmap or kMarkerSymbolRgbaImage if defined with MarkerDefineRGBAImage.

171.1.199 MoveCaretInsideView

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If the caret is off the top or bottom of the view, it is moved to the nearest line that is visible to its current position.
Notes: Any selection is lost.

171.1.200 MoveSelectedLinesDown

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Move the selected lines down one line, shifting the line below before the selection.
Notes: The selection will be automatically extended to the beginning of the selection's first line and the end of the selection's last line. If nothing was selected, the line the cursor is currently at will be selected.

171.1.201 MoveSelectedLinesUp

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Move the selected lines up one line, shifting the line above after the selection.
Notes: The selection will be automatically extended to the beginning of the selection's first line and the end of the selection's last line. If nothing was selected, the line the cursor is currently at will be selected.

171.1.202 MultiEdgeAddLine(column as Integer, edgeColour as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds a new vertical edge to the view.
Notes: The edge will be displayed at the given column number. The resulting edge position depends on the metric of a space character in STYLE_DEFAULT. All the edges can be cleared with MultiEdgeClearAll. MultiEdgeColumn returns the column of the Nth vertical edge (indexed from 0). If which is greater or equal to the number of vertical edges, this returns -1.

171.1.203 MultiEdgeClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: All the edges can be cleared with MultiEdgeClearAll.

171.1.204 MultiEdgeColumn(which as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: MultiEdgeColumn returns the column of the Nth vertical edge (indexed from 0).
Notes: If which is greater or equal to the number of vertical edges, this returns -1.

171.1.205 MultipleSelectAddEach

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: MultipleSelectAddEach is similar to MultipleSelectAddNext but adds multiple occurrences instead of just one.

171.1.206 MultipleSelectAddNext

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds the next occurrence of the main selection within the target to the set of selections as main.
Notes: If the current selection is empty then select word around caret. The current searchFlags are used so the application may choose case sensitivity and word search options.

171.1.207 NewLine

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.208 PageDown

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.209 PageDownExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.210 PageDownRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.211 PageUp

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.212 PageUpExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.213 PageUpRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.214 ParaDown

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.215 ParaDownExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.216 ParaUp

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.217 ParaUpExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.218 Paste

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Performs the paste operation from clipboard.

171.1.219 PointXFromPosition(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Return the x display pixel location of text at position pos in the document.

171.1.220 PointYFromPosition(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Return the y display pixel location of text at position pos in the document.

171.1.221 PositionAfter(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the position after another position in the document taking into account the current code page.
Notes: The minimum position returned is 0 and the maximum is the last position in the document. If called with a position within a multi byte character will return the position of the start/end of that character.

171.1.222 PositionBefore(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the position before another position in the document taking into account the current code page.
Notes: The minimum position returned is 0 and the maximum is the last position in the document. If called with a position within a multi byte character will return the position of the start/end of that character.

171.1.223 PositionFromLine(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the document position that corresponds with the start of the line.
Notes: If line is negative, the position of the line holding the start of the selection is returned. If line is greater than the lines in the document, the return value is -1. If line is equal to the number of lines in the document (i.e. 1 line past the last line), the return value is the end of the document.

171.1.224 PositionFromPoint(x as Integer, y as integer) as integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Finds the closest character position to a point.

171.1.225 PositionFromPointClose(x as Integer, y as integer) as integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Finds the closest character position to a point.
Notes: Returns -1 if the point is outside the window or not close to any characters.

171.1.226 PositionRelative(pos as Integer, relative as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Count a number of whole characters before or after the argument position and return that position.
Notes: The minimum position returned is 0 and the maximum is the last position in the document. If the position goes past the document end then 0 is returned.

171.1.227 PositionRelativeCodeUnits(pos as Integer, relative as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Count a number of whole characters before or after the argument position and return that position.
Notes: The minimum position returned is 0 and the maximum is the last position in the document. If the position goes past the document end then 0 is returned.

These is the UTF-16 versions of PositionRelative() working in terms of UTF-16 code units

171.1.228 PropertyInt(name as String, defaultValue as Integer = 0) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Lookup a keyword:value pair using the specified key; if found, interpret the value as an integer and return it.
Notes: If not found (or the value is an empty string) then return the supplied default. If the keyword:value pair is found but is not a number, then return 0.

171.1.229 PropertyType(name as String) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries property type.
Notes: See kTypeProperty* constants.

171.1.230 PushUndoActionType(type as Integer, Pos as Integer)

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Appends an action to the undo stack with a particular type and position then the text and length of that action are set with.
Notes: Next call ChangeLastUndoActionText to set the text.

171.1.231 Redo

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Undoes the effect of the last Undo operation.

171.1.232 RegisterRGBAImage(type as Integer, Width as Integer, Height as Integer, Pixels as MemoryBlock)

MBS Scintilla Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Registers an icon for auto completion.
Example:

```
// register red dot for auto complete later
Const size = 18

Var r As New Picture(size, size) // red dot
Var m As New Picture(size, size) // mask, a white dot on black, black is transparent
Var rg As Graphics = r.Graphics
Var mg As Graphics = m.Graphics

// we draw the image and the mask one
rg.DrawingColor = &c000000
rg.FillRectangle 0, 0, size, size
rg.DrawingColor = &cFF0000
rg.FillOval 0, 0, size, size
mg.DrawingColor = &c000000
mg.FillRectangle 0, 0, size, size
mg.DrawingColor = &cFFFFFF
mg.FillOval 0, 0, size, size
```

```
// now we convert to memoryblock
Var rr As RGBSurface = r.RGBSurface
Var mr As RGBSurface = m.RGBSurface

Var pixels As New MemoryBlock(size * size * 4)
Var PixelPtr As ptr = pixels
Var o As Integer = 0
For y As Integer = 0 To size-1
For x As Integer = 0 To size-1
Var mc As Color = mr.Pixel(x,y)
Var rc As Color = rr.Pixel(x,y)
PixelPtr.UInt8(o+0) = rc.Red
PixelPtr.UInt8(o+1) = rc.Green
PixelPtr.UInt8(o+2) = rc.Blue
PixelPtr.UInt8(o+3) = mc.Green
o = o + 4
Next
Next

c.RegisterRGBAImage(1, size, size, pixels)
```

Notes: Autocompletion list items may display an image as well as text. Each image is first registered with an integer type. Then this integer is included in the text of the list separated by a '?' from the text. For example, "fclose?2 fopen" displays image 2 before the string "fclose" and no image before "fopen". The images are in RGBA format and set with RegisterRGBAImage.
The set of registered images can be cleared with ClearRegisteredImages method and the '?' separator changed with AutoCompleteSeparator property.

171.1.233 ReleaseAllExtendedStyles

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Releases any extended styles allocated by the container.

171.1.234 ReleaseLineCharacterIndex(lineCharacterIndex as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Release one or more indexes.
Notes: Different aspects of an application may need indexes for different periods and should allocate for those periods. Indexes use additional memory so releasing them can help minimize memory but they also take time to recalculate. Scintilla may also allocate indexes to support features like accessibility or input method editors. Only one index of each type is created for a document at a time.

171.1.235 ReplaceRectangular(length as Integer, text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Replaces the selected text or empty selection with the given text.
Notes: The insertion is performed similarly to rectangular pastes: new lines in the given text are interpreted as moving to the next line without inserting new lines unless at the end of the document.

171.1.236 ReplaceSelection(text as string)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The currently selected text between the anchor and the current position is replaced by the text string.
Notes: If the anchor and current position are the same, the text is inserted at the caret position. The caret is positioned after the inserted text and the caret is scrolled into view.

171.1.237 ReplaceTarget(text as string) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Replace target area with new text.
Notes: After replacement, the target range refers to the replacement text. The return value is the length of the replacement string.
Note that the recommended way to delete text in the document is to set the target to the text to be removed, and to perform a replace target with an empty string.

171.1.238 ReplaceTargetMinimal(text as string) as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Replaces the target.
Notes: This is similar to ReplaceTarget but tries to minimize change history when the current target text shares a common prefix or suffix with the replacement. Only the text that is actually different is marked as changed. This might be used when automatically reformatting some text so that the whole area formatted doesn't show change marks. If length is -1, text is a zero terminated string, otherwise length sets the number of character to replace the target with. After replacement, the target range refers to the replacement text. The return value is the length of the replacement string.
Note that the recommended way to delete text in the document is to set the target to the text to be removed, and to perform a replace target with an empty string.

171.1.239 ReplaceTargetRE(text as string) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This replaces the target using regular expressions.
Notes: If length is -1, text is a zero terminated string, otherwise length is the number of characters to use. The replacement string is formed from the text string with any sequences of \1 through \9 replaced by tagged matches from the most recent regular expression search. \0 is replaced with all the matched text from the most recent search. After replacement, the target range refers to the replacement text. The return value is the length of the replacement string.

171.1.240 ResetElementColour(element as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This removes the element colour returning to the default colour or set of colours.

171.1.241 RotateSelection

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Makes the next selection be the main selection.

171.1.242 SaveToHTML(Title as String, tabSize as Integer = 4, wysiwyg as boolean = false, tabs as boolean = true, folding as boolean = false, onlyStylesUsed as boolean = true) as String

MBS Scintilla Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a html text with the text and styles from the Scintilla control.
Example:

```
Var html As String = MyScintillaControl.SaveToHTML(Me.Title, 4, True, True, True)

// write to file on desktop
Var f As FolderItem = SpecialFolder.Desktop.Child("export.html")
Var b As BinaryStream = BinaryStream.Create(f, True)
b.Write html
b.Close

// and open in browser
f.open
```

Notes: Title: is used for the title attribute in the html.
tabSize: defines how many spaces to use for a tab character.
wysiwyg: if true, changes html to look more like on screen.
tabs: If true, we output tab character instead of space.
folding: If true, adds JavaScript to allow folding sections.
onlyStylesUsed: If true will only add CSS styles for the used styles instead of all defined ones.

171.1.243 scintillaLibraryLoaded as boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the scintilla library got loaded.
Notes: Returns true on MacOS when you loaded the Scintilla.framework before.
Returns true if you loaded Scintilla.dll on Windows or Scintilla.so on Linux.

171.1.244 ScrollCaret

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If the current position (this is the caret if there is no selection) is not visible, the view is scrolled to make it visible according to the current caret policy.

171.1.245 ScrollRange(secondary as Integer, primary as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Scroll the argument positions and the range between them into view giving priority to the primary position then the secondary position.
Notes: The behaviour is similar to ScrollCaret with the primary position used instead of the caret. An effort is then made to ensure that the secondary position and range between are also visible. This may be used to make a search match visible.

171.1.246 ScrollToEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The ScrollToEnd commands scroll the document to the end without changing the selection. These commands match OS X platform conventions for the behaviour of the home and end keys. Scintilla can be made to match OS X applications by binding the home and end keys to these commands.

You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.247 ScrollToStart

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The ScrollToStart commands scroll the document to the start without changing the selection. These commands match OS X platform conventions for the behaviour of the home and end keys. Scintilla can be made to match OS X applications by binding the home and end keys to these commands.

You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.248 ScrollVertical(docLine as Integer, subLine as Integer)

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the vertical scroll position to be the display line for the subLine of the docLine.
Notes: Like calling SetFirstVisibleLine(VisibleFromDocLine(docLine)+subLine)

The subLine is capped to the maximum number of sublines for that document line which may change because of styling and wrapping. It is ignored when line wrapping is off.

If line wrapping is on, then that docLine/subLine is remembered and reapplied as lines are wrapped. This ensures that when wrapping is completed, which may take some time, the line at the top of the view is that requested by the application and the view range is stable during the wrapping process. It is forgotten once the document is fully wrapped or the user performs scrolling manually such as by dragging the scroll bar.

This method is a good way for applications to restore the user's positional context when re-selecting a document as it is robust to changes in window width and styles.

171.1.249 SearchAnchor

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the search start point used by SearchNext and SearchPrev to the start of the current selection, that is, the end of the selection that is nearer to the start of the document.
Notes: You should always call this before calling either of SearchNext or SearchPrev.

171.1.250 SearchInTarget(text as string) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This searches for the first occurrence of a text string in the target defined by TargetStart and TargetEnd.
Notes: The search is modified by the search flags set by SearchFlags property. If the search succeeds, the target is set to the found text and the return value is the position of the start of the matching text. If the search fails, the result is -1.

See Tag() for regular expression results.

Character	Description
.	Matches any character
\(	This marks the start of a region for tagging a match.
\)	This marks the end of a tagged region.
\n	Where n is 1 through 9 refers to the first through ninth tagged region when replacing. For example, if the search string was Fred\([1-9] \)XXX and the replace string was Sam\1YYY, when applied to Fred2XXX this would generate Sam2YYY. \0 refers to all of the matching text.
\<	This matches the start of a word using Scintilla's definitions of words.
\>	This matches the end of a word using Scintilla's definition of words.
\x	This allows you to use a character x that would otherwise have a special meaning. For example, \[would be interpreted as [and not as the start of a character set.
[...]	This indicates a set of characters, for example, [abc] means any of the characters a, b or c. You can also use ranges, for example [a-z] for any lower case character.
[^...]	The complement of the characters in the set. For example, [^A-Za-z] means any character except an alphabetic character.
^	This matches the start of a line (unless used inside a set, see above).
$	This matches the end of a line.
*	This matches 0 or more times. For example, Sa*m matches Sm, Sam, Saam, Saaam and so on.
+	This matches 1 or more times. For example, Sa+m matches Sam, Saam, Saaam and so on.

171.1.251 SearchNext(searchFlags as Integer, text as String) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: SearchNext and SearchPrev search for the next and previous occurrence of the search string pointed at by text.
Notes: The search is modified by the searchFlags.
See kFindOption* constants.

The return value is -1 if nothing is found, otherwise the return value is the start position of the matching text. The selection is updated to show the matched text, but is not scrolled into view.

171.1.252 SearchPrev(searchFlags as Integer, text as String) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: SearchNext and SearchPrev search for the next and previous occurrence of the search string pointed at by text.
Notes: The search is modified by the searchFlags.
See kFindOption* constants.

The return value is -1 if nothing is found, otherwise the return value is the start position of the matching text. The selection is updated to show the matched text, but is not scrolled into view.

171.1.253 SelectAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This selects all the text in the document.
Notes: The current position is not scrolled into view.

171.1.254 SelectionDuplicate

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.255 SelectionFromPoint(X as Integer, Y as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Return the index of the selection at the point.
Notes: If there is no selection at the point, return -1. This can be used to drop a selection or make it the

main selection.

171.1.256 SelectionNEndVirtualSpace(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Query the virtual space at start and end of each selection.
Notes: Selection parameter is zero based.

171.1.257 SelectionNStartVirtualSpace(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Query the virtual space at start and end of each selection.
Notes: Selection parameter is zero based.

171.1.258 SetAdditionalSelBackColor(value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets background color for additional selection.
Notes: Modify the appearance of additional selections so that they can be differentiated from the main selection.

171.1.259 SetAdditionalSelForeColor(value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets foreground color for additional selection.
Notes: Modify the appearance of additional selections so that they can be differentiated from the main selection.

171.1.260 SetCharsDefault

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Use the default sets of word and whitespace characters.
Notes: This sets whitespace to space, tab and other characters with codes less than &h20, with word characters set to alphanumeric and '_'.

171.1.261 SetDocument(otherControl as Variant)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets document for this control to be same as the other control.
Notes: Using this method you can allow multiple controls to share same document, e.g. for split views.

Pass nil to create new empty document.

This method does the following:
1. It removes the current window from the list held by the current document.
2. It reduces the reference count of the current document by 1.
3. If the reference count reaches 0, the document is deleted.
4. doc is set as the new document for the window.
5. If doc was 0, a new, empty document is created and attached to the window.
6. If doc was not 0, its reference count is increased by 1.

Please pass either DesktopScintillaControlMBS or DesktopDesktopScintillaControlMBS here to point to new control.

After you assigned new document, please configure styles as needed.

171.1.262 SetEmptySelection(caret as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This removes any selection and sets the caret at caret.
Notes: The caret is not scrolled into view.

171.1.263 SetFoldFlags(FoldFlags as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets folder flags.
Notes: In addition to showing markers in the folding margin, you can indicate folds to the user by drawing lines in the text area. The lines are drawn in the kElementFoldLine colour if set. If it is not set then the foreground colour set for kStylesCommonDefault is used.

171.1.264 SetFoldMarginColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour of the fold margin.
Example:

```
// turn folder margin to red
c.SetFoldMarginColor(True, Color.red)
```

Notes: Defaults to system color for this.

The FoldMarginColor and the FoldMarginHighlightColor colors are used together to draw the chequerboard pattern in the folder margin.

171.1.265 SetFoldMarginHighlightColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour of the fold margin highlight.
Notes: Defaults to system color for this.

The FoldMarginColor and the FoldMarginHighlightColor colors are used together to draw the chequerboard pattern in the folder margin.

171.1.266 SetHotspotActiveBackColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets background color for hotspot.
Notes: While the cursor hovers over text in a style with the hotspot attribute set, the default colouring can be modified and an underline drawn with these settings.

171.1.267 SetHotspotActiveForeColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets foreground color for hotspot.
Notes: While the cursor hovers over text in a style with the hotspot attribute set, the default colouring can be modified and an underline drawn with these settings.

171.1.268 SetSavePoint

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method tells Scintilla that the current state of the document is unmodified.
Notes: This is usually done when the file is saved or loaded, hence the name "save point". As Scintilla performs undo and redo operations, it notifies the container that it has entered or left the save point with SavePointReached and SavePointLeft events, allowing the container to know if the file should be considered dirty or not.
See also: EmptyUndoBuffer or Modify property.

171.1.269 SetSel(anchor as Integer, caret as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets both the anchor and the current position.
Notes: If caret is negative, it means the end of the document. If anchor is negative, it means remove any selection (i.e. set the anchor to the same position as caret). The caret is scrolled into view after this operation.

171.1.270 SetSelBackColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: You can choose to override the default selection colouring.
Example:

```
// use highlight color for selection and white text

Var c as DesktopScintillaControlMBS // your control
c.SetSelBackColor(True, Color.HighlightColor)
c.SetSelForeColor(True, Color.White)
```

Notes: With the method, the colour you provide is used if you set useSetting to true. If it is set to false, the default styled colouring is used and the fore or back argument has no effect.

171.1.271 SetSelection(caret as Integer, anchor as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set a single selection from anchor to caret as the only selection.

171.1.272 SetSelForeColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: You can choose to override the default selection colouring.
Example:

```
// use highlight color for selection and white text

Var c as DesktopScintillaControlMBS // your control
c.SetSelBackColor(True, Color.HighlightColor)
c.SetSelForeColor(True, Color.White)
```

Notes: With the method, the colour you provide is used if you set useSetting to true. If it is set to false, the default styled colouring is used and the fore or back argument has no effect.

171.1.273 setStatusText(Text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Targets: Desktop only.

Function: Sets message of status field.

171.1.274 SetStyling(length as Integer, style as ScintillaStyleMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the style of length characters starting at the styling position and then increases the styling position by length, ready for the next call.
Notes: StartStyling should be called before the first call to this.
See also:

- 171.1.275 SetStyling(start as Integer, length as Integer, style as ScintillaStyleMBS) 20897

171.1.275 SetStyling(start as Integer, length as Integer, style as ScintillaStyleMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the style of length characters starting at the styling position and then increases the styling position by length, ready for the next call.
Notes: StartStyling should be called before the first call to this.
See also:

- 171.1.274 SetStyling(length as Integer, style as ScintillaStyleMBS) 20897

171.1.276 SetStylingEx(Styles as MemoryBlock)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets styling for a range of text.
Notes: As an alternative to SetStyling, which applies the same style to each byte, you can use this method which specifies the styles for each of length bytes from the styling position and then increases the styling position by length, ready for the next call. StartStyling should be called before the first call to this.

171.1.277 SetTargetRange(start as Integer, ende as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set the start and end of the target.

171.1.278 SetVisiblePolicy(visiblePolicy as Integer, visibleSlop as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This determines how the vertical positioning is determined when EnsureVisibleEnforcePolicy is called.
Notes: It takes kVisiblePolicySlop and kVisiblePolicyStrict flags for the visiblePolicy parameter. It is similar in operation to SetYCaretPolicy.

171.1.279 SetWhitespaceBackColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets background color for white space.
Notes: By default, the colour of visible white space is determined by the lexer in use. The foreground and/or background colour of all visible white space can be set globally, overriding the lexer's colours.

171.1.280 SetWhitespaceForeColor(useSetting as boolean, value as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets foreground color for white space.
Notes: By default, the colour of visible white space is determined by the lexer in use. The foreground and/or background colour of all visible white space can be set globally, overriding the lexer's colours.

171.1.281 SetXCaretPolicy(caretPolicy as Integer, caretSlop as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the caret policy.
Notes: See kCaretPolicy* constants.

slop	strict	jumps	even	Caret can go to the margin	"On reaching limit (going out of visibility or going into the UZ) display is..."
0	0	0	0	Yes	moved to put caret on top/on right
0	0	0	1	Yes	moved by one position
0	0	1	0	Yes	moved to put caret on top/on right
0	0	1	1	Yes	centred on the caret
0	1	-	0	Caret is always on top/on right of display	-
0	1	-	1	No, caret is always centred	-
1	0	0	0	Yes	moved to put caret out of the asymmetrical UZ
1	0	0	1	Yes	moved to put caret out of the UZ
1	0	1	0	Yes	moved to put caret at 3UZ of the top or right margin
1	0	1	1	Yes	moved to put caret at 3UZ of the margin
1	1	-	0	Caret is always at UZ of top/right margin	-
1	1	0	1	No, kept out of UZ	moved by one position
1	1	1	0	No, kept out of UZ	moved to put caret at 3UZ of the margin

171.1.282 SetYCaretPolicy(caretPolicy as Integer, caretSlop as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the caret policy.
Notes: See kCaretPolicy* constants.

slop	strict	jumps	even	Caret can go to the margin	"On reaching limit (going out of visibility or going into the UZ) display is..."
0	0	0	0	Yes	moved to put caret on top/on right
0	0	0	1	Yes	moved by one position
0	0	1	0	Yes	moved to put caret on top/on right
0	0	1	1	Yes	centred on the caret
0	1	-	0	Caret is always on top/on right of display	-
0	1	-	1	No, caret is always centred	-
1	0	0	0	Yes	moved to put caret out of the asymmetrical UZ
1	0	0	1	Yes	moved to put caret out of the UZ
1	0	1	0	Yes	moved to put caret at 3UZ of the top or right margin
1	0	1	1	Yes	moved to put caret at 3UZ of the margin
1	1	-	0	Caret is always at UZ of top/right margin	-
1	1	0	1	No, kept out of UZ	moved by one position
1	1	1	0	No, kept out of UZ	moved to put caret at 3UZ of the margin

171.1.283 ShowLines(lineStart as Integer, lineEnd as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Marks a range of lines as visible and then redraw the display.

171.1.284 StartRecord

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Turn macro recording on.

171.1.285 StartStyling(start as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This prepares for styling by setting the styling position start to start at.
Notes: After StartStyling, send multiple SetStyling messages for each lexical entity to style or send SetStylingEX to style in blocks.

171.1.286 StopRecord

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Turn macro recording off.

171.1.287 StringOfSpan(Span as ScintillaSpanMBS) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries text for given span.

171.1.288 StutteredPageDown

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.289 StutteredPageDownExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.

You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.290 StutteredPageUp

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.291 StutteredPageUpExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.292 Style(index as Integer) as ScintillaStyleMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries style with given index.
Notes: Index ranges from 0 to 255.

171.1.293 StyleAt(position as Integer) as ScintillaStyleMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the style at pos in the document, or 0 if pos is negative or past the end of the document.

171.1.294 StyleClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This message sets all styles to have the same attributes as the default style.
Notes: If you are setting up Scintilla for syntax colouring, it is likely that the lexical styles you set will be very similar. One way to set the styles is to:
1. Set kStylesCommonDefault to the common features of all styles.
2. Use StyleClearAll to copy this to all styles.

3. Set the style attributes that make your lexical styles different.

171.1.295 StyleResetDefault

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This message resets default style (kStylesCommonDefault) to its state when Scintilla was initialised.

171.1.296 SupportsFeature(feature as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Different platforms support different features and SupportsFeature can be used to check which are currently available.
Notes: For example, on Win32, Direct2D supports drawing translucent lines but GDI does not so SupportsFeature(kSupportsTranslucentStroke) will return 1 for Direct2D and 0 for GDI. Its possible that translucent line drawing will be implemented in a future revision to the GDI platform layer or will be implemented on particular Windows versions. This call allows applications to tailor their settings: perhaps displaying a box with translucent coloured fill on Direct2D but a hollow box on GDI.

See kSupport* constants.

171.1.297 SwapMainAnchorCaret

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Moves the caret to the opposite end of the main selection.

171.1.298 Tab

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.299 Tag(tagNumber as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Discover what text was matched by tagged expressions in a regular expression search.
Notes: This is useful if the application wants to interpret the replacement string itself.

171.1.300 TargetFromSelection

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set the target start and end to the start and end positions of the selection.

171.1.301 TargetWholeDocument

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set the target start to the start of the document and target end to the end of the document.

171.1.302 TextHeight(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the height in pixels of a particular line.
Notes: Currently all lines are the same height.

171.1.303 ToggleCaretSticky

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: These method set, get or toggle the caretSticky setting which controls when the last position of the caret on the line is saved.
Notes: When set to kCaretStickyOff (0), the sticky flag is off; all text changes (and all caret position changes) will remember the caret's new horizontal position when moving to different lines. This is the default.
When set to kCaretStickyOn (1), the sticky flag is on, and the only thing which will cause the editor to remember the horizontal caret position is moving the caret with mouse or keyboard (left/right arrow keys, home/end keys, etc).
When set to kCaretStickyWhiteSpace (2), the caret acts like mode 0 (sticky off) except under one special case; when space or tab characters are inserted. (Including pasting only space/tabs – undo, redo, etc. do not exhibit this behaviour..).
ToggleCaretSticky switches from kCaretStickyOn and kCaretStickyWhiteSpace to kCaretStickyOff and from kCaretStickyOff to kCaretStickyOn.

171.1.304 ToggleFold(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Toggle a folder at the given line.
Notes: Each fold point may be either expanded, displaying all its child lines, or contracted, hiding all the child lines. This method toggle the folding state of the given line as long as it has the kFoldLevelHeaderFlag set. This method take care of folding or expanding all the lines that depend on the line. The display updates after this method.

171.1.305 ToggleFoldShowText(Line as Integer, text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Toggle a folder at the given line with hsowing text.
Notes: Each fold point may be either expanded, displaying all its child lines, or contracted, hiding all the child lines. This method toggle the folding state of the given line as long as it has the kFoldLevelHeaderFlag set. This method take care of folding or expanding all the lines that depend on the line. The display updates after this method.

An optional text tag may be shown to the right of the folded text with the text argument to ToggleFoldShowText. The default text for all header lines can be set with DefaultFoldDisplayText. The text is drawn with the kStylesCommonFoldDisplayText style.

171.1.306 Undo

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Undoes one action.
Notes: Or if the undo buffer has reached a EndUndoAction point, all the actions back to the corresponding BeginUndoAction.

Scintilla has multiple level undo and redo. It will continue to collect undoable actions until memory runs out. Scintilla saves actions that change the document. Scintilla does not save caret and selection movements, view scrolling and the like. Sequences of typing or deleting are compressed into single transactions to make it easier to undo and redo at a sensible level of detail. Sequences of actions can be combined into transactions that are undone as a unit. These sequences occur between BeginUndoAction and EndUndoAction messages. These transactions can be nested and only the top-level sequences are undone as units.

171.1.307 UndoActionPosition(action as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the position of an undo action.

171.1.308 UndoActionText(action as Integer) as String

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries the type of the actioon.
Notes: Should be called with indices from 0 to one less than the result of UndoActions. The actions should only be iterated in the positive direction and should start from 0.

171.1.309 UndoActionType(action as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries the type of the action.

171.1.310 UpperCase

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.311 UsePopUp(popUpMode as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clicking the wrong button on the mouse pops up a short default editing menu.
Notes: This may be turned off with UsePopup(kPopUpNever). If you turn it off, context menu commands (in Windows, WM_CONTEXTMENU) will not be handled by Scintilla, so the parent of the Scintilla window will have the opportunity to handle the message.

171.1.312 UserListShow(listType as Integer, itemList as string)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Shows an user list.
Notes: User lists use the same internal mechanisms as autocompletion lists, and all the calls listed for autocompletion work on them; you cannot display a user list at the same time as an autocompletion list is active. They differ in the following respects:

- The AutoCChooseSingle method has no effect.
- When the user makes a selection you are sent a UserListSelection event rather than AutoCompleteSelection.

BEWARE: if you have set fillup characters or stop characters, these will still be active with the user list, and may result in items being selected or the user list cancelled due to the user typing into the editor.

The listType parameter is carried to the events. It must be greater than 0 as this is how Scintilla tells the difference between an autocompletion list and a user list. If you have different types of list, for example a list of buffers and a list of macros, you can use listType to tell which one has returned a selection.

171.1.313 VCHome

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.314 VCHomeDisplay

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.315 VCHomeDisplayExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.316 VCHomeExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.317 VCHomeRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.318 VCHomeWrap

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.319 VCHomeWrapExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.320 VerticalCentreCaret

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.321 VisibleFromDocLine(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When some lines are hidden and/or annotations are displayed, then a particular line in the document may be displayed at a different position to its document position.
Notes: If no lines are hidden and there are no annotations, this method returns docLine. Otherwise, this returns the display line (counting the very first visible line as 0). The display line of an invisible line is the same as the previous visible line. The display line number of the first line in the document is 0. If lines are hidden and docLine is outside the range of lines in the document, the return value is -1. Lines can occupy more than one display line if they wrap.

171.1.322 WordEndPosition(pos as Integer, onlyWordCharacters as boolean) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the end of words using the same definition of words as used internally within Scintilla.
Notes: You can set your own list of characters that count as words with WordChars. The position sets the start or the search, which is forwards when searching for the end and backwards when searching for the start.

171.1.323 WordLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.

Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.324 WordLeftEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The *End methods move between word ends instead of word starts.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.325 WordLeftEndExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The *End methods move between word ends instead of word starts.
This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.326 WordLeftExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.327 WordPartLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The WordPart** commands are used to move between word segments marked by capitalisation (aCamelCaseIdentifier) or underscores (an_under_bar_ident).
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.328 WordPartLeftExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The WordPart** commands are used to move between word segments marked by capitalisation (aCamelCaseIdentifier) or underscores (an_under_bar_ident).
This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.329 WordPartRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The WordPart** commands are used to move between word segments marked by capitalisation (aCamelCaseIdentifier) or underscores (an_under_bar_ident).
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.330 WordPartRightExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The WordPart** commands are used to move between word segments marked by capitalisation (aCamelCaseIdentifier) or underscores (an_under_bar_ident).
This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.331 WordRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.332 WordRightEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The *End methods move between word ends instead of word starts.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.333 WordRightEndExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The *End methods move between word ends instead of word starts.
This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.334 WordRightExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: This action extends the selection.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.1.335 WordStartPosition(pos as Integer, onlyWordCharacters as boolean) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the start of words using the same definition of words as used internally within Scintilla.
Notes: You can set your own list of characters that count as words with WordChars. The position sets the start or the search, which is forwards when searching for the end and backwards when searching for the start.

171.1.336 WrapCount(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Document lines can occupy more than one display line if they wrap and this returns the number of display lines needed to wrap a document line.

171.1.337 ZoomIn

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Increases the zoom factor by one point if the current zoom factor is less than 20 points.

171.1.338 ZoomOut

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Ddecreases the zoom factor by one point if the current zoom factor is greater than -10 points.

171.1.339 Properties

171.1.340 Accessibility as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Enable or disable accessibility status.
Notes: Can be set to kAccessibilityEnabled to enable.
(Read and Write property)

171.1.341 AdditionalCaretForeColor as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Modify the appearance of additional carets so that they can be differentiated from the main caret which has its appearance.
Notes: (Read and Write property)

171.1.342 AdditionalCaretsBlink as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Modify the appearance of additional carets so that they can be differentiated from the main caret which has its appearance.
Notes: (Read and Write property)

171.1.343 AdditionalCaretsVisible as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Determine whether to show additional carets (defaults to true).
Notes: (Read and Write property)

171.1.344 AdditionalSelAlpha as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets alpha for additional selection.
Notes: Modify the appearance of additional selections so that they can be differentiated from the main selection.
(Read and Write property)

171.1.345 AdditionalSelectionTyping as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether typing, new line, cursor left/right/up/down, backspace, delete, home, and end work with multiple selections simultaneously.
Notes: Also allows selection and word and line deletion commands.
(Read and Write property)

171.1.346 AllLinesVisible as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns true if all lines are visible and false if some lines are hidden.
Notes: (Read only property)

171.1.347 Anchor as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The current anchor position.
Notes: This sets the anchor position and creates a selection between the anchor position and the current position. The caret is not scrolled into view.
(Read and Write property)

171.1.348 AnnotationVisible as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Annotations can be made visible in a view and there is a choice of display style when visible.
Notes: See kAnnotationVisible* constants.
(Read and Write property)

171.1.349 AutoCImageScale as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the scale factor in percent for all autocompletion list images.
Notes: This is useful on macOS with a retina display where each display unit is 2 pixels: use a factor of 200 so that each image pixel is displayed using a screen pixel. The default scale, 100, will stretch each image pixel to cover 4 screen pixels on a retina display.

This is currently only implemented for the Qt and GTK platforms.
(Read and Write property)

171.1.350 AutoCompleteActive as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns true if there is an active auto completion list and false if there is not.
Notes: (Read only property)

171.1.351 AutoCompleteAutoHide as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: By default, the list is cancelled if there are no viable matches (the user has typed characters that no longer match a list entry).
Notes: If you want to keep displaying the original list, set autoHide to false. This also effects AutoCompleteSelect.
(Read and Write property)

171.1.352 AutoCompleteCancelAtStart as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The default behaviour is for the list to be cancelled if the caret moves to the location it was at when the list was displayed.
Notes: By calling this message with a false argument, the list is not cancelled until the caret moves at least one character before the word being completed.
(Read and Write property)

171.1.353 AutoCompleteCaseInsensitiveBehaviour as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether to ignore case on auto completion.
Notes: When auto completion is set to ignore case (kCaseInsensitiveBehaviourIgnoreCase), by default it will nonetheless select the first list member that matches in a case sensitive way to entered characters. This corresponds to a behaviour property of kCaseInsensitiveBehaviourRespectCase (0). If you want auto completion to ignore case at all, choose kCaseInsensitiveBehaviourIgnoreCase (1).
(Read and Write property)

171.1.354 AutoCompleteChooseSingle as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether to choose single item directly.
Notes: If you use AutoCompleteChooseSingle(1) and a list has only one item, it is automatically added and no list is displayed. The default is to display the list even if there is only a single item.
(Read and Write property)

171.1.355 AutoCompleteCurrent as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set to select an item in the autocompletion list.
Notes: It searches the list of words for the first that matches select. By default, comparisons are case sensitive, but you can change this with AutoCIgnoreCase. The match is character by character for the length of the select string. That is, if select is "Fred" it will match "Frederick" if this is the first item in the list that begins with "Fred". If an item is found, it is selected. If the item is not found, the autocompletion list closes if auto-hide is true (see AutoCAutoHide).
The current selection index can be retrieved with AutoCompleteCurrent.
(Read only property)

171.1.356 AutoCompleteCurrentText as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Retrieves the current selected text in the autocompletion list.
Notes: Normally the AutoCompletion event is used instead.
The value is copied to the text buffer or if not found, an empty string is returned.
(Read only property)

171.1.357 AutoCompleteDropRestOfWord as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When an item is selected, any word characters following the caret are first erased if dropRestOfWord is set true.
Notes: The default is false.
(Read and Write property)

171.1.358 AutoCompleteIgnoreCase as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: By default, matching of characters to list members is case sensitive.
Notes: These method let you set and get case sensitivity.
(Read and Write property)

171.1.359 AutoCompleteMaxHeight as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the maximum number of rows that will be visible in an auto completion list.
Notes: If there are more rows in the list, then a vertical scrollbar is shown. The default is 5.
(Read and Write property)

171.1.360 AutoCompleteMaxWidth as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the maximum width of an auto completion list expressed as the number of characters in the longest item that will be totally visible.
Notes: If zero (the default) then the list's width is calculated to fit the item with the most characters. Any items that cannot be fully displayed within the available width are indicated by the presence of ellipsis.
(Read and Write property)

171.1.361 AutoCompleteMulti as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether to auto complete multiple selections.
Notes: When auto completing with multiple selections present, the auto completed text can go into just the main selection with kMultiAutoCompleteOnce (0) or into each selection with kMultiAutoCompleteEach

(1). The default is kMultiAutoCompleteOnce.
(Read and Write property)

171.1.362 AutoCompleteOptions as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set options for auto completion.
Notes: See kAutoCompleteOption* constants.
(Read and Write property)

171.1.363 AutoCompleteOrder as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The default setting kOrderingPreSorted (0) requires that the list be provided in alphabetical sorted order.
Notes: Sorting the list can be done by Scintilla instead of the application with kOrderingPerformSort (1). This will take additional time.
Applications that wish to prioritize some values and show the list in order of priority instead of alphabetical order can use kOrderingCustom (2). This requires extra processing in AutoCompleteShow to create a sorted index.
Setting the order should be done before calling AutoCompleteShow.
(Read and Write property)

171.1.364 AutoCompleteSeparator as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the separator character used to separate words in the AutoCompleteShow list.
Notes: The default is the space character.
(Read and Write property)

171.1.365 AutoCompleteTypeSeparator as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or get the type separator for auto complete.
Notes: (Read and Write property)

171.1.366 AutoCStyle as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the style used by autocompletion lists to determine the font facename, size and character set used to display characters.
Notes: Defaults to STYLE_DEFAULT. Always call AllocateExtendedStyles(1) to make a new style.
(Read and Write property)

171.1.367 AutomaticFold as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The automatic folding behavior.
Notes: The fundamental operation in folding is making lines invisible or visible. Line visibility is a property of the view rather than the document so each view may be displaying a different set of lines. From the point of view of the user, lines are hidden and displayed using fold points. Generally, the fold points of a document are based on the hierarchical structure of the document contents. In Python, the hierarchy is determined by indentation and in C++ by brace characters. This hierarchy can be represented within a Scintilla document object by attaching a numeric "fold level" to each line. The fold level is most easily set by a lexer, but you can also set it with method.

It is up to your code to set the connection between user actions and folding and unfolding. The best way to see how this is done is to search the SciTE source code for the methods used in this section of the documentation and see how they are used. You will also need to use markers and a folding margin to complete your folding implementation. The "fold" property should be set to "1" with SetProperty("fold", "1") to enable folding.

Instead of implementing all the logic for handling folding in the container, Scintilla can provide behaviour that is adequate for many applications. The automaticFold argument is a bit set defining which of the 3 pieces of folding implementation should be enabled. Most applications should be able to use the kAutomaticFoldShow and kAutomaticFoldChange flags unless they wish to implement quite different behaviour such as defining their own fold structure. kAutomaticFoldClick is more likely to be set off when an application would like to add or change click behaviour such as showing method headers only when Shift+Alt is used in conjunction with a click.
(Read and Write property)

171.1.368 BackSpaceUnIndents as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether backspace unindents.
Notes: Inside indentation white space, the tab and backspace keys can be made to indent and unindent rather than insert a tab character or delete a character with the TabIndents and BackSpaceUnIndents functions.

(Read and Write property)

171.1.369 Bidirectional as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets or queries bidirectional support.
Notes: The bidirectional features in Scintilla are experimental and incomplete.

Some languages, like Arabic and Hebrew, are written from right to left instead of from left to right as English is. Documents that use multiple languages may contain both directions and this is termed "bidirectional". The default text direction may be right to left or left to right. Scintilla only correctly displays bidirectional text on some platforms. Currently, there is experimental support for bidirectional text on Win32 using DirectWrite and on macOS using Cocoa. Only UTF-8 documents will show bidirectional behaviour and only in kBidirectionalL2R mode. Some features, such as virtual space may not work with bidirectional text or may work only in some circumstances. kBidirectionalR2L may be implemented in the future.

There are additional processing and storage costs to bidirectional text. As some applications may not want to pay the costs, bidirectional support must be explicitly enabled by calling Bidirectional = kBidirectionalL2R (1) which chooses left to right as the default direction or Bidirectional = kBidirectionalR2L (2) for default right to left.

On Win32, this should be done after setting the technology to kTechnologyDirectWrite, kTechnologyDirectWriteRetain, or kTechnologyDirectWriteDC.

If the call succeeded Bidirectional query will return the same value otherwise kBidirectionalDisabled (0) is returned.
(Read and Write property)

171.1.370 CallTipActive as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns true if a call tip is active and false if it is not active.
Notes: (Read only property)

171.1.371 CallTipPosStart as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This property returns or sets the value of the current position when CallTipShow started to display the tip.
Notes: (Read and Write property)

171.1.372 CanPaste as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether clipboard has text and paste can be performed.
Notes: Returns false if document is read only or selection contains protected text.
(Read only property)

171.1.373 CanRedo as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether Undo was performed and a Redo step is possible.
Notes: You could typically use the result of this property to enable/disable the Edit menu Redo command.
(Read only property)

171.1.374 CanUndo as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether undo stack contains data and can be used to undo.
Notes: You would typically use the result of this property to enable/disable the Edit menu Undo command.
(Read only property)

171.1.375 CaretForeColor as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour of the caret.
Example:

```
Var ScintillaEditor as DesktopScintillaControlMBS // your control

// set cursor width and color

ScintillaEditor.CaretForeColor = Color.HighlightColor
ScintillaEditor.CaretWidth = 8
```

Notes: (Read and Write property)

171.1.376 CaretLineBackAlpha as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The caret line be drawn translucently which allows other background colours to show through.
Notes: hTis is done by setting the alpha (translucency) value by calling CaretLineBackAlpha. When the alpha is not kAlphaNoAlpha, the caret line is drawn after all other features so will affect the colour of all other features.
(Read and Write property)

171.1.377 CaretLineBackColor as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The background colour of the line containing the caret different
Notes: Set the desired background colour with CaretLineBackColor, then use CaretLineVisible = true to enable the effect. You can cancel the effect with CaretLineVisible = false.
(Read and Write property)

171.1.378 CaretLineFrame as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: can be used to display the caret line framed instead of filling the whole background.
Notes: Set width <>0 to enable this option and width = 0 to disable it.
(Read and Write property)

171.1.379 CaretLineHighlightSubLine as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Choose to highlight only the subline containing the caret instead of the whole line.
Notes: Default behaviour CaretLineHighlightSubLine = false the whole caret line is highlighted.
(Read and Write property)

171.1.380 CaretLineLayer as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: You can choose to make the background colour of the line containing the caret.
Notes: This effect may be drawn translucently over the text or opaquely on the base layer with CaretLineLayer. Background colouring has highest priority when a line has markers that would otherwise change the background colour. When drawn translucently other background colours can show through.

See kLayer* constants.
(Read and Write property)

171.1.381 CaretLineVisible as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether caret line is visible.
Notes: Set the desired background colour with CaretLineBackColor, then use CaretLineVisible = true to enable the effect. You can cancel the effect with CaretLineVisible = false.
(Read and Write property)

171.1.382 CaretLineVisibleAlways as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Choose to make the caret line always visible even when the window is not in focus.
Notes: Default behaviour false the caret line is only visible when the window is in focus.
(Read and Write property)

171.1.383 CaretPeriod as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The rate at which the caret blinks.
Notes: The rate at which the caret blinks can be set with CaretPeriod which determines the time in milliseconds that the caret is visible or invisible before changing state. Setting the period to 0 stops the caret blinking. The default value is 500 milliseconds.
(Read and Write property)

171.1.384 CaretSticky as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set, get or toggle the caretSticky setting which controls when the last position of the caret on the line is saved.
Notes: These messages set, get or toggle the caretSticky setting which controls when the last position of the caret on the line is saved.

When set to kCaretStickyOff (0), the sticky flag is off; all text changes (and all caret position changes) will remember the caret's new horizontal position when moving to different lines. This is the default.

When set to kCaretStickyOn (1), the sticky flag is on, and the only thing which will cause the editor to remember the horizontal caret position is moving the caret with mouse or keyboard (left/right arrow keys, home/end keys, etc).

When set to kCaretStickyWhiteSpace (2), the caret acts like mode 0 (sticky off) except under one special case; when space or tab characters are inserted. (Including pasting only space/tabs – undo, redo, etc. do not exhibit this behaviour..).

SCI_TOGGLECARETSTICKY switches from kCaretStickyOn and kCaretStickyWhiteSpace to kCaretStickyOff and from kCaretStickyOff to kCaretStickyOn.
(Read and Write property)

171.1.385 CaretStyle as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The style of the caret.
Notes: There are separate styles for insert mode (lower 4-bits, kCaretStyleInsMask) and overtype mode (bit 4).

See kCaretStyle* constants.

The block caret draws most combining and multibyte character sequences successfully, though some fonts like Thai Fonts (and possibly others) can sometimes appear strange when the cursor is positioned at these characters, which may result in only drawing a part of the cursor character sequence. This is most notable on Windows platforms.
(Read and Write property)

171.1.386 CaretWidth as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The width of the line caret.
Example:

```
Var ScintillaEditor as DesktopScintillaControlMBS // your control

// set cursor width and color

ScintillaEditor.CaretForeColor = Color.HighlightColor
ScintillaEditor.CaretWidth = 8
```

Notes: can be set to a value of between 0 and 20 pixels. The default width is 1 pixel.

A width of 0 makes the caret invisible, similar to setting the caret style to kCaretStyleInvisible (though not interchangeable). This setting only affects the width of the cursor when the cursor style is set to line caret mode, it does not affect the width for a block caret.
(Read and Write property)

171.1.387 ChangeHistory as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Turns this feature on and off and determines whether changes are visible in the margin or text or both.
Notes: Change history depends on the undo history and can only be enabled when undo history is enabled and empty. It should be enabled once when a file is loaded after setting UndoCollection to true and using SavePoint.

The changeHistory argument can be a combination of:

kChangeHistoryOptionDisabled	0	The default: change history turned off.
kChangeHistoryOptionEnabled	1	Track changes to the document.
kChangeHistoryOptionMarkers	2	Display changes in the margin using the SC_MARKNUM_HISTORY markers.
kChangeHistoryOptionIndicators	4	Display changes in the text using the INDICATOR_HISTORY indicators.

There are default visuals assigned to each history marker and indicator but these may be overridden by the application.
(Read and Write property)

171.1.388 CharacterCategoryOptimization as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Optimize speed of character category features like determining whether a character is a space or number at the expense of memory.
Notes: Mostly used for Unicode documents. The countCharacters parameter determines how many character starting from 0 are added to a look-up table with one byte used for each character. It is reasonable to cover the set of characters likely to be used in a document so &h100 for simple Roman text, &h1000 to cover most simple alphabets, &h10000 to cover most of East Asian languages, and &h110000 to cover all possible characters.
(Read and Write property)

171.1.389 ControlCharSymbol as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The mnemonics may be replaced by a nominated symbol with an ASCII code in the range 32 to 255.
Notes: If you set a symbol value less than 32, all control characters are displayed as mnemonics. The symbol you set is rendered in the font of the style set for the character.

The default symbol value is 0.
(Read and Write property)

171.1.390 CopySeparator as String

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When a multiple selection is copied, this string property is added between each part.
Notes: Defaults to empty.
(Read and Write property)

171.1.391 CurrentLine as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This retrieves the text of the line containing the caret and returns the position within the line of the caret.
Notes: (Read only property)

171.1.392 Cursor as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The current mouse cursor.
Notes: The cursor is normally chosen in a context sensitive way, so it will be different over the margin than when over the text. When performing a slow action, you may wish to change to a wait cursor. You set the cursor type with assignment to this property.
See kCursorShape* constants.

Cursor values 1 through 7 have defined cursors, but only kCursorShapeWait is usefully controllable. Other values of cursorType cause a pointer to be displayed. Reading the cursor property returns the last cursor type you set, or kCursorShapeNormal (-1) if you have not set a cursor type.
(Read and Write property)

171.1.393 DefaultFoldDisplayText as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the default text displayed at the right of the folded text.
Notes: (Read and Write property)

171.1.394 DescribeKeyWordSets as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A description of all of the keyword sets separated by LF.
Notes: (Read only property)

171.1.395 DocumentOptions as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The documentation options used to create the document.
Notes: (Read only property)

171.1.396 EdgeColor as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the colour of the marker used to show that a line has exceeded the length set by EdgeColumn property.
Notes: (Read and Write property)

171.1.397 EdgeColumn as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the column number at which to display the long line marker.
Notes: When drawing lines, the column sets a position in units of the width of a space character in kStylesCommonDefault. When setting the background colour, the column is a character count (allowing for tabs) into the line.
(Read and Write property)

171.1.398 EdgeMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the mode used to display long lines.
Notes: You can choose to mark lines that exceed a given length by drawing a vertical line or by colouring the background of characters that exceed the set length.

See kEdgeVisualStyle* constants.
(Read and Write property)

171.1.399 EndAtLastLine as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: EndAtLastLine sets the scroll range so that maximum scroll position has the last line at the bottom of the view (default).
Notes: Setting this to false allows scrolling one page below the last line.
(Read and Write property)

171.1.400 EOLAnnotationVisible as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the annotation display mode.
Notes: End of Line Annotations can be made visible in a view and there is a choice of display style when

visible.

See kEOLAnnotationVisible* constants.
(Read and Write property)

171.1.401 EOLMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the characters that are added into the document when the user presses the Enter key.
Notes: You can set eolMode to one of kEndOfLineCRLF (0), kEndOfLineCR (1), or kEndOfLineLF (2).

Scintilla can handle the major line end conventions and, depending on settings and the current lexer also support additional Unicode line ends.
Scintilla can interpret any of the Macintosh (CR), Unix (LF) and Windows (CR+LF) line ends. When the user presses the Enter key, one of these line end strings is inserted into the buffer. The default is CRL+LF in Windows and LF in Unix, but this can be changed with the EOLMode proeprty. You can also convert the entire document to one of these line endings with ConvertEOLs. Finally, you can choose to display the line endings with ViewEOL.

For the UTF-8 encoding, three additional Unicode line ends, Next Line (NEL=U+0085), Line Separator (LS=U+2028), and Paragraph Separator (PS=U+2029) may optionally be interpreted when Unicode line ends is turned on and the current lexer also supports Unicode line ends.
(Read and Write property)

171.1.402 ExtraAscent as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The extra ascent.
Notes: Text is drawn with the base of each character on a 'baseline'. The height of a line is found from the maximum that any style extends above the baseline (its 'ascent'), added to the maximum that any style extends below the baseline (its 'descent'). Space may be added to the maximum ascent (ExtraAscent) and the maximum descent (ExtraDescent) to allow for more space between lines. This may done to make the text easier to read or to accommodate underlines or highlights.

The extra ascent and descent values can be negative but that should be done with care as it may lead to unexpected interference when lines share space.
(Read and Write property)

171.1.403 ExtraDescent as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The extra descent.
Notes: Text is drawn with the base of each character on a 'baseline'. The height of a line is found from the maximum that any style extends above the baseline (its 'ascent'), added to the maximum that any style extends below the baseline (its 'descent'). Space may be added to the maximum ascent (ExtraAscent) and the maximum descent (ExtraDescent) to allow for more space between lines. This may done to make the text easier to read or to accommodate underlines or highlights.

The extra ascent and descent values can be negative but that should be done with care as it may lead to unexpected interference when lines share space.
(Read and Write property)

171.1.404 FirstVisibleLine as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Retrieve or set the line number of the first visible line in the Scintilla view.
Notes: The first line in the document is numbered 0. The value is a visible line rather than a document line.
(Read and Write property)

171.1.405 Focus as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether we have focus.
Notes: Scintilla can be told to grab the focus with GrabFocus. This is needed more on GTK where focus handling is more complicated than on Windows.
The internal focus flag can be set with Focus. This is used by clients that have complex focus requirements such as having their own window that gets the real focus but with the need to indicate that Scintilla has the logical focus.
(Read and Write property)

171.1.406 FoldDisplayTextStyle as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Changes the appearance of fold text tags.
Notes: (Read and Write property)

171.1.407 FontLocale as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set the locale used for font selection with language-dependent glyphs.
Notes: It may, depending on platform and other circumstances influence the display of text, so setting ”zh-Hant” may result in traditional Chinese display and ”zh-Hans” may result in simplified Chinese display. It is currently only implemented for Win32 using DirectWrite where the value is passed as the localeName argument to CreateTextFormat. The default value is US English ”en-us”.
(Read and Write property)

171.1.408 FontQuality as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Manage font quality (antialiasing method).
Notes: See kFontQualityQuality* constants.
(Read and Write property)

171.1.409 HasBorder as Boolean

MBS Scintilla Plugin, Plugin Version: 22.4, Platform: Windows, Targets: Desktop only.

Function: Enable/disable border for Windows.
Notes: If this flag is set before the control is constructed, you get the control instated on Windows with a border line.
(Read and Write property)

171.1.410 HighlightGuide as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When brace highlighting occurs, the indentation guide corresponding to the braces may be highlighted with the brace highlighting style, kStylesCommonBraceLight (34).
Notes: Set column to 0 to cancel this highlight.
(Read and Write property)

171.1.411 HotspotActiveBack as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries background color for hotspot.
Notes: (Read only property)

171.1.412 HotspotActiveFore as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries foreground color for hotspot.
Notes: (Read only property)

171.1.413 HotspotActiveUnderline as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: While the cursor hovers over text in a style with the hotspot attribute set, this option shows underline.
Notes: (Read and Write property)

171.1.414 HotspotSingleLine as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Single line mode stops a hotspot from wrapping onto next line.
Notes: (Read and Write property)

171.1.415 HScrollBar as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The horizontal scroll bar is only displayed if it is needed for the assumed width.
Notes: If you never wish to see it, call HScrollBar = false. Use HScrollBar = true to enable it again. Querying HScrollBar returns the current state. The default state is to display it when needed.
(Read and Write property)

171.1.416 IdleStyling as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The idel styling setting.
Notes: By default, kIdleStylingNone (0), syntax styling is performed for all the currently visible text before displaying it. On very large files, this may make scrolling down slow. With kIdleStylingToVisible (1), a small amount of styling is performed before display and then further styling is performed incrementally in the background as an idle-time task. This may result in the text initially appearing uncoloured and then, some time later, it is coloured. Text after the currently visible portion may be styled in the background with kIdleStylingAfterVisible (2). To style both before and after the visible text in the background use kIdleStylingAll (3).
Since wrapping also needs to perform styling and also uses idle time, this setting has no effect when the document is displayed wrapped.
(Read and Write property)

171.1.417 IMEInteraction as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Configures IME interaction.
Notes: When entering text in Chinese, Japanese, or Korean an Input Method Editor (IME) may be displayed. The IME may be an extra window appearing above Scintilla or may be displayed by Scintilla itself as text. On some platforms there is a choice between the two techniques. A windowed IME kIMEInteractionWindowed (0) may be more similar in appearance and behaviour to the IME in other applications. An inline IME kIMEInteractionInline (1) may work better with some Scintilla features such as rectangular and multiple selection.
The windowed behaviour can be chosen with IMEInteraction = kIMEInteractionWindowed and the inline behaviour with IMEInteraction = kIMEInteractionInline. Scintilla may ignore this call in some cases. For example, the inline behaviour might only be supported for some languages.
When the inline IME mode is active, characters are added tentatively before being finalised and an CharacterAdded event (with characterSource set to kCharacterSourceTentativeInput) is sent for each character.
(Read and Write property)

171.1.418 Indent as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the size of indentation in terms of the width of a space in KStylesCommonDefault.
Notes: If you set a width of 0, the indent size is the same as the tab size. There are no limits on indent sizes, but values less than 0 or large values may have undesirable effects.

Indentation (the white space at the start of a line) is often used by programmers to clarify program structure and in some languages, for example Python, it may be part of the language syntax. Tabs are normally used in editors to insert a tab character or to pad text with spaces up to the next tab.
When Scintilla is laying out a section of text, text after a tab character will usually be displayed at the next multiple of TabWidth columns from the left. However, it is also possible to explicitly set tabstops in pixels for each line.
Scintilla can be set to treat tab and backspace in the white space at the start of a line in a special way: inserting a tab indents the line to the next indent position rather than just inserting a tab at the current character position and backspace unindents the line rather than deleting a character. Scintilla can also display indentation guides (vertical lines) to help you to generate code.
(Read and Write property)

171.1.419 IndentationGuides as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Indentation guides are dotted vertical lines that appear within indentation white space every indent size columns.

Notes: They make it easy to see which constructs line up especially when they extend over multiple pages. Style kStylesCommonIndentGuide (37) is used to specify the foreground and background colour of the indentation guides.
There are 4 indentation guide views. kIndentViewNone turns the feature off but the other 3 states determine how far the guides appear on empty lines.
(Read and Write property)

171.1.420 IndicatorCurrent as ScintillaIndicatorMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The current indicator.
Notes: (Read and Write property)

171.1.421 IndicatorValue as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the value that will be set by calls to IndicatorFillRange.
Notes: (Read and Write property)

171.1.422 LayoutCache as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Enable layout cache.
Notes: (Read and Write property)

171.1.423 LayoutThreads as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The time taken to measure text runs.
Notes: The time taken to measure text runs on wide lines or when wrapping can be improved by performing the task concurrently on multiple threads when SupportsFeature(kSupportsThreadSafeMeasureWidths) is available. This can be a dramatic improvement - a 4 core processor is often able to reduce text layout time to just over one quarter of the single-threaded time.

The default is to use just the main thread but applications may set LayoutThreads to specify the maximum number of threads to use. The number of threads is limited to the hardware concurrency of the system - for a 4 core processor with hyper-threading that would be 8. If an application just wants maximum concurrency

then call with a large number LayoutThreads = 1000 and that will be reduced to a reasonable value.
(Read and Write property)

171.1.424 Length as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The length of the document in bytes.
Notes: (Read only property)

171.1.425 LexerLanguage as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the name of the current lexer.
Notes: (Read only property)

171.1.426 LibraryError as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The error message from loading the library.
Notes: (Read only property)

171.1.427 LineCharacterIndex as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns which if any indexes are active.
Notes: (Read only property)

171.1.428 LineCount as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the number of lines in the document.
Notes: An empty document contains 1 line. A document holding only an end of line sequence has 2 lines.
(Read only property)

171.1.429 LineEndTypesActive as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reports the set of line ends currently interpreted by Scintilla.
Notes: It is LineEndTypesSupported and LineEndTypesAllowed.

See kLineEndType* constants.
(Read only property)

171.1.430 LineEndTypesAllowed as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: By default, only the ASCII line ends are interpreted.
Notes: Unicode line ends may be requested with LineEndTypesAllowed = kLineEndTypeUnicode but this will be ineffective unless the lexer also allows you Unicode line ends.

See kLineEndType* constants.
(Read and Write property)

171.1.431 LineEndTypesSupported as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reports the different types of line ends supported by the current lexer.
Notes: This is a bit set although there is currently only a single choice with either kLineEndTypeDefault (0) or kLineEndTypeUnicode (1). These values are also used by the other messages concerned with Unicode line ends.

See kLineEndType* constants.
(Read only property)

171.1.432 LinesOnScreen as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the number of complete lines visible on the screen.
Notes: With a constant line height, this is the vertical space available divided by the line separation. Unless you arrange to size your window to an integral number of lines, there may be a partial line visible at the bottom of the view.

(Read only property)

171.1.433 MainSelection as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries index of main selection.
Notes: One of the selections is the main selection which is used to determine what range of text is automatically visible. The main selection may be displayed in different colours or with a differently styled caret. Only an already existing selection can be made main.
(Read and Write property)

171.1.434 MarginLeft as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the width of the blank margin on left side of the text in pixels.
Notes: The default is to one pixel on each side.
(Read and Write property)

171.1.435 MarginOptions as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Define margin options by enabling appropriate bit flags.
Notes: At the moment, only one flag is available kMarginOptionSubLineSelect = 1, which controls how wrapped lines are selected when clicking on margin in front of them. If kMarginOptionSubLineSelect is set only sub line of wrapped line is selected, otherwise whole wrapped line is selected. Margin options are set to kMarginOptionNone=0 by default.
(Read and Write property)

171.1.436 MarginRight as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the width of the blank margin on right side of the text in pixels.
Notes: The default is to one pixel on each side.
(Read and Write property)

171.1.437 Margins as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Allocate the number of margins or find the number of margins currently allocated.
Notes: (Read and Write property)

171.1.438 MaxLineState as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the last line that has any line state.
Notes: (Read only property)

171.1.439 ModEventMask as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The modification event masks.
Notes: Set and get an event mask that determines which document change events are notified to the container with Modify event. For example, a container may decide to see only notifications about changes to text and not styling changes by setting ModEventMask = kModificationFlagsInsertText + kModificationFlagsDeleteText.
(Read and Write property)

171.1.440 Modify as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns true if the document is modified and false if it is unmodified.
Notes: The modified status of a document is determined by the undo position relative to the save point. The save point is set by SetSavePoint, usually when you have saved data to a file.
If you need to be notified when the document becomes modified, Scintilla notifies the container that it has entered or left the save point with the SavePointReached and SavePointLeft notification messages.
(Read only property)

171.1.441 MouseDownCaptures as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When the mouse is pressed inside Scintilla, it is captured so future mouse movement events are sent to Scintilla.

Notes: This behaviour may be turned off with MouseDownCaptures = false.
(Read and Write property)

171.1.442 MouseDwellTime as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The time the mouse must sit still, in milliseconds, to generate a DWellStart event.
Notes: If set to kTimeForever, the default, no dwell events are generated.
(Read and Write property)

171.1.443 MouseSelectionRectangularSwitch as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Enable or disable the ability to switch to rectangular selection mode while making a selection with the mouse.
Notes: When this option is turned on, mouse selections in stream mode can be switched to rectangular mode by pressing the corresponding modifier key. They then stick to rectangular mode even when the modifier key is released again. When this option is turned off, mouse selections will always stick to the mode the selection was started in. It is off by default.
(Read and Write property)

171.1.444 MouseWheelCaptures as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether to capture mouse wheel events.
Notes: On Windows, Scintilla captures all WM_MOUSEWHEEL messages if it has the focus, even if the mouse pointer is nowhere near the Scintilla editor window. This behaviour can be changed with MouseWheelCaptures = false so that Scintilla passes the WM_MOUSEWHEEL messages to its parent window. Scintilla will still react to the mouse wheel if the mouse pointer is over the editor window.
(Read and Write property)

171.1.445 MoveExtendsSelection as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns true if regular caret moves will extend or reduce the selection, false if not.
Notes: SetSelectionMode toggles this setting between on and off.

(Read and Write property)

171.1.446 MultiPaste as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: How to do paste with multiple selection.
Notes: When pasting into multiple selections, the pasted text can go into just the main selection with kMultiPasteOnce=0 or into each selection with kMultiPasteEach=1. kMultiPasteOnce is the default.
(Read and Write property)

171.1.447 MultipleSelection as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Enable or disable multiple selection.
Notes: When multiple selection is disabled, it is not possible to select multiple ranges by holding down the Ctrl key while dragging with the mouse.

There may be multiple selections active at one time. More selections are made by holding down the Ctrl key while dragging with the mouse. The most recent selection is the main selection and determines which part of the document is shown automatically. Any selection apart from the main selection is called an additional selection. The calls in the previous section operate on the main selection. There is always at least one selection. The selection can be simplified down to just the main selection by Cancel which is normally mapped to the Esc key.

Rectangular selections are handled as multiple selections although the original rectangular range is remembered so that subsequent operations may be handled differently for rectangular selections. For example, pasting a rectangular selection places each piece in a vertical column.

Virtual space is space beyond the end of each line. The caret may be moved into virtual space but no real space will be added to the document until there is some text typed or some other text insertion command is used.

When discontiguous selections are copied to the clipboard, each selection is added to the clipboard text in order with no delimiting characters. For rectangular selections the document's line end is added after each line's text. Rectangular selections are always copied from top line to bottom, not in the in order of selection.Virtual space is not copied.
(Read and Write property)

171.1.448 NamedStyles as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Retrieve the number of named styles for the lexer.
Notes: (Read only property)

171.1.449 NSView as Variant

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Cocoa view for macOS.
Notes: Value is a NSViewMBS. We use variant to reduce dependency to other plugins.
(Read only property)

171.1.450 Overtype as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When overtype is enabled, each typed character replaces the character to the right of the text caret.
Notes: When overtype is disabled, characters are inserted at the caret. Returns true if overtyping is active, otherwise false will be returned.
(Read and Write property)

171.1.451 PasteConvertEndings as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether to match end of line on pasting.
Notes: If this property is set then when text is pasted any line ends are converted to match the document's end of line mode as set with EOLMode. Defaults to true.
(Read and Write property)

171.1.452 Position as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The current position.
Notes: This sets the current position and creates a selection between the anchor and the current position. The caret is not scrolled into view.

(Read and Write property)

171.1.453 PositionCache as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The size in entries of the position cache.
Notes: The position cache stores position information for short runs of text so that their layout can be determined more quickly if the run recurs.
(Read and Write property)

171.1.454 PrintColourMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the method used to render coloured text on a printer that is probably using white paper.
Notes: It is especially important to consider the treatment of colour if you use a dark or black screen background. Printing white on black uses up toner and ink very many times faster than the other way around.
See kPrintOption* constants.
(Read and Write property)

171.1.455 PrintMagnification as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Lets you to print at a different size than the screen font.
Notes: magnification is the number of points to add to the size of each screen font. A value of -3 or -4 gives reasonably small print.
(Read and Write property)

171.1.456 PrintWrapMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get and set the printer wrap mode.
Notes: wrapMode can be set to kWrapNone (0) or kWrapWord (1). The default is kWrapWord, which wraps printed output so that all characters fit into the print rectangle. If you set kWrapNone, each line of text generates one line of output and the line is truncated if it is too long to fit into the print area.
kWrapWord tries to wrap only between words as indicated by white space or style changes although if a word is longer than a line, it will be wrapped before the line end.

kWrapChar is not supported for printing.
(Read and Write property)

171.1.457 PropertyNames as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns a string with all of the valid properties separated by LF.
Notes: If the lexer does not support this call then an empty string is returned.
(Read only property)

171.1.458 PunctuationChars as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Similar to WordChars and WhiteSpaceChars, this message allows the user to define which chars Scintilla considers as punctuation.
Notes: (Read and Write property)

171.1.459 ReadOnly as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the read-only flag for the document.
Notes: If you mark a document as read only, attempts to modify the text cause the ModifyAttemptRead-Only event.
(Read and Write property)

171.1.460 RectangularSelectionAnchor as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position for the anchor of the rectangular selection.
Notes: After setting the rectangular selection, this is broken down into multiple selections, one for each line.
(Read and Write property)

171.1.461 RectangularSelectionAnchorVirtualSpace as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position and amount of virtual space for the of the rectangular selection.
Notes: After setting the rectangular selection, this is broken down into multiple selections, one for each line.
(Read and Write property)

171.1.462 RectangularSelectionCaret as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position for the caret of the rectangular selection.
Notes: After setting the rectangular selection, this is broken down into multiple selections, one for each line.

There may be multiple selections active at one time. More selections are made by holding down the Ctrl key while dragging with the mouse. The most recent selection is the main selection and determines which part of the document is shown automatically. Any selection apart from the main selection is called an additional selection. The calls in the previous section operate on the main selection. There is always at least one selection. The selection can be simplified down to just the main selection by Cancel which is normally mapped to the Esc key.

Rectangular selections are handled as multiple selections although the original rectangular range is remembered so that subsequent operations may be handled differently for rectangular selections. For example, pasting a rectangular selection places each piece in a vertical column.

Virtual space is space beyond the end of each line. The caret may be moved into virtual space but no real space will be added to the document until there is some text typed or some other text insertion command is used.

When discontiguous selections are copied to the clipboard, each selection is added to the clipboard text in order with no delimiting characters. For rectangular selections the document's line end is added after each line's text. Rectangular selections are always copied from top line to bottom, not in the in order of selection.Virtual space is not copied.
(Read and Write property)

171.1.463 RectangularSelectionCaretVirtualSpace as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position and amount of virtual space for the caret of the rectangular selection.

Notes: After setting the rectangular selection, this is broken down into multiple selections, one for each line.
(Read and Write property)

171.1.464 RectangularSelectionModifier as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: On GTK and Qt, the key used to indicate that a rectangular selection should be created when combined with a mouse drag can be set.
Notes: The three possible values are kKeyModCtrl=2, kKeyModAlt=4 (default) or kKeyModSuper=8. Since kKeyModAlt may already be used by a window manager, the window manager may need configuring to allow this choice. kKeyModSuper is often a system dependent modifier key such as the Left Windows key on a Windows keyboard or the Command key on a Mac.
(Read and Write property)

171.1.465 ScrollWidth as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: For performance, Scintilla does not measure the display width of the document to determine the properties of the horizontal scroll bar.
Notes: Instead, an assumed width is used. These messages set and get the document width in pixels assumed by Scintilla. The default value is 2000. To ensure the width of the currently visible lines can be scrolled use ScrollWidthTracking.
(Read and Write property)

171.1.466 ScrollWidthTracking as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If scroll width tracking is enabled then the scroll width is adjusted to ensure that all of the lines currently displayed can be completely scrolled.
Notes: This mode never adjusts the scroll width to be narrower.
(Read and Write property)

171.1.467 SearchFlags as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: These get and set the searchFlags used by SearchInTarget.

Notes: There are several option flags including a simple regular expression search.
See kFindOption* constants.
(Read and Write property)

171.1.468 SelAlpha as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets or gets selection alpha value.
Notes: (Read and Write property)

171.1.469 SelectedText as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This copies the currently selected text.
Notes: This allows for rectangular and discontiguous selections as well as simple selections. See Multiple Selection for information on how multiple and rectangular selections and virtual space are copied.
(Read only property)

171.1.470 SelectionEmpty as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Return true if every selected range is empty else false.
Notes: This can be used as CanCopy or CanCut for building menu.
(Read only property)

171.1.471 SelectionEnd as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The end position of the selection.
Notes: SelectionStart and SelectionEnd return the start and end of the selection without regard to which end is the current position and which is the anchor. SelectionStart returns the smaller of the current position or the anchor position. SelectionEnd returns the larger of the two values.

Assign new value to set the selection based on the assumption that the anchor position is less than the current position.
(Read and Write property)

171.1.472 SelectionHidden as Boolean

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the selection is hidden.
Notes: The normal state is to make the selection visible by drawing it as set by SetSelBackColor, SetSelForeColor, and related calls. However, if you hide the selection, it is drawn as normal text.
(Read only property)

171.1.473 SelectionIsRectangle as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns true if the current selection is in rectangle mode, false if not.
Notes: (Read only property)

171.1.474 SelectionLayer as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The selection background can be drawn translucently over the text or opaquely on the base layer.
Notes: See kLayer* constants.
(Read and Write property)

171.1.475 SelectionMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The selection mode.
Notes: Can be stream (kSelectionModeStream=0) or rectangular (kSelectionModeRectangle=1) or by lines (kSelectionModeLines=2) or thin rectangular (kSelectionModeThin=3). When set in these modes, regular caret moves will extend or reduce the selection, until the mode is cancelled by a call with same value or with Cancel. The get function returns the current mode even if the selection was made by mouse or with regular extended moves. SC_SEL_THIN is the mode after a rectangular selection has been typed into and ensures that no characters are selected.
(Read and Write property)

171.1.476 Selections as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Return the number of selections currently active.
Notes: There is always at least one selection.
(Read only property)

171.1.477 SelectionSerialized as String

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the selection type and positions as a serialized string. The format of this string may change in future versions so should not be persisted beyond the current session.
Notes: The format is currently
[selType:R | L | T] [# mainRange ,] [anchor [v virtualSpace] [- caret [v virtualSpace]]] [, ...]
Example of a multiple selection with virtual space: #1,5v3-2,1
(Read and Write property)

171.1.478 SelectionSpan as ScintillaSpanMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries selection start and end as a span object.
Notes: (Read only property)

171.1.479 SelectionStart as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The start position of the selection.
Notes: SelectionStart and SelectionEnd return the start and end of the selection without regard to which end is the current position and which is the anchor. SelectionStart returns the smaller of the current position or the anchor position. SelectionEnd returns the larger of the two values.

Assign new value to set the selection based on the assumption that the anchor position is less than the current position.
(Read and Write property)

171.1.480 SelEOLFilled as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The selection can be drawn up to the right hand border by setting this property.
Notes: (Read and Write property)

171.1.481 ShowInfoBar as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether to show info bar on macOS.
Notes: Defaults to true.
The info bar allows you to show a status message and to do zoom levels.
(Read and Write property)

171.1.482 Status as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If an error occurs, Scintilla may set an internal error number that can be retrieved with this property.
Notes: To clear the error status call SCI_SETSTATUS(0). Status values from 1 to 999 are errors and status kStatusWarnStart (1000) and above are warnings.
See kStatus* constants.
(Read and Write property)

171.1.483 TabDrawMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get and set how tab characters are drawn when white space is visible.
Notes: See kTabDrawMode* constants.
(Read and Write property)

171.1.484 TabIndents as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether tab indents.
Notes: Inside indentation white space, the tab and backspace keys can be made to indent and unindent rather than insert a tab character or delete a character with the TabIndents and BackSpaceUnIndents functions.
(Read and Write property)

171.1.485 TabMinimumWidth as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The minimum size of a tab in pixels to ensure that the tab can be seen.
Notes: The default value is 2. This is particularly useful with proportional fonts with fractional widths where the character before the tab may end a fraction of a pixel before a tab stop, causing the tab to only be a fraction of a pixel wide without this setting. Where displaying a miniaturized version of the document, setting this to 0 may make the miniaturized version lay out more like the normal size version.
(Read and Write property)

171.1.486 TabWidth as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The size of a tab as a multiple of the size of a space character in kStylesCommonDefault.
Notes: The default tab width is 8 characters. There are no limits on tab sizes, but values less than 1 or large values may have undesirable effects.
(Read and Write property)

171.1.487 TargetEnd as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: End of target selection in text.
Notes: (Read and Write property)

171.1.488 TargetEndVirtualSpace as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: End of the virtual space of target selection in text.
Notes: This allows text to be inserted in virtual space more easily.
(Read and Write property)

171.1.489 TargetSpan as ScintillaSpanMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries targert start and end as a span object.
Notes: (Read and Write property)

171.1.490 TargetStart as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Start of the virtual space of target selection in text.
Notes: This allows text to be inserted in virtual space more easily.
When searching you can set start greater than end to find the last matching text in the target rather than the first matching text.
The target is also set by a successful by SearchInTarget.
(Read and Write property)

171.1.491 TargetStartVirtualSpace as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Start of target selection in text.
Notes: When searching you can set start greater than end to find the last matching text in the target rather than the first matching text.
(Read and Write property)

171.1.492 TargetText as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Retrieve the value in the target.
Notes: (Read only property)

171.1.493 Technology as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The technology property allows choosing between different drawing APIs and options.
Notes: On most platforms, the only choice is kTechnologyDefault (0). On Windows Vista or later, kTechnologyDirectWrite (1), kTechnologyDirectWriteRetain (2), or kTechnologyDirectWriteDC (3) can be chosen to use the Direct2D and DirectWrite APIs for higher quality antialiased drawing. kTechnologyDirectWriteRetain differs from kTechnologyDirectWrite by requesting that the frame is retained after being presented which may prevent drawing failures on some cards and drivers. kTechnologyDirectWriteDC differs from kTechnologyDirectWrite by using DirectWrite to draw into a GDI DC.
On Win32, buffered drawing is set to a reasonable value for the technology: on for GDI and off for Direct2D as Direct2D performs its own buffering. This can be changed after setting technology with BufferDraw property.
When using DirectWrite, you can use FontLocale to set an appropriate font locale to draw text with expected language-dependent glyphs.

(Read and Write property)

171.1.494 Text as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set the text of the document.
Notes: (Read and Write property)

171.1.495 TextLength as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The length of the document in bytes.
Notes: (Read only property)

171.1.496 UndoActions as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries the number of undo actions.
Notes: (Read only property)

171.1.497 UndoCollection as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: You can control whether Scintilla collects undo information.
Notes: Set to true to collect information and false to stop collecting. If you stop collection, you should also use EmptyUndoBuffer to avoid the undo buffer being unsynchronized with the data in the buffer.

You might wish to turn off saving undo information if you use the Scintilla to store text generated by a program (a Log view) or in a display window where text is often deleted and regenerated.
(Read and Write property)

171.1.498 UndoCurrent as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The current undo value.
Notes: (Read and Write property)

171.1.499 UndoDetach as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries the undo detach value.
Notes: (Read and Write property)

171.1.500 UndoSavePoint as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The undo save point.
Notes: (Read and Write property)

171.1.501 UndoSelectionHistory as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The selection for each action can be saved and then restored when undo or redo is performed.
Notes: There is a memory cost for this feature with a minimum of 150 bytes for each of undo and redo for each recorded action. Recording may be turned on at any time.

The undoSelectionHistory argument can be:

kUndoSelectionHistoryOptionDisabled	0	The default: undo selection history turned off.
kUndoSelectionHistoryOptionEnabled	1	Restore selection for each undo and redo.
kUndoSelectionHistoryOptionScroll	2	Restore vertical scroll position. Has no effect without kUndoSelectionHistoryOptionEnabled.

(Read and Write property)

171.1.502 UndoSequence as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set undo sequence.
Notes: Determine if an undo sequence is active with a positive value indicating that a sequence is active

and 0 that there is no current sequence. The value returned is the nesting depth of the sequence, that is, the number of times BeginUndoAction was called without a corresponding EndUndoAction.
A negative value indicates an error.
(Read only property)

171.1.503 UndoTentative as Integer

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Get or set undo tentative.
Notes: (Read and Write property)

171.1.504 UseTabs as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Determines whether indentation should be created out of a mixture of tabs and spaces or be based purely on spaces.
Notes: Set useTabs to false (0) to create all tabs and indents out of spaces. The default is true. You can use Column() to get the column of a position taking the width of a tab into account.
(Read and Write property)

171.1.505 ViewEOL as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Normally, the end of line characters are hidden, but ViewEOL allows you to display (or hide) them by setting visible true (or false).
Notes: The visible rendering of the end of line characters is similar to (CR), (LF), or (CR+LF).

Scintilla can handle the major line end conventions and, depending on settings and the current lexer also support additional Unicode line ends.
Scintilla can interpret any of the Macintosh (CR), Unix (LF) and Windows (CR+LF) line ends. When the user presses the Enter key, one of these line end strings is inserted into the buffer. The default is CRL+LF in Windows and LF in Unix, but this can be changed with the EOLMode proeprty. You can also convert the entire document to one of these line endings with ConvertEOLs. Finally, you can choose to display the line endings with ViewEOL.

For the UTF-8 encoding, three additional Unicode line ends, Next Line (NEL=U+0085), Line Separator (LS=U+2028), and Paragraph Separator (PS=U+2029) may optionally be interpreted when Unicode line ends is turned on and the current lexer also supports Unicode line ends.
(Read and Write property)

171.1.506 ViewWS as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: White space can be made visible which may be useful for languages in which white space is significant, such as Python.
Example:

```
Var c as DesktopScintillaControlMBS // your control

// show white space
c.ViewWS = c.kWhiteSpaceVisibleAlways
```

Notes: Space characters appear as small centred dots and tab characters as light arrows pointing to the right. There are also ways to control the display of end of line characters. The two messages set and get the white space display mode.
See kWhiteSpaceVisible* constants.
(Read and Write property)

171.1.507 VirtualSpaceOptions as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Virtual space can be enabled or disabled for rectangular selections or in other circumstances or in both.
Notes: There are three bit flags kVirtualSpaceRectangularSelection=1, kVirtualSpaceUserAccessible=2, and kVirtualSpaceNoWrapLineStart=4 which can be set independently.
kVirtualSpaceNone=0, the default, disables all use of virtual space.
kVirtualSpaceNoWrapLineStart prevents left arrow movement and selection from wrapping to the previous line. This is most commonly desired in conjunction with virtual space but is an independent setting so works without virtual space.
(Read and Write property)

171.1.508 VScrollBar as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: By default, the vertical scroll bar is always displayed when required.
Notes: You can choose to hide or show it with VScrollBar property and get the current state with VScrollBar.
(Read and Write property)

171.1.509 WhitespaceChars as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The white space characters.
Notes: Similar to WordChars, this property allows the user to define which chars Scintilla considers as whitespace. Setting the whitespace chars allows the user to fine-tune Scintilla's behaviour doing such things as moving the cursor to the start or end of a word; for example, by defining punctuation chars as whitespace, they will be skipped over when the user presses ctrl+left or ctrl+right. This function should be called after WordChars as it will reset the whitespace characters to the default set. WhiteSpaceChars behaves similarly to WordChars.
(Read and Write property)

171.1.510 WhitespaceSize as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the size of the dots used for mark space characters.
Notes: The value 0 is valid and makes the dots invisible.
(Read and Write property)

171.1.511 WordChars as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Defines which characters are members of the word category.
Notes: The character categories are set to default values before processing this function. For example, if you don't allow '_' in your set of characters use:
WordChars = "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789"

This fills the characters parameter with all the characters included in words.
The characters parameter must be large enough to hold all of the characters. If the characters parameter is 0 then the length that should be allocated to store the entire set is returned.
For multi-byte encodings, this API will not return meaningful values for &h80 and above.
(Read and Write property)

171.1.512 WrapIndentMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Wrapped sublines can be indented to the position of their first subline or one more indent level.
Notes: The default is kWrapIndentModeFixed.
(Read and Write property)

171.1.513 WrapMode as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The wrap mode.
Notes: Set wrapMode to kWrapWord (1) to enable wrapping on word or style boundaries, kWrapChar (2) to enable wrapping between any characters, kWrapWhiteSpace (3) to enable wrapping on whitespace, and kWrapNone (0) to disable line wrapping. kWrapChar is preferred for Asian languages where there is no white space between words.

By default, Scintilla does not wrap lines of text. If you enable line wrapping, lines wider than the window

width are continued on the following lines. Lines are broken after space or tab characters or between runs of different styles. If this is not possible because a word in one style is wider than the window then the break occurs after the last character that completely fits on the line. The horizontal scroll bar does not appear when wrap mode is on.

For wrapped lines Scintilla can draw visual flags (little arrows) at end of a a subline of a wrapped line and at begin of the next subline. These can be enabled individually, but if Scintilla draws the visual flag at the beginning of the next subline this subline will be indented by one char. Independent from drawing a visual flag at the begin the subline can have an indention.

Much of the time used by Scintilla is spent on laying out and drawing text. The same text layout calculations may be performed many times even when the data used in these calculations does not change. To avoid these unnecessary calculations in some circumstances, the line layout cache can store the results of the calculations. The cache is invalidated whenever the underlying data, such as the contents or styling of the document changes. Caching the layout of the whole document has the most effect, making dynamic line wrap as much as 20 times faster but this requires 7 times the memory required by the document contents plus around 80 bytes per line.

Wrapping is not performed immediately there is a change but is delayed until the display is redrawn. This delay improves performance by allowing a set of changes to be performed and then wrapped and displayed once. Because of this, some operations may not occur as expected. If a file is read and the scroll position moved to a particular line in the text, such as occurs when a container tries to restore a previous editing session, then the scroll position will have been determined before wrapping so an unexpected range of text will be displayed. To scroll to the position correctly, delay the scroll until the wrapping has been performed by waiting for an initial Painted event.
(Read and Write property)

171.1.514 WrapStartIndent as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The size of indentation of sublines for wrapped lines.
Notes: WrapStartIndent sets the size of indentation of sublines for wrapped lines in terms of the average character width in kStylesCommonDefault. There are no limits on indent sizes, but values less than 0 or large values may have undesirable effects.
The indention of sublines is independent of visual flags, but if kWrapVisualFlagStart is set an indent of at least 1 is used.
(Read and Write property)

171.1.515 WrapVisualFlags as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: You can enable the drawing of visual flags to indicate a line is wrapped.
Notes: Bits set in wrapVisualFlags determine which visual flags are drawn.
See kWrapVisualFlag* constants.
(Read and Write property)

171.1.516 WrapVisualFlagsLocation as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: You can set whether the visual flags to indicate a line is wrapped are drawn near the border or near the text.
Notes: Bits set in wrapVisualFlagsLocation set the location to near the text for the corresponding visual flag.
See kWrapVisualLocation* constants.
(Read and Write property)

171.1.517 XOffset as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The xOffset is the horizontal scroll position in pixels of the start of the text view.
Notes: A value of 0 is the normal position with the first text column visible at the left of the view.

See FirstVisibleLine property for vertical position.
(Read and Write property)

171.1.518 Zoom as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The zoom factor directly.
Notes: There is no limit set on the factors you can set, so limiting yourself to -10 to +20 to match the incremental zoom functions is a good idea.

Scintilla incorporates a ”zoom factor” that lets you make all the text in the document larger or smaller in steps of one point. The displayed point size never goes below 2, whatever zoom factor you set. You can set zoom factors in the range -10 to +20 points.
(Read and Write property)
See also:

- 171.1.587 Zoom 20981

171.1.519 AnnotationStyle(line as Integer) as ScintillaStyleMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets styles for a line.
Notes: The whole of the text annotation on a line may be displayed in a particular style with AnnotationStyle or each character may be individually styled with AnnotationStyles which uses an array of bytes with each byte setting the style of the corresponding text byte similar to SetStylingEx. The text must be set first as it specifies how long the annotation is so how many bytes of styling to read. Setting an annotation will cause a ChangeAnnotation event to be sent.

Only some style attributes are active in annotations: font, size/sizeFractional, bold/weight, italics, fore, back, and characterSet.
(Read and Write computed property)

171.1.520 AnnotationStyles(line as Integer) as MemoryBlock

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets styles for a line.
Notes: The whole of the text annotation on a line may be displayed in a particular style with AnnotationStyle or each character may be individually styled with AnnotationStyles which uses an array of bytes with each byte setting the style of the corresponding text byte similar to SetStylingEX. The text must be set first as it specifies how long the annotation is so how many bytes of styling to read. Setting an annotation will cause a ChangeAnnotation event to be sent.

Only some style attributes are active in annotations: font, size/sizeFractional, bold/weight, italics, fore, back, and characterSet.
(Read and Write computed property)

171.1.521 AnnotationText(line as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A different string may be set for each line with AnnotationText.
Notes: Set to empty string to clear it.
(Read and Write computed property)

171.1.522 ElementColour(element as Integer) as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This changes the colour of the indicated visual element overriding any current colour.
Notes: If the element supports translucency, then the alpha portion of the value is used. An opaque alpha value (&hff) should always be included when an opaque colour is desired as the value 0 is completely transparent and thus invisible.
(Read and Write computed property)

171.1.523 EOLAnnotationStyle(line as Integer) as ScintillaStyleMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Gets or sets the style to use for the EOL annotation.
Notes: (Read and Write computed property)

171.1.524 EOLAnnotationText(line as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A different string may be set for each line with EOLAnnotationText.
Notes: To clear end of line annotations assign EOLAnnotationText with a empty string. The whole of the text EOLANNOTATION on a line may be displayed in a particular style with EOLAnnotationStyle(). Setting an end of line annotation will cause a kModificationFlagsChangeEOLAnnotation notification to be sent.
Only some style attributes are active in end of line annotations: font, size/sizeFractional, bold/weight, italics, fore, back, and characterSet.

End of Line Annotations are read-only lines of text at the end of each line of editable text. End of Line Annotations can be used to display an assembler version of code for debugging or to show diagnostic messages inline or to line up different versions of text in a merge tool.
(Read and Write computed property)

171.1.525 FoldExpanded(line as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get the expanded state of a single line.
Notes: The set message has no effect on the visible state of the line or any lines that depend on it. It does change the markers in the folding margin. If you ask for the expansion state of a line that is outside the document, the result is false (0).

If you just want to toggle the fold state of one line and handle all the lines that are dependent on it, it is much easier to use ToggleFold. You would use the FolderExpanded() method to process many folds without updating the display until you had finished. See FoldAll() and Expand() for examples of the use of these

methods.
(Read and Write computed property)

171.1.526 FoldLevel(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set and get a 32-bit value that contains the fold level of a line and some flags associated with folding.
Notes: The fold level is a number in the range 0 to kFoldLevelNumberMask (&h0FFF). However, the initial fold level is set to kFoldLevelBase (&h400) to allow unsigned arithmetic on folding levels. There are two addition flag bits. kFoldLevelWhiteFlag indicates that the line is blank and allows it to be treated slightly different then its level may indicate. For example, blank lines should generally not be fold points and will be considered part of the preceding section even though they may have a lesser fold level. kFoldLevelHeaderFlag indicates that the line is a header (fold point). kFoldLevelNone is a default level that may occur before folding.

Use FoldLevel(line) AND kFoldLevelNumberMask to get the fold level of a line. Likewise, use FoldLevel(line) AND kFoldLevelNumber*Flag to get the state of the flags. To set the fold level you must or in the associated flags. For instance, to set the level to thisLevel and mark a line as being a fold point use: FoldLevel(line) = thisLevel OR kFoldLevelHeaderFlag.

This method causes the display to redraw.
(Read and Write computed property)

171.1.527 KeyWords(keyWordSet as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The keyword list.
Notes: You can set up to 9 lists of keywords for use by the current lexer. keyWordSet can be 0 to 8 (actually 0 to KEYWORDSET_MAX) and selects which keyword list to replace. keyWords is a list of keywords separated by spaces, tabs, "\n" or "\r" or any combination of these. It is expected that the keywords will be composed of standard ASCII printing characters, but there is nothing to stop you using any non-separator character codes from 1 to 255 (except common sense).
How these keywords are used is entirely up to the lexer. Some languages, such as HTML may contain embedded languages, VBScript and JavaScript are common for HTML. For HTML, key word set 0 is for HTML, 1 is for JavaScript and 2 is for VBScript, 3 is for Python, 4 is for PHP and 5 is for SGML and DTD keywords. Review the lexer code to see examples of keyword list. A fully conforming lexer sets the fourth argument of the LexerModule constructor to be a list of strings that describe the uses of the keyword lists. Alternatively, you might use set 0 for general keywords, set 1 for keywords that cause indentation and set 2 for keywords that cause unindentation. Yet again, you might have a simple lexer that colours keywords and you could change languages by changing the keywords in set 0. There is nothing to stop you building your own keyword lists into the lexer, but this means that the lexer must be rebuilt if more keywords are added.

(Read and Write computed property)

171.1.528 LineIndentation(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The amount of indentation on a line.
Notes: The indentation is measured in character columns, which correspond to the width of space characters.
(Read and Write computed property)

171.1.529 LineState(Line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The state for each line.
Notes: As well as the 8 bits of lexical state stored for each character there is also an integer stored for each line. This can be used for longer lived parse states such as what the current scripting language is in an ASP page. Assign to LineState to set the integer value and query LineState() to get the value. Changing the value produces a ChangeLineState event.
(Read and Write computed property)

171.1.530 MarginStyle(Line as Integer) as ScintillaStyleMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The tyle for the margin on this line.
Notes: The style to use for the margin.
(Read and Write computed property)

171.1.531 MarginStyles(line as Integer) as MemoryBlock

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The styles for the margin on this line.
Notes: The MemoryBlock contains an array of bytes with each byte setting the style of the corresponding text byte similar to style index.
(Read and Write computed property)

171.1.532 MarginText(line as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The text for the margin on this line.
Notes: Text margins are created with the type kMarginTypeText or kMarginTypeRText. A different string may be set for each line with MarginText(). The whole of the text margin on a line may be displayed in a particular style with MarginStyle() or each character may be individually styled with MarginStyles() which uses an array of bytes with each byte setting the style of the corresponding text byte similar to style index. Setting a text margin will cause a kModificationFlagsChangeMargin notification to be sent.
Only some style attributes are active in text margins: font, size/sizeFractional, bold/weight, italics, fore, back, and characterSet.
(Read and Write computed property)

171.1.533 PropertyValue(Key as String) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or get properties.
Notes: Lookup a keyword:value pair using the specified key; if found, copy the value to the user-supplied buffer and return the length (not including the terminating 0). If not found, copy an empty string to the buffer and return 0.

If the value argument is 0 then the length that should be allocated to store the value is returned; again, the terminating 0 is not included.

You can communicate settings to lexers with keyword:value string pairs. There is no limit to the number of keyword pairs you can set, other than available memory. key is a case sensitive keyword, value is a string that is associated with the keyword. If there is already a value string associated with the keyword, it is replaced. If you pass a zero length string, the method does nothing. Both key and value are used without modification; extra spaces at the beginning or end of key are significant.
The value string can no longer refer to other keywords as was possible in older releases of Scintilla.

Lexers may only store values for keywords they support.
Currently the "fold" property is defined for most of the lexers to set the fold structure if set to "1". SCLEX_PYTHON understands "tab.timmy.whinge.level" as a setting that determines how to indicate bad indentation. Most keywords have values that are interpreted as integers. Search the lexer sources for GetPropertyInt to see how properties are used.
There is a convention for naming properties used by lexers so that the set of properties can be found by scripts. Property names should start with "lexer.<lexer>." or "fold.<lexer>." when they apply to one lexer or start with "lexer." or "fold." if they apply to multiple lexers.

Applications may discover the set of properties used by searching the source code of lexers for lines that contain GetProperty or DefineProperty and a double quoted string and extract the value of the double

quoted string as the property name. The lexilla/scripts/LexillaData.py script does this and can be used as an example. Documentation for the property may be located above the call as a multi-line comment starting with
// property <property-name>
(Read and Write computed property)

171.1.534 Representation(encodedCharacter as String) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets or gets a representation.
Notes: Some characters, such as control characters and invalid bytes, do not have a visual glyph or use a glyph that is hard to distinguish.

Control characters (characters with codes less than 32, or between 128 and 159 in some encodings) are displayed by Scintilla using their mnemonics inverted in a rounded rectangle. These mnemonics come from the early days of signalling, though some are still used (LF = Line Feed, BS = Back Space, CR = Carriage Return, for example).
For the low 'C0' values: "NUL", "SOH", "STX", "ETX", "EOT", "ENQ", "ACK", "BEL", "BS", "HT", "LF", "VT", "FF", "CR", "SO", "SI", "DLE", "DC1", "DC2", "DC3", "DC4", "NAK", "SYN", "ETB", "CAN", "EM", "SUB", "ESC", "FS", "GS", "RS", "US".
For the high 'C1' values: "PAD", "HOP", "BPH", "NBH", "IND", "NEL", "SSA", "ESA", "HTS", "HTJ", "VTS", "PLD", "PLU", "RI", "SS2", "SS3", "DCS", "PU1", "PU2", "STS", "CCH", "MW", "SPA", "EPA", "SOS", "SGCI", "SCI", "CSI", "ST", "OSC", "PM", "APC".
Invalid bytes are shown in a similar way with an 'x' followed by their value in hexadecimal, like "xFE".

Any character, including those normally displayed as mnemonics may be represented by a Unicode string inverted in a rounded rectangle.

For example, the Ohm sign ,Ñ¶ U+2126 looks very similar to the Greek Omega character Œ© U+03C9 so, for the UTF-8 encoding, to distinguish the Ohm sign as "U+2126 ,Ñ¶" this call could be made: Representation(",Ñ¶", "U+2126 ,Ñ¶")

The encodedCharacter parameter is a string of the bytes for one character in the current encoding. This can not be used to set a representation for multiple-character strings.
The representation parameter is an UTF-8 string with a maximum length of 200 bytes.

One exception to the single character restriction is that the two character sequence "CRLF" (Carriage Return + Line Feed) can have a representation that is visible in line end viewing (ViewEOL property) mode. If there is no representation for "CRLF" then the individual 'CR' and 'LF' representations will be seen.

The NULL (0) character is a special case and specified as an empty string.
(Read and Write computed property)

171.1.535 RepresentationAppearance(encodedCharacter as String) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The appearance may be changed using these flags.
Notes: If a colour is set and the appearance is set without RepresentationColour() then the representation will show in the colour of the underlying text.
(Read and Write computed property)

171.1.536 RepresentationColour(encodedCharacter as String) as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour and translucency of a representation may be set.
Notes: (Read and Write computed property)

171.1.537 SelectionNAnchor(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position and amount of virtual space for the anchor of each already existing selection.
Notes: Selection parameter is zero based.
(Read and Write computed property)

171.1.538 SelectionNAnchorVirtualSpace(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position and amount of virtual space for the caret of each already existing selection.
Notes: Selection parameter is zero based.
(Read and Write computed property)

171.1.539 SelectionNCaret(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position and amount of virtual space for the caret of each already existing selection.
Notes: Selection parameter is zero based.
(Read and Write computed property)

171.1.540 SelectionNCaretVirtualSpace(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the position and amount of virtual space for the caret of each already existing selection.
Notes: Selection parameter is zero based.
(Read and Write computed property)

171.1.541 SelectionNEnd(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: et or query the end position of each already existing selection.
Notes: Mostly of use to query each range for its text. The selection parameter is zero-based.
(Read and Write computed property)

171.1.542 SelectionNStart(selection as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set or query the start position of each already existing selection.
Notes: Mostly of use to query each range for its text. The selection parameter is zero-based.
(Read and Write computed property)

171.1.543 Events

171.1.544 AutoCompleteCancelled

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Auto complete was cancelled.

171.1.545 AutoCompleteCharacterDeleted

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: The user deleted a character while autocompletion list was active.

171.1.546 AutoCompleteCompleted(Position as Integer, Character as Integer, Text as String, listCompletionMethod as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event is generated after an autocompletion has inserted its text.
Notes:

Parameter	Description
position	The start position of the word being completed.
text	The text of the selection.
Character	If a fillup character was the method of selection, the used character, otherwise 0.
listCompletionMethod	A value indicating the way in which the completion occurred. See the table below.

Symbol	Value	Meaning
kCompletionMethodsFillUp	1	A fillup character triggered the completion. The character used is in Character.
kCompletionMethodsDoubleClick	2	A double-click triggered the completion. Character is 0.
kCompletionMethodsTab	3	The tab key or Tab method triggered the completion. Character is 0.
kCompletionMethodsNewline	4	A new line or Newline method triggered the completion. Character is 0.
kCompletionMethodsCommand	5	The AutoCSelect method triggered the completion. Character is 0.

171.1.547 AutoCompleteSelection(Position as Integer, Character as Integer, Text as String, listCompletionMethod as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: The user has selected an item in an autocompletion list.
Notes: The event is sent before the selection is inserted. Automatic insertion can be cancelled by calling AutoCCancel method before returning from the event.

Parameter	Description
position	The start position of the word being completed.
text	The text of the selection.
Character	If a fillup character was the method of selection, the used character, otherwise 0.
listCompletionMethod	A value indicating the way in which the completion occurred. See the table below.

Symbol	Value	Meaning
kCompletionMethodsFillUp	1	A fillup character triggered the completion. The character used is in Character.
kCompletionMethodsDoubleClick	2	A double-click triggered the completion. Character is 0.
kCompletionMethodsTab	3	The tab key or Tab method triggered the completion. Character is 0.
kCompletionMethodsNewline	4	A new line or Newline method triggered the completion. Character is 0.
kCompletionMethodsCommand	5	The AutoCSelect method triggered the completion. Character is 0.

171.1.548 AutoCompleteSelectionChange(Position as Integer, Text as String, listType as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event is sent when items are highlighted in an autocompletion or user list.
Notes:

Field	Usage
listType	This is set to the listType parameter from the SCI_USERLISTSHOW message or 0 for an autocompletion.
text	The text of the selection.
position	The position the list was displayed at.

171.1.549 CallTipClick(Position as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event is generated when the user clicks on a calltip.
Notes: This event can be used to display the next function prototype when a function name is overloaded with different arguments. The position field is set to 1 if the click is in an up arrow, 2 if in a down arrow, and 0 if elsewhere.

171.1.550 CharacterAdded(Character as Integer, CharacterSource as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This is sent when the user types an ordinary text character (as opposed to a command character) that is entered into the text.
Notes: The container can use this to decide to display a call tip or an auto completion list.
For single byte character sets, this is the byte value of the character; for UTF-8, it is the Unicode code point; for DBCS, it is (first byte * 256 + second byte) for 2 byte characters and the byte value for 1 byte characters. This notification is sent before the character has been styled so processing that depends on styling should instead be performed in the UpdateUI event.

Symbol	Value	Meaning
kCharacterSourceDirectInput	0	Direct input characters, including characters generated by calling keyboard commands like NewLine method.
kCharacterSourceTentativeInput	1	Tentative input characters. They are used by IME (inline mode, see IMEInteraction) to composite final string, normally different from final composited string (which is the string that has been truly added into current document), and may be withdrawn when the user cancels typing (e.g. by pressing Esc key). Some system (at least Cocoa) also use tentative input for non-IME features like using dead key to composite diacritical marks (grave accent, etc.). These characters are not added to macro recording. Most applications can simply ignore the notification when this value is set.
kCharacterSourceImeResult	2	IME (either inline or windowed mode) full composited string. Modern IME is able to composite English word or sentence, when this value is set, current character may not a Chinese, Japanese or Korean character. Currently, this is only set on Windows.

171.1.551 Closing

Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

171.1.552 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

171.1.553 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

You can use UsePopUp(kPopUpNever) to disable the contextual menu from Scintilla and use Xojo menus.

171.1.554 DoubleClick(Position as Integer, line as integer, modifiers as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: The mouse button was double clicked in editor.
Notes: The position parameter is set to the text position of the double click, the line parameter is set to the line of the double click, and the modifiers parameter is set to the key modifiers held down in a similar manner to Key event.

171.1.555 DWellEnd(Position as Integer, X as Integer, Y as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: DWellEnd is generated after a DWellStart and the mouse is moved or other activity such as key press indicates the dwell is over.

171.1.556 DWellStart(Position as Integer, X as Integer, Y as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: DWellStart is generated when the user keeps the mouse in one position for the dwell period (see MouseDwellTime).

171.1.557 FocusIn

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event is raised when Scintilla receives focus.
Notes: While the control can have a focus from the Xojo point of view, this event informs you that the actual text control part got focus.

So the Xojo wrapper control can have a focus and within it the text control can than have a focus and there are two different states.

171.1.558 FocusLost

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.

171.1.559 FocusOut

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event is raised when it loses focus.

171.1.560 FocusReceived

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function:

The control got focus.
In older Xojo versions, this event is named GotFocus.

171.1.561 FolderToggled(Line as Integer, Position as Integer, Margin as ScintillaMarginMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: A folder was toggled due to a mouse click.

Notes: THis is called when a folder is hit.
MarginClicked event will also be raised.

171.1.562 HotSpotClick(Position as Integer, modifiers as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: These event are generated when the user clicks on text that is in a style with the hotspot attribute set.
Notes: This event can be used to link to variable definitions or web pages. In the notification handler, you should avoid calling any function that modifies the current selection or caret position. The position parameter is set the text position of the click or double click and the modifiers field set to the key modifiers held down in a similar manner to Key event. Only the state of the Ctrl key is reported for HotspotReleaseClick.

171.1.563 HotSpotDoubleCLick(Position as Integer, modifiers as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: These event are generated when the user double clicks on text that is in a style with the hotspot attribute set.
Notes: This event can be used to link to variable definitions or web pages. In the notification handler, you should avoid calling any function that modifies the current selection or caret position. The position parameter is set the text position of the double click and the modifiers field set to the key modifiers held down in a similar manner to Key event. Only the state of the Ctrl key is reported for HotspotReleaseClick.

171.1.564 HotspotReleaseClick(Position as Integer, modifiers as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: These event are generated when the user clicks on text that is in a style with the hotspot attribute set.

171.1.565 IndicatorClick(Position as Integer, modifiers as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: These event is generated when the user clicks the mouse on text that has an indicator.

Notes: The position parameter is set the text position of the click or double click and the modifiers field set to the key modifiers held down in a similar manner to Key.

171.1.566 IndicatorRelease(Position as Integer, modifiers as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: These event is generated when the user releases the mouse on text that has an indicator.
Notes: The position parameter is set the text position of the click or double click and the modifiers field set to the key modifiers held down in a similar manner to Key.

171.1.567 Key(Character as Integer, modifiers as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Reports all keys pressed but not consumed by Scintilla.
Notes: Used on GTK because of some problems with keyboard focus and is not sent by the Windows version. Character holds the key code and modifiers holds the modifier flags. This notification is sent if the modifiers include kKeyModAlt or kKeyModCtrl and the key code is less than 256.

171.1.568 MacroRecord(Message as Integer, wParam as Integer, lParam as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: The event for a new macro step to record.
Notes: The StartRecord and StopRecord method enable and disable macro recording. When enabled, each time a recordable change occurs, the MacroRecord event is sent to the container. It is up to the container to record the action. To see the complete list of SCI_* messages that are recordable, search the Scintilla source Editor.cxx for Editor::NotifyMacroRecord.

Field	Usage
message	The SCI_* message that caused the notification.
wParam	The value of wParam in the SCI_* message.
lParam	The value of lParam in the SCI_* message.

171.1.569 MarginClick(Position as Integer, modifiers as Integer, margin as ScintillaMarginMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event tell the container that the mouse was left clicked inside a margin that was marked as sensitive.
Notes: This can be used to perform folding or to place breakpoints.

Field	Usage
modifiers	The appropriate combination of kKeyModShift, kKeyModCtrl and kKeyModAlt to indicate the keys that were held down at the time of the margin click.
position	The position of the start of the line in the document that corresponds to the margin click.
margin	The margin number that was clicked.

171.1.570 MarginRightClick(Position as Integer, modifiers as Integer, margin as ScintillaMarginMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event tell the container that the mouse was right clicked inside a margin that was marked as sensitive.
Notes: This can be used to perform folding or to place breakpoints.

Field	Usage
modifiers	The appropriate combination of kKeyModShift, kKeyModCtrl and kKeyModAlt to indicate the keys that were held down at the time of the margin click.
position	The position of the start of the line in the document that corresponds to the margin click.
margin	The margin number that was clicked.

171.1.571 MenuBarSelected

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

171.1.572 Modified(Position as Integer, modificationType as Integer, Text as String, length as Integer, linesAdded as Integer, line as Integer, foldLevelNow as Integer, foldLevelPrev as Integer, token as Integer, annotationLinesAdded as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This notification is sent when the text or styling of the document changes or is about to change.
Notes: You can set a mask for the notifications that are sent to the container with ModEventMask. The parameters contains information about what changed, how the change occurred and whether this changed the number of lines in the document. No modifications may be performed while in a Modified event.

Parameter	Usage
modificationType	A set of flags that identify the change(s) made. See the next table.
position	Start position of a text or styling change. Set to 0 if not used.
length	Length of the change in bytes when the text or styling changes. Set to 0 if not used.
linesAdded	Number of added lines. If negative, the number of deleted lines. Set to 0 if not used or no lines added or deleted.
text	Valid for text changes, not for style changes. If we are collecting undo information this holds a pointer to the text that is handed to the Undo system, otherwise it is zero. For user performed SC_MOD_BEFOREDELETE the text field is 0.
line	The line number at which a fold level or marker change occurred. This is 0 if unused and may be -1 if more than one line changed.
foldLevelNow	The new fold level applied to the line or 0 if this parameter is unused.
foldLevelPrev	The previous folding level of the line or 0 if this parameter is unused.

The modificationType field has bits set to tell you what has been done. The kModificationFlags* constants bits correspond to actions. They tell you if the action was done by the user, or the result of Undo or Redo of a previous action.

171.1.573 ModifyAttemptReadOnly

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Symbol	Value	Meaning	Parameters
kModificationFlagsNone	0	Base value with no fields valid. Will not occur but is useful in tests.	
kModificationFlagsInsertText	1	Text has been inserted into the document.	position, length, text, linesAdded
kModificationFlagsDeleteText	2	Text has been removed from the document.	position, length, text, linesAdded
kModificationFlagsChangeStyle	4	A styling change has occurred.	position, length
kModificationFlagsChangeFold	8	A folding change has occurred.	line, foldLevelNow, foldLevelPrev
kModificationFlagsUser	&h10	Information: the operation was done by the user.	None
kModificationFlagsUndo	&h20	Information: this was the result of an Undo.	None
kModificationFlagsRedo	&h40	Information: this was the result of a Redo.	None
kModificationFlagsMultiStepUndoRedo	&h80	This is part of a multi-step Undo or Redo transaction.	None
kModificationFlagsLastStepInUndoRedo	&h100	This is the final step in an Undo or Redo transaction.	None
kModificationFlagsChangeMarker	&h200	One or more markers has changed in a line.	line
kModificationFlagsBeforeInsert	&h400	Text is about to be inserted into the document.	position, if performed by user then text in bytes, length in bytes
kModificationFlagsBeforeDelete	&h800	Text is about to be deleted from the document.	position, length
kModificationFlagsChangeIndicator	&h4000	An indicator has been added or removed from a range of text.	position, length
kModificationFlagsChangeLineState	&h8000	A line state has changed because LineState was set.	line
kModificationFlagsChangeTabStops	&h200000	The explicit tab stops on a line have changed because ClearTabstops or AddTabStop was called.	line
kModificationFlagsMultiline	&h4000	Text has been inserted or deleted over a range.	position, length
kModificationFlagsChangeMargin	&h10000	A text margin has changed.	line
kModificationFlagsChangeAnnotation	&h20000	An annotation has changed.	line
kModificationFlagsInsertCheck	&h100000	Text is about to be inserted. The handler may change the text being inserted by calling SCI_CHANGEINSERTION. No other modifications may be made in this handler.	position, length, text
kModificationFlagsMultilineUndoRedo	&h1000	This is part of an Undo or Redo with multi-line changes.	None
kModificationFlagsStartAction	&h2000	This is set on a SC_PERFORMED_USER action when it is the first or only step in an undo transaction. This can be used to integrate the Scintilla undo stack with an undo stack in the container application by adding a Scintilla action to the container's stack for the currently opened container transaction or to open a new container transaction if there is no open container transaction.	None
kModificationFlagsContainer	&h40000	This is set on for actions that the container stored into the undo stack with AddUndoAction.	token
kModificationFlagsEventMaskAll	&hFFFFFF	This is a mask for all valid flags. This is the default mask state set by ModEventMask.	None

Function: When in read-only mode, this notification is sent to the container if the user tries to change the text.
Notes: This can be used to check the document out of a version control system. You can set the read-only state of a document with ReadOnly property.

171.1.574 NeedsShown(Position as Integer, length as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Scintilla has determined that a range of lines that is currently invisible should be made visible.
Example:

```
sub NeedsShown(Position as Integer)
Var firstLine as Integer = LineFromPosition(me.position)
Var lastLine as Integer = LineFromPosition(me.position+me.length-1)
for line as integer = firstLine to lastLine
me.EnsureVisible(line)
next
end sub
```

Notes: An example of where this may be needed is if the end of line of a contracted fold point is deleted. This message is sent to the container in case it wants to make the line visible in some unusual way such as making the whole document visible. Most containers will just ensure each line in the range is visible by calling EnsureVisible. The position and length fields of SCNotification indicate the range of the document that should be made visible.

The container code will be similar to the following code skeleton in the example above.
If the event is not implemented, we do similar automatically.

171.1.575 Opening

Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: .

Function:

The control is about to was created and you can initialize it.

In older Xojo versions, this event is named Open.

171.1.576 Painted

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Painting has just been done.
Notes: Useful when you want to update some other widgets based on a change in Scintilla, but want to have the paint occur first to appear more responsive.

171.1.577 Prepare

MBS Scintilla Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: The prepare event.
Notes: Called before we create the control, so you can change properties like HasBorder.

171.1.578 SavePointLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Sent to the container when the save point is entered or left, allowing the container to display a ”document dirty” indicator and change its menus.

171.1.579 SavePointReached

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Sent to the container when the save point is entered or left, allowing the container to display a ”document dirty” indicator and change its menus.

171.1.580 ScaleFactorChanged(NewFactor as double)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

171.1.581 SelectionChanged(updated as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Selection changed.
Notes: If content is changed or selection, this event is fired.

The UpdateUI event will also be called.

171.1.582 StyleNeeded(Position as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Queries you to provide style information.
Example:

```
// sample event to color digits

Sub StyleNeeded(Position as Integer) Handles StyleNeeded
#pragma BackgroundTasks false

Var startPos As Integer = Me.EndStyled
Var lineNumber As Integer = Me.LineFromPosition(startPos)
Var LineStartPos As Integer = Me.PositionFromLine(lineNumber)

System.DebugLog "Style at "+Position.ToString+" from "+LineStartPos.ToString+" to "+position.ToString

Var t As String = Me.Text
Var pos As Integer = LineStartPos

While pos <position

Var ch As Integer = t.Middle(pos, 1).Asc

If ch >= 48 And ch <= 57 Then
// digit
Me.SetStyling(pos, 1, Me.Style(2))
end if
```

```
pos = pos + 1
Wend
End Sub
```

Notes: If you used no explicit lexer to make the container act as the lexer, you will receive this notification when Scintilla is about to display or print text that requires styling.

You are required to style the text from the line that contains the position returned by EndStyled up to the position passed in position. Symbolically, you need code of the form:

```
startPos = me.EndStyled
lineNumber = LineFromPosition(startPos)
startPos = PositionFromLine(lineNumber)
ApplyStyles(startPos, position)
```

171.1.583 TextChanged(Position as Integer, modificationType as Integer, Text as String, length as Integer, linesAdded as Integer, line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Text changed.
Notes: Our plugin calls this to inform you about a text change.
No modifications may be performed while in a Modified event.
Modified event will also be raised.

171.1.584 UpdateUI(updated as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Either the text or styling of the document has changed or the selection range or scroll position may have changed.
Notes: Now would be a good time to update any container UI elements that depend on document or view state. As it is sometimes difficult to determine whether a change has occurred, these events may also fire when there has been no actual change. The updated field is set to the bit set of things changed since the previous notification.

See kUpdate* constants.

171.1.585 URIDropped(text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: Indicates that the user has dragged a URI such as a file name or Web address onto Scintilla.
Notes: The container could interpret this as a request to open the file.

171.1.586 UserListSelection(Position as Integer, Character as Integer, Text as String, listType as Integer, listCompletionMethod as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: The user has selected an item in a user list.
Notes:

Field	Usage
listType	This is set to the listType parameter from the UserListShow message that initiated the list.
text	The text of the selection.
position	The position the list was displayed at.
Character	If a fillup character was the method of selection, the used character, otherwise 0.
listCompletionMethod	A value indicating the way in which the completion occurred.

171.1.587 Zoom

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop & Console.

Function: This event is generated when the user zooms the display using the keyboard or the Zoom method is called.
Notes: This event can be used to recalculate positions, such as the width of the line number margin to maintain sizes in terms of characters rather than pixels.
See also:

- 171.1.518 Zoom as Integer 20959

171.1.588 Constants

Constants

Constant	Value	Description
kAlphaOpaque	255	One of the alpha channel constants. Opaque color.
kAlphaTransparent	0	One of the alpha channel constants. Full transparency.
kInvalidPosition	-1	Invalid position constant.
kMaskFolders	&hFE000000	The mask for folder flags.
kTimeForever	10000000	The constant for MouseDwellTime to mean forever in duration.

Accessibility Status

Constant	Value	Description
kAccessibilityDisabled	0	Accessibility is disabled.
kAccessibilityEnabled	1	Accessibility is enabled.

Alpha

Constant	Value	Description
kAlphaNoAlpha	256	Special value to indicate no alpha.

Annotation Visibility

Constant	Value	Description
kAnnotationVisibleBoxed	2	Annotations are indented to match the text and are surrounded by a box.
kAnnotationVisibleHidden	0	Annotations are not displayed.
kAnnotationVisibleIndented	3	Annotations are indented to match the text.
kAnnotationVisibleStandard	1	Annotations are drawn left justified with no adornment.

Auto Completion Flags

Constant	Value	Description
kAutoCompleteOptionFixedSize	1	On Win32 only, use a fixed size list instead of one that can be resized by the user. This also avoids a header rectangle above the list.
kAutoCompleteOptionNormal	0	Display autocompletion using default settings.

Automatic Folding

Constant	Value	Description
kAutomaticFoldChange	&h0004	Show lines as needed when fold structure is changed. The Modified notification is still sent unless it is disabled by the container.
kAutomaticFoldClick	&h0002	Handle clicks in fold margin automatically. This avoids sending the MarginClick event for folding margins.
kAutomaticFoldNone	&h0000	Value with no automatic behaviour.
kAutomaticFoldShow	&h0001	Automatically show lines as needed. This avoids sending the NeedsShown notification.

Bidirectional Modes

Constant	Value	Description
kBidirectionalDisabled	0	Disabled
kBidirectionalL2R	1	Left to Right
kBidirectionalR2L	2	Right to Left

Caret Policy

Constant	Value	Description
kCaretPolicyEven	&h08	If not set, instead of having symmetrical UZs, the left and bottom UZs are extended up to right and top UZs respectively. This way, we favour the displaying of useful information: the beginning of lines, where most code reside, and the lines after the caret, for example, the body of a function.
kCaretPolicyJumps	&h10	If set, the display is moved more energetically so the caret can move in the same direction longer before the policy is applied again. '3UZ' notation is used to indicate three time the size of the UZ as a distance to the margin.
kCaretPolicySlop	&h01	If set, we can define a slop value: caretSlop. This value defines an unwanted zone (UZ) where the caret is... unwanted. This zone is defined as a number of pixels near the vertical margins, and as a number of lines near the horizontal margins. By keeping the caret away from the edges, it is seen within its context. This makes it likely that the identifier that the caret is on can be completely seen, and that the current line is seen with some of the lines following it, which are often dependent on that line.
kCaretPolicyStrict	&h04	If set, the policy set by kCaretPolicySlop is enforced... strictly. The caret is centred on the display if caretSlop is not set, and cannot go in the UZ if caretSlop is set.

Caret Sticky

Constant	Value	Description
kCaretStickyOff	0	When set to kCaretStickyOff (0), the sticky flag is off; all text changes (and all caret position changes) will remember the caret's new horizontal position when moving to different lines. This is the default.
kCaretStickyOn	1	When set to kCaretStickyOn (1), the sticky flag is on, and the only thing which will cause the editor to remember the horizontal caret position is moving the caret with mouse or keyboard (left/right arrow keys, home/end keys, etc).
kCaretStickyWhiteSpace	2	When set to kCaretStickyWhiteSpace (2), the caret acts like mode 0 (sticky off) except under one special case; when space or tab characters are inserted. (Including pasting only space/tabs – undo, redo, etc. do not exhibit this behaviour..).

Caret Styles

Constant	Value	Description
kCaretStyleBlock	2	Draws insertion carets as blocks.
kCaretStyleBlockAfter	&h100	When the caret end of a range is at the end and a block caret style is chosen, draws the block outside the selection instead of inside. This can be ored with kCaretStyleBlock or kCaretStyleBlockCurses.
kCaretStyleInsMask	&hF	The mask to only get the bits for insert mode.
kCaretStyleInvisible	0	Carets are not drawn at all.
kCaretStyleLine	1	Draws insertion carets as lines. This is the default.
kCaretStyleOverstrikeBar	0	Draws an overstrike caret as a bar. This is the default.
kCaretStyleOverstrikeBlock	&h10	Draws an overstrike caret as a block. This should be ored with one of the first three styles.

Case Insenstive Behavior Flags

Constant	Value	Description
kCaseInsensitiveBehaviourIgnoreCase	1	Ignore Case
kCaseInsensitiveBehaviourRespectCase	0	Respect Case

Change History Options

Constant	Value	Description
kChangeHistoryOptionDisabled	0	The default: change history turned off.
kChangeHistoryOptionEnabled	1	Track changes to the document.
kChangeHistoryOptionIndicators	4	Display changes in the text using the INDICATOR_HISTORY indicators.
kChangeHistoryOptionMarkers	2	Display changes in the margin using the SC_MARKNUM_HISTORY markers.

Character Sets

Constant	Value	Description
kCharacterSetAnsi	0	ANSI
kCharacterSetArabic	178	Arabic
kCharacterSetBaltic	186	Baltic
kCharacterSetChineseBig5	136	Chinese Big 5
kCharacterSetCyrillic	1251	Cyrillic
kCharacterSetDefault	1	Default one
kCharacterSetEastEurope	238	East Europe
kCharacterSetGB2312	134	GB 2312
kCharacterSetGreek	161	Greek
kCharacterSetHangul	129	Hangul
kCharacterSetHebrew	177	Hebrew
kCharacterSetIso8859_15	1000	ISO 8859-15
kCharacterSetJohab	130	Johab
kCharacterSetMac	77	Mac
kCharacterSetOem	255	OEM
kCharacterSetOem866	866	OEM 866
kCharacterSetRussian	204	Russian
kCharacterSetShiftJis	128	ShiftJis
kCharacterSetSymbol	2	Symbol
kCharacterSetThai	222	Thai
kCharacterSetTurkish	162	Turkish
kCharacterSetVietnamese	163	Vietnamese

Character Sources

Constant	Value	Description
kCharacterSourceDirectInput	0	Direct input characters, including characters generated by calling keyboard commands like NewLine method.
kCharacterSourceImeResult	2	IME (either inline or windowed mode) full composited string. Modern IME is able to composite English word or sentence, when this value is set, current character may not a Chinese, Japanese or Korean character. Currently, this is only set on Windows.
kCharacterSourceTentativeInput	1	Tentative input characters. They are used by IME (inline mode, see IMEInteraction) to composite final string, normally different from final composited string (which is the string that has been truly added into current document), and may be withdrawn when the user cancels typing (e.g. by pressing Esc key). Some system (at least Cocoa) also use tentative input for non-IME features like using dead key to composite diacritical marks (grave accent, etc.). These characters are not added to macro recording. Most applications can simply ignore the notification when this value is set.

Completion Methods

Constant	Value	Description
kCompletionMethodsCommand	5	The AutoCSelect method triggered the completion. Character is 0.
kCompletionMethodsDoubleClick	2	A double-click triggered the completion. Character is 0.
kCompletionMethodsFillUp	1	A fillup character triggered the completion. The character used is in Character
kCompletionMethodsNewline	4	A new line or Newline method triggered the completion. Character is 0.
kCompletionMethodsTab	3	The tab key or Tab method triggered the completion. Character is 0.

Cursor Shapes

Constant	Value	Description
kCursorShapeArrow	2	Normal arrow.
kCursorShapeNormal	-1	The normal cursor is displayed.
kCursorShapeReverseArrow	7	Reverse arrow.
kCursorShapeWait	4	The wait cursor is displayed when the mouse is over or owned by the Scintilla window.

Document Option

Constant	Value	Description
kDocumentOptionDefault	0	Standard options.
kDocumentOptionStylesNone	&h1	Stops allocation of memory to style characters which saves significant memory, often 40% with the whole document treated as being style 0.
kDocumentOptionTextLarge	&h100	Accommodates documents larger than 2 GigaBytes in 64-bit executables.

Long line display modes

Constant	Value	Description
kEdgeVisualStyleBackground	2	The background colour of characters after the column limit is changed to the colour set by EdgeColor property. This is recommended for proportional fonts.
kEdgeVisualStyleLine	1	A vertical line is drawn at the column number set by EdgeColumn(). This works well for monospaced fonts. The line is drawn at a position based on the width of a space character in kStylesCommonDefault, so it may not work very well if your styles use proportional fonts or if your style have varied font sizes or you use a mixture of bold, italic and normal text.
kEdgeVisualStyleMultiLine	3	This is similar to kEdgeVisualStyleLine but in contrary to showing only one single line a configurable set of vertical lines can be shown simultaneously. This edgeMode uses a completely independent dataset that can only be configured by using the MultiEdge* methods.
kEdgeVisualStyleNone	0	Long lines are not marked. This is the default state.

Elements

Constant	Value	Description
kElementCaret	40	Colour of caret for main selection
kElementCaretAdditional	41	Colour of caret for additional selections
kElementCaretLineBack	50	Colour of caret line background
kElementFoldLine	80	Colour of fold lines
kElementHiddenLine	81	Colour of line drawn to show there are lines hidden at that point
kElementHotSpotActive	70	Text colour of active hot spot
kElementHotSpotActiveBack	71	Background colour of active hot spot
kElementList	0	Text colour in autocompletion lists
kElementListBack	1	Background colour of autocompletion lists
kElementListSelected	2	Text colour of selected item in autocompletion lists
kElementListSelectedBack	3	Background colour of selected item in autocompletion lists
kElementSelectionAdditionalBack	13	Background colour of additional selections
kElementSelectionAdditionalText	12	Text colour of additional selections
kElementSelectionBack	11	Background colour of main selection
kElementSelectionInactiveBack	17	Background colour of selections when another window has focus
kElementSelectionInactiveText	16	Text colour of selections when another window has focus
kElementSelectionSecondaryBack	15	Background colour of selections when another window contains the primar selection
kElementSelectionSecondaryText	14	Text colour of selections when another window contains the primary selectio
kElementSelectionText	10	Text colour of main selection
kElementWhiteSpace	60	Colour of visible white space
kElementWhiteSpaceBack	61	Colour of visible white space background

End Of Line

Constant	Value	Description
kEndOfLineCR	1	CR, the old Mac line ending.
kEndOfLineCRLF	0	CRLF, the Windows line ending.
kEndOfLineLF	2	LF, the unix line ending.

End of Line Annotation

Constant	Value	Description
kEOLAnnotationVisibleAngleCircle	&h102	Surround with a ,óÑshape,óó with angled left end and curved right end.
kEOLAnnotationVisibleAngleFlat	&h112	Surround with a ,óÑshape | with angled left end and flat right end.
kEOLAnnotationVisibleAngles	&h122	Surround with a ,óÑshape,ñ with angles on each end.
kEOLAnnotationVisibleBoxed	&h2	End of Line Annotations are indented to match the text and are surroun by a box.
kEOLAnnotationVisibleCircleAngle	&h120	Surround with a ,óñshape,ñ with curved left end and angled right end.
kEOLAnnotationVisibleCircleFlat	&h110	Surround with a ,óñshape | with curved left end and flat right end.
kEOLAnnotationVisibleFlatAngle	&h121	Surround with a | shape,ñ with flat left end and angled right end.
kEOLAnnotationVisibleFlatCircle	&h101	Surround with a | shape,óó with flat left end and curved right end.
kEOLAnnotationVisibleFlats	&h111	Surround with a | shape | with flat ends.
kEOLAnnotationVisibleHidden	&h0	End of Line Annotations are not displayed.
kEOLAnnotationVisibleStadium	&h100	Surround with a ,óñstadium,óó - a rectangle with rounded ends.
kEOLAnnotationVisibleStandard	&h1	End of Line Annotations are drawn left justified with no adornment.

Search Flags

Constant	Value	Description
kFindOptionCxx11RegEx	&h00800000	This flag may be set to use C++11 <regex>instead of Scintilla's basic regular expressions. If the regular expression is invalid then -1 is returned and status is set to SC_STATUS_WARN_REGEX. The ECMAScript flag is set on the regex object and UTF-8 documents will exhibit Unicode-compliant behaviour. For MSVC, where wchar_t is 16-bits, the regular expression ".." will match a single astral-plane character. There may be other differences between compilers. Must also have kFindOptionRegExP set.
kFindOptionMatchCase	&h4	A match only occurs with text that matches the case of the search string.
kFindOptionNone	&h0	Default setting is case-insensitive literal match.
kFindOptionPosix	&h00400000	Treat regular expression in a more POSIX compatible manner by interpreting bare (and) for tagged sections rather than \(and \). Has no effect when kFindOptionCxx11RegEx is set.
kFindOptionRegExp	&h00200000	The search string should be interpreted as a regular expression. Uses Scintilla's base implementation unless combined with kFindOptionCxx11RegEx.
kFindOptionWholeWord	&h2	A match only occurs if the characters before and after are not word characters as defined by WordChars property.
kFindOptionWordStart	&h00100000	A match only occurs if the character before is not a word character as defined by WordChars.

Folder Actions

Constant	Value	Description
kFoldActionContract	0	Contract.
kFoldActionExpand	1	Expand.
kFoldActionToggle	2	Toggle between contracted and expanded.

Folder Display Text Style

Constant	Value	Description
kFoldDisplayTextStyleBoxed	2	Display the text tags with a box drawn around them.
kFoldDisplayTextStyleHidden	0	Do not display the text tags. This is the default.
kFoldDisplayTextStyleStandard	1	Display the text tags.

Folder Flags

Constant	Value	Description
kFoldFlagLevelNumbers	&h0040	Display hexadecimal fold levels in line margin to aid debugging of folding. Th appearance of this feature may change in the future.
kFoldFlagLineAfterContracted	&h0010	Draw below if not expanded
kFoldFlagLineAfterExpanded	&h0008	Draw below if expanded
kFoldFlagLineBeforeContracted	&h0004	Draw above if not expanded
kFoldFlagLineBeforeExpanded	&h0002	Draw above if expanded
kFoldFlagLineState	&h0080	Display hexadecimal line state in line margin to aid debugging of lexing an folding. May not be used at the same time as kFoldFlagLevelNumbers.
kFoldFlagNone	&h0000	Default value.

Folder Levels

Constant	Value	Description
kFoldLevelBase	&h400	The initial fold level.
kFoldLevelHeaderFlag	&h2000	Indicates that the line is a header (fold point).
kFoldLevelNone	&h0	Default level that may occur before folding.
kFoldLevelNumberMask	&h0FFF	The mask for numbers.
kFoldLevelWhiteFlag	&h1000	Indicates that the line is blank and allows it to be treated slightly different then its level may indicate.

Font Quality with Antialiasing

Constant	Value	Description
kFontQualityQualityAntialiased	2	Antialiased
kFontQualityQualityDefault	0	Default.
kFontQualityQualityLcdOptimized	3	LCD Optimized
kFontQualityQualityMask	&hF	In case it is necessary to squeeze more options into this property, only a limi number of bits defined by kFontQualityQualityMask will be used for quali
kFontQualityQualityNonAntialiased	1	Non Antialiased

Font Stretchs

Constant	Value	Description
kFontStretchCondensed	3	75%
kFontStretchExpanded	7	125%
kFontStretchExtraCondensed	2	62.5%
kFontStretchExtraExpanded	8	150%
kFontStretchNormal	5	100%
kFontStretchSemiCondensed	4	87.5%
kFontStretchSemiExpanded	6	112.5%
kFontStretchUltraCondensed	1	50%
kFontStretchUltraExpanded	9	200%

Idle Styling

Constant	Value	Description
kIdleStylingAfterVisible	2	Text after the currently visible portion may be styled in the background.
kIdleStylingAll	3	Style both before and after the visible text.
kIdleStylingNone	0	Syntax styling is performed for all the currently visible text before displaying it.
kIdleStylingToVisible	1	A small amount of styling is performed before display and then further styling is performed incrementally in the background as an idle-time task.

IME Interaction Mode

Constant	Value	Description
kIMEInteractionInline	1	Show inline.
kIMEInteractionWindowed	0	Show on window.

Indentation Guides

Constant	Value	Description
kIndentViewLookBoth	3	Indentation guides are shown beyond the actual indentation up to the level of the next non-empty line or previous non-empty line whichever is the greater. This setting is good for most languages.
kIndentViewLookForward	2	Indentation guides are shown beyond the actual indentation up to the level of the next non-empty line. If the previous non-empty line was a fold header then indentation guides are shown for one more level of indent than that line. This setting is good for Python.
kIndentViewNone	0	No indentation guides are shown.
kIndentViewReal	1	Indentation guides are shown inside real indentation white space.

Modifier Keys

Constant	Value	Description
kKeyModAlt	4	Alt key. (named Option on MacOS usually)
kKeyModCtrl	2	Control key (the Command key on Mac, the Ctrl key on other platforms).
kKeyModMeta	16	Meta key (the Ctrl key on Mac, the Windows key on other platforms).
kKeyModNorm	0	No modifier key.
kKeyModShift	1	Shift Key
kKeyModSuper	8	This is the same as kKeyModMeta on all platforms.

Keys

Constant	Value	Description
kKeysAdd	310	
kKeysBack	8	
kKeysDelete	308	
kKeysDivide	312	
kKeysDown	300	
kKeysEnd	305	
kKeysEscape	7	
kKeysHome	304	
kKeysInsert	309	
kKeysLeft	302	
kKeysMenu	315	
kKeysNext	307	
kKeysPrior	306	
kKeysReturn	13	
kKeysRight	303	
kKeysRWin	314	
kKeysSubtract	311	
kKeysTab	9	
kKeysUp	301	
kKeysWin	313	

Layers

Constant	Value	Description
kLayerBase	0	Draw the selection background opaquely on the base layer
kLayerOverText	2	Draw the selection background translucently over the text.
kLayerUnderText	1	Draw the selection background translucently under the text. This will not work in single phase drawing mode as there is no under-text phase.

Layout line cache modes

Constant	Value	Description
kLineCacheCaret	1	One line is cached. This is the default.
kLineCacheDocument	3	All lines in the document.
kLineCacheNone	0	No lines are cached.
kLineCachePage	2	Visible lines plus the line containing the caret.

Line Character Index Types

Constant	Value	Description
kLineCharacterIndexTypeNone	0	Bytewise.
kLineCharacterIndexTypeUtf16	2	UTF-16 code units are indexed.
kLineCharacterIndexTypeUtf32	1	Whole characters are indexed.

Line End Types

Constant	Value	Description
kLineEndTypeDefault	0	
kLineEndTypeUnicode	1	

Margin Options

Constant	Value	Description
kMarginOptionNone	0	Whole wrapped line is selected.
kMarginOptionSubLineSelect	1	Only sub line of wrapped line is selected.

Modification Flags

Constant	Value	Description
kModificationFlagsBeforeDelete	&h800	Text is about to be deleted from the document.
kModificationFlagsBeforeInsert	&h400	Text is about to be inserted into the document.
kModificationFlagsChangeAnnotation	&h20000	An annotation has changed.
kModificationFlagsChangeEOLAnnotation	&h400000	An annotation has changed.
kModificationFlagsChangeFold	&h8	A folding change has occurred.
kModificationFlagsChangeIndicator	&h4000	An indicator has been added or removed from a range of text.
kModificationFlagsChangeLineState	&h8000	A line state has changed because SCI_SETLINESTATE was
kModificationFlagsChangeMargin	&h10000	A text margin has changed.
kModificationFlagsChangeMarker	&h200	One or more markers has changed in a line.
kModificationFlagsChangeStyle	&h4	A style change has occurred.
kModificationFlagsChangeTabStops	&h200000	The explicit tab stops on a line have changed because ClearT dTabStop was called.
kModificationFlagsContainer	&h40000	This is set on for actions that the container stored into the AddUndoAction.
kModificationFlagsDeleteText	&h2	Text has been removed from the document.
kModificationFlagsEventMaskAll	&h7FFFFF	This is a mask for all valid flags. This is the default mask sta ventMask.
kModificationFlagsInsertCheck	&h100000	Text is about to be inserted. The handler may change the tex by calling ChangeInsertion method. No other modifications this handler.
kModificationFlagsInsertText	&h1	Text has been inserted into the document.
kModificationFlagsLastStepInUndoRedo	&h100	This is the final step in an Undo or Redo transaction.
kModificationFlagsLexerState	&h80000	The internal state of a lexer has changed over a range.
kModificationFlagsMultilineUndoRedo	&h1000	This is part of an Undo or Redo with multi-line changes.
kModificationFlagsMultiStepUndoRedo	&h80	This is part of a multi-step Undo or Redo transaction.
kModificationFlagsNone	&h0	Base value with no fields valid. Will not occur but is useful in
kModificationFlagsRedo	&h40	Information: this was the result of a Redo.
kModificationFlagsStartAction	&h2000	This is set on a kModificationFlagsUser action when it is the in an undo transaction. This can be used to integrate the Scin with an undo stack in the container application by adding a S the container's stack for the currently opened container transa a new container transaction if there is no open container trans
kModificationFlagsUndo	&h20	Information: this was the result of an Undo.
kModificationFlagsUser	&h10	Information: the operation was done by the user.

Auto Completion for Multiple Selections

Constant	Value	Description
kMultiAutoCompleteEach	1	Each selection.
kMultiAutoCompleteOnce	0	Only first selection.

Multi Paste Options

Constant	Value	Description
kMultiPasteEach	1	The paste text can go into each selection.
kMultiPasteOnce	0	The pasted text can go into just the main selection.

Ordering Options

Constant	Value	Description
kOrderingCustom	2	Custom sorting.
kOrderingPerformSort	1	The control will sort for you.
kOrderingPreSorted	0	You pass list pre-sorted.

Popup Modi

Constant	Value	Description
kPopUpAll	1	Show default editing menu if clicking on scintilla.
kPopUpNever	0	Never show default editing menu.
kPopUpText	2	Show default editing menu only if clicking on text area.

Print Options

Constant	Value	Description
kPrintOptionBlackOnWhite	2	Print all text as black on a white background.
kPrintOptionColourOnWhite	3	Everything prints in its own colour on a white background.
kPrintOptionColourOnWhiteDefaultBG	4	Everything prints in its own foreground colour but all styles up to and in kStylesCommonLineNumber will print on a white background.
kPrintOptionInvertLight	1	If you use a dark screen background this saves ink by inverting the ligh of all colours and printing on a white background.
kPrintOptionNormal	0	Print using the current screen colours with the exception of line number r which print on a white background. This is the default.
kPrintOptionScreenColours	5	Print using the current screen colours for both foreground and backg This is the only mode that does not set the background colour of t number margin to white.

Representation Appearance

Constant	Value	Description
kRepresentationAppearanceBlob	1	Draw the representation text inverted in a rounded rectangle. This is t default appearance.
kRepresentationAppearanceColour	&h10	Draw the representation in the colour set with RepresentationColour() instea of in the colour of the style of the text being represented.
kRepresentationAppearancePlain	0	Draw the representation text with no decorations.

Selection Mode

Constant	Value	Description
kSelectionModeLines	2	Line selection.
kSelectionModeRectangle	1	Rectangular
kSelectionModeStream	0	Stream
kSelectionModeThin	3	Thin rectangular selection

Status Codes

Constant	Value	Description
kStatusBadAlloc	2	Memory is exhausted.
kStatusFailure	1	Generic failure.
kStatusOk	0	No failures.
kStatusRegEx	1001	Regular expression is invalid.
kStatusWarnStart	1000	Warnings start with this value.

Support

Constant	Value	Description
kSupportsFractionalStrokeWidth	2	Can lines be drawn with fractional widths like 1.5 or 0.5 pixels?
kSupportsLineDrawsFinal	0	Whether drawing a line draws its final position. Only false on Win32 GD
kSupportsPixelDivisions	1	Are logical pixels larger than physical pixels? Currently only true for macOS Cocoa with 'retina' displays. When true, ating pixmaps at twice the resolution can produce clearer output with blur.
kSupportsPixelModification	4	Can individual pixels be modified? This is false for character cell platf like curses.
kSupportsThreadSafeMeasureWidths	5	Can text measurement be safely performed concurrently on multiple thre Currently only true for macOS Cocoa, DirectWrite on Win32, and GTK or Wayland.
kSupportsTranslucentStroke	3	Can translucent lines, polygons, ellipses, and text be drawn?

Tab Draw Modes

Constant	Value	Description
kTabDrawModeLongArrow	0	
kTabDrawModeStrikeOut	1	

Drawing Technology

Constant	Value	Description
kTechnologyDefault	0	Default
kTechnologyDirectWrite	1	Use DirectWrite API.
kTechnologyDirectWriteDC	3	DirectWrite to draw into a GDI DC.
kTechnologyDirectWriteRetain	2	Use DirectWrite API with retaining frame.

Property Types

Constant	Value	Description
kTypePropertyBoolean	0	Property is a boolean.
kTypePropertyInteger	1	Property is an integer.
kTypePropertyString	2	Property is a string.

Undo Flags

Constant	Value	Description
kUndoFlagsMayCoalesce	1	If the container action may be coalesced along with any insertion and deletion actions into a single compound action.
kUndoFlagsNone	0	Coalescing treats coalescible container actions as transparent so will still only group together insertions that look like typing or deletions that look like multiple uses of the Backspace or Delete keys.

Undo Selection History Options

Constant	Value	Description
kUndoSelectionHistoryOptionDisabled	0	The default: undo selection history turned off.
kUndoSelectionHistoryOptionEnabled	1	Restore selection for each undo and redo.
kUndoSelectionHistoryOptionScroll	2	Restore vertical scroll position. Has no effect without kUndoSelectionHi OptionEnabled.

Update Flags

Constant	Value	Description
kUpdateContent	&h1	Contents, styling or markers may have been changed.
kUpdateHScroll	&h8	May have scrolled horizontally.
kUpdateNone	&h0	Value without any changes.
kUpdateSelection	&h2	Selection may have been changed.
kUpdateVScroll	&h4	May have scrolled vertically.

Virtual Space Flags

Constant	Value	Description
kVirtualSpaceNone	0	Disables all use of virtual space.
kVirtualSpaceNoWrapLineStart	4	Prevents left arrow movement and selection from wrapping to the previo line. This is most commonly desired in conjunction with virtual space but an independent setting so works without virtual space.
kVirtualSpaceRectangularSelection	1	Rectangular selection.
kVirtualSpaceUserAccessible	2	User accessible.

Visibility Policy

Constant	Value	Description
kVisiblePolicySlop	&h01	If set, we can define a slop value: caretSlop. This value defines an unwanted zone (UZ) where the caret is... unwanted. This zone is defined as a number of pixels near the vertical margins, and as a number of lines near the horizontal margins. By keeping the caret away from the edges, it is seen within its context. This makes it likely that the identifier that the caret is on can be completely seen, and that the current line is seen with some of the lines following it, which are often dependent on that line.
kVisiblePolicyStrict	&h04	If set, the policy set by slop is kVisiblePolicySlop... strictly. The caret is centred on the display if caretSlop is not set, and cannot go in the UZ if caretSlop is set.

White Space Visibility

Constant	Value	Description
kWhiteSpaceInvisible	0	The normal display mode with white space displayed as an empty background colour.
kWhiteSpaceVisibleAfterIndent	2	White space used for indentation is displayed normally but after the first visible character, it is shown as dots and arrows.
kWhiteSpaceVisibleAlways	1	White space characters are drawn as dots and arrows,
kWhiteSpaceVisibleOnlyInIndent	3	White space used for indentation is displayed as dots and arrows.

Wrap Modes

Constant	Value	Description
kWrapChar	2	Enable wrapping between any characters.
kWrapNone	0	Disable line wrapping.
kWrapWhiteSpace	3	Enable wrapping on whitespace.
kWrapWord	1	Enable wrapping on word or style boundaries.

Wrap Indent Mode

Constant	Value	Description
kWrapIndentModeDeepIndent	3	Wrapped sublines are aligned to first subline indent plus two more levels of indentation
kWrapIndentModeFixed	0	Wrapped sublines aligned to left of window plus amount set by WrapStartIndent.
kWrapIndentModeIndent	2	Wrapped sublines are aligned to first subline indent plus one more level of indentation
kWrapIndentModeSame	1	Wrapped sublines are aligned to first subline indent

Wrap Visual Flags

Constant	Value	Description
kWrapVisualFlagEnd	&h0001	Visual flag at end of subline of a wrapped line.
kWrapVisualFlagMargin	&h0004	Visual flag in line number margin.
kWrapVisualFlagNone	&h0000	No visual flags
kWrapVisualFlagStart	&h0002	Visual flag at begin of subline of a wrapped line. Subline is indented by at least 1 to make room for the flag.

Wrap Visual Location

Constant	Value	Description
kWrapVisualLocationDefault	&h0000	Visual flags drawn near border
kWrapVisualLocationEndByText	&h0001	Visual flag at end of subline drawn near text
kWrapVisualLocationStartByText	&h0002	Visual flag at beginning of subline drawn near text

171.2 control ScintillaControlMBS

171.2.1 control ScintillaControlMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The Xojo control to host Scintilla editor.

171.2.2 Methods

171.2.3 AddSelection(caret as Integer, anchor as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Add a new selection from anchor to caret as the main selection retaining all other selections as additional selections.
Notes: Since there is always at least one selection, to set a list of selections, the first selection should be added with SetSelection() and later selections added with AddSelection().

171.2.4 AddStyledText(StyledText as MemoryBlock)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This behaves just like AddText, but inserts styled text.
Notes: See GetStyledText function.

171.2.5 AddTabStop(line as Integer, x as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds an explicit tabstop at the specified distance from the left (in pixels).
Notes: Changing tab stops produces a ChangeTabStops event.

171.2.6 AddText(Text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This inserts the first length characters from the string text at the current position.
Notes: This will include any 0's in the string that you might have expected to stop the insert operation. The current position is set at the end of the inserted text, but it is not scrolled into view.

171.2.7 AddUndoAction(token as Integer, UndoFlags as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Adds an undo action.
Notes: The container can add its own actions into the undo stack by calling AddUndoAction and an Modify event will be sent to the container with the KModificationFlagsContainer flag when it is time to undo (PerformedUndo) or redo (PerformedRedo) the action. The token argument supplied is returned in the token field of the notification.
For example, if the container wanted to allow undo and redo of a 'toggle bookmark' command then it could call AddUndoAction(line, 0) each time the command is performed. Then when it receives a notification to undo or redo it toggles a bookmark on the line given by the token field. If there are different types of commands or parameters that need to be stored into the undo stack then the container should maintain a stack of its own for the document and use the current position in that stack as the argument to AddUndoAction(line). AddUndoAction commands are not combined together into a single undo transaction unless grouped with BeginUndoAction and EndUndoAction.

The flags argument can be KUndoFlagsMayCoalesce (1) if the container action may be coalesced along with any insertion and deletion actions into a single compound action, otherwise kUndoFlagsNone (0). Coalescing treats coalescible container actions as transparent so will still only group together insertions that look like

typing or deletions that look like multiple uses of the Backspace or Delete keys.

171.2.8 AllocateBytes(bytes as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Allocate a document buffer large enough to store a given number of bytes.
Notes: The document will not be made smaller than its current contents.

171.2.9 AllocateLineCharacterIndex(lineCharacterIndex as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Allocate one or more indexes.
Notes: Most Scintilla APIs use byte positions but some applications want to use positions based on counting (UTF-32) characters or (UTF-16) code units or need to communicate with other code written in terms of characters or code units. With only byte positions, this may require examining many bytes to count characters or code units in the document but this may be sped up in some cases by indexing the line starts by character or code unit.

Different aspects of an application may need indexes for different periods and should allocate for those periods. Indexes use additional memory so releasing them can help minimize memory but they also take time to recalculate. Scintilla may also allocate indexes to support features like accessibility or input method editors. Only one index of each type is created for a document at a time.

171.2.10 AllocateLines(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Allocate line indices to match the lines argument.
Notes: This is an optimization that can prevent multiple reallocations of the indices as text is inserted if the application can estimate the number of lines in the document. The number of lines will not be reduced by this call.

171.2.11 AnnotationClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears all annotations.
Notes: All the lines can be cleared of annotations with AnnotationClearAll which is equivalent to clearing

each line (setting to "") and then deleting other memory used for this feature.

171.2.12 AnnotationLines(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The number of lines annotating a line can be retrieved with AnnotationLines.

171.2.13 AppendText(Text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This adds the text to the end of the document.
Notes: This will include any 0's in the string that you might have expected to stop the operation. The current selection is not changed and the new text is not scrolled into view.

171.2.14 AssignCmdKey(keyDefinition as Integer, sciCommand as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This assigns the given key definition to a Scintilla command identified by sciCommand.
Notes: sciCommand can be any SCI_* command that has no arguments.

There is a default binding of keys to commands that is defined in the Scintilla library. You can change the mapping to suit your own requirements.

keyDefinition
: a key definition contains the key code in the low 16-bits and the key modifiers in the high 16-bits. To combine keyCode and keyMod set:

keyDefinition = keyCode + Bitwise.ShiftLeft(keyMod, 16)

The key code is a visible or control character or a key from the kKeys* enumeration, which contains:

kKeysAdd, kKeysBack, kKeysDelete, kKeysDivide, kKeysDown, kKeysEnd, kKeysEscape, kKeysHome, kKeysInsert, kKeysLeft, kKeysMenu, kKeysNext (Page Down), kKeysPrior (Page Up), kKeysReturn, kKeysRight, kKeysRWin, kKeysSubtract, kKeysTab, kKeysUp, and kKeysWin.

The modifiers are a combination of zero or more of kKeyModAlt, kKeyModCtrl, kKeyModShift, kKey-

ModMeta, and kKeyModSuper. On OS X, the Command key is mapped to kKeyModCtrl and the Control key to kKeyModMeta. kKeyModSuper is only available on GTK which is commonly the Windows key. If you are building a table, you might want to use kKeyModNorm, which has the value 0, to mean no modifiers.

On Win32, the numeric keypad with Alt pressed can be used to enter characters by number. This can produce unexpected results in non-numlock mode when function keys are assigned so potentially problematic keys are ignored. For example, setting kKeyModAlt, kKeysUP will only be active for the Up key on the main cursor keys, not the numeric keypad.

171.2.15 AutoComplete

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method triggers autocompletion.
Notes: This has the same effect as the tab key.

171.2.16 AutoCompleteCancel

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cancels any displayed auto completion list.
Notes: When in auto completion mode, the list should disappear when the user types a character that can not be part of the auto completion, such as '.', '(' or ' [' when typing an identifier. A set of characters that will cancel autocompletion can be specified with AutoCompleteStops.

171.2.17 AutoCompletePosStart as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the value of the current position when AutoCompleteShow started display of the list.

171.2.18 AutoCompleteSelect(Value as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method selects an item in the autocompletion list.
Notes: It searches the list of words for the first that matches select. By default, comparisons are case sensitive, but you can change this with AutoCIgnoreCase. The match is character by character for the length of the select string. That is, if select is "Fred" it will match "Frederick" if this is the first item in the list that begins with "Fred". If an item is found, it is selected. If the item is not found, the autocompletion list closes if auto-hide is true (see AutoCAutoHide).

The current selection index can be retrieved with AutoCompleteCurrent.

171.2.19 AutoCompleteSetFillUps(characterSet as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If a fillup character is typed with an auto completion list active, the currently selected item in the list is added into the document, then the fillup character is added.
Notes: Common fillup characters are '(', ' [' and '.' but others are possible depending on the language. By default, no fillup characters are set.

171.2.20 AutoCompleteShow(lengthEntered as Integer, itemList as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method causes a list to be displayed.
Notes: lengthEntered is the number of characters of the word already entered and itemList is the list of words separated by separator characters. The initial separator character is a space but this can be set or got with AutoCompleteSeparator property.

With default settings, the list of words should be in sorted order. If set to ignore case mode with AutoCompleteIgnoreCase, then strings are matched after being converted to upper case. One result of this is that the list should be sorted with the punctuation characters ' [', '\', '] ', '^', '_', and '`' sorted after letters. Alternative handling of list order may be specified with AutoCompleteOrder property.

171.2.21 AutoCompleteStops(characterSet as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The characterSet argument is a string containing a list of characters that will automatically cancel the auto completion list.
Notes: When you start the editor, this list is empty.

171.2.22 BackTab

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.23 BeginUndoAction

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Starts a composed undo action.
Notes: Call BeginUndoAction to mark the beginning and EndUndoAction to end of a set of operations that you want to undo all as one operation but that you have to generate as several operations. Alternatively, you can use these to mark a set of operations that you do not want to have combined with the preceding or following operations if they are undone.

171.2.24 BraceBadLight(pos as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Shows bad brace highlight.
Notes: If there is no matching brace then the brace badlighting style, style kStylesCommonBraceBad (35), can be used to show the brace that is unmatched. Using a position of kInvalidPosition (-1) removes the highlight.

171.2.25 BraceBadLightIndicator(useSetting as Boolean, indicator as ScintillaIndicatorMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Use specified indicator to highlight non matching brace instead of changing its style

171.2.26 BraceHighlight(posA as Integer, posB as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Up to two characters can be highlighted in a 'brace highlighting style', which is defined as style number BraceHighlight (34).
Notes: If you have enabled indent guides, you may also wish to highlight the indent that corresponds with the brace. You can locate the column with Column() and highlight the indent with HighlightGuide.

171.2.27 BraceHighlightIndicator(useSetting as Boolean, indicator as ScintillaIndicatorMBS)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Use specified indicator to highlight matching braces instead of changing their style.

171.2.28 BraceMatch(pos as Integer, maxReStyle as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The BraceMatch method finds a corresponding matching brace given pos, the position of one brace.
Notes: The brace characters handled are '(', ')', ' [', '] ', ' { ', ' } ', '<', and '>'. The search is forwards from an opening brace and backwards from a closing brace. If the character at position is not a brace character, or a matching brace cannot be found, the return value is -1. Otherwise, the return value is the position of the matching brace.
A match only occurs if the style of the matching brace is the same as the starting brace or the matching brace is beyond the end of styling. Nested braces are handled correctly. The maxReStyle parameter must currently be 0 - it may be used in the future to limit the length of brace searches.

171.2.29 BraceMatchNext(pos as Integer, startPos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Similar to BraceMatch, but matching starts at the explicit start position startPos instead of the implicitly next position pos ¬± 1.

171.2.30 CallTipCancel

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method cancels any displayed call tip.
Notes: Scintilla will also cancel call tips for you if you use any keyboard commands that are not compatible with editing the argument list of a function. Call tips are cancelled if you delete back past the position where the caret was when the tip was triggered.

171.2.31 CallTipSetBackColor(backColor as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The background colour of call tips can be set with this property;
Notes: The default colour is white. It is not a good idea to set a dark colour as the background as the default colour for normal calltip text is mid grey and the default colour for highlighted text is dark blue. This also sets the background colour of kStylesCommonCallTip.

171.2.32 CallTipSetForeColor(foreColor as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour of call tip text can be set with this method.
Notes: The default colour is mid grey.
This also sets the foreground colour of kStylesCommonCallTip.

171.2.33 CallTipSetForeColorHighlight(foreColor as Color)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The colour of highlighted call tip text can be set with this method.
Notes: The default colour is dark blue.

171.2.34 CallTipSetHighlight(highlightStart as Integer, highlightEnd as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This sets the region of the call tips text to display in a highlighted style.
Notes: highlightStart is the zero-based index into the string of the first character to highlight and highlightEnd is the index of the first character after the highlight. highlightEnd must be greater than highlightStart; highlightEnd-highlightStart is the number of characters to highlight. Highlights can extend over line ends if this is required.
Unhighlighted text is drawn in a mid grey. Selected text is drawn in a dark blue. The background is white. These can be changed with CallTipSetBackColor, CallTipSetForeColor, and CallTipSetForeColorHighlight.

171.2.35 CallTipSetPosition(above as Boolean)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: By default the calltip is displayed below the text, setting above to true will display it above the text.

171.2.36 CallTipShow(pos as Integer, definition as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method starts the process by displaying the call tip window.
Notes: If a call tip is already active, this has no effect.

pos is the position in the document at which to align the call tip. The call tip text is aligned to start 1 line below this character unless you have included up and/or down arrows in the call tip text in which case the tip is aligned to the right-hand edge of the rightmost arrow. The assumption is that you will start the text with something like "\001 1 of 3 \002".

definition is the call tip text. This can contain multiple lines separated by '\n' (Line Feed, ASCII code 10) characters. Do not include Carriage Return (ASCII code 13), as this will most likely print as an empty box. Tab (ASCII code 9) is supported if you set a tabsize with CallTipUseStyle.

The position of the caret is remembered here so that the call tip can be cancelled automatically if subsequent deletion moves the caret before this position.

Call tips are small windows displaying the arguments to a function and are displayed after the user has typed the name of the function. They normally display characters using the font facename, size and character set defined by kStylesCommonDefault. You can choose to use kStylesCommonCallTip to define the facename, size, foreground and background colours and character set with CallTipUseStyle. This also enables support for Tab characters. There is some interaction between call tips and autocompletion lists in that showing a call tip cancels any active autocompletion list, and vice versa.

Call tips can highlight part of the text within them. You could use this to highlight the current argument to a function by counting the number of commas (or whatever separator your language uses).

The mouse may be clicked on call tips and this causes a CallTipClick event to be sent to the container. Small up and down arrows may be displayed within a call tip by, respectively, including the characters '\001', or '\002'. This is useful for showing that there are overloaded variants of one function name and that the user can click on the arrows to cycle through the overloads.
Alternatively, call tips can be displayed when you leave the mouse pointer for a while over a word in response to the DWellStart event and cancelled in response to DWellEnd. This method could be used in a debugger to give the value of a variable, or during editing to give information about the word under the pointer.

171.2.37 CallTipUseStyle(tabSize as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method changes the style used for call tips from KStylesCommonDefault to KStylesCommoCallTip and sets a tab size in screen pixels.
Notes: If tabsize is less than 1, Tab characters are not treated specially. Once this call has been used, the call tip foreground and background colours are also taken from the style.

171.2.38 Cancel

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cancels autocompletion and calltip display and drops any additional selections.

171.2.39 ChangeInsertion(text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Changes insert.
Notes: This may only be called from a kModificationFlagsInsertCheck in Modify event handler and will change the text being inserted to that provided.

171.2.40 ChangeLastUndoActionText(action as Integer, text as String)

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets the text for the undo action.

171.2.41 ChangeLexerState(start as Integer, ende as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Indicate that the internal state of a lexer has changed over a range and therefore there may be a need to redraw.

171.2.42 ChangeSelectionMode(SelectionMode as Integer)

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Changes the selection mode.
Notes: Can be stream (kSelectionModeStream=0) or rectangular (kSelectionModeRectangle=1) or by lines (kSelectionModeLines=2) or thin rectangular (kSelectionModeThin=3). When set in these modes, regular caret moves will extend or reduce the selection, until the mode is cancelled by a call with same value or with Cancel. The get function returns the current mode even if the selection was made by mouse or with regular extended moves. SC_SEL_THIN is the mode after a rectangular selection has been typed into and ensures that no characters are selected.

171.2.43 Character(position as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This returns the character at pos in the document or 0 if pos is negative or past the end of the document.

171.2.44 CharacterString(position as Integer, byref Length as Integer) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This queries character at given position.
Notes: If the position has a multi byte UTF-8 character, we take multiple characters and return length in bytes via Length parameter.
Otherwise character is returned for 1 byte and then length is set to 1.

See also Character() to get individual bytes.

171.2.45 CharLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.46 CharLeftExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.47 CharLeftRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.48 CharPositionFromPoint(x as Integer, y as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Finds the closest character to a point.

171.2.49 CharPositionFromPointClose(x as Integer, y as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Finds the closest character to a point.
Notes: Returns -1 if the point is outside the window or not close to any characters. This is similar to the previous CharPositionFromPoint method but finds characters rather than inter-character positions.

171.2.50 CharRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.51 CharRightExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.52 CharRightRectExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.53 ChooseCaretX

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Scintilla remembers the x value of the last position horizontally moved to explicitly by the user and this value is then used when moving vertically such as by using the up and down keys.
Notes: This message sets the current x position of the caret as the remembered value.

171.2.54 Clear

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears text from current selection.

171.2.55 ClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Unless the document is read-only, this deletes all the text.

171.2.56 ClearAllCmdKeys

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This command removes all keyboard command mapping by setting an empty mapping table.

171.2.57 ClearAllRepresentations

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reset representations to defaults.

171.2.58 ClearCmdKey(keyDefinition as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This makes the given key definition do nothing by assigning the action Null to it.
Example:

```
Var c as ScintillaControlMBS
// disable tab key for editor
c.ClearCmdKey c.kKeysTab
```

171.2.59 ClearDocumentStyle

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When wanting to completely restyle the document, for example after choosing a lexer, the ClearDocumentStyle method can be used to clear all styling information and reset the folding state.

171.2.60 ClearRegisteredImages

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears all registered images.

171.2.61 ClearRepresentation(encodedCharacter as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Reset this representation to default.

171.2.62 ClearSelections

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Set a single empty selection at 0 as the only selection.

171.2.63 ClearTabStops(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears explicit tabstops on a line.
Notes: Changing tab stops produces a ChangeTabStops event.

171.2.64 Colourise(start as Integer, ende as Integer = -1)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This requests the current lexer or the container (if the lexer is set to nil) to style the document between start and end.
Notes: If end is -1, the document is styled from start to the end. If the "fold" property is set to "1" and

your lexer or container supports folding, fold levels are also set. This method causes a redraw.

171.2.65 ColouriseAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This requests the current lexer or the container (if the lexer is set to nil) to style the document.
Notes: If the "fold" property is set to "1" and your lexer or container supports folding, fold levels are also set. This method causes a redraw.

171.2.66 Column(pos as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method returns the column number of a position pos within the document taking the width of tabs into account.
Notes: This returns the column number of the last tab on the line before pos, plus the number of characters between the last tab and pos. If there are no tab characters on the line, the return value is the number of characters up to the position on the line. In both cases, double byte characters count as a single character. This is probably only useful with monospaced fonts.

171.2.67 ContractedFoldNext(lineStart as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Search efficiently for lines that are contracted fold headers.
Notes: This is useful when saving the user's folding when switching documents or saving folding with a file. The search starts at line number lineStart and continues forwards to the end of the file. lineStart is returned if it is a contracted fold header otherwise the next contracted fold header is returned. If there are no more contracted fold headers then -1 is returned.

171.2.68 ConvertEOLs(EndOfLineMode as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Converts end of line characters for the document.
Notes: Scintilla can handle the major line end conventions and, depending on settings and the current lexer also support additional Unicode line ends.
Scintilla can interpret any of the Macintosh (CR), Unix (LF) and Windows (CR+LF) line ends. When the user presses the Enter key, one of these line end strings is inserted into the buffer. The default is CRL+LF in Windows and LF in Unix, but this can be changed with the EOLMode proeprty. You can also convert

the entire document to one of these line endings with ConvertEOLs. Finally, you can choose to display the line endings with ViewEOL.

For the UTF-8 encoding, three additional Unicode line ends, Next Line (NEL=U+0085), Line Separator (LS=U+2028), and Paragraph Separator (PS=U+2029) may optionally be interpreted when Unicode line ends is turned on and the current lexer also supports Unicode line ends.

171.2.69 Copy

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copy current text selection and puts text on the clipboard.

171.2.70 CopyAllowLine

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Works the same as Copy() except that if the selection is empty then the current line is copied.
Notes: On Windows, an extra "MSDEVLineSelect" marker is added to the clipboard which is then used in SCI_PASTE to paste the whole line before the current line.

171.2.71 CopyRange(RangeStart as Integer, RangeEnd as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copies a range of text from the document to the system clipboard.

171.2.72 CopyText(Text as String)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Copies a supplied piece of text to the system clipboard.

171.2.73 CountCharacters(start as Integer, ende as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the number of whole characters between two positions.

171.2.74 CountCodeUnits(start as Integer, ende as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the number of whole characters between two positions.
Notes: This counts in UTF-16 code units.

171.2.75 CreateLoader(bytes as Integer = 1000000, documentOptions as Integer = 0) as ScintillaLoaderMBS

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Creates a loader object.
Notes: An application can load all of a file into a buffer it allocates on a background thread and then add the data in that buffer into a Scintilla document on the user interface thread. That technique uses extra memory to store a complete copy of the file and also means that the time that Scintilla takes to perform initial line end discovery blocks the user interface.

To avoid these issues, a loader object may be created and used to load the file.
Returns an object that supports the ScintillaLoaderMBS interface which can be used to load data and then be turned into a Scintilla document object for attachment to a view object. The bytes argument determines the initial memory allocation for the document as it is more efficient to allocate once rather than rely on the buffer growing as data is added. If CreateLoader fails then nil is returned.

See kDocumentOption* constants.

171.2.76 Cut

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cuts current text selection and puts text on the clipboard.

171.2.77 CutAllowLine

MBS Scintilla Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The same as Cut except that if the selection is empty then the current line is cut.
Notes: On Windows, an extra "MSDEVLineSelect" marker is added to the clipboard which is then used in Paste to paste the whole line before the current line.

171.2.78 DeleteBack

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.79 DeleteBackNotLine

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.80 DeleteRange(start as Integer, lengthDelete as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Deletes a range of text in the document.

171.2.81 DelLineLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.82 DelLineRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.83 DelWordLeft

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.84 DelWordRight

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.85 DelWordRightEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: The *End methods move between word ends instead of word starts.
You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.86 DescribeProperty(Key as String) as String

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Information may be retrieved about the properties that can be set for the current lexer.

171.2.87 DocLineFromVisible(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: When some lines are hidden and/or annotations are displayed, then a particular line in the document may be displayed at a different position to its document position.
Notes: This method returns the document line number that corresponds to a display line (counting the display line of the first line in the document as 0). If displayLine is less than or equal to 0, the result is 0. If displayLine is greater than or equal to the number of displayed lines, the result is the number of lines in the document.

171.2.88 DocumentEnd

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.89 DocumentEndExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.90 DocumentStart

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.91 DocumentStartExtend

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.92 DropSelectionN(selection as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: If there are multiple selections, remove the indicated selection.
Notes: If this was the main selection then make the previous selection the main and if it was the first then the last selection becomes main. If there is only one selection, or there is no selection selection, then there is no effect.

171.2.93 EditToggleOvertype

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The method to perform the action when this key is pressed.
Notes: You can call it directly to perform this action if needed, e.g. from toolbar or menu command.

171.2.94 ElementAllowsTranslucent(element as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns true when the element currently allows translucent drawing when an alpha component is included.
Notes: This may change based on circumstances - different platforms or graphics technologies may implement translucency and newer versions of Scintilla may implement translucency for elements that did not previously support it.

171.2.95 ElementBaseColour(element as Integer) as Color

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the default colour of an element.
Notes: This may be a value defined by Scintilla or it may be derived from the operating system or platform. Which values are set from the operating system may differ between operating systems and operating system versions. When undefined the return value is 0 which is equivalent to completely transparent black. These colours may be useful when defining styles with similarities such as synthesizing dark mode styles that use the same colours as the system.

On Win32, autocompletion list colours like kElementList are currently provided by the platform layer and on Cocoa, selection background colours like kElementSelectionBack are provided.

171.2.96 ElementIsSet(element as Integer) as Boolean

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns true when an element colour has been set.
Notes: When false indicates that a default colour or set of colours is displayed.

171.2.97 EmptyUndoBuffer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This command tells Scintilla to forget any saved undo or redo history.
Notes: It also sets the save point to the start of the undo buffer, so the document will appear to be unmodified. This does not cause the SavePointReached event to be sent to the container.

171.2.98 EndStyled as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: End styling.
Notes: Scintilla keeps a record of the last character that is likely to be styled correctly. This is moved

forwards when characters after it are styled and moved backwards if changes are made to the text of the document before it. Before drawing text, this position is checked to see if any styling is needed and, if so, a StyleNeeded event is sent to the container. The container can send EndStyled to work out where it needs to start styling. Scintilla will always ask to style whole lines.

171.2.99 EndUndoAction

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Ends a composed undo action.
Notes: Call BeginUndoAction to mark the beginning and EndUndoAction to end of a set of operations that you want to undo all as one operation but that you have to generate as several operations. Alternatively, you can use these to mark a set of operations that you do not want to have combined with the preceding or following operations if they are undone.

171.2.100 EnsureVisible(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A line may be hidden because more than one of its parent lines is contracted.
Notes: Both these message travels up the fold hierarchy, expanding any contracted folds until they reach the top level. The line will then be visible. If you use EnsureVisibleEnforcePolicy(), the vertical caret policy set by VisiblePolicy() is then applied.

171.2.101 EnsureVisibleEnforcePolicy(line as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A line may be hidden because more than one of its parent lines is contracted.
Notes: Both these message travels up the fold hierarchy, expanding any contracted folds until they reach the top level. The line will then be visible. If you use EnsureVisibleEnforcePolicy(), the vertical caret policy set by VisiblePolicy() is then applied.

171.2.102 EOLAnnotationClearAll

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Clears all EOL annotations.
Notes: All the lines can be cleared of end of line annotations with EOLAnnotationClearAll which is equivalent to clearing each line (setting to 0) and then deleting other memory used for this feature.

171.2.103 ExpandChildren(Line as Integer, FoldLevel as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This is used to respond to a change to a line causing its fold level or whether it is a header to change, perhaps when adding or removing a ' { '.
Notes: By the time the container has received the notification that the line has changed, the fold level has already been set, so the container has to use the previous level in this call so that any range hidden underneath this line can be shown.

171.2.104 FindColumn(line as Integer, column as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Returns the position of a column on a line taking the width of tabs into account.
Notes: It treats a multi-byte character as a single column. Column numbers, like lines start at 0.

171.2.105 FindIndicatorFlash(start as Integer, ende as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Show and animate the find indicator.
Notes: The indicator remains visible with FindIndicatorShow and fades out after showing for half a second with FindIndicatorFlash. FindIndicatorShow behaves similarly to the OS X TextEdit and Safari applications and is best suited to editing documentation where the search target is often a word. FindIndicatorFlash is similar to Xcode and is suited to editing source code where the match will often be located next to operators which would otherwise be hidden under the indicator's padding.

171.2.106 FindIndicatorHide

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Hides the find indicator.

171.2.107 FindIndicatorShow(start as Integer, ende as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Show and animate the find indicator.
Notes: The indicator remains visible with FindIndicatorShow and fades out after showing for half a second with FindIndicatorFlash. FindIndicatorShow behaves similarly to the OS X TextEdit and Safari applications and is best suited to editing documentation where the search target is often a word. FindIndicatorFlash is

similar to Xcode and is suited to editing source code where the match will often be located next to operators which would otherwise be hidden under the indicator's padding.

171.2.108 FindText(searchFlags as Integer, Text as String, byref RangeStart as Integer, byref RangeEnd as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Searches for text in the document.
Notes: It does not use or move the current selection. The searchFlags argument controls the search type, which includes regular expression searches.
See kFindOption* constants.

You can search backwards to find the previous occurrence of a search string by setting the end of the search range before the start.

RangeStart and RangeEnd provide the range of positions in the document to search. You can search backwards by setting RangeEnd less than RangeStart. The text parameter holds the search pattern. If your language makes the use of _TextToFind difficult, you should consider using SearchInTarget instead.

The return value is -1 if the search fails or the position of the start of the found text if it succeeds. The RangeStart and RangeEnd parameters of TextToFind are filled in with the start and end positions of the found text.

171.2.109 FoldAll(FoldAction as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Contracts, expands or toggles all lines.
Notes: Provides a higher-level approach to folding instead of setting expanded flags and showing or hiding individual lines.

An individual fold can be contracted/expanded/toggled with FoldLine(). To affect all child folds as well call FoldChildren().

To affect the entire document call FoldAll(). With kFoldActionToggle the first fold header in the document is examined to decide whether to expand or contract.

171.2.110 FoldChildren(Line as Integer, FoldAction as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Contracts, expands or toggles children.
Notes: Provides a higher-level approach to folding instead of setting expanded flags and showing or hiding individual lines.

An individual fold can be contracted/expanded/toggled with FoldLine(). To affect all child folds as well call FoldChildren().

To affect the entire document call FoldAll(). With kFoldActionToggle the first fold header in the document is examined to decide whether to expand or contract.

171.2.111 FoldLine(Line as Integer, FoldAction as Integer)

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Contracts, expands or toggles one line.
Notes: Provides a higher-level approach to folding instead of setting expanded flags and showing or hiding individual lines.

An individual fold can be contracted/expanded/toggled with FoldLine(). To affect all child folds as well call FoldChildren().

To affect the entire document call FoldAll(). With kFoldActionToggle the first fold header in the document is examined to decide whether to expand or contract.

171.2.112 FoldParent(line as Integer) as Integer

MBS Scintilla Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: This method returns the line number of the first line before line that is marked as a fold point with kFoldLevelHeaderFlag and has a fold level less than the line.
Notes: If no line is found, or if the header flags and fold levels are inconsistent, the return value is -1.

171.2.113 FormatRange(draw as boolean, range as ScintillaRangeToFormatMBS) as Integer

MBS Scintilla Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: FormatRange can be used to draw the text onto a display surface which can include a printer display surface.
Notes: Printed output shows text styling as on the screen, but it hides all margins except a line number margin. Markers do not appear in a margin but will change line background colour. The selection and caret are hidden.

Different platforms use different display surface ID types to print on. On Windows, these are HDCs., on GTK 3.x cairo_t *, and on Cocoa CGContextRef is used.

For macOS use Integer(g.Handle(Graphics.HandleTypes.CGContextRef)), for windows use Integer(g.Handle(Graphics.HandleTypes.HDC)), for Linux use Integer(g.Handle(Graphics.HandleTypes.CairoContext)) to get the handle.

This call renders a range of text into a device context. If you use this for printing, you will probably want to arrange a page header and footer; Scintilla does not do this for you. Each use of this message renders a range of text into a rectangular area and returns the position in the document of the next character to print.

The draw parameter controls if any output is done. Set this to false if you are paginating.

On Windows, hdc and hdcTarget should both be set to the device context handle of the output device (usually a printer). If you print to a metafile these will not be the same as Windows metafiles (unlike extended metafiles) do not implement the full API for returning information. In this case, set hdcTarget to the screen DC.

Page* properties define the rectangle { 0, 0, maxX, maxY } where maxX+1 and maxY+1 are the number of physically printable pixels in x and y.
