Function: Provides a set of properties that are used to manage a cookie.
Notes: All functions may raise WebView2ExceptionMBS in case of errors.
Requires WebView2 version 1.0.705.50 from January 2021.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 23.1pr4

208.4.2 Methods

208.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

208.4.4 Properties

208.4.5 Domain as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The domain for which the cookie is valid.
Notes: The default is the host that this cookie has been received from. Note that, for instance, ".bing.com", "bing.com", and "www.bing.com" are considered different domains.
(Read only property)

208.4.6 Expires as Double

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The expiration date and time for the cookie as the number of seconds since the UNIX epoch.
Notes: The default is -1.0, which means cookies are session cookies by default.

Cookies are session cookies and will not be persistent if Expires is set to -1.0. NaN, infinity, and any negative value set other than -1.0 is disallowed.
(Read and Write property)

208.4.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

208.4.8 IsHttpOnly as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Whether this cookie is http-only.
Notes: True if a page script or other active content cannot access this cookie. The default is false.
(Read and Write property)

208.4.9 IsSecure as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The security level of this cookie.
Notes: True if the client is only to return the cookie in subsequent requests if those requests use HTTPS. The default is false. Note that cookie that requests kCookieSameSiteKindNone but is not marked Secure will be rejected.
(Read and Write property)

208.4.10 IsSession as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Whether this is a session cookie. The default is false.
Notes: (Read only property)

208.4.11 Name as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Cookie name.
Notes: (Read only property)

208.4.12 Path as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The path for which the cookie is valid.
Notes: The default is "/", which means this cookie will be sent to all pages on the Domain.
(Read only property)

208.4.13 SameSite as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: SameSite status of the cookie which represents the enforcement mode of the cookie.
Notes: The default is kCookieSameSiteKindLax.
(Read and Write property)

208.4.14 Value as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Cookie value.
Notes: (Read and Write property)

208.4.15 Constants

Same Site Rules

Constant	Value	Description
kCookieSameSiteKindLax	1	Lax.
kCookieSameSiteKindNone	0	None.
kCookieSameSiteKindStrict	2	Strict.

208.5 class WebView2ExceptionMBS

208.5.1 class WebView2ExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The class for the exceptions raised by our WebView2 control.
Notes: Subclass of the RuntimeException class.

208.6 class WebView2PrintSettingsMBS

208.6.1 class WebView2PrintSettingsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: Settings used by the PrintToPdf method.
Notes: Other programmatic printing is not currently supported, but Microsoft may add more later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

208.6.2 Methods

208.6.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

208.6.4 Properties

208.6.5 Collation as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: Printer collation.
Notes: See kCollation* constants for descriptions of collation.
The default value is kCollationDefault.

Printing uses default value of printer's collation if an invalid value is provided for the specific printer.

This value is ignored in PrintToPdf method.
(Read and Write property)

208.6.6 ColorMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: Printer color mode.
Notes: See kColorMode* constants for descriptions of color modes.
The default value is kColorModeDefault.

Printing uses default value of printer supported color if an invalid value is provided for the specific printer.
(Read and Write property)

208.6.7 Copies as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: Number of copies to print.
Notes: Minimum value is 1 and the maximum copies count is 999. The default value is 1.
(Read and Write property)

208.6.8 Duplex as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: Printer duplex settings.
Notes: See kDuplex* constants for descriptions of duplex.
The default value is CoreWebView2PrintDuplex.Default.
Printing uses default value of printer's duplex if an invalid value is provided for the specific printer.
This value is ignored in PrintToPdf method.
(Read and Write property)

208.6.9 FooterURI as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The URI in the footer if ShouldPrintHeaderAndFooter is true.
Notes: The default value is the current URI. If an empty string value is provided, no URI is shown in the footer.
(Read and Write property)

208.6.10 HeaderTitle as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The title in the header if ShouldPrintHeaderAndFooter is true.
Notes: The default value is the title of the current document. If an empty string value is provided, no title is shown in the header.
(Read and Write property)

208.6.11 MarginBottom as Double

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The bottom margin in inches.
Notes: Unit is inches.
The default is 1 cm, or
textasciitilde 0.4 inches. A margin cannot be less than zero. If an invalid value is provided, the current value is not changed and an ArgumentException is thrown.
(Read and Write property)

208.6.12 MarginLeft as Double

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The left margin in inches.
Notes: Unit is inches.
The default is 1 cm, or
textasciitilde 0.4 inches. A margin cannot be less than zero. If an invalid value is provided, the current value is not changed and an ArgumentException is thrown.
(Read and Write property)

208.6.13 MarginRight as Double

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The right margin in inches.
Notes: Unit is inches.
The default is 1 cm, or
textasciitilde 0.4 inches. A margin cannot be less than zero. If an invalid value is provided, the current value is not changed and an ArgumentException is thrown.
(Read and Write property)

208.6.14 MarginTop as Double

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The top margin in inches.
Notes: Unit is inches.
The default is 1 cm, or
textasciitilde 0.4 inches. A margin cannot be less than zero. If an invalid value is provided, the current value is not changed and an ArgumentException is thrown.
(Read and Write property)

208.6.15 Orientation as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The orientation can be portrait or landscape.
Notes: The default orientation is portrait. See kOrientation* constants.
(Read and Write property)

208.6.16 PageHeight as Double

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The page height in inches.
Notes: Unit is inches.
The default height is 11 inches. If the provided page height is less than or equal to zero, the current value is not changed and an ArgumentException is thrown.
(Read and Write property)

208.6.17 PageRanges as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: Page range to print.
Notes: Defaults to empty string, which means print all pages. The PageRanges property is a list of page ranges specifying one or more pages that should be printed separated by commas. Any whitespace between page ranges is ignored. A valid page range is either a single integer identifying the page to print, or a range in the form [start page] - [last page] where start page and last page are integers identifying the first and last inclusive pages respectively to print. Every page identifier is an integer greater than 0 unless wildcards are used (see below examples). The first page is 1.

In a page range of the form [start page] - [last page] the start page number must be larger than 0 and less than or equal to the document's total page count. If the start page is not present, then 1 is used as the start

page. The last page must be larger than the start page. If the last page is not present, then the document total page count is used as the last page.

Repeating a page does not print it multiple times. To print multiple times, use the Copies property.

The pages are always printed in ascending order, even if specified in non-ascending order.
If page range is not valid or if a page is greater than document total page count, ArgumentException is thrown.

The following examples assume a document with 20 total pages.

Example	Result	Notes
"2"	Page 2	
"1-4, 9, 3-6, 10, 11"	Pages 1-6, 9-11	
"1-4, -6"	Pages 1-6	The "-6" is interpreted as "1-6".
"2-"	Pages 2-20	The "2-" is interpreted as "pages 2 to the end of the document".
"4-2, 11, -6"	Invalid	"4-2" is an invalid range.
"-"	Pages 1-20	The "-" is interpreted as "page 1 to the end of the document".
"1-4dsf, 11"	Invalid	
"2-2"	Page 2	

(Read and Write property)

208.6.18 PagesPerSide as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: Prints multiple pages of a document on a single piece of paper.
Notes: Choose from 1, 2, 4, 6, 9 or 16. The default value is 1.

If an invalid value is provided, ArgumentException is thrown.

Below examples shows print output for PagesPerSide and Duplex.

PagesPerSide	Total pages	Two-sided printing	Result
1	1	-	1 page on the front side.
2	1	Yes	1 page on the front side.
2	4	-	2 pages on the first paper and 2 pages on the next paper.
2	4	Yes	2 pages on the front side and 2 pages on back side.
4	4	Yes	4 pages on the front side.
4	8	Yes	4 pages on the front side and 4 pages on the back side.

(Read and Write property)

208.6.19 PageWidth as Double

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The page width in inches.
Notes: Unit is inches.
The default width is 8.5 inches. If the provided page width is less than or equal to zero, the current value is not changed and an ArgumentException is thrown.
(Read and Write property)

208.6.20 PrinterName as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The name of the printer to use.
Notes: Defaults to empty string. If the printer name is empty string or null, then it prints to the default printer on the user OS.

If provided printer name doesn't match with the name of any installed printers on the user OS, the method returns with CoreWebView2PrintStatus.PrinterUnavailable.

Use DeviceInformation.FindAllAsync to get the list of local printers with AQS as "System.Devices.HardwareIds:
textasciitilde
textasciitilde "PRINTENUM\LocalPrintQueue""

This value is ignored in PrintToPdf method
(Read and Write property)

208.6.21 ScaleFactor as Double

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The scale factor is a value between 0.1 and 2.0.
Notes: The default is 1.0. If an invalid value is provided, the current value is not changed and an ArgumentException is thrown.
(Read and Write property)

208.6.22 ShouldPrintBackgrounds as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: True if background colors and images should be printed.
Notes: The default value is false.
(Read and Write property)

208.6.23 ShouldPrintHeaderAndFooter as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: True if header and footer should be printed.
Notes: The default value is false. The header consists of the date and time of printing, and the title of the page. The footer consists of the URI and page number. The height of the header and footer is 0.5 cm, or textasciitilde 0.2 inches.
(Read and Write property)

208.6.24 ShouldPrintSelectionOnly as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: True if only the current end user's selection of HTML in the document should be printed.
Notes: The default value is false.
(Read and Write property)

208.6.25 Constants

Collation

Constant	Value	Description
kCollationCollated	1	Indicate that the collation has been selected for the printed output.
kCollationDefault	0	The default collation for a printer.
kCollationUncollated	2	Indicate that the collation has not been selected for the printed output.

Color Modes

Constant	Value	Description
kColorModeColor	1	Indicate that the printed output will be in color.
kColorModeDefault	0	The default color mode for a printer.
kColorModeGrayScale	2	Indicate that the printed output will be in shades of gray.

Duplex Modes

Constant	Value	Description
kDuplexDefault	0	The default duplex for a printer.
kDuplexOneSided	1	Print on only one side of the sheet.
kDuplexTwoSidedLongEdge	2	Print on both sides of the sheet, flipped along the long edge.
kDuplexTwoSidedShortEdge	3	Print on both sides of the sheet, flipped along the short edge.

Orientations

Constant	Value	Description
kOrientationLandscape	1	Print the page(s) in landscape orientation.
kOrientationPortrait	0	Print the page(s) in portrait orientation.

208.7 class WebView2WindowFeaturesMBS

208.7.1 class WebView2WindowFeaturesMBS

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: The window features for a WebView popup window.
Notes: The fields match the windowFeatures passed to window.open as specified in Window features on MDN. There is no requirement for you to respect the values. If your app does not have corresponding UI features (for example, no toolbar) or if all instance of WebView are opened in tabs and do not have distinct size or positions, then your app does not respect the values. You may want to respect values, but perhaps only some apply to the UI of you app. Accordingly, you may respect all, some, or none of the properties as appropriate for your app. For all numeric properties, if the value that is passed to window.open is outside the range of an unsigned 32bit int, the resulting value is the absolute value of the maximum for unsigned 32bit integer. If you are not able to parse the value an integer, it is considered 0. If the value is a floating point value, it is rounded down to an integer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

208.7.2 Methods

208.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

208.7.4 Properties

208.7.5 HasPosition as Boolean

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Specifies left and top values.
Notes: (Read and Write property)

208.7.6 HasSize as Boolean

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Specifies height and width values.
Notes: (Read and Write property)

208.7.7 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the height of the window.
Notes: Minimum value is 100. If HasSize is set to false, this field is ignored.
(Read and Write property)

208.7.8 Left as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the left position of the window.
Notes: If HasPosition is set to false, this field is ignored.
(Read and Write property)

208.7.9 ShouldDisplayMenuBar as Boolean

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Indicates that the menu bar is displayed.
Notes: (Read and Write property)

208.7.10 ShouldDisplayScrollBars as Boolean

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Indicates that the scroll bars are displayed.
Notes: (Read and Write property)

208.7.11 ShouldDisplayStatus as Boolean

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Indicates that the status bar is displayed.
Notes: (Read and Write property)

208.7.12 ShouldDisplayToolbar as Boolean

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Indicates that the browser toolbar is displayed.
Notes: (Read and Write property)

208.7.13 Top as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the top position of the window.
Notes: If HasPosition is set to false, this field is ignored.
(Read and Write property)

208.7.14 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the width of the window.
Notes: Minimum value is 100. If HasSize is set to false, this field is ignored.
(Read and Write property)

Chapter 209

Whisper

209.1 class WhisperContextMBS

209.1.1 class WhisperContextMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a whisper context.

209.1.2 Methods

209.1.3 Constructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.
See also:

- 209.1.4 Constructor(Buffer as MemoryBlock, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816
- 209.1.5 Constructor(File as FolderItem, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816
- 209.1.6 Constructor(Path as String, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816

209.1.4 Constructor(Buffer as MemoryBlock, Params as WhisperContextParamsMBS, InitState as boolean = true)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads a model with a buffer holding the model.
See also:

- 209.1.3 Constructor 23815
- 209.1.5 Constructor(File as FolderItem, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816
- 209.1.6 Constructor(Path as String, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816

209.1.5 Constructor(File as FolderItem, Params as WhisperContextParamsMBS, InitState as boolean = true)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads a model with a folderitem.
See also:

- 209.1.3 Constructor 23815
- 209.1.4 Constructor(Buffer as MemoryBlock, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816
- 209.1.6 Constructor(Path as String, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816

209.1.6 Constructor(Path as String, Params as WhisperContextParamsMBS, InitState as boolean = true)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads a model with a path.
See also:

- 209.1.3 Constructor 23815
- 209.1.4 Constructor(Buffer as MemoryBlock, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816
- 209.1.5 Constructor(File as FolderItem, Params as WhisperContextParamsMBS, InitState as boolean = true) 23816

209.1.7 Destructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

209.1.8 full(params as WhisperFullParamsMBS, samples as Ptr, sampleCount as Integer, state as WhisperStateMBS = nil) as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs the complete transcription process, typically taking audio input and generating text output.
Notes: It involves all the necessary steps, including audio feature extraction, language modeling, and decoding, to produce a full transcription of the audio input.

Run the entire model: PCM ->log mel spectrogram ->encoder ->decoder ->text
Not thread safe for same context.

You need to pass a pointer with floats for the sample data.
See also:

- 209.1.9 full(params as WhisperFullParamsMBS, samples() as Single, state as WhisperStateMBS = nil) as Integer 23817

209.1.9 full(params as WhisperFullParamsMBS, samples() as Single, state as WhisperStateMBS = nil) as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs the complete transcription process, typically taking audio input and generating text output.
Notes: It involves all the necessary steps, including audio feature extraction, language modeling, and decoding, to produce a full transcription of the audio input.

Run the entire model: PCM ->log mel spectrogram ->encoder ->decoder ->text
Not thread safe for same context.

For convenience you can pass here a Xojo array instead of a ptr.
See also:

- 209.1.8 full(params as WhisperFullParamsMBS, samples as Ptr, sampleCount as Integer, state as WhisperStateMBS = nil) as Integer 23817

209.1.10 FullGetSegmentSpeakerTurnNext(Segment as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get whether the next segment is predicted as a speaker turn.

209.1.11 FullGetSegmentT0(Segment as Integer) as Int64

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the start time of the specified segment.

209.1.12 FullGetSegmentT1(Segment as Integer) as Int64

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the end time of the specified segment.

209.1.13 FullGetToken(Segment as Integer, Token as Integer) as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the token in the specified segment.

209.1.14 FullGetTokenData(Segment as Integer, Token as Integer) as WhisperTokenDataMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get token data for the specified token in the specified segment.
Notes: This contains probabilities, timestamps, etc.

209.1.15 FullGetTokenDatas(Segment as Integer) as WhisperTokenDataMBS()

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries all token data for the specified token in the specified segment.
Notes: This contains probabilities, timestamps, etc.

209.1.16 FullGetTokenP(Segment as Integer, Token as Integer) as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the probability of the specified token in the specified segment.

209.1.17 FullGetTokens(Segment as Integer) as WhisperTokenMBS()

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get all the tokens in the specified segment.

209.1.18 FullGetTokenText(Segment as Integer, Token as Integer) as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the token text of the specified token in the specified segment.

209.1.19 FullGetTokenTexts(Segment as Integer) as String()

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get all token texts of the specified segment.

209.1.20 FullSegmentText(Segment as Integer) as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the text of the specified segment.

209.1.21 FullTokens(Segment as Integer) as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get number of tokens in the specified segment.

209.1.22 InitState as WhisperStateMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initiales the state of the Whisper model before transcription begins.
Notes: This state includes setting up the model's internal variables, memory, and other necessary components to ensure the model can process audio effectively.

209.1.23 Logits as Ptr

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The Token logits obtained from the last call to Decode().

209.1.24 PrintSystemInfo as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print system information.
Notes: e.g.
AVX = 0 | AVX2 = 0 | AVX512 = 0 | FMA = 0 | NEON = 1 | ARM_FMA = 1 | F16C = 0 | FP16_VA = 1 | WASM_SIMD = 0 | SSE3 = 0 | SSSE3 = 0 | VSX = 0 | COREML = 0 | OPENVINO = 0 |

209.1.25 PrintTimings

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print timings.

209.1.26 ResetTimings

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reset the timings.

209.1.27 Timings as WhisperTimingsMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries timing.
Notes: See also PrintTimings and ResetTiming.

209.1.28 TokenBEG as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a special token for the beginning of the text.

209.1.29 TokenCount(text as String) as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the number of tokens in the provided text.

209.1.30 TokenEOT as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a special token for the ending of the text.

209.1.31 Tokenize(text as String) as WhisperTokenMBS()

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convert the provided text into tokens.
Notes: The plugin estimates the number of tokens, allocates a buffer and fills the token array with the result.

209.1.32 TokenLANG(LangID as Integer) as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a token for the given language id.

209.1.33 TokenNOSP as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets special token for NOSP.

209.1.34 TokenNOT as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets special token for NOT

209.1.35 TokenPREV as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets special token for PREV.

209.1.36 TokenSOLM as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets special token for SOLM.

209.1.37 TokenSOT as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets special token for SOT.

209.1.38 TokenTranscribe as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The task token for transcribe.

209.1.39 TokenTranslate as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The task token for translation.

209.1.40 Properties

209.1.41 Abort as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to abort processing.
Notes: Set to true to cancel processing.
(Read and Write property)
See also:

- 209.1.65 Abort as Boolean 23828

209.1.42 AudioCtx as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Defines the context window size for the audio frames that the Whisper model processes at a time.
Notes: It determines how much of the surrounding audio the model uses to understand the current segment, influencing the model's ability to capture and transcribe continuous speech, especially in challenging or overlapping audio.
(Read only property)

209.1.43 ContextHandle as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The handle for the context.
Notes: (Read only property)

209.1.44 FullLangId as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Language id associated with the context's default state.
Notes: (Read only property)

209.1.45 FullSegments as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of generated text segments.
Notes: A segment can be a few words, a sentence, or even a paragraph.
(Read only property)

209.1.46 IsMultilingual as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to use the multilingual mode.
Notes: Whisper uses the first 30 seconds to detect the language.
(Read only property)

209.1.47 Length as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The length of the input sequence (in terms of tokens or frames) that the Whisper model can process at once.
Notes: It defines the maximum number of tokens or audio frames the model can handle in a single pass, helping to control memory usage and processing efficiency during transcription.
(Read only property)

209.1.48 ModelAaudioLayer as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the number of layers in the audio processing part of the Whisper model.
Notes: These layers are responsible for transforming the raw audio input into features that can be used for transcription, with more layers generally allowing the model to capture more complex acoustic patterns and improving its ability to transcribe audio accurately.
(Read only property)

209.1.49 ModelAudioCtx as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The context window size for the audio input in the Whisper model.
Notes: It specifies the number of audio frames or tokens the model considers at once when processing the input, helping it capture the necessary acoustic context to improve transcription accuracy, especially in noisy or complex audio scenarios.

(Read only property)

209.1.50 ModelAudioHead as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the number of attention heads in the audio processing part of the Whisper model. #
Notes: Each attention head allows the model to focus on different parts of the audio input simultaneously, helping it to better capture various acoustic features and relationships in the speech, leading to more accurate transcription.
(Read only property)

209.1.51 ModelAudioState as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal state or memory size of the audio processing part of the Whisper model.
Notes: It determines how much of the previous audio context the model retains when processing the current input, helping it maintain coherence and continuity over longer segments of speech for more accurate transcription.
(Read only property)

209.1.52 ModelFType as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the file type or format of the Whisper model files being used, such as whether the model is stored in a standard format or a compressed version.
Notes: It helps the system determine how to properly load and handle the model files during inference, affecting compatibility and potentially loading efficiency.
(Read only property)

209.1.53 ModelMels as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the number of Mel frequency bins used in the model's spectrogram representation of the audio input.
Notes: It determines the granularity of the frequency analysis, with a higher number of Mel bins providing more detailed frequency information, which can improve transcription accuracy, especially for complex audio.

(Read only property)

209.1.54 ModelTextCtx as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Defines the context window size for the text input in the Whisper model.
Notes: It specifies the maximum number of tokens (words or subwords) the model considers when processing the transcription, influencing how much of the preceding text the model uses to understand and generate the current token during transcription.
(Read only property)

209.1.55 ModelTextHead as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the number of attention heads in the text processing layers of the Whisper model.
Notes: Each attention head allows the model to focus on different parts of the input sequence simultaneously, improving its ability to capture diverse relationships and dependencies in the transcribed text.
(Read only property)

209.1.56 ModelTextLayer as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the number of layers in the text processing part of the Whisper model.
Notes: These layers are responsible for interpreting the sequence of tokens during transcription, with more layers generally allowing the model to capture more complex patterns and relationships in the text, improving accuracy at the cost of increased computational resources.
(Read only property)

209.1.57 ModelTextState as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Refers to the internal state or memory size of the text processing part of the Whisper model.
Notes: It controls how much of the previous context or information the model retains during the transcription process, influencing its ability to maintain coherence and context across longer segments of speech or text.
(Read only property)

209.1.58 ModelType as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Specifies the internal model type used by the Whisper system.
Notes: This corresponds to the architecture or variant of the model (e.g., "base", "small", "medium", "large"). It determines the model's capabilities in terms of performance, speed, and accuracy, with larger models generally providing better accuracy at the cost of higher resource usage.
(Read only property)

209.1.59 ModelTypeReadable as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retruns a human-readable string that specifies the type of Whisper model being used, such as "small", "medium", or "large."
Notes: It helps identify the model variant, which can influence transcription speed, accuracy, and resource usage depending on the chosen size.
(Read only property)

209.1.60 ModelVocab as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the size of the vocabulary the Whisper model uses for tokenization during transcription.
Notes: It determines the number of unique tokens (such as words, subwords, or characters) that the model can recognize and generate.
(Read only property)

209.1.61 TextCtx as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Defines the maximum number of tokens the model considers as context during transcription.
Notes: It controls how much of the previous transcription the model "remembers" at any given time, balancing context accuracy with computational efficiency.
(Read only property)

209.1.62 Vocab as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Defines the size of the vocabulary that the Whisper model uses during transcription.
Notes: It specifies the number of unique tokens (such as words, subwords, or characters) that the model can recognize and generate, influencing the model's ability to handle various languages and transcription tasks.
(Read only property)

209.1.63 Yield as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: How much time is given back to Xojo for other ticks.
Example:

```
Var t as new WhisperContextMBS
t.Yield = 6 // only use 1/10th of a second
```

Notes: If value is greater than zero, the application will yield to another Xojo thread after the given number of ticks have passed. 60 ticks are one second. Using a small value can slow down processing a lot while a big value keeps your application not responding to mouse clicks.
If you use this property with e.g. 6 as the value, you may also want to use this method in a thread so you can handle mouse events or let Xojo redraw a progressbar.
(Read and Write property)

209.1.64 Events

209.1.65 Abort as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to abort processing.
Notes: Return true to cancel processing.
See also:

- 209.1.41 Abort as Boolean 23823

209.1.66 EncoderBegin(State as WhisperStateMBS) as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The event called each time before the encoder starts.
Notes: If you return true, the computation is aborted.

209.1.67 Log(Level as Integer, Text as String)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The event called for each log message.
Notes: Since the logger is global, we dispatch it to all instances.

209.1.68 NewSegment(State as WhisperStateMBS, n_new as Integer)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The event called for every newly generated text segment.

209.1.69 Progress(State as WhisperStateMBS, progress as Integer)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The event to report progress.

209.1.70 Constants

Logs

Constant	Value	Description
LogLevelDebug	4	Debug
LogLevelError	3	Error
LogLevelInfo	1	Information
LogLevelNone	0	No logging
LogLevelWarn	2	Warning

209.2 class WhisperContextParamsMBS

209.2.1 class WhisperContextParamsMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for context parameters.
Blog Entries

- How to Use Whisper in Xojo to Transcribe Audio Files

209.2.2 Methods

209.2.3 Constructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the default parameters.

209.2.4 Destructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

209.2.5 Properties

209.2.6 dtw_aheads_preset as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: DTW aheads preset.
Notes: Defaults to 0.
(Read and Write property)

209.2.7 dtw_token_timestamps as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: DTW token timestamps.
Notes: Defaults to false.

(Read and Write property)

209.2.8 FlashAttn as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Flash attention.
Notes: Defaults to false.
(Read and Write property)

209.2.9 GPUDevice as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The ID for the GPU device to use.
Notes: CUDA device.
(Read and Write property)

209.2.10 UseGPU as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to use the GPU.
Notes: Defaults to true.
(Read and Write property)

209.2.11 Constants

Alignment Heads Preset

Constant	Value	Description
AheadsBase	6	Base
AheadsBaseEN	5	Base EN
AheadsCustom	2	Custom
AheadsLargeV1	11	Large V1
AheadsLargeV2	12	Large V2
AheadsLargeV3	13	Large V3
AheadsLargeV3Turbo	14	Large V3 Turbo
AheadsMedium	10	Medium
AheadsMediumEN	9	Medium EN
AheadsNone	0	
AheadsNTopMost	1	NTopMost
AheadsSmall	8	Small
AheadsSmallEN	7	Small EN
AheadsTiny	4	Tiny
AheadsTinyEN	3	Tiny EN

209.3 class WhisperFullParamsMBS

209.3.1 class WhisperFullParamsMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parameters for the Full function.
Blog Entries

- How to Use Whisper in Xojo to Transcribe Audio Files

209.3.2 Methods

209.3.3 Constructor(Strategy as Integer)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the default parameters.

209.3.4 Destructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

209.3.5 GrammarRules as WhisperGrammarElementMBS()

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the grammar rules.

209.3.6 PromptTokens as WhisperTokenMBS()

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries prompt tokens.

209.3.7 SetGrammarRules(rules() as WhisperGrammarElementMBS)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the grammar rules.

209.3.8 SetPromptTokens(tokens() as WhisperTokenMBS)

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets prompt tokens.
Notes: Tokens to provide to the whisper decoder as initial prompt.
These are prepended to any existing text context from a previous call use Tokenize() to convert text to tokens maximum of MaxTextContext/2 tokens are used (typically 224)

209.3.9 Properties

209.3.10 AudioContextSize as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Overwrite the audio context size (0 = use default).
Notes: (Read and Write property)

209.3.11 DebugMode as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable debug_mode provides extra info (eg. Dump log_mel).
Notes: (Read and Write property)

209.3.12 DetectLanguage as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to detect language.
Notes: (Read and Write property)

209.3.13 DurationMS as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Audio duration to process in ms.
Notes: (Read and Write property)

209.3.14 EntropyThold as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A parameter that influences the model's decoding behaviour.
Notes: It sets a threshold for the entropy of the generated text segments. If the entropy of a segment is below this threshold, the segment is considered unreliable or of low quality and may be discarded. This mechanism helps in filtering out segments that are likely to be erroneous or nonsensical.
(Read and Write property)

209.3.15 GrammarPenalty as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A parameter used to control how strictly the model adheres to grammatical correctness during transcription or text generation.
Notes: (Read and Write property)

209.3.16 GrammarRuleCount as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of grammar rules.
Notes: (Read only property)

209.3.17 InitialPrompt as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initial prompt text.
Notes: Tokens to provide to the whisper decoder as initial prompt.
These are prepended to any existing text context from a previous call use Tokenize() to convert text to tokens maximum of MaxTextContext/2 tokens are used (typically 224)
(Read and Write property)

209.3.18 Language as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The language.
Notes: Use "" for auto-detection.
(Read and Write property)

209.3.19 LengthPenalty as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Optional token length penalty coefficient (alpha).
Notes: uses simple length normalization by default.
(Read and Write property)

209.3.20 LogprobThold as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Log probability threshold determines the cutoff point for the model,Äôs confidence in the generated tokens (words or parts of words).
Notes: (Read and Write property)

209.3.21 MaxInitialTS as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The initial timestamp cannot be later than this.
Notes: (Read and Write property)

209.3.22 MaxLen as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Max segment length in characters.
Notes: (Read and Write property)

209.3.23 MaxTextContext as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Max tokens to use from past text as prompt for the decoder.
Notes: (Read and Write property)

209.3.24 MaxTokens as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Max tokens per segment (0 = no limit).
Notes: (Read and Write property)

209.3.25 NoContext as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not use past transcription (if any) as initial prompt for the decoder.
Notes: (Read and Write property)

209.3.26 NoSpeechThold as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A threshold for how confident the model must be that speech is present in the audio.
Notes: If the confidence is below this threshold, the model assumes there is no speech and stops transcribing that segment.
(Read and Write property)

209.3.27 NoTimestamps as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Do not generate timestamps.
Notes: (Read and Write property)

209.3.28 OffsetMS as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Start offset in ms.
Notes: (Read and Write property)

209.3.29 PrintProgress as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print progress information.
Notes: (Read and Write property)

209.3.30 PrintRealtime as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print results from within whisper.cpp (avoid it, use callback instead).
Notes: (Read and Write property)

209.3.31 PrintSpecial as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print special tokens (e.g. <SOT>, <EOT>, <BEG>, etc.).
Notes: (Read and Write property)

209.3.32 PrintTimestamps as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Print timestamps for each text segment when printing realtime.
Notes: (Read and Write property)

209.3.33 SingleSegment as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Force single segment output (useful for streaming).
Notes: (Read and Write property)

209.3.34 SplitOnWord as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Split on word rather than on token (when used with MaxLen).
Notes: (Read and Write property)

209.3.35 StartRule as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Index of the start rule.
Notes: Defines the condition or trigger that determines when the transcription process begins. It ensures the model starts transcribing only when it detects certain criteria, such as speech activity or a specific audio event.
(Read and Write property)

209.3.36 Strategy as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The strategy passed in the constructor.
Notes: (Read only property)

209.3.37 SuppressBlank as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Suppress blank outputs.
Notes: (Read and Write property)

209.3.38 SuppressNst as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Surpress non non-speech tokens.
Notes: (Read and Write property)

209.3.39 SuppressRegex as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A regular expression that matches tokens to suppress.
Notes: (Read and Write property)

209.3.40 TdrzEnable as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable tinydiarize speaker turn detection.
Notes: (Read and Write property)

209.3.41 Temperature as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initial decoding temperature.
Notes: (Read and Write property)

209.3.42 TemperatureInc as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Controls how much the model's "creativity" or randomness increases during decoding as it generates text.
Notes: A higher value encourages the model to produce more diverse and less predictable outputs, while a lower value keeps the transcription more focused and deterministic.
(Read and Write property)

209.3.43 TholdPT as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Timestamp token probability threshold (
textasciitilde 0.01).
Notes: (Read and Write property)

209.3.44 TholdPTSum as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Timestamp token sum probability threshold (
textasciitilde 0.01).
Notes: (Read and Write property)

209.3.45 Threads as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of threads to use.
Notes: (Read and Write property)

209.3.46 TokenTimestamps as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enable token-level timestamps.
Notes: (Read and Write property)

209.3.47 Translate as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to translate.
Notes: (Read and Write property)

209.3.48 Constants

Available sampling strategies

Constant	Value	Description
SamplingStrategyBeamSearch	1	Similar to OpenAI's BeamSearchDecoder.
SamplingStrategyGreedy	0	Similar to OpenAI's GreedyDecoder.

209.4 class WhisperGrammarElementMBS

209.4.1 class WhisperGrammarElementMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a grammar element.

209.4.2 Properties

209.4.3 Type as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The grammar element type.
Notes: (Read and Write property)

209.4.4 Value as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Unicode code point or rule ID.
Notes: (Read and Write property)

209.4.5 Constants

Grammar Element Types

Constant	Value	Description
GretypeAlt	1	Start of alternate definition for rule.
GretypeChar	3	Terminal element: character (code point)
GretypeCharAlt	6	Modifies a preceding GretypeChar or GretypeCharRngUpper to add an alternate char to match ([ab] , [a-zA])
GretypeCharNot	4	Inverse char(s) ([^a] , [^a-b] [^abc])
GretypeCharRngUpper	5	modifies a preceding WHISPER_GRETYPE_CHAR or LLAMA_GRETYPE_CHAR_ALT to be an inclusive range ([a-z])
GretypeEnd	0	End of rule definition.
GretypeRuleRef	2	Non-terminal element: reference to rule.

209.5 module WhisperMBS

209.5.1 module WhisperMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The module for global whisper functions.

- MBS Xojo Plugins, version 25.3pr1

Xojo Developer Magazine

- 23.5, page 9: News

209.5.2 Methods

209.5.3 LangID(Name as String) as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the id of the specified language, returns -1 if not found.
Notes: Examples:
”de” ->2
”german” ->2

209.5.4 LangString(id as Integer) as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the language string for the id.
Notes: Return the short string of the specified language id (e.g. 2 ->”de”), returns ”” if not found.

209.5.5 LangStringFull(id as Integer) as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the language string for the id.
Notes: Returns the short string of the specified language name (e.g. 2 ->”german”), returns ”” if not found

209.5.6 Loaded as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the library is loaded.

209.5.7 LoadErrorMessage as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The error message for loading the library.

209.5.8 LoadLibrary(File as FolderItem) as boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the library.
Notes: Set the LoadErrorMessage property.
See also:

- 209.5.9 LoadLibrary(Path as String) as boolean 23844

209.5.9 LoadLibrary(Path as String) as boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads the library.
Notes: Set the LoadErrorMessage property.
See also:

- 209.5.8 LoadLibrary(File as FolderItem) as boolean 23844

209.5.10 Properties

209.5.11 LangMaxID as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Largest language id (i.e. number of available languages - 1)
Notes: (Read only property)

209.6 class WhisperStateMBS

209.6.1 class WhisperStateMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a whisper state.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

209.6.2 Methods

209.6.3 Constructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

209.6.4 Destructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

209.6.5 FullGetSegmentSpeakerTurnNext(Segment as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get whether the next segment is predicted as a speaker turn.

209.6.6 FullGetSegmentT0(Segment as Integer) as Int64

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the start time of the specified segment.

209.6.7 FullGetSegmentT1(Segment as Integer) as Int64

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the end time of the specified segment.

209.6.8 FullGetToken(Segment as Integer, Token as Integer) as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the token in the specified segment.

209.6.9 FullGetTokenData(Segment as Integer, Token as Integer) as WhisperTokenDataMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get token data for the specified token in the specified segment.
Notes: This contains probabilities, timestamps, etc.

209.6.10 FullGetTokenP(Segment as Integer, Token as Integer) as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the probability of the specified token in the specified segment.

209.6.11 FullGetTokenText(Segment as Integer, Token as Integer) as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the token text of the specified token in the specified segment.

209.6.12 FullTokens(Segment as Integer) as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get number of tokens in the specified segment.

209.6.13 Logits as Ptr

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The Token logits obtained from the last call to Decode().

209.6.14 SegmentText(Segment as Integer) as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the text of the specified segment.

209.6.15 Properties

209.6.16 ContextHandle as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The handle for the context.
Notes: (Read only property)

209.6.17 FullLangId as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Language id associated with the provided state.
Notes: (Read only property)

209.6.18 FullSegments as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of generated text segments.
Notes: A segment can be a few words, a sentence, or even a paragraph.
(Read only property)

209.6.19 Handle as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

209.6.20 Length as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The Token logits obtained from the last call to Decode().
Notes: (Read only property)

209.7 class WhisperTimingsMBS

209.7.1 class WhisperTimingsMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performance information from the default state.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

209.7.2 Methods

209.7.3 Constructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

209.7.4 Properties

209.7.5 BatchdMS as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The time needed for batch.
Notes: In milliseconds.
(Read only property)

209.7.6 DecodeMS as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The time needed for decode.
Notes: In milliseconds.
(Read only property)

209.7.7 EncodeMS as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The time needed for encode.
Notes: In milliseconds.
(Read only property)

209.7.8 PromptMS as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The time needed for prompt.
Notes: In milliseconds.
(Read only property)

209.7.9 SampleMS as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The time needed for sample.
Notes: In milliseconds.
(Read only property)

209.8 class WhisperTokenDataMBS

209.8.1 class WhisperTokenDataMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for token data.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

209.8.2 Methods

209.8.3 Constructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

209.8.4 Destructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

209.8.5 Properties

209.8.6 ContextHandle as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The handle for the context.
Notes: (Read only property)

209.8.7 dtw as Int64

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Token-level timestamps with DTW.
Notes: (Read only property)

209.8.8 p as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Probability of the token.
Notes: (Read only property)

209.8.9 plog as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Log probability of the token.
Notes: (Read only property)

209.8.10 pt as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Probability of the timestamp token.
Notes: (Read only property)

209.8.11 ptsum as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sum of probabilities of all timestamp tokens.
Notes: (Read only property)

209.8.12 t0 as Int64

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Start time of the token.
Notes: (Read only property)

209.8.13 t1 as Int64

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: End time of the token.
Notes: (Read only property)

209.8.14 TokenID as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The token ID.
Notes: (Read only property)

209.8.15 TokenTID as WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The forced timestamp token id.
Notes: (Read only property)

209.8.16 VoiceLength as Single

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Voice length of the token.
Notes: (Read only property)

209.9 class WhisperTokenMBS

209.9.1 class WhisperTokenMBS

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a token.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- How to Use Whisper in Xojo to Transcribe Audio Files

209.9.2 Methods

209.9.3 Constructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

209.9.4 Destructor

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

209.9.5 Properties

209.9.6 ContextHandle as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The handle for the context.
Notes: (Read only property)

209.9.7 Text as String

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The text representation of the token.
Notes: Works only as long as the context exists.
(Read only property)

209.9.8 Token as Integer

MBS Tools Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The token value.
Notes: (Read only property)

Chapter 210

Window

210.1 class DesktopWindow

210.1.1 class DesktopWindow

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extends Xojo's Window Class.
Example:

window1.HasNoTitleBarMBS = true

Notes: In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

210.1.2 Methods

210.1.3 ActivateWindowMBS

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Windows, Targets: Desktop only.

Function: Activates the window.
Notes: This function does more than just show. if the window has been minimized, it will restore it. Also the window is moved to front and made the current window for keyboard input.

Sadly windows limits which windows can go to front, so some windows may not come to front unless they are clicked on.

As activation can be asynchronously, the window may activate later, e.g. after current method ends.

For MacOS Cocoa apps, we simply bring the window to the front.

210.1.4 BackingScaleFactorMBS as double

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the scale factor representing the number of backing store pixels corresponding to each linear unit in window space on this window.
Notes: This is generally only necessary when building a bitmap context or image whose resolution needs to match that of a particular Window. Note that a Window's backing scale factor can change over time, such as when the window moves from one display to another, or when a display's resolution changes, so clients should not cache the value returned by this function.

If platform does not support scaling factor, we return 1.0. (on Windows, Linux and older Mac OS X)
Supported for Carbon and Cocoa windows.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.

210.1.5 CGContextMBS as CGContextMBS

MBS MacCG Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new CGContextMBS object for the given Window.
Example:

```
Var CGContext as CGContextMBS
Var OverlayPic as Picture=LogoMBS(500)
Var contentpicture as CGImageMBS= CGCreateImageMBS(OverlayPic)

CGContext=window1.CGContextMBS

CGContext.ClearRect CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)
CGContext.DrawPicture contentpicture, CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)
```

Notes: Requires Mac OS X to work.
Please make sure the CGContextMBS object is released in the paint event if you use it there, so all the drawings are flushed. Not releasing it my be visible in missing statictext or other strange graphics effects.

But on a Cocoa window the context is not always available, so in the window paint event, you can context

from Graphics object.

210.1.6 CleanUpTransparentMBS(refValue as integer)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cleans up transparency support for a Xojo window.
Example:

```
Var p as Integer // property on Windows

p = window1.MakeTransparentMBS

// later in close event

window1.CleanUpTransparentMBS p
```

Notes: Call this in the close event of a window passing the value you got from the MakeTransparentMBS call.
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.

210.1.7 ClearTransparencyMBS

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Clears transparency of a window.

210.1.8 CollapsableMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns true if this window is collapsed. You can set it.
Example:

```
mainwindow.collapsedMBS=false 'show window
```

Notes: Collapseable windows are the normal document windows.
You can't collapse dialogs or floating windows well.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

210.1.9 ConstrainWindowToScreenMBS(animate as Boolean)

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Makes sure the window is on one screen visible.
Notes: Implemented on Mac for both Carbon and Cocoa.

210.1.10 GTKWindow as GTKWindowMBS

MBS Linux Plugin, Plugin Version: 21.5, Platform: Linux, Targets: Desktop only.

Function: Queries a GTKWindow object for this window.
Notes: Returns only a valid object on linux.
On other platforms, this function returns nil.

210.1.11 HideKeyboardMBS

MBS Win Plugin, Plugin Version: 23.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: Hides the keyboard.
Notes: On Windows same as ShowKeyboardMBS, but may not launch the keyboard.

If you called ShowKeyboardMBS before, you can call this function to hide it.

210.1.12 InvalidateShadowMBS

MBS MacOSX Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This method causes a window's shadow to be recalculated.
Notes: InvalidateShadowMBS is not typically used by applications. However, it may be useful for applications with customized window frames that change shape dynamically; in this case, after the application has drawn the new window shape, the window shadow must be recalculated to follow the new window shape.

This method causes the window shadow to be immediately recalculated and redrawn based on the current contents of the window's back buffer. For best performance and visual appearance, you should follow these steps when invalidating a window shadow: disable updates with DisableScreenUpdatesMBS, draw, flush, invalidate the shadow, and enable updates. For a compositing window, after invalidating any views that should be redrawn, you will need to explicitly draw and flush using HIWindowFlush, rather than waiting for the event loop to draw and flush the window, because you cannot disable updates or invalidate the window shadow if drawing is done via the event loop.

210.1.13 IsFullScreenMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Queries whether window is fullscreen.
Notes: Indicates that a window has fullscreen appearance.
A fullscreen window does not draw its titlebar, and may have special handling for its toolbar.
Available in Mac OS X v10.7 and later.

210.1.14 MakeTransparentMBS as integer

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Installs transparency support to a Xojo window.
Example:

```
Var p as Integer // property on Windows

p = window1.MakeTransparentMBS

// later in close event

window1.CleanUpTransparentMBS p
```

Notes: Will return non zero value if successfull.
The window doesn't change if you don't use the CGContextMBS property.

Requires Mac OS X, Windows 2000 or Windows XP to work. The window must be a document window.

Set MacProcID of the window to 1104 and you can make it transparent without a title bar. (on Mac OS X)

With plugin version 11.1, we now return a value which should store with the window. Later in the Close event, you call CleanUpTransparentMBS passing this value.

Added Cocoa support in 11.3 plugins.
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel. Calls to MakeTransparentMBS and CleanUpTransparentMBS are not required for Linux.

210.1.15 NSPanelMBS as NSPanelMBS

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSPanel for the given Xojo window.
Example:

MsgBox window1.NSPanelMBS.Title

Notes: Works only for Cocoa Windows in Cocoa target which are floating panels.

210.1.16 NSToolbarMBS as NSToolbarMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The window's toolbar.
Notes: So you can get the toolbar without going over NSWindowMBS.
But there you can assign a new toolbar...

210.1.17 NSWindowMBS as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSWindow for the given Xojo window.
Example:

MsgBox window1.NSWindowMBS.Title

Notes: Works only for Cocoa Windows in Cocoa target and for Carbon Windows in carbon targets.

210.1.18 RefreshThreadSafeMBS(immediately As Boolean = False)

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Refresh the rectangle.
Notes: This method is to allow you to refresh in a thread without a problem.

If called on main thread, the plugin will simply call Refresh method directly.
If called on other threads the plugin will schedule to call Refresh method a short time later on the main thread.
See also:

- 210.1.19 RefreshThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, immediately As Boolean = False)

210.1.19 RefreshThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, immediately As Boolean = False)

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Refresh the rectangle.
Notes: This method is to allow you to refresh in a thread without a problem.

If called on main thread, the plugin will simply call RefreshRect method directly.
If called on other threads the plugin will schedule to call RefreshRect method a short time later on the main thread.
See also:

- 210.1.18 RefreshThreadSafeMBS(immediately As Boolean = False) 23862

210.1.20 RemoveWindowProxyIconMBS

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Removes any Proxy Icon from the Window.
Example:

```
mainwindow.RemoveWindowProxyIconMBS
```

Notes: Requires Mac OS 8.5 or newer.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

210.1.21 ScreenshotWindowMBS as picture

MBS Picture Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the content of the window buffer on Mac OS X.
Example:

```
Var p as Picture
p=mainwindow.screenshotWindowMBS
```

Notes: Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Xojo 2006 or newer, please add a self. on front of the method call in case you want to use the method on the current window.

210.1.22 ScreenshotWindowRectMBS(left as integer, top as integer, width as integer, height as integer) as picture

MBS Picture Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a part of the content of the window buffer on Mac OS X.
Example:

```
Var p as picture
p=mainwindow.ScreenshotWindowRectMBS(100,100,200,200)
```

Notes: Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Xojo 2006 or newer, please add a self. on front of the method call in case you want to use the method on the current window.

210.1.23 SetTransparencyMBS(value as integer) as boolean

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Your window can have transparency on Mac OS X.
Example:

```
if window1.SetTransparencyMBS(127) then
'fine
else
'error
end if
```

Notes: Use values between 0 and 255.
Requires Mac OS X, Windows 2000 or Windows XP to work.
May be limited to simple windows like normal document windows.
You need to call MakeTransparent before to install transparency.
(this function was replaced in v4.4)
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.

210.1.24 SetWindowFeedbackSettingMBS(Feedback as Integer, value as Variant) as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Sets the feedback configuration for a window.
Example:

```
const FEEDBACK_TOUCH_CONTACTVISUALIZATION = 1
const FEEDBACK_PEN_BARRELVISUALIZATION = 2
const FEEDBACK_PEN_TAP = 3
const FEEDBACK_PEN_DOUBLETAP = 4
const FEEDBACK_PEN_PRESSANDHOLD = 5
const FEEDBACK_PEN_RIGHTTAP = 6
const FEEDBACK_TOUCH_TAP = 7
const FEEDBACK_TOUCH_DOUBLETAP = 8
const FEEDBACK_TOUCH_PRESSANDHOLD = 9
const FEEDBACK_TOUCH_RIGHTTAP = 10
const FEEDBACK_GESTURE_PRESSANDTAP = 11
```

```
Var r as Boolean = self.SetWindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, true)

if r then
Var value as Boolean
Var b as Boolean = self.WindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, value)
if b then
MsgBox "WindowFeedbackSettingMBS: "+str(value)
end if
end if
```

Notes: Returns true if successful; otherwise, returns false.

Value can be nil to reset value. Or true/false to set it.
Requires Windows 8 or Windows Server 2012 in desktop apps only.

Constant Name	Value	Description
FEEDBACK_TOUCH_CONTACTVISUALIZATION	1	Feedback for a touch contact event.
FEEDBACK_PEN_BARRELVISUALIZATION	2	Feedback for a pen barrel-button event.
FEEDBACK_PEN_TAP	3	Feedback for a pen tap event.
FEEDBACK_PEN_DOUBLETAP	4	Feedback for a pen double-tap event.
FEEDBACK_PEN_PRESSANDHOLD	5	Feedback for a pen press-and-hold event.
FEEDBACK_PEN_RIGHTTAP	6	Feedback for a pen right-tap event.
FEEDBACK_TOUCH_TAP	7	Feedback for a touch tap event.
FEEDBACK_TOUCH_DOUBLETAP	8	Feedback for a touch double-tap event.
FEEDBACK_TOUCH_PRESSANDHOLD	9	Feedback for a touch press-and-hold event.
FEEDBACK_TOUCH_RIGHTTAP	10	Feedback for a touch right-tap event.
FEEDBACK_GESTURE_PRESSANDTAP	11	Feedback for a press-and-tap gesture.

210.1.25 SetWindowIconMBS(Type as integer, File as FolderItem, IconID as integer) as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Sets the window icon using the icon in the file.

Example:

```
call window1.SetWindowIconMBS(0,getfolderitem("icon.ico"),1)
```

Notes: Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.
See also:

- 210.1.26 SetWindowIconMBS(Type as integer, Icon as Picture, Mask as Picture) as Boolean 23866

210.1.26 SetWindowIconMBS(Type as integer, Icon as Picture, Mask as Picture) as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Sets the window icon using the given picture with mask.
Example:

```
Var p as Picture
Var m as Picture

// random colored circle image
p=New Picture(16,16,32)
p.Graphics.ForeColor=&c000000
p.Graphics.FillRect 0,0,16,16
p.Graphics.ForeColor=rgb(rnd*256,rnd*256,rnd*256)
p.Graphics.Filloval 0,0,16,16

// circle mask
m=New Picture(16,16,32)
m.Graphics.ForeColor=&cFFFFFF // transparent
m.Graphics.Fillrect 0,0,16,16
m.Graphics.ForeColor=&c000000 // color
m.Graphics.Filloval 0,0,16,16

Canvas1.Backdrop=p // show in canvas
Canvas2.Backdrop=m

call window1.SetWindowIconMBS(0,p,m)
```

Notes: The mask picture ist converted to black/white.
What image depths are used and supported depends on the Windows version.
Returns true on success and false on failure.

Possible values for type:

ICON_BIG = 1	Set the large icon for the window.
ICON_SMALL = 0	Set the small icon for the window.

See also:

- 210.1.25 SetWindowIconMBS(Type as integer, File as FolderItem, IconID as integer) as Boolean 23865

210.1.27 SetWindowMaskMBS(p as picture, redraw as Boolean, transparentColor as color) as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Sets the mask of a window.
Notes: Redraw decides whether the window is redrawn after it has been changed.
Returns true if successfull.

If you want to do the same on Mac OS X, check the example projects "transparent window" and the Photoshop Splash Screen example.

210.1.28 ShowHideToolbarMBS(animate as Boolean, value as Boolean)

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Shows or hides the toolbar.
Notes: Only working on MacOS.

210.1.29 ShowKeyboardMBS

MBS Win Plugin, Plugin Version: 23.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: Shows the keyboard viewer.
Notes: On Windows you can trigger this a second time to hide it.

See also ShowCharacterPaletteMBS function.

210.1.30 SmoothResizeCenteredMBS(width as integer,height as integer)

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Resizes the window smoothly to all directions.
Example:

```
Var w,h as Integer

// get destination dimension

w=300
h=200

// Resize

window1.SmoothResizeCenteredMBS w,h

// Now resize via RB to make it permament.

width=w
height=h
```

Notes: You need to set the new size using Xojo's Windows properties, too. (no longer needed with Xojo)
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

210.1.31 SmoothResizeMBS(width as integer,height as integer)

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Resizes the window smoothly.
Example:

```
Var w,h as Integer

// get destination dimension

w=300
h=200

// Resize

window1.SmoothResizeMBS w,h

// Now resize via RB to make it permament.

width=w
```

height=h

Notes: You need to set the new size using Xojo's Windows properties, too. (no longer needed with Xojo)
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

210.1.32 ToggleFullScreenMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Toggles fullscreen mode for this window.
Notes: Returns true on success.
If an application supports fullscreen, it should add a menu item to the View menu with toggleFullScreen as the action.
Available in Mac OS X v10.7 and later.
This method does not much if you don't mark a window to be the primary fullscreen window.

210.1.33 UpdateNowMBS

MBS MacOSX Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: On MacOS all windows are doublebuffered and the OS updates the screen from time to time. This method forces a screen update.
Example:

Mainwindow.UpdateNowMBS

Notes: Updated for 64-bit in plugin version 18.3.

210.1.34 UpdateNowRectMBS(left as integer, top as integer, width as integer, height as integer)

MBS MacOSX Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: On Mac OS all windows are doublebuffered and the OS updates the screen from time to time. This method forces a screen update for a part of your window.
Example:

Mainwindow.UpdateNowRectMBS Mainwindow.text.left, Mainwindow.text.top, Mainwindow.text.width, Mainwindow.text.height

210.1.35 WinAnimateWindowMBS(Flags as integer, Time as integer=200) as boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: The AnimateWindow function enables you to produce special effects when showing or hiding windows.
Example:

```
Var flags as Integer

const AW_SLIDE = &h040000 // Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
const AW_ACTIVATE = &h020000 // Activates the window. Do not use this value with AW_HIDE.
const AW_BLEND = &h080000 // Uses a fade effect. This flag can be used only if hwnd is a top-level window.
const AW_HIDE = &h010000 //Hides the window. By default, the window is shown.
const AW_CENTER = &h10 // Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
const AW_HOR_POSITIVE = 1 // Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_HOR_NEGATIVE = 2 // Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_POSITIVE = 4 // Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_NEGATIVE = 8 // Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

window2.hide

flags=BitwiseOr(AW_SLIDE, AW_HOR_POSITIVE)

if window2.WinAnimateWindowMBS(flags, 1000) then
window2.show
else
MsgBox "Animatin failed."
end if
```

Notes: There are four types of animation: roll, slide, collapse or expand, and alpha-blended fade.

self: The window to animate. The calling thread must own this window.
Time: Specifies how long it takes to play the animation, in milliseconds. Typically, an animation takes 200 milliseconds to play.
Flags: Specifies the type of animation. This parameter can be one or more of the following values. Note that, by default, these flags take effect when showing a window. To take effect when hiding a window, use AW_HIDE and a bitwiseor operator with the appropriate flags.

AW_SLIDE	= &h040000	Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
AW_ACTIVATE	= &h020000	Activates the window. Do not use this value with AW_HIDE.
AW_BLEND	= &h080000	Uses a fade effect. This flag can be used only if hwnd is a top-level window.
AW_HIDE	= &h010000	Hides the window. By default, the window is shown.
AW_CENTER	= &h10	Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
AW_HOR_POSITIVE	= 1	Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_HOR_NEGATIVE	= 2	Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_POSITIVE	= 4	Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_NEGATIVE	= 8	Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

Return Value:
If the function succeeds, the return value is true.
If the function fails, the return value is false.
The function will fail in the following situations:

- If the window uses the window region. Windows XP: This does not cause the function to fail.
- If the window is already visible and you are trying to show the window.
- If the window is already hidden and you are trying to hide the window.
- If there is no direction specified for the slide or roll animation.
- When trying to animate a child window with AW_BLEND.
- If the thread does not own the window. Note that, in this case, AnimateWindow fails but GetLastError returns ERROR_SUCCESS. To get extended error information, call the GetLastError function.

To show or hide a window without special effects, use Show.
When using slide or roll animation, you must specify the direction. It can be either AW_HOR_POSITIVE, AW_HOR_NEGATIVE, AW_VER_POSITIVE, or AW_VER_NEGATIVE.
You can combine AW_HOR_POSITIVE or AW_HOR_NEGATIVE with AW_VER_POSITIVE or AW_VER_NEGATIVE to animate a window diagonally.
The window procedures for the window and its child windows should handle any WM_PRINT or WM_PRINTCLIENT messages. Dialog boxes, controls, and common controls already handle WM_PRINTCLIENT. The default window procedure already handles WM_PRINT.
If a child window is displayed partially clipped, when it is animated it will have holes where it is clipped.
AnimateWindow supports RTL windows.
Avoid animating a window that has a drop shadow because it produces visually distracting, jerky animations.

210.1.36 WindowFeedbackSettingMBS(Feedback as Integer, byref value as boolean, IncludeAncestors as Boolean = false) as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Retrieves the feedback configuration for a window.
Notes: IncludeAncestors: Specifies that the parent window chain should be checked.

Returns true if the specified feedback setting is configured on the specified window. Otherwise, it returns false (and config won't be modified).

Requires Windows 8 [desktop apps only] or Windows Server 2012 [desktop apps only] .

Constant Name	Value	Description
FEEDBACK_TOUCH_CONTACTVISUALIZATION	1	Feedback for a touch contact event.
FEEDBACK_PEN_BARRELVISUALIZATION	2	Feedback for a pen barrel-button event.
FEEDBACK_PEN_TAP	3	Feedback for a pen tap event.
FEEDBACK_PEN_DOUBLETAP	4	Feedback for a pen double-tap event.
FEEDBACK_PEN_PRESSANDHOLD	5	Feedback for a pen press-and-hold event.
FEEDBACK_PEN_RIGHTTAP	6	Feedback for a pen right-tap event.
FEEDBACK_TOUCH_TAP	7	Feedback for a touch tap event.
FEEDBACK_TOUCH_DOUBLETAP	8	Feedback for a touch double-tap event.
FEEDBACK_TOUCH_PRESSANDHOLD	9	Feedback for a touch press-and-hold event.
FEEDBACK_TOUCH_RIGHTTAP	10	Feedback for a touch right-tap event.
FEEDBACK_GESTURE_PRESSANDTAP	11	Feedback for a press-and-tap gesture.

210.1.37 WinFlashWindowMBS(Invert as boolean)

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Flashes Window.
Example:

window1.WinFlashWindowMBS true

Notes: Flashes the specified window one time. It does not change the active state of the window.

Invert: If this parameter is true, the window is flashed from one state to the other. If it is false, the window is returned to its original state (either active or inactive).

When an application is minimized and this parameter is true, the taskbar window button flashes active/inactive. If it is false, the taskbar window button flashes inactive, meaning that it does not change colors. It flashes, as if it were being redrawn, but it does not provide the visual invert clue to the user.

Flashing a window means changing the appearance of its caption bar as if the window were changing from inactive to active status, or vice versa. (An inactive caption bar changes to an active caption bar; an active

caption bar changes to an inactive caption bar.)
Typically, a window is flashed to inform the user that the window requires attention but that it does not currently have the keyboard focus.
The FlashWindow function flashes the window only once; for repeated flashing, the application should create a system timer.

210.1.38 WinHideTooltipMBS as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Hides all tooltips.
Notes: You can call that in window.deactivate event to hide tooltips which did not hide themselves.
Returns number of hidden tooltips.

210.1.39 Properties

210.1.40 CanBeVisibleWithoutLoginMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window can be visible before login.
Example:

```
window1.CanBeVisibleWithoutLoginMBS = true
```

Notes: This window can be made visible prior to user login. By default, in Mac OS X 10.5 and later no windows can be visible before a user logs into the system; this protects the user against certain types of malicious use of insecure applications. However, some software, such as input methods or other accessibility software, may need to deliberately make windows available prior to user login. Such software should add this window attribute to its windows. Available for all windows in Mac OS X 10.5 and later.
(Read and Write computed property)

210.1.41 CGColorSpaceMBS as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Get or set the colorspace profile for this window.
Example:

```
Var c as CGColorSpaceMBS = window1.CGColorSpaceMBS

if c<>Nil then
MsgBox str(c.NumberOfComponents)
```

```
else
MsgBox "nil"
end if
```

Notes: Requires MacOS 10.6 or newer.

On Cocoa, the NSColorSpace is queried and the matching CGColorspace is returned. For setting a NSColorSpace is created for the given CGColorspace.
In Carbon applications, the CoreGraphics color space is passed directly.
(Read and Write computed property)

210.1.42 CollapsedMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns true if this window can be collapsed.
Example:

```
MsgBox str(window1.CollapsableMBS)
```

Notes: Collapseable windows are the normal document windows.
You can't collapse dialogs or floating windows well.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.43 FullScreenAuxiliaryMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window is setup as being the auxiliary fullscreen window.
Notes: (Read and Write computed property)

210.1.44 FullScreenPrimaryMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window is setup as being the primary fullscreen window.
Notes: If true, the window receives the fullscreen widget in the title bar.
(Read and Write computed property)

210.1.45 HasBorderMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Decides whether the window has a border.
Example:

mainwindow.HasborderMBS=false ' Remove border

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it). This option removes the title bar. HasCaptionMBS removes even more.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.46 HasCaptionMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether the window has a caption (a title bar)
Example:

Window1.HasCaptionMBS=false

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.47 HasCloseBoxMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window has a CloseBox.
Example:

mainwindow.HasCloseboxMBS=false 'remove closebox

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.48 HasCollapseBoxMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window has a Collapsebox.
Example:

mainwindow.HasCollapseBoxMBS=false 'remove Collapsebox

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.49 HasMaximizeBoxMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window has a Maximize Button.
Example:

mainwindow.HasMaximizeBoxMBS=false 'remove Maximize button

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.50 HasMinimizeBoxMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window has a Minimize Button.
Example:

mainwindow.HasMinimizeBoxMBS=false 'remove Minimize button

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.51 HasNoShadowMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window has no shadow.
Example:

mainwindow.HasNoShadowMBS=true 'remove shadow

Notes: Available for all windows on Mac OS X. This attribute is automatically given to windows of kOverlayWindowClass.

Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.52 HasNoTitleBarMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Function:** For Document, Floating, and Utility windows, this attribute allows you to hide the title bar of a window.
Example:

window1.HasNoTitleBarMBS = true

// for Cocoa:
window1.HasCloseBoxMBS = false

window1.HasCollapseBoxMBS = false
window1.IsResizableMBS = false
window1.HasNoTitleBarMBS = true

Notes: For Mac OS X 10.4 or later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.53 HasSystemMenuMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether the window has a system menu inside the title bar.
Example:

Window1.HasSystemMenuMBS=false

Notes: This property has only an effect on Windows. It will disable the system menu and also the minimize, maximize and close buttons. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.54 HasToolbarButtonMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window has a toolbar button.
Example:

mainwindow.HasToolbarButtonMBS=true 'shows Toolbar Button

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
The Button is shown on next redraw of the window frame.

Use the CarbonWindowsEventsMBS class to receive events when the button is pressed.

Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.55 IgnoreClicksMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Can be used to control whether mouse clicks are ignored for this window.
Example:

Window1.IgnoreClicksMBS=true

Notes: Whether this window never receives mouse events, even in areas that are opaque. Instead, clicks on the window will be passed through to windows beneath it. Available for all windows on Mac OS X 10.2 and later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.56 IsIconicMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window is inside the taskbar.
Example:

MsgBox str(window1.IsIconicMBS)

Notes: If you set IsIconic to true the window is minimized and if you set it to false the window size and position is restored.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.57 IsMetalWindowMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window uses the Metal appearance.
Example:

```
if window1.Frame = window.FrameTypeMetal then
MsgBox "Window is metal. "+str(window1.IsMetalWindowMBS)
else
MsgBox "Window is not metal. "+str(window1.IsMetalWindowMBS)
end if
```

Notes: Available for document windows on Mac OS X 10.2 and later, and for floating windows on Mac OS X 10.3 and later. Drawers can also be metal, but dynamically adjust their appearance based on their parent window's appearance; it is not necessary to specify this attribute for a metal drawer.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.58 IsResizableMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window is resizeable.
Example:

```
Window1.IsResizableMBS=false
```

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

Use GrowBoxTransparentMBS on Composite Mac OS windows to enable the transparent grow box.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works in Cocoa.
(Read and Write computed property)

210.1.59 IsZoomedMacMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns true if the window is zoomed.
Example:

MsgBox str(window1.IsZoomedMacMBS)

Notes: Requires Mac OS 8.5 or newer.
Seems not to work correctly on RB 5.5.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

210.1.60 IsZoomedMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window has been maximized.
Example:

MsgBox str(window1.IsZoomedMBS)

Notes: If you set IsZoomed to true the window is maximized and if you set it to false the window size and position is restored.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works on Cocoa.
(Read and Write computed property)

210.1.61 ModifiedMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: You can set or get the value of the modified state.
Example:

mainwindow.modifiedMBS=true

Notes: Requires Mac OS 8.5 or newer.
As long as you don't set modified to false the window keeps to tell you that it's modified. Not sure why, so just set modified to false early in creating the window.
(Read and Write computed property)

210.1.62 ToolbarVisibleMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the toolbar is shown in this window or not.
Notes: Value is false on any error.
Only working on MacOS.
(Read and Write computed property)

210.1.63 TransparencyMBS as single

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The transparency of the window on Mac OS X, Windows 2000 and Windows XP.
Notes: 1 for opaque, 0 for invisible.
Return 1 on any error. On Windows it returns always 1 as the current transparency value can't be queried.
You need to call MakeTransparent before to install transparency.
(Read and Write computed property)

210.1.64 UnifiedTitleAndToolbarMBS as Boolean

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether this window has an unified title and toolbar look.
Example:

window1.UnifiedTitleAndToolbarMBS = true

Notes: This window draws its window title and toolbar using a unified appearance that has no separator between the two areas. A window may not have both UnifiedTitleAndToolbar and Metal appearance. If a window already has the metal attribute, attempting to set the Unified attribute will cause ChangeWindows to return an error, and vice versa. This constant was not added to this header file until Mac OS X 10.5, but it is actually available at runtime on Mac OS X 10.4 and later for windows of kDocumentWindowClass. However, on Mac OS X 10.5 and later, kHIWindowBitUnifiedTitleAndToolbar no longer has any effect, since all windows with toolbars now have a unified look.

(Read and Write computed property)

210.1.65 WindowDisplayAffinityMBS as Integer

MBS Util Plugin, Plugin Version: 25.3, Platform: Windows, Targets: Desktop only.

Function: The window display affinity.
Example:

Window1.WindowDisplayAffinityMBS = &h11

Notes: Specifies where the content of the window can be displayed.
The display affinity setting that specifies where the content of the window can be displayed.

This parameter can be one of the following values:

Name	Value	Meaning
None	0	Imposes no restrictions on where the window can be displayed.
Monitor	1	The window content is displayed only on a monitor. Everywhere else, the window appears with no content.
ExcludeFromCapture	&h11	The window is displayed only on a monitor. Everywhere else, the window does not appear at all. One use for this affinity is for windows that show video recording controls, so that the controls are not included in the capture.

This property is designed to support the window content protection feature that is new to Windows 7. This feature enables applications to protect their own onscreen window content from being captured or copied through a specific set of public operating system features and APIs. However, it works only when the Desktop Window Manager(DWM) is composing the desktop.

It is important to note that unlike a security feature or an implementation of Digital Rights Management (DRM), there is no guarantee that using SetWindowDisplayAffinity, will strictly protect windowed content, for example where someone takes a photograph of the screen.

Starting in Windows 10 Version 2004, ExcludeFromCapture is a supported value. Setting the display affinity to ExcludeFromCapture on previous version of Windows will behave as if Monitor is applied.
(Read and Write computed property)

210.1.66 WindowProxyIconFileMBS as folderitem

MBS Util Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: That's the icon to the window which belongs to the file.
Example:

```
Var f as folderItem

f=getopenFolderItem("special/any")
if f<>nil then
window1.WindowProxyIconFileMBS=f
end if
```

Notes: Requires Mac OS 8.5 or newer.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.67 WinMenuHandleMBS as integer

MBS Util Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: A property to access the handle used for the menu of a Window.
Example:

```
Var menu as Integer // global

if menu=0 then
menu=Window1.WinMenuHandleMBS // read it on the first window
else
Window1.winmenuHandleMBS=menu // set it on the second window
end if
```

Notes: Used in the example "Menu in every Window" to have a menubar in every window on Windows. But never forget to quit your app after all windows were closed.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.1.68 WinTopMostWindowMBS as boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether a window is staying on the top of the other windows.
Example:

```
window1.WinTopMostWindowMBS=true
```

Notes: If true the window stays in front of other windows. Default is false for Xojo windows and true for overlays.
(Read and Write computed property)

210.2 class GTKWindowMBS

210.2.1 class GTKWindowMBS

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: The class to control a GTKWindow.
Notes: We can directly modify a window on Linux using this class.
If you need methods to do something special, please do not hesitate to email us.

210.2.2 Methods

210.2.3 Constructor(win as DesktopWindow)

MBS Linux Plugin, Plugin Version: 22.0, Platform: Linux, Targets: Desktop only.

Function: Creates a new GTKWindow object pointing to a given window.
Notes: Raises exception on Mac/Win to prevent you from creating invalid object.
See also:

- 210.2.4 Constructor(win as window) 23886

210.2.4 Constructor(win as window)

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Creates a new GTKWindow object pointing to a given window.
Notes: Raises exception on Mac/Win to prevent you from creating invalid object.
See also:

- 210.2.3 Constructor(win as DesktopWindow) 23886

210.2.5 Deiconify

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to deiconify (i.e. unminimize) the specified window.
Notes: Note that you shouldn't assume the window is definitely deiconified afterward, because other entities (e.g. the user or window manager) could iconify it again before your code which assumes deiconification gets to run.

210.2.6 Fullscreen

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to place window in the fullscreen state.
Notes: Note that you shouldn't assume the window is definitely full screen afterward, because other entities (e.g. the user or window manager) could unfullscreen it again, and not all window managers honor requests to fullscreen windows. But normally the window will end up fullscreen. Just don't write code that crashes if not.

210.2.7 Iconify

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to iconify (i.e. minimize) the specified window.
Notes: Note that you shouldn't assume the window is definitely iconified afterward, because other entities (e.g. the user or window manager) could deiconify it again, or there may not be a window manager in which case iconification isn't possible, etc. But normally the window will end up iconified. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be iconified before it ever appears onscreen.

210.2.8 Maximize

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to maximize window, so that it becomes full-screen.
Notes: Note that you shouldn't assume the window is definitely maximized afterward, because other entities (e.g. the user or window manager) could unmaximize it again, and not all window managers support maximization. But normally the window will end up maximized. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be maximized when it appears onscreen initially.

210.2.9 SetIcon(pic as picture)

MBS Linux Plugin, Plugin Version: 14.0, Platform: Linux, Targets: Desktop only.

Function: Assigns an icon to the picture.
Notes: The operating system will scale the picture to required size, so please use bigger images.
Please use picture with alpha channel for best result.

210.2.10 SetKeepAbove(setting as boolean)

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to keep window above, so that it stays on top.
Notes: Note that you shouldn't assume the window is definitely above afterward, because other entities (e.g. the user or window manager) could not keep it above, and not all window managers support keeping windows above. But normally the window will end kept above. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be kept above when it appears onscreen initially.

Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

210.2.11 SetKeepBelow(setting as boolean)

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to keep window below, so that it stays in bottom.
Notes: Note that you shouldn't assume the window is definitely below afterward, because other entities (e.g. the user or window manager) could not keep it below, and not all window managers support putting windows below. But normally the window will be kept below. Just don't write code that crashes if not.

It's permitted to call this function before showing a window, in which case the window will be kept below when it appears onscreen initially.

Note that, according to the Extended Window Manager Hints specification, the above state is mainly meant for user preferences and should not be used by applications e.g. for drawing attention to their dialogs.

210.2.12 Stick

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to stick window, which means that it will appear on all user desktops.
Notes: Note that you shouldn't assume the window is definitely stuck afterward, because other entities (e.g. the user or window manager) could unstick it again, and some window managers do not support sticking windows. But normally the window will end up stuck. Just don't write code that crashes if not.

It's permitted to call this function before showing a window.

210.2.13 Unfullscreen

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to toggle off the fullscreen state for window.
Notes: Note that you shouldn't assume the window is definitely not full screen afterward, because other entities (e.g. the user or window manager) could fullscreen it again, and not all window managers honor requests to unfullscreen windows. But normally the window will end up restored to its normal state. Just don't write code that crashes if not.

210.2.14 Unmaximize

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to unmaximize window.
Notes: Note that you shouldn't assume the window is definitely unmaximized afterward, because other entities (e.g. the user or window manager) could maximize it again, and not all window managers honor requests to unmaximize. But normally the window will end up unmaximized. Just don't write code that crashes if not.

210.2.15 Unstick

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Asks to unstick window, which means that it will appear on only one of the user's desktops.
Notes: Note that you shouldn't assume the window is definitely unstuck afterward, because other entities (e.g. the user or window manager) could stick it again. But normally the window will end up stuck. Just don't write code that crashes if not.

210.2.16 Properties

210.2.17 AcceptFocus as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Get/Set whether window should receive focus.
Notes: Windows may set a hint asking the desktop environment not to receive the input focus. This function sets this hint.
(Read and Write property)

210.2.18 Handle as Integer

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: The internal window handle.
Notes: (Read and Write property)

210.2.19 IsComposited as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Whether this window can rely on having its alpha channel drawn correctly.
Notes: On X11 this function returns whether a compositing manager is running for window's screen.
(Read only property)

210.2.20 Opacity as Double

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Get or set the Opacity of this window.
Notes: Request the windowing system to make window partially transparent, with opacity 0 being fully transparent and 1 fully opaque. (Values of the opacity parameter are clamped to the [0,1] range.) On X11 this has any effect only on X screens with a compositing manager running. See isComposited.
(Read and Write property)

210.2.21 Resizable as Boolean

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Get or set whether the user can resize a window.

Notes: (Read and Write property)

210.2.22 Title as string

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Get or set the window title.
Notes: The title of a window will be displayed in its title bar; on the X Window System, the title bar is rendered by the window manager, so exactly how the title appears to users may vary according to a user's exact configuration. The title should help a user distinguish this window from other windows they may have open. A good title might include the application name and current document filename, for example.
(Read and Write property)

210.2.23 XWindowID as Integer

MBS Linux Plugin, Plugin Version: 24.2, Platform: Linux, Targets: Desktop only.

Function: Queries the X-Window ID for the window.
Notes: Value is zero if not available.
(Read only property)

210.3 class MAAttachedWindowMBS

210.3.1 class MAAttachedWindowMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** A class for attached windows in Cocoa.
Notes: For Mac OS X 10.7 you can use NSPopoverMBS. This class does something similar for Mac OS X 10.4 to 10.7.

Base on MAAttachedWindow code by Matt Gemmell.
See his website http://mattgemmell.com/

Below are the positions the attached window can be displayed at.

ote that these positions are relative to the point passed to the constructor, e.g. MAPositionBottomRight will put the window below the point and towards the right, MAPositionTop will horizontally center the window above the point, MAPositionRightTop will put the window to the right and above the point, and so on.

You can also pass MAPositionAutomatic and the attached window will try to position itself sensibly, based on available screen-space.

Notes regarding automatically-positioned attached windows:

(a) The window prefers to position itself horizontally centered below the specified point. This gives a certain enhanced visual sense of an attachment/relationship.

(b) The window will try to align itself with its parent window (if any); i.e. it will attempt to stay within its parent window's frame if it can.

(c) The algorithm isn't perfect. :) If in doubt, do your own calculations and then explicitly request that the window attach itself to a particular side.

Notes regarding accessor methods:

1. The border is drawn inside the viewMargin area, expanding inwards; it does not increase the width/height of the window. You can use the BorderWidth and ViewMargin methods together to achieve the exact look/geometry you want. (viewMargin is the distance between the edge of the view and the window edge.)

2. The specified setter methods are primarily intended to be used _before_ the window is first shown. If

you use them while the window is already visible, be aware that they may cause the window to move and/or resize, in order to stay anchored to the point specified in the initializer. They may also cause the view to move within the window, in order to remain centered there.

Note that the HasArrow method can safely be used at any time, and will not cause moving/resizing of the window. This is for convenience, in case you want to add or remove the arrow in response to user interaction. For example, you could make the attached window movable by its background, and if the user dragged it away from its initial point, the arrow could be removed. This would duplicate how Aperture's attached windows behave.

3. drawsRoundCornerBesideArrow takes effect when the arrow is being drawn at a corner, i.e. when it's not at one of the four primary compass directions. In this situation, if drawsRoundCornerBesideArrow is true (the default), then that corner of the window will be rounded just like the other three corners, thus the arrow will be inset slightly from the edge of the window to allow room for the rounded corner. If this value is false, the corner beside the arrow will be a square corner, and the other three corners will be rounded.

This is useful when you want to attach a window very near the edge of another window, and don't want the attached window's edge to be visually outside the frame of the parent window.

4. Note that to retrieve the background color of the window, you should use the windowBackgroundColor method, instead of backgroundColor. This is because we draw the entire background of the window (rounded path, arrow, etc) in an NSColor pattern image, and set it as the backgroundColor of the window.
Subclass of the NSWindowMBS class.

210.3.2 Methods

210.3.3 attachedWindow(view as NSViewMBS, point as NSPointMBS = nil, window as NSWindowMBS = nil, onSide as Integer = 12, distance as Double = 0.0) as MAAttachedWindowMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new attached window.
Notes: view: The view to display in the attached window. Must not be nil.
point: The point to which the attached window should be attached. If you are also specifying a parent window, the point should be in the coordinate system of that parent window. If you are not specifying a window, the point should be in the screen's coordinate space. This value is required.
window: The parent window to attach this one to. Note that no actual relationship is created (particularly, this window is not made a childWindow of the parent window). Default: nil.
onSide: The side of the specified point on which to attach this window. Default: MAPositionAutomatic.
distance: How far from the specified point this window should be. Default: 0.

Returns a new attached window.

210.3.4 Constructor(view as NSViewMBS, point as NSPointMBS = nil, window as NSWindowMBS = nil, onSide as Integer = 12, distance as Double = 0.0)

MBS MacExtras Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new attached window.
Notes: After constructor finished without exception, please check handle property for success. Handle is zero on failure.

view: The view to display in the attached window. Must not be nil.
point: The point to which the attached window should be attached. If you are also specifying a parent window, the point should be in the coordinate system of that parent window. If you are not specifying a window, the point should be in the screen's coordinate space. This value is required.
window: The parent window to attach this one to. Note that no actual relationship is created (particularly, this window is not made a childWindow of the parent window). Default: nil.
onSide: The side of the specified point on which to attach this window. Default: MAPositionAutomatic.
distance: How far from the specified point this window should be. Default: 0.

210.3.5 setBackgroundImage(image as NSImageMBS)

MBS MacExtras Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: Here you can set the background image.

210.3.6 setPoint(point as NSPointMBS, side as Integer)

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sets the position and redraws window.

210.3.7 side as Integer

MBS MacExtras Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Which side the attached window is showing at.
Notes: If you passed automatic side mode to Constructor or attachedWindow method, you can query here which side was chosen.

210.3.8 Properties

210.3.9 arrowBaseWidth as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The arrow base width.
Notes: Default is 20.
(Read and Write computed property)

210.3.10 arrowHeight as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The height of the arrow.
Notes: Default is 16.
(Read and Write computed property)

210.3.11 borderColor as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The border color.
Notes: Default is white.
(Read and Write computed property)

210.3.12 borderWidth as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The border width.
Notes: Default is 2.
(Read and Write computed property)

210.3.13 cornerRadius as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The corner radius.
Notes: Default is 8.
(Read and Write computed property)

210.3.14 drawsRoundCornerBesideArrow as boolean

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether to draw round corners beside arrow.
Notes: Default is true.
(Read and Write computed property)

210.3.15 hasArrow as boolean

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether the window shows an arrow.
Notes: Default is true.
(Read and Write computed property)

210.3.16 viewMargin as Double

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The view margin.
Notes: Default is 2.
(Read and Write computed property)

210.3.17 windowBackgroundColor as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The window background color.
Notes: Default is 25% dark gray.
(Read and Write computed property)

210.3.18 Constants

Position constants

Constant	Value	Description
MAPositionAutomatic	12	automatic
MAPositionBottom	1	bottom
MAPositionBottomLeft	10	bottom left
MAPositionBottomRight	11	bottom right
MAPositionLeft	0	left
MAPositionLeftBottom	5	left bottom
MAPositionLeftTop	4	left top
MAPositionRight	2	right
MAPositionRightBottom	7	right bottom
MAPositionRightTop	6	right top
MAPositionTop	3	top
MAPositionTopLeft	8	top left
MAPositionTopRight	9	top right

210.4 Globals

210.4.1 DisableScreenUpdatesMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: Temporarily disables redraw of the screen after changes to window geometry or window contents.
Notes: It is appropriate to disable updates if you are moving or resizing multiple windows and you want all of the geometry changes to appear onscreen simulataneously. In most other cases, you should strive to avoid disabling screen updates. The window server will automatically re-enable updates (and print a message to the Console log) if you leave updates disabled for a sufficiently long period of time, currently about 1 second.

The window server records the number of calls to DisableScreenUpdates and does not re-enable updates until a matching number of calls to EnableScreenUpdates have been made.

Updated for 64-bit in plugin version 18.3.
Blog Entries

- MBS Xojo Plugins, version 18.3pr3

210.4.2 EnableScreenUpdatesMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: Re-enables redraw of the screen after changes to window geometry or window contents.
Notes: Screen redraw is not actually enabled until the number of calls to EnableScreenUpdatesMBS matches the number of calls to DisableScreenUpdatesMBS.

Updated for 64-bit in plugin version 18.3.
Blog Entries

- MBS Xojo Plugins, version 18.3pr3

210.4.3 MenuBarHeightMBS as Integer

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the height of the menubar in pixels.
Example:

```
msgbox "The menubar is "+str(MenuBarHeightMBS)+" pixels height."
```

Notes: Requires the appearance manager.

Without plugin, you can use this:

```
declare function GetThemeMenuBarHeight lib "Carbon" (p as ptr) as Integer

Var l as Integer
Var p as memoryBlock
p=newmemoryBlock(10)

error=GetThemeMenuBarHeight(p) // 0 if okay.
menuheight=p.short(0) // in pixels. 22 on Mac OS X.
```

Added Cocoa support in plugin version 10.0.

210.5 class OverlayMBS

210.5.1 class OverlayMBS

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This class gives you a window overlaying all other windows with an alpha channel.
Example:

```
Var o as OverlayMBS
Var p as Picture

o=new OverlayMBS(100,100,300,300)

p=New Picture(300,300,32)
p.Graphics.ForeColor=&c000000
p.Graphics.FillRect 0,0,300,300

o.Pict=p

p=New Picture(300,300,32)
p.Graphics.ForeColor=&c000000
p.Graphics.FillOval 0,0,300,300
p.Graphics.ForeColor=&cFFFFFF
p.Graphics.FillOval 100,100,100,100

o.Mask=p

o.UpdateShow

// wait 5 seconds to see the window
DelayMBS 5
```

Notes: Requires Mac OS X 10.3.9 or Windows 2000 or newer.

Cocoa implementation added with Mac OS X 10.4 class.
To support high resolution mode on Mac OS X high resolution displays, please make the picture+mask exact the double width and height of the window.

210.5.2 Methods

210.5.3 Close

MBS Overlay Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: Desktop only.

Function: Calls the destructor.
Notes: Closes the window and releases all memory used from the overlay.

210.5.4 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, MacAttributes as Integer, WinExStyle as Integer, WinStyle as Integer)

MBS Overlay Plugin, Plugin Version: 10.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: The advanced constructor where you can pass flags for Mac and Windows directly.
Notes: Windows ExStyle flags:

WS_EX_DLGMODALFRAME	&h00000001

210.5.5 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, WindowsNoActivate as boolean = false, WindowsTopMost as boolean=true)

MBS Overlay Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: Desktop only.

Function: Creates a new window.
Example:

```
// a dark window with round edges

Var m,p as Picture
static o as OverlayMBS

const rect_width=300
const rect_height=300
const round_rect_int=30

p=New Picture(rect_width,rect_height,32)
m=New Picture(rect_width,rect_height,32)

p.Graphics.ForeColor = RGB( 20,20,20 )
p.Graphics.DrawRect 0, 0, rect_width, rect_height
p.Graphics.FillRect 0, 0, rect_width, rect_height

// fill the window mask with around 10% transparency
```

```
m.Graphics.ForeColor = RGB( 20,20,20 )
m.Graphics.FillRoundRect 0, 0, rect_width, rect_height, round_rect_int, round_rect_int

// write text into picture
p.Graphics.ForeColor=&cFFFFFF
p.Graphics.DrawString "Hello",10,20

// make the text not transparent
m.Graphics.ForeColor=&c000000
m.Graphics.DrawString "Hello",10,20

o=new OverlayMBS(200,200,rect_width, rect_height, true)
o.Pict=p
o.Mask=m
o.UpdateShow
```

Notes: Requires Mac OS X 10.3.9 or Windows 2000 or newer.
On success the handle property is not zero.

If WindowsNoActivate the window is setup to not become the front window. This may be a better setup for a toolbar like window.
If WindowsTopMost is false the window is not floating in front of all other windows.

Seems like WindowsNoActivate on Windows works better if you call Show(4) right after the constructor.

For proper support of high resolutions, the pictures used here may need to be 2x or 3x times the window size.
See also:

- 210.5.4 Constructor(left as Integer, top as Integer, width as Integer, height as Integer, MacAttributes as Integer, WinExStyle as Integer, WinStyle as Integer) 23901

210.5.6 Hide

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: Hides the window.

210.5.7 InvalidateShadow

MBS Overlay Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Invalidates the shadow of the window.

Notes: As soon as possible the operating system will recalculate the shadow.
Works only on Mac OS X with Carbon or Cocoa window.

210.5.8 Move(left as Integer, top as Integer)

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: Moves the window on the screen to the given position.

210.5.9 Resize(width as Integer, height as Integer)

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: Resizes the window.
Notes: You need to provide bigger picture before you call this method.

210.5.10 SetFocus

MBS Overlay Plugin, Plugin Version: 17.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: The method to call to set focus to the overlay window.
Notes: Works for Windows and macOS Cocoa.

210.5.11 Show(WindowsShowMode as Integer = 0)

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: Shows the window onscreen.
Notes: Values for the Windows show mode:

default 0
SW_SHOWNORMAL 1
SW_NORMAL 1
SW_SHOWMINIMIZED 2
SW_SHOWMAXIMIZED 3
SW_MAXIMIZE 3
SW_SHOWNOACTIVATE 4
SW_SHOW 5
SW_MINIMIZE 6
SW_SHOWMINNOACTIVE 7
SW_SHOWNA 8

SW_RESTORE 9
SW_SHOWDEFAULT 10
SW_FORCEMINIMIZE 11

210.5.12 Update

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: Updates the window.
Notes: After you draw new content into the pict and mask pictures, you call this method to apply changes to the window.
See also:

- 210.5.13 Update(NSImage as Variant) 23905

210.5.13 Update(NSImage as Variant)

MBS Overlay Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Updates overlay window with given NSImage.
Notes: Please pass NSImageMBS object.

Version 16.2 and newer also accepts CGImageMBS object here.
If you pass picture, we use it as CGImage or NSImage depending on what picture type you pass.
See also:

- 210.5.12 Update 23905

210.5.14 UpdateShow

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: Shows the window and performs an update.
Notes: Runs Update and Show internally.

210.5.15 Properties

210.5.16 Alpha as Double

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The alpha value of the window.
Notes: 0 is invisible and 1.0 is visible.
(Read and Write property)

210.5.17 AutoCaptureMouse as Boolean

MBS Overlay Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop only.

Function: Whether the mouse should be captured automatically on Windows.
Notes: If you return true from MouseDown the mouse is catched. This way you can get the drag events even if the mouse moves out of the window.
On MouseUp the mouse is released.
(Read and Write property)

210.5.18 CurrentImage as Variant

MBS Overlay Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Last image drawn.
Notes: For debugging only.
CGImageMBS or NSImageMBS depending on what you set.
(Read only property)

210.5.19 Height as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The height of the window.
Notes: Using Resize method is more efficient than assigning width and height properties.
(Read and Write property)

210.5.20 IgnoreMouseClicks as Boolean

MBS Overlay Plugin, Plugin Version: 8.7, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether this window should react to mouse clicks.
Notes: In Mac OS X 10.7 and newer setting IgnoreMouseClicks = false does not give the same behavior as without setting this property before.

Implemented for windows in v24.1.
(Read and Write property)

210.5.21 Left as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The position of the window.
Example:

```
static o as OverlayMBS // keep the variable global somewhere. Static or part of a module or in app class.

o = new OverlayMBS(100,100,100,100)

o.Pict = LogoMBS(100)
o.mask = LogoMBS(100)

o.Left = 200

o.UpdateShow
```

Notes: Using Move method is more efficient than assigning left and top properties.
(Read and Write property)

210.5.22 Mask as Picture

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The mask for the window.
Notes: You need to create and assign your own image.
If you assign nil for the mask, the plugin uses the mask or alpha channel of the picture.

For proper support of high resolutions, the pictures used here may need to be 2x or 3x times the window size.
(Read and Write property)

210.5.23 MovableByWindowBackground as Boolean

MBS Overlay Plugin, Plugin Version: 24.1, Platforms: macOS, Windows, Targets: Desktop only.

Function: A Boolean value that indicates whether the window is movable by clicking and dragging anywhere in its background.
Notes: The value of this property is true when the window is movable by clicking and dragging anywhere

in its background; otherwise, false.

Works on macOS and Windows.
(Read and Write property)

210.5.24 NSView as Variant

MBS Overlay Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The NSView showing the content of the overlay.
Notes: Value is a NSViewMBS. We use variant to reduce dependency to other plugins.
(Read only property)

210.5.25 NSWindow as Variant

MBS Overlay Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop only.

Function: Returns a reference to the NSWindowMBS object which you can use to make additional settings to the overlay window.
Example:

```
Var o as OverlayMBS // your window

Var n as NSWindowMBS = o.NSWindow
// this window should not hide if app hides
n.canHide = false
```

Notes: Only for the Cocoa target in Xojo.
(Read only property)

210.5.26 Pict as Picture

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The picture for the window content.
Notes: You need to provide your own picture here.
Pict and Mask pictures must have the same size.

Alpha Channel Pictures are not really supported.
But for Mac OS X an alpha channel picture does currently work.

For proper support of high resolutions, the pictures used here may need to be 2x or 3x times the window size.
(Read and Write property)

210.5.27 Top as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The position of the window.
Example:

```
static o as OverlayMBS // keep the variable global somewhere. Static or part of a module or in app class.

o = new OverlayMBS(100,100,100,100)

o.Pict = LogoMBS(100)
o.mask = LogoMBS(100)

o.top = 200

o.UpdateShow
```

Notes: Using Move method is more efficient than assigning left and top properties.
(Read and Write property)

210.5.28 Visible as Boolean

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: Whether the window is visible.
Example:

```
Var o as OverlayMBS
// ....
o.visible=true
```

Notes: True if visible, false if hidden.
(Read and Write property)

210.5.29 Width as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The width of the window.
Notes: Using Resize method is more efficient than assigning width and height properties.
(Read and Write property)

210.5.30 WindowHandle as Integer

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: The internal used window handle.
Notes: On Mac OS a WindowRef and on Windows a HWND.
(Read only property)

210.5.31 WindowID as Integer

MBS Overlay Plugin, Plugin Version: 10.2, Platform: macOS, Targets: Desktop only.

Function: Queries the CoreGraphics Window ID for the given window.
Notes: Returns 0 on any error.
This ID can be used for CGWindowListCreateImageMBS.
(Read only property)

210.5.32 WindowsClassName as String

MBS Overlay Plugin, Plugin Version: 18.4, Platform: Windows, Targets: Desktop only.

Function: The Windows' window class name.
Notes: (Read only property)

210.5.33 hasShadow as boolean

MBS Overlay Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: Whether the window has a shadow.
Notes: (Read and Write computed property)

210.5.34 Title as string

MBS Overlay Plugin, Plugin Version: 11.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: The title of the window.
Notes: This name is not visible as the window has no title bar.
But if you see the window in some window list, this title property will give your overlay window a name.
(Read and Write computed property)

210.5.35 WinIsTopMost as boolean

MBS Overlay Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Whether a window is staying on the top of the other windows.
Notes: If true the window stays in front of other windows. Default is false for Xojo windows and true for overlays.
(Read and Write computed property)

210.5.36 Events

210.5.37 Draw(CGContext as Variant, NSGraphicsContext as Variant)

MBS Overlay Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: Draws the content of the window.
Example:

```
Sub Draw(CGContext as Variant, NSGraphicsContext as Variant)
Var c as CGContextMBS = CGContext
Var n as NSGraphicsMBS = NSGraphicsContext
// draw here
End Sub
```

Notes: The drawing area is cleared for you.
Please put the given parameters in the local variables with correct type.
We use variants here to reduce plugin dependencies.

With version 19.5, the don't clear content anymore for you, so you may need to call ClearRect if needed.

210.5.38 GotFocus

MBS Overlay Plugin, Plugin Version: 17.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: The event called when focus is set on the overlay window.
Notes: Works for Windows and macOS Cocoa.

210.5.39 KeyDown(key as String, keyCode as Integer, modifiers as integer) as Boolean

MBS Overlay Plugin, Plugin Version: 17.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: The key down event.
Notes: The plugin translates keycodes into key as text, but also provides keycode and modifier flags.
Works for Windows and macOS Cocoa.

210.5.40 KeyUp(key as String, keyCode as Integer, modifiers as integer) as Boolean

MBS Overlay Plugin, Plugin Version: 17.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: The key up event.
Notes: The plugin translates keycodes into key as text, but also provides keycode and modifier flags.
Works for Windows and macOS Cocoa.

210.5.41 LostFocus

MBS Overlay Plugin, Plugin Version: 17.4, Platforms: macOS, Windows, Targets: Desktop only.

Function: The event called when focus is lost on the overlay window.
Notes: Works for Windows and macOS Cocoa.

210.5.42 menuForEvent(NSEvent as variant) as Variant

MBS Overlay Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Provide a contextual menu for Cocoa Mac.
Notes: NSEvent is an NSEventMBS object.
Please return NSMenuMBS object. (and please keep a reference somewhere)

210.5.43 MouseDown(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the user clicks with the mouse inside the window.
Notes: Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

210.5.44 MouseDragged(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the user moves the mouse over the window while the mouse is pressed.
Notes: Return true if you handled this event.
modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

210.5.45 MouseEnter(x as Integer, y as Integer, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: This is event is called when mouse enters window.
Notes: modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

210.5.46 MouseExit(x as Integer, y as Integer, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: This is event is called when mouse leaves window.
Notes: modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

210.5.47 MouseMoved(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the user moves the mouse over the window.
Notes: Return true if you handled this event.

modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

210.5.48 MouseUp(x as Integer, y as Integer, modifiers as Integer) as boolean

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the user releases the mousebutton inside the window.
Notes: Return true if you handled this event.

modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

210.5.49 MouseWheel(x as Integer, y as Integer, dx as Double, dy as Double, modifiers as Integer)

MBS Overlay Plugin, Plugin Version: 13.0, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the user uses the mouse wheel inside the window.
Notes: modifiers: Platform dependent keyboard modifiers. Different values for Carbon, Cocoa and Windows!

For Cocoa to set mouse cursor, please use NSCursorMBS class.

210.5.50 WindowBoundsChanged

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called whenever the size of the window changes.
Notes: Can also be called on position changes.

210.5.51 WindowClosed

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the window is closed.

210.5.52 WindowHidden

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the window is hidden.
Notes: Cocoa support added for version 14.0.

210.5.53 WindowShown

MBS Overlay Plugin, Plugin Version: 8.6, Platforms: macOS, Windows, Targets: Desktop only.

Function: This event is called when the window is shown.
Notes: Cocoa support added for version 14.0.

210.5.54 Constants

Modifiers

Constant	Value	Description
kModifierFlagCommand	1048576	The command key is pressed. Use with BitwiseAnd(Modifiers, kModifierFlagCommand) <>0 to check if the flag is set in key events.
kModifierFlagControl	262144	The control key is pressed. Use with BitwiseAnd(Modifiers, kModifierFlagControl) <>0 to check if the flag is set in key events.
kModifierFlagOption	524288	The option (alt) key is pressed. Use with BitwiseAnd(Modifiers, kModifierFlagOption) <>0 to check if the flag is set in key events.
kModifierFlagShift	131072	The shift key is pressed. Use with BitwiseAnd(Modifiers, kModifierFlagShift) <>0 to check if the flag is set in key events.

210.6 class Window

210.6.1 class Window

Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Extends Xojo's Window Class.
Example:

window1.HasNoTitleBarMBS = true

Notes: In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

210.6.2 Methods

210.6.3 ActivateWindowMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: Activates the window.
Notes: This function does more than just show. if the window has been minimized, it will restore it. Also the window is moved to front and made the current window for keyboard input.

Sadly windows limits which windows can go to front, so some windows may not come to front unless they are clicked on.

As activation can be asynchronously, the window may activate later, e.g. after current method ends.

For MacOS Cocoa apps, we simply bring the window to the front.

210.6.4 BackingScaleFactorMBS as Double

MBS Util Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns the scale factor representing the number of backing store pixels corresponding to each linear unit in window space on this window.
Notes: This is generally only necessary when building a bitmap context or image whose resolution needs to match that of a particular Window. Note that a Window's backing scale factor can change over time, such as when the window moves from one display to another, or when a display's resolution changes, so clients should not cache the value returned by this function.

If platform does not support scaling factor, we return 1.0. (on Windows, Linux and older Mac OS X)
Supported for Carbon and Cocoa windows.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.

210.6.5 CGContextMBS as CGContextMBS

MBS MacCG Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop only.

Function: Creates a new CGContextMBS object for the given Window.
Example:

```
Var CGContext as CGContextMBS
Var OverlayPic as Picture=LogoMBS(500)
Var contentpicture as CGImageMBS= CGCreateImageMBS(OverlayPic)

CGContext=window1.CGContextMBS

CGContext.ClearRect CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)
CGContext.DrawPicture contentpicture, CGMakeRectMBS(0, 0, OverlayPic.width, OverlayPic.height)
```

Notes: Requires Mac OS X to work.
Please make sure the CGContextMBS object is released in the paint event if you use it there, so all the

drawings are flushed. Not releasing it my be visible in missing statictext or other strange graphics effects.

But on a Cocoa window the context is not always available, so in the window paint event, you can context from Graphics object.

210.6.6 CleanUpTransparentMBS(refValue as Integer)

MBS Util Plugin, Plugin Version: 5.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Cleans up transparency support for a Xojo window.
Example:

```
Var p as Integer // property on Windows

p = window1.MakeTransparentMBS

// later in close event

window1.CleanUpTransparentMBS p
```

Notes: Call this in the close event of a window passing the value you got from the MakeTransparentMBS call.
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.
Blog Entries

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr5

210.6.7 ClearTransparencyMBS

MBS Util Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop only.

Function: Clears transparency of a window.

210.6.8 CollapsableMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns true if this window can be collapsed.
Example:

```
MsgBox str(window1.CollapsableMBS)
```

Notes: Collapseable windows are the normal document windows.
You can't collapse dialogs or floating windows well.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.

210.6.9 ConstrainWindowToScreenMBS(animate as boolean)

MBS Util Plugin, Plugin Version: 10.5, Platform: macOS, Targets: Desktop only.

Function: Makes sure the window is on one screen visible.
Notes: Implemented on Mac for both Carbon and Cocoa.
Blog Entries

- MBS REALbasic Plugins, version 10.6pr6

210.6.10 GTKWindow as GTKWindowMBS

MBS Linux Plugin, Plugin Version: 13.0, Platform: Linux, Targets: Desktop only.

Function: Queries a GTKWindow object for this window.
Notes: Returns only a valid object on linux.
On other platforms, this function returns nil.

210.6.11 HideKeyboardMBS

MBS Win Plugin, Plugin Version: 23.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: Hides the keyboard.
Notes: On Windows same as ShowKeyboardMBS, but may not launch the keyboard.

If you called ShowKeyboardMBS before, you can call this function to hide it.

210.6.12 InvalidateRectThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Platform: macOS, Targets: Desktop only.

Function: Invalidate the rectangle.
Notes: This method is to allow you to invalidate in a thread without a problem.

If called on main thread, the plugin will simply call InvalidateRect method directly.
If called on other threads the plugin will schedule to call InvalidateRect method a short time later on the main thread.
Blog Entries

- MBS Xojo Plugins, version 19.5pr3

210.6.13 InvalidateShadowMBS

MBS MacOSX Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: This method causes a window's shadow to be recalculated.
Notes: InvalidateShadowMBS is not typically used by applications. However, it may be useful for applications with customized window frames that change shape dynamically; in this case, after the application has drawn the new window shape, the window shadow must be recalculated to follow the new window shape.

This method causes the window shadow to be immediately recalculated and redrawn based on the current contents of the window's back buffer. For best performance and visual appearance, you should follow these steps when invalidating a window shadow: disable updates with DisableScreenUpdatesMBS, draw, flush, invalidate the shadow, and enable updates. For a compositing window, after invalidating any views that should be redrawn, you will need to explicitly draw and flush using HIWindowFlush, rather than waiting for the event loop to draw and flush the window, because you cannot disable updates or invalidate the window shadow if drawing is done via the event loop.

210.6.14 InvalidateThreadSafeMBS(EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Platform: macOS, Targets: Desktop only.

Function: Invalidate the window.
Notes: This method is to allow you to invalidate in a thread without a problem.

If called on main thread, the plugin will simply call Invalidate method directly.
If called on other threads the plugin will schedule to call Invalidate method a short time later on the main thread.

210.6.15 IsFullScreenMBS as Boolean

MBS Util Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Queries whether window is fullscreen.
Notes: Indicates that a window has fullscreen appearance.
A fullscreen window does not draw its titlebar, and may have special handling for its toolbar.
Available in Mac OS X v10.7 and later.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr9

210.6.16 MakeTransparentMBS as Integer

MBS Util Plugin, Plugin Version: 5.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Installs transparency support to a Xojo window.
Example:

```
Var p as Integer // property on Windows

p = window1.MakeTransparentMBS

// later in close event

window1.CleanUpTransparentMBS p
```

Notes: Will return non zero value if successfull.
The window doesn't change if you don't use the CGContextMBS property.

Requires Mac OS X, Windows 2000 or Windows XP to work. The window must be a document window.

Set MacProcID of the window to 1104 and you can make it transparent without a title bar. (on Mac OS X)

With plugin version 11.1, we now return a value which should store with the window. Later in the Close event, you call CleanUpTransparentMBS passing this value.

Added Cocoa support in 11.3 plugins.
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel. Calls

to MakeTransparentMBS and CleanUpTransparentMBS are not required for Linux.

210.6.17 NSPanelMBS as NSPanelMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSPanel for the given Xojo window.
Example:

MsgBox window1.NSPanelMBS.Title

Notes: Works only for Cocoa Windows in Cocoa target which are floating panels.

210.6.18 NSToolbarMBS as NSToolbarMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The window's toolbar.
Notes: So you can get the toolbar without going over NSWindowMBS.
But there you can assign a new toolbar...

210.6.19 NSWindowMBS as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSWindow for the given Xojo window.
Example:

MsgBox window1.NSWindowMBS.Title

Notes: Works only for Cocoa Windows in Cocoa target and for Carbon Windows in carbon targets.

210.6.20 RefreshRectThreadSafeMBS(X As Integer, Y As Integer, Width As Integer, Height As Integer, EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Platform: macOS, Targets: Desktop only.

Function: Refresh the rectangle.
Notes: This method is to allow you to refresh in a thread without a problem.

If called on main thread, the plugin will simply call RefreshRect method directly.
If called on other threads the plugin will schedule to call RefreshRect method a short time later on the main thread.
Blog Entries

- MBS Xojo Plugins, version 19.5pr3

210.6.21 RefreshThreadSafeMBS(EraseBackground as boolean = true)

MBS Util Plugin, Plugin Version: 19.5, Platform: macOS, Targets: Desktop only.

Function: Refresh the rectangle.
Notes: This method is to allow you to refresh in a thread without a problem.

If called on main thread, the plugin will simply call Refresh method directly.
If called on other threads the plugin will schedule to call Refresh method a short time later on the main thread.

210.6.22 RemoveWindowProxyIconMBS

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Removes any Proxy Icon from the Window.
Example:

mainwindow.RemoveWindowProxyIconMBS

Notes: Requires Mac OS 8.5 or newer.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
Blog Entries

- MBS REALbasic Plugins, version 11.1pr4

210.6.23 ScreenshotWindowMBS as picture

MBS Picture Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns the content of the window buffer on Mac OS X.
Example:

```
Var p as Picture
p=mainwindow.screenshotWindowMBS
```

Notes: Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Xojo 2006 or newer, please add a self. on front of the method call in case you want to use the method on the current window.

210.6.24 ScreenshotWindowRectMBS(left as Integer, top as Integer, width as Integer, height as Integer) as picture

MBS Picture Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Returns a part of the content of the window buffer on Mac OS X.
Example:

```
Var p as picture
p=mainwindow.ScreenshotWindowRectMBS(100,100,200,200)
```

Notes: Only for Mac OS X. Image is taken from window back buffer.
This will not capture overlay windows.

On Xojo 2006 or newer, please add a self. on front of the method call in case you want to use the method on the current window.

210.6.25 SetTransparencyMBS(value as Integer) as boolean

MBS Util Plugin, Plugin Version: 5.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Your window can have transparency on Mac OS X.
Example:

```
if window1.SetTransparencyMBS(127) then
'fine
else
'error
end if
```

Notes: Use values between 0 and 255.
Requires Mac OS X, Windows 2000 or Windows XP to work.
May be limited to simple windows like normal document windows.
You need to call MakeTransparent before to install transparency.
(this function was replaced in v4.4)
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.

210.6.26 SetWindowFeedbackSettingMBS(Feedback as Integer, value as Variant) as Boolean

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Sets the feedback configuration for a window.
Example:

```
const FEEDBACK_TOUCH_CONTACTVISUALIZATION = 1
const FEEDBACK_PEN_BARRELVISUALIZATION = 2
const FEEDBACK_PEN_TAP = 3
const FEEDBACK_PEN_DOUBLETAP = 4
const FEEDBACK_PEN_PRESSANDHOLD = 5
const FEEDBACK_PEN_RIGHTTAP = 6
const FEEDBACK_TOUCH_TAP = 7
const FEEDBACK_TOUCH_DOUBLETAP = 8
const FEEDBACK_TOUCH_PRESSANDHOLD = 9
const FEEDBACK_TOUCH_RIGHTTAP = 10
const FEEDBACK_GESTURE_PRESSANDTAP = 11
```

```
Var r as Boolean = self.SetWindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, true)

if r then
Var value as Boolean
Var b as Boolean = self.WindowFeedbackSettingMBS(FEEDBACK_TOUCH_TAP, value)
if b then
MsgBox "WindowFeedbackSettingMBS: "+str(value)
end if
end if
```

Notes: Returns true if successful; otherwise, returns false.

Value can be nil to reset value. Or true/false to set it.
Requires Windows 8 or Windows Server 2012 in desktop apps only.

Constant Name	Value	Description
FEEDBACK_TOUCH_CONTACTVISUALIZATION	1	Feedback for a touch contact event.
FEEDBACK_PEN_BARRELVISUALIZATION	2	Feedback for a pen barrel-button event.
FEEDBACK_PEN_TAP	3	Feedback for a pen tap event.
FEEDBACK_PEN_DOUBLETAP	4	Feedback for a pen double-tap event.
FEEDBACK_PEN_PRESSANDHOLD	5	Feedback for a pen press-and-hold event.
FEEDBACK_PEN_RIGHTTAP	6	Feedback for a pen right-tap event.
FEEDBACK_TOUCH_TAP	7	Feedback for a touch tap event.
FEEDBACK_TOUCH_DOUBLETAP	8	Feedback for a touch double-tap event.
FEEDBACK_TOUCH_PRESSANDHOLD	9	Feedback for a touch press-and-hold event.
FEEDBACK_TOUCH_RIGHTTAP	10	Feedback for a touch right-tap event.
FEEDBACK_GESTURE_PRESSANDTAP	11	Feedback for a press-and-tap gesture.

Videos

- Presentation from London conference about MBS Plugins.

210.6.27 SetWindowIconMBS(Type as Integer, File as FolderItem, IconID as Integer) as Boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop only.

Function: Sets the window icon using the icon in the file.
Example:

```
call window1.SetWindowIconMBS(0,getfolderitem("icon.ico"),1)
```

Notes: Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.
See also:

- 210.6.28 SetWindowIconMBS(Type as Integer, Icon as Picture, Mask as Picture) as Boolean 23927

210.6.28 SetWindowIconMBS(Type as Integer, Icon as Picture, Mask as Picture) as Boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop only.

Function: Sets the window icon using the given picture with mask.
Example:

```
Var p as Picture
Var m as Picture

// random colored circle image
p=New Picture(16,16,32)
p.Graphics.ForeColor=&c000000
p.Graphics.FillRect 0,0,16,16
p.Graphics.ForeColor=rgb(rnd*256,rnd*256,rnd*256)
p.Graphics.Filloval 0,0,16,16

// circle mask
m=New Picture(16,16,32)
m.Graphics.ForeColor=&cFFFFFF // transparent
m.Graphics.Fillrect 0,0,16,16
m.Graphics.ForeColor=&c000000 // color
m.Graphics.Filloval 0,0,16,16

Canvas1.Backdrop=p // show in canvas
Canvas2.Backdrop=m

call window1.SetWindowIconMBS(0,p,m)
```

Notes: The mask picture ist converted to black/white.
What image depths are used and supported depends on the Windows version.
Returns true on success and false on failure.

Possible values for type:

See also:

ICON_BIG = 1	Set the large icon for the window.
ICON_SMALL = 0	Set the small icon for the window.

- 210.6.27 SetWindowIconMBS(Type as Integer, File as FolderItem, IconID as Integer) as Boolean 23926

210.6.29 SetWindowMaskMBS(p as picture, redraw as Boolean, transparentColor as color) as Boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop only.

Function: Sets the mask of a window.
Notes: Redraw decides whether the window is redrawn after it has been changed.
Returns true if successfull.

If you want to do the same on Mac OS X, check the example projects "transparent window" and the Photoshop Splash Screen example.

210.6.30 ShowHideToolbarMBS(animate as boolean, value as boolean)

MBS Util Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: Shows or hides the toolbar.
Notes: Only working on MacOS.

210.6.31 ShowKeyboardMBS

MBS Win Plugin, Plugin Version: 23.2, Platforms: macOS, Windows, Targets: Desktop only.

Function: Shows the keyboard viewer.
Notes: On Windows you can trigger this a second time to hide it.

See also ShowCharacterPaletteMBS function.

210.6.32 SmoothResizeCenteredMBS(width as Integer,height as Integer)

MBS Util Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Resizes the window smoothly to all directions.
Example:

```
Var w,h as Integer

// get destination dimension

w=300
h=200

// Resize

window1.SmoothResizeCenteredMBS w,h

// Now resize via RB to make it permament.

width=w
height=h
```

Notes: You need to set the new size using Xojo's Windows properties, too. (no longer needed with Xojo) In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr3

210.6.33 SmoothResizeMBS(width as Integer,height as Integer)

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Resizes the window smoothly.
Example:

```
Var w,h as Integer

// get destination dimension

w=300
h=200

// Resize

window1.SmoothResizeMBS w,h
```

// Now resize via RB to make it permament.

width=w
height=h

Notes: You need to set the new size using Xojo's Windows properties, too. (no longer needed with Xojo)
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works on Cocoa on 10.4 and newer.

210.6.34 ToggleFullScreenMBS as Boolean

MBS Util Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Toggles fullscreen mode for this window.
Notes: Returns true on success.
If an application supports fullscreen, it should add a menu item to the View menu with toggleFullScreen as the action.
Available in Mac OS X v10.7 and later.
This method does not much if you don't mark a window to be the primary fullscreen window.

210.6.35 UpdateNowMBS

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Function: On MacOS all windows are doublebuffered and the OS updates the screen from time to time. This method forces a screen update.
Example:

Mainwindow.UpdateNowMBS

Notes: Updated for 64-bit in plugin version 18.3.
Blog Entries

- MBS Xojo Plugins, version 18.3pr3

210.6.36 UpdateNowRectMBS(left as Integer, top as Integer, width as Integer, height as Integer)

MBS MacOSX Plugin, Platform: macOS, Targets: Desktop only.

Function: On Mac OS all windows are doublebuffered and the OS updates the screen from time to time. This method forces a screen update for a part of your window.
Example:

Mainwindow.UpdateNowRectMBS Mainwindow.text.left, Mainwindow.text.top, Mainwindow.text.width, Mainwindow.text.height

Notes: Updated for 64-bit in plugin version 18.3.

210.6.37 WinAnimateWindowMBS(Flags as Integer, Time as Integer=200) as boolean

MBS Win Plugin, Plugin Version: 9.4, Platform: Windows, Targets: Desktop only.

Function: The AnimateWindow function enables you to produce special effects when showing or hiding windows.
Example:

```
Var flags as Integer

const AW_SLIDE = &h040000 // Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
const AW_ACTIVATE = &h020000 // Activates the window. Do not use this value with AW_HIDE.
const AW_BLEND = &h080000 // Uses a fade effect. This flag can be used only if hwnd is a top-level window.
const AW_HIDE = &h010000 //Hides the window. By default, the window is shown.
const AW_CENTER = &h10 // Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
const AW_HOR_POSITIVE = 1 // Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_HOR_NEGATIVE = 2 // Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_POSITIVE = 4 // Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
const AW_VER_NEGATIVE = 8 // Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

window2.hide

flags=BitwiseOr(AW_SLIDE, AW_HOR_POSITIVE)
```

```
if window2.WinAnimateWindowMBS(flags, 1000) then
window2.show
else
MsgBox "Animatin failed."
end if
```

Notes: There are four types of animation: roll, slide, collapse or expand, and alpha-blended fade.

self: The window to animate. The calling thread must own this window.
Time: Specifies how long it takes to play the animation, in milliseconds. Typically, an animation takes 200 milliseconds to play.
Flags: Specifies the type of animation. This parameter can be one or more of the following values. Note that, by default, these flags take effect when showing a window. To take effect when hiding a window, use AW_HIDE and a bitwiseor operator with the appropriate flags.

AW_SLIDE	= &h040000	Uses slide animation. By default, roll animation is used. This flag is ignored when used with AW_CENTER.
AW_ACTIVATE	= &h020000	Activates the window. Do not use this value with AW_HIDE.
AW_BLEND	= &h080000	Uses a fade effect. This flag can be used only if hwnd is a top-level window.
AW_HIDE	= &h010000	Hides the window. By default, the window is shown.
AW_CENTER	= &h10	Makes the window appear to collapse inward if AW_HIDE is used or expand outward if the AW_HIDE is not used. The various direction flags have no effect.
AW_HOR_POSITIVE	= 1	Animates the window from left to right. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_HOR_NEGATIVE	= 2	Animates the window from right to left. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_POSITIVE	= 4	Animates the window from top to bottom. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.
AW_VER_NEGATIVE	= 8	Animates the window from bottom to top. This flag can be used with roll or slide animation. It is ignored when used with AW_CENTER or AW_BLEND.

Return Value:
If the function succeeds, the return value is true.
If the function fails, the return value is false.
The function will fail in the following situations:

- If the window uses the window region. Windows XP: This does not cause the function to fail.
- If the window is already visible and you are trying to show the window.
- If the window is already hidden and you are trying to hide the window.
- If there is no direction specified for the slide or roll animation.
- When trying to animate a child window with AW_BLEND.
- If the thread does not own the window. Note that, in this case, AnimateWindow fails but GetLastError returns ERROR_SUCCESS. To get extended error information, call the GetLastError function.

To show or hide a window without special effects, use Show.
When using slide or roll animation, you must specify the direction. It can be either AW_HOR_POSITIVE, AW_HOR_NEGATIVE, AW_VER_POSITIVE, or AW_VER_NEGATIVE.
You can combine AW_HOR_POSITIVE or AW_HOR_NEGATIVE with AW_VER_POSITIVE or AW_VER_NEGATIVE to animate a window diagonally.
The window procedures for the window and its child windows should handle any WM_PRINT or WM_PRINTCLIENT messages. Dialog boxes, controls, and common controls already handle WM_PRINTCLIENT. The default window procedure already handles WM_PRINT.
If a child window is displayed partially clipped, when it is animated it will have holes where it is clipped.
AnimateWindow supports RTL windows.
Avoid animating a window that has a drop shadow because it produces visually distracting, jerky animations.
Blog Entries

- MBS REALbasic plug-ins version 9.4

210.6.38 WindowFeedbackSettingMBS(Feedback as Integer, byref value as boolean, IncludeAncestors as Boolean = false) as Boolean

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Retrieves the feedback configuration for a window.
Notes: IncludeAncestors: Specifies that the parent window chain should be checked.

Returns true if the specified feedback setting is configured on the specified window. Otherwise, it returns false (and config won't be modified).

Requires Windows 8 [desktop apps only] or Windows Server 2012 [desktop apps only] .

Constant Name	Value	Description
FEEDBACK_TOUCH_CONTACTVISUALIZATION	1	Feedback for a touch contact event.
FEEDBACK_PEN_BARRELVISUALIZATION	2	Feedback for a pen barrel-button event.
FEEDBACK_PEN_TAP	3	Feedback for a pen tap event.
FEEDBACK_PEN_DOUBLETAP	4	Feedback for a pen double-tap event.
FEEDBACK_PEN_PRESSANDHOLD	5	Feedback for a pen press-and-hold event.
FEEDBACK_PEN_RIGHTTAP	6	Feedback for a pen right-tap event.
FEEDBACK_TOUCH_TAP	7	Feedback for a touch tap event.
FEEDBACK_TOUCH_DOUBLETAP	8	Feedback for a touch double-tap event.
FEEDBACK_TOUCH_PRESSANDHOLD	9	Feedback for a touch press-and-hold event.
FEEDBACK_TOUCH_RIGHTTAP	10	Feedback for a touch right-tap event.
FEEDBACK_GESTURE_PRESSANDTAP	11	Feedback for a press-and-tap gesture.

Blog Entries

- MBS Xojo Plugins, version 17.5pr6

210.6.39 WinFlashWindowMBS(Invert as boolean)

MBS Util Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: Flashes Window.
Example:

window1.WinFlashWindowMBS true

Notes: Flashes the specified window one time. It does not change the active state of the window.

Invert: If this parameter is true, the window is flashed from one state to the other. If it is false, the window is returned to its original state (either active or inactive).

When an application is minimized and this parameter is true, the taskbar window button flashes active/inactive. If it is false, the taskbar window button flashes inactive, meaning that it does not change colors. It flashes, as if it were being redrawn, but it does not provide the visual invert clue to the user.

Flashing a window means changing the appearance of its caption bar as if the window were changing from inactive to active status, or vice versa. (An inactive caption bar changes to an active caption bar; an active caption bar changes to an inactive caption bar.)
Typically, a window is flashed to inform the user that the window requires attention but that it does not currently have the keyboard focus.
The FlashWindow function flashes the window only once; for repeated flashing, the application should create a system timer.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr2

210.6.40 WinHideTooltipMBS as Integer

MBS Win Plugin, Plugin Version: 16.1, Platform: Windows, Targets: Desktop only.

Function: Hides all tooltips.
Notes: You can call that in window.deactivate event to hide tooltips which did not hide themselves.
Returns number of hidden tooltips.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr4

210.6.41 Properties

210.6.42 CanBeVisibleWithoutLoginMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop only.

Function: Whether this window can be visible before login.
Example:

```
window1.CanBeVisibleWithoutLoginMBS = true
```

Notes: This window can be made visible prior to user login. By default, in Mac OS X 10.5 and later no windows can be visible before a user logs into the system; this protects the user against certain types of malicious use of insecure applications. However, some software, such as input methods or other accessibility software, may need to deliberately make windows available prior to user login. Such software should add this window attribute to its windows. Available for all windows in Mac OS X 10.5 and later.
(Read and Write computed property)

210.6.43 CGColorSpaceMBS as CGColorSpaceMBS

MBS MacCG Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

Function: Get or set the colorspace profile for this window.
Example:

```
Var c as CGColorSpaceMBS = window1.CGColorSpaceMBS

if c<>Nil then
MsgBox str(c.NumberOfComponents)
else
MsgBox "nil"
end if
```

Notes: Requires MacOS 10.6 or newer.

On Cocoa, the NSColorSpace is queried and the matching CGColorspace is returned. For setting a NSColorSpace is created for the given CGColorspace.
In Carbon applications, the CoreGraphics color space is passed directly.
(Read and Write computed property)

210.6.44 collapsedMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Returns true if this window is collapsed. You can set it.
Example:

mainwindow.collapsedMBS=false 'show window

Notes: Collapseable windows are the normal document windows.
You can't collapse dialogs or floating windows well.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

210.6.45 FullScreenAuxiliaryMBS as Boolean

MBS Util Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether this window is setup as being the auxiliary fullscreen window.
Notes: (Read and Write computed property)

210.6.46 FullScreenPrimaryMBS as Boolean

MBS Util Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether this window is setup as being the primary fullscreen window.
Notes: If true, the window receives the fullscreen widget in the title bar.
(Read and Write computed property)

210.6.47 HasborderMBS as boolean

MBS Util Plugin, Platform: Windows, Targets: Desktop only.

Function: Decides whether the window has a border.
Example:

mainwindow.HasborderMBS=false ' Remove border

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it). This option removes the title bar. HasCaptionMBS removes even more.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

(Read and Write computed property)

210.6.48 HasCaptionMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop only.

Function: Whether the window has a caption (a title bar)
Example:

Window1.HasCaptionMBS=false

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.49 HasCloseBoxMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Whether this window has a CloseBox.
Example:

mainwindow.HasCloseboxMBS=false 'remove closebox

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.50 HasCollapseBoxMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Whether this window has a Collapsebox.
Example:

mainwindow.HasCollapseBoxMBS=false 'remove Collapsebox

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.51 HasMaximizeBoxMBS as boolean

MBS Util Plugin, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window has a Maximize Button.
Example:

mainwindow.HasMaximizeBoxMBS=false 'remove Maximize button

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.52 HasMinimizeBoxMBS as boolean

MBS Util Plugin, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window has a Minimize Button.
Example:

mainwindow.HasMinimizeBoxMBS=false 'remove Minimize button

Notes: This property has only an effect on Windows. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.53 HasNoShadowMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Whether this window has no shadow.
Example:

mainwindow.HasNoShadowMBS=true 'remove shadow

Notes: Available for all windows on Mac OS X. This attribute is automatically given to windows of kOverlayWindowClass.

Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

210.6.54 HasNoTitleBarMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use NSWindowMBS for Cocoa instead. **Function:** For Document, Floating, and Utility windows, this attribute allows you to hide the title bar of a window.
Example:

window1.HasNoTitleBarMBS = true

// for Cocoa:
window1.HasCloseBoxMBS = false
window1.HasCollapseBoxMBS = false
window1.IsResizableMBS = false
window1.HasNoTitleBarMBS = true

Notes: For Mac OS X 10.4 or later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in Plugin version 10.4.
(Read and Write computed property)

210.6.55 HasSystemMenuMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop only.

Function: Whether the window has a system menu inside the title bar.
Example:

Window1.HasSystemMenuMBS=false

Notes: This property has only an effect on Windows. It will disable the system menu and also the minimize, maximize and close buttons. The window needs to be redrawn before the change is visible (for example move it).

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.56 HasToolbarButtonMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: Whether this window has a toolbar button.
Example:

mainwindow.HasToolbarButtonMBS=true 'shows Toolbar Button

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
The Button is shown on next redraw of the window frame.

Use the CarbonWindowsEventsMBS class to receive events when the button is pressed.

Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.57 IgnoreClicksMBS as Boolean

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Can be used to control whether mouse clicks are ignored for this window.
Example:

Window1.IgnoreClicksMBS=true

Notes: Whether this window never receives mouse events, even in areas that are opaque. Instead, clicks on the window will be passed through to windows beneath it. Available for all windows on Mac OS X 10.2 and later.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

210.6.58 IsIconicMBS as boolean

MBS Util Plugin, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window is inside the taskbar.
Example:

MsgBox str(window1.IsIconicMBS)

Notes: If you set IsIconic to true the window is minimized and if you set it to false the window size and position is restored.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.59 IsMetalWindowMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Function: Whether this window uses the Metal appearance.
Example:

```
if window1.Frame = window.FrameTypeMetal then
```

```
MsgBox "Window is metal. "+str(window1.IsMetalWindowMBS)
else
MsgBox "Window is not metal. "+str(window1.IsMetalWindowMBS)
end if
```

Notes: Available for document windows on Mac OS X 10.2 and later, and for floating windows on Mac OS X 10.3 and later. Drawers can also be metal, but dynamically adjust their appearance based on their parent window's appearance; it is not necessary to specify this attribute for a metal drawer.

You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.60 IsResizableMBS as Boolean

MBS Util Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Function: Whether this window is resizeable.
Example:

```
Window1.IsResizableMBS=false
```

Notes: You can read the state on Mac Classic, but you can only change it on Mac Carbon.
Returns false on any error.

Use GrowBoxTransparentMBS on Composite Mac OS windows to enable the transparent grow box.

In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works in Cocoa.
(Read and Write computed property)

210.6.61 IsZoomedMacMBS as boolean

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: Desktop only.

Function: Returns true if the window is zoomed.
Example:

MsgBox str(window1.IsZoomedMacMBS)

Notes: Requires Mac OS 8.5 or newer.
Seems not to work correctly on RB 5.5.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

210.6.62 IsZoomedMBS as boolean

MBS Util Plugin, Platform: Windows, Targets: Desktop only.

Function: Returns true if this window has been maximized.
Example:

MsgBox str(window1.IsZoomedMBS)

Notes: If you set IsZoomed to true the window is maximized and if you set it to false the window size and position is restored.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Works on Cocoa.
(Read and Write computed property)

210.6.63 ModifiedMBS as boolean

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: You can set or get the value of the modified state.
Example:

mainwindow.modifiedMBS=true

Notes: Requires Mac OS 8.5 or newer.
As long as you don't set modified to false the window keeps to tell you that it's modified. Not sure why, so just set modified to false early in creating the window.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

210.6.64 ToolbarVisibleMBS as boolean

MBS Util Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop only.

Function: Whether the toolbar is shown in this window or not.
Notes: Value is false on any error.
Only working on MacOS.
(Read and Write computed property)

210.6.65 TransparencyMBS as single

MBS Util Plugin, Plugin Version: 5.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The transparency of the window on Mac OS X, Windows 2000 and Windows XP.
Notes: 1 for opaque, 0 for invisible.
Return 1 on any error. On Windows it returns always 1 as the current transparency value can't be queried.
You need to call MakeTransparent before to install transparency.
(added Windows support in version 4.4)
Linux supported added with 14.0, but works only with Linux desktop which support alpha channel.
(Read and Write computed property)

210.6.66 UnifiedTitleAndToolbarMBS as Boolean

MBS Util Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop only.

Function: Whether this window has an unified title and toolbar look.
Example:

window1.UnifiedTitleAndToolbarMBS = true

Notes: This window draws its window title and toolbar using a unified appearance that has no separator between the two areas. A window may not have both UnifiedTitleAndToolbar and Metal appearance. If a window already has the metal attribute, attempting to set the Unified attribute will cause ChangeWindows to return an error, and vice versa. This constant was not added to this header file until Mac OS X 10.5, but it is actually available at runtime on Mac OS X 10.4 and later for windows of kDocumentWindowClass. However, on Mac OS X 10.5 and later, kHIWindowBitUnifiedTitleAndToolbar no longer has any effect, since all windows with toolbars now have a unified look.
(Read and Write computed property)

210.6.67 WindowDisplayAffinityMBS as Integer

MBS Util Plugin, Plugin Version: 25.3, Platform: Windows, Targets: Desktop only.

Function: The window display affinity.
Example:

Window1.WindowDisplayAffinityMBS = &h11

Notes: Specifies where the content of the window can be displayed.
The display affinity setting that specifies where the content of the window can be displayed.

This parameter can be one of the following values:

Name	Value	Meaning
None	0	Imposes no restrictions on where the window can be displayed.
Monitor	1	The window content is displayed only on a monitor. Everywhere else, the window appears with no content.
ExcludeFromCapture	&h11	The window is displayed only on a monitor. Everywhere else, the window does not appear at all. One use for this affinity is for windows that show video recording controls, so that the controls are not included in the capture.

This property is designed to support the window content protection feature that is new to Windows 7. This feature enables applications to protect their own onscreen window content from being captured or copied through a specific set of public operating system features and APIs. However, it works only when the Desktop Window Manager(DWM) is composing the desktop.

It is important to note that unlike a security feature or an implementation of Digital Rights Management (DRM), there is no guarantee that using SetWindowDisplayAffinity, will strictly protect windowed content, for example where someone takes a photograph of the screen.

Starting in Windows 10 Version 2004, ExcludeFromCapture is a supported value. Setting the display affinity to ExcludeFromCapture on previous version of Windows will behave as if Monitor is applied.
(Read and Write computed property)

210.6.68 WindowProxyIconFileMBS as folderitem

MBS Util Plugin, Platform: macOS, Targets: Desktop only.

Function: That's the icon to the window which belongs to the file.
Example:

```
Var f as folderItem

f=getopenFolderItem("special/any")
if f<>nil then
window1.WindowProxyIconFileMBS=f
```

```
end if
```

Notes: Requires Mac OS 8.5 or newer.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.

Added Cocoa support in plugin version 10.0.
(Read and Write computed property)

210.6.69 WinMenuHandleMBS as Integer

MBS Util Plugin, Platform: Windows, Targets: Desktop only.

Function: A property to access the handle used for the menu of a Window.
Example:

```
Var menu as Integer // global

if menu=0 then
menu=Window1.WinMenuHandleMBS // read it on the first window
else
Window1.winmenuHandleMBS=menu // set it on the second window
end if
```

Notes: Used in the example "Menu in every Window" to have a menubar in every window on Windows. But never forget to quit your app after all windows were closed.
In Xojo 2005 and newer you need to use self. in front of the method as the propertyname alone is not accepted.
(Read and Write computed property)

210.6.70 WinTopMostWindowMBS as boolean

MBS Win Plugin, Plugin Version: 9.6, Platform: Windows, Targets: Desktop only.

Function: Whether a window is staying on the top of the other windows.
Example:

```
window1.WinTopMostWindowMBS=true
```

Notes: If true the window stays in front of other windows. Default is false for Xojo windows and true for overlays.
(Read and Write computed property)

Chapter 211

Windows

211.1 control DesktopWinPreviewControlMBS

211.1.1 control DesktopWinPreviewControlMBS

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The preview control for Windows.
Notes: Used to show PDF documents on Windows using the built-in preview handler on Windows 10 and newer.
Can also be used to use other built-in preview handlers on Windows by setting classID.

Since the control is handled by Windows, the key and mouse events are not expected to work.

211.1.2 Methods

211.1.3 LoadData(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes: Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.
See also:

- 211.1.4 LoadData(data as string) 23948

211.1.4 LoadData(data as string)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes: Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.
See also:

- 211.1.3 LoadData(data as MemoryBlock) 23948

211.1.5 LoadFile(file as folderitem)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given file.
Notes: Lasterror is set.
If the preview handler does not support reading file, the plugin reads the file and passes as data.

If the file path is invalid, the preview will show a file not found error message.

211.1.6 Properties

211.1.7 classID as String

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The class ID for the previewer to use.
Notes: If empty, uses PDF viewer.
Available preview classes in a typical Windows 10 installation:

Class ID	Description
{ 13D3C4B8-B179-4ebb-BF62-F704173E7448 }	Windows Contact Preview Handler
{ 1531d583-8375-4d3f-b5fb-d23bbd169f22 }	Windows TXT Previewer
{ 53BEDF0B-4E5B-4183-8DC9-B844344FA104 }	Microsoft Windows MAPI Preview Handler
{ 8a7cae0e-5951-49cb-bf20-ab3fa1e44b01 }	Windows Font previewer
{ 92dbad9f-5025-49b0-9078-2d78f935e341 }	Microsoft Windows Mail Mime Preview Handler
{ a42c2ccb-67d3-46fa-abe6-7d2f3488c7a3 }	Windows RTF Previewer
{ b9815375-5d7f-4ce2-9245-c9d4da436930 }	Microsoft Windows Mail Mime Preview Handler
{ BFD468D2-D0A0-4bdc-878C-E69C2F5B435D }	Microsoft Windows Mail Html Preview Handler
{ E64164EB-1AE0-4C50-BAEF-A413C2B3A4BC }	Microsoft 3MF Shell Thumbnail and Preview Handler
{ f8b8412b-dea3-4130-b36c-5e8be73106ac }	Microsoft Windows Mail Html Preview Handler
{ 3A84F9C2-6164-485C-A7D9-4B27F8AC009E }	Microsoft PDF Previewer
{ DC6EFB56-9CFA-464D-8880-44885D7DC193 }	Adobe PDF Preview Handler for Vista

(Read and Write property)

211.1.8 Lasterror as Integer

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

211.1.9 LasterrorString as String

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The error message for the error number in the lasterror property.
Notes: (Read only property)

211.1.10 Events

211.1.11 Closing

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The close event.
In older Xojo versions, this event is named Close.

211.1.12 Configure

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called while initializing, where you can apply properties just before plugin reads them.
Notes: e.g. set classID here in code.

211.1.13 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 23.3, Platform: Windows, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

211.1.14 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 23.3, Platform: Windows, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

211.1.15 FocusLost

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The lost focus event.
In older Xojo versions, this event is named LostFocus.

211.1.16 FocusReceived

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The got focus event.
In older Xojo versions, this event is named GotFocus.

211.1.17 MenuBarSelected

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The enable menu items event.
In older Xojo versions, this event is named EnableMenuItems.

211.1.18 Opening

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The open event.
In older Xojo versions, this event is named Open.

211.2 class MapiFileMBS

211.2.1 class MapiFileMBS

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class contain information about a file containing a message attachment stored as a temporary file.
Example:

```
Var file as new MapiFileMBS
Var t as TextOutputStream
Var f as FolderItem

// write a temp file
f=SpecialFolder.Desktop.Child("test.txt")
t=TextOutputStream.Create(f)
t.WriteLine "Test file content"
t.Close

// create file
file=new MapiFileMBS
file.Path=f
file.Filename="test file"
file.Position=-1

// next add it to message
```

Notes: Important:
Simple MAPI is not installed by Exchange Server 2003 or later. However, Simple MAPI is supported for use with Exchange 2003. To function properly, the underlying Exchange or Microsoft Outlook®MAPI subsystem must be properly installed on the client computer.

211.2.2 Properties

211.2.3 Filename as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The attachment filename seen by the recipient, which may differ from the filename in the PathName member if temporary files are being used.
Notes: If the FileName member is empty, the filename from PathName is used.
(Read and Write property)

211.2.4 Flags as Integer

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The flags.
Notes: Currently not used with the plugin.
(Read and Write property)

211.2.5 Path as FolderItem

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The path of the attached file.
Notes: When this property is set the PathName property is filled with the absolute path. If you query this property, you get the PathName property as a folderitem.
So this property was made for your convenience.
(Read and Write property)

211.2.6 PathName as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The fully qualified path of the attached file.
Notes: This path should include the disk drive letter and directory name.
(Read and Write property)

211.2.7 Position as Integer

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: An integer used to indicate where in the message text to render the attachment.
Notes: Attachments replace the character found at a certain position in the message text. That is, attachments replace the character in the MapiMessage NoteText property at offset nPosition (nPosition is zero based!). A value of -1 means the attachment position is not indicated; the client application will have to provide a way for the user to access the attachment.
(Read and Write property)

211.3 class MapiMessageMBS

211.3.1 class MapiMessageMBS

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a message.
Example:

```
Var m as new MapiMessageMBS
Var r as new MapiRecipientMBS
Var o as new MapiRecipientMBS

o.Address="SMTP:sender@example.com"
o.Name="Me"
o.Type=o.TypeOriginator

r.Address="SMTP:receiver@example.com"
r.Name="You"
r.Type=o.TypeTo

m.AddRecipient r
m.Originator=o
m.Subject="Test Email"
m.NoteText="Hello World"
m.Flags=0

Var SendFlags as integer = m.kSendFlagDialog + m.kSendFlagLogonDialog

title=str(m.SendMail(self, SendFlags, false))
```

Notes: This can use Outlook or Thunderbird on Windows to send email with or without GUI.
Using Messaging Application Programming Interface (MAPI)

Does not work with Micorosft Outlook Web App as we need a locally installed Outlook with a MAPI component. Since Outlook for Windows is a web app wrapped in a desktop app, it doesn't do MAPI.

211.3.2 Methods

211.3.3 AddFile(file as MapiFileMBS)

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a file to the message file list.
Notes: File must be not nil.
Adds the file to the internal Files array.

211.3.4 AddRecipient(recipient as MapiRecipientMBS)

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a recipient to the message.
Notes: Recipient must not be nil.
Adds the recipient to the internal Recipients array.

211.3.5 Files as MapiFileMBS()

MBS Win Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the array with the files.
Example:

```
Var m As New MapiMessageMBS // your message

Var files() As MapiFileMBS = m.Files
// inspect
```

211.3.6 IsAvailable as boolean

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether MAPI is available.
Notes: Checks whether the library was loaded and whether the MAPI Registry key exists, so this has been initialized.
(mail account may not exist)

Returns true if MAPI can be used.

211.3.7 IsUnicodeAvailable as boolean

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether MAPI is available with unicode.
Notes: Checks whether the library was loaded and whether the MAPI Registry key exists, so this has been initialized.
(mail account may not exist)

Returns true if MAPI can be used with unicode.

211.3.8 Recipients as MapiRecipientMBS()

MBS Win Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the array with the recipients.
Example:

```
Var m As New MapiMessageMBS // your message

Var Recipients() As MapiRecipientMBS = m.Recipients
// inspect
```

211.3.9 SendMail(parent as DesktopWindow, SendFlags as Integer, Threaded as Boolean) as integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Sends an email.
Notes: Parameters:

parent:
The parent window for the dialogs used. If not nil the dialogs used will be modal.

SendFlags: Send flags. Default in older plugin versions was kSendFlagDialog when DisplayDialog parameter is true and kSendFlagLogonDialog if DisplayLogonDialog parameter was true.

Error codes:

The MAPI SendMail function sends a standard message, with or without any user interaction. The profile must be configured so that MAPISendMail can open the default service providers without requiring user interaction.

const SUCCESS_SUCCESS = 0	No error.
const MAPI_USER_ABORT = 1	The user canceled one of the dialog boxes. No message was sent.
const MAPI_E_FAILURE = 2	One or more unspecified errors occurred. No message was sent.
const MAPI_E_LOGON_FAILURE = 3	There was no default logon, and the user failed to log on successfully when the logon dialog box was displayed. No message was sent.
const MAPI_E_DISK_FULL = 4	
const MAPI_E_INSUFFICIENT_MEMORY = 5	There was insufficient memory to proceed. No message was sent.
const MAPI_E_ACCESS_DENIED = 6	
const MAPI_E_TOO_MANY_SESSIONS = 8	
const MAPI_E_TOO_MANY_FILES = 9	There were too many file attachments. No message was sent.
const MAPI_E_TOO_MANY_RECIPIENTS = 10	There were too many recipients. No message was sent.
const MAPI_E_ATTACHMENT_NOT_FOUND = 11	The specified attachment was not found. No message was sent.
const MAPI_E_ATTACHMENT_OPEN_FAILURE = 12	The specified attachment could not be opened. No message was sent.
const MAPI_E_ATTACHMENT_WRITE_FAILURE = 13	
const MAPI_E_UNKNOWN_RECIPIENT = 14	
const MAPI_E_BAD_RECIPTYPE = 15	The type of a recipient was not TypeTO, TypeCC, or TypeBCC. No message was sent.
const MAPI_E_NO_MESSAGES = 16	
const MAPI_E_INVALID_MESSAGE = 17	
const MAPI_E_TEXT_TOO_LARGE = 18	The text in the message was too large. No message was sent.
const MAPI_E_INVALID_SESSION = 19	
const MAPI_E_TYPE_NOT_SUPPORTED = 20	
const MAPI_E_AMBIGUOUS_RECIPIENT = 21	A recipient matched more than one of the recipient descriptor structures and Dialog is false. No message was sent.
const MAPI_E_MESSAGE_IN_USE = 22	
const MAPI_E_NETWORK_FAILURE = 23	
const MAPI_E_INVALID_EDITFIELDS = 24	
const MAPI_E_INVALID_RECIPS = 25	One or more recipients were invalid or did not resolve to any address.
const MAPI_E_NOT_SUPPORTED = 26	

Client applications can provide a full or partial list of recipient names, subject text, file attachments, or message text. If any information is missing, MAPISendMail can prompt the user for it. If no information is missing, either the message can be sent as is or the user can be prompted to verify the information, changing values if necessary.

A successful return from MAPISendMail does not necessarily imply recipient validation. The message might not have been sent to all recipients. Depending on the transport provider, recipient validation can be a lengthy process.

A "" value for the Subject indicates that there is no text for the subject of the message. A "" value for the NoteText member indicates that there is no message text. Some client applications can truncate subject lines that are too long or contain carriage returns, line feeds, or form feeds.

Each paragraph should be terminated with a CR (0x0d), an LF (0x0a), or a CRLF pair (0x0d0a). MAPISendMail wraps lines as appropriate. If the text exceeds system limits, the function returns the MAPI_E_TEXT_TOO_LARGE value.

The MessageType property is used only by non-IPM applications. Applications that handle IPM messages can set it to "".

The number of attachments per message can be limited in some messaging systems. If the limit is exceeded, the MAPI_E_TOO_MANY_FILES value is returned. File attachments are copied to the message before MAPISendMail returns; therefore, later changes to the files do not affect the contents of the message. The files must be closed when they are copied. Do not attempt to display attachments outside the range of the message text.

Some messaging systems can limit the number of recipients per message. If the client application passes a non-nil value indicating a number of recipients exceeding the system limit, MAPISendMail returns the MAPI_E_TOO_MANY_RECIPIENTS value. If the recipient array is empty, the Dialog parameter must be true in the call to MAPISendMail.

Note that the recipients can include either an entry identifier, the recipient's name, an address, or a name and address pair. The following table shows how MAPISendMail handles the variety of information that can be specified:

Information	Action
entry identifier	No name resolution; the name and address are ignored.
name	Name resolved using the Simple MAPI resolution rules.
address	No name resolution; address is used for both message delivery and for displaying the recipient name.
name and address	No name resolution; name used only for displaying the recipient name.

Client applications that send messages to custom recipients can avoid name resolution. Such clients should set the Address member of the recipient to the custom address.

MAPISendMail does not require an originator-type recipient to send a message.

Important Simple MAPI is not installed by Exchange Server 2003 or later. However, Simple MAPI is supported for use with Exchange 2003. To function properly, the underlying Exchange or Microsoft Outlook®MAPI subsystem must be properly installed on the client computer.

211.3.10 SendMail(parent as window, SendFlags as Integer, Threaded as Boolean) as integer

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop only.

Function: Sends an email.
Notes: Parameters:

parent:
The parent window for the dialogs used. If not nil the dialogs used will be modal.

SendFlags: Send flags. Default in older plugin versions was kSendFlagDialog when DisplayDialog parameter is true and kSendFlagLogonDialog if DisplayLogonDialog parameter was true.

Error codes:

const SUCCESS_SUCCESS = 0	No error.
const MAPI_USER_ABORT = 1	The user canceled one of the dialog boxes. No message was sent.
const MAPI_E_FAILURE = 2	One or more unspecified errors occurred. No message was sent.
const MAPI_E_LOGON_FAILURE = 3	There was no default logon, and the user failed to log on successfully when the logon dialog box was displayed. No message was sent.
const MAPI_E_DISK_FULL = 4	
const MAPI_E_INSUFFICIENT_MEMORY = 5	There was insufficient memory to proceed. No message was sent.
const MAPI_E_ACCESS_DENIED = 6	
const MAPI_E_TOO_MANY_SESSIONS = 8	
const MAPI_E_TOO_MANY_FILES = 9	There were too many file attachments. No message was sent.
const MAPI_E_TOO_MANY_RECIPIENTS = 10	There were too many recipients. No message was sent.
const MAPI_E_ATTACHMENT_NOT_FOUND = 11	The specified attachment was not found. No message was sent.
const MAPI_E_ATTACHMENT_OPEN_FAILURE = 12	The specified attachment could not be opened. No message was sent.
const MAPI_E_ATTACHMENT_WRITE_FAILURE = 13	
const MAPI_E_UNKNOWN_RECIPIENT = 14	
const MAPI_E_BAD_RECIPTYPE = 15	The type of a recipient was not TypeTO, TypeCC, or TypeBCC. No message was sent.
const MAPI_E_NO_MESSAGES = 16	
const MAPI_E_INVALID_MESSAGE = 17	
const MAPI_E_TEXT_TOO_LARGE = 18	The text in the message was too large. No message was sent.
const MAPI_E_INVALID_SESSION = 19	
const MAPI_E_TYPE_NOT_SUPPORTED = 20	
const MAPI_E_AMBIGUOUS_RECIPIENT = 21	A recipient matched more than one of the recipient descriptor structures and Dialog is false. No message was sent.
const MAPI_E_MESSAGE_IN_USE = 22	
const MAPI_E_NETWORK_FAILURE = 23	
const MAPI_E_INVALID_EDITFIELDS = 24	
const MAPI_E_INVALID_RECIPS = 25	One or more recipients were invalid or did not resolve to any address.
const MAPI_E_NOT_SUPPORTED = 26	

The MAPI SendMail function sends a standard message, with or without any user interaction. The profile must be configured so that MAPISendMail can open the default service providers without requiring user interaction.

Client applications can provide a full or partial list of recipient names, subject text, file attachments, or message text. If any information is missing, MAPISendMail can prompt the user for it. If no information is missing, either the message can be sent as is or the user can be prompted to verify the information, changing values if necessary.

A successful return from MAPISendMail does not necessarily imply recipient validation. The message might not have been sent to all recipients. Depending on the transport provider, recipient validation can be a lengthy process.

A "" value for the Subject indicates that there is no text for the subject of the message. A "" value for the NoteText member indicates that there is no message text. Some client applications can truncate subject lines that are too long or contain carriage returns, line feeds, or form feeds.

Each paragraph should be terminated with a CR (0x0d), an LF (0x0a), or a CRLF pair (0x0d0a). MAPISendMail wraps lines as appropriate. If the text exceeds system limits, the function returns the MAPI_E_TEXT_TOO_LARGE value.

The MessageType property is used only by non-IPM applications. Applications that handle IPM messages can set it to "".

The number of attachments per message can be limited in some messaging systems. If the limit is exceeded, the MAPI_E_TOO_MANY_FILES value is returned. File attachments are copied to the message before MAPISendMail returns; therefore, later changes to the files do not affect the contents of the message. The files must be closed when they are copied. Do not attempt to display attachments outside the range of the message text.

Some messaging systems can limit the number of recipients per message. If the client application passes a non-nil value indicating a number of recipients exceeding the system limit, MAPISendMail returns the MAPI_E_TOO_MANY_RECIPIENTS value. If the recipient array is empty, the Dialog parameter must be true in the call to MAPISendMail.

Note that the recipients can include either an entry identifier, the recipient's name, an address, or a name and address pair. The following table shows how MAPISendMail handles the variety of information that can be specified:

Information	Action
entry identifier	No name resolution; the name and address are ignored.
name	Name resolved using the Simple MAPI resolution rules.
address	No name resolution; address is used for both message delivery and for displaying the recipient name.
name and address	No name resolution; name used only for displaying the recipient name.

Client applications that send messages to custom recipients can avoid name resolution. Such clients should set the Address member of the recipient to the custom address.

MAPISendMail does not require an originator-type recipient to send a message.

Important Simple MAPI is not installed by Exchange Server 2003 or later. However, Simple MAPI is supported for use with Exchange 2003. To function properly, the underlying Exchange or Microsoft Out-

look®MAPI subsystem must be properly installed on the client computer.

- 211.3.11 SendMail(SendFlags as Integer, Threaded as Boolean) as integer 23961

211.3.11 SendMail(SendFlags as Integer, Threaded as Boolean) as integer

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sends an email.
Notes: This method is without parent window for dialogs, so you can use it in a console project.
See also:

- 211.3.9 SendMail(parent as DesktopWindow, SendFlags as Integer, Threaded as Boolean) as integer 23956
- 211.3.10 SendMail(parent as window, SendFlags as Integer, Threaded as Boolean) as integer 23958

211.3.12 Properties

211.3.13 ConversationID as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string identifying the conversation thread to which the message belongs.
Notes: Some messaging systems can ignore and not return this member.
(Read and Write property)

211.3.14 DateReceived as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string indicating the date when the message was received.
Notes: The format is YYYY/MM/DD HH:MM, using a 24-hour clock.
(Read and Write property)

211.3.15 Flags as Integer

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Bitmask of message status flags.
Notes: Can be a combination of kFlagsReceiptRequested, kFlagsSent and kFlagsUnread.
(Read and Write property)

211.3.16 MessageType as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string indicating a non-IPM type of message.
Notes: Client applications can select message types for their non-IPM messages. Clients that only support IPM messages can ignore the MessageType member when reading messages and set it to empty when sending messages.
(Read and Write property)

211.3.17 NoteText as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string containing the message text.
Notes: If this member is empty, there is no message text.
(Read and Write property)

211.3.18 Originator as MapiRecipientMBS

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The reference to the originator of this message.
Notes: (Read and Write property)

211.3.19 Subject as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text string describing the message subject, typically limited to 256 characters or less.
Notes: If this member is empty, the user has not entered subject text.
(Read and Write property)

211.3.20 UseUnicode as Boolean

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to use Unicode API.
Notes: Microsoft offers both unicode and ANSI interfaces.
By default UseUnicode is true and you can set it to false to use ANSI interface if needed.
If no unicode interface is needed, we automatically use the ANSI interface.
(Read and Write property)

211.3.21 Constants

Message Flags

Constant	Value	Description
kFlagsReceiptRequested	2	A receipt notification is requested. Client applications set this flag when sending a message. Note: Most email applications ignore the receipt notifications.
kFlagsSent	4	The message has been sent.
kFlagsUnread	1	The message has not been read.

Send Flags

Constant	Value	Description
kSendFlagDialog	8	Display a send note UI A dialog box should be displayed to prompt the user for recipients and other sending options. When Dialog is false, at least one recipient must be specified.
kSendFlagLogonDialog	1	Display logon UI. A dialog box should be displayed to prompt the user to log on if required. When the DisplayLogonDialog is false, the client application does not display a logon dialog box and returns an error value if the user is not logged on. SendMail ignores this flag if the MessageID parameter is empty.
kSendFlagNewSession	2	Don't use shared session Create a new session.

211.4 class MapiRecipientMBS

211.4.1 class MapiRecipientMBS

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class contains information about a message sender or recipient.
Example:

```
Var o as new MapiRecipientMBS

o.Address="SMTP:sender@example.com"
o.Name="Me"
o.Type=o.TypeOriginator

// next add it to message
```

211.4.2 Properties

211.4.3 Address as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Optional the recipient or sender's address.
Example:

```
Var o as new MapiRecipientMBS
o.Address="SMTP:sender@example.com"
o.Name="Me"
o.Type=o.TypeOriginator
```

Notes: This address is provider-specific message delivery data. Generally, the messaging system provides such addresses for inbound messages. For outbound messages, the Address member can point to an address entered by the user for a recipient not in an address book (that is, a custom recipient). The format of an address pointed to by the Address member is [address type] [e-mail address] . Examples of valid addresses are FAX:206-555-1212 and SMTP:M@X.COM.
(Read and Write property)

211.4.4 Name as String

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the recipient.
Notes: (Read and Write property)

211.4.5 Type as Integer

MBS Win Plugin, Plugin Version: 8.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains a numeric value that indicates the type of recipient.
Example:

```
Var o as new MapiRecipientMBS
o.Address="SMTP:you@example.com"
o.Name="You"
o.Type=o.TypeTo
```

Notes: Use one of the Type constants.
(Read and Write property)

211.4.6 Constants

Constants

Constant	Value	Description
TypeBCC	3	One of the constants for the type property. Indicates a recipient of a blind copy.
TypeCC	2	One of the constants for the type property. Indicates a recipient of a message copy.
TypeOriginator	0	One of the constants for the type property. Indicates the original sender of the message.
TypeTo	1	One of the constants for the type property. Indicates a primary message recipient.

211.5 class TaskDialogButtonMBS

211.5.1 class TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a button.

211.5.2 Properties

211.5.3 Default as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is default button.
Notes: Only one button can be default.
(Read and Write property)

211.5.4 Enabled as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to enable this button.
Notes: Default: true.

This is a live property. Setting it while dialog is open changes the button state.
(Read and Write property)

211.5.5 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The unique ID for the button.
Notes: The IDs should be unique for all buttons.
(Read and Write property)

211.5.6 Text as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The caption for the button.
Notes: (Read and Write property)

211.5.7 Visible as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this button is visible.
Notes: Default true.
(Read and Write property)

211.6 class TaskDialogMBS

211.6.1 class TaskDialogMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a dialog in Windows.
Notes: This class function creates, displays, and operates a task dialog. The task dialog contains application-defined icons, messages, title, verification check box, command links, push buttons, and radio buttons.

Requires Windows Vista or newer.

211.6.2 Methods

211.6.3 AppendButton(button as TaskDialogButtonMBS)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a button.
Example:

```
Var td as TaskDialogMBS

Var b as new TaskDialogButtonMBS
b.Text = "Hello"
b.ID = 123

td.AppendButton b
```

211.6.4 AppendRadioButton(button as TaskDialogButtonMBS)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a radio button.
Example:

```
Var td as TaskDialogMBS

Var b as new TaskDialogButtonMBS
b.Text = "Hello"
b.ID = 123

td.AppendRadioButton b
```

211.6.5 CloseDialog

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the dialog.

211.6.6 FindButtonByID(ID as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds button by ID.
Notes: This searches buttons and radiobuttons for given ID.
It will not find common buttons.
Returns button if found or nil if not found.

211.6.7 ShowDialog as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Shows the dialog.
Example:

```
Var td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
```

```
end if

else
MsgBox "Failed"
end if
```

Notes: Returns true if everything worked right.
Returns false if creation of dialog failed.

Requires Windows Vista or newer.

211.6.8 Properties

211.6.9 AllowDialogCancellation as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to allow cancel.
Notes: Indicates that the dialog should be able to be closed using Alt-F4, Escape, and the title bar's close button even if no cancel button is specified in either the CommonButtons or Buttons members.
(Read and Write property)

211.6.10 CanBeMinimized as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the task dialog can be minimized.
Notes: (Read and Write property)

211.6.11 CollapsedControlText as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used to label the button for expanding the expandable information.
Notes: This member is ignored when the ExpandedInformation member is empty. If this member is empty and the CollapsedControlText is specified, then the CollapsedControlText value will be used for this member as well.
(Read and Write property)

211.6.12 CommonButtons as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the push buttons displayed in the task dialog.
Example:

```
Var td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
end if

else
MsgBox "Failed"
end if
```

Notes: If no common buttons are specified and no custom buttons are specified through buttons array, the task dialog will contain the OK button by default. This parameter may be a combination of flags from the following group:

kCommonButtonOK	The task dialog contains the push button: OK.
kCommonButtonYes	The task dialog contains the push button: Yes.
kCommonButtonNo	The task dialog contains the push button: No.
kCommonButtonCancel	The task dialog contains the push button: Cancel. If this button is specified, the task dialog will respond to typical cancel actions (Alt-F4 and Escape).
kCommonButtonRetry	The task dialog contains the push button: Retry.
kCommonButtonClose	The task dialog contains the push button: Close.

(Read and Write property)

211.6.13 Content as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used for the dialog's primary content.
Example:

```
Var td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
end if

else
MsgBox "Failed"
end if
```

Notes: If the EnableHyperlinks flag is true, then this string may contain hyperlinks in the form: <A HREF="executablestring">Hyperlink Text</A>.
WARNING: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.
(Read and Write property)

211.6.14 DefaultButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The default button for the task dialog.
Notes: This may be any of the values specified in ID of one of the buttons, or one of the IDs corresponding to the buttons specified in the CommonButtons property.

kIDCancel	Make the Cancel button the default.
kIDNo	Make the No button the default.
kIDOk	Make the OK button the default.
kIDRetry	Make the Retry button the default.
kIDYes	Make the Yes button the default.
kIDClose	Make the Close button the default.

You can also mark buttons default with their default flag.
(Read and Write property)

211.6.15 DefaultRadioButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The button ID of the radio button that is selected by default.
Notes: If this value does not correspond to a button ID, the first button in the array is selected by default. You can also mark buttons default with their default flag.
(Read and Write property)

211.6.16 DialogHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the dialog.
Notes: This is only valid (and non zero) while dialog is visible.
(Read only property)

211.6.17 EnableHyperlinks as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to enable hyperlinks.
Notes: Enables hyperlink processing for the strings specified in the Content, ExpandedInformation and Footer members. When enabled, these members may point to strings that contain hyperlinks in the following form:

<A HREF="executablestring">Hyperlink Text</A>

Warning: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.

Note: Task Dialogs will not actually execute any hyperlinks. Hyperlink execution must be handled in the HyperlinkClicked event.
(Read and Write property)

211.6.18 ExpandedByDefault as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the string specified by the ExpandedInformation member is displayed when the dialog is initially displayed.
Notes: This flag is ignored if the ExpandedInformation member is empty.

(Read and Write property)

211.6.19 ExpandedControlText as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used to label the button for collapsing the expandable information.
Notes: This member is ignored when the ExpandedInformation member is empty. If this member is empty and the CollapsedControlText is specified, then the CollapsedControlText value will be used for this member as well.
(Read and Write property)

211.6.20 ExpandedInformation as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used for displaying additional information.
Notes: The additional information is displayed either immediately below the content or below the footer text depending on whether the ExpandFooterArea flag is true. If the EnableHyperlinks flag is true, then this string may contain hyperlinks in the form: <A HREF="executablestring">Hyperlink Text</A>.
WARNING: Enabling hyperlinks when using content from an unsafe source may cause security vulnerabilities.
(Read and Write property)

211.6.21 ExpandFooterArea as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether expand footer area is displayed at the bottom.
Notes: Indicates that the string specified by the ExpandedInformation member is displayed at the bottom of the dialog's footer area instead of immediately after the dialog's content. This flag is ignored if the ExpandedInformation member is empty.
(Read and Write property)

211.6.22 Flags as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The flags.
Notes: You should not need to set flags as we have properties for all relevant flags.

(Read and Write property)

211.6.23 Footer as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used in the footer area of the task dialog.
Notes: If EnableHyperlinks is true, this can show clickable links.
(Read and Write property)

211.6.24 FooterIconPicture as Picture

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A picture to be used as Icon that is to be displayed in the footer of the task dialog.
Notes: The picture must have a valid mask.
(Read and Write property)

211.6.25 Icon as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The icon to be displayed in the task dialog.
Notes: Can be one of the kIcon* constants.
Or you set IconPicture property.
(Read and Write property)

211.6.26 IconPicture as Picture

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The icon to be displayed in the task dialog.
Notes: The picture must have a valid mask.
(Read and Write property)

211.6.27 MainInstruction as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used for the main instruction.
Notes: (Read and Write property)

211.6.28 NoDefaultRadioButton as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that no default item will be selected.
Notes: (Read and Write property)

211.6.29 parent as Variant

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: Parent window.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

211.6.30 parentHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Parent window handle.
Notes: (Read and Write property)

211.6.31 PositionRelativeToWindow as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the task dialog is positioned (centered) relative to the window specified by parent.
Notes: If the flag is not supplied (or no parent member is specified), the task dialog is positioned (centered) relative to the monitor.
(Read and Write property)

211.6.32 ProgressbarMax as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The maximum of progress bar.
Notes: Default is 100.

This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

211.6.33 ProgressbarMin as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The minimum value of the progress bar.
Notes: This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

211.6.34 ProgressbarState as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state of the progress bar.
Notes: Default kProgressbarNone.
Can be set to other states to turn on progressbar.
(Read and Write property)

211.6.35 ProgressbarValue as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current value of the progress bar.
Notes: This is a live property. Setting it while dialog is open will change the control.
(Read and Write property)

211.6.36 RightToLeftLayout as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that text is displayed reading right to left.
Notes: (Read and Write property)

211.6.37 SelectedButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the clicked button.
Example:

```
Var td as new TaskDialogMBS

td.CommonButtons = BitwiseOr(td.kCommonButtonOK, td.kCommonButtonCancel)
td.Content = "Hello World"

if td.ShowDialog then

if td.SelectedButton = td.kIDOK then
MsgBox "OK"
else
MsgBox "Cancel"
end if

else
MsgBox "Failed"
end if
```

Notes: (Read and Write property)

211.6.38 SelectedRadioButton as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the selected radio button.
Notes: (Read and Write property)

211.6.39 Showing as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether dialog is currently showing.
Notes: (Read and Write property)

211.6.40 TimedOut as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether we got a timeout.
Notes: (Read only property)

211.6.41 timeoutMS as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The timeout for the dialog.
Notes: In Milliseconds. The dialog closes after given time.
(Read and Write property)

211.6.42 TitleIcon as Picture

MBS Win Plugin, Plugin Version: 26.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The icon to add to the window title bar.
Notes: (Read and Write property)

211.6.43 VerificationChecked as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state of the verification checkbox.
Example:

```
Var td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"

'td.VerificationChecked = true
td.VerificationText = "Don't show again"

call td.ShowDialog

if td.VerificationChecked then
MsgBox "and we will not show again"
end if
```

Notes: Before: Indicates whether the verification checkbox in the dialog is checked when the dialog is initially displayed.
After: True if the verification checkbox was checked when the dialog was dismissed.

This is a live property. Changing it while the dialog is open will change the checkbox.
(Read and Write property)

211.6.44 VerificationEnabled as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The enable state of the verification checkbox.
Notes: Can be true to enable the checkbox or false to disable.
(Read and Write property)

211.6.45 VerificationText as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used to label the verification checkbox.
Example:

```
Var td as new TaskDialogMBS

td.CommonButtons = td.kCommonButtonOK
td.Content = "Hello World"

'td.VerificationChecked = true
td.VerificationText = "Don't show again"

call td.ShowDialog

if td.VerificationChecked then
MsgBox "and we will not show again"
end if
```

Notes: If this parameter is empty, the verification checkbox is not displayed in the task dialog. If the VerificationEnabled is false, the checkbox is not enabled.
(Read and Write property)

211.6.46 Width as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the task dialog's client area, in dialog units.
Notes: If 0, the task dialog manager will calculate the ideal width.
(Read and Write property)

211.6.47 WindowTitle as String

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string to be used for the task dialog title.
Notes: (Read and Write property)

211.6.48 Yield as Boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield time.
Notes: Whether the plugin should yield time to other Xojo threads while dialog is open.
(Read and Write property)

211.6.49 Button(index as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Array of the custom buttons that are to be displayed in the task dialog.
Notes: You can create TaskDialogButtonMBS objects and assign them to indexes in the array.
(Read and Write computed property)

211.6.50 RadioButton(index as Integer) as TaskDialogButtonMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Array of the custom radio buttons that are to be displayed in the task dialog.
Notes: You can create TaskDialogButtonMBS objects and assign them to indexes in the array.
(Read and Write computed property)

211.6.51 Events

211.6.52 ButtonClicked(ID as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that a button has been selected.
Notes: The command ID of the button is specified by ID.
To prevent the task dialog from closing, the application must return true, otherwise the task dialog is closed

and the button ID is returned via the original application call.

211.6.53 Close

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the Task Dialog has been destroyed.

211.6.54 Constructed

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the Task Dialog has been created but has not been displayed yet.
Notes: You can adjust here if you need.

211.6.55 ExpandButtonClicked(Expanded as Boolean)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the expand button has been selected.

211.6.56 Help

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the F1 key has been pressed while the Task Dialog has focus.

211.6.57 HyperlinkClicked(link as string)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that a hyperlink has been selected.

211.6.58 Navigated

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that navigation has occurred.

211.6.59 Open

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the Task Dialog has been created.

211.6.60 RadioButtonClicked(ID as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that a radio button has been selected.
Notes: The command ID of the radio button is specified by ID.

211.6.61 Timer(Time as Integer)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the Task Dialog timer has fired.
Notes: The total elapsed time is specified by Time. You can update the progress bar by setting ProgressbarValue.

This is called regularly so you can do background work.
(or check time and dismiss dialog automatically)

211.6.62 VerificationClicked(Checked as Boolean)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates that the Task Dialog verification check box has been selected.

211.6.63 Constants

Common Buttons

Constant	Value	Description
kCommonButtonCancel	8	The task dialog contains the push button: Cancel. If this button is specified, the task dialog will respond to typical cancel actions (Alt-F4 and Escape).
kCommonButtonClose	32	The task dialog contains the push button: Close.
kCommonButtonNo	4	The task dialog contains the push button: No.
kCommonButtonOK	1	The task dialog contains the push button: OK.
kCommonButtonRetry	16	The task dialog contains the push button: Retry.
kCommonButtonYes	2	The task dialog contains the push button: Yes.

Icon Constants

Constant	Value	Description
kIconApplication	5	An application icon appears in the task dialog.
kIconError	2	A stop-sign icon appears in the task dialog.
kIconInformation	3	An icon consisting of a lowercase letter i in a circle appears in the task dialog.
kIconNone	0	No icon.
kIconShield	4	A shield icon appears in the task dialog.
kIconWarning	1	An exclamation-point icon appears in the task dialog.

Standard Button IDs

Constant	Value	Description
kIDAbort	3	Abort button
kIDCancel	2	Cancel button
kIDIgnore	5	Ignore button
kIDNo	7	No button
kIDOK	1	OK Button
kIDRetry	4	Retry Button
kIDYes	6	Yes Button

Progressbar State

Constant	Value	Description
kProgressbarError	3	Error state.
kProgressbarMarquee	8	Marquee state
kProgressbarNone	0	No progress bar.
kProgressbarNormal	1	Normal progressbar
kProgressbarPause	2	Paused progress bar

211.7 class TimerMBS

211.7.1 class TimerMBS

MBS Win Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class for a timer.
Notes: This timer can work with smaller periods than the normal Xojo timers on Windows.
Works on Mac OS X and Linux, too.

Please create TimerMBS only on the main thread on Windows.

Xojo Developer Magazine

- 21.3, page 10: News
- 21.2, page 9: News
- 17.3, page 11: News

211.7.2 Methods

211.7.3 Constructor(Period as Integer, Threaded as boolean = true)

MBS Win Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Please pass a period between 1 and 999 Milliseconds.

The timer will try to be as exact as possible, but if main thread is busy, action events are delayed.

Threaded decides on Windows whether you like the high performance version with a thread in background or just a regular timer.

211.7.4 Destructor

MBS Win Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.7.5 Properties

211.7.6 Enabled as Boolean

MBS Win Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether timer is enabled.
Notes: Default is true, but you can set to false to disable the timer for some time.
(Read and Write property)

211.7.7 Period as Integer

MBS Win Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The period used.
Notes: In milliseconds.
(Read only property)

211.7.8 Threaded as Boolean

MBS Win Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether this timer uses a thread.
Notes: Only true on Windows if you requested a thread.
(Read only property)

211.7.9 Yield as Boolean

MBS Win Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether we should yield to keep other processes running.
Example:

```
// start timer to yield in order to keep threads running when you use PopupMenus
// in app.open:
#if TargetWindows
Static timer As TimerMBS

timer = New TimerMBS(50, False)
timer.Yield = True
#endif
```

Notes: Setting yield to true tells the plugin to yield time to other threads and timers in the Xojo application. By yielding with a non threaded TimerMBS, you can keep menus activate on Windows.
(Read and Write property)

211.7.10 Events

211.7.11 Action

MBS Win Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The action event.

211.8 Globals

211.8.1 GetWindowsErrorMessageMBS(ErrorCode as Integer) as String

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Formats a windows error message for the given error code.
Example:

EditField1.text = GetWindowsErrorMessageMBS(-2147352567)

Notes: Returns empty string for unknown error codes.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr6

211.8.2 InitMessageFilterMBS

MBS Win Plugin, Plugin Version: 18.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes COM message filter.
Notes: If a COM message can't be handled right away, COM may show a standard dialog to retry, switch task or cancel, which may bring your app in an endless dialog series. MBS Plugin implements a message filter which delays messages till the current processing is done and avoids the dialog. So long running options can perform well.

211.8.3 WindowsExecuteMBS(ApplicationName as string, CommandLine as string, CurrentDirectory as string, byref PID as integer, Flags as integer = 0, ShowWindow as Integer = -1) as integer

MBS Win Plugin, Plugin Version: 11.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new process and its primary thread. The new process runs in the security context of the calling process.
Example:

```
Var error, pid as Integer

pid = 0

error = WindowsExecuteMBS("", "explorer.exe", "", pid)
if error = 0 then
MsgBox "Launched explorer with process id: "+str(pid)
else
MsgBox "Error: "+str(error)
end if

pid = 0

error = WindowsExecuteMBS("", "notepad.exe ""C:\boot.ini""", "", pid)
if error = 0 then
MsgBox "Launched Notepad with process id: "+str(pid)
else
MsgBox "Error: "+str(error)
end if
```

Notes: ApplicationName:
The name of the module to be executed. This module can be a Windows-based application. It can be some other type of module (for example, MS-DOS or OS/2) if the appropriate subsystem is available on the local computer.

The string can specify the full path and file name of the module to execute or it can specify a partial name. In the case of a partial name, the function uses the current drive and current directory to complete the specification. The function will not use the search path. This parameter must include the file name extension; no default extension is assumed.

The ApplicationName parameter can be empty. In that case, the module name must be the first white space–delimited token in the CommandLine string. If you are using a long file name that contains a space, use quoted strings to indicate where the file name ends and the arguments begin; otherwise, the file name is ambiguous. For example, consider the string "c:\program files\sub dir\program name". This string can be interpreted in a number of ways. The system tries to interpret the possibilities in the following order:

- c:\program.exe files\sub dir\program name
- c:\program files\sub.exe dir\program name
- c:\program files\sub dir\program.exe name
- c:\program files\sub dir\program name.exe

If the executable module is a 16-bit application, ApplicationName should be empty, and the string pointed to by CommandLine should specify the executable module as well as its arguments.

To run a batch file, you must start the command interpreter; set ApplicationName to cmd.exe and set CommandLine to the following arguments: /c plus the name of the batch file.

CommandLine:
The command line to be executed. The maximum length of this string is 32,767 characters.. If ApplicationName is empty, the module name portion of CommandLine is limited to MAX_PATH (256) characters.

The CommandLine parameter can be empty. In that case, the function uses the string pointed to by ApplicationName as the command line.

If both ApplicationName and CommandLine are non-empty, the ApplicationName string specifies the module to execute, and the CommandLine string specifies the command line. The new process can use GetCommandLine to retrieve the entire command line. Console processes written in C can use the argc and argv arguments to parse the command line. Because argv [0] is the module name, C programmers generally repeat the module name as the first token in the command line.

If ApplicationName is empty, the first white space–delimited token of the command line specifies the module name. If you are using a long file name that contains a space, use quoted strings to indicate where the file name ends and the arguments begin (see the explanation for the ApplicationName parameter). If the file name does not contain an extension, .exe is appended. Therefore, if the file name extension is .com, this parameter must include the .com extension. If the file name ends in a period (.) with no extension, or if the file name contains a path, .exe is not appended. If the file name does not contain a directory path, the system searches for the executable file in the following sequence:

- The directory from which the application loaded.
- The current directory for the parent process.
- The 32-bit Windows system directory. Use the GetSystemDirectory function to get the path of this directory.
- The 16-bit Windows system directory. There is no function that obtains the path of this directory, but it is searched. The name of this directory is System.
- The Windows directory. Use the GetWindowsDirectory function to get the path of this directory.
- The directories that are listed in the PATH environment variable. Note that this function does not search the per-application path specified by the App Paths registry key. To include this per-application path in the search sequence, use the ShellExecute function.
- The system adds a terminating null character to the command-line string to separate the file name from the arguments. This divides the original string into two strings for internal processing.

CurrentDirectory:
The full path to the current directory for the process. The string can also specify a UNC path.

If this parameter is empty, the new process will have the same current drive and directory as the calling process. (This feature is provided primarily for shells that need to start an application and specify its initial drive and working directory.)

pid:
The variable to store the process ID of the new process.

Returns 0 for success or a windows error code for any error.

Note that the function returns before the process has finished initialization. If a required DLL cannot be located or fails to initialize, the process is terminated. To get the termination status of a process, call GetExitCodeProcess.

Possible Flags:

ShowWindow can be values for ShowWindow function to define how first window of new application is shown. Available values:

211.8.4 WindowsRunAsMBS(Username as string, Domain as string, Password as string, LoginFlags as Integer, ApplicationName as string, CommandLine as string, CurrentDirectory as string, byref PID as Integer, Flags as Integer = -1) as Integer

MBS Win Plugin, Plugin Version: 13.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs an application with a different user login.
Notes: Please see Microsoft website for details:
http://msdn.microsoft.com/en-us/library/windows/desktop/ms682431(v=vs.85).aspx

The plugin passes parameters. If Flags is -1, we use CREATE_DEFAULT_ERROR_MODE Or CREATE_NEW_CONSOLE Or CREATE_NEW_PROCESS_GROUP.
The StartupInfo handles are closed and the PID is returned in the PID parameter.
Returns the Windows error code on failure. Else we return zero for success. On Mac and Linux the result is always -1.

211.8.5 WindowsShellExecuteAsAdminMBS(ParentWindowHandle as integer, File as string, Parameters as string = """, Directory as string = """, ShowCmd as integer = 5) as integer

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs given file as admin.
Example:

```
// run me as admin
Var r As Integer = WindowsShellExecuteAsAdminMBS(0, app.ExecutableFile.NativePath, "", "", 3)

If r <>0 Then
MsgBox "error: "+Str(r)
End If
```

Notes: See also WindowsShellExecuteMBS function.
Returns Windows error code, zero on success.

ShowCmd values are shown in documentation WindowsExecuteMBS function.

211.8.6 WinGetSysColorMBS(Index as Integer) as Color

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the current color of the specified display element.
Notes: Display elements are the parts of a window and the display that appear on the system display screen.

Index: The display element whose color is to be retrieved. This parameter can be one of the following values.

The function returns the red, green, blue (RGB) color value of the given element.

211.8.7 WinOpenFolderAndSelectItemsMBS(folder as folderitem, files() as folderItem, ShowOnDesktop as Boolean = false, EditName as Boolean = false) as Integer

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens a Windows Explorer window with specified items in a particular folder selected.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var folder as FolderItem = file.Parent

Var r as Integer = WinOpenFolderAndSelectItemsMBS(folder, array(file))

if r = 0 then
MsgBox "OK"
else
MsgBox "Error: "+str(r)
end if
```

Notes: Please pass a folder to open. Pass the files you want to select in that folder.
Returns Windows error code. Zero for success.

Under Windows XP the flag parameters are ignored. They work in Windows Vista and newer:

Editname: Pass true to select an item and put its name in edit mode. This flag can only be used when a single item is being selected. For multiple item selections, it is ignored.

ShowOnDesktop: Pass true to select the item or items on the desktop rather than in a Windows Explorer window. Note that if the desktop is obscured behind open windows, it will not be made visible.

For Mac, please use NSWorkspaceMBS.selectfile function.
Blog Entries

- [ANN] MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 14.4
- MBS Xojo / Real Studio Plugins, version 14.4pr3

211.8.8 WinSetSysColorMBS(Index as Integer, value as Color) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the colors for the specified display elements.
Notes: Display elements are the various parts of a window and the display that appear on the system display screen.

If the function succeeds, the return value is true.
For indexes, please check WinGetSysColorMBS.

211.8.9 WindowsShellExecuteMBS(ParentWindowHandle as Integer, Operation as string, File as string, Parameters as string = "", Directory as string = "", ShowCmd as Integer = 5) as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Performs an operation on a specified file.
Example:

```
Var e as Integer
Var f as FolderItem

// show documents folder

f = SpecialFolder.Documents
e = WindowsShellExecuteMBS(0, "explore", f.NativePath, "", "", 10)

// Launch Notepad application

e = WindowsShellExecuteMBS(0, "", "notepad.exe", "", "", 10)

// launch file, folder or application

f = SpecialFolder.Desktop.Child("Auto1.JPG")
e = WindowsShellExecuteMBS(0, "", f.NativePath, "", "", 10)
```

Notes: Use ConsoleExecuteMBS on Mac OS X and Linux.

ParentWindowHandle:
A handle to the owner window used for displaying a UI or error messages. This value can be 0 if the operation is not associated with a window. You can pass window.handle from a Xojo window.

Operation:
A string, referred to in this case as a verb, that specifies the action to be performed. The set of available verbs depends on the particular file or folder. Generally, the actions available from an object's shortcut menu are available verbs. The following verbs are commonly used:

File:
A string that specifies the file or object on which to execute the specified verb. To specify a Shell namespace object, pass the fully qualified parse name. Note that not all verbs are supported on all objects. For example, not all document types support the "print" verb. If a relative path is used for the Directory parameter do

not use a relative path for File.

Parameters:
If File specifies an executable file, this parameter is a string that specifies the parameters to be passed to the application. The format of this string is determined by the verb that is to be invoked. If File specifies a document file, Parameters should be "".

Directory:
A string that specifies the default (working) directory for the action. If this value is NULL, the current working directory is used. If a relative path is provided at File, do not use a relative path for Directory.

ShowCmd:
The flags that specify how an application is to be displayed when it is opened. If File specifies a document file, the flag is simply passed to the associated application. It is up to the application to decide how to handle it.

Return Value:
If the function succeeds, it returns a value greater than 32. If the function fails, it returns an error value that indicates the cause of the failure. The return value is cast as an HINSTANCE for backward compatibility with 16-bit Windows applications.

This method allows you to execute any commands in a folder's shortcut menu or stored in the registry.
To open a folder, use either of the following calls:

WindowsShellExecuteMBS(handle, "", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);
or
WindowsShellExecuteMBS(handle, "open", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);

To explore a folder, use the following call:
WindowsShellExecuteMBS(handle, "explore", <fully_qualified_path_to_folder>, "", "", SW_SHOWNORMAL);
To launch the Shell's Find utility for a directory, use the following call.

WindowsShellExecuteMBS(handle, "find", <fully_qualified_path_to_folder>, "", "", 0);

If Operation is empty, the function opens the file specified by File. If Operation is "open" or "explore", the function attempts to open or explore the folder.

Note The Launch folder windows in a separate process setting in Folder Options affects ShellExecute. If that option is disabled (the default setting), ShellExecute uses an open Explorer window rather than launch a new one. If no Explorer window is open, ShellExecute launches a new one.

See also ConsoleExecuteMBS, WindowsShellExecuteAsAdminMBS, WindowsProcessMBS (Windows only), NSTask (Mac only) and ShellMBS (cross platform).

211.8.10 DriveToUNCPathMBS(Driver as string) as string

MBS Win Plugin, Plugin Version: 13.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the system tables for which UNC network path belongs to a mapped drive.
Example:

msgbox DriveToUNCPathMBS("W:")

Notes: Please pass the local drive name, which is drive letter and double colon.
Returns empty string on any error.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr5

211.8.11 GetFullWindowsNameMBS(UserName as string, Domain as string) as string

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the full username of an user in a domain.
Example:

Var ShortName as string = "your short name"
Var Domain as string = "your domain"

MsgBox GetFullWindowsNameMBS(ShortName, Domain)

Notes: Returns an empty string on any error.

Use a current Windows NT-style domain, and a username that exists on the PDC.

This will work with any NT-Style PDC (tested on XP bound to Mac OS X Server running SMB as PDC). Windows 2000/2003 and 2008 should also work.

211.9 class WindowsADSystemInfoMBS

211.9.1 class WindowsADSystemInfoMBS

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class retrieves data about the local computer if it is running a Windows operating system in a Windows domain.
Notes: For example, you can get the domain, site, and distinguished name of the local computer.

211.9.2 Methods

211.9.3 AnyDCName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the DNS name of a domain controller in the local computer's domain.
Notes: Lasterror is set.

211.9.4 Constructor

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Raises unsupportedOperationException on failure.

211.9.5 DCSiteName(Server as String) as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the Active Directory site that contains the local computer.
Notes: Server: DNS name of the service server.

An Active Directory site is one or more well-connected TCP/IP subnets holding Active Directory domain controllers
Lasterror is set.

211.9.6 RefreshSchemaCache

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Refreshes the Active Directory schema cache.
Notes: When you call this method, it does a Put() of the schemaUpdateNow function on the RootDSE. Normally, when you make changes to the schema, they are not updated to the RootDSE until the next automatic update. This method does an immediate update to the schema so that you can view the changes to the schema.
Lasterror is set.

211.9.7 Properties

211.9.8 ComputerName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the distinguished name of the local computer.
Notes: Lasterror is set.
(Read only property)

211.9.9 DomainDNSName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the DNS name of the local computer's domain, such as "domainName.companyName.com".
Notes: Lasterror is set.
(Read only property)

211.9.10 DomainShortName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the short name of the local computer's domain, such as "domainName".
Notes: Lasterror is set.
(Read only property)

211.9.11 ForestDNSName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the DNS name of the local computer's forest.
Notes: Lasterror is set.
(Read only property)

211.9.12 Handle as Integer

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

211.9.13 IsNativeMode as Boolean

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines whether the local computer's domain is in native or mixed mode.
Notes: Lasterror is set.
(Read only property)

211.9.14 Lasterror as Integer

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error reported by any of the properties/methods.
Notes: (Read and Write property)

211.9.15 PDCRoleOwner as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the distinguished name of the directory service agent (DSA) object for the DC that owns the primary domain controller role in the local computer's domain.

Notes: Lasterror is set.
(Read only property)

211.9.16 SchemaRoleOwner as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the distinguished name of the directory service agent (DSA) object for the DC that owns the schema master role in the local computer's forest.
Notes: Lasterror is set.
(Read only property)

211.9.17 SiteName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the site name of the local computer.
Notes: Lasterror is set.
(Read only property)

211.9.18 UserName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Active Directory distinguished name of the current user, which is the logged-on user or the user impersonated by the calling thread.
Notes: Lasterror is set.
(Read only property)

Constant	Value	Description
CREATE_BREAKAWAY_FROM_JOB	&h01000000	The child processes of a process associated with a job are not associated with the job. If the calling process is not associated with a job, this constant has no effect. If the calling process is associated with a job, the job must set the JOB_OBJECT_LIMIT_BREAKAWAY_OK limit.
CREATE_DEFAULT_ERROR_MODE	&h04000000	The new process does not inherit the error mode of the calling process. Instead, the new process gets the default error mode. This feature is particularly useful for multi-threaded shell applications that run with hard errors disabled. The default behavior is for the new process to inherit the error mode of the caller. Setting this flag changes that default behavior.
CREATE_NEW_CONSOLE	&h00000010	The new process has a new console, instead of inheriting its parent's console (the default). For more information, see Creation of a Console. This flag cannot be used with DETACHED_PROCESS.
CREATE_NEW_PROCESS_GROUP	&h00000200	The new process is the root process of a new process group. The process group includes all processes that are descendants of this root process. The process identifier of the new process group is the same as the process identifier, which is returned in the lpProcessInformation parameter. Process groups are used by the GenerateConsoleCtrlEvent function to enable sending a CTRL+BREAK signal to a group of console processes. If this flag is specified, CTRL+C signals will be disabled for all processes within the new process group. This flag is ignored if specified with CREATE_NEW_CONSOLE.
CREATE_NO_WINDOW	&h08000000	The process is a console application that is being run without a console window. Therefore, the console handle for the application is not set. This flag is ignored if the application is not a console application, or if it is used with either CREATE_NEW_CONSOLE or DETACHED_PROCESS.
CREATE_PROTECTED_PROCESS	&h00040000	The process is to be run as a protected process. The system restricts access to protected processes and the threads of protected processes. For more information on how processes can interact with protected processes, see Process Security and Access Rights. To activate a protected process, the binary must have a special signature. This signature is provided by Microsoft but not currently available for non-Microsoft binaries. There are currently four protected processes: media foundation, audio engine, Windows error reporting, and system. Components that load into these binaries must also be signed. Multimedia companies can leverage the first two protected processes. For more information, see Overview of the Protected Media Path. Windows Server 2003 and Windows XP/2000: This value is not supported.
CREATE_PRESERVE_CODE_AUTHZ_LEVEL	&h02000000	Allows the caller to execute a child process that bypasses the process restrictions that would normally be applied automatically to the process. Windows 2000: This value is not supported.
CREATE_SEPARATE_WOW_VDM	&h00000800	This flag is valid only when starting a 16-bit Windows-based application. If set, the new process runs in a private Virtual DOS Machine (VDM). By default, all 16-bit Windows-based applications run as threads in a single, shared VDM. The advantage of running separately is that a crash only terminates the single VDM; any other programs running in distinct VDMs continue to function normally. Also, 16-bit Windows-based applications that are run in separate VDMs have separate input queues. That means that if one application stops responding momentarily, applications in separate VDMs continue to receive input. The disadvantage of running separately is that it takes significantly more memory to do so. You should use this flag only if the user requests that 16-bit applications should run in their own VDM.
CREATE_SHARED_WOW_VDM	&h00001000	The flag is valid only when starting a 16-bit Windows-based application. If the DefaultSeparateVDM switch in the Windows section of WIN.INI is TRUE, this flag overrides the switch. The new process is run in the shared Virtual DOS Machine.
CREATE_SUSPENDED	&h00000004	The primary thread of the new process is created in a suspended state, and does not run until the ResumeThread function is called.
CREATE_UNICODE_ENVIRONMENT	&h00000400	If this flag is set, the environment block pointed to by lpEnvironment uses Unicode characters. Otherwise, the environment block uses ANSI characters.
DEBUG_ONLY_THIS_PROCESS	&h00000002	The calling thread starts and debugs the new process. It can receive all related debug events using the WaitForDebugEvent function.
DEBUG_PROCESS	&h00000001	The calling thread starts and debugs the new process and all child processes created by the new process. It can receive all related debug events using the WaitForDebugEvent function. A process that uses DEBUG_PROCESS becomes the root of a debugging chain. This continues until another process in the chain is created with DEBUG_PROCESS. If this flag is combined with DEBUG_ONLY_THIS_PROCESS, the caller debugs only the new process, not any child processes.
DETACHED_PROCESS	&h00000008	For console processes, the new process does not inherit its parent's console (the default). The new process can call the AllocConsole function at a later time to create a console. For more information, see Creation of a Console. This value cannot be used with CREATE_NEW_CONSOLE.
EXTENDED_STARTUPINFO_PRESENT	&h00080000	The process is created with extended startup information; the lpStartupInfo parameter specifies a STARTUPINFOEX structure. Windows Server 2003 and Windows XP/2000: This value is not supported.
INHERIT_PARENT_AFFINITY	&h00010000	The process inherits its parent's affinity. If the parent process has threads in more than one processor group, the new process inherits the group-relative affinity of an arbitrary group in use by the parent. Windows Server 2008, Windows Vista, Windows Server 2003, and Windows XP/2000: This value is not supported.
ABOVE_NORMAL_PRIORITY_CLASS	&h00008000	Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.
BELOW_NORMAL_PRIORITY_CLASS	&h00004000	Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.

Constants	Value	Meaning
SW_FORCEMINIMIZE	11	Minimizes a window, even if the thread that owns the window is not responding. This flag should only be used when minimizing windows from a different thread.
SW_HIDE	0	Hides the window and activates another window.
SW_MAXIMIZE	3	Maximizes the specified window.
SW_MINIMIZE	6	Minimizes the specified window and activates the next top-level window in the Z order.
SW_RESTORE	9	Activates and displays the window. If the window is minimized or maximized, the system restores it to its original size and position. An application should specify this flag when restoring a minimized window.
SW_SHOW	5	Activates the window and displays it in its current size and position.
SW_SHOWDEFAULT	10	Sets the show state based on the SW_ value specified in the STARTUPINFO structure passed to the CreateProcess function by the program that started the application.
SW_SHOWMAXIMIZED	3	Activates the window and displays it as a maximized window.
SW_SHOWMINIMIZED	2	Activates the window and displays it as a minimized window.
SW_SHOWMINNOACTIVE	7	Displays the window as a minimized window. This value is similar to SW_SHOWMINIMIZED, except the window is not activated.
SW_SHOWNA	8	Displays the window in its current size and position. This value is similar to SW_SHOW, except that the window is not activated.
SW_SHOWNOACTIVATE	4	Displays a window in its most recent size and position. This value is similar to SW_SHOWNORMAL, except that the window is not activated.
SW_SHOWNORMAL	1	Activates and displays a window. If the window is minimized or maximized, the system restores it to its original size and position. An application should specify this flag when displaying the window for the first time.

Name	Value	Description
COLOR_3DDKSHADOW	21	Dark shadow for three-dimensional display elements.
COLOR_3DFACE	15	Face color for three-dimensional display elements and for dialog box backgrounds.
COLOR_3DHIGHLIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DHILIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DLIGHT	22	Light color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DSHADOW	16	Shadow color for three-dimensional display elements (for edges facing away from the light source).
COLOR_ACTIVEBORDER	10	Active window border.
COLOR_ACTIVECAPTION	2	Active window title bar. Specifies the left side color in the color gradient of an active window's title bar if the gradient effect is enabled.
COLOR_APPWORKSPACE	12	Background color of multiple document interface (MDI) applications.
COLOR_BACKGROUND	1	Desktop.
COLOR_BTNFACE	15	Face color for three-dimensional display elements and for dialog box backgrounds.
COLOR_BTNHIGHLIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_BTNHILIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_BTNSHADOW	16	Shadow color for three-dimensional display elements (for edges facing away from the light source).
COLOR_BTNTEXT	18	Text on push buttons.
COLOR_CAPTIONTEXT	9	Text in caption, size box, and scroll bar arrow box.
COLOR_DESKTOP	1	Desktop.
COLOR_GRADIENTACTIVECAPTION	27	Right side color in the color gradient of an active window's title bar. COLOR_ACTIVECAPTION specifies the left side color. Use SPI_GETGRADIENTCAPTIONS with the SystemParametersInfo function to determine whether the gradient effect is enabled.
COLOR_GRADIENTINACTIVECAPTION	28	Right side color in the color gradient of an inactive window's title bar. COLOR_INACTIVECAPTION specifies the left side color.
COLOR_GRAYTEXT	17	Grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.
COLOR_HIGHLIGHT	13	Item(s) selected in a control.
COLOR_HIGHLIGHTTEXT	14	Text of item(s) selected in a control.
COLOR_HOTLIGHT	26	Color for a hyperlink or hot-tracked item.
COLOR_INACTIVEBORDER	11	Inactive window border.
COLOR_INACTIVECAPTION	3	Inactive window caption. Specifies the left side color in the color gradient of an inactive window's title bar if the gradient effect is enabled.
COLOR_INACTIVECAPTIONTEXT	19	Color of text in an inactive caption.
COLOR_INFOBK	24	Background color for tooltip controls.
COLOR_INFOTEXT	23	Text color for tooltip controls.
COLOR_MENU	4	Menu background.
COLOR_MENUHILIGHT	29	The color used to highlight menu items when the menu appears as a flat menu (see SystemParametersInfo). The highlighted menu item is outlined with COLOR_HIGHLIGHT. Windows 2000: This value is not supported.
COLOR_MENUBAR	30	The background color for the menu bar when menus appear as flat menus (see SystemParametersInfo). However, COLOR_MENU continues to specify the background color of the menu popup. Windows 2000: This value is not supported.
COLOR_MENUTEXT	7	Text in menus.
COLOR_SCROLLBAR	0	Scroll bar gray area.
COLOR_WINDOW	5	Window background.
COLOR_WINDOWFRAME	6	Window frame.
COLOR_WINDOWTEXT	8	Text in windows.

edit	Launches an editor and opens the document for editing. If File is not a document file, the function will fail.
explore	Explores a folder specified by File.
find	Initiates a search beginning in the directory specified by Directory.
open	Opens the item specified by the File parameter. The item can be a file or folder.
print	Prints the file specified by File. If File is not a document file, the function fails.
""	In systems prior to Windows 2000, the default verb is used if it is valid and available in the registry. If not, the "open" verb is used. In Windows 2000 and later, the default verb is used if available. If not, the "open" verb is used. If neither verb is available, the system uses the first verb listed in the registry.

SW_HIDE	0	Hides the window and activates another window.
SW_MAXIMIZE	3	Maximizes the specified window.
SW_MINIMIZE	6	Minimizes the specified window and activates the next top-level window in the z-order.
SW_RESTORE	9	Activates and displays the window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when restoring a minimized window.
SW_SHOW	5	Activates the window and displays it in its current size and position.
SW_SHOWDEFAULT	10	Sets the show state based on the SW_ flag specified in the STARTUPINFO structure passed to the CreateProcess function by the program that started the application. An application should call ShowWindow with this flag to set the initial show state of its main window.
SW_SHOWMAXIMIZED	3	Activates the window and displays it as a maximized window.
SW_SHOWMINIMIZED	2	Activates the window and displays it as a minimized window.
SW_SHOWMINNOACTIVE	7	Displays the window as a minimized window. The active window remains active.
SW_SHOWNA	8	Displays the window in its current state. The active window remains active.
SW_SHOWNOACTIVATE	4	Displays a window in its most recent size and position. The active window remains active.
SW_SHOWNORMAL	1	Activates and displays a window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when displaying the window for the first time.

Return code	Description
0	The operating system is out of memory or resources.
ERROR_FILE_NOT_FOUND = 2	The specified file was not found.
ERROR_PATH_NOT_FOUND = 3	The specified path was not found.
ERROR_BAD_FORMAT = 11	The .exe file is invalid (non-Win32 .exe or error in .exe image).
SE_ERR_ACCESSDENIED = 5	The operating system denied access to the specified file.
SE_ERR_ASSOCINCOMPLETE = 27	The file name association is incomplete or invalid.
SE_ERR_DDEBUSY = 30	The DDE transaction could not be completed because other DDE transactions were being processed.
SE_ERR_DDEFAIL = 29	The DDE transaction failed.
SE_ERR_DDETIMEOUT = 28	The DDE transaction could not be completed because the request timed out.
SE_ERR_DLLNOTFOUND = 32	The specified DLL was not found.
SE_ERR_FNF = 2	The specified file was not found.
SE_ERR_NOASSOC = 31	There is no application associated with the given file name extension. This error will also be returned if you attempt to print a file that is not printable.
SE_ERR_OOM = 8	There was not enough memory to complete the operation.
SE_ERR_PNF = 3	The specified path was not found.
SE_ERR_SHARE = 26	A sharing violation occurred.

211.10 class WindowsClipboardMBS

211.10.1 class WindowsClipboardMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The windows clipboard class.
Notes: Use it to access the clipboard on Windows.

Be aware that in the constructor we open the clipboard connection. Since Xojo may itself like to look into the clipboard to decide whether to enable copy & paste events, our clipboard connection may get taken or times out. Only one app at a time can have clipboard access.

- 15.6, page 9: News

211.10.2 Methods

211.10.3 Clear

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears the contents of the clipboard.

211.10.4 ClipboardFormats as Integer()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an array with all clipboard formats currently in the clipboard.

211.10.5 ClipboardSequenceNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the clipboard sequence number for the current window station.
Notes: The return value is the clipboard sequence number. If you do not have WINSTA_ACCESSCLIPBOARD access to the window station, the function returns zero.

The system keeps a serial number for the clipboard for each window station. This number is incremented whenever the contents of the clipboard change or the clipboard is emptied. You can track this value to determine whether the clipboard contents have changed and optimize creating DataObjects. If clipboard rendering is delayed, the sequence number is not incremented until the changes are rendered.

211.10.6 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Connects to the clipboard.
Notes: As the clipboard has exclusive access, do not keep WindowsClipboardMBS objects around. Best you only use them within a method so once the method ends, everything is released.

211.10.7 CountClipboardFormats as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of different data formats currently on the clipboard.
Notes: If the function succeeds, the return value is the number of different data formats currently on the clipboard.

If the function fails, the return value is zero.

211.10.8 Destructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Automatically closes the clipboard.

211.10.9 EnumClipboardFormats(format as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enumerates the data formats currently available on the clipboard.
Example:

```
// show list of all formats
var w as new WindowsClipboardMBS

var formats() as string
var f as integer = w.EnumClipboardFormats(0)
while f <>0
formats.Add f.ToString+": "+w.GetClipboardFormatName(f)

f = w.EnumClipboardFormats(f)
wend

MessageBox join(formats, EndOfLine)
```

Notes: Clipboard data formats are stored in an ordered list. To perform an enumeration of clipboard data formats, you make a series of calls to the EnumClipboardFormats function. For each call, the format parameter specifies an available clipboard format, and the function returns the next available clipboard format.

format: A clipboard format that is known to be available.

To start an enumeration of clipboard formats, set format to zero. When format is zero, the function retrieves the first available clipboard format. For subsequent calls during an enumeration, set format to the result of the previous EnumClipboardFormats call.

If the function succeeds, the return value is the clipboard format that follows the specified format, namely the next available clipboard format.

If the function fails, the return value is zero.
If there are no more clipboard formats to enumerate, the return value is zero.

You must open the clipboard before enumerating its formats. Use the OpenClipboard function to open the clipboard. The EnumClipboardFormats function fails if the clipboard is not open.

The EnumClipboardFormats function enumerates formats in the order that they were placed on the clip-

board. If you are copying information to the clipboard, add clipboard objects in order from the most descriptive clipboard format to the least descriptive clipboard format. If you are pasting information from the clipboard, retrieve the first clipboard format that you can handle. That will be the most descriptive clipboard format that you can handle.

The system provides automatic type conversions for certain clipboard formats. In the case of such a format, this function enumerates the specified format, then enumerates the formats to which it can be converted. For more information, see Standard Clipboard Formats and Synthesized Clipboard Formats.

211.10.10 GetClipboardFormatName(format as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves from the clipboard the name of the specified registered format. The function copies the name to the specified buffer.
Example:

```
// show items on clipboard

Var w as new WindowsClipboardMBS
Var types(-1) as integer = w.ClipboardFormats
Var names() as string

for each type as integer in types
Var n as string = w.GetClipboardFormatName(type)

n = str(type)+" "+n

names.append n
next

MsgBox Join(names,EndOfLine)
```

211.10.11 GetData(type as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves data from the clipboard in a specified format.
Example:

```
Var TypeRTF as Integer = WindowsClipboardMBS.RegisterClipboardFormat("Rich Text Format")
var w as new WindowsClipboardMBS

if w.IsClipboardFormatAvailable(TypeRTF) then
var rtf as string = w.GetData(TypeRTF)
```

```
Break

end if
```

Notes: Format: A clipboard format.

If the function succeeds, the return value is the string with the clipboard data in the specified format.

If the function fails, the return value is "".

An application can enumerate the available formats in advance by using the EnumClipboardFormats function.

211.10.12 GetDIB as Picture

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop only.

Function: Queries DIB picture on the clipboard.
Notes: Returns nil on any error.
This is using DIB type in clipboard for a Device Independent Bitmap.

Please use GetPicture for bitmap handles.

211.10.13 GetFiles as string()

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries list of file paths on the clipboard.
Notes: This is for working with Explorers copy & paste feature.

211.10.14 GetPicture as Picture

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop only.

Function: Queries bitmap on the clipboard.
Notes: Returns nil on any error.
This is using BITMAP type in clipboard for a bitmap handle.

Please use GetDIB for Device Independent Bitmap.

211.10.15 IsClipboardFormatAvailable(type as Integer) as boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines whether the clipboard contains data in the specified format.
Notes: type: A standard or registered clipboard format.

If the clipboard format is available, the return value is true.
If the clipboard format is not available, the return value is false.

Typically, an application that recognizes only one clipboard format would call this function when processing the EnableMenuItems event. The application would then enable or disable the Paste menu item, depending on the return value.

211.10.16 RegisterClipboardFormat(type as string) as Integer

MBS Win Plugin, Plugin Version: 13.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a new clipboard format. This format can then be used as a valid clipboard format.
Example:

```
Var TypeHTML as Integer
Var TypeRTF as Integer

TypeHTML = WindowsClipboardMBS.RegisterClipboardFormat("HTML Format")
TypeRTF = WindowsClipboardMBS.RegisterClipboardFormat("Rich Text Format")
```

Notes: If the function succeeds, the return value identifies the registered clipboard format.
If the function fails, the return value is zero.

If a registered format with the specified name already exists, a new format is not registered and the return value identifies the existing format. This enables more than one application to copy and paste data using the same registered clipboard format. Note that the format name comparison is case-insensitive.
Registered clipboard formats are identified by values in the range &hC000 through &hFFFF.

211.10.17 SetData(type as Integer, rawData as string) as boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Places data on the clipboard in a specified clipboard format.
Notes: Format: The clipboard format. This parameter can be a registered format or any of the standard clipboard formats.
rawData: A string with the data in the specified format.

If the function succeeds, the return value is true.
If the function fails, the return value is false.

The system performs implicit data format conversions between certain clipboard formats when an application calls the GetClipboardData function. For example, if the kTypeOEMTEXT format is on the clipboard, a window can retrieve data in the kTypeTEXT format. The format on the clipboard is converted to the requested format on demand. For more information, see Synthesized Clipboard Formats.

211.10.18 SetDIB(pic as Picture) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop only.

Function: Puts a DIB picture on the clipboard.
Notes: Returns true on success.
This is using DIB type in clipboard for a bitmap handle.

Please use SetPicture for Device Independent Bitmap.

211.10.19 SetFiles(paths() as string) as boolean

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Puts a list of file paths on the clipboard.
Notes: This is for working with Explorers copy & paste feature.
Returns true on success.
Folder paths may work better if they have no training backslash.

211.10.20 SetPicture(pic as Picture) as boolean

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop only.

Function: Puts a bitmap picture on the clipboard.
Notes: Returns true on success.
This is using BITMAP type in clipboard for a bitmap handle.

Please use SetDIB for Device Independent Bitmap.

211.10.21 Properties

211.10.22 Valid as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A flag whether the constructor got a clipboard connection.
Notes: (Read and Write property)

211.10.23 Constants

Constants

Constant	Value	Description
kTypeBitmap	2	One of standard clipboard formats defined by the system. A handle to a bitmap (HBITMAP).
kTypeDIB	8	One of standard clipboard formats defined by the system. A memory object containing a BITMAPINFO structure followed by the bitmap bits.
kTypeDIBV5	17	One of standard clipboard formats defined by the system. A memory object containing a BITMAPV5HEADER structure followed by the bitmap color space information and the bitmap bits.
kTypeDIF	5	One of standard clipboard formats defined by the system. Software Arts' Data Interchange Format.
kTypeENHMetaFile	14	One of standard clipboard formats defined by the system. A handle to an enhanced metafile (HENHMETAFILE).
kTypeHDROP	15	One of standard clipboard formats defined by the system. A handle to type HDROP that identifies a list of files. An application can retrieve information about the files by passing the handle to the DragQueryFile function.
kTypeLocale	16	One of standard clipboard formats defined by the system. The data is a handle to the locale identifier associated with text in the clipboard. When you close the clipboard, if it contains kTypeText data but no kTypeLocale data, the system automatically sets the kTypeLocale format to the current input language. You can use the kTypeLocale format to associate a different locale with the clipboard text. An application that pastes text from the clipboard can retrieve this format to determine which character set was used to generate the text. Note that the clipboard does not support plain text in multiple character sets. To achieve this, use a formatted text data type such as RTF instead. The system uses the code page associated with kTypeLocale to implicitly convert from kTypeText to kTypeUnicodeText. Therefore, the correct code page table is used for the conversion.
kTypeMetaFilePict	3	One of standard clipboard formats defined by the system. Handle to a metafile picture format as defined by the METAFILEPICT structure. When passing a kTypeMetaFilePict handle by means of DDE, the application responsible for deleting hMem should also free the metafile referred to by the kTypeMetaFilePict handle.
kTypeOEMText	7	One of standard clipboard formats defined by the system. Text format containing characters in the OEM character set. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.
kTypePalette	9	One of standard clipboard formats defined by the system. Handle to a color palette. Whenever an application places data in the clipboard that depends on or assumes a color palette, it should place the palette on the clipboard as well. If the clipboard contains data in the kTypePalette (logical color palette) format, the application should use the SelectPalette and RealizePalette functions to realize (compare) any other data in the clipboard against that logical palette. When displaying clipboard data, the clipboard always uses as its current palette any object on the clipboard that is in the kTypePalette format.
kTypePenData	10	One of standard clipboard formats defined by the system. Data for the pen extensions to the Microsoft Windows for Pen Computing
kTypeRIFF	11	One of standard clipboard formats defined by the system. Represents audio data more complex than can be represented in a CF_WAVE standard wave format.
kTypeSylk	4	One of standard clipboard formats defined by the system. Microsoft Symbolic Link (SYLK) format.
kTypeText	1	One of standard clipboard formats defined by the system. Text format. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data. Use this format for ANSI text.

211.11 class WindowsCompressorMBS

211.11.1 class WindowsCompressorMBS

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Windows compression class.
Example:

```
// build some data to compress
Var m As String = "Hello World "
m = m + m + m + m
m = m + m + m + m
m = m + m + m + m
m = m + m + m + m

Var algorithm As Integer = WindowsCompressorMBS.AlgorithmLZMS

// compress with one class
Var c As New WindowsCompressorMBS(algorithm)
Var m2 As String = c.Compress(m)

// and decompress with other class
Var d As New WindowsDecompressorMBS(algorithm)
Var m3 As String = d.Decompress(m2)

Break
```

Notes: Using the built-in compression libraries in Windows 8 or newer.

All methods and properties can raise an UnsupportedOperationException reporting back a Windows error.

211.11.2 Methods

211.11.3 Compress(UncompressedData as MemoryBlock) as MemoryBlock

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Compresses a block of data.

Notes: Returns compressed data on success.
See also:

- 211.11.4 Compress(UncompressedData as Ptr, UncompressedDataSize as Integer, CompressedBuffer as Ptr, CompressedBufferSize as Integer) as Integer 24016
- 211.11.5 Compress(UncompressedData as String) as String 24016

211.11.4 Compress(UncompressedData as Ptr, UncompressedDataSize as Integer, CompressedBuffer as Ptr, CompressedBufferSize as Integer) as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Compresses a block of data.
Notes: Returns number of bytes written to output buffer.

UncompressedData: Contains the block of information that is to be compressed. The size in bytes of the uncompressed block is given by UncompressedDataSize.
UncompressedDataSize: Size in bytes of the uncompressed information.
CompressedBuffer: The buffer that receives the compressed information. The maximum size in bytes of the buffer is given by CompressedBufferSize.
CompressedBufferSize: Maximum size in bytes of the buffer that receives the compressed information.
CompressedDataSize: Actual size in bytes of the compressed information received.
See also:

- 211.11.3 Compress(UncompressedData as MemoryBlock) as MemoryBlock 24015
- 211.11.5 Compress(UncompressedData as String) as String 24016

211.11.5 Compress(UncompressedData as String) as String

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Compresses a block of data.
Notes: Returns compressed data on success.
See also:

- 211.11.3 Compress(UncompressedData as MemoryBlock) as MemoryBlock 24015
- 211.11.4 Compress(UncompressedData as Ptr, UncompressedDataSize as Integer, CompressedBuffer as Ptr, CompressedBufferSize as Integer) as Integer 24016

211.11.6 CompressData(Algorithm as Integer, UncompressedData as MemoryBlock) as MemoryBlock

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Compresses a block of data.
Example:

```
// just empty memoryblock
var m as new MemoryBlock(1000)

var algorithm as integer = WindowsCompressorMBS.AlgorithmLZMS

// compress
var c as MemoryBlock = WindowsCompressorMBS.CompressData(algorithm, m)

// and decompress
var d as MemoryBlock = WindowsDecompressorMBS.DecompressData(algorithm, c)

Break
```

Notes: Convenience function to create the compressor, allocates output buffer and performs compression. Returns compressed data on success.
See also:

- 211.11.7 CompressData(Algorithm as Integer, UncompressedData as String) as String 24017

211.11.7 CompressData(Algorithm as Integer, UncompressedData as String) as String

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Compresses a block of data.
Example:

```
var m as string = "Hello World "
m = m + m + m + m
m = m + m + m + m

var algorithm as integer = WindowsCompressorMBS.AlgorithmLZMS

// compress
Var c As String = WindowsCompressorMBS.CompressData(algorithm, m)

// and decompress
Var d As String = WindowsDecompressorMBS.DecompressData(algorithm, c)
```

Break

Notes: Convenience function to create the compressor, allocates output buffer and performs compression. Returns compressed data on success.
See also:

- 211.11.6 CompressData(Algorithm as Integer, UncompressedData as MemoryBlock) as MemoryBlock 24017

211.11.8 Constructor(Algorithm as Integer)

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new compressor.
Notes: Algorithm: The type of compression algorithm and mode to be used by this compressor.
This parameter can have one of the following values optionally combined with the CompressRaw flag. Use a "bitwise OR" operator to include CompressRaw and to create a block mode compressor. If CompressRaw is not included, the Compression API creates a buffer mode compressor. For more information about selecting a compression algorithm and mode, see Using the Compression API.

211.11.9 Destructor

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.11.10 Reset

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Prepares the compressor for the compression of a new stream.
Notes: The compressor object retains properties set with BlockSize and Level properties. The sequence of blocks generated is independent of previous blocks.

211.11.11 Properties

211.11.12 BlockSize as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Customized block size.
Notes: The value specified may be from 65536 to 67108864 bytes. This value can be used only with the

LZMS compression algorithm. A minimum size of 1 MB is suggested to get a better compression ratio.
(Read and Write property)

211.11.13 Handle as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

211.11.14 Level as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Desired level of compression.
Notes: The default value is 0. The value 1 can improve the compression ratio with a slightly slower compression speed. This value can be used only with the XPRESS compression algorithm or the XPRESS with Huffman encoding compression algorithm.
(Read and Write property)

211.11.15 Constants

Algorithms

Constant	Value	Description
AlgorithmInvalid	0	Invalid value
AlgorithmLZMS	5	LZMS compression algorithm
AlgorithmMax	6	Maximum value
AlgorithmMSZip	2	MSZIP compression algorithm
AlgorithmNull	1	No compression
AlgorithmXPress	3	XPRESS compression algorithm
AlgorithmXPressHuff	4	XPRESS compression algorithm with Huffman encoding
CompressRaw	536870912	Use a "bitwise OR" operator to include CompressRaw and to create a block mode compressor. If CompressRaw is not included, the Compression API creates a buffer mode compressor.

211.12 class WindowsDecompressorMBS

211.12.1 class WindowsDecompressorMBS

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Windows decompression class.
Example:

```
// build some data to compress
Var m As String = "Hello World "
m = m + m + m + m
m = m + m + m + m
m = m + m + m + m
m = m + m + m + m

Var algorithm As Integer = WindowsCompressorMBS.AlgorithmLZMS

// compress with one class
Var c As New WindowsCompressorMBS(algorithm)
Var m2 As String = c.Compress(m)

// and decompress with other class
Var d As New WindowsDecompressorMBS(algorithm)
Var m3 As String = d.Decompress(m2)

Break
```

Notes: Using the built-in compression libraries in Windows 8 or newer.

All methods and properties can raise an UnsupportedOperationException reporting back a Windows error.

211.12.2 Methods

211.12.3 Constructor(Algorithm as Integer)

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new compressor.
Notes: Algorithm: The type of compression algorithm and mode to be used by this compressor.

This parameter can have one of the following values optionally combined with the CompressRaw flag. Use a "bitwise OR" operator to include CompressRaw and to create a block mode compressor. If CompressRaw is not included, the Compression API creates a buffer mode compressor. For more information about selecting a compression algorithm and mode, see Using the Compression API.

211.12.4 Decompress(CompressedData as MemoryBlock) as MemoryBlock

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Decompresses data.
Notes: Returns uncompressed data on success.
See also:

- 211.12.5 Decompress(CompressedData as Ptr, CompressedDataSize as Integer, UncompressedBuffer as Ptr, UncompressedBufferSize as Integer) as Integer 24021
- 211.12.6 Decompress(CompressedData as String) as String 24021

211.12.5 Decompress(CompressedData as Ptr, CompressedDataSize as Integer, UncompressedBuffer as Ptr, UncompressedBufferSize as Integer) as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Decompresses data.
Notes: Returns number of bytes of uncompressed data on success.

CompressedData: Contains the block of information that is to be decompressed. The size in bytes of the compressed block is given by CompressedDataSize.
CompressedDataSize: The size in bytes of the compressed information.
UncompressedBuffer: The buffer that receives the uncompressed information. The size in bytes of the buffer is given by UncompressedBufferSize.
UncompressedBufferSize: Size in bytes of the buffer that receives the uncompressed information.
UncompressedDataSize: Actual size in bytes of the uncompressed information received.
See also:

- 211.12.4 Decompress(CompressedData as MemoryBlock) as MemoryBlock 24021
- 211.12.6 Decompress(CompressedData as String) as String 24021

211.12.6 Decompress(CompressedData as String) as String

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Decompresses data.
Notes: Returns uncompressed data on success.
See also:

- 211.12.4 Decompress(CompressedData as MemoryBlock) as MemoryBlock 24021
- 211.12.5 Decompress(CompressedData as Ptr, CompressedDataSize as Integer, UncompressedBuffer as Ptr, UncompressedBufferSize as Integer) as Integer 24021

211.12.7 DecompressData(Algorithm as Integer, CompressedData as MemoryBlock) as MemoryBlock

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Decompresses data.
Example:

```
// just empty memoryblock
var m as new MemoryBlock(1000)

var algorithm as integer = WindowsCompressorMBS.AlgorithmLZMS

// compress
var c as MemoryBlock = WindowsCompressorMBS.CompressData(algorithm, m)

// and decompress
var d as MemoryBlock = WindowsDecompressorMBS.DecompressData(algorithm, c)

Break
```

Notes: Convenience function to create the decompressor, allocates output buffer and performs decompression.
Returns uncompressed data on success.
See also:

- 211.12.8 DecompressData(Algorithm as Integer, CompressedData as String) as String 24022

211.12.8 DecompressData(Algorithm as Integer, CompressedData as String) as String

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Decompresses data.
Example:

```
var m as string = "Hello World "
m = m + m + m + m
```

```
m = m + m + m + m

var algorithm as integer = WindowsCompressorMBS.AlgorithmLZMS

// compress
Var c As String = WindowsCompressorMBS.CompressData(algorithm, m)

// and decompress
Var d As String = WindowsDecompressorMBS.DecompressData(algorithm, c)

Break
```

Notes: Convenience function to create the decompressor, allocates output buffer and performs decompression.
Returns uncompressed data on success.
See also:

- 211.12.7 DecompressData(Algorithm as Integer, CompressedData as MemoryBlock) as MemoryBlock 24022

211.12.9 Destructor

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.12.10 Reset

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Prepares the decompressor for the decompression of a new stream.

211.12.11 Properties

211.12.12 BlockSize as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Customized block size.
Notes: The value specified may be from 65536 to 67108864 bytes. This value can be used only with the LZMS compression algorithm. A minimum size of 1 MB is suggested to get a better compression ratio.
(Read and Write property)

211.12.13 Handle as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

211.12.14 Level as Integer

MBS Win Plugin, Plugin Version: 25.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Desired level of compression.
Notes: The default value is 0. The value 1 can improve the compression ratio with a slightly slower compression speed. This value can be used only with the XPRESS compression algorithm or the XPRESS with Huffman encoding compression algorithm.
(Read and Write property)

211.12.15 Constants

Algorithms

Constant	Value	Description
AlgorithmInvalid	0	Invalid value
AlgorithmLZMS	5	LZMS compression algorithm
AlgorithmMax	6	Maximum value
AlgorithmMSZip	2	MSZIP compression algorithm
AlgorithmNull	1	No compression
AlgorithmXPress	3	XPRESS compression algorithm
AlgorithmXPressHuff	4	XPRESS compression algorithm with Huffman encoding
CompressRaw	536870912	Use a "bitwise OR" operator to include CompressRaw and to create a block mode compressor. If CompressRaw is not included, the Compression API creates a buffer mode compressor.

211.13 class WindowsDeviceMBS

211.13.1 class WindowsDeviceMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class is for device
Example:

```
Var devices(-1) as WindowsDeviceMBS = WindowsDeviceMBS.Devices
for each device as WindowsDeviceMBS in devices
msgbox device.Description
next
```

Notes: For Mac you can take a look on the MacUSBDeviceMBS class and the IORegistryMBS class.
See also WinUSBDeviceMBS and WinUSBMBS classes.
For cross platform development also check LibUSBDeviceMBS classes.

211.13.2 Methods

211.13.3 CompatibleIDs as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The list of compatible IDs for a device.
Notes: A device has only one device ID that is the most specific ID for a device. A device can also have less specific hardware IDs and compatible IDs. Windows first tries to find an INF file that matches the device ID. If it does not find such a match, Windows next tries to find a match to one of the less specific hardware IDs or compatible IDs.

211.13.4 Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS()

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all devices on the system matching the given Class GUID.
Example:

```
const PortsGUID = " { 4D36E978-E325-11CE-BFC1-08002BE10318 } "
Var devices(-1) as WindowsDeviceMBS = WindowsDeviceMBS.Devices(PortsGUID)
```

Notes: If present is true, only devices currently present on the system are returned.
The array is empty on any error.

Class	{ GUID }	Device Description
CDROM	{ 4D36E965-E325-11CE-BFC1-08002BE10318 }	CD/DVD/Blu-ray drives
DiskDrive	{ 4D36E967-E325-11CE-BFC1-08002BE10318 }	Hard drives
Display	{ 4D36E968-E325-11CE-BFC1-08002BE10318 }	Video adapters
FDC	{ 4D36E969-E325-11CE-BFC1-08002BE10318 }	Floppy controllers
FloppyDisk	{ 4D36E980-E325-11CE-BFC1-08002BE10318 }	Floppy drives
HDC	{ 4D36E96A-E325-11CE-BFC1-08002BE10318 }	Hard drive controllers
HIDClass	{ 745A17A0-74D3-11D0-B6FE-00A0C90F57DA }	Some USB devices
1394	{ 6BDD1FC1-810F-11D0-BEC7-08002BE2092F }	IEEE 1394 host controller

Net	{ 4D36E972-E325-11CE-BFC1-08002BE10318 }	Network adapters
Ports	{ 4D36E978-E325-11CE-BFC1-08002BE10318 }	Serial and parallel ports
SCSIAdapter	{ 4D36E97B-E325-11CE-BFC1-08002BE10318 }	SCSI and RAID controllers
System	{ 4D36E97D-E325-11CE-BFC1-08002BE10318 }	System buses, bridges, etc.
USB	{ 36FC9E60-C465-11CF-8056-444553540000 }	USB host controllers and hubs

See also:

- 211.13.5 Devices(present as boolean = true) as WindowsDeviceMBS() 24026

211.13.5 Devices(present as boolean = true) as WindowsDeviceMBS()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all devices on the system.
Notes: If present is true, only devices currently present on the system are returned.
The array is empty on any error.
See also:

- 211.13.4 Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS() 24025

211.13.6 HardwareID as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The list of hardware IDs for a device.

211.13.7 LocationPaths as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the device in the device tree.
Notes: Windows Server 2003 and later.

211.13.8 LowerFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The names of a device's lower-filter drivers.

211.13.9 UpperFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The names of a device's upper filter drivers.

211.13.10 Properties

211.13.11 Address as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's address.
Notes: (Read and Write property)

211.13.12 BusNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's bus number.
Notes: (Read and Write property)

211.13.13 BusTypeGUID as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GUID for the device's bus type.
Notes: (Read and Write property)

211.13.14 Capabilities as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device capabilities.
Notes: A combination of the kDeviceCapability* constants.
(Read and Write property)

211.13.15 Characteristics as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device characteristics.
Notes: (Read and Write property)

211.13.16 ClassGUID as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GUID that represents the device setup class of a device.
Notes: (Read and Write property)

211.13.17 ClassName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device setup class of a device.
Notes: (This property should be named Class, but was renamed ClassName as Class is a reserved word in Xojo)
(Read and Write property)

211.13.18 ConfigFlags as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's configuration flags.
Notes: (Read and Write property)

211.13.19 Description as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description of a device.
Notes: Maybe localized.
(Read and Write property)

211.13.20 DeviceID as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: If a device is associated with this device entry, here you have the ID string for this device.
Notes: (Read and Write property)

211.13.21 DevicePath as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For devices with device ID, this is the device path.
Notes: (Read and Write property)

211.13.22 DeviceType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's type.
Notes: See kDeviceType* constants.
(Read and Write property)

211.13.23 Driver as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that identifies the device's software key (sometimes called the driver key).
Notes: (Read and Write property)

211.13.24 EnumeratorName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that contains the name of the device's enumerator.
Notes: (Read and Write property)

211.13.25 Exclusive as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a user can obtain exclusive use of the device.
Notes: The value is true if exclusive use is allowed, or false otherwise.
(Read and Write property)

211.13.26 FriendlyName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The friendly name of a device.
Notes: (Read and Write property)

211.13.27 HID as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the plugin found additional HID details on the device.
Notes: (Read and Write property)

211.13.28 HIDAccessible as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the plugin was able to access the device and query the properties.
Notes: HIDAccessible is true if and only if HID is also true.
(Read and Write property)

211.13.29 HIDFeatureReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the HID feature reports for this USB HID device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.30 HIDInputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the HID input reports for this USB HID device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.31 HIDManufacturerName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The manufacturer name for this device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.32 HIDOutputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the HID output reports for this USB HID device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.33 HIDProductID as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product ID for this USB device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.34 HIDProductName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product name for this HID Device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.35 HIDSerialNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number for this USB device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.36 HIDVendorID as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vendor ID for this USB device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.37 HIDVersionNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The version number for this HID Device.
Notes: Only valid if HID and HIDAccessible are true.
(Read and Write property)

211.13.38 InstallState as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The install state of this device.
Notes: See kInstallState* constants.
(Read and Write property)

211.13.39 LegacyBusType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's legacy bus type.
Notes: (Read and Write property)

211.13.40 LocationInformation as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The hardware location of a device.
Notes: (Read and Write property)

211.13.41 Manufacturer as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the device manufacturer.
Notes: (Read and Write property)

211.13.42 PhysicalDeviceObjectName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name that is associated with the device's PDO.
Notes: (Read and Write property)

211.13.43 RemovalPolicy as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's current removal policy.
Notes: Windows XP and later
(Read and Write property)

211.13.44 RemovalPolicyHWDefault as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's hardware-specified default removal policy.
Notes: Windows XP and later
(Read and Write property)

211.13.45 RemovalPolicyOverride as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's override removal policy (if it exists) from the registry.
Notes: Windows XP and later
(Read and Write property)

211.13.46 SecurityDescriptor as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's security descriptor.
Notes: The format of security descriptor strings is described in Microsoft Windows SDK documentation.
(Read and Write property)

211.13.47 Service as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The service name for a device.
Notes: (Read and Write property)

211.13.48 UINumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The UINumber.
Notes: Specifies a number associated with the device that can be displayed in the user interface.

This number is typically a user-perceived slot number, such as a number printed next to the slot on the board, or some other number that makes locating the physical device easier for the user. For buses with no such convention, or when the UINumber is unknown, the bus driver leaves this member at its default value of -1.
(Read and Write property)

211.13.49 Constants

Constants

Constant	Value	Description
kDeviceCapabilityDockDevice	8	One of the capabilities constants. Dock Device
kDeviceCapabilityEjectSupported	2	One of the capabilities constants. Eject Supported
kDeviceCapabilityHardwareDisabled	256	One of the capabilities constants. Hardware Disabled
kDeviceCapabilityLockSupported	1	One of the capabilities constants. Lock Supported
kDeviceCapabilityNonDynamic	512	One of the capabilities constants. Non Dynamic
kDeviceCapabilityRAWDeviceOK	64	One of the capabilities constants. Raw Device OK
kDeviceCapabilityRemovable	4	One of the capabilities constants. Removable
kDeviceCapabilitySilentInstall	32	One of the capabilities constants. Silent Install
kDeviceCapabilitySurpriseRemovalOK	128	One of the capabilities constants. Surprise Removal OK
kDeviceCapabilityUniqueID	16	One of the capabilities constants. Unique ID
kDeviceType8042Port	&h27	One of the device type constants.
kDeviceTypeACPI	&h32	One of the device type constants.
kDeviceTypeBattery	&h29	One of the device type constants.
kDeviceTypeBeep	&h01	One of the device type constants.
kDeviceTypeBusExtender	&h2a	One of the device type constants.
kDeviceTypeCDROM	&h02	One of the device type constants.
kDeviceTypeCDROWFileSystem	&h03	One of the device type constants.
kDeviceTypeChanger	&h30	One of the device type constants.
kDeviceTypeController	&h04	One of the device type constants.
kDeviceTypeDataLink	&h05	One of the device type constants.
kDeviceTypeDFS	&h06	One of the device type constants.
kDeviceTypeDFSFileSystem	&h35	One of the device type constants.
kDeviceTypeDFSVolume	&h36	One of the device type constants.
kDeviceTypeDisk	&h07	One of the device type constants.
kDeviceTypeDiskFileSystem	&h08	One of the device type constants.
kDeviceTypeDVD	&h33	One of the device type constants.
kDeviceTypeFileSystem	&h09	One of the device type constants.
kDeviceTypeFips	&h3a	One of the device type constants.
kDeviceTypeFullscreenVideo	&h34	One of the device type constants.
kDeviceTypeInportPort	&h0a	One of the device type constants.
kDeviceTypeKeyboard	&h0b	One of the device type constants.
kDeviceTypeKS	&h2f	One of the device type constants.
kDeviceTypeKSec	&h39	One of the device type constants.
kDeviceTypeMailslot	&h0c	One of the device type constants.
kDeviceTypeMassStorage	&h2d	One of the device type constants.
kDeviceTypeMidiIn	&h0d	One of the device type constants.
kDeviceTypeMidiOut	&h0e	One of the device type constants.
kDeviceTypeModem	&h2b	One of the device type constants.
kDeviceTypeMouse	&h0f	One of the device type constants.
kDeviceTypeMultiUncProvider	&h10	One of the device type constants.
kDeviceTypeNamedPipe	&h11	One of the device type constants.
kDeviceTypeNetwork	&h12	One of the device type constants.
kDeviceTypeNetworkBrowser	&h13	One of the device type constants.
kDeviceTypeNetworkFileSystem	&h14	One of the device type constants.
kDeviceTypeNetworkRedirector	&h28	One of the device type constants.
kDeviceTypeNull	&h15	One of the device type constants.
kDeviceTypeParallelPort	&h16	One of the device type constants.
kDeviceTypePhysicalNetcard	&h17	One of the device type constants.

211.14 class WindowsDiscInfoMBS

211.14.1 class WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to query details on a disc drive on Windows.
Example:

```
Var discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices

for each disc as WindowsDiscInfoMBS in discs
MsgBox disc.ModelNumber
next
```

Blog Entries

- MBS REALbasic Plugins, version 10.4pr4

211.14.2 Methods

211.14.3 Device(file as folderitem) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the device with the given path.
Example:

```
// volume(0) is boot volume
Var disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device(volume(0))
```

Notes: Returns nil on any error (like missing permissions).
Seems like on Windows Vista/7 you need admin rights to query this.
The path of the folderitem must be something starting with a drive letter.
See also:

- 211.14.4 Device(path as string) as WindowsDiscInfoMBS 24036

211.14.4 Device(path as string) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the device with the given path.
Example:

```
Var disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device("C")
```

Notes: Returns nil on any error (like missing permissions).
Seems like on Windows Vista/7 you need admin rights to query this.
Path must be something starting with a drive letter.
See also:

- 211.14.3 Device(file as folderitem) as WindowsDiscInfoMBS 24036

211.14.5 Devices() as WindowsDiscInfoMBS()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the device list.
Example:

```
// enumerate all drives
Var discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices
```

Notes: Returns empty array on error.
May get more information on Windows Vista/7 if application runs as administrator.

211.14.6 Properties

211.14.7 BufferSize as Int64

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The buffer size of the disc controller.
Notes: This value is set if Mode contains 1.
(Read only property)

211.14.8 BytesPerSector as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes per sector.
Notes: This value is set if Mode contains 4.
Typically 512 bytes, but that can increase in the future.

(Read and Write property)

211.14.9 Drive as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The drive number.
Notes: (Read and Write property)

211.14.10 Fixed as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this device is fixed.
Notes: This value is set if Mode contains 1 or 4.
(Read and Write property)

211.14.11 Mode as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This value shows which properties of the instance have been set with values.
Notes: Mode is a bitwise or combination of values 1, 2 or 4. So value is 6 if mode 2 and 4 are set. You can test with bitwiseand(mode,mask). For example if bitwiseAnd(mode,4)=4 then BytesPerSector is valid.
(Read and Write property)

211.14.12 ModelNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The model number string for this device.
Example:

```
Var discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices

for each disc as WindowsDiscInfoMBS in discs
MsgBox disc.ModelNumber
next
```

Notes: This string is not available for all discs.
This value is set if Mode contains 1 or 2.

(Read and Write property)

211.14.13 ProductRevision as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product revision string.
Notes: This string is not available for all discs.
This value is set if Mode contains 2.
(Read and Write property)

211.14.14 Removable as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this device is removable.
Notes: This value is set if Mode contains 1 or 4.
(Read and Write property)

211.14.15 RevisionNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The revision number of the disc.
Notes: This string is not available for all discs.
This value is set if Mode contains 1.
(Read and Write property)

211.14.16 SectorsPerTrack as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of sectors per track.
Notes: This value is set if Mode contains 4.
(Read and Write property)

211.14.17 SerialNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number of the device.
Notes: This string is not available for all discs.
This value is set if Mode contains 1 or 2.
(Read and Write property)

211.14.18 Size as Int64

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of this disc in bytes.
Notes: This value is set if Mode contains 1 or 4.
(Read only property)

211.14.19 TracksPerCylinder as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of tracks per cylinder.
Notes: This value is set if Mode contains 4.
(Read and Write property)

211.14.20 VendorId as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vendor ID of the disc.
Notes: This value is set if Mode contains 2.
This string is not available for all discs.
(Read and Write property)

211.15 class WindowsDisplayMBS

211.15.1 class WindowsDisplayMBS

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for details on displays.

211.15.2 Methods

211.15.3 Displays as WindowsDisplayMBS()

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries list of displays.
Notes: Returns nil in case of error.

211.15.4 Properties

211.15.5 DeviceInstanceID as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device instance ID in setup database.
Notes: (Read only property)

211.15.6 DeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device name of display.
Notes: (Read only property)

211.15.7 DisplayAdapterActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a monitor is presented as being "on" by the respective GDI view.
Notes: (Read only property)

211.15.8 DisplayAdapterDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device ID for the display adapter.
Notes: (Read only property)

211.15.9 DisplayAdapterDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The display adapter device key.
Notes: (Read only property)

211.15.10 DisplayAdapterDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The adapter device name.
Notes: (Read only property)

211.15.11 DisplayAdapterDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device context string.
Notes: This is a description of the display adapter.
(Read only property)

211.15.12 DisplayAdapterRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device is removable; it cannot be the primary display.
Notes: (Read only property)

211.15.13 DisplayAdapterStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state flags.
Notes: (Read only property)

211.15.14 DisplayMonitorActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a monitor is presented as being "on" by the respective GDI view.
Notes: (Read only property)

211.15.15 DisplayMonitorDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device ID for the display monitor.
Notes: (Read only property)

211.15.16 DisplayMonitorDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The display monitor device key.
Notes: (Read only property)

211.15.17 DisplayMonitorDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The monitor device name.
Notes: (Read only property)

211.15.18 DisplayMonitorDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device context string.
Notes: This is a description of the display monitor.
(Read only property)

211.15.19 DisplayMonitorRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device is removable; it cannot be the primary display.
Notes: (Read only property)

211.15.20 DisplayMonitorStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state flags.
Notes: (Read only property)

211.15.21 Height as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the display in pixels.
Notes: (Read only property)

211.15.22 HeightDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DPI for the display.
Notes: Calculated based on HeightInch property.
Value is zero if we don't know.
(Read only property)

211.15.23 HeightInch as Double

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical height of the screen in inches.
Notes: Value is zero if we don't know.
(Read only property)

211.15.24 HeightMM as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical height of the screen in millimeters.
Notes: Value is zero if we don't know.
(Read only property)

211.15.25 LogHeight as Integer

MBS Win Plugin, Plugin Version: 24.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the display in logical points.
Notes: This is basically Height * 96 / LogPixelY;
(Read only property)

211.15.26 LogPixelsX as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen width.
Notes: In a system with multiple display monitors, this value is the same for all monitors.

e.g. 200% is 96 * 2 = 192
(Read only property)

211.15.27 LogPixelsY as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen height.
Notes: In a system with multiple display monitors, this value is the same for all monitors.

e.g. 200% is 96 * 2 = 192
(Read only property)

211.15.28 LogScaleFactor as Double

MBS Win Plugin, Plugin Version: 24.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The logical scale factor.
Notes: Same as LogPixelsX/96.
(Read only property)

211.15.29 LogWidth as Integer

MBS Win Plugin, Plugin Version: 24.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the display in logical points.
Notes: This is basically Width * 96 / LogPixelX;
(Read only property)

211.15.30 LogX as Integer

MBS Win Plugin, Plugin Version: 24.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of the display in the virtual desktop space in logical points..
Notes: Primary display is always at 0/0.
This is basically X * 96 / LogPixelX;
(Read only property)

211.15.31 LogY as Integer

MBS Win Plugin, Plugin Version: 24.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of the display in the virtual desktop space in logical points.
Notes: Primary display is always at 0/0.
This is basically Y * 96 / LogPixelY;
(Read only property)

211.15.32 MonitorHandle as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle for the monitor.
Notes: (Read only property)

211.15.33 MonitorHeight as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The monitor height.
Notes: (Read only property)

211.15.34 MonitorWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The monitor width.
Notes: (Read only property)

211.15.35 MonitorX as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of monitor.
Notes: The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

211.15.36 MonitorY as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of monitor.
Notes: The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

211.15.37 Primary as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is primary display.
Notes: (Read only property)

211.15.38 Width as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the display in pixels.
Notes: (Read only property)

211.15.39 WidthDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DPI for the display.
Notes: Calculated based on WidthInch property.
Value is zero if we don't know.
(Read only property)

211.15.40 WidthInch as Double

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical width of the screen in inches.
Notes: Value is zero if we don't know.
(Read only property)

211.15.41 WidthMM as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical width of the screen in millimeters.
Notes: Value is zero if we don't know.
(Read only property)

211.15.42 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area height in pixels.
Notes: (Read only property)

211.15.43 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area width in pixels.
Notes: (Read only property)

211.15.44 WorkX as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area position.
Notes: The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

211.15.45 WorkY as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area position.
Notes: The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

211.15.46 X as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of the display in the virtual desktop space in pixels.
Notes: Primary display is always at 0/0.
(Read only property)

211.15.47 Y as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of the display in the virtual desktop space in pixels.
Notes: Primary display is always at 0/0.
(Read only property)

211.16 class WindowsFileCopyMBS

211.16.1 class WindowsFileCopyMBS

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to help you copying files on Windows using system functions.

211.16.2 Methods

211.16.3 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file, notifying the application of its progress through the progress event.
Notes: Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

- 211.16.4 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean 24051

211.16.4 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file, notifying the application of its progress through the progress event.
Notes: Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

- 211.16.3 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean 24051

211.16.5 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file.
Notes: ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.
See also:

- 211.16.6 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean 24052

211.16.6 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file.
Notes: ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.
See also:

- 211.16.5 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean 24052

211.16.7 FileOperationCopy(source as folderitem, dest as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copy the files specified in the source parameter to the location specified in the dest parameter.
Notes: This method has several varations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

211.16.8 FileOperationCopy(source as string, dest as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copy the files specified in the source parameter to the location specified in the dest parameter.
Notes: This method has several varations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

211.16.27 MoveFileSimple(ExistingFileName as folderitem, NewFileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves an existing file or a directory, including its children.
Notes: ExistingFileName:The current name of the file or directory on the local computer.

NewFileName: The new name for the file or directory. The new name must not already exist. A new file may be on a different file system or drive. A new directory must be on the same drive.

Returns true on success and false on failure.

The MoveFile function will move (rename) either a file or a directory (including its children) either in the same directory or across directories. The one caveat is that the MoveFile function will fail on directory moves when the destination is on a different volume.

If a file is moved across volumes, MoveFile does not move the security descriptor with the file. The file will be assigned the default security descriptor in the destination directory.

The MoveFile function coordinates its operation with the link tracking service, so link sources can be tracked as they are moved.
See also:

- 211.16.28 MoveFileSimple(ExistingFileName as String, NewFileName as String) as boolean 24074

211.16.28 MoveFileSimple(ExistingFileName as String, NewFileName as String) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves an existing file or a directory, including its children.
Notes: ExistingFileName:The current name of the file or directory on the local computer.

NewFileName: The new name for the file or directory. The new name must not already exist. A new file may be on a different file system or drive. A new directory must be on the same drive.

Returns true on success and false on failure.

The MoveFile function will move (rename) either a file or a directory (including its children) either in the same directory or across directories. The one caveat is that the MoveFile function will fail on directory moves when the destination is on a different volume.

If a file is moved across volumes, MoveFile does not move the security descriptor with the file. The file will be assigned the default security descriptor in the destination directory.

- 211.16.27 MoveFileSimple(ExistingFileName as folderitem, NewFileName as folderitem) as boolean 24073

211.16.29 MoveFileWithProgress(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves a file or directory, including its children.
Notes: ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is nil, MoveFileWithProgress registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESS_CANCEL due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESS_STOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

- 211.16.30 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean 24076

211.16.30 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves a file or directory, including its children.
Notes: ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is "", MoveFileWithProgress registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESS_CANCEL due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESS_STOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

- 211.16.29 MoveFileWithProgress(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

211.16.31 Properties

211.16.32 Lasterror as Integer

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: This value is typically zero on success and -1 if the function is not supported by the plugin.

The FileOperation* functions have special error codes as following, but other methods have normal Windows Error codes:

DE_SAMEFILE	= &h71	The source and destination files are the same file.
DE_MANYSRC1DEST	= &h72	Multiple file paths were specified in the source buffer, but only one destination file path.
DE_DIFFDIR	= &h73	Rename operation was specified but the destination path is a different directory. Use the move operation instead.
DE_ROOTDIR	= &h74	The source is a root directory, which cannot be moved or renamed.
DE_OPCANCELLED	= &h75	The operation was cancelled by the user, or silently cancelled if the appropriate flags were supplied to SHFileOperation.
DE_DESTSUBTREE	= &h76	The destination is a subtree of the source.
DE_ACCESSDENIEDSRC	= &h78	Security settings denied access to the source.
DE_PATHTOODEEP	= &h79	The source or destination path exceeded or would exceed MAX_PATH.
DE_MANYDEST	= &h7A	The operation involved multiple destination paths, which can fail in the case of a move operation.
DE_INVALIDFILES	= &h7C	The path in the source or destination or both was invalid.
DE_DESTSAMETREE	= &h7D	The source and destination have the same parent folder.
DE_FLDDESTISFILE	= &h7E	The destination path is an existing file.
DE_FILEDESTISFLD	= &h80	The destination path is an existing folder.
DE_FILENAMETOOLONG	= &h81	The name of the file exceeds MAX_PATH.
DE_DEST_IS_CDROM	= &h82	The destination is a read-only CD-ROM, possibly unformatted.
DE_DEST_IS_DVD	= &h83	The destination is a read-only DVD, possibly unformatted.
DE_DEST_IS_CDRECORD	= &h84	The destination is a writable CD-ROM, possibly unformatted.
DE_FILE_TOO_LARGE	= &h85	The file involved in the operation is too large for the destination media or file system.
DE_SRC_IS_CDROM	= &h86	The source is a read-only CD-ROM, possibly unformatted.
DE_SRC_IS_DVD	= &h87	The source is a read-only DVD, possibly unformatted.
DE_SRC_IS_CDRECORD	= &h88	The source is a writable CD-ROM, possibly unformatted.
DE_ERROR_MAX	= &hB7	MAX_PATH was exceeded during the operation.
UnknownError	= &h402	An unknown error occurred. This is typically due to an invalid path in the source or destination. This error does not occur on Windows Vista and later.
ERRORONDEST	= &h10000	An unspecified error occurred on the destination.
DE_ROOTDIR | ERRORONDEST	= &h10074	Destination is a root directory and cannot be renamed.

(Read and Write property)

211.16.33 MultiThreaded as Boolean

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to use helper thread for better GUI responsiveness.
Notes: This property allows you to call this method in a Thread. The plugin will perform the actual operation on a helper thread, so it does not block Xojo's threading. Your GUI can continue to run this way. Progress event fires asynchronously.
(Read and Write property)

211.16.34 OperationsAborted as Boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: This flag is set by the FileOperation method to indicate whether the operation was aborted.
Notes: (Read and Write property)

211.16.35 Parent as Variant

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop only.

Function: The parent window for the FileOperation methods.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

211.16.36 Events

211.16.37 Progress(TotalFileSize as int64, TotalBytesTransferred as int64, StreamSize as int64, StreamBytesTransferred as Int64, StreamNumber as Integer, Reason as Integer) as Integer

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: It is called when a portion of a copy or move operation is completed.
Notes: This event is called by the CopyFileEx and the MoveFileWithProgress methods.

TotalFileSize: The total size of the file, in bytes.
TotalBytesTransferred: The total number of bytes transferred from the source file to the destination file since the copy operation began.
StreamSize: The total size of the current file stream, in bytes.
StreamBytesTransferred: The total number of bytes in the current stream that have been transferred from the source file to the destination file since the copy operation began.
StreamNumber: A handle to the current stream. The first time CopyProgressRoutine is called, the stream number is 1.
Reason: CallbackChunkFinished or CallbackStreamSwitched.

Return ProgressCancel, ProgressStop, ProgressContinue or ProgressQuiet.
If you use multithreading option, you may receive additional events after you cancelled or stopped the operation due to the events coming asynchronously.

211.16.38 Constants

Constants

Constant	Value	Description
CallbackChunkFinished	0	One of the reason constants for the Progress event. Another part of the data file was copied.
CallbackStreamSwitched	1	One of the reason constants for the Progress event. Another stream was created and is about to be copied. This is th reason given when the callback routine is first invoked.
CopyFileAllowDecryptedDestination	8	One of the constants used with CopyFileEx. An attempt to copy an encrypted file will succeed even if the destin cannot be encrypted. Windows 2000: This value is not supported.
CopyFileCopySymLink	&h800	One of the constants used with CopyFileEx. If the source file is a symbolic link, the destination file is also a sym pointing to the same file that the source symbolic link is pointing to. Server 2003 and Windows XP/2000: This value is not supported.
CopyFileFailIfExists	1	One of the constants used with CopyFileEx. The copy operation fails immediately if the target file already exists
CopyFileOpenSourceForWrite	4	One of the constants used with CopyFileEx. The file is copied and the original file is opened for write access.
CopyFileRestartable	2	One of the constants used with CopyFileEx. Progress of the copy is tracked in the target file in case the copy failed copy can be restarted at a later time by specifying the same source and dest as those used in the call that failed.
FileOperationAllowUndo	&h40	One of the flag constants for the FileOperation methods. Preserve undo information, if possible. Prior to Windows Vista, operations could be undone only from the sa that performed the original operation. In Windows Vista and later systems, the scope of the undo is a us Any process running in the user session can undo another operation. state is held in the Explorer.exe process, and as long as that process i it can coordinate the undo functions. If the source file parameter does not contain fully qualified path and this flag is ignored.
FileOperationFilesOnly	&h80	One of the flag constants for the FileOperation methods. Perform the operation only on files (not on folders) if a wildcard file is specified.
FileOperationMultiDestFiles	1	One of the flag constants for the FileOperation methods. The destination multiple destination files (one for each source fil rather than one directory where all source files are to be deposited.
FileOperationNoConfirmation	&h10	One of the flag constants for the FileOperation methods. Respond with Yes to All for any dialog box that is displayed.
FileOperationNoConfirmationMkDir	&h200	One of the flag constants for the FileOperation methods. Do not ask the user to confirm the creation of a new directory if the requires one to be created.
FileOperationNoConnectedElements	&H2000	One of the flag constants for the FileOperation methods. Do not move connected files as a group. Only move the specified fil
FileOperationNoCopySecurityAttributes	&h800	One of the flag constants for the FileOperation methods. Do not copy the security attributes of the file. The destination file r security attributes of its new folder.
FileOperationNoErrorUI	&h400	One of the flag constants for the FileOperation methods. Do not display a dialog to the user if an error occurs.
FileOperationNoRecursion	&h1000	One of the flag constants for the FileOperation methods. Only perform the operation in the local directory. Don't operate into subdirectories, which is the default behavior.
FileOperationRenameCollision	8	One of the flag constants for the FileOperation methods. Give the file being operated on a new name in a move, copy, or rename if a file with the target name already exists at the destination.
FileOperationSilent	4	One of the flag constants for the FileOperation methods. Do not display a progress dialog box.
FileOperationSimpleProgress	&h100	One of the flag constants for the FileOperation methods. Display a progress dialog box but do not show individual file nam

211.17 class WindowsFileInfoMBS

211.17.1 class WindowsFileInfoMBS

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The window file information class.
Example:

```
Var f as FolderItem = SelectFolder

if f<>Nil then
Var w as new WindowsFileInfoMBS(f)
MsgBox str(w.FileIndex)
end if
```

Notes: The identifier that is stored in the FileIndex members is called the file ID. Support for file IDs is file system-specific. File IDs are not guaranteed to be unique over time, because file systems are free to reuse them. In some cases, the file ID for a file can change over time.

In the FAT file system, the file ID is generated from the first cluster of the containing directory and the byte offset within the directory of the entry for the file. Some defragmentation products change this byte offset. (Windows in-box defragmentation does not.) Thus, a FAT file ID can change over time. Renaming a file in the FAT file system can also change the file ID, but only if the new file name is longer than the old one.

In the NTFS file system, a file keeps the same file ID until it is deleted. You can replace one file with another file without changing the file ID by using the ReplaceFile function. However, the file ID of the replacement file, not the replaced file, is retained as the file ID of the resulting file.

Not all file systems can record creation and last access time, and not all file systems record them in the same manner. For example, on a Windows FAT file system, create time has a resolution of 10 milliseconds, write time has a resolution of 2 seconds, and access time has a resolution of 1 day (the access date). On the NTFS file system, access time has a resolution of 1 hour. For more information, see File Times.

- 17.5, page 43: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes

211.17.2 Methods

211.17.3 Constructor(file as folderitem)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a folderitem.
Notes: On success the valid property is set to true.
See also:

- 211.17.4 Constructor(handle as Integer) 24082
- 211.17.5 Constructor(path as string) 24082
- 211.17.6 Constructor(stream as BinaryStream) 24083

211.17.4 Constructor(handle as Integer)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a Windows File Handle.
Notes: On success the valid property is set to true.
See also:

- 211.17.3 Constructor(file as folderitem) 24082
- 211.17.5 Constructor(path as string) 24082
- 211.17.6 Constructor(stream as BinaryStream) 24083

211.17.5 Constructor(path as string)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a file path.
Notes: On success the valid property is set to true.
See also:

- 211.17.3 Constructor(file as folderitem) 24082
- 211.17.4 Constructor(handle as Integer) 24082
- 211.17.6 Constructor(stream as BinaryStream) 24083

211.17.6 Constructor(stream as BinaryStream)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a binarystream.
Notes: On success the valid property is set to true.
See also:

- 211.17.3 Constructor(file as folderitem) 24082
- 211.17.4 Constructor(handle as Integer) 24082
- 211.17.5 Constructor(path as string) 24082

211.17.7 Properties

211.17.8 CreationDate as Date

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: A date that specifies when a file or directory is created.
Notes: If the underlying file system does not support creation time, this member is nil.
(Read only property)

211.17.9 CreationTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: An UInt64 that specifies when a file or directory is created.
Notes: If the underlying file system does not support creation time, this member is zero (0).
(Read only property)

211.17.10 FileAttributes as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file attributes.
Notes: For possible values and their descriptions, see kFileAttribute* constants.
(Read only property)

211.17.11 FileIndex as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The unique identifier that is associated with a file.
Notes: The identifier and the volume serial number uniquely identify a file on a single computer. To determine whether two open handles represent the same file, combine the identifier and the volume serial number for each file and compare them.
(Read only property)

211.17.12 FileSize as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file size.
Notes: (Read only property)

211.17.13 LastAccessDate as Date

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is read from or written to.
Notes: For a directory, the structure specifies when the directory is created. For both files and directories, the specified date is correct, but the time of day is always set to midnight. If the underlying file system does not support the last access time, this member is nil.
(Read only property)

211.17.14 LastAccessTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is read from or written to.
Notes: For a directory, the structure specifies when the directory is created. For both files and directories, the specified date is correct, but the time of day is always set to midnight. If the underlying file system does not support the last access time, this member is zero (0).
(Read only property)

211.17.15 LastWriteDate as Date

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is written to.
Notes: For a directory, the structure specifies when the directory is created. If the underlying file system does not support the last write time, this member is nil.

(Read only property)

211.17.16 LastWriteTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is written to.
Notes: For a directory, the structure specifies when the directory is created. If the underlying file system does not support the last write time, this member is zero (0).
(Read only property)

211.17.17 NumberOfLinks as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of links to this file.
Notes: For the FAT file system this member is always 1. For the NTFS file system, it can be more than 1.
(Read only property)

211.17.18 Valid as Boolean

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the constructor got the values.
Notes: (Read only property)

211.17.19 VolumeSerialNumber as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number of the volume that contains a file.
Notes: (Read only property)

211.17.20 Constants

Constants

Constant	Value	Description
kFileAttributeArchive	32	One of the file attribute constants. A file or directory that is an archive file or directory. Applications typicall use this attribute to mark files for backup or removal.
kFileAttributeCompressed	2048	One of the file attribute constants. A file or directory that is compressed. For a file, all of the data in the file compressed. For a directory, compression is the default for newly created fil and subdirectories.
kFileAttributeDevice	64	One of the file attribute constants. This value is reserved for system use.
kFileAttributeDirectory	16	One of the file attribute constants. The handle that identifies a directory.
kFileAttributeEncrypted	16384	One of the file attribute constants. A file or directory that is encrypted. For a file, all data streams in the file a encrypted. For a directory, encryption is the default for newly created files an subdirectories.
kFileAttributeHidden	2	One of the file attribute constants. The file or directory is hidden. It is not included in an ordinary director listing.
kFileAttributeNormal	128	One of the file attribute constants. A file that does not have other attributes set. This attribute is valid only whe used alone.
kFileAttributeNotContentIndexed	8192	One of the file attribute constants. The file or directory is not to be indexed by the content indexing service.
kFileAttributeOffline	4096	One of the file attribute constants. The data of a file is not available immediately. This attribute indicates that th file data is physically moved to offline storage. This attribute is used by Remot Storage, which is the hierarchical storage management software. Applicatio should not arbitrarily change this attribute.
kFileAttributeReadonly	1	One of the file attribute constants. A file that is read-only. Applications can read the file, but cannot write to it delete it. This attribute is not honored on directories. For more informatio see "You cannot view or change the Read-only or the System attributes folders in Windows Server 2003, in Windows XP, or in Windows Vista".
kFileAttributeReparsePoint	1024	One of the file attribute constants. A file or directory that has an associated reparse point, or a file that is symbolic link.
kFileAttributeSparseFile	512	One of the file attribute constants. A file that is a sparse file.
kFileAttributeSystem	4	One of the file attribute constants. A file or directory that the operating system uses a part of, or uses exclusivel
kFileAttributeTemporary	256	One of the file attribute constants. A file that is being used for temporary storage. File systems avoid writing dat back to mass storage if sufficient cache memory is available, because typicall an application deletes a temporary file after the handle is closed. In tha scenario, the system can entirely avoid writing the data. Otherwise, the dat is written after the handle is closed.
kFileAttributeVirtual	65536	One of the file attribute constants. This value is reserved for system use.

211.18 class WindowsFileStreamMBS

211.18.1 class WindowsFileStreamMBS

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for file streams on Windows.
Notes: Windows can store more than one data stream in a file.

(on Mac/Linux, please check the ExtendedAttributesMBS module)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.4pr5

211.18.2 Methods

211.18.3 Constructor

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

211.18.4 List(file as folderitem) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Lists file streams in a file at given folderitem.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var w() as WindowsFileStreamMBS = WindowsFileStreamMBS.List(f)

Break
```

Notes: Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.
See also:

- 211.18.5 List(Path as String) as WindowsFileStreamMBS() 24088

211.18.5 List(Path as String) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Lists file streams in a file at given path.
Notes: Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.
See also:

- 211.18.4 List(file as folderitem) as WindowsFileStreamMBS() 24087

211.18.6 Properties

211.18.7 Name as String

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the stream.
Notes: (Read only property)

211.18.8 Size as UInt64

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size in bytes.
Notes: (Read only property)

211.19 class WindowsFileVersionMBS

211.19.1 class WindowsFileVersionMBS

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to read Windows version information from a file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetInternalName
end if
```

Blog Entries

- MBS Plugins 10.3 Release Notes
- Tipp of the day: WindowsFileVersionMBS

211.19.2 Methods

211.19.3 FileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file version in an user readable string.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.FileVersion
end if
```

Notes: format is "1.2.3.4".

211.19.4 GetCompanyName as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key CompanyName.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetCompanyName
end if
```

211.19.5 GetFileDescription as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key FileDescription.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetFileDescription
end if
```

211.19.6 GetFileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key FileVersion.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetFileVersion
end if
```

211.19.7 GetInternalName as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key InternalName.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetInternalName
```

```
end if
```

211.19.8 GetLegalCopyright as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key LegalCopyright.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetLegalCopyright
end if
```

211.19.9 GetOriginalFilename as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key OriginalFilename.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetOriginalFilename
end if
```

211.19.10 GetProductName as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key ProductName.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetProductName
end if
```

211.19.11 GetProductVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key ProductVersion.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetProductVersion
end if
```

211.19.12 OpenFile(file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads file information from a given file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetCompanyName
end if
```

Notes: Returns true on success and false on failure.

211.19.13 ProductVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product version in an user readable string.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.ProductVersion
end if
```

Notes: format is "1.2.3.4"

211.19.14 QueryBinaryValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Low level function to read a binary item from the information resource.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
// we define encoding as UTF16 as we know the value for ProductName is an UTF16 string.
MsgBox DefineEncoding(w.QueryBinaryValue("ProductName"), encodings.UTF16)
end if
```

Notes: Returns "" on any error.

211.19.15 QueryUnicodeValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Low level function to read an unicode string item from the information resource.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.QueryUnicodeValue("ProductName"))
end if
```

Notes: Returns "" on any error.

211.19.16 Properties

211.19.17 FileDateLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File date number. Lower part.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileDateLS)
```

```
end if
```

Notes: Filedate is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file's 64-bit binary creation date and time stamp.
(Read and Write property)

211.19.18 FileDateMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File date number. Higher part.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileDateMS)
end if
```

Notes: Filedate is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file's 64-bit binary creation date and time stamp.
(Read and Write property)

211.19.19 FileFlags as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file flags.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileFlags)
end if
```

Notes: Contains a bitmask that specifies the Boolean attributes of the file. This member can include one or more of the following values.

(Read and Write property)

VS_FF_DEBUG	= 1	The file contains debugging information or is compiled with debugging features enabled.
VS_FF_INFOINFERRED	= 16	The file's version structure was created dynamically; therefore, some of the members in this structure may be empty or incorrect. This flag should never be set in a file's VS_VERSIONINFO data.
VS_FF_PATCHED	= 4	The file has been modified and is not identical to the original shipping file of the same version number.
VS_FF_PRERELEASE	= 2	The file is a development version, not a commercially released product.
VS_FF_PRIVATEBUILD	= 8	The file was not built using standard release procedures. If this flag is set, the StringFileInfo structure should contain a PrivateBuild entry.
VS_FF_SPECIALBUILD	= 32	The file was built by the original company using standard release procedures but is a variation of the normal file of the same version number. If this flag is set, the StringFileInfo structure should contain a SpecialBuild entry.

211.19.20 FileOS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file os settings.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileOS)
end if
```

Notes: Specifies the operating system for which this file was designed. This member can be one of the following values.

VOS_DOS	= &h00010000	The file was designed for MS-DOS.
VOS_NT	= &h00040000	The file was designed for Windows NT.
VOS___WINDOWS16	= &h00000001	The file was designed for 16-bit Windows.
VOS___WINDOWS32	= &h00000004	The file was designed for 32-bit Windows.
VOS_OS216	= &h00020000	The file was designed for 16-bit OS/2.
VOS_OS232	= &h00030000	The file was designed for 32-bit OS/2.
VOS___PM16	= &h00000002	The file was designed for 16-bit Presentation Manager.
VOS___PM32	= &h00000003	The file was designed for 32-bit Presentation Manager.
VOS_UNKNOWN	= &h00000000	The operating system for which the file was designed is unknown to the system.

An application can combine these values to indicate that the file was designed for one operating system running on another. The following FileOS values are examples of this, but are not a complete list.

(Read and Write property)

VOS_DOS_WINDOWS16	= &h00010001	The file was designed for 16-bit Windows running on MS-DOS.
VOS_DOS_WINDOWS32	= &h00010004	The file was designed for 32-bit Windows running on MS-DOS.
VOS_NT_WINDOWS16	= ?	The file was designed for Windows NT.
VOS_OS216_PM16	= &h00020002	The file was designed for 16-bit Presentation Manager running on 16-bit OS/2.
VOS_OS232_PM32	= &h00030003	The file was designed for 32-bit Presentation Manager running on 32-bit OS/2.

211.19.21 FileSubtype as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Windows file subtype code.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileSubType)
end if
```

Notes: Specifies the function of the file. The possible values depend on the value of FileType. For all values of FileType not described in the following list, FileSubtype is zero.

If FileType is VFT_DRV, FileSubtype can be one of the following values.

VFT2_UNKNOWN	= 0	The driver type is unknown by the system.
VFT2_DRV_COMM	= 10	The file contains a communications driver.
VFT2_DRV_PRINTER	= 1	The file contains a printer driver.
VFT2_DRV_KEYBOARD	= 2	The file contains a keyboard driver.
VFT2_DRV_LANGUAGE	= 3	The file contains a language driver.
VFT2_DRV_DISPLAY	= 4	The file contains a display driver.
VFT2_DRV_MOUSE	= 5	The file contains a mouse driver.
VFT2_DRV_NETWORK	= 6	The file contains a network driver.
VFT2_DRV_SYSTEM	= 7	The file contains a system driver.
VFT2_DRV_INSTALLABLE	= 8	The file contains an installable driver.
VFT2_DRV_SOUND	= 9	The file contains a sound driver.
VFT2_DRV_VERSIONED_PRINTER	= 10	The file contains a versioned printer driver.

If FileType is VFT_FONT, FileSubtype can be one of the following values.

VFT2_UNKNOWN	= 0	The font type is unknown by the system.
VFT2_FONT_RASTER	= 1	The file contains a raster font.
VFT2_FONT_VECTOR	= 2	The file contains a vector font.
VFT2_FONT_TRUETYPE	= 3	The file contains a TrueType font.

If FileType is VFT_VXD, FileSubtype contains the virtual device identifier included in the virtual device control block.
All FileSubtype values not listed here are reserved.
(Read and Write property)

211.19.22 FileType as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Windows file type code.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileType)
end if
```

Notes: Specifies the general type of file. This member can be one of the following values. All other values are reserved.

VFT_UNKNOWN	= 0	The file type is unknown to the system.
VFT_APP	= 1	The file contains an application.
VFT_DLL	= 2	The file contains a DLL.
VFT_DRV	= 3	The file contains a device driver. If dwFileType is VFT_DRV, FileSubtype contains a more specific description of the driver.
VFT_FONT	= 4	The file contains a font. If dwFileType is VFT_FONT, FileSubtype contains a more specific description of the font file.
VFT_VXD	= 5	The file contains a virtual device.
VFT_STATIC_LIB	= 7	The file contains a static-link library.

(Read and Write property)

211.19.23 FileVersionLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File version number. Lower part.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
```

```
MsgBox str(w.FileVersionLS)
end if
```

Notes: Fileversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file's binary version number. This member is used with FileVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

211.19.24 FileVersionMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File version number. Higher part.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileVersionMS)
end if
```

Notes: Fileversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file's binary version number. This member is used with FileVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

211.19.25 LangCharset as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The language charset to use.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.LangCharset)
end if
```

Notes: OpenFile sets this to the default value.

You can change it later.
Value is used on each call of GetOriginalFilename, GetFileVersion, GetCompanyName, GetProductName, GetInternalName, GetProductVersion, GetFileDescription, GetLegalCopyright, QueryUnicodeValue and QueryBinaryValue.
(Read and Write property)

211.19.26 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Lasterror means no error has happend.
Normally a Windows error code.
(Read and Write property)

211.19.27 ProductVersionLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Product version number. Lower part.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.ProductVersionLS)
end if
```

Notes: Productversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

211.19.28 ProductVersionMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Product version number. Higher part.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.ProductVersionMS)
end if
```

Notes: Productversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

211.19.29 RawData as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the data of the file version record as string.
Notes: (Read only property)

211.19.30 Success as Boolean

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether last call to OpenFile was successful.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
Var w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.Success)
end if
```

Notes: (Read and Write property)

211.20 class WindowsIniMBS

211.20.1 class WindowsIniMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to handle INI files on Windows.
Notes: Ini files are build by this:

[Sectionname]
key1=value1

[Appname]
key2=value2

An ini file contains one or more sections which are labeled with a name of a section or in the Win.ini file with the application name.
Each section is filled with one or more key = value pairs.
Blog Entries

- MBS Real Studio Plugins, version 13.0pr10

211.20.2 Methods

211.20.3 GetPrivateProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads an integer value from the ini file.
Notes: This is the function to work on a private ini file.
Returns the default value on any error.

211.20.4 GetPrivateProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a section from an ini file.
Notes: This is the function to work on a private ini file.
The string is built using CStrings (with ending chr(0)).
Returns "" on any error.

211.20.5 GetPrivateProfileString(appname as string, keyname as string, defaultValue as string = "") as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads a string from an ini file.
Example:

```
Var l as new WindowsIniMBS

l.filename="c:\test.ini"

Var value as string = l.GetPrivateProfileString("appname","keyname")
msgBox "Read: "+value
```

Notes: This is the function to work on a private ini file.
Returns the default value on any error.

211.20.6 GetPrivateProfileStruct(section as string, keyname as string, size as Integer) as memoryblock

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads a structure from an ini file.
Notes: This is the function to work on a private ini file.
Size is the size of the memoryblock returned.
Returns nil on any error.
A checksum is checked to verify that the data is unchanged.

211.20.7 GetProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an integer value of the Win.ini file.
Notes: Returns the default value on any error.

211.20.8 GetProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a profile section of the Win.ini file.
Notes: The string is built using CStrings (with ending chr(0)).

Returns "" on any error.

211.20.9 GetProfileString(appname as string, keyname as string, defaultValue as string = "") as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an integer value of the Win.ini file.
Example:

```
Var l as new WindowsIniMBS

l.filename="c:\test.ini"

Var value as string = l.GetProfileString("appname","keyname")
msgBox "Read: "+value
```

Notes: Searches for a string.
All three parameters are not allowed to be empty. And you must pass trimmed strings (no space on the left and/or right side)
Returns the default string on any error.

211.20.10 WritePrivateProfileSection(appname as string, value as string) as boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Write a section to an ini file.
Notes: This is the function to work on a private ini file.
Value is an array of strings concated with chr(0) as the delimiter.
Returns true if successfull.

211.20.11 WritePrivateProfileString(appname as string, keyname as string, value as string) as boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes a string to an ini file.
Example:

```
Var l as windowsIniMBS

l=new windowsIniMBS
```

```
l.filename="c:\test.ini"

if l.writePrivateProfileString("appname","keyname","value") then
msgBox "ok"
end if
```

Notes: This is the function to work on a private ini file.

211.20.12 WritePrivateProfileStruct(section as string, keyname as string, mem as memoryblock, size as Integer) as boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes a memoryblock as a structure to a ini file.
Notes: This is the function to work on a private ini file.
Returns true if successfull.
A checksum is stored to verify later whether the data was changed.

211.20.13 Properties

211.20.14 BufferSize as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the buffer used for reading strings from the INI files.
Notes: Should not be bigger than 32767 bytes on Windows 95/98/ME.
Default size is 32000.
(Read and Write property)

211.20.15 Filename as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file path of the private profile file to use.
Notes: e.g. "C:\Test.ini" or just "myapp.ini".
(Read and Write property)

211.21 class WindowsKeyboardLayoutMBS

211.21.1 class WindowsKeyboardLayoutMBS

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a keyboard layout on Windows.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

211.21.2 Methods

211.21.3 Constructor

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new keyboard layout object with current layout.
Example:

```
Var w as new WindowsKeyboardLayoutMBS
MsgBox w.name
```

See also:

- 211.21.4 Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer) 24105

211.21.4 Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer)

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new keyboard layout object with the given ID.
See also:

- 211.21.3 Constructor 24105

211.21.5 KeyboardLayoutName as string

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop only.

Function: Returns the name of the current keyboard layout name.
Example:

```
msgbox WindowsKeyboardLayoutMBS.KeyboardLayoutName
```

211.21.6 List as WindowsKeyboardLayoutMBS()

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop only.

Function: Returns a list of all keyboard layouts installed.
Example:

```
Var list() as WindowsKeyboardLayoutMBS = WindowsKeyboardLayoutMBS.List
MsgBox str(UBound(list)+1)+" keyboard layouts."
```

211.21.7 Properties

211.21.8 Handle as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal ID of the keyboard layout.
Notes: (Read only property)

211.21.9 Name as String

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the name of the keyboard layout.
Example:

```
Var w as new WindowsKeyboardLayoutMBS
MsgBox w.name
```

Notes: (Read only property)

211.21.10 PrimaryLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The primary ID for this language.
Notes: (Read and Write property)

211.21.11 SubLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The sub language ID.
Notes: This is needed as there are for example 16 different English variants.
(Read and Write property)

211.22 class WindowsKeyFilterMBS

211.22.1 class WindowsKeyFilterMBS

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to filter several windows keyboard shortcuts with a low level event filter.
Notes: There is no need to keep the instance as all internal data is stored in global variables.

Key codes for Windows:

Blog Entries

211.22.2 Methods

211.22.3 Install as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Install the event filter.
Notes: Returns true on success and false on failure.
Second call in an application will return false unless Uninstall was called between.

211.22.4 Uninstall as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Uninstalls the event filter.
Notes: You only call this after Install returned true.

211.22.5 Properties

211.22.6 BlockAlt as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the alt key.
Notes: (Read and Write property)

211.22.7 BlockAltEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Alt-Escape key combination.
Notes: (Read and Write property)

211.22.8 BlockAltF4 as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the ALT-F4 key combination.
Notes: By default this one closes the application.
(Read and Write property)

211.22.9 BlockAltTab as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the ALT-Tab key combination.
Notes: This combination is for task switching.
(Read and Write property)

211.22.10 BlockApplicationWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the application windows key.
Notes: (Read and Write property)

211.22.11 BlockBack as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the back key.
Notes: (Read and Write property)

211.22.12 BlockCancel as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Cancel key.
Notes: (Read and Write property)

211.22.13 BlockCapital as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the CapsLock key.
Notes: (Read and Write property)

211.22.14 BlockClear as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Clear key.
Notes: (Read and Write property)

211.22.15 BlockControl as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the control key.
Notes: (Read and Write property)

211.22.16 BlockControlAltDelete as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Control-Alt-Delete key combination.
Notes: Sorry, does not have any effect as this key combination is processed earlier in event chain.
(Read and Write property)

211.22.17 BlockControlEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Control-Escape key combination.
Notes: (Read and Write property)

211.22.18 BlockDelete as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the delete key.
Notes: (Read and Write property)

211.22.19 BlockDown as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the down key.
Notes: (Read and Write property)

211.22.20 BlockEnd as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the end key.
Notes: (Read and Write property)

211.22.21 BlockEscape as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the escape key.
Notes: (Read and Write property)

211.22.22 BlockExecute as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the execute key.
Notes: (Read and Write property)

211.22.23 BlockF1 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F1 key.
Notes: (Read and Write property)

211.22.24 BlockF10 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F10 key.
Notes: (Read and Write property)

211.22.25 BlockF11 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F11 key.
Notes: (Read and Write property)

211.22.26 BlockF12 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F12 key.
Notes: (Read and Write property)

211.22.27 BlockF13 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F13 key.
Notes: (Read and Write property)

211.22.28 BlockF14 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F14 key.
Notes: (Read and Write property)

211.22.29 BlockF15 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F15 key.
Notes: (Read and Write property)

211.22.30 BlockF16 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F16 key.
Notes: (Read and Write property)

211.22.31 BlockF17 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F17 key.
Notes: (Read and Write property)

211.22.32 BlockF18 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F18 key.
Notes: (Read and Write property)

211.22.33 BlockF19 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F19 key.
Notes: (Read and Write property)

211.22.34 BlockF2 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F2 key.
Notes: (Read and Write property)

211.22.35 BlockF20 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F20 key.
Notes: (Read and Write property)

211.22.36 BlockF21 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F21 key.
Notes: (Read and Write property)

211.22.37 BlockF22 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F22 key.
Notes: (Read and Write property)

211.22.38 BlockF23 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F23 key.
Notes: (Read and Write property)

211.22.39 BlockF24 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F24 key.
Notes: (Read and Write property)

211.22.40 BlockF3 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F3 key.
Notes: (Read and Write property)

211.22.41 BlockF4 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F4 key.
Notes: (Read and Write property)

211.22.42 BlockF5 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F5 key.
Notes: (Read and Write property)

211.22.43 BlockF6 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F6 key.
Notes: (Read and Write property)

211.22.44 BlockF7 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F7 key.
Notes: (Read and Write property)

211.22.45 BlockF8 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F8 key.
Notes: (Read and Write property)

211.22.46 BlockF9 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F9 key.
Notes: (Read and Write property)

211.22.47 BlockHelp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the help key.
Notes: (Read and Write property)

211.22.48 BlockHome as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the home key.
Notes: (Read and Write property)

211.22.49 BlockInsert as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the insert key.
Notes: (Read and Write property)

211.22.50 BlockLeft as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the left key.
Notes: (Read and Write property)

211.22.51 BlockLeftButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the left mouse button.
Notes: (Read and Write property)

211.22.52 BlockLeftWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the left windows key.
Notes: (Read and Write property)

211.22.53 BlockMiddleButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the middle mouse button.
Notes: (Read and Write property)

211.22.54 BlockPause as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the pause key.
Notes: (Read and Write property)

211.22.55 BlockPrint as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the print key.
Notes: BlockSnapshot is to block screenshots.
(Read and Write property)

211.22.56 BlockReturn as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the return key.
Notes: (Read and Write property)

211.22.57 BlockRight as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the right key.
Notes: (Read and Write property)

211.22.58 BlockRightButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the right mouse button.
Notes: (Read and Write property)

211.22.59 BlockRightWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the right windows key.
Notes: (Read and Write property)

211.22.60 BlockSelect as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the select key.
Notes: (Read and Write property)

211.22.61 BlockShift as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the shift key.
Notes: (Read and Write property)

211.22.62 BlockShiftSpace as boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Shift-Space key combination.
Notes: This combination is for making non-breakable spaces.
(Read and Write property)

211.22.63 BlockSleep as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the sleep key.
Notes: (Read and Write property)

211.22.64 BlockSnapshot as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the snapshot key.
Notes: This is the print key to do screenshots.
(Read and Write property)

211.22.65 BlockSpace as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the space key.
Notes: (Read and Write property)

211.22.66 BlockTab as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the tab key.
Notes: (Read and Write property)

211.22.67 BlockUp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the up key.
Notes: (Read and Write property)

211.22.68 BlockKey(virtualkeycode as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to block a key with a specific virtual key code.
Notes: You can set this to true for all keys you want to block.
The virtual key codes are in the windows header files.
For most common keys this class has properties. More can be added.
(Read and Write computed property)

211.22.69 Events

211.22.70 KeyDown(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The key down event.
Notes: vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.

the flag bits are like this:
bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.

We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it.
Please have this event being as fast as possible. Do not put msgbox there. Better detect a key shortcut and launch a timer to perform the action a millisecond later, so you don't block the keyboard event system.
Blocks only KeyUp or only KeyDown can lead to trouble if the internal counters for special keys get our of sync.

211.22.71 KeyUp(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The key up event.
Notes: vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.

the flag bits are like this:
bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.

We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it.
Please have this event being as fast as possible. Do not put msgbox there. Better detect a key shortcut and launch a timer to perform the action a millisecond later, so you don't block the keyboard event system.

211.23 class WindowsListMBS

211.23.1 class WindowsListMBS

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to list all the windows on a Windows system.
Notes: To find all processes on Mac, use the ProcessMBS class.
To find all windows on Mac OS X, use the CGSWindowListMBS class.
Blog Entries

- MBS Xojo Plugins, version 19.2pr1
- SetFrontMost for Windows
- MBS Xojo / Real Studio Plugins, version 16.4pr1

211.23.2 Methods

211.23.3 ActivateWindow(index as integer)

MBS Win Plugin, Plugin Version: 19.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Activates the window.
Notes: This function does more than just show. if the window has been minimized, it will restore it. Also the window is moved to front and made the current window for keyboard input.

Sadly windows limits which windows can go to front, so some windows may not come to front unless they are clicked on.

As activation can be asynchronously, the window may activate later, e.g. after current method ends.

211.23.4 Constructor

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which queries the values.
See also:

- 211.23.5 Constructor(win as DesktopWindow) 24127
- 211.23.6 Constructor(win as window) 24127
- 211.23.7 Constructor(WindowHandle as Integer) 24127

211.23.5 Constructor(win as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor which queries the values.
Notes: If win is not nil, we lookup child windows of this window.
See also:

- 211.23.4 Constructor 24126
- 211.23.6 Constructor(win as window) 24127
- 211.23.7 Constructor(WindowHandle as Integer) 24127

211.23.6 Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop only.

Function: The constructor which queries the values.
Notes: If win is not nil, we lookup child windows of this window.
See also:

- 211.23.4 Constructor 24126
- 211.23.5 Constructor(win as DesktopWindow) 24127
- 211.23.7 Constructor(WindowHandle as Integer) 24127

211.23.7 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which queries the values.
Notes: If WindowHandle is not zero, we lookup child windows of this window.
See also:

- 211.23.4 Constructor 24126
- 211.23.5 Constructor(win as DesktopWindow) 24127
- 211.23.6 Constructor(win as window) 24127

211.23.8 Focus as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the handle to the window that has the keyboard focus, if the window is attached to the calling thread's message queue.

Notes: If the calling thread's message queue does not have an associated window with the keyboard focus, the return value is 0.

211.23.9 ForegroundWindow as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a handle to the foreground window (the window with which the user is currently working).
Notes: The system assigns a slightly higher priority to the thread that creates the foreground window than it does to other threads.
The return value is a handle to the foreground window. The foreground window can be 0 in certain circumstances, such as when a window is losing activation.

211.23.10 Update

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the values and returns true on success.

211.23.11 WindowClassName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the window class name of the window with the given index.
Notes: For example "SciCalc" for the calc.exe main window.

This may send a message to the thread owning the window and if that one doesn't answer quickly, the call may wait for an answer.
You may want to skip your own process windows to not wait for your own threads.

211.23.12 WindowClassNameFromHandle(Handle as Integer) as String

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the window class name of the window with the given handle.
Notes: For example "SciCalc" for the calc.exe main window.

211.23.13 WindowHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

211.23.14 WindowHeight(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

211.23.15 WindowIconic(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the window with the given index is minimized.

211.23.16 WindowImageFileName(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the path to the execuable file of the process which owns the window with the given index.
Notes: Requires Windows XP or newer.
Returns an empty string on any error.

211.23.17 WindowLeft(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The x position of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

211.23.18 WindowProcessID(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The process ID of the process which ows the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

211.23.19 WindowText(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the title of the window with the given index.
Notes: This may send a message to the thread owning the window and if that one doesn't answer quickly, the call may wait for an answer.
You may want to skip your own process windows to not wait for your own threads.

211.23.20 WindowTextFromHandle(Handle as Integer) as String

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the title of the window with the given handle.
Notes: This may send a message to the thread owning the window and if that one doesn't answer quickly, the call may wait for an answer.
You may want to skip your own process windows to not wait for your own threads.

211.23.21 WindowThreadHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The thread handle of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

211.23.22 WindowTop(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y position of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

211.23.23 WindowVisible(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the window with the given index is visible.

211.23.24 WindowWidth(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

211.23.25 WindowZoomed(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the window with the given index is zoomed.

211.23.26 Properties

211.23.27 CurrentProcessID as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current process ID.
Notes: This value is updated by the Constructor and the Update method.
(Read and Write property)

211.23.28 CurrentThreadID as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current thread ID.
Notes: This value is updated by the Constructor and the Update method.
(Read and Write property)

211.23.29 DesktopWindowHandle as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the desktop window.
Notes: This value is updated by the Constructor and the Update method.

(Read and Write property)

211.23.30 ForegroundWindowHandle as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the foreground window.
Notes: This value is updated by the Constructor and the Update method.
(Read and Write property)

211.23.31 ParentWindowHandle as Integer

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the parent window.
Notes: This value is set by the Constructor.
(Read and Write property)

211.23.32 WindowCount as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of windows.
Notes: This value is updated by the Constructor and the Update method.
(Read and Write property)

211.24 class WindowsMonitorMBS

211.24.1 class WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to query monitor details on Windows.
Example:

```
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
MsgBox m.DeviceName+": "+str(m.Left)+"x"+str(m.top)+" "+str(m.Width)+"x"+str(m.Height)
next
```

Blog Entries

- MBS Real Studio Plugins, version 11.3pr2

211.24.2 Methods

211.24.3 AllMonitors as WindowsMonitorMBS()

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all monitors.
Example:

```
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
MsgBox m.DeviceName+": "+str(m.Left)+"x"+str(m.top)+" "+str(m.Width)+"x"+str(m.Height)
next
```

Notes: Returns an array with an entry for each monitor connected to this computer.
See also:

- 211.24.4 AllMonitors(monitors() as WindowsMonitorMBS) as Integer 24133

211.24.4 AllMonitors(monitors() as WindowsMonitorMBS) as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all monitors.
Notes: Returns the number of monitors found and sets the monitor objects in the array.
if the array is too short, you get the first ubound(monitors)+1 fonts set there.
See also:

- 211.24.3 AllMonitors as WindowsMonitorMBS() 24133

211.24.5 MonitorFromPoint(x as Integer, y as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MonitorFromPoint function retrieves a handle to the display monitor that contains a specified point.
Example:

```
Var m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromPoint(1900, 1000)

if m = nil then
MsgBox "Your display is smaller than 1900 x 1000"
else
MsgBox m.DeviceName
end if
```

Notes: x and y: The point of interest in virtual-screen coordinates.
Flags: Determines the function's return value if the point is not contained within any display monitor.

This parameter can be one of the following values.

Value	Meaning
kDefaultToNearest	Returns a handle to the display monitor that is nearest to the point.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns a handle to the primary display monitor.

If the point is contained by a display monitor, the return value is that display monitor.
If the point is not contained by a display monitor, the return value depends on the value of flags.

211.24.6 MonitorFromRect(left as Integer, top as Integer, width as Integer, height as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MonitorFromRect function retrieves the display monitor that has the largest area of intersection with a specified rectangle.
Example:

```
Var m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromRect(0,0,100,100)
MsgBox m.DeviceName
```

Notes: left, top, width, height: The rectangle of interest in virtual-screen coordinates.

Flags: Determines the function's return value if the rectangle does not intersect any display monitor.

This parameter can be one of the following values.

Value	Meaning
kDefaultToNearest	Returns a handle to the display monitor that is nearest to the rectangle.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns a handle to the primary display monitor.

If the rectangle intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the rectangle.
If the rectangle does not intersect a display monitor, the return value depends on the value of Flags.

211.24.7 MonitorFromWindow(win as DesktopWindow, flags as integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Notes: win: The window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 211.24.8 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS 24136

- 211.24.9 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS 24136

211.24.8 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop only.

Function: The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Example:

```
Var m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1)
MsgBox m.DeviceName
```

Notes: win: The window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 211.24.7 MonitorFromWindow(win as DesktopWindow, flags as integer = 0) as WindowsMonitorMBS 24135
- 211.24.9 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS 24136

211.24.9 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Example:

```
Var m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1.handle)
MsgBox m.DeviceName
```

Notes: WindowHandle: A handle to the window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 211.24.7 MonitorFromWindow(win as DesktopWindow, flags as integer = 0) as WindowsMonitorMBS 24135
- 211.24.8 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS 24136

211.24.10 Properties

211.24.11 Bottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The bottom value of the display monitor.
Notes: Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.12 DeviceName as String

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the device name of the monitor being used.
Notes: (Read and Write property)

211.24.13 Height as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the display monitor.
Notes: Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values. (Read and Write property)

211.24.14 HMonitor as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal window handle for this monitor.
Notes: (Read and Write property)

211.24.15 IsPrimary as Boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is the primary display monitor.
Notes: (Read and Write property)

211.24.16 Left as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left position of the display monitor.
Notes: Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values. (Read and Write property)

211.24.17 Right as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The right value of the display monitor.
Notes: Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.18 Top as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top position of the display monitor.
Notes: Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.19 Width as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the display monitor.
Notes: Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.20 WorkBottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The bottom value from useable screen area.
Notes: Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.21 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height value from useable screen area.
Notes: Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.22 WorkLeft as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left value from useable screen area.
Notes: Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.23 WorkRight as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The right value from useable screen area.
Notes: Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.24 WorkTop as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top value from useable screen area.
Notes: Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.25 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width value from useable screen area.
Notes: Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

211.24.26 Constants

Constants

Constant	Value	Description
kDefaultToNearest	2	One of the flag constants. Return the display monitor that is nearest to the window, point or rectangle.
kDefaultToNull	0	One of the flag constants. Returns nil if no monitor matches is located at point, window or rectangle.
kDefaultToPrimary	1	One of the flag constants. Returns the primary display monitor if point, rect or window does not point to a monitor.

211.25 class WindowsPipeMBS

211.25.1 class WindowsPipeMBS

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a Windos Pipe.
Notes: A replacement for IPCSocket on Windows.
Can be used in two applications to exchange data.

- MBS Xojo Plugins, version 19.5pr1
- New Windows Pipe class for Xojo

Videos

- XDC 2020 MBS Plugins Presentation

Xojo Developer Magazine

- 18.3, page 51: Happy Birthday MonkeyBread Software, What is new in the MBS Xojo Plugins by Stefanie Juchmes

211.25.2 Methods

211.25.3 Close

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the pipe.
Notes: Called by destructor automatically.

211.25.4 Constructor

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

211.25.5 CreatePipe(Name as string, MessageMode as Boolean = false, BufferSize as Integer = &h100000, AllowAllUsers as Boolean = false) as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a named pipe.
Notes: Buffersize defines the size for input/output buffers.
Returns true on success or false on failure.
Lasterror is set.

Normally the pipe allows only same user.
But if AllowAllUsers is true, you can talk to other users or from service to user.

If name does not start with \then we prefix it with "\\.\Pipe\".

211.25.6 OpenPipe(Name as string) as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens an existing named pipe from client side.
Notes: Returns true on success or false on failure.
Lasterror is set.

If name does not start with \then we prefix it with "\\.\Pipe\".

211.25.7 Peek(ByteCount as Integer) as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads data without removing it from the buffer.
Notes: Reads up to the given number of bytes.
BytesRead property is set and data is returned.
LastError property is set.

211.25.8 PeekAll as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads all data without removing it from the buffer.
Notes: Reads whole message or in byte mode

BytesRead property is set and data is returned.
LastError property is set.

211.25.9 Read(ByteCount as Integer) as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads data.
Notes: Reads up to the given number of bytes.
BytesRead property is set and data is returned.
LastError property is set.

211.25.10 ReadAll as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads all data.
Example:

```
Var Pipe as WindowsPipeMBS // your pipe

Var r As String = pipe.ReadAll
Var d As String = DefineEncoding(r, Encodings.UTF8)

List.AddRow d
```

Notes: Reads whole message or in byte mode what is available.
BytesRead property is set and data is returned.
LastError property is set.

211.25.11 Write(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes data.
Notes: Lasterror is set.
BytesWritten is set to number of bytes sent.
See also:

- 211.25.12 Write(data as string)

211.25.12 Write(data as string)

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes data.
Example:

```
Var Pipe as WindowsPipeMBS // your pipe

Var d As String = ConvertEncoding(MessageField.Text, encodings.UTF8)
If d.Len >0 Then
pipe.Write d
MessageField.Text = ""
End If
```

Notes: Lasterror is set.
BytesWritten is set to number of bytes sent.
See also:

- 211.25.11 Write(data as MemoryBlock) 24144

211.25.13 Properties

211.25.14 BytesAvailable as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries number of bytes available in buffer.
Notes: (Read only property)

211.25.15 BytesRead as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of bytes read.
Notes: (Read and Write property)

211.25.16 BytesWritten as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of bytes written.
Notes: (Read and Write property)

211.25.17 Handle as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle for the pipe.
Notes: (Read only property)

211.25.18 InputBufferSize as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The input buffer size.
Notes: (Read only property)

211.25.19 IsClient as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is client or server side.
Notes: True if this is client side.
(Read only property)

211.25.20 IsMessageMode as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this pipe is in message mode.
Notes: (Read only property)

211.25.21 IsOpen as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether pipe is open.
Notes: (Read only property)

211.25.22 IsServer as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is client or server side.
Notes: True if this is server side.
(Read only property)

211.25.23 LastError as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: A Windows error code.
(Read and Write property)

211.25.24 MessageBytesAvailable as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries number of bytes available for current message.
Notes: (Read only property)

211.25.25 Name as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the pipe.
Notes: This is name as used in CreatePipe or OpenPipe method.
(Read and Write property)

211.25.26 NamedPipeClientComputerName as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the client computer name for the specified named pipe.
Example:

```
Var Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientComputerName: "+pipe.NamedPipeClientComputerName
```

Notes: (Read only property)

211.25.27 NamedPipeClientProcessId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the client process identifier for the specified named pipe.
Example:

```
Var Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientProcessId: "+str(pipe.NamedPipeClientProcessId)
```

Notes: (Read only property)

211.25.28 NamedPipeClientSessionId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the client session identifier for the specified named pipe.
Example:

```
Var Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientSessionId: "+str(pipe.NamedPipeClientSessionId)
```

Notes: (Read only property)

211.25.29 NamedPipeServerProcessId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the server process identifier for the specified named pipe.
Example:

```
Var Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeServerProcessId: "+str(pipe.NamedPipeServerProcessId)
```

Notes: (Read only property)

211.25.30 NamedPipeServerSessionId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the server session identifier for the specified named pipe.
Example:

```
Var Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeServerSessionId: "+str(pipe.NamedPipeServerSessionId)
```

Notes: (Read only property)

211.25.31 OutputBufferSize as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The output buffer size.
Notes: (Read only property)

211.25.32 Events

211.25.33 Connected

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The connected event.
Notes: Called when pipe is connected on either client or server side.

211.25.34 DataAvailable(BytesAvailable as Integer, MessageBytesAvailable as Integer)

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called when new data is available.

211.25.35 PipeBroken

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called when pipe breaks.
Notes: The plugin will stop calling DataAvailable handler.
You can call Close and CreatePipe method to open pipe again.

211.26 class WindowsPowerManagerMBS

211.26.1 class WindowsPowerManagerMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to information about a device's battery and power supply status.
Example:

MessageBox str(WindowsPowerManagerMBS.RemainingChargePercent)+"% remaining"

Notes: See also WindowsPowerStateMBS class.

Xojo Developer Magazine

- 23.4, page 10: News

211.26.2 Methods

211.26.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Registers the events.

211.26.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: Unregisters the events.

211.26.5 Properties

211.26.6 BatteryStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the device's battery status.
Example:

```
var status as integer = WindowsPowerManagerMBS.BatteryStatus
var message as string

Select case status
case WindowsPowerManagerMBS.BatteryStatusCharging
message = "Charging"
case WindowsPowerManagerMBS.BatteryStatusDischarging
message = "Discharging"
case WindowsPowerManagerMBS.BatteryStatusIdle
message = "Idle"
case WindowsPowerManagerMBS.BatteryStatusNotPresent
message = "NotPresent"
end Select

MessageBox status.ToString+" "+message
```

Notes: (Read only property)

211.26.7 EnergySaverStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the devices's battery saver status, indicating when to save energy.
Example:

```
var status as integer = WindowsPowerManagerMBS.EnergySaverStatus
var message as string

Select case status
case WindowsPowerManagerMBS.EnergySaverStatusDisabled
message = "Disabled"
case WindowsPowerManagerMBS.EnergySaverStatusOff
message = "Off"
case WindowsPowerManagerMBS.EnergySaverStatusOn
message = "On"
end Select
```

```
MessageBox status.ToString+" "+message
```

Notes: (Read only property)

211.26.8 PowerSupplyStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the device's power supply status.
Example:

```
var status as integer = WindowsPowerManagerMBS.PowerSupplyStatus
var message as string

Select case status
case WindowsPowerManagerMBS.PowerSupplyStatusAdequate
message = "Adequate"
case WindowsPowerManagerMBS.PowerSupplyStatusInadequate
message = "Inadequate"
case WindowsPowerManagerMBS.PowerSupplyStatusNotPresent
message = "NotPresent"
end Select

MessageBox status.ToString+" "+message
```

Notes: (Read only property)

211.26.9 RemainingChargePercent as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the total percentage of charge remaining from all batteries connected to the device.
Example:

```
MessageBox str(WindowsPowerManagerMBS.RemainingChargePercent)+"% remaining"
```

Notes: (Read only property)

211.26.10 RemainingDischargeTime as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the total runtime remaining from all batteries connected to the device.
Notes: This is Max Int64 if unknown.
(Read only property)

211.26.11 Yield as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield to other Xojo threads.
Notes: If true allows other cooperative threads to run in the background.
(Read and Write property)

211.26.12 Events

211.26.13 BatteryStatusChanged

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Occurs when BatteryStatus changes.

211.26.14 EnergySaverStatusChanged

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Occurs when EnergySaverStatus changes.

211.26.15 PowerSupplyStatusChanged

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Occurs when the PowerSupplyStatus changes.

211.26.16 RemainingChargePercentChanged

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Occurs when RemainingChargePercent changes.

211.26.17 RemainingDischargeTimeChanged

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Occurs when RemainingDischargeTime changes.

211.26.18 Constants

Constants

Constant	Value	Description
EnergySaverStatusOff	1	One of the constants to specify the status of battery saver. Battery saver is off now, but ready to turn on automatically.
EnergySaverStatusOn	2	One of the constants to specify the status of battery saver. Battery saver is on. Save energy where possible.

Battery Status

Constant	Value	Description
BatteryStatusCharging	3	The battery is charging.
BatteryStatusDischarging	1	The battery is discharging.
BatteryStatusIdle	2	The battery is idle.
BatteryStatusNotPresent	0	The battery or battery controller is not present.

EnergySaver Status

Constant	Value	Description
EnergySaverStatusDisabled	0	Battery saver is off permanently or the device is plugged in.

Power Supply Status

Constant	Value	Description
PowerSupplyStatusAdequate	2	The device has an adequate power supply.
PowerSupplyStatusInadequate	1	The device has an inadequate power supply.
PowerSupplyStatusNotPresent	0	The device has no power supply.

211.27 class WindowsPreviewHandlerMBS

211.27.1 class WindowsPreviewHandlerMBS

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The class for showing previews on windows.
Notes: This is linke a control which you can put into a window to show a preview for a file.

Uses IPreviewHandler class from Microsoft, so also see here:
https://docs.microsoft.com/en-us/windows/win32/api/shobjidl_core/nn-shobjidl_core-ipreviewhandler
https://docs.microsoft.com/de-de/windows/win32/shell/preview-handlers

The preview handlers we find are those listed in the registry here:
Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\PreviewHandlers

See WinPreviewControlMBS control to use this class as a control.

Xojo Developer Magazine

- 10.6, page 10: News

211.27.2 Methods

211.27.3 Constructor(ClassID as string)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Initializes the object with loading the class with the given classid.
Notes: You find those ClassIDs in the registry (See example project).

See HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\PreviewHandlers in the registry.

211.27.4 DoPreview

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to load data from the source specified in an earlier Initialize method call, and to begin rendering to the previewer window.
Notes: Lasterror is set.

If the previewer window has not yet been created, then it must be created after this method has been called. The preview handler is responsible for painting the area specified in SetWindow or SetRect. If these methods are called while the preview handler is rendering, the window must be reparented/resized without stopping or restarting the rendering of the item.
This method should be called only after SetWindow has been called.
Additionally, this method should be called only after Constructor has been called.

211.27.5 InitWithData(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes: Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.

You need to call Preview next on success to show a preview.
See also:

- 211.27.6 InitWithData(data as string) 24156

211.27.6 InitWithData(data as string)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes: Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.

You need to call Preview next on success to show a preview.
See also:

• 211.27.5 InitWithData(data as MemoryBlock) 24156

211.27.7 InitWithFile(file as folderitem)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given file.
Notes: Lasterror is set.
If the preview handler does not support reading file, the plugin reads the file and passes as data.

You need to call Preview next on success to show a preview.

If the file path is invalid, the preview will show a file not found error message.

211.27.8 SetBackgroundColor(red as Integer, green as Integer, blue as Integer)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Sets the background color of the preview handler.
Notes: Lasterror is set.
Not all preview handlers implement this method.

211.27.9 SetFocus

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to set focus to itself.
Notes: Lasterror is set.

211.27.10 SetFont(size as Integer, font as string)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Sets the font attributes to be used for text within the preview handler.
Notes: Lasterror is set.
Not all preview handlers implement this method.

211.27.11 SetRect(left as Integer, top as Integer, width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to change the area within the parent hwnd that it draws into.
Notes: Lasterror is set.

If called before the preview handler window has been created, the new rectangle replaces the rectangle previously received in the SetWindow call.
If called after the preview handler window has been created, the preview handler window must be resized.
If the preview handler is already rendering, then the preview must be resized without interrupting the render process.

211.27.12 SetTextColor(red as Integer, green as Integer, blue as Integer)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Sets the color of the text within the preview handler.
Notes: Lasterror is set.
Not all preview handlers implement this method.

211.27.13 SetWindow(win as ContainerControl)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Sets the parent of the preview to be the container with it's size.
Notes: We query size of the container automatically to set the right size independent of the screen scaling.

- 211.27.18 SetWindow(win as DesktopContainer, left as integer, top as integer, width as integer, height as integer) 24161
- 211.27.19 SetWindow(win as DesktopControl) 24162
- 211.27.20 SetWindow(win as DesktopControl, left as integer, top as integer, width as integer, height as integer) 24163

- 211.27.21 SetWindow(win as DesktopWindow) 24163
- 211.27.22 SetWindow(win as DesktopWindow, left as integer, top as integer, width as integer, height as integer) 24164
- 211.27.24 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer) 24166

211.27.14 SetWindow(win as ContainerControl, left as integer, top as integer, width as integer, height as integer)

MBS Win Plugin, Plugin Version: 22.1, Platform: Windows, Targets: Desktop only.

Function: Sets the parent to a container control.
Notes: Coordinates in pixels.
See also:

- 211.27.13 SetWindow(win as ContainerControl) 24158

211.27.15 SetWindow(win as Control)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Sets the parent of the preview to be the control with it's size.
Notes: e.g. use a Canvas to host the preview.

We query size of the container automatically to set the right size independent of the screen scaling.

- 211.27.24 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer) 24166

211.27.22 SetWindow(win as DesktopWindow, left as integer, top as integer, width as integer, height as integer)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Sets the parent window of the previewer window, as well as the area within the parent to be used for the previewer window.
Notes: Pass the window and the area for the previewer.
Lasterror is set.

The preview handler is responsible for painting the entire area. If the previewer window has been created, the preview handler must associate the previewer window to the new parent hwnd and resize the previewer window to the area defined by the rectangle. If the previewer window has not yet been created, the preview handler must remember this information for when the previewer window is created in DoPreview.
It is preferred that this information be stored prior to calling DoPreview. Doing so increases performance at setup time for any cases where the preview does not start.

Coordinates in pixels.

211.27.25 Unload

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to cease rendering a preview and to release all resources that have been allocated based on the item passed in during the initialization.

Notes: Lasterror is set.
When called, the preview window will be destroyed.

This method should be called only after Constructor has been called. All resources associated with this initialization will be released. Prior to calling DoPreview, this preview handler will be re-initialized with a call to one of the initialization interfaces and a call to SetWindow.

211.27.26 Properties

211.27.27 Handle as Integer

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

211.27.28 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

211.27.29 LasterrorString as String

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The error message for the error number in the lasterror property.
Notes: (Read only property)

211.27.30 SupportsDataLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Whether the preview handler supports loading data from a string or memoryblock.
Notes: (Read only property)

211.27.31 SupportsFileLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Whether the preview handler supports loading files.
Notes: As the plugin can also load file and pass as data if needed, this function also returns true if SupportsDataLoading is also true.
(Read only property)

211.27.32 Window as Variant

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The parent window.
Notes: Can reference a Window or DesktopWindow object.
(Read only property)

211.28 class WindowsProcessCpuUsageReportMBS

211.28.1 class WindowsProcessCpuUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data about the CPU usage of the process.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS
var c as WindowsProcessCpuUsageReportMBS = s.CpuUsage

ListBox1.AddRow c.UserTime.ToString+" user time"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

211.28.2 Methods

211.28.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

211.28.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.28.5 Properties

211.28.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

211.28.7 KernelTime as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of CPU kernel time consumed by the process.
Notes: (Read only property)

211.28.8 UserTime as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of CPU user time consumed by the process.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS
var c as WindowsProcessCpuUsageReportMBS = s.CpuUsage

ListBox1.AddRow c.UserTime.ToString+" user time"
```

Notes: (Read only property)

211.29 class WindowsProcessDiagnosticExceptionMBS

211.29.1 class WindowsProcessDiagnosticExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop only.

Function: The exception to report issues with the process/system diagnostic classes.
Notes: Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo Plugins, version 25.1pr5

211.30 class WindowsProcessDiagnosticInfoMBS

211.30.1 class WindowsProcessDiagnosticInfoMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides diagnostic information about a process, such as CPU usage, disk usage, memory usage and so on.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS

MessageBox s.ExecutableFileName
```

Blog Entries

- News from the MBS Xojo Plugins in Version 25.1

211.30.2 Methods

211.30.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The convenience constructor to initialize an object for the current process.

211.30.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.30.5 Process(ProcessID as UInt32) as WindowsProcessDiagnosticInfoMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a ProcessDiagnosticInfo object for the specified process.
Example:

```
var s as WindowsProcessDiagnosticInfoMBS

// please put in a process ID
```

```
s = WindowsProcessDiagnosticInfoMBS.Process(9156)

MessageBox s.ExecutableFileName
```

Notes: If you call this method for the current app process ID, there is no capability check. Calling the method for any other process requires user consent, which defaults to denied. Users can provide consent in the Settings app.

211.30.6 Processes as WindowsProcessDiagnosticInfoMBS()

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a list of ProcessDiagnosticInfo objects for all running processes that are accessible to the caller.
Example:

```
var Names() as string
var processes() as WindowsProcessDiagnosticInfoMBS = WindowsProcessDiagnosticInfoMBS.Processes

for each process as WindowsProcessDiagnosticInfoMBS in processes
names.add process.ExecutableFileName
next

MessageBox join(names, EndOfLine)
```

211.30.7 Properties

211.30.8 CpuUsage as WindowsProcessCpuUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the CPU time used by the process.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS
var c as WindowsProcessCpuUsageReportMBS = s.CpuUsage

ListBox1.AddRow c.UserTime.ToString+" user time"
```

Notes: (Read only property)

211.30.9 CurrentProcess as WindowsProcessDiagnosticInfoMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the ProcessDiagnosticInfo for the currently running process.
Example:

```
var s as WindowsProcessDiagnosticInfoMBS

s = WindowsProcessDiagnosticInfoMBS.CurrentProcess

MessageBox s.ProcessId.ToString
```

Notes: (Read only property)

211.30.10 DiskUsage as WindowsProcessDiskUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the disk I/O usage of the process.
Notes: (Read only property)

211.30.11 ExecutableFileName as String

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the executable file for the process.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS

MessageBox s.ExecutableFileName
```

Notes: (Read only property)

211.30.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

211.30.13 IsPackaged as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a Boolean value indicating whether or not this ProcessDiagnosticInfo instance has any related UWP information.
Notes: (Read only property)

211.30.14 MemoryUsage as WindowsProcessMemoryUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets memory usage data for the process.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS
var m as WindowsProcessMemoryUsageReportMBS = s.MemoryUsage

MessageBox m.WorkingSetSizeInBytes.ToString + " bytes used for this app"
```

Notes: (Read only property)

211.30.15 Parent as WindowsProcessDiagnosticInfoMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the ProcessDiagnosticInfo for the parent process.
Example:

```
var s as WindowsProcessDiagnosticInfoMBS

s = WindowsProcessDiagnosticInfoMBS.CurrentProcess

var p as WindowsProcessDiagnosticInfoMBS = s.Parent

MessageBox s.ExecutableFileName+" has parent "+p.ExecutableFileName
```

Notes: (Read only property)

211.30.16 ProcessId as UInt32

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the unique process ID.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS

MessageBox s.ExecutableFileName+" with process id "+s.ProcessId.ToString
```

Notes: (Read only property)

211.30.17 ProcessStartTime as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the time the process was started.
Notes: (Read only property)

211.31 class WindowsProcessDiskUsageReportMBS

211.31.1 class WindowsProcessDiskUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data about the disk usage of the process.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.31.5 Properties

211.31.6 BytesReadCount as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of bytes the process has read from disk.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS
var c as WindowsProcessDiskUsageReportMBS = s.DiskUsage

MessageBox c.BytesReadCount.ToString+" bytes read"
```

Notes: (Read only property)

211.31.7 BytesWrittenCount as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of bytes the process has written to disk.
Notes: (Read only property)

211.31.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

211.31.9 OtherBytesCount as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of bytes used by the process in disk operations that were not read or write operations.
Notes: (Read only property)

211.31.10 OtherOperationCount as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of disk operations performed by the process that were not read or write operations.
Notes: (Read only property)

211.31.11 ReadOperationCount as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of disk read operations performed by the process.
Notes: (Read only property)

211.31.12 WriteOperationCount as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of disk write operations performed by the process.
Notes: (Read only property)

211.32 class WindowsProcessMemoryUsageReportMBS

211.32.1 class WindowsProcessMemoryUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data about the memory usage of the process.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS
var m as WindowsProcessMemoryUsageReportMBS = s.MemoryUsage

MessageBox m.WorkingSetSizeInBytes.ToString + " bytes used for this app"
```

Notes: See also WindowsProcessMemoryInfoMBS and WindowsProcessStatisticsMBS classes.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 25.1pr5

211.32.2 Methods

211.32.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

211.32.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.32.5 Properties

211.32.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

211.32.7 NonPagedPoolSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of non-paged memory available to the process, in bytes.
Notes: (Read only property)

211.32.8 PagedPoolSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of paged memory available to the process, in bytes.
Notes: (Read only property)

211.32.9 PageFaultCount as UInt32

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of memory page faults.
Notes: (Read only property)

211.32.10 PageFileSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the size of the memory page file in bytes.
Notes: (Read only property)

211.32.11 PeakNonPagedPoolSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum amount of non-paged memory used by the process, in bytes.
Notes: (Read only property)

211.32.12 PeakPagedPoolSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum amount of paged memory used by the process, in bytes.
Notes: (Read only property)

211.32.13 PeakPageFileSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum size of the memory page file used by the process, in bytes.
Notes: (Read only property)

211.32.14 PeakVirtualMemorySizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum amount of virtual memory used by the associated process.
Notes: (Read only property)

211.32.15 PeakWorkingSetSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum amount of physical memory used by the associated process.
Notes: (Read only property)

211.32.16 PrivatePageCount as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of private memory pages allocated for the associated process.
Notes: (Read only property)

211.32.17 VirtualMemorySizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of the virtual memory allocated for the associated process.
Notes: (Read only property)

211.32.18 WorkingSetSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of physical memory allocated for the associated process.
Example:

```
var s as new WindowsProcessDiagnosticInfoMBS
var m as WindowsProcessMemoryUsageReportMBS = s.MemoryUsage

MessageBox m.WorkingSetSizeInBytes.ToString + " bytes used for this app"
```

Notes: (Read only property)

211.33 class WindowsPropertiesMBS

211.33.1 class WindowsPropertiesMBS

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The class for window properties.
Example:

```
Var w as new WindowsPropertiesMBS(self)

Var key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true

Var c as integer = w.count
for i as integer = 0 to c-1
Var k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

211.33.2 Methods

211.33.3 Close

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Closes properties.
Notes: Same as destructor.

211.33.4 Commit

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Commits values.
Notes: Optional as window properties are set directly.
LastError and LastErrorMessage are set.

211.33.5 Constructor(Win as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves an object that represents a specific window's collection of properties, which allows those properties to be queried or set.
Notes: Requires Windows 7 or Windows Server 2008 R2 or newer.

An application can use this function to obtain access to a window's property store so that it can set an explicit Application User Model ID (AppUserModelID) in the System.AppUserModel.ID property.

Raises FunctionNotFoundException if function is not available, PlatformNotSupportedException if not running on Windows, NilObjectException if window is nil or invalid and UnsupportedOperationException if Window properties can't be queried.
See also:

- 211.33.6 Constructor(Win as Window) 24185

211.33.6 Constructor(Win as Window)

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Retrieves an object that represents a specific window's collection of properties, which allows those properties to be queried or set.
Notes: Requires Windows 7 or Windows Server 2008 R2 or newer.

An application can use this function to obtain access to a window's property store so that it can set an explicit Application User Model ID (AppUserModelID) in the System.AppUserModel.ID property.

Raises FunctionNotFoundException if function is not available, PlatformNotSupportedException if not running on Windows, NilObjectException if window is nil or invalid and UnsupportedOperationException if Window properties can't be queried.
See also:

- 211.33.5 Constructor(Win as DesktopWindow) 24185

211.33.7 Count as Integer

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Queries number of values.
Example:

```
Var w as new WindowsPropertiesMBS(self)

// show all keys with values
Var c as integer = w.count
for i as integer = 0 to c-1
Var k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

Notes: LastError and LastErrorMessage are set.

211.33.8 EdgeGestureDisableTouchWhenFullscreen as String

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The property name used to disable touch gesture with full screen window.
Example:

```
Var w as new WindowsPropertiesMBS(self)
Var key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true
```

211.33.9 Key(Index as Integer) as String

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The key with given index.
Notes: Index from 0 to Count-1.
Keys are passed as UUID followed by property ID.
LastError and LastErrorMessage are set.

211.33.10 Values as Dictionary

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries all values as dictionary.
Notes: The dictionary is a copy, so changes to the dictionary are not going back to the window.

211.33.11 Properties

211.33.12 Handle as Integer

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

211.33.13 LastError as Integer

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

211.33.14 LastErrorMessage as String

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The last error message.
Notes: (Read and Write property)

211.33.15 Value(Key as String) as Variant

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Set or query property value.
Example:

```
Var w as new WindowsPropertiesMBS(self)

// show all keys with values
Var c as integer = w.count
for i as integer = 0 to c-1
Var k as string = w.key(i)
MsgBox k+" "+w.Value(k)
```

next

Notes: Keys are passed as UUID followed by property ID.
LastError and LastErrorMessage are set.
(Read and Write computed property)

211.34 class WindowsReportErrorMBS

211.34.1 class WindowsReportErrorMBS

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an event source on Windows to report errors.
Example:

```
// early on app start, setup this
Var r as new WindowsReportErrorMBS("Application")

// later report something
const Category = 1
const EventID = 1000
r.Report r.kEventLogWarningType, Category, EventID, array("Hello World")
```

- 19.2, page 9: News

211.34.2 Methods

211.34.3 Constructor(SourceName as String, UNCServerName as String = "")

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a registered handle to the specified event log.
Notes: UNCServerName: The Universal Naming Convention (UNC) name of the remote server on which this operation is to be performed. If this parameter is "", the local computer is used.
SourceName: The name of the event source whose handle is to be retrieved. The source name must be a subkey of a log under the Eventlog registry key. Note that the Security log is for system use only.
Note This string must not contain characters prohibited in XML Attributes, with the exception of XML Escape sequences such as &lt &gl.

If the source name cannot be found, the event logging service uses the Application log. Although events will be reported , the events will not include descriptions because there are no message and category message files for looking up descriptions related to the event identifiers.

Raises exception on failure.

211.34.4 Report(Type as Integer, Category as Integer, EventID as Integer, Strings() as string = nil, RawData as MemoryBlock = nil)

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes an entry at the end of the event log.
Notes: Type: The type of event to be logged. See kEventLog* constants.
Category: The event category. This is source-specific information; the category can have any value.
EventID: The event identifier. The event identifier specifies the entry in the message file associated with the event source.
Strings: An array of strings that are merged into the message before Event Viewer displays the string to the user. This parameter must can be nil for no strings. Each string is limited to 31,839 characters.
RawData:

211.34.5 Properties

211.34.6 Handle as Integer

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle to the event source.
Notes: (Read and Write property)

211.34.7 Constants

Event Types

Constant	Value	Description
kEventLogAuditFailure	16	Failure Audit event
kEventLogAuditSuccess	8	Success Audit event
kEventLogErrorType	1	Error event
kEventLogInformationType	4	Information event
kEventLogSuccess	0	Information event
kEventLogWarningType	2	Warning event

211.35 class WindowsScriptErrorExceptionMBS

211.35.1 class WindowsScriptErrorExceptionMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The exception class raised when an error happens while executing a script.
Example:

```
Var w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

Notes: Subclass of the RuntimeException class.
Blog Entries

- Windows Scripts in REALbasic

211.36 class WindowsScriptErrorMBS

211.36.1 class WindowsScriptErrorMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for error details.
Example:

```
Var w as new WindowsScriptMBS

w.Language = "JScript"

try
w.AddCode "function Test(a,b) { 1 return a+b; } " // 1 is there to make error

Var p(-1) as string = array("Hello ", "World from JavaScript")
Var x as string = w.Run("Test", p)
catch e as WindowsScriptErrorExceptionMBS
Var error as WindowsScriptErrorMBS = w.Error
MsgBox error.Description+EndOfLine+"in "+str(error.Line)+":"+str(error.Column)
end try
```

211.36.2 Properties

211.36.3 Column as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Source code column position where the error occurred.
Notes: (Read and Write property)

211.36.4 Description as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Friendly description of error.
Notes: (Read and Write property)

211.36.5 Line as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Source code line number where the error occurred.
Notes: (Read and Write property)

211.36.6 Number as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Error number.
Notes: (Read and Write property)

211.36.7 Source as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Source of the error.
Notes: (Read and Write property)

211.36.8 Text as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Line of source code on which the error occurred.
Notes: (Read and Write property)

211.37 class WindowsScriptMBS

211.37.1 class WindowsScriptMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to run Windows Scripts.
Example:

```
Var w as new WindowsScriptMBS

w.Language = "JScript"
w.AddCode "function Test(a,b) { return a+b; } "

Var p(-1) as string = array("Hello ", "World from JavaScript")
Var x as string = w.Run("Test", p)

MsgBox x
```

211.37.2 Methods

211.37.3 AddCode(code as string)

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Add code to the global module.
Example:

```
Var w as new WindowsScriptMBS

w.Language = "VBScript"
```

```
w.AddCode "a = 1" // define some global variables
w.AddCode "b = 2"
```

Notes: If you use VBScript, you don't need "dim" keyword for defining variables.

211.37.4 ClearError

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears the current error.

211.37.5 Eval(code as string) as string

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Evaluate an expression within the context of the global module.

211.37.6 ExecuteStatement(statement as string)

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Execute a statement within the context of the global module.
Example:

```
Var w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

211.37.7 Reset

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reset the scripting engine to a newly created state.

211.37.8 Run(functionName as string, parameters() as string) as string

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Call a procedure defined in the global module.
Example:

```
Var w as new WindowsScriptMBS

// First try VBScript
w.Language = "VBScript"

Var lines(-1) as string

lines.append "Function Test(a,b)"
lines.append "Test = a+b"
lines.append "End Function"

w.AddCode Join(lines, EndOfLine.Windows)

Var p(-1) as string = array("Hello ", "World from VBScript")
Var x as string = w.Run("Test", p)

'MsgBox x

// Second try JScript
w.Language = "JScript"

redim lines(-1)
lines.append "function Test(a,b)"
lines.Append " { "
lines.append "return a+b;"
lines.append " } "

w.AddCode Join(lines, EndOfLine.Windows)

p = array("Hello ", "World from JavaScript")
x = w.Run("Test", p)

MsgBox x
```

```
Exception e as WindowsScriptErrorExceptionMBS
MsgBox "Exception: "+e.message
```

211.37.9 Properties

211.37.10 AllowUI as Boolean

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enable or disable display of the UI.
Example:

```
Var w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

Notes: (Read and Write property)

211.37.11 Error as WindowsScriptErrorMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current error status.
Notes: (Read only property)

211.37.12 Language as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Language engine to use.
Example:

```
Var w as new WindowsScriptMBS

w.Language = w.kLanguageJScript

MsgBox w.Language // shows "JScript"

w.Language = w.kLanguageVBScript

MsgBox w.Language // shows "VBScript"
```

Notes: Use kLanguageVBScript or kLanguageJScript constants.
Setting this property calls reset internally.
(Read and Write property)

211.37.13 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: 0 is no error. -1 is a parameter error on the plugin side. All other codes are from Windows.
(Read and Write property)

211.37.14 SitehWnd as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The window handle for the window being parent to any window the scripts create.
Example:

```
Var w as new WindowsScriptMBS
w.SitehWnd = window1.handle
```

Notes: The window is used as the parent window for message boxes, alerts, etc.
(Read and Write property)

211.37.15 Timeout as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of time in milliseconds that a script can execute before being considered hung.
Notes: (Read and Write property)

211.37.16 UseSafeSubset as Boolean

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Force script to execute in safe mode and disallow potentially harmful actions.
Notes: (Read and Write property)

211.37.17 Constants

Constants

Constant	Value	Description
kLanguageJScript	"JScript"	One of the language constants. Using this constant you can switch to JavaScript.
kLanguageVBScript	"VBScript"	One of the language constants. Using this constant you can switch to VBScript.

211.38 class WindowsSerialPortsMBS

211.38.1 class WindowsSerialPortsMBS

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This is a class to query the serial ports on a Windows system.
Notes: This class was created in response to feedback report 8212: Serial Port Hangup on Windows.
Blog Entries

- MBS Xojo Plugins, version 19.0pr7
- MBS Xojo / Real Studio Plugins, version 14.0pr5
- Plugins 10.1

Videos

- Presentation from Xojo Developer Conference 2019 in Miami.

211.38.2 Methods

211.38.3 Constructor(OnlyPresent as boolean = true)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which builds the list of devices.

211.38.4 Description(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description of this serial port.

211.38.5 DevicePath(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device path of this serial port.

211.38.6 FriendlyName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The display name of this serial port.

211.38.7 Location(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of this serial port.

211.38.8 QueryComDevices as String()

MBS Win Plugin, Plugin Version: 19.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries list of DOS COM Port names.
Notes: While Constructor builds a list based on registry information (setup database), this function will use QueryDosDevice to ask Windows about device names for DOS starting with COM in their name and return the list.

Returns nil in case of failure.

211.38.9 Properties

211.38.10 Count as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of serial ports found.
Notes: (Read and Write property)

211.39 class WindowsSystemCpuUsageReportMBS

211.39.1 class WindowsSystemCpuUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data about the CPU usage of the system.
Example:

```
var s as new WindowsSystemDiagnosticInfoMBS
var c as WindowsSystemCpuUsageReportMBS = s.CpuUsage

var t as Int64 = c.IdleTime + c.KernelTime + c.UserTime
var percentIdle as Double = c.IdleTime / t
var percentUser as Double = c.UserTime / t
var percentKernel as Double = c.KernelTime / t

var i,u,k as string

i = str(percentIdle, "0.0%") + " idle, "
u = str(percentUser, "0.0%") + " user, "
k = str(percentKernel, "0.0%") + " kernel."

MessageBox i+u+k
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 25.1pr5

211.39.2 Methods

211.39.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

211.39.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.39.5 Properties

211.39.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

211.39.7 IdleTime as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of time the CPU was idle.
Notes: (Read only property)

211.39.8 KernelTime as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of CPU kernel time consumed by the system.
Notes: (Read only property)

211.39.9 UserTime as Int64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of CPU user time consumed by the system.
Notes: (Read only property)

211.40 class WindowsSystemDiagnosticInfoMBS

211.40.1 class WindowsSystemDiagnosticInfoMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides diagnostic information about the system, such as CPU usage, disk usage, memory usage and so on.
Blog Entries

- MBS Xojo Plugins, version 25.1pr5

211.40.2 Methods

211.40.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The convenience constructor to initialize an object for the current system.

211.40.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.40.5 IsArchitectureSupported(type as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines if the system supports the specified processor architecture..
Example:

```
var t as integer

t = WindowsSystemDiagnosticInfoMBS.ProcessorArchitectureArm64

if WindowsSystemDiagnosticInfoMBS.IsArchitectureSupported(t) then
// ARM 64-bit app
MessageBox "ARM64 supported"
else
// not an ARM 64-bit app
MessageBox "ARM64 not supported"
```

```
end if
```

211.40.6 Properties

211.40.7 CpuUsage as WindowsSystemCpuUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the CPU time used by the system.
Example:

```
var s as new WindowsSystemDiagnosticInfoMBS
var c as WindowsSystemCpuUsageReportMBS = s.CpuUsage

var t as Int64 = c.IdleTime + c.KernelTime + c.UserTime
var percentIdle as Double = c.IdleTime / t
var percentUser as Double = c.UserTime / t
var percentKernel as Double = c.KernelTime / t

var i,u,k as string

i = str(percentIdle, "0.0%") + " idle, "
u = str(percentUser, "0.0%") + " user, "
k = str(percentKernel, "0.0%") + " kernel."

MessageBox i+u+k
```

Notes: (Read only property)

211.40.8 CurrentSystem as WindowsSystemDiagnosticInfoMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the SystemDiagnosticInfo for the current system.
Example:

```
var s as WindowsSystemDiagnosticInfoMBS
s = WindowsSystemDiagnosticInfoMBS.CurrentSystem
var c as WindowsSystemMemoryUsageReportMBS = s.MemoryUsage

var a,t as string
a = str(c.AvailableSizeInBytes/1024/1024,"0")
t = str(c.TotalPhysicalSizeInBytes/1024/1024,"0")
```

```
MessageBox a+" of "+t+" MegaBytes available"
```

Notes: (Read only property)

211.40.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

211.40.10 MemoryUsage as WindowsSystemMemoryUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets memory usage data for the system.
Example:

```
var s as new WindowsSystemDiagnosticInfoMBS
var c as WindowsSystemMemoryUsageReportMBS = s.MemoryUsage

var a,t as string
a = str(c.AvailableSizeInBytes/1024/1024,"0")
t = str(c.TotalPhysicalSizeInBytes/1024/1024,"0")

MessageBox a+" of "+t+" MegaBytes available"
```

Notes: (Read only property)

211.40.11 PreferredArchitecture as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the system's preferred processor architecture.
Example:

```
var s as new WindowsSystemDiagnosticInfoMBS

Select case s.PreferredArchitecture
case s.ProcessorArchitectureArm64
MessageBox "Arm64"
case s.ProcessorArchitectureArm
MessageBox "Arm"
```

```
case s.ProcessorArchitectureX64
MessageBox "X64"
case s.ProcessorArchitectureX86
MessageBox "X86"
case s.ProcessorArchitectureX86OnArm64
MessageBox "X86OnArm64"
end Select
```

Notes: (Read only property)

211.40.12 Constants

Processor Architectures

Constant	Value	Description
ProcessorArchitectureArm	5	ARM 32-bit
ProcessorArchitectureArm64	12	ARM 64-bit
ProcessorArchitectureNeutral	11	Neutral
ProcessorArchitectureUnknown	65535	Unknown
ProcessorArchitectureX64	9	Intel 64-bit.
ProcessorArchitectureX86	0	Intel 32-bit.
ProcessorArchitectureX86OnArm64	14	Intel 64-bit in emulation on ARM 64-bit.

211.41 class WindowsSystemMemoryUsageReportMBS

211.41.1 class WindowsSystemMemoryUsageReportMBS

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data about the memory usage of the system.
Example:

```
var s as new WindowsSystemDiagnosticInfoMBS
var c as WindowsSystemMemoryUsageReportMBS = s.MemoryUsage

var a,t as string
a = str(c.AvailableSizeInBytes/1024/1024,"0")
t = str(c.TotalPhysicalSizeInBytes/1024/1024,"0")

MessageBox a+" of "+t+" MegaBytes available"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

211.41.2 Methods

211.41.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

211.41.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.41.5 Properties

211.41.6 AvailableSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of system memory available in bytes.
Notes: (Read only property)

211.41.7 CommittedSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the amount of committed memory for the system.
Notes: (Read only property)

211.41.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

211.41.9 TotalPhysicalSizeInBytes as UInt64

MBS WinFrameworks Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get the total amount of physical memory for the system.
Notes: (Read only property)

211.42 class WindowsTaskbarListMBS

211.42.1 class WindowsTaskbarListMBS

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for windows with methods that control the taskbar.
Notes: It allows you to dynamically add, remove, and activate items on the taskbar.
Blog Entries

- Show progress in task bar on Windows
- SetProgressState on Windows
- MBS REALbasic plug-ins version 10.2

211.42.2 Methods

211.42.3 ActivateTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Activates an item on the taskbar.
Notes: The window is not actually activated; the window's item on the taskbar is merely displayed as active.
Lasterror is set.

211.42.4 AddTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds an item to the taskbar.
Notes: Any type of window can be added to the taskbar, but it is recommended that the window at least have the WS_CAPTION style.

Any window added with this method must be removed with the DeleteTab method when the added window is destroyed.

Lasterror is set.

211.42.5 DeleteTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes an item from the taskbar.

211.42.6 MarkFullscreenWindow(WindowHandle as Integer, Fullscreen as Boolean)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Marks a window as full-screen.
Notes: Fullscreen: A Boolean value marking the desired full-screen status of the window.

Setting the value of fFullscreen to TRUE, the Shell treats this window as a full-screen window, and the taskbar is moved to the bottom of the z-order when this window is active. Setting the value of fFullscreen to FALSE removes the full-screen marking, but does not cause the Shell to treat the window as though it were definitely not full-screen. With a FALSEfFullscreen value, the Shell depends on its automatic detection facility to specify how the window should be treated, possibly still flagging the window as full-screen.

Requires Windows XP or Windows Server 2003 or newer.
Lasterror is set.

211.42.7 RegisterTab(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Informs the taskbar that a new tab or document thumbnail has been provided for display in an application's taskbar group flyout.
Notes: Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
By itself, registering a tab thumbnail alone will not result in its being displayed. You must also call SetTabOrder to instruct the group where to display it.

211.42.8 SetActiveAlt(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Marks a taskbar item as active but does not visually activate it.
Notes: SetActiveAlt marks the item associated with hwnd as the currently active item for the window's process without changing the pressed state of any item. Any user action that would activate a different tab in that process will activate the tab associated with hwnd instead. The active state of the window's item is not guaranteed to be preserved when the process associated with this window is not active. To ensure that a given tab is always active, call SetActiveAlt whenever any of your windows are activated. Calling SetActiveAlt with a nil window handle clears this state.

211.42.9 SetOverlayIcon(TabWindowHandle as Integer, IconHandle as Integer, Description as string)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies an overlay to a taskbar button to indicate application status or a notification to the user.
Notes: Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle:
The handle of the window whose associated taskbar button receives the overlay. This handle must belong to a calling process associated with the button's application and must be a valid HWND or the call is ignored.

IconHandle:
The handle of an icon to use as the overlay. This should be a small icon, measuring 16x16 pixels at 96 dpi. If an overlay icon is already applied to the taskbar button, that existing overlay is replaced.

This value can be 0. How a 0 value is handled depends on whether the taskbar button represents a single window or a group of windows.

- If the taskbar button represents a single window, the overlay icon is removed from the display.
- If the taskbar button represents a group of windows and a previous overlay is still available (received earlier than the current overlay, but not yet freed by a 0 value), then that previous overlay is displayed in place of the current overlay.

It is the responsibility of the calling application to free hIcon when it is no longer needed. This can generally be done after you've called SetOverlayIcon because the taskbar makes and uses its own copy of the icon.

Description:
A string that provides an alt text version of the information conveyed by the overlay, for accessibility purposes.

In versions of Windows earlier than Windows 7, applications often used icons in the notification area of the taskbar to display application status and notifications to the user. The Windows 7 taskbar allows an application to provide that same sort of user feedback through its taskbar button, centralizing more of the application information in one place. These overlays are similar to existing overlays used for shortcut icons or security notifications, displayed at the lower-right corner of the button.

The following illustration shows an overlay (the small, green square that indicates the user status as "Available") applied to the far-right taskbar button.

Windows Messenger taskbar button with an overlay to indicate an Available status.

Icon overlays serve as a contextual notification of status, and are intended to negate the need for a separate notification area status icon to communicate that information to the user. The application designer must decide during the development cycle which method—icon overlay or notification area status icon—best serves that application. Overlay icons are intended to supply important, long-standing status or notifications such as network status, messenger status, or new mail. They should not be frequently changed, nor should they be animated.

To display an overlay icon, the taskbar must be in the default large icon mode. If the taskbar is configured through Taskbar and Start Menu Properties to show small icons, overlays cannot be applied and calls to this method are ignored.

Because a single overlay is applied to the taskbar button instead of to the individual window thumbnails, this is a per-group feature rather than per-window. Requests for overlay icons can be received from individual windows in a taskbar group, but they do not queue. The last overlay received is the overlay shown. If the last overlay received is removed, the overlay that it replaced is restored so long as it is still active. As an example, windows 1, 2, and 3 set, in order, overlays A, B, and C. Because overlay C was received last, it is shown on the taskbar button. Window 2 calls SetOverlayIcon with a 0 value to remove overlay B. Window 3 then does the same to remove overlay C. Because window 1's overlay A is still active, that overlay is then displayed on the taskbar button.

If Windows Explorer shuts down unexpectedly, overlays are not restored when Windows Explorer is restored. The application should wait to receive the TaskbarButtonCreated message that indicates that Windows Explorer has restarted and the taskbar button has been re-created, and then call SetOverlayIcon again to reapply the overlay.

211.42.10 SetProgressState(WindowHandle as Integer, Flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the type and state of the progress indicator displayed on a taskbar button.
Notes: Use the ProgressStateFlag* constants. Flags that control the current state of the progress button. Specify only one of the following flags; all states are mutually exclusive of all others.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

Progress bar information is not shown in high contrast color schemes to guarantee that no accessibility needs are compromised.

Developers accustomed to the existing progress bar control should find the taskbar button progress indicator to be a similar experience both in concept and visuals. Here, the taskbar button itself becomes a progress bar. A taskbar button's progress indicator should be a reflection of a more detailed progress bar in the associated window. This allows the user to see specifics, such as the percentage number and the amount of

time remaining, that cannot be shown in a taskbar button. Also, because a taskbar button can show the progress of only a single window in a group, it allows the user to check the progress of individual windows. It also provides progress information to the user when the taskbar button cannot, such as in a high-contrast color scheme.

Note that a taskbar button progress bar is not intended for use with normally peripheral actions such as the loading of a Web page or the printing of a document. That type of progress should continue to be shown in a window's status bar.

The progress indicator is displayed between the taskbar button's icon or text and the background. If progress is shown for both the active taskbar button and an inactive button, shading in the respective progress bars is such that the active button is still obvious to the user. Also, button functionality such as the display of thumbnails continues to work normally when the button is being used to display progress.

When exiting an error or paused state, call this method again with the ProgressStateFlagNormal or ProgressStateFlagIndeterminate flag to continue in the original state or TBPF_NOPROGRESS if the operation is cancelled.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. This includes the situation where the taskbar button represents a group and more than one window in that group is broadcasting progress information. In that case, the taskbar button chooses its progress display based on state priority. State priority is shown in the following table with priority 1 being the highest.

Priority	State
1	ProgressStateFlagError
2	ProgressStateFlagPaused
3	ProgressStateFlagNormal
4	ProgressStateFlagIndeterminate

Changing a window's state changes its priority in relation to other windows in the group which in turn might change which window in a group is used for the progress indicator in the taskbar button.

In the case of a priority collision between two windows that are broadcasting determinate progress, the window with the least progress is used.

Based on this priority, the indeterminate progress indicator can be displayed in the taskbar button only in these cases:

- The taskbar button does not represent a group and the single window that it represents has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, and all of those windows have set ProgressStateFlagIndeterminate.

A determinate progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting determinate progress information, and no window has set ProgressStateFlagError or ProgressStateFlagPaused.

Note that a call to SetProgressValue will switch a progress indicator currently in an indeterminate mode (ProgressStateFlagIndeterminate) to a normal (determinate) display and clear the ProgressStateFlagIndeterminate flag.

If the handle is a ptr, you need to cast it with Integer(YourPtr) to pass it.

211.42.11 SetProgressValue(WindowHandle as Integer, Completed as UInt64, Total as UInt64)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Displays or updates a progress bar hosted in a taskbar button to show the specific percentage completed of the full operation.
Notes: Completed: An application-defined value that indicates the proportion of the operation that has been completed at the time the method is called.
Total: An application-defined value that specifies the value ullCompleted will have when the operation is complete.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

Determinate Progress Bar Lifecycle

An application first calls SetProgressValue to begin the display of a determinate progress bar, and then calls it again as needed to update the bar as the progress changes. When progress is complete, the application must call SetProgressState with the TBPF_NOPROGRESS flag to dismiss the progress bar.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. When the taskbar button represents a group and more than one of the windows in that group are broadcasting progress information, the taskbar button chooses its progress display based on the following state priority.

Priority	State
1	ProgressStateFlagError
2	ProgressStateFlagPaused
3	ProgressStateFlagNormal
4	ProgressStateFlagIndeterminate

Unless SetProgressState has set a blocking state (ProgressStateFlagError or ProgressStateFlagPaused) for the window, a call to SetProgressValue assumes the ProgressStateFlagNormal state even if it is not explicitly set. A call to SetProgressValue overrides and clears the ProgressStateFlagIndeterminate state.

In the case of a priority collision where two windows are broadcasting determinate progress, the window with the least progress is used.

Based on that priority, this determinate (specific percentage) progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information through this method.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information through this method.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting progress information through this method, and none of those windows has set the ProgressStateFlagError or ProgressStateFlagPaused state.

If a window in the group has set ProgressStateFlagError or ProgressStateFlagPaused, that state will be used for the button display. However, you can still make calls to SetProgressValue on other, unblocked windows in the group to update their progress in the background.

If the handle is a ptr, you need to cast it with Integer(YourPtr) to pass it.

211.42.12 SetTabActive(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Informs the taskbar that a tab or document window has been made the active window.
Notes: Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle: Handle of the active tab window. This handle must already be registered through RegisterTab. This value can be 0 if no tab is active.

MDIWindowHandle: Handle of the application's main window. This value tells the taskbar which group the thumbnail is a member of. This value is required and cannot be 0.

211.42.13 SetTabOrder(TabWindowHandle as Integer, InsertBeforeWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Inserts a new thumbnail into a tabbed-document interface (TDI) or multiple-document interface (MDI) application's group flyout or moves an existing thumbnail to a new position in the application's group.
Notes: TabWindowHandle: The handle of the tab window whose thumbnail is being placed. This value is required, must already be registered through RegisterTab, and cannot be 0.
InsertBeforeWindowHandle: The handle of the tab window whose thumbnail that hwndTab is inserted to the left of. This handle must already be registered through RegisterTab. If this value is 0, the new thumbnail is added to the end of the list.

211.42.14 SetTabProperties(TabWindowHandle as Integer, flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Allows a tab to specify whether the main application frame window or the tab window should be used as a thumbnail or in the peek feature under certain circumstances.
Notes: An application might want to use the thumbnail or peek representation of its associated parent window if the application cannot generate its own thumbnail for a tab or for its active tab content (such as an animation) to appear live.

flags: One of the TabPropertyFlag* constants.
Available on Windows 7 or Windows Server 2008 R2 or newer.

211.42.15 SetThumbnailClip(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects a portion of a window's client area to display as that window's thumbnail in the taskbar.
Notes: This variant of the method clears the clip that is already in place and return to the default display of the thumbnail.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
See also:

- 211.42.16 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h as Integer) 24218

211.42.16 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects a portion of a window's client area to display as that window's thumbnail in the taskbar.
Notes: Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
See also:

- 211.42.15 SetThumbnailClip(TabWindowHandle as Integer) 24218

211.42.17 SetThumbnailTooltip(TabWindowHandle as Integer, tip as string)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies or updates the text of the tooltip that is displayed when the mouse pointer rests on an individual preview thumbnail in a taskbar button flyout.
Notes: Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle: The handle to the window whose thumbnail displays the tooltip. This handle must belong to the calling process.

tip: The text to be displayed in the tooltip. This value can be empty, in which case the title of the window specified by WindowHandle is used as the tooltip.

211.42.18 UnregisterTab(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a thumbnail from an application's preview group when that tab or document is closed in the application.
Notes: It is the responsibility of the calling application to free hwndTab through DestroyWindow. UnregisterTab must be called before the handle is freed.
Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

211.42.19 Properties

211.42.20 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList interface.
Notes: The ITaskbarList interface is available on Windows 2000 Professional, Windows XP or Windows 2000 Server or newer.
(Read and Write property)

211.42.21 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList2 interface.
Notes: The ITaskbarList4 interface is available on Windows XP or Windows Server 2003 or newer.
(Read and Write property)

211.42.22 Handle3 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList3 interface.
Notes: The ITaskbarList3 interface is available on Windows 7 or Windows Server 2008 R2 or newer.
(Read and Write property)

211.42.23 Handle4 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList4 interface.
Notes: The ITaskbarList4 interface is available on Windows 7 or Windows Server 2008 R2 or newer.
(Read and Write property)

211.42.24 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code from one of the methods.
Notes: (Read and Write property)

211.42.25 Constants

Constants

Constant	Value	Description
ProgressStateFlagError	4	One of the progress state flag constants. The progress indicator turns red to show that an error has oc the windows that is broadcasting progress. This is a determina progress indicator is in the indeterminate state, it switches to a display of a generic percentage not indicative of actual progres
ProgressStateFlagIndeterminate	1	One of the progress state flag constants. The progress indicator does not grow in size, but cycles repea length of the taskbar button. This indicates activity without proportion of the progress is complete. Progress is taking pla no prediction as to how long the operation will take.
ProgressStateFlagNoProgress	0	One of the progress state flag constants. Stops displaying progress and returns the button to its norr this method with this flag to dismiss the progress bar when t complete or cancelled.
ProgressStateFlagNormal	2	One of the progress state flag constants. The progress indicator grows in size from left to right in pr estimated amount of the operation completed. This is a deter indicator; a prediction is being made as to the duration of the
ProgressStateFlagPaused	8	One of the progress state flag constants. he progress indicator turns yellow to show that progress is curre one of the windows but can be resumed by the user. No error and nothing is preventing the progress from continuing. This i state. If the progress indicator is in the indeterminate state a yellow determinate display of a generic percentage not indi progress.
TabPropertyFlagNone	0	One of the flag values you can use with SetTabProperties. No specific property values are specified. The default behavior window provides a thumbnail and peek image, either live or sta ate.
TabPropertyFlagUseAppPeekAlways	4	One of the flag values you can use with SetTabProperties. Always use the peek image provided by the main application rather than a peek image provided by the individual tab wi combine this value with TabPropertyFlagUseAppPeekWhenA will result in an error.
TabPropertyFlagUseAppPeekWhenActive	8	One of the flag values you can use with SetTabProperties. When the application tab is active and a live representation available, show the main application frame in the peek feature. use the tab window. Do not combine this value with TabPr AppPeekAlways; doing so will result in an error.
TabPropertyFlagUseAppThumbnailAlways	1	One of the flag values you can use with SetTabProperties. Always use the thumbnail provided by the main application rather than a thumbnail provided by the individual tab windo bine this value with TabPropertyFlagUseAppThumbnailWhen will result in an error.
TabPropertyFlagUseAppThumbnailWhenActive	2	One of the flag values you can use with SetTabProperties. When the application tab is active and a live representation available, use the main application frame window thumbnail. use the tab window thumbnail. Do not combine this value w tyFlagUseAppThumbnailAlways; doing so will result in an erro

211.43 class WindowsThreadExecutionStateMBS

211.43.1 class WindowsThreadExecutionStateMBS

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the thread execution state.
Example:

```
Var flags as integer = WindowsThreadExecutionStateMBS.kSystemRequired
Var w as new WindowsThreadExecutionStateMBS(flags)
window1.WindowsThreadExecutionState = w // store it in property
```

Notes: The state is set in constructor and reset in destructor, so you can put this object in a property of a window, so when the window is destroyed, the state is reset automatically.

Enables an application to inform the system that it is in use, thereby preventing the system from entering sleep or turning off the display while the application is running.

For macOS, please check NSProcessInfoMBS class.

The system automatically detects activities such as local keyboard or mouse input, server activity, and changing window focus. Activities that are not automatically detected include disk or CPU activity and video display.

To run properly on a power-managed computer, applications such as fax servers, answering machines, backup agents, and network management applications must use both kSystemRequired when they process events. Multimedia applications, such as video players and presentation applications, must use kDisplayRequired when they display video for long periods of time without user input. Applications such as word processors, spreadsheets, browsers, and games do not need to use this.

The kAwayModeRequired value should be used only when absolutely necessary by media applications that require the system to perform background tasks such as recording television content or streaming media to other devices while the system appears to be sleeping. Applications that do not require critical background processing or that run on portable computers should not enable away mode because it prevents the system from conserving power by entering true sleep.

To enable away mode, an application uses both kAwayModeRequired; to disable away mode, let the destructor reset. When away mode is enabled, any operation that would put the computer to sleep puts it in away mode instead. The computer appears to be sleeping while the system continues to perform tasks that do not require user input. Away mode does not affect the sleep idle timer; to prevent the system from entering sleep when the timer expires, an application must also set the kSystemRequired value.

This class cannot be used to prevent the user from putting the computer to sleep. Applications should respect that the user expects a certain behavior when they close the lid on their laptop or press the power button.

This function does not stop the screen saver from executing.

- News from the MBS Xojo Plugins in Version 23.0
- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.0
- MBS Xojo Plugins, version 22.6pr4

Xojo Developer Magazine

- 21.3, page 10: News
- 21.2, page 9: News

211.43.2 Methods

211.43.3 Constructor(Flags as Integer)

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the state and stores old state in property.
Example:

```
Var flags as integer = WindowsThreadExecutionStateMBS.kSystemRequired
Var w as new WindowsThreadExecutionStateMBS(flags)
window1.WindowsThreadExecutionState = w // store it in property
```

Notes: Does nothing if called on macOS, iOS or Linux.

211.43.4 Destructor

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: Puts back the old state.
Does nothing if called on macOS, iOS or Linux.

211.43.5 Properties

211.43.6 newState as Integer

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The new state set.
Notes: (Read only property)

211.43.7 oldState as Integer

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The old state before.
Notes: (Read only property)

211.43.8 Constants

Flags

Constant	Value	Description
kAwayModeRequired	64	Enables away mode. Away mode should be used only by media-recording and media-distribution applications that must perform critical background processing on desktop computers while the computer appears to be sleeping.
kDisplayRequired	2	Forces the display to be on by resetting the display idle timer.
kSystemRequired	1	Forces the system to be in the working state by resetting the system idle timer.

211.44 class WindowsVerticalBlankMBS

211.44.1 class WindowsVerticalBlankMBS

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for checking on Windows with the retrace of the display.
Notes: Sometimes you may want to draw only if the device is currently not touching the video memory.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr10

211.44.2 Methods

211.44.3 Constructor

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes the class.

211.44.4 GetMonitorFrequency as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the frequency of the monitor that the DirectDraw object controls.
Notes: Returns the monitor frequency, in Hz.
Lasterror is set.

211.44.5 GetScanLine as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method retrieves the scan line that is currently being drawn on the monitor.
Notes: To synchronize with the vertical blank, use the WaitForVerticalBlank method.
Lasterror is set.

Scan lines are reported as zero-based integers.
The returned scan line value is between 0 and n, where scan line 0 is the first visible scan line on the screen and n is the last visible scan line, plus scan lines that occur during the vertical blank period.

So, in a case where an application is running at 640x480, and there are 12 scan lines during the vertical blank period, the values returned by this method will range from 0 to 491.

211.44.6 GetVerticalBlankStatus as boolean

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the status of the vertical blank.
Notes: Returns the status of the vertical blank. True if a vertical blank is occurring, and false otherwise.
Lasterror is set.

211.44.7 WaitForVerticalBlankBegin

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Helps the application synchronize itself with the vertical-blank interval.
Notes: WaitForVerticalBlank returns when the vertical-blank interval begins.
Lasterror is set.

211.44.8 WaitForVerticalBlankEnd

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Helps the application synchronize itself with the vertical-blank interval.
Notes: WaitForVerticalBlank returns when the vertical-blank interval ends and the display begins.
Lasterror is set.

211.44.9 Properties

211.44.10 Available as Boolean

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this class will work.
Notes: (Read and Write property)

211.44.11 Lasterror as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last windows error string.
Notes: (Read and Write property)

211.44.12 LasterrorString as String

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last windows error string.
Notes: (Read only property)

211.45 class WindowsWMIMBS

211.45.1 class WindowsWMIMBS

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to run queries in the Windows Management Interface.
Example:

```
Var w as WindowsWMIMBS

w=new WindowsWMIMBS

if w.ConnectServer("root\cimv2") then
MsgBox "ConnectServer: ok"

if w.query("WQL","SELECT * FROM Win32_Processor") then
MsgBox "query: ok"

if w.NextItem then
MsgBox "NextItem: ok"

MsgBox w.GetPropertyString("Name") // string
MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
MsgBox str(w.GetPropertyInteger("ProcessorType")) // uint16

else
MsgBox "NextItem: fail"
end if
else
MsgBox "query: fail"
end if

else
MsgBox "ConnectServer: fail"
end if
```

Notes: In Windows 8.1 (or later) it looks like WindowsWMIMBS.InitSecurity(false) must be called at app.Constructor time as Xojo will do some things in background when opening first window which block our queries.
Subclass of the WMIObjectMBS class.

Xojo Developer Magazine

- 24.1, page 9: News

211.45.2 Methods

211.45.3 CancelAsyncCall as boolean

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops events being delivered to this WindowsWMIMBS object.
Notes: Lasterror is set.

211.45.4 ConnectServer(NetworkResource as string, Username as string="", Password as string="", Locale as string="", Authority as string="") as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Connect to WMI server.
Example:

```
Var w as WindowsWMIMBS // your WMI object
call w.ConnectServer("root\cimv2")
```

Notes: Returns true on success and false on failure.
Authority parameter added in plugin version 12.2.

211.45.5 Constructor

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

211.45.6 ExecNotificationQueryAsync(QueryLanguage as string, QueryText as string) as boolean

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ExecNotificationQueryAsync method executes a query to receive events.
Notes: The plugin receives events and enqueues them in a queue. You read objects from this queue in a timer and process them.
NextItem returns nil if the queue is empty.

Returns true on success and false on failure.
Lasterror is set. e.g. &h80041018 if you have syntax error in the query or &h80041058 if the query can't be parsed.

211.45.7 InitAuthentication(User as string, Domain as string, Password as string) as boolean

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes authentication data.
Notes: Call before ConnectServer.
This settings are passed to objects for authentication.

211.45.8 InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers security and sets the default security values for the process.
Notes: You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.

AuthnLevel:
The default authentication level for the process. Both servers and clients use this parameter when they call CoInitializeSecurity. COM will fail calls that arrive with a lower authentication level. By default, all proxies will use at least this authentication level. This value should contain one of the authentication level constants.

By default, all calls to IUnknown are made at this level.

ImpLevel:
The default impersonation level for proxies. The value of this parameter is used only when the process is a client. It should be a value from the impersonation level constants, except for kImpersonationLevelDefault, which is not for use with CoInitializeSecurity.
Outgoing calls from the client always use the impersonation level as specified. (It is not negotiated.) Incoming calls to the client can be at any impersonation level. By default, all IUnknown calls are made with this impersonation level, so even security-aware applications should set this level carefully. To determine which impersonation levels each authentication service supports, see the description of the authentication services in COM and Security Packages. For more information about impersonation levels, see Impersonation.

Please call in App.Constructor before Xojo can initialize COM and prevent our function from working!
See also:

- 211.45.9 InitSecurity(remote as boolean) as boolean 24231

211.45.9 InitSecurity(remote as boolean) as boolean

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes security.
Notes: You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.

Calling InitSecurity with remote=true will initialize security with kImpersonationLevelImpersonate. If remote=false, we use kImpersonationLevelIdentity which is the default.

Please call in App.Constructor before Xojo can initialize COM and prevent our function from working!
See also:

- 211.45.8 InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean 24230

211.45.10 NextItem as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves to next item in the list.
Notes: You need to call this at least once to move to the first item.
Returns false if no more items are there.

211.45.11 Query(QueryLanguage as string, QueryText as string) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a query.
Example:

```
Var w as WindowsWMIMBS
call w.query("WQL","SELECT * FROM Win32_Processor")
```

Notes: Returns true on success and false on failure.

211.45.12 Properties

211.45.13 EnumeratorHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the used IEnumWbemClassObject object.
Notes: (Read only property)

211.45.14 LocatorHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the used IWbemLocator object.
Notes: (Read only property)

211.45.15 ServiceHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the used IWbemServices object.
Notes: (Read only property)

211.45.16 Constants

Authentication Level

Constant	Value	Description
kAuthenticationLevelCall	3	Authenticates only at the beginning of each remote procedure call when server receives the request. Datagram transports use kAuthenticationLe Paket instead.
kAuthenticationLevelConnect	2	Authenticates the credentials of the client only when the client establish relationship with the server. Datagram transports always use kAuthenticat LevelPacket instead.
kAuthenticationLevelDefault	0	Tells DCOM to choose the authentication level using its normal security bla negotiation algorithm. For more information, see Security Blanket Negotiat
kAuthenticationLevelNone	1	Performs no authentication.
kAuthenticationLevelPacket	4	Authenticates that all data received is from the expected client.
kAuthenticationLevelPacketIntegrity	5	Authenticates and verifies that none of the data transferred between client server has been modified.
kAuthenticationLevelPacketPrivacy	6	Authenticates all previous levels and encrypts the argument value of each mote procedure call.

Impersonation Level Constants

Constant	Value	Description
kImpersonationLevelAnonymous	1	The client is anonymous to the server. The server process can impersonate the client, but the impersonation token will not contain any information and cannot be used.
kImpersonationLevelDefault	0	DCOM can choose the impersonation level using its normal security blanket negotiation algorithm. For more information, see Security Blanket Negotiation
kImpersonationLevelDelegate	4	The server process can impersonate the client's security context while acting on behalf of the client. The server process can also make outgoing calls to other servers while acting on behalf of the client, using cloaking. The server may use the client's security context on other machines to access local and remote resources as the client. When impersonating at this level, the impersonation token can be passed across any number of computer boundaries.
kImpersonationLevelIdentity	2	The server can obtain the client's identity. The server can impersonate the client for ACL checking, but it cannot access system objects as the client.
kImpersonationLevelImpersonate	3	The server process can impersonate the client's security context while acting on behalf of the client. This level of impersonation can be used to access local resources such as files. When impersonating at this level, the impersonation token can only be passed across one machine boundary. The Schannel authentication service only supports this level of impersonation.

211.46 class WinExceptionMBS

211.46.1 class WinExceptionMBS

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to catch windows system exceptions.
Notes: This class was made to intercept crashes in a Xojo application.
Whenever the application crashes, this class will fire its event so you have a chance to report that crash to your user and maybe save a crash report.

Do not try to save data as this could overwrite good data with bad data. Remember your application already crashed. Maybe because of data corruption!

Only one instance can exist in your application.

See also SignalHandlerMBS, NSExceptionHandlerMBS and GlobalExceptionHandlerMBS classes.

211.46.2 Methods

211.46.3 Close

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the exception handler from the system.

211.46.4 Properties

211.46.5 ExceptionAddress as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The address in memory where the exception was raised.
Notes: (Read only property)

211.46.6 ExceptionCode as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code of this exception.

Notes: Normally one of the kException* constants.
(Read only property)

211.46.7 ExceptionFlags as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The exception flags.
Notes: (Read only property)

211.46.8 ExceptionIsNonContinuable as Boolean

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this exception allows to continue in code.
Notes: For example a division by zero can be continued.
(Read only property)

211.46.9 ExceptionName as String

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the exception.
Notes: If ExceptionCode=kExceptionAccessViolation then returns "ExceptionAccessViolation".

This is a convenience function which you can use to show the exception to the user.
(Read only property)

211.46.10 Events

211.46.11 GotException() as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called when an exception was received.
Notes: Your application has crashed on this point, but instead of seeing the Microsoft dialog to tell you that the application crashed, your application has the chance to report that problem.

Return one of the following constants: kExecuteHandler, kContinueCode, kNextHandler, kExecuteHandlerNoDialog.

The plugin already removed the crash callback from the system so if the code in this event crashes again, the system dialog shows.

211.46.12 Constants

Constants

Constant	Value	Description
kContinueCode	2	One of the constants you can use for the GotException event ret This one is not recommented as it can raise the same exception a your application.
kExceptionAccessViolation	&hC0000005	One of the constants for exception codes. The thread attempts to read from or write to a virtual addres does not have access.
kExceptionArrayBoundsExceeded	&hC000008C	One of the constants for exception codes. The thread attempts to access an array element that is out of bo underlying hardware supports bounds checking.
kExceptionBreakPoint	&h80000003	One of the constants for exception codes. A breakpoint is encountered.
kExceptionDataTypeMisalignment	&h80000002	One of the constants for exception codes. The thread attempts to read or write data that is misaligned on h does not provide alignment. For example, 16-bit values must 2-byte boundaries, 32-bit values on 4-byte boundaries, and so on
kExceptionFloatDenormalOperand	&hC000008D	One of the constants for exception codes. One of the operands in a floating point operation is denormal. value is one that is too small to represent as a standard floating
kExceptionFloatDivideByZero	&hC000008E	One of the constants for exception codes. The thread attempts to divide a floating point value by a floating of 0 (zero).
kExceptionFloatInexactResult	&hC000008F	One of the constants for exception codes. The result of a floating point operation cannot be represented decimal fraction.
kExceptionFloatInvalidOperation	&hC0000090	One of the constants for exception codes. A floating point exception that is not included in this list.
kExceptionFloatOverflow	&hC0000091	One of the constants for exception codes. The exponent of a floating point operation is greater than the lowed by the corresponding type.
kExceptionFloatStackCheck	&hC0000092	One of the constants for exception codes. The stack has overflowed or underflowed, because of a floating po
kExceptionFloatUnderflow	&hC0000093	One of the constants for exception codes. The exponent of a floating point operation is less than the magn by the corresponding type.
kExceptionIllegalInstruction	&hC000001D	One of the constants for exception codes. The thread tries to execute an invalid instruction.
kExceptionInPageError	&hC0000006	One of the constants for exception codes. The thread tries to access a page that is not present, and the syste load the page. For example, this exception might occur if a netwo is lost while running a program over a network.
kExceptionIntegerDivideByZero	&hC0000094	One of the constants for exception codes. The thread attempts to divide an integer value by an integer divis
kExceptionIntegerOverflow	&hC0000095	One of the constants for exception codes. The result of an integer operation causes a carry out of the most of the result.
kExceptionInvalidDisposition	&hC0000026	One of the constants for exception codes. An exception handler returns an invalid disposition to the excepti Programmers using a high-level language such as C should never exception.
kExceptionNonContinueableException	&hC0000025	One of the constants for exception codes. The thread attempts to continue execution after a non-continua occurs.
kExceptionPrivilegedInstruction	&hC0000096	One of the constants for exception codes. The thread attempts to execute an instruction with an operati allowed in the current computer mode.
kExceptionSingleStep	&h80000004	One of the constants for exception codes. A trace trap or other single instruction mechanism signals that o is executed.

211.47 class WinGestureConfigMBS

211.47.1 class WinGestureConfigMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: ets and sets the configuration for enabling gesture messages and the type of this configuration.
Example:

```
// make a config for accepting pan/rotate gestures
Var c1 as new WinGestureConfigMBS

c1.ID = c1.kGestureIDPan
c1.Want = c1.kPan
c1.Block = 0

Var c2 as new WinGestureConfigMBS
c2.ID = c2.kGestureIDRotate
c2.Want = c2.kRotate
c2.Block = 0

Var configs() as WinGestureConfigMBS
configs.Append c1
configs.Append c2

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
MsgBox "OK"
end if
```

Notes: It is impossible to disable two-finger panning and keep single finger panning. You must set the want bits for GC_PAN before you can set them for GC_PAN_WITH_SINGLE_FINGER_HORIZONTALLY or GC_PAN_WITH_SINGLE_FINGER_VERTICALLY.
An inertia vector is included in the GID_PAN message with the GF_END flag if inertia was disabled by a call to SetGestureConfig.
When you pass this structure, the dwID member contains information for a set of gestures. This determines what the other flags will mean. If you set flags for pan messages, they will be different from those flags that are set for rotation messages.
The following table indicates the various identifiers for gestures that are supported by the dwID member of the GESTURECONFIG structure. Note that setting dwID to 0 indicates that global gesture configuration flags are set.

The following flags are used when dwID is set to 0.

The following flags are used when dwID is set to GID_ZOOM.

Name	Value	Description
GID_ZOOM	3	Indicates configuration settings for the zoom gesture.
GID_PAN	4	Indicates the pan gesture.
GID_ROTATE	5	Indicates the rotation gesture.
GID_TWOFINGERTAP	6	Indicates the two-finger tap gesture.
GID_PRESSANDTAP	7	Indicates the press and tap gesture.

Name	Value	Description
GC_ALLGESTURES	0x00000001	Indicates all of the gestures.

Name	Value	Description
GC_ZOOM	0x00000001	Indicates the zoom gesture.

The following flags are used when dwID is set to GID_PAN.

Note Setting the GID_PAN flags in SetGestureConfig will affect the default gesture handler for panning. You should not have both dwWant and dwBlock set for the same flags; this will result in unexpected behavior. See Windows Touch Gestures for more information on panning and legacy panning support; see SetGestureConfig for examples of enabling and blocking gestures.

The following flags are used when dwID is set to GID_ROTATE.

The following flags are used when dwID is set to GID_TWOFINGERTAP.

The following flags are used when dwID is set to GID_PRESSANDTAP.

Blog Entries

Videos

- Presentation from Munich conference about MBS Plugins.

211.47.2 Properties

211.47.3 Block as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Name	Value	Description
GC_PAN	0x00000001	Indicates all pan gestures.
GC_PAN_WITH_SINGLE_FINGER_VERTICALLY	0x00000002	Indicates vertical pans with one finger.
GC_PAN_WITH_SINGLE_FINGER_HORIZONTALLY	0x00000004	Indicates horizontal pans with one finger.
GC_PAN_WITH_GUTTER	0x00000008	Limits perpendicular movement to primary direction until a threshold is reached to break out of the gutter.
GC_PAN_WITH_INERTIA	0x00000010	Indicates panning with inertia to smoothly slow when pan gestures stop.

Name	Value	Description
GC_ROTATE	0x00000001	Indicates the rotation gesture.

Function: The messages to disable.
Example:

```
// make a config for accepting some pan gestures
Var c as new WinGestureConfigMBS

c.ID = kGestureIDPan
c.Want = c.kPanWithSingleFingerVertically + c.kPanWithGutter + c.kPanWithInteria
c.Block = c.kPanWithSingleFingerHorizontally
```

Notes: (Read and Write property)

211.47.4 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identifier for the type of configuration that will have messages enabled or disabled.
Example:

```
// make a config for accepting some pan/rotate gestures
Var c1 as new WinGestureConfigMBS

c1.ID = 0
c1.Want = c1.kAllGestures
c1.Block = 0

Var configs() as WinGestureConfigMBS
configs.Append c1

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
MsgBox "OK"
end if
```

Notes: (Read and Write property)

Name	Value	Description
GC_TWOFINGERTAP	0x00000001	Indicates the two-finger tap gesture.

Name	Value	Description
GC_PRESSANDTAP	0x00000001	Indicates the press and tap gesture.

211.47.5 Want as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The messages to enable.
Example:

```
// make a config for accepting all gestures
Var c as new WinGestureConfigMBS

c.ID = 0 // catch all IDs
c.Want = c.kAllGestures
```

Notes: (Read and Write property)

211.47.6 Constants

Gesture Options

Constant	Value	Description
kAllGestures	1	Indicates all of the gestures. (for ID = 0)
kPan	1	Indicates all pan gestures.
kPanWithGutter	8	Limits perpendicular movement to primary direction until a threshold reached to break out of the gutter.
kPanWithInteria	16	Indicates panning with inertia to smoothly slow when pan gestures stop.
kPanWithSingleFingerHorizontally	4	Indicates horizontal pans with one finger.
kPanWithSingleFingerVertically	2	Indicates vertical pans with one finger.
kPressAndTap	1	Indicates the press and tap gesture.
kRotate	1	Indicates the rotation gesture.
kTwoFingerTap	1	Indicates the two-finger tap gesture.
kZoom	1	Indicates the zoom gesture. (for ID = kGestureIDZoom)

Gesture IDs

Constant	Value	Description
kGestureIDBegin	1	Begin of gesture.
kGestureIDEnd	2	End of a gesture
kGestureIDPan	4	Pan gesture
kGestureIDPressAndTap	7	Press and Tap gesture
kGestureIDRotate	5	Rotate gesture
kGestureIDTwoFingerTap	6	Two-Finger Tap
kGestureIDZoom	3	Zoom gesture

211.48 class WinGestureInfoMBS

211.48.1 class WinGestureInfoMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stores information about a gesture.
Notes: Parameters for touches:
If kFlagBegin flag is set, save Location so you have first point. And save argument to check later.

For Zoom, get second point from this class. Than you can calculate center point and zoom factor is OldArgumentsLower/NewArgumentsLower.

For Pan, check difference between last point and new point to know how much moved.

For Rotate, please check difference between old RotateAngle and new RotateAngle.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Windows Touch Events

211.48.2 Methods

211.48.3 Constructor

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

211.48.4 Properties

211.48.5 Arguments as Int64

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A 64-bit unsigned integer that contains the arguments for gestures that fit into 8 bytes.
Notes: (Read only property)

211.48.6 ArgumentsHigher as UInt32

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The higher 32bits from Arguments.
Notes: (Read only property)

211.48.7 ArgumentsLower as UInt32

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The lower 32bits from Arguments.
Notes: Most events just use lower bits.
(Read only property)

211.48.8 Flags as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state of the gesture.
Notes: See kFlagBegin/kFlagInertia/kFlagEnd constants.
(Read only property)

211.48.9 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identifier of the gesture command.
Notes: see kGestureID* constants.
(Read only property)

211.48.10 InstanceID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An internally used identifier for the structure.
Notes: (Read only property)

211.48.11 LocationInWindowX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes: This is LocationX relative to target window.

(Read only property)

211.48.12 LocationInWindowY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes: This is LocationY relative to target window.
(Read only property)

211.48.13 LocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes: These coordinates are always relative to the origin of the screen.
(Read only property)

211.48.14 LocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes: These coordinates are always relative to the origin of the screen.
(Read only property)

211.48.15 RotateAngle as Double

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The argument as angle for rotate gesture.
Notes: (Read only property)

211.48.16 SequenceID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An internally used identifier for the sequence.
Notes: (Read only property)

211.48.17 TargetWindow as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A handle to the window that is targeted by this gesture.
Notes: (Read only property)

211.48.18 Constants

Flags

Constant	Value	Description
kFlagBegin	1	A gesture is starting.
kFlagEnd	4	A gesture has finished.
kFlagInertia	2	A gesture has triggered inertia.

Gesture IDs

Constant	Value	Description
kGestureIDBegin	1	Begin of a gesture
kGestureIDEnd	2	End of a gesture
kGestureIDPan	4	Pan gesture
kGestureIDPressAndTap	7	Press and Tap gesture
kGestureIDRotate	5	Rotate gesture
kGestureIDTwoFingerTap	6	Two-Finger Tap
kGestureIDZoom	3	Zoom gesture

211.49 class WinMouseFilterMBS

211.49.1 class WinMouseFilterMBS

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to filter mouse events in the whole application.
Notes: You may be able to intercept all mouse actions and block mouse events.

You can only have one instance to receive events at a time.

211.49.2 Methods

211.49.3 Constructor

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

211.49.4 Properties

211.49.5 Enabled as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Global flag to enable/disable it.
Notes: Set true to enable or false to disable.
(Read and Write property)

211.49.6 IncludeMouseHOver as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to include hover events.
Notes: By default false to disable hover events.
Set to true to include those.
(Read and Write property)

211.49.7 IncludeMouseMove as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to include move events.
Notes: By default false to disable move events.
Set to true to include those.
(Read and Write property)

211.49.8 IncludeMouseWheel as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to include wheel events.
Notes: By default false to disable wheel events.
Set to true to include those.
(Read and Write property)

211.49.9 Events

211.49.10 ReceivedEvent(Message as Integer, mouseX as Integer, mouseY as Integer, windowHandle as Integer, HitTestCode as Integer, ExtraInfo as Integer) as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Received an event.
Notes: Message: The identifier of the mouse message. See constants.
mouseX and mouseY: The x- and y-coordinates of the cursor, in screen coordinates.
WindowHandle: A handle to the window that will receive the mouse message corresponding to the mouse event.
HitTestCode: The hit-test value. For a list of hit-test values, see the description of the WM_NCHITTEST message.
ExtraInfo: Additional information associated with the message.

211.49.11 Constants

Mouse Events

Constant	Value	Description
kLButtonDoubleClick	&h0203	Left mouse button double click
kLButtonDown	&h0201	Left mouse button down
kLButtonUp	&h0202	Left mouse button up
kMButtonDoubleClick	&h0209	Middle mouse button double click
kMButtonDown	&h0207	Middle mouse button down
kMButtonUp	&h0208	Middle mouse button up
kMouseHOver	&h02a1	Mouse hover
kMouseHWheel	&h020e	Horizontal mouse wheel
kMouseLeave	&h02a3	Mouse Leave
kMouseMove	&h0200	Mouse moved
kMouseWheel	&h020a	Vertical mouse wheel
kRButtonDoubleClick	&h0206	Right mouse button double click
kRButtonDown	&h0204	Right mouse button down
kRButtonUp	&h0205	Right mouse button up
kXButtonDoubleClick	&h020d	Other mouse button double click
kXButtonDown	&h020b	Other mouse button down
kXButtonUp	&h020c	Other mouse button up

211.50 class WinPointerEventsMBS

211.50.1 class WinPointerEventsMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to capture touch events on Windows.
Notes: The plugin can only deliver events the Xojo runtime doesn't consume.

Videos

- Presentation from Munich conference about MBS Plugins.

211.50.2 Methods

211.50.3 Close

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Cleans up.
Notes: Optional and does same as destructor, but now.
You can call this in a window's close event to shutdown the event handler class.

211.50.4 Constructor(control as DesktopUIControl)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a control.
Notes: Call in a control's open event to attach event listener to the control.
See also:

- 211.50.5 Constructor(control as RectControl) 24251
- 211.50.6 Constructor(win as DesktopWindow) 24251
- 211.50.7 Constructor(win as window) 24251
- 211.50.8 Constructor(WindowHandle as Integer) 24252

211.50.5 Constructor(control as RectControl)

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a control.
Notes: Call in a control's open event to attach event listener to the control.
See also:

- 211.50.4 Constructor(control as DesktopUIControl) 24250
- 211.50.6 Constructor(win as DesktopWindow) 24251
- 211.50.7 Constructor(win as window) 24251
- 211.50.8 Constructor(WindowHandle as Integer) 24252

211.50.6 Constructor(win as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a window.
Notes: Call in a window's open event to attach event listener to the window.
See also:

- 211.50.4 Constructor(control as DesktopUIControl) 24250
- 211.50.5 Constructor(control as RectControl) 24251
- 211.50.7 Constructor(win as window) 24251
- 211.50.8 Constructor(WindowHandle as Integer) 24252

211.50.7 Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a window.
Notes: Call in a window's open event to attach event listener to the window.
See also:

- 211.50.4 Constructor(control as DesktopUIControl) 24250
- 211.50.5 Constructor(control as RectControl) 24251
- 211.50.6 Constructor(win as DesktopWindow) 24251
- 211.50.8 Constructor(WindowHandle as Integer) 24252

211.50.8 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: This method allows you to attach to any window.
So this works in console projects, too.
With any window, not just xojo windows.
See also:

- 211.50.4 Constructor(control as DesktopUIControl) 24250
- 211.50.5 Constructor(control as RectControl) 24251
- 211.50.6 Constructor(win as DesktopWindow) 24251
- 211.50.7 Constructor(win as window) 24251

211.50.9 EnableMouseInPointer(enable as boolean) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enables the mouse to act as a pointer input device and send pointer events.
Notes: Requires Windows 8 or newer.

If the function succeeds, the return value is true.
If the function fails, the return value is false.
To get extended error information, call GetLastError.

This function can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.

On the first call in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls, the state will not change. If the current state is not equal to the specified state, the call fails.

Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

211.50.10 GetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: Same as other GetGestureConfig, but for a control, not a window.
See also:

- 211.50.11 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24253
- 211.50.12 GetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24253
- 211.50.13 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24254

211.50.11 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: Same as other GetGestureConfig, but for a control, not a window.
See also:

- 211.50.10 GetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24252
- 211.50.12 GetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24253
- 211.50.13 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24254

211.50.12 GetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: win: The window to get the gesture configuration from.
Flags: A gesture command flag value indicating options for retrieving the gesture configuration. Can be 1 to return consolidated configuration for the specified window and its parent window chain.
Config: an array of gesture configuration structures that specify the gesture configuration.

Please pass an empty array and the plugin appends config objects.

Return function returns number of configs found.
Returns -1 in case of error.
See also:

- 211.50.10 GetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24252
- 211.50.11 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24253
- 211.50.13 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24254

211.50.13 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: win: The window to get the gesture configuration from.
Flags: A gesture command flag value indicating options for retrieving the gesture configuration. Can be 1 to return consolidated configuration for the specified window and its parent window chain.
Config: an array of gesture configuration structures that specify the gesture configuration.

Please pass an empty array and the plugin appends config objects.

Return function returns number of configs found.
Returns -1 in case of error.
See also:

- 211.50.10 GetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24252
- 211.50.11 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24253
- 211.50.12 GetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 24253

211.50.14 IsMouseInPointerEnabled as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether EnableMouseInPointer is set for the mouse to act as a pointer input device and send pointer events.
Notes: Requires Windows 8 or newer.

If EnableMouseInPointer is set, the return value is true.
If EnableMouseInPointer is not set, the return value is false.

EnableMouseInPointer can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.
On the first call to EnableMouseInPointer in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls to EnableMouseInPointer, the state will not change. If the current state is not equal to the specified state, the call fails.
Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

211.50.15 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes: Same as other SetGestureConfig, but for a control, not a window.
See also:

- 211.50.16 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean 24255
- 211.50.17 SetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS = nil) as boolean 24256
- 211.50.18 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean 24256

211.50.16 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes: Same as other SetGestureConfig, but for a control, not a window.
See also:

- 211.50.15 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean 24255
- 211.50.17 SetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS = nil) as boolean 24256
- 211.50.18 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean 24256

211.50.17 SetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes: Win: The window to set the gesture configuration on.
config: An array of gesture configuration structures that specify the gesture configuration.

If the function succeeds, the return value is true, else false.

If you don't expect to change the gesture configuration, call SetGestureConfig at window creation time. If you want to dynamically change the gesture configuration, call SetGestureConfig in response to GestureNotify event.
See also:

- 211.50.15 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean 24255
- 211.50.16 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean 24255
- 211.50.18 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean 24256

211.50.18 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes: Win: The window to set the gesture configuration on.
config: An array of gesture configuration structures that specify the gesture configuration.

If the function succeeds, the return value is true, else false.

If you don't expect to change the gesture configuration, call SetGestureConfig at window creation time. If you want to dynamically change the gesture configuration, call SetGestureConfig in response to GestureNotify event.
See also:

- 211.50.15 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean 24255
- 211.50.16 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean 24255

- 211.50.17 SetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS = nil) as boolean 24256

211.50.19 Properties

211.50.20 WindowHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The window handle.
Notes: (Read only property)

211.50.21 Events

211.50.22 Gesture(info as WinGestureInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Passes information about a gesture.
Notes: Return true, if you processed the message, else false.

211.50.23 GestureNotify

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you a chance to set the gesture configuration.
Notes: When the GestureNotify event is received, the application can use SetGestureConfig to specify the gestures to receive.

211.50.24 PointerDeviceChange(Change as Integer, Param as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sent to a window when there is a change in the settings of a monitor that has a digitizer attached to it.
Notes: This message contains information regarding the scaling of the display mode.
See kDeviceChange* constants.

211.50.25 PointerDeviceInRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sent to a window when a pointer device is detected within range of an input digitizer.
Notes: This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.

211.50.26 PointerDeviceOutOfRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sent to a window when a pointer device has departed the range of an input digitizer.
Notes: This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.

211.50.27 PointerDown(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Posted when a pointer makes contact over the client area of a window.
Notes: This input message targets the window over which the pointer makes contact, and the pointer is implicitly captured to the window so that the window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down. A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

If an application processes this message, it should return true, else false.

Important When a window loses capture of a pointer and it receives the PointerCaptureChanged notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event.
When a pointer is aborted, kFlagCanceled is set.
A WM_POINTERLEAVE message may also be generated when a non-captured pointer moves outside the bounds of a window.

To convert the lParam parameter to a POINTS structure, use the MAKEPOINTS macro.
To retrieve further information associated with the message, use the GetPointerInfo function.
To determine the keyboard modifier key states associated with this message, use the GetKeyState function.
For example, to detect that the ALT key was pressed, check whether GetKeyState(VK_MENU) <0.
Note that if the application does not process this message, DefWindowProc may generate one or more WM_GESTURE messages if the sequence of input from this and, possibly, other pointers is recognized as

a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input.
If an application selectively consumes some pointer input and passes the rest to DefWindowProc, the resulting behavior is undefined.
When a window loses capture of a pointer and receives the WM_POINTERCAPTURECHANGED notification, it will typically not receive any further notifications. Therefore, it is important that a window does not make any assumptions of its pointer status, regardless of whether it receives evenly paired DOWN / UP or ENTER / LEAVE notifications.

211.50.28 PointerEnter(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sent to a window when a new pointer enters detection range over the window (hover) or when an existing pointer moves within the boundaries of the window.
Notes: We provide Pointer ID, Flags, X and Y.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	Indicates whether this message is the first message generated by a new pointer entering detection range (hover).
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Indicates whether this message was generated by a pointer that has not left detection range. This flag is always set for PointerEnter messages.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

Contains the point location of the pointer.
Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerEnter notification can be used by a window to provide feedback to the user while the pointer is over its surface or to otherwise react to the presence of a pointer over its surface.
This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.

Action	Flags Set	Notifications Sent To
A new pointer enters detection range (hover).	kFlagNew and kFlagInRange	Window over which the pointer enters detection range.
A hovering pointer crosses within the window boundaries.	kFlagInRange	Window within which the pointer has crossed.

Important:
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions

based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

When inputs come from the mouse, as a result of mouse and pointer message integration, PointerEnter is not sent.

211.50.29 PointerHWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Posted to the window with foreground keyboard focus when a horizontal scroll wheel is rotated.
Notes: We provide, the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of application,Äôs window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window of the foregournd message queue receives the wheel messages.

211.50.30 PointerLeave(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sent to a window when a pointer leaves detection range over the window (hover) or when a pointer moves outside the boundaries of the window.
Notes: We provide the pointer ID, Flags, X and Y values.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Indicates whether this message was generated by a pointer that has not left detection range. This flag is not set when the pointer leaves the detection range of the window.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerLeave notification can be used by a window to change mode or stop any feedback to the user while the pointer is over the window surface.
This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.

Action	Flags Set	Notifications Sent To
A hovering pointer crosses window boundaries.	BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Window outside of whose boundary the pointer moved.
A pointer goes out of detection range.	N/A	Window for which the pointer leaves detection range.

Important:
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

If contact is maintained with the input digitizer and the pointer moves outside the window, PointerLeave is not generated. PointerLeave is generated only when a hovering pointer crosses window boundaries or contact is terminated.
PointerLeave is posted to the posted message queue if the input is originated from a mouse device.

211.50.31 PointerUp(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Posted when a pointer that made contact over the client area of a window breaks contact.
Notes: This input message targets the window over which the pointer makes contact and the pointer is, at that point, implicitly captured to the window so that the window continues to receive input messages including the WM_POINTERUP notification for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

See Pointer Flags for more details.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down. A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate event while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a WM_POINTERLEAVE message.
When a pointer is aborted, kFlagCanceled is set.
A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window.
To obtain the horizontal and vertical position of a pointer, use the following:

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input.
If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.

211.50.32 PointerUpdate(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Posted to provide an update on a pointer that made contact over the client area of a window or on a hovering uncaptured pointer over the client area of a window.
Notes: While the pointer is hovering, the message targets whichever window the pointer happens to be over. While the pointer is in contact with the surface, the pointer is implicitly captured to the window over which the pointer made contact and that window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down.

A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

See Pointer Flags for more details.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse

buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnterevent is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event.
When a pointer is aborted, kFlagCanceled is set.
A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window.

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, Windows may generate mouse input.
If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.
If the application does not process these messages as fast as they are generated, some moves may be coalesced. The history of inputs that were coalesced into this message can be retrieved using the GetPointerInfoHistory function.

211.50.33 PointerWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Posted to the window with foreground keyboard focus when a vertical scroll wheel is rotated.
Notes: We provide, the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of application,Äôs window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window

of the foregournd message queue receives the wheel messages.

211.50.34 Constants

Device Change Flags

Constant	Value	Description
kDeviceChangeArrival	1	A new device is attached.
kDeviceChangeAspectRatioPreserved	2048	The display aspect ratio.
kDeviceChangeMapping	256	The change in display to digitizer mapping.
kDeviceChangeModeCentered	128	Centered display mode.
kDeviceChangeModeDefault	64	The default display mode.
kDeviceChangeOrientation0	4	Orientation of the device: 0¬∞
kDeviceChangeOrientation180	16	Orientation of the device: 180¬∞
kDeviceChangeOrientation270	32	Orientation of the device: 270¬∞
kDeviceChangeOrientation90	8	Orientation of the device: 90¬∞
kDeviceChangeOrigin	1024	The display origin.
kDeviceChangeRemoval	2	A device has been detached.
kDeviceChangeResolution	512	Display resolution.

211.51 class WinPointerInfoMBS

211.51.1 class WinPointerInfoMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for pointer input details.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Windows Touch Events

211.51.2 Methods

211.51.3 Constructor

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

211.51.4 Properties

211.51.5 ButtonChangeType as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the change in button state between this input and the previous input.
Notes: See kPointerChange* constants.
(Read only property)

211.51.6 frameId as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An identifier common to multiple pointers for which the source device reported an update in a single input frame.
Notes: For example, a parallel-mode multi-touch digitizer may report the positions of multiple touch contacts in a single update to the system.
Note that frame identifier is assigned as input is reported to the system for all pointers across all devices. Therefore, this field may not contain strictly sequential values in a single series of messages that a window receives. However, this field will contain the same numerical value for all input updates that were reported in the same input frame by a single device.

(Read only property)

211.51.7 HimetricLocationRawX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in HIMETRIC units.
Notes: For adjusted screen coordinates, see HimetricLocation.
(Read only property)

211.51.8 HimetricLocationRawY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in HIMETRIC units.
Notes: For adjusted screen coordinates, see HimetricLocation.
(Read only property)

211.51.9 HimetricLocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in HIMETRIC units.
Notes: The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

211.51.10 HimetricLocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in HIMETRIC units.
Notes: The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

211.51.11 historyCount as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Count of inputs that were coalesced into this message.
Notes: This count matches the total count of entries that can be returned by a call to GetPointerInfoHistory. If no coalescing occurred, this count is 1 for the single input represented by the message.
(Read only property)

211.51.12 hwndTarget as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Window to which this message was targeted.
Notes: If the pointer is captured, either implicitly by virtue of having made contact over this window or explicitly using the pointer capture API, this is the capture window. If the pointer is uncaptured, this is the window over which the pointer was when this message was generated.
(Read only property)

211.51.13 InputData as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A value whose meaning depends on the nature of input.
Notes: When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multiples or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated forward and a negative value indicates that the wheel was rotated backward.
When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multiples or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated to the right and a negative value indicates that the wheel was rotated to the left.
(Read only property)

211.51.14 KeyStates as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates which keyboard modifier keys were pressed at the time the input was generated.
Notes: May be zero or a combination of the following values:

(Read only property)

8 A SHIFT key was pressed.
4 A CTRL key was pressed.

211.51.15 PerformanceCount as Int64

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The value of the high-resolution performance counter when the pointer message was received (high-precision, 64 bit alternative to Time).
Notes: The value can be calibrated when the touch digitizer hardware supports the scan timestamp information in its input report.
(Read only property)

211.51.16 PixelLocationRawX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in pixels.
Notes: For adjusted screen coordinates, see PixelLocation.
(Read only property)

211.51.17 PixelLocationRawY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in pixels.
Notes: For adjusted screen coordinates, see PixelLocation.
(Read only property)

211.51.18 PixelLocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in pixels.
Notes: The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

211.51.19 PixelLocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in pixels.
Notes: The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

211.51.20 pointerFlags as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: May be any reasonable combination of flags from the flags constants.
Notes: See kFlag* constants.
(Read only property)

211.51.21 pointerId as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An identifier that uniquely identifies a pointer during its lifetime.
Notes: A pointer comes into existence when it is first detected and ends its existence when it goes out of detection range. Note that if a physical entity (finger or pen) goes out of detection range and then returns to be detected again, it is treated as a new pointer and may be assigned a new pointer identifier.
(Read only property)

211.51.22 pointerType as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The pointer type.
Notes: See kType* constants.
(Read only property)

211.51.23 sourceDevice as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handle to the source device that can be used in calls to the raw input device API and the digitizer device API.
Notes: (Read only property)

211.51.24 Time as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time of the event.
Notes: Value is 0 or the time stamp of the message, based on the system tick count when the message was received.
The application can specify the input time stamp in either Time or PerformanceCount. The value cannot be more recent than the current tick count or QueryPerformanceCount (QPC) value of the injection thread. Once a frame is injected with a time stamp, all subsequent frames must include a timestamp until all contacts in the frame go to an UP state. The custom timestamp value must also be provided for the first element in the contacts array. The time stamp values after the first element are ignored. The custom timestamp value must increment in every injection frame.
When PerformanceCount is specified, the time stamp will be converted to the current time in .1 millisecond resolution upon actual injection. If a custom PerformanceCount resulted in the same .1 millisecond window from the previous injection, ERROR_NOT_READY is returned and injection will not occur. While injection will not be invalidated immediately by the error, the next successful injection must have a PerformanceCount value that is at least 0.1 millisecond from the previously successful injection. This is also true if Time is used.
If both Time and PerformanceCount are specified in InjectTouchInput, ERROR_INVALID_PARAMETER is returned.
InjectTouchInput cannot switch between Time and PerformanceCount once injection has started.
If neither Time and PerformanceCount are specified, InjectTouchInput allocates the timestamp based on the timing of the call. If InjectTouchInput calls are repeatedly less than 0.1 millisecond apart, ERROR_NOT_READY might be returned. The error will not invalidate the input immediately, but the injection application needs to retry the same frame again for injection to succeed.
(Read only property)

211.51.25 Constants

Constants

Constant	Value	Description
kPointerChangeFifthButtonDown	9	The fifth button transitioned to a pressed state.
kPointerChangeFifthButtonUp	10	The fifth button transitioned to a released state.
kPointerChangeFirstButtonDown	1	The first button transitioned to a pressed state.
kPointerChangeFirstButtonUp	2	The first button transitioned to a released state.
kPointerChangeFourthButtonDown	7	The fourth button transitioned to a pressed state.
kPointerChangeFourthButtonUp	8	The fourth button transitioned to a released state.
kPointerChangeNone	0	No change in button state.
kPointerChangeSecondButtonDown	3	The second button transitioned to a pressed state.
kPointerChangeSecondButtonUp	4	The second button transitioned to a released state.
kPointerChangeThirdButtonDown	5	The third button transitioned to a pressed state.
kPointerChangeThirdButtonUp	6	The third button transitioned to a released state.

Flag Constants

Constant	Value	Description
kFlagCanceled	&h8000	Indicates that the pointer is departing in an abnormal manner, such as when the system receives invalid input for the pointer or when a device with active pointers departs abruptly. If the application receiving the input is in a position to do so, it should treat the interaction as not completed and reverse any effects of the concerned pointer.
kFlagCaptureChanged	&h200000	Indicates that this pointer was captured by (associated with) another element and the original element has lost capture.
kFlagConfidence	&h4000	Confidence is a suggestion from the source device about whether the pointer represents an intended or accidental interaction, which is especially relevant for touch pointers where an accidental interaction (such as with the palm of the hand) can trigger input. The presence of this flag indicates that the source device has high confidence that this input is part of an intended interaction.
kFlagDown	&h10000	Indicates that this pointer transitioned to a down state; that is, it made contact with the digitizer surface.
kFlagFifthButton	&h100	Analogous to a second extended mouse (XButton2) button down. A touch pointer does not use this flag. A pen pointer does not use this flag. A mouse pointer has this flag set when the second extended mouse (XBUTTON2) button is down.
kFlagFirstButton	&h10	Indicates a primary action, analogous to a left mouse button down. A touch pointer has this flag set when it is in contact with the digitizer surface. A pen pointer has this flag set when it is in contact with the digitizer surface with no buttons pressed. A mouse pointer has this flag set when the left mouse button is down.
kFlagFourthButton	&h80	Analogous to a first extended mouse (XButton1) button down. A touch pointer does not use this flag. A pen pointer does not use this flag. A mouse pointer has this flag set when the first extended mouse (XBUTTON1) button is down.
kFlagHasTransform	&h400000	Indicates that this pointer has an associated transform.
kFlagHWheel	&h100000	Indicates input associated with a pointer h-wheel. For mouse pointers, this is equivalent to the action of the mouse horizontal scroll wheel.
kFlagInContact	4	Indicates that this pointer is in contact with the digitizer surface. When this flag is not set, it indicates a hovering pointer.
kFlagInRange	2	Indicates that this pointer continues to exist. When this flag is not set, it indicates the pointer has left detection range. This flag is typically not set only when a hovering pointer leaves detection range (kFlagUpdate is set) or when a pointer in contact with a window surface leaves detection range (kFlagUp is set).
kFlagNew	1	Indicates the arrival of a new pointer.
kFlagNone	0	Default
kFlagPrimary	&h2000	Indicates that this pointer has been designated as the primary pointer. A primary pointer is a single pointer that can perform actions beyond those available to non-primary pointers. For example, when a primary pointer makes contact with a window,Äôs surface, it may provide the window an opportunity to activate by sending it a PointerActivate event. The primary pointer is identified from all current user interactions on the system (mouse, touch, pen, and so on). As such, the primary pointer might not be associated with your app. The first contact in a multi-touch interaction is set as the primary pointer. Once a primary pointer is identified, all contacts must be lifted before a new contact can be identified as a primary pointer. For apps that don't process pointer input, only the primary pointer's events are promoted to mouse events.
kFlagSecondButton	&h20	Indicates a secondary action, analogous to a right mouse button down. A touch pointer does not use this flag. A pen pointer has this flag set when it is in contact with the digitizer surface with the pen barrel button pressed. A mouse pointer has this flag set when the right mouse button is down.

Pointer Types

Constant	Value	Description
kTypeMouse	4	Mouse pointer type.
kTypePen	3	Pen pointer type.
kTypePointer	1	Generic pointer type. This type never appears in pointer messages or pointer data. Some data query functions allow the caller to restrict the query to specific pointer type. The kTypePointer type can be used in these functions to specify that the query is to include pointers of all types
kTypeTouch	2	Touch pointer type.
kTypeTouchpad	5	Touchpad pointer type (Windows 8.1 and later).

211.52 control WinPreviewControlMBS

211.52.1 control WinPreviewControlMBS

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The preview control for Windows.
Notes: Used to show PDF documents on Windows using the built-in preview handler on Windows 10 and newer.
Can also be used to use other built-in preview handlers on Windows by setting classID.

Since the control is handled by Windows, the key and mouse events are not expected to work.

Available on Windows 10 and newer.
Use QLPreviewViewControlMBS or PDFViewControlMBS for macOS to show previews and QLPreview-ControllerMBS or PDFViewIOSControlMBS for iOS.

Xojo Developer Magazine

- 21.5, page 10: News

211.52.2 Methods

211.52.3 LoadData(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes: Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.
See also:

- 211.52.4 LoadData(data as string)

211.52.4 LoadData(data as string)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes: Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.
See also:

- 211.52.3 LoadData(data as MemoryBlock) 24276

211.52.5 LoadFile(file as folderitem)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given file.
Notes: Lasterror is set.
If the preview handler does not support reading file, the plugin reads the file and passes as data.

If the file path is invalid, the preview will show a file not found error message.

211.52.6 Properties

211.52.7 classID as String

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The class ID for the previewer to use.
Notes: If empty, uses PDF viewer.
Available preview classes in a typical Windows 10 installation:

Class ID	Description
{ 13D3C4B8-B179-4ebb-BF62-F704173E7448 }	Windows Contact Preview Handler
{ 1531d583-8375-4d3f-b5fb-d23bbd169f22 }	Windows TXT Previewer
{ 53BEDF0B-4E5B-4183-8DC9-B844344FA104 }	Microsoft Windows MAPI Preview Handler
{ 8a7cae0e-5951-49cb-bf20-ab3fa1e44b01 }	Windows Font previewer
{ 92dbad9f-5025-49b0-9078-2d78f935e341 }	Microsoft Windows Mail Mime Preview Handler
{ a42c2ccb-67d3-46fa-abe6-7d2f3488c7a3 }	Windows RTF Previewer
{ b9815375-5d7f-4ce2-9245-c9d4da436930 }	Microsoft Windows Mail Mime Preview Handler
{ BFD468D2-D0A0-4bdc-878C-E69C2F5B435D }	Microsoft Windows Mail Html Preview Handler
{ E64164EB-1AE0-4C50-BAEF-A413C2B3A4BC }	Microsoft 3MF Shell Thumbnail and Preview Handler
{ f8b8412b-dea3-4130-b36c-5e8be73106ac }	Microsoft Windows Mail Html Preview Handler
{ 3A84F9C2-6164-485C-A7D9-4B27F8AC009E }	Microsoft PDF Previewer
{ DC6EFB56-9CFA-464D-8880-44885D7DC193 }	Adobe PDF Preview Handler for Vista

(Read and Write property)

211.52.8 Lasterror as Integer

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

211.52.9 LasterrorString as String

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The error message for the error number in the lasterror property.
Notes: (Read only property)

211.52.10 Events

211.52.11 Close

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The close event.
In Xojo version 2021r3 and newer this event is named Closing.

211.52.12 Closing

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The close event.
In older Xojo versions, this event is named Close.

211.52.13 Configure

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called while initializing, where you can apply properties just before plugin reads them.
Notes: e.g. set classID here in code.

211.52.14 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This event is called when it is appropriate to display a contextual menu for the control.

211.52.15 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

211.52.16 EnableMenuItems

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The enable menu items event.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

211.52.17 FocusLost

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The lost focus event.
In older Xojo versions, this event is named LostFocus.

211.52.18 FocusReceived

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The got focus event.
In older Xojo versions, this event is named GotFocus.

211.52.19 GotFocus

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The got focus event.
In Xojo version 2021r3 and newer this event is named FocusReceived.

211.52.20 LostFocus

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The lost focus event.
In Xojo version 2021r3 and newer this event is named FocusLost.

211.52.21 MenuBarSelected

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The enable menu items event.
In older Xojo versions, this event is named EnableMenuItems.

211.52.22 Open

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function:

The open event.
In Xojo version 2021r3 and newer this event is named Opening.

211.52.23 Opening

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The open event.
In older Xojo versions, this event is named Open.

211.53 class WinThreadPoolMBS

211.53.1 class WinThreadPoolMBS

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to control Windows Thread Pool.
Example:

```
static pool as WinThreadPoolMBS // global or window property

pool = New WinThreadPoolMBS
pool.ThreadMaximum = 4
```

Notes: You can have an instance of this class to create and define a thread pool.
If you never initialize a pool with this class, the default pool is used.

211.53.2 Methods

211.53.3 Constructor

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

211.53.4 Destructor

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

211.53.5 Properties

211.53.6 Handle as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle of the thread pool.
Notes: (Read and Write property)

211.53.7 LastError as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

211.53.8 StackCommit as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The stack commit size.
Notes: Default is 4 KB for the default stack grow size.
The rate the stack grows.
Should be in page size multiplies, e.g. 4096.

Sets the stack reserve and commit sizes for new threads in the specified thread pool. Stack reserve and commit sizes for existing threads are not changed.
(Read and Write property)

211.53.9 StackReserve as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The stack reservie size.
Example:

```
static pool as WinThreadPoolMBS // property or global

// increase stack size from default
pool = New WinThreadPoolMBS
pool.StackReserve = 2048*1024
```

Notes: Default is 1 MB for the default stack size.
The rate the stack grows.
Should be in page size multiplies, e.g. 4096.

Sets the stack reserve and commit sizes for new threads in the specified thread pool. Stack reserve and commit sizes for existing threads are not changed.
(Read and Write property)

211.53.10 ThreadMaximum as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The upper limit for thread count.
Example:

```
static pool as WinThreadPoolMBS // property or global

pool = New WinThreadPoolMBS
pool.StackReserve = 2048*1024
pool.ThreadMaximum = 4
```

Notes: Default for Windows is 500, but it may be much lower in practice as it's relative to the number of CPU cores and jobs.
(Read and Write property)

211.53.11 ThreadMinimum as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The lower limit for thread count.
Notes: Default 0 to allow having no thread.
(Read and Write property)

211.54 class WMIObjectMBS

211.54.1 class WMIObjectMBS

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a WMI object.

211.54.2 Methods

211.54.3 GetNames as string()

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the names of all properties in this object.

211.54.4 GetProperty(Name as string) as Variant

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a variant.
Notes: Objects, booleans, strings and numbers are supported directly. Also string arrays in version 13.1. Other values are casted to string first.

Added support for integer, double, single and boolean arrays in v25.4.

If you find a type we don't handle, please let us know. See GetPropertyType() or GetPropertyTypeString().

211.54.5 GetPropertyBoolean(Name as string) as Boolean

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as an integer.
Notes: Value must be of a numeric type.

211.54.6 GetPropertyBooleanArray(Name as string) as Boolean()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a boolean array.
Notes: If values are not Boolean, we cast them to Boolean.

211.54.7 GetPropertyDouble(Name as string) as Double

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as a double.
Notes: Value must be of a numeric type.

211.54.8 GetPropertyDoubleArray(Name as string) as Double()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a Double array.
Notes: If values are not Double, we cast them to Double.

211.54.9 GetPropertyInt16Array(Name as string) as Int16()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a Int16 array.
Notes: If values are not Int16, we cast them to Int16.

211.54.10 GetPropertyInt32Array(Name as string) as Int32()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a Int32 array.
Notes: If values are not Int32, we cast them to Int32.

211.54.11 GetPropertyInt64(Name as string) as Int64

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as an integer value.

211.54.12 GetPropertyInt64Array(Name as string) as Int64()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a Int64 array.
Notes: If values are not Int64, we cast them to Int64.

211.54.13 GetPropertyInt8Array(Name as string) as Int8()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a Int8 array.
Notes: If values are not Int8, we cast them to Int8.

211.54.14 GetPropertyInteger(Name as string) as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as an integer.
Example:

```
Var w as WindowsWMIMBS // your WMI object

MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
```

Notes: Value must be of a numeric type.

211.54.15 GetPropertyObject(Name as string) as WMIObjectMBS

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as an object.
Notes: Value must be of an IUnknown type.

211.54.16 GetPropertySingleArray(Name as string) as Single()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a Single array.
Notes: If values are not Single, we cast them to Single.

211.54.17 GetPropertyString(Name as string) as string

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a string.
Example:

```
Var w as WindowsWMIMBS
MsgBox w.GetPropertyString("Name") // string
```

211.54.18 GetPropertyStringArray(Name as string) as string()

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a string array.
Example:

```
Var w as WindowsWMIMBS
MsgBox join(w.GetPropertyStringArray("Name"), ", ")
```

211.54.19 GetPropertyType(Name as string) as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the type of a property.
Notes: You can send in the value you get here and the plugin can be changed to handle this type, too. Currently only numbers and strings are handled.

211.54.20 GetPropertyTypeString(Name as string) as string

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the type of a property as a string.
Notes: For example type 8 is returned as "string".

211.54.21 GetPropertyUInt16Array(Name as string) as UInt16()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a UInt16 array.
Notes: If values are not UInt16, we cast them to UInt16.

211.54.22 GetPropertyUInt32Array(Name as string) as UInt32()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a UInt32 array.
Notes: If values are not UInt32, we cast them to UInt32.

211.54.23 GetPropertyUInt64Array(Name as string) as UInt64()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a UInt64 array.
Notes: If values are not UInt64, we cast them to UInt64.

211.54.24 GetPropertyUInt8Array(Name as string) as UInt8()

MBS Win Plugin, Plugin Version: 25.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a UInt8 array.
Notes: If values are not UInt8, we cast them to UInt8.

211.54.25 Properties

211.54.26 Handle as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

211.54.27 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code reported from one of the functions.
Notes: -1 is the value used by the plugin if the function is not available.
(Read and Write property)

211.54.28 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes: This may help to debug the errors.
(Read only property)

Chapter 212

Windows Console

212.1 class ConsoleStateMBS

212.1.1 class ConsoleStateMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for handling a console window state.

212.1.2 Properties

212.1.3 BackColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The colorcode of the background.
Notes: Color codes can be build up from red, blue, green and highlight.
red=1, blue=2, green=4 and highlight=8.
(Read and Write property)

212.1.4 CursorX as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The horizontal cursor position in characters.
Notes: (Read and Write property)

212.1.5 CursorY as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vertical cursor position in characters.
Notes: (Read and Write property)

212.1.6 Height as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the window in characters.
Notes: (Read and Write property)

212.1.7 MaxHeight as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The maximum height of the window in characters.
Notes: (Read and Write property)

212.1.8 MaxWidth as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The maximum width of the window in characters.
Notes: (Read and Write property)

212.1.9 TextColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The colorcode of the text.
Notes: Color codes can be build up from red, blue, green and highlight.
red=1, blue=2, green=4 and highlight=8.
(Read and Write property)

212.1.10 Width as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the window in characters.
Notes: (Read and Write property)

212.1.11 WindowHeight as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the console window.
Notes: (Read and Write property)

212.1.12 WindowLeft as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left position of the console window.
Notes: (Read and Write property)

212.1.13 WindowTop as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top position of the console window.
Notes: (Read and Write property)

212.1.14 WindowWidth as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the console window.
Notes: (Read and Write property)

212.2 class WindowsConsoleMBS

212.2.1 class WindowsConsoleMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for handling a console window in Windows.

212.2.2 Methods

212.2.3 Close

MBS Win Plugin, Plugin Version: 4.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

212.2.4 FlushConsole

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The FlushConsole function flushes the console input buffer.
Notes: All input records currently in the input buffer are discarded.

212.2.5 ReadConsole(maxcount as Integer) as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads maximum of maxcount characters from the input stream.

212.2.6 SetCursorPosition(x as Integer,y as Integer)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the cursor position inside the console window.

212.2.7 SetWindowPosition(absolute as boolean, left as Integer,top as Integer, right as Integer, bottom as Integer)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the window position and size.
Notes: If absolute=false, the coordinates are relative to the current one.

212.2.8 State as ConsoleStateMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current state of the console window.

212.2.9 WriteConsole(message as string) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes the message to the console.
Notes: Returns true if successfull.

212.2.10 Properties

212.2.11 AutoScrollAtEOL as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Automatical scrolling at end of line?
Notes: When writing with WriteConsole or echoing with ReadFile, the cursor moves to the beginning of the next row when it reaches the end of the current row. This causes the rows displayed in the console window to scroll up automatically when the cursor advances beyond the last row in the window. It also causes the contents of the screen buffer to scroll up (discarding the top row of the screen buffer) when the cursor advances beyond the last row in the screen buffer. If this mode is disabled, the last character in the row is overwritten with any subsequent characters.
(Read and Write property)

212.2.12 BackColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text background color used.
Notes: (Read and Write property)

212.2.13 CursorSize as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the cursor in percent (from 0 to 100).
Notes: (Read and Write property)

212.2.14 CursorVisible as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Is the cursor visible?
Notes: (Read and Write property)

212.2.15 EchoInput as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Echo the input on the screen?
Notes: Characters read by the ReadFile function are written to the active screen buffer as they are read. This mode can be used only if the WaitForReturn mode is also enabled.
(Read and Write property)

212.2.16 GotConsole as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: whether the console was created inside the constructor.
Notes: (Read only property)

212.2.17 InputCodepage as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Codepage of the input stream.
Notes: (Read and Write property)

212.2.18 OutputCodepage as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Codepage of the output stream.
Notes: (Read and Write property)

212.2.19 ProcessInput as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Process input before reading?
Notes: Ctrl+c is processed by the system and is not placed in the input buffer. If the input buffer is being read by ReadConsole, other control keys are processed by the system and are not returned in the ReadConsole buffer. If the WaitForReturn mode is also enabled, backspace, carriage return, and linefeed characters are handled by the system.
(Read and Write property)

212.2.20 ProcessOutput as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Process output before reading?
Notes: Characters written by the WriteConsole function or echoed by the ReadFile or ReadConsole function are parsed for ASCII control sequences, and the correct action is performed. Backspace, tab, bell, carriage return, and linefeed characters are processed.
(Read and Write property)

212.2.21 TextColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text color used.
Notes: (Read and Write property)

212.2.22 Title as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The title bar of the console window.
Notes: (Read and Write property)

212.2.23 WaitForReturn as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Wait for return key on reading?
Notes: The ReadConsole function returns only when a carriage return character is read. If this mode is disabled, the functions return when one or more characters are available.
(Read and Write property)

212.2.24 Events

212.2.25 ConsoleClosed

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Console was closed.

212.2.26 ConsoleOpened

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Console was opened.

212.2.27 ControlBreak as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Control-Break was pressed.
Notes: Return true if you handled it yourself.
Return false for the default handler.

212.2.28 ControlC as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Control-C was pressed.
Notes: Return true if you handled it yourself.
Return false for the default handler.

212.2.29 Logoff as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The user is logging off.
Notes: Return true if you handled it yourself.
Return false for the default handler.

212.2.30 Shutdown as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The user is shutting down the computer.
Notes: Return true if you handled it yourself.
Return false for the default handler.

212.2.31 UserClose as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The user pressed the close button.
Notes: Return true if you handled it yourself.
Return false for the default handler.

212.2.32 Constants

Constants

Constant	Value	Description
Black	0	The color code for Black. Read only property with value 0.
Blue	1	The color code for Blue. Read only property with value 2.
Green	2	The color code for Green. Read only property with value 4.
Highlight	8	The color code for Highlight. Read only property with value 8.
Red	4	The color code for Red. Read only property with value 1.

Chapter 213

Windows Graphics

213.1 class DirectDrawGraphicsMBS

213.1.1 class DirectDrawGraphicsMBS

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for drawing with DirectDraw 2D into a graphics context in Xojo.
Example:

```
Var p as Picture = BitmapForCaching(me.Width, me.Height)
Var g as graphics = p.Graphics

// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height

// now draw a few things
Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)
call d.CreateStrokeStyle 0, 0, 0, 0, 0, d.DashStyleDash

const size = 50
const offset = 10
const delta = offset + size

d.FillRectangle offset + delta * 0, offset + 0 * delta, offset + delta * 0 + size, offset + 0 * delta +
size
d.DrawRectangle offset + delta * 0, offset + 1 * delta, offset + delta * 0 + size, offset + 1 * delta + size

d.FillEllipse offset + delta * 1 + size/2, offset + 0 * delta + size/2, size /2, size /2
```

```
d.DrawEllipse offset + delta * 1 + size/2, offset + 1 * delta + size/2, size /2, size /2

d.FillRoundedRectangle offset + delta * 2, offset + 0 * delta, offset + delta * 2 + size, offset + 0 *
delta + size, 20, 20
d.DrawRoundedRectangle offset + delta * 2, offset + 1 * delta, offset + delta * 2 + size, offset + 1 * delta
+ size, 20, 20

// save to desktop
Var f as FolderItem = SpecialFolder.Desktop.Child("directdraw.jpg")
p.Save(f, Picture.Formats.JPEG, picture.QualityMaximum)

// show in window
window1.Backdrop = p
```

Blog Entries

- MBS Xojo Plugins, version 20.3pr3

213.1.2 Methods

213.1.3 ClearStrokeStyle

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears stroke style.
Notes: If no stroke style is defined, a default one is used.

213.1.4 Constructor(Graphics as Graphics)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height
```

```
Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)
d.DrawLine 10, 10, 190,190

Backdrop = p
```

Notes: Pass the graphics in a paint event or from a picture.

Requires Xojo 2019r2 or newer.

213.1.5 CreateSolidColorBrush(c as Color) as Boolean

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new solid color brush that has the specified color and a base opacity of 1.0.
Example:

```
Var d as new DirectDrawGraphicsMBS(g)

// make full blue with no alpha
call d.CreateSolidColorBrush(&c0000FFFF)
```

Notes: Pass the red, green, blue, and alpha values of the brush's color as a Xojo color.
See also:

- 213.1.6 CreateSolidColorBrush(red as Single, green as Single, blue as Single, alpha as Single = 1.0) as Boolean 24303

213.1.6 CreateSolidColorBrush(red as Single, green as Single, blue as Single, alpha as Single = 1.0) as Boolean

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new solid color brush that has the specified color and a base opacity of 1.0.
Notes: Pass the red, green, blue, and alpha values of the brush's color.
Range of values is from 0.0 to 1.0.
See also:

- 213.1.5 CreateSolidColorBrush(c as Color) as Boolean 24303

213.1.7 CreateStrokeStyle(startCap as Integer = 0, endCap as Integer = 0, dashCap as Integer = 0, lineJoin as Integer = 0, miterLimit as Single = 1.0, dashStyle as Integer = 0, dashOffset as Single = 0, Dashes() as Single = nil) as Boolean

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an stroke style that describes start cap, dash pattern, and other features of a stroke.
Notes: Creates and sets the stroke style. Returns true on success and false on failure.

startCap	The cap applied to the start of all the open figures in a stroked geometry.
endCap	The cap applied to the end of all the open figures in a stroked geometry.
dashCap	The shape at either end of each dash segment.
lineJoin	A value that describes how segments are joined. This value is ignored for a vertex if the segment flags specify that the segment should have a smooth join.
miterLimit	The limit of the thickness of the join on a mitered corner. This value is always treated as though it is greater than or equal to 1.0.
dashStyle	A value that specifies whether the stroke has a dash pattern and, if so, the dash style.
dashOffset	A value that specifies an offset in the dash sequence. A positive dash offset value shifts the dash pattern, in units of stroke width, toward the start of the stroked geometry. A negative dash offset value shifts the dash pattern, in units of stroke width, toward the end of the stroked geometry.
Dashes	An array whose elements are set to the length of each dash and space in the dash pattern. The first element sets the length of a dash, the second element sets the length of a space, the third element sets the length of a dash, and so on. The length of each dash and space in the dash pattern is the product of the element value in the array and the stroke width.

213.1.8 Destructor

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

213.1.9 DrawEllipse(x as single, y as single, radiusX as single, radiusY as single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Draws the outline of the specified ellipse using the specified stroke style.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height

Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)
call d.CreateStrokeStyle 0, 0, 0, 0, 0, d.DashStyleDash
d.DrawEllipse 100, 100, 90, 90

Backdrop = p
```

Notes: x/y: The position of the ellipse to draw, in device-independent pixels.
radiusX/radiusY: The radius of the ellipse to draw, in device-independent pixels.

Uses current brush, strokeWidth and strokeStyle.

213.1.10 DrawLine(x1 as single, y1 as single, x2 as single, y2 as single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Draws a line between the specified points using the specified stroke style.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height

Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)
d.DrawLine 10, 10, 190,190

Backdrop = p
```

Notes: x1/y1: The start point of the line, in device-independent pixels.
x2/y2: The end point of the line, in device-independent pixels.

Uses current brush, strokeWidth and strokeStyle.

213.1.11 DrawRectangle(left as single, top as single, right as single, bottom as single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Draws the outline of a rectangle that has the specified dimensions and stroke style.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height

Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)
call d.CreateStrokeStyle 0, 0, 0, 0, 0, d.DashStyleDash
d.DrawRectangle 10, 10, 190, 190

Backdrop = p
```

Notes: Pass the dimensions of the rectangle to draw, in device-independent pixels.

Uses current brush, strokeWidth and strokeStyle.

213.1.12 DrawRoundedRectangle(left as single, top as single, right as single, bottom as single, radiusX as single, radiusY as single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Draws the outline of the specified rounded rectangle using the specified stroke style.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height

Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)
call d.CreateStrokeStyle 0, 0, 0, 0, 0, d.DashStyleDash
d.DrawRoundedRectangle 10, 10, 190, 190, 20, 20
```

```
Backdrop = p
```

Notes: Pass the dimensions of the rounded rectangle to draw, in device-independent pixels.

Uses current brush, strokeWidth and strokeStyle.

213.1.13 FillEllipse(x as single, y as single, radiusX as single, radiusY as single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Paints the interior of the specified ellipse.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height

Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)

d.FillEllipse 100, 100, 90, 90

Backdrop = p
```

Notes: The position and radius, in device-independent pixels, of the ellipse to paint.
Uses current brush.

213.1.14 FillRectangle(left as single, top as single, right as single, bottom as single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Paints the interior of the specified rectangle.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height
```

```
Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)

d.FillRectangle 10, 10, 190, 190

Backdrop = p
```

Notes: The dimension of the rectangle to paint, in device-independent pixels.
Uses current brush.

213.1.15 FillRoundedRectangle(left as single, top as single, right as single, bottom as single, radiusX as single, radiusY as single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Paints the interior of the specified rounded rectangle.
Example:

```
Var p as new Picture(200,200)
Var g as Graphics = p.Graphics
// Clear image with white
g.DrawingColor = &cFFFFFF
g.FillRectangle 0, 0, g.Width, g.Height

Var d as new DirectDrawGraphicsMBS(g)

call d.CreateSolidColorBrush(&cFF0000)

d.FillRoundedRectangle 10, 10, 190, 190, 20, 20

Backdrop = p
```

Notes: The dimensions of the rounded rectangle to paint, in device independent pixels.
Uses current brush.

213.1.16 GetTransform(byref m11 as Single, byref m12 as Single, byref m21 as Single, byref m22 as Single, byref dx as Single, byref dy as Single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the current transform of the render target.

213.1.17 RestoreDrawingState

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Restores the current drawing state.
Notes: Our plugin manages the stack of drawing states saved.
We raise an exception if your calls to restore are not balanced with save.

213.1.18 SaveDrawingState

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Saves the current drawing state.
Notes: Our plugin manages the stack of drawing states saved, so you can restore them later.

213.1.19 SetTransform(m11 as Single, m12 as Single, m21 as Single, m22 as Single, dx as Single, dy as Single)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies the specified transform to the render target, replacing the existing transformation.
Notes: All subsequent drawing operations occur in the transformed space.

213.1.20 Properties

213.1.21 AntialiasMode as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The antialiasing mode of the render target.
Notes: The antialiasing mode applies to all subsequent drawing operations, excluding text and glyph drawing operations.
To specify the antialiasing mode for text and glyph operations, use the SetTextAntialiasMode method.
(Read and Write property)

213.1.22 brushHandle as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference for current brush.
Notes: Reference to ID2D1Brush object.
(Read and Write property)

213.1.23 DPIX as Single

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Return the render target's dots per inch (DPI).
Notes: The horizontal DPI of the render target.
(Read only property)

213.1.24 DPIY as Single

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Return the render target's dots per inch (DPI).
Notes: The vertical DPI of the render target.
(Read only property)

213.1.25 factoryHandle as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference for the factory.
Notes: Reference to ID2D1Factory object.
(Read and Write property)

213.1.26 Handle as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Reference to ID2D1RenderTarget object.
(Read and Write property)

213.1.27 Height as Single

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the render target in device-independent pixels.
Notes: (Read only property)

213.1.28 PixelHeight as UInt32

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the render target in device pixels.
Notes: (Read only property)

213.1.29 PixelWidth as UInt32

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the render target in device pixels.
Notes: (Read only property)

213.1.30 strokeStyleHandle as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference for current stroke style.
Notes: Reference to ID2D1StrokeStyle object.
(Read and Write property)

213.1.31 strokeWidth as Single

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The stroke width to use.
Notes: Default is 1.

The width of the stroke, in device-independent pixels. The value must be greater than or equal to 0.0. If this parameter isn't specified, it defaults to 1.0. The stroke is centered on the line.
(Read and Write property)

213.1.32 TextAntialiasMode as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the antialiasing mode to use for subsequent text and glyph drawing operations.
Notes: The antialiasing mode to use for subsequent text and glyph drawing operations.
(Read and Write property)

213.1.33 Width as Single

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the render target in device-independent pixels.
Notes: (Read only property)

213.1.34 Constants

Anti Alias Modes

Constant	Value	Description
AntiAliasModeAliased	1	Objects are aliased in most cases. Objects are antialiased only when they are drawn to a render target created by the CreateDxgiSurfaceRenderTarget method and Direct3D multisampling has been enabled on the backing DirectX Graphics Infrastructure (DXGI) surface.
AntiAliasModePerPrimitive	0	Edges are antialiased using the Direct2D per-primitive method of high-quality antialiasing.

Cap Styles

Constant	Value	Description
CapStyleFlat	0	A cap that does not extend past the last point of the line. Comparable to cap used for objects other than lines.
CapStyleRound	0	A semicircle that has a diameter equal to the line thickness.
CapStyleSquare	0	Half of a square that has a length equal to the line thickness.
CapStyleTriangle	0	An isosceles right triangle whose hypotenuse is equal in length to the thickness of the line.

Dash Styles

Constant	Value	Description
DashStyleCustom	5	The dash pattern is specified by an array of floating-point values.
DashStyleDash	1	A dash followed by a gap of equal length. The dash and the gap are each twice as long as the stroke thickness. The equivalent dash array for D2D1_DASH_STYLE_DASH is { 2, 2 } .
DashStyleDashDot	3	A dash, followed by a gap, followed by a dot, followed by another gap. The equivalent dash array for D2D1_DASH_STYLE_DASH_DOT is { 2, 2, 0, 2 } .
DashStyleDashDotDot	4	A dash, followed by a gap, followed by a dot, followed by another gap, followed by another dot, followed by another gap. The equivalent dash array for D2D1_DASH_STYLE_DASH_DOT_DOT is { 2, 2, 0, 2, 0, 2 } .
DashStyleDot	2	A dot followed by a longer gap. The equivalent dash array for D2D1_DASH_STYLE_DOT is { 0, 2 } .
DashStyleSolid	0	A solid line with no breaks.

Line Join

Constant	Value	Description
LineJoinBevel	1	Beveled vertices.
LineJoinMiter	0	Regular angular vertices.
LineJoinMiterOrBevel	3	Regular angular vertices unless the join would extend beyond the miter limit; otherwise, beveled vertices.
LineJoinRound	2	Rounded vertices.

Text Anti Alias Modes

Constant	Value	Description
TextAntiAliasModeAliased	1	Do not use antialiasing.
TextAntiAliasModeClearType	1	Use ClearType antialiasing.
TextAntiAliasModeDefault	0	Use the system default. See Remarks.
TextAntiAliasModeGrayscale	1	Use grayscale antialiasing.

213.2 Globals

213.2.1 WindowsDrawPictureIntoDeviceContextMBS(pic as picture, HDC as Integer, x as Integer, y as Integer, w as Integer, h as Integer, Transparent as boolean)

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Draws a Xojo Picture into a HDC on Windows.
Example:

```
// get a picture
Var logo as Picture = LogoMBS(500)

// get HDC
Var h as Integer = g.Handle(g.HandleTypeHDC)

// and draw into it
WindowsDrawPictureIntoDeviceContextMBS(logo, h, 0, 0, 500, 500, false)
```

Notes: Some SDKs from other companies give you sometimes HDC value to draw your stuff inside. You can prepare a Xojo picture and copy it into the HDC.
Specify rectangle and whether to use transparency.

213.3 class WindowsAVIWriteMBS

213.3.1 class WindowsAVIWriteMBS

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The class to create an AVI video file from pictures.
Example:

```
Var w As New WindowsAVIWriteMBS
Var p as Picture = logoMBS(500)
w.Width = p.width
w.Height = p.Height

Var file as FolderItem = SpecialFolder.Desktop.Child("test.avi")

call w.CreateFile(file)
call w.CreateVideoStream
call w.SetOptions
call w.AddFrame(p)
call w.CloseFile
```

Notes: This classes uses Video for Windows functions to create videos from images.
No sound functions.

You frist create the file, then the video stream, set options and add frames.
Destructor or CloseFile method will close the file.
Blog Entries

- News from the MBS Xojo Plugins in Version 25.1
- MonkeyBread Software Releases the MBS Xojo Plugins in version 25.1
- MBS Xojo Plugins, version 25.1pr1

Xojo Developer Magazine

- 23.4, page 10: News
- 23.3, page 10: News

213.3.2 Methods

213.3.3 AddFrame(Pic as Picture) as boolean

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Adds a frame to the video track.
Notes: Updates time property.

Returns true on success and false on failure.
Sets LastError property.

The picture size must match the size given with Height and Width properties.

213.3.4 CloseFile

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Explicitly closes the video file.

213.3.5 Constructor

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The constructor.

213.3.6 CreateFile(File as FolderItem) as Boolean

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Creates a new video file.
Notes: Returns true on success and false on failure.
Sets LastError property.

213.3.7 CreateVideoStream as boolean

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Creates the video stream.
Notes: Returns true on success.

213.3.8 SetOptions as boolean

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: Sets options without dialog.
Notes: Sets default settings, basically no compression.

Returns true on success and false on failure.
Sets LastError property.
See also:

- 213.3.9 SetOptions(ParentWindow as DesktopWindow) as boolean 24316
- 213.3.10 SetOptions(ParentWindow as Window) as boolean 24317

213.3.9 SetOptions(ParentWindow as DesktopWindow) as boolean

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop only.

Function: Sets options by showing the options dialog box.
Notes: Returns true on success and false on failure.

Sets LastError property.
See also:

- 213.3.8 SetOptions as boolean 24316
- 213.3.10 SetOptions(ParentWindow as Window) as boolean 24317

213.3.10 SetOptions(ParentWindow as Window) as boolean

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: Desktop only.

Function: Sets options by showing the options dialog box.
Notes: Returns true on success and false on failure.
Sets LastError property.
See also:

- 213.3.8 SetOptions as boolean 24316
- 213.3.9 SetOptions(ParentWindow as DesktopWindow) as boolean 24316

213.3.11 Properties

213.3.12 BufferSize as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The suggested buffer size for the new video stream.
Notes: e.g. width * height * 4.
(Read and Write property)

213.3.13 Handle as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

213.3.14 Height as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The height of the video frame.
Notes: (Read and Write property)

213.3.15 LastError as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

213.3.16 LastErrorString as String

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The last error message.
Notes: (Read only property)

213.3.17 Rate as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The rate for the time.
Notes: The Rate/TimeScale defines the frame rate.

By default, the rate is 30 and timescale 30, which gives 30 pictures per second.
(Read and Write property)

213.3.18 Time as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The current time in frames.
Notes: (Read and Write property)

213.3.19 TimeScale as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The time scale.
Notes: Default is 30 for 30 frames per second.
(Read and Write property)

213.3.20 Width as Integer

MBS Audio Plugin, Plugin Version: 25.1, Platform: Windows, Targets: All.

Function: The width of the video frame.
Notes: (Read and Write property)

213.4 module WindowsBitmapMBS

213.4.1 module WindowsBitmapMBS

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Windows bitmap handling module.
Notes: In this module we collect a few useful conversion functions for handling bitmap in Xojo.
Please contact us if you have idea for new function.

- MBS Releases the MBS Xojo / Real Studio plug-ins in version 15.1

Xojo Developer Magazine

- 13.4, page 10: News

213.4.2 Methods

213.4.3 BitmapToDIB(HBitmap as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HBitmap to a HDIB.
Notes: HPalette is optional a color palette handle for images with 8 bit or less per pixel.

213.4.4 DeleteBitmap(HBitmap as Ptr)

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Frees a HDIB or HBITMAP.
Notes: You need to free the images you allocate to make sure memory is released.

213.4.5 DIBToBitmap(HDIB as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HDIB to HBitmap.
Notes: HPalette is optional a color palette handle for images with 8 bit or less per pixel.
Returns nil in case of no memory.

213.4.6 DuplicateHBitmap(HBitmap as Ptr, Width as Integer, Height as Integer) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Duplicates a bitmap handle.
Notes: Please use DeleteBitmap later to free bitmap.

213.4.7 HBitmapInfo(HBitmap as Ptr, byref Width as Integer, byref Height as Integer, byref WidthBytes as Integer, byref Planes as Integer, byref BitsPixel as Integer) as Boolean

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Queries details about a bitmap handle.
Notes: Returns true on success.

213.4.8 HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HBITMAP to Xojo picture.
Notes: If UsingDraw is true, the plugin creates a new HBitmap and draws picture inside.
Else if UsingDraw is false, the plugin copies picture and mask into a new picture.

UsingDraw with false works only for 24 or 32 bit images with one plane.
See also:

- 213.4.9 HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture 24321

213.4.9 HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HBITMAP to Xojo picture.
Notes: Draws the HBitmap in a new picture of the given size.
This method can be used to resize the bitmap on the fly while drawing.
See also:

- 213.4.8 HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture 24321

213.4.10 PictureToHBitmap(Pic as Picture) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Queries HBitmap of a picture.
Notes: As Xojo picture's are internally HBitmaps, the plugin returns the handle of the picture.
No copy is made and you should not free the image. If you need a copy, please use DuplicateHBitmap function.

Please use DeleteBitmap later to free bitmap.

213.5 class WindowsGraphicsDeviceContextMBS

213.5.1 class WindowsGraphicsDeviceContextMBS

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The class to safely access a HDC of a graphics object.
Notes: The plugin will get the handle in constructor and release it in destructor/close.
Blog Entries

- MBS Xojo Plugins, version 21.1pr4
- MonkeyBread Software Releases the MBS Xojo Plugins in version 20.3
- MBS Xojo Plugins, version 20.3pr5

213.5.2 Methods

213.5.3 Close

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Closes the handle by releasing memory.
Notes: Same as destructor.

213.5.4 Constructor(c as control)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop only.

Function: The constructor for a control object.
Notes: Queries HDC for control object.
Raises exceptions on failure.
See also:

- 213.5.5 Constructor(c as DesktopControl) 24324
- 213.5.6 Constructor(g as graphics) 24324
- 213.5.7 Constructor(p as Picture) 24324
- 213.5.8 Constructor(w as DesktopWindow) 24325
- 213.5.9 Constructor(w as window) 24325

213.5.5 Constructor(c as DesktopControl)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor for a control object.
Notes: Queries HDC for control object.
Raises exceptions on failure.
See also:

- 213.5.4 Constructor(c as control) 24323
- 213.5.6 Constructor(g as graphics) 24324
- 213.5.7 Constructor(p as Picture) 24324
- 213.5.8 Constructor(w as DesktopWindow) 24325
- 213.5.9 Constructor(w as window) 24325

213.5.6 Constructor(g as graphics)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor for a graphics object.
Notes: Queries HDC for graphics object.
Raises exceptions on failure.
See also:

- 213.5.4 Constructor(c as control) 24323
- 213.5.5 Constructor(c as DesktopControl) 24324

- 213.5.8 Constructor(w as DesktopWindow) 24325
- 213.5.9 Constructor(w as window) 24325

213.5.7 Constructor(p as Picture)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop only.

Function: The constructor for a picture object.
Notes: Queries HDC for picture object.
Raises exceptions on failure.
See also:

- 213.5.4 Constructor(c as control) 24323
- 213.5.5 Constructor(c as DesktopControl) 24324

- 213.5.6 Constructor(g as graphics) 24324
- 213.5.8 Constructor(w as DesktopWindow) 24325
- 213.5.9 Constructor(w as window) 24325

213.5.8 Constructor(w as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor for a window object.
Notes: Queries HDC for window object.
Raises exceptions on failure.
See also:

- 213.5.4 Constructor(c as control) 24323
- 213.5.5 Constructor(c as DesktopControl) 24324
- 213.5.6 Constructor(g as graphics) 24324
- 213.5.7 Constructor(p as Picture) 24324
- 213.5.9 Constructor(w as window) 24325

213.5.9 Constructor(w as window)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop only.

Function: The constructor for a window object.
Notes: Queries HDC for window object.
Raises exceptions on failure.
See also:

- 213.5.4 Constructor(c as control) 24323
- 213.5.5 Constructor(c as DesktopControl) 24324
- 213.5.6 Constructor(g as graphics) 24324
- 213.5.7 Constructor(p as Picture) 24324
- 213.5.8 Constructor(w as DesktopWindow) 24325

213.5.10 Properties

213.5.11 Graphics as Graphics

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The references graphics object.
Notes: (Read only property)

213.5.12 Handle as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The handle.
Notes: This is HDC to be used with declares.
(Read only property)

213.6 class WindowsGUIResourcesMBS

213.6.1 class WindowsGUIResourcesMBS

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Class to retrieves the count of handles to graphical user interface (GUI) objects in use by the specified process.
Notes: Allows you to monitor how many handles you use from GDI.
As they are limited, your app will crash if it hits a limit.

Videos

- Presentation from Munich conference about MBS Plugins.
- Presentation from Xojo Developer Conference 2019 in Miami.

213.6.2 Methods

213.6.3 Constructor

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Examines current process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.

A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.
See also:

- 213.6.4 Constructor(ProcessID as integer) 24327

213.6.4 Constructor(ProcessID as integer)

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Examines given process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.

A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.
See also:

- 213.6.3 Constructor 24327

213.6.5 Properties

213.6.6 GDIObjectCount as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The count of GDI objects.
Notes: (Read only property)

213.6.7 GDIObjectPeak as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak count of GDI objects.
Notes: (Read only property)

213.6.8 LastError as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error from Windows.
Notes: Should be zero on success.
But could give error code like permissions denied, if you want to examine another process.
(Read only property)

213.6.9 UserObjectCount as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The count of USER objects.
Notes: (Read only property)

213.6.10 UserObjectPeak as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak count of USER objects.
Notes: (Read only property)

Chapter 214

Windows ICM

214.1 class WindowsICMColorMBS

214.1.1 class WindowsICMColorMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a color value.
Notes: A variable of type color may be accessed as any of the supported color space colors by accessing the appropriate member of the union.

Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

214.1.2 Properties

214.1.3 a as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The a color value of a Lab color.
Notes: (Read and Write property)

214.1.4 b as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The b color value of a Lab color.
Notes: (Read and Write property)

214.1.5 black as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The black color value of a CMYK color.
Notes: (Read and Write property)

214.1.6 blue as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The blue value.
Notes: Range from 0 to 255.
(Read and Write property)

214.1.7 ch1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The first channel color value of a three channel color.
Notes: (Read and Write property)

214.1.8 ch2 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The second channel color value of a three channel color.
Notes: (Read and Write property)

214.1.9 ch3 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The third channel color value of a three channel color.
Notes: (Read and Write property)

214.1.10 cyan as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The cyan color value of a CMYK color.
Notes: (Read and Write property)

214.1.11 gray as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The gray color value.
Notes: For grayscale color space.
(Read and Write property)

214.1.12 green as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The green value.
Notes: Range from 0 to 255.
(Read and Write property)

214.1.13 Index as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The index value for an indexed color space.
Notes: (Read and Write property)

214.1.14 L as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The L color value of a Lab color.
Notes: (Read and Write property)

214.1.15 magenta as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The magenta color value of a CMYK color.
Notes: (Read and Write property)

214.1.16 red as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The red value.
Notes: Range from 0 to 255.
(Read and Write property)

214.1.17 XYZ_X as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of a XYZ color.
Notes: (Read and Write property)

214.1.18 XYZ_Y as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of a XYZ color.
Notes: (Read and Write property)

214.1.19 XYZ_Z as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of a XYZ color.
Notes: (Read and Write property)

214.1.20 yellow as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The yellow color value of a CMYK color.
Notes: (Read and Write property)

214.1.21 Yxy_x as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The x value of a Yxy color.
Notes: (Read and Write property)

214.1.22 Yxy_y as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The y value of a Yxy color.
Notes: Yxy_YY is the first Y and Yxy_Y the second one in a Yxy color.
(Read and Write property)

214.1.23 Yxy_YY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The y value of a Yxy color.
Notes: Yxy_YY is the first Y and Yxy_Y the second one in a Yxy color.
(Read and Write property)

214.1.24 Channel(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The channel value of a colorspaces with 3 to 8 channels.
Notes: Index from 0 to 7.
(Read and Write computed property)

214.1.25 Constants

Constants

Constant	Value	Description
MAX_COLOR_CHANNELS	8	The maximum number of supported color channels.

Color Type Constants

Constant	Value	Description
COLOR_3_CHANNEL	6	The COLOR is in the GENERIC3CHANNEL color space.
COLOR_5_CHANNEL	8	The COLOR is in a five channel color space.
COLOR_6_CHANNEL	9	The COLOR is in a six channel color space.
COLOR_7_CHANNEL	10	The COLOR is in a seven channel color space.
COLOR_8_CHANNEL	11	The COLOR is in an eight channel color space.
COLOR_CMYK	7	The COLOR is in the CMYKCOLOR color space.
COLOR_GRAY	1	The COLOR is in the GRAYCOLOR color space.
COLOR_Lab	5	The COLOR is in the LabCOLOR color space.
COLOR_NAMED	12	The COLOR is in a named color space.
COLOR_RGB	2	The COLOR is in the RGBCOLOR color space.
COLOR_XYZ	3	The COLOR is in the XYZCOLOR color space.
COLOR_Yxy	4	The COLOR is in the YxyCOLOR color space.

214.2 class WindowsICMEnumMBS

214.2.1 class WindowsICMEnumMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WindowsICMEnumMBS class contains information that defines the profile enumeration constraints.
Example:

```
Var c as new WindowsICMEnumMBS // no options set

Var a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
MsgBox s
next
```

Notes: see also

Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

214.2.2 Properties

214.2.3 Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile that can be any of the following values.
Notes:

Constant	Meaning
ATTRIB_TRANSPARENCY	Turns transparency on. If this flag is not used, the attribute is reflective by default.
ATTRIB_MATTE	Turns matte display on. If this flag is not used, the attribute is glossy by default.

(Read and Write property)

214.2.4 Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile that can be any of the following values.
Notes:

Constant	Meaning
ATTRIB_TRANSPARENCY	Turns transparency on. If this flag is not used, the attribute is reflective by default.
ATTRIB_MATTE	Turns matte display on. If this flag is not used, the attribute is glossy by default.

(Read and Write property)

214.2.5 Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the profile class.
Notes: For a description of profile classes, see Using Device Profiles with WCS.
http://msdn.microsoft.com/en-us/library/dd372213(v=VS.85).aspx

A profile class may have any of the following values.

Profile Class	Signature
Input Device Profile	CLASS_SCANNER
Display Device Profile	CLASS_MONITOR
Output Device Profile	CLASS_PRINTER
Device Link Profile	CLASS_LINK
Color Space Conversion Profile	CLASS_COLORSPACE
Abstract Profile	CLASS_ABSTRACT
Named Color Profile	CLASS_NAMED
Color Appearance Model Profile	CLASS_CAMP
Color Gamut Map Model Profile	CLASS_GMMP

(Read and Write property)

214.2.6 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the CMM that is used in the profile.
Notes: Identification numbers are registered with the ICC.
(Read and Write property)

214.2.7 ConnectionSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile connection space (PCS) is defined.
Notes: Can be any of the following values: SPACE_XYZ or SPACE_Lab

When the Classs member is set to CLASS_LINK, the PCS is taken from the DataColorSpace member.
(Read and Write property)

214.2.8 Creator as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Signature of the software that created the profile.
Notes: Signatures are registered with the ICC.
(Read and Write property)

214.2.9 DataColorSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile data is defined.
Notes: Can be any value from the SPACE_* Constants.
(Read and Write property)

214.2.10 DeviceClass as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the device class.
Notes: A device class may have one of the following values.

Profile Class	Signature
Input Device Profile	CLASS_SCANNER
Display Device Profile	CLASS_MONITOR
Output Device Profile	CLASS_PRINTER

(Read and Write property)

214.2.11 DeviceName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: User friendly name of the device.
Notes: (Read and Write property)

214.2.12 DitheringMode as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the style of dithering that will be used when an image is displayed.
Notes: (Read and Write property)

214.2.13 Fields as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates which fields in this class are being used.
Notes: Can be set to any combination of the following constant values:

ET_DEVICENAME
ET_MEDIATYPE
ET_DITHERMODE
ET_RESOLUTION
ET_CMMTYPE
ET_CLASS
ET_DATACOLORSPACE
ET_CONNECTIONSPACE
ET_SIGNATURE
ET_PLATFORM
ET_PROFILEFLAGS
ET_MANUFACTURER
ET_MODEL
ET_ATTRIBUTES
ET_RENDERINGINTENT
ET_CREATOR
ET_DEVICECLASS
(Read and Write property)

214.2.14 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the device profile manufacturer.
Notes: All manufacturer identification numbers are registered with the ICC.
(Read and Write property)

214.2.15 MediaType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates which type of media is associated with the profile, such as a printer or screen.
Notes: (Read and Write property)

214.2.16 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device manufacturer's device model number.
Notes: All model identification numbers are registered with the ICC.
(Read and Write property)

214.2.17 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The primary platform for which the profile was created.
Notes: The member can be set to any of the following values.

Platform	Value
Apple Computer, Inc.	'APPL'
Microsoft Corp.	'MSFT'
Silicon Graphics, Inc.	'SGI'
Sun Microsystems, Inc.	'SUNW'
Taligent	'TGNT'

(Read and Write property)

214.2.18 ProfileFlags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Bit flags containing hints that the CMM uses to interpret the profile data and can be set to one of the following values.
Notes:

Constant	Meaning
FLAG_EMBEDDEDPROFILE	The profile is embedded in a bitmap file.
FLAG_DEPENDENTONDATA	The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

(Read and Write property)

214.2.19 RenderingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The profile rendering intent.
Notes: The member can be set to one of the following values:

INTENT_PERCEPTUALINTENT_SATURATIONINTENT_RELATIVE_COLORIMETRICINTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=VS.85).aspx
(Read and Write property)

214.2.20 ResolutionX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The horizontal resolution in pixels of the device on which the image will be displayed.
Notes: (Read and Write property)

214.2.21 ResolutionY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vertical resolution in pixels of the device on which the image will be displayed.
Notes: (Read and Write property)

214.2.22 Signature as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reserved for internal use.
Notes: (Read and Write property)

214.2.23 Constants

Attribute Constants

Constant	Value	Description
ATTRIB_MATTE	2	Turns matte display on. If this flag is not used, the attribute is glossy by default.
ATTRIB_TRANSPARENCY	1	Turns transparency on. If this flag is not used, the attribute is reflective by default.

Profile Class Constants

Constant	Value	Description
CLASS_ABSTRACT	&h61627374	
CLASS_CAMP	&h6C616D70	
CLASS_COLORSPACE	&h73706163	
CLASS_GMMP	&h676D6D70	
CLASS_LINK	&h6C696E6B	
CLASS_MONITOR	&h6D6E7472	
CLASS_NAMED	&h6E6D636C	
CLASS_PRINTER	&h70727472	
CLASS_SCANNER	&h73636E72	

Field usage flags

Constant	Value	Description
ET_ATTRIBUTES	&h02000	
ET_CLASS	&h00020	
ET_CMMTYPE	&h00010	
ET_CONNECTIONSPACE	&h00080	
ET_CREATOR	&h08000	
ET_DATACOLORSPACE	&h00040	
ET_DEVICECLASS	&h10000	
ET_DEVICENAME	&h00001	
ET_DITHERMODE	&h00004	
ET_MANUFACTURER	&h00800	
ET_MEDIATYPE	&h00002	
ET_MODEL	&h01000	
ET_PLATFORM	&h00200	
ET_PROFILEFLAGS	&h00400	
ET_RENDERINGINTENT	&h04000	
ET_RESOLUTION	&h00008	
ET_SIGNATURE	&h00100	

Profile flag constants.

Constant	Value	Description
FLAG_DEPENDENTONDATA	2	The profile can't be used independently of the embe profiles that are embedded in bitmap files.
FLAG_EMBEDDEDPROFILE	1	The profile is embedded in a bitmap file.
FLAG_ENABLE_CHROMATIC_ADAPTATION	&h02000000	

Platform signature

Constant	Value	Description
SigMacintosh	&h4150504C	APPL = Apple Computer, Inc.
SigMicrosoft	&h4D534654	MSFT = Microsoft Corp.
SigSGI	&h53474920	SGI = Silicon Graphics, Inc.
SigSolaris	&h53554E57	SUNW = Sun Microsystems, Inc.
SigTaligent	&h54474E54	TGNT = Taligent

Color Space Constants

Constant	Value	Description
SPACE_Lab	&h4C616220	Lab
SPACE_XYZ	&h58595A20	XYZ

214.3 class WindowsICMLogColorSpaceMBS

214.3.1 class WindowsICMLogColorSpaceMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class contains information that defines a logical color space.
Notes: If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of this structure are ignored, and WCS uses the sRGB color space. The Endpoints, GammaRed, GammaGreen, and GammaBlue members are used to describe the logical color space. The Endpoints member is a CIEXYZTRIPLE that contains the x, y, and z values of the color space's RGB endpoint.

The required DWORD bit format for the GammaRed, GammaGreen, and GammaBlue is an 8.8 fixed point interger left-shifted by 8 bits. The plugin takes care about that detail.

Whenever the Filename member contains a file name and the CSType member is set to LCS_CALIBRATED_RGB, WCS ignores the other members of this class. It uses the color space in the file as the color space to which this LOGCOLORSPACE structure refers.

The relation between tri-stimulus values X,Y,Z and chromaticity values x,y,z is as follows:

x = X/(X+Y+Z)
y = Y/(X+Y+Z)
z = Z/(X+Y+Z)

If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of this structure are ignored, and ICM uses the sRGB color space. Applications should still initialize the rest of the structure since CreateProfileFromLogColorSpace ignores CSType member and uses Endpoints, GammaRed, GammaGreen, GammaBlue members to create a profile, which may not be initialized in case of LCS_sRGB or LCS_WINDOWS_COLOR_SPACE color spaces.
Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

214.3.2 Properties

214.3.3 CSType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Color space type.
Notes: The member can be one of the following values.

Value	Meaning
LCS_CALIBRATED_RGB	Color values are calibrated RGB values. The values are translated using the endpoints specified by the lcsEndpoints member before being passed to the device.
LCS_sRGB	Color values are values are sRGB values.
LCS_WINDOWS_COLOR_SPACE	Color values are Windows default color space color values.

(Read and Write property)

214.3.4 EndpointsBX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of the Blue Endpoint.
Notes: (Read and Write property)

214.3.5 EndpointsBY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of the Blue Endpoint.
Notes: (Read and Write property)

214.3.6 EndpointsBZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of the Blue Endpoint.
Notes: (Read and Write property)

214.3.7 EndpointsGX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of the Green Endpoint.
Notes: (Read and Write property)

214.3.8 EndpointsGY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of the Green Endpoint.
Notes: (Read and Write property)

214.3.9 EndpointsGZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of the Green Endpoint.
Notes: (Read and Write property)

214.3.10 EndpointsRX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of the Red Endpoint.
Notes: (Read and Write property)

214.3.11 EndpointsRY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of the Red Endpoint.
Notes: (Read and Write property)

214.3.12 EndpointsRZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of the Red Endpoint.
Notes: (Read and Write property)

214.3.13 Filename as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that names a color profile file.
Notes: This member is typically set to "", but may be used to set the color space to be exactly as specified by the color profile. This is useful for devices that input color values for a specific printer, or when using an installable image color matcher. If a color profile is specified, all other members of this class should be set to reasonable values, even if the values are not completely accurate.
(Read and Write property)

214.3.14 GammaBlue as Double

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scale of the blue coordinate.
Notes: (Read and Write property)

214.3.15 GammaGreen as Double

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scale of the green coordinate.
Notes: (Read and Write property)

214.3.16 GammaRed as Double

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scale of the red coordinate.
Notes: (Read and Write property)

214.3.17 Intent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The gamut mapping method.
Notes: This member can be one of the following values.

Value	Value	Intent	ICC Name	Meaning
LCS_GM_BUSINESS	1	Graphic	Saturation	Maintain saturation. Used for business charts and other situations in which undithered colors are required.
LCS_GM_GRAPHICS	2	Proof	Relative Colorimetric	Maintain colorimetric match. Used for graphic designs and named colors.
LCS_GM_IMAGES	4	Picture	Perceptual	Maintain contrast. Used for photographs and natural images.
LCS_GM_ABS_COLORIMETRIC	8	Match	Absolute Colorimetric	Maintain the white point. Match the colors to their nearest color in the destination gamut.

(Read and Write property)

214.3.18 Constants

Rendering Intent Constants

Constant	Value	Description
INTENT_ABSOLUTE_COLORIMETRIC	3	Maintain the white point. Match the colors to their nearest color i nation gamut.
INTENT_PERCEPTUAL	0	Maintain contrast. Used for photographs and natural images.
INTENT_RELATIVE_COLORIMETRIC	1	Maintain colorimetric match. Used for graphic designs and named
INTENT_SATURATION	2	Maintain saturation. Used for business charts and other situatio undithered colors are required.

Color Space Type Constants

Constant	Value	Description
LCS_CALIBRATED_RGB	0	Color values are calibrated RGB values. The values are translate endpoints specified by the Endpoints member before being passed t
LCS_sRGB	&h73524742	Color values are values are sRGB values.
LCS_WINDOWS_COLOR_SPACE	&h57696E20	Color values are Windows default color space color values.

214.4 module WindowsICMModuleMBS

214.4.1 module WindowsICMModuleMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The main module for Windows Image Color Matching functions.
Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

214.4.2 Methods

214.4.3 AssociateColorProfileWithDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The AssociateColorProfileWithDevice function associates a specified color profile with a specified device.
Notes: ProfileName: The file name of the profile to associate.
DeviceName: The name of the device to associate.

Returns true on success and false on failure.

The AssociateColorProfileWithDevice function will fail if the profile has not been installed on the computer using the InstallColorProfile function.

Note that under Windows (Windows 95 or later), the PostScript device driver for printers assumes a CMYK color model. Therefore, all PostScript printers must use a CMYK color profile. Windows 2000 does not have this limitation.

If the specified device is a monitor, this function updates the default profile.

Several profiles are typically associated with printers, based on paper and ink types. There is no default. The GDI selects the best one from the associated profiles when your application creates a device context (DC).

Scanners also have no default profile. However, it is atypical to associate more than one profile with a scanner.

AssociateColorProfileWithDevice always adds the specified profile to the current user's per-user profile association list for the specified device. Before adding the profile to the list, AssociateColorProfileWithDevice determines whether the user has previously expressed the desire to use a per-user profile association list

for the device. If so, then AssociateColorProfileWithDevice simply adds the specified profile to the existing per-user profile association list for the device. If not, then AssociateColorProfileWithDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It then appends the specified profile to the per-user list. From that point on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

214.4.4 DisassociateColorProfileFromDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DisassociateColorProfileFromDevice function disassociates a specified color profile with a specified device on a specified computer.
Notes: Returns true on success and false on failure.

ProfileName: The file name of the profile to disassociate.
DeviceName: The name of the device to disassociate.

If more than one profile is associated with a device, WCS uses the last one associated as the default. That is, if your application sequentially associates three profiles with a device, WCS will use the last one associated as the default. If your application then calls the DisassociateColorProfileFromDevice function to disassociate the third profile (which is the default in this example), the WCS will use the second profile as the default.

If your application disassociates all profiles from a device, WCS uses the sRGB profile as the default.

DisassociateColorProfileFromDevice always removes the specified profile from the current user's per-user profile association list for the specified device. Before removing the profile from the list, DisassociateColorProfileFromDevice determines whether the user has previously expressed the desire to use a per-user profile association list for the device. If so, then DisassociateColorProfileFromDevice simply removes the specified profile from the existing per-user profile association list for the device. If not, then DisassociateColorProfileFromDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It then removes the specified profile from the per-user list. From that point on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

214.4.5 EnumColorProfiles(criterias as WindowsICMEnumMBS) as string()

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The EnumColorProfiles function enumerates all the profiles satisfying the given enumeration criteria.

Example:

```
Var c as new WindowsICMEnumMBS // no options set

Var a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
MsgBox s
next
```

Notes: On success the function returns an array of profile names.

Several profiles are typically associated with printers, based on the paper and ink types. There is a default profile for each device. For International Color Consortium (ICC) profiles, GDI selects the best one from the ICC-associated profiles when your application creates a device context (DC).

Do not attempt to use EnumColorProfiles to determine the default profile for a device. Instead, create a device context for the device and then invoke the GetICMProfile function. On Windows Vista and Windows 7, the WcsGetDefaultColorProfile function can also be used to determine a device's default color profile.

If the Fields member of WindowsICMEnumMBS that is pointed to by the criterias parameter is set to ET_DEVICENAME, this function will enumerate all of the color profiles associated with all types of devices attached to the user's computer, regardless of the device class. If the Fields member is set to ET_DEVICENAME or ET_DEVICECLASS and a device class is specified in the DeviceClass member, this function will only enumerate the profiles associated with the specified device class. If the Fields member is set only to ET_DEVICECLASS, the EnumColorProfiles function will enumerate all profiles that can be associated with that type of device.

Whenever EnumColorProfiles is examining the profiles associated with a specific device, the results depend on whether the user has chosen to use the system-wide list of profiles associated with that device, or his or her own ("per-user") list. Calling SetUsePerUserProfiles with its usePerUserProfiles parameter set to TRUE causes future calls to EnumColorProfiles to look at only the current user's per-user list of profile associations for the specified device. Calling WcsSetUsePerUserProfiles with its usePerUserProfiles parameter set to FALSE causes future calls to EnumColorProfiles to look at the system-wide list of profile associations for the specified device. If SetUsePerUserProfiles has never been called for the current user, EnumColorProfiles examines the system-wide list.

This function will provide the information for converting WCS-specific DMP information to the legacy EnumType record in enable consistent profile enumeration. The defaults will be the same as ICC if this information is not present.

Per-user/LUA support

The enumeration is specific to current user. Both system wide and current user device associations are considered. For default profile configuration, current user settings override system wide ones.

214.4.6 GetColorDirectory as folderitem

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorDirectory function retrieves the path of the Windows COLOR directory on a specified machine.
Example:

```
Var f as FolderItem = WindowsICMModuleMBS.GetColorDirectory

if f=nil then
MsgBox "No path?"
else
MsgBox f.NativePath
end if
```

Notes: On success returns folderitem for color directory. Returns nil on any error.

214.4.7 GetStandardColorSpaceProfile(ProfileID as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetStandardColorSpaceProfile function retrieves the color profile registered for the specified standard color space.
Example:

```
MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_WINDOWS_COLOR_S
```

Notes: ProfileID: Specifies the ID value of the standard color space for which to retrieve the profile. The only valid values for this parameter are LCS_sRGB and LCS_WINDOWS_COLOR_SPACE.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return an error if such profiles are used.

Overview of Windows Vista Specific Functionality

This will support WCS DMPs in addition to ICC profiles. It will not support WCS CAMP or GMMP profiles and will return an error if such profiles are used with this API.

Per-user/LUA support

This will retrieve the color profile registered for the given standard color space for current user. If there is no such setting for the current user, it retrieves the system wide setting.

This uses WcsGetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context.

214.4.8 InstallColorProfile(file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The InstallColorProfile function installs a given profile for use on a specified machine.
Notes: The profile is also copied to the COLOR directory.
Returns true on success and false on failure.

214.4.9 RegisterCMM(cmmID as Integer, file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: RegisterCMM associates a specified identification value with the specified color management module dynamic link library (CMM DLL).
Notes: When this ID appears in a color profile, Windows can then locate the corresponding CMM so as to create a transform.

cmmID: Specifies the ID signature of the CMM registered with the International Color Consortium (ICC).

file: Points to the CMM DLL.

Returns true on success and false on failure.

214.4.10 SelectCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: SelectCMM allows an application to select the preferred color management module (CMM) to use.

Notes: cmmID: Specifies the signature of the desired CMM as registered with the International Color Consortium (ICC).

Windows 2000 only: Setting this parameter to 0 causes the WCS system to select the default CMM.

Returns true on success and false on failure.

214.4.11 SetStandardColorSpaceProfile(ProfileID as Integer, ProfileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetStandardColorSpaceProfile function registers a specified profile for a given standard color space.
Notes: The profile can be queried using GetStandardColorSpaceProfile.

ProfileID: Specifies the ID value of the standard color space that the given profile represents.
Profilename: path to the profile file.

Returns true on success and false on failure.

The profile must already be installed on the system before it can be registered for a standard color space.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return an error if such profiles are used.

Per-user/LUA support

This will register a specified profile for a given standard color space only for current user.

This uses SetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context if the profile is already installed, fails otherwise with access denied since install is system-wide and requires administrator privileges.

214.4.12 UninstallColorProfile(ProfileName as string, DeleteFile as boolean = true) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: UninstallColorProfile removes a specified color profile from a specified computer. Associated files are optionally deleted from the system.
Notes: ProfileName: Points to the file name of the profile to uninstall.

DeleteFile: If set to true, the function deletes the profile from the COLOR directory. If set to false, this function has no effect.

Returns true on success and false on failure.

214.4.13 UnregisterCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The UnregisterCMM function dissociates a specified ID value from a given color management module dynamic-link library (CMM DLL).
Notes: cmmID: Specifies the ID value identifying the CMM whose registration is to be removed. This is the signature of the CMM registered with the International Color Consortium (ICC).

Returns true on success and false on failure.

214.4.14 Constants

Info selectors for GetInfo

Constant	Value	Description
CMM_DESCRIPTION	5	A text string that describes the color management module.
CMM_DLL_VERSION	3	Version number of the CMM DLL.
CMM_DRIVER_VERSION	2	
CMM_IDENT	1	The CMM identification signature registered with the International Color Consortium (ICC).
CMM_LOGOICON	6	The logo icon for this CMM.
CMM_VERSION	4	Version of Windows supported.
CMM_WIN_VERSION	0	Backward compatibility with Windows 95.

Profile ID Constants

Constant	Value	Description
LCS_sRGB	&h73524742	
LCS_WINDOWS_COLOR_SPACE	&h57696E20	

214.5 class WindowsICMNamedProfileInfoMBS

214.5.1 class WindowsICMNamedProfileInfoMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class is used to store information about a named color profile.
Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

214.5.2 Properties

214.5.3 Count as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Total number of named colors in the profile.
Notes: (Read and Write property)

214.5.4 CountDevCoordinates as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Total number of device coordinates for each named color.
Notes: (Read and Write property)

214.5.5 Flags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Flags for this information record.
Notes: Not currently used by the default CMM.
(Read and Write property)

214.5.6 Prefix as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string containing the prefix for each color name.
Notes: (Read and Write property)

214.5.7 Suffix as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string containing the suffix for each color name.
Notes: (Read and Write property)

214.6 class WindowsICMProfileHeaderMBS

214.6.1 class WindowsICMProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class contains information that describes the contents of a device profile file.
Notes: This header occurs at the beginning of a device profile file.

- MBS Real Studio Plugins, version 11.1pr11

214.6.2 Properties

214.6.3 Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile.
Notes: (Read and Write property)

214.6.4 Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile.
Notes: (Read and Write property)

214.6.5 Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the profile class.
Example:

```
// some profile file
Var file as FolderItem = SpecialFolder.Desktop.Child("test.icc")

// open profile read only
Var w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

// get headers
```

```
Var h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

// show color space name
Select case h.Classs
case WindowsICMProfileHeaderMBS.CLASS_MONITOR
msgbox "Monitor"
case WindowsICMProfileHeaderMBS.CLASS_PRINTER
msgbox "Printer"
case WindowsICMProfileHeaderMBS.CLASS_SCANNER
msgbox "Scanner"
case WindowsICMProfileHeaderMBS.CLASS_LINK
msgbox "Link"
case WindowsICMProfileHeaderMBS.CLASS_ABSTRACT
msgbox "Abstract"
case WindowsICMProfileHeaderMBS.CLASS_COLORSPACE
msgbox "Colorspace"
case WindowsICMProfileHeaderMBS.CLASS_NAMED
msgbox "Named"
case WindowsICMProfileHeaderMBS.CLASS_CAMP
msgbox "Camp"
case WindowsICMProfileHeaderMBS.CLASS_GMMP
msgbox "GNMP"
else
msgbox "Unknown: "+hex(h.Classs)
end Select
```

Notes: For a description of profile classes, see Using Device Profiles with WCS:
http://msdn.microsoft.com/en-us/library/dd372213(v=VS.85).aspx

A profile class may have any of the values from the CLASS_* constants.

Class is written with three s here as Class is a reserved word in Xojo.
(Read and Write property)

214.6.6 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the CMM that is used in the profile.
Notes: Identification numbers are registered with the ICC.
(Read and Write property)

214.6.7 ConnectionSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile connection space (PCS) is defined.
Notes: The member can be any of the following values: SPACE_XYZ or SPACE_Lab.
(Read and Write property)

214.6.8 Creator as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Signature of the software that created the profile.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
Var w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PRO-
FILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXIST-
ING)
Var h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

MsgBox hex(h.Creator)
```

Notes: Signatures are registered with the ICC.
(Read and Write property)

214.6.9 DataColorSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile data is defined.
Example:

```
function Name() as string
Var w as WindowsICMProfileMBS // your profile
Var h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

if h=nil then Return "?"

Select case h.DataColorSpace
case WindowsICMProfileHeaderMBS.SPACE_XYZ
Return "XYZ"
case WindowsICMProfileHeaderMBS.SPACE_Lab
Return "Lab"
```

```
case WindowsICMProfileHeaderMBS.SPACE_Luv
Return "Luv"
case WindowsICMProfileHeaderMBS.SPACE_YCbCr
Return "YCbCr"
case WindowsICMProfileHeaderMBS.SPACE_Yxy
Return "Yxy"
case WindowsICMProfileHeaderMBS.SPACE_RGB
Return "RGB"
case WindowsICMProfileHeaderMBS.SPACE_GRAY
Return "GRAY"
case WindowsICMProfileHeaderMBS.SPACE_HSV
Return "HSV"
case WindowsICMProfileHeaderMBS.SPACE_HLS
Return "HLS"
case WindowsICMProfileHeaderMBS.SPACE_CMYK
Return "CMYK"
case WindowsICMProfileHeaderMBS.SPACE_CMY
Return "CMY"
case WindowsICMProfileHeaderMBS.SPACE_2_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_3_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_4_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_5_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_6_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_7_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_8_CHANNEL
Return "2 Channel"
else
Return "Unknown: "+hex(h.DataColorSpace)
end Select
end function
```

Notes: The member can be any of value from the SPACE_* Constants.
(Read and Write property)

214.6.10 DateTime0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data and time that the profile was created.
Notes: (Read and Write property)

214.6.11 DateTime1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data and time that the profile was created.
Notes: (Read and Write property)

214.6.12 DateTime2 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data and time that the profile was created.
Notes: (Read and Write property)

214.6.13 IlluminantX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: X value of the Profile illuminant.
Notes: (Read and Write property)

214.6.14 IlluminantY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Y value of the Profile illuminant.
Notes: (Read and Write property)

214.6.15 IlluminantZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Z value of the Profile illuminant.
Notes: (Read and Write property)

214.6.16 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the device profile manufacturer.
Notes: All manufacturer identification numbers are registered with the ICC.
(Read and Write property)

214.6.17 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device manufacturer's device model number.
Notes: All model identification numbers are registered with the ICC.
(Read and Write property)

214.6.18 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The primary platform for which the profile was created.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
Var w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
Var h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

MsgBox DecodingFromHexMBS(hex(h.Platform)) // shows platform, e.g. "APPL"
```

Notes: The primary platform can be set to any of the following values.

Platform	Value
Apple Computer, Inc.	'APPL'
Microsoft Corp.	'MSFT'

(Read and Write property)

214.6.19 ProfileFlags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Bit flags containing hints that the CMM uses to interpret the profile data.
Notes: The member can be set to the following values.

Constant	Meaning
FLAG_EMBEDDEDPROFILE	The profile is embedded in a bitmap file.
FLAG_DEPENDENTONDATA	The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

(Read and Write property)

214.6.20 RenderingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The profile rendering intent.
Notes: The member can be set to one of the following values:

INTENT_PERCEPTUALINTENT_SATURATIONINTENT_RELATIVE_COLORIMETRICINTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=VS.85).aspx
(Read and Write property)

214.6.21 Signature as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reserved for internal use.
Notes: (Read and Write property)

214.6.22 Version as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The version number of the profile.
Notes: The version number is determined by the ICC. The current major version number is &h02. The

current minor version number is &h10. The major and minor version numbers are in binary coded decimal (BCD). They must be stored in the following format.

Byte Number	Contents
0	Major version number in BCD.
1	Minor version number in the most significant nibble of this byte. Bug fix version number in the least significant nibble.
2	Reserved. Must be set to 0.
3	Reserved. Must be set to 0.

(Read and Write property)

214.6.23 Constants

Attribute Constants

Constant	Value	Description
ATTRIB_MATTE	2	Turns matte display on. If this flag is not used, the attribute is glossy by default.
ATTRIB_TRANSPARENCY	1	Turns transparency on. If this flag is not used, the attribute is reflective by default.

Profile Class Constants

Constant	Value	Description
CLASS_ABSTRACT	&h61627374	Abstract Profile
CLASS_CAMP	&h6C616D70	Color Appearance Model Profile
CLASS_COLORSPACE	&h73706163	Color Space Conversion Profile
CLASS_GMMP	&h676D6D70	Color Gamut Map Model Profile
CLASS_LINK	&h6C696E6B	Device Link Profile
CLASS_MONITOR	&h6D6E7472	Display Device Profile
CLASS_NAMED	&h6E6D636C	Named Color Profile
CLASS_PRINTER	&h70727472	Output Device Profile
CLASS_SCANNER	&h73636E72	Input Device Profile

Profile Flags

Constant	Value	Description
FLAG_DEPENDENTONDATA	2	The profile can't be used independently of the embe profiles that are embedded in bitmap files.
FLAG_EMBEDDEDPROFILE	1	The profile is embedded in a bitmap file.
FLAG_ENABLE_CHROMATIC_ADAPTATION	&h02000000	

Color Space Constants

Constant	Value	Description
SPACE_2_CHANNEL	&h32434C52	Generic 2 channel
SPACE_3_CHANNEL	&h33434C52	Generic 3 channel
SPACE_4_CHANNEL	&h34434C52	Generic 4 channel
SPACE_5_CHANNEL	&h35434C52	Generic 5 channel
SPACE_6_CHANNEL	&h36434C52	Generic 6 channel
SPACE_7_CHANNEL	&h37434C52	Generic 7 channel
SPACE_8_CHANNEL	&h38434C52	Generic 8 channel
SPACE_CMY	&h434D5920	CMY
SPACE_CMYK	&h434D594B	CMYK
SPACE_GRAY	&h47524159	Gray scale
SPACE_HLS	&h484C5320	HLS
SPACE_HSV	&h48535620	HSV
SPACE_Lab	&h4C616220	Lab
SPACE_Luv	&h4C757620	Luv
SPACE_RGB	&h52474220	RGB
SPACE_XYZ	&h58595A20	XYZ
SPACE_YCbCr	&h59436272	YCbCr
SPACE_Yxy	&h59787920	Yxy

214.7 class WindowsICMProfileMBS

214.7.1 class WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a color profile.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.1pr4
- MBS Xojo / Real Studio Plugins, version 14.1pr3
- MBS Real Studio Plugins, version 11.1pr11

214.7.2 Methods

214.7.3 ConvertColorNameToIndex(name as string) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CMConvertColorNameToIndex function converts color names in a named color space to index numbers in a color profile.
Notes: name: The name of the color.

Returns the color index.

This function is required in the default CMM. It is optional for all other CMMs.

214.7.4 ConvertIndexToColorName(index as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ConvertIndexToColorName transforms indices in a color space to an array of names in a named color space.
Notes: This function is required in the default CMM. It is optional for all other CMMs.

214.7.5 CountColorProfileElements as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetCountColorProfileElements function retrieves the number of tagged elements in a given color profile.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
Var w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox "CountColorProfileElements: "+str(w.CountColorProfileElements)
```

Notes: Returns number of tagged elements in the profile or 0 on any error.
This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP.

214.7.6 CreateIccProfile(options as Integer = 0) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts a WCS profile into an International Color Consortium (ICC) profile.
Notes: Options: A flag value that specifies the profile conversion options.By default, the original WCS profiles used for the conversion are embedded in the output ICC profile in a Microsoft private tag, ProfilesTag (with signature "MS000". This produces an ICC profile that is compatible with ICC software, yet retains the original WCS profile data available to code designed to parse it.The possible values of this parameter are as follows. Any bits not defined in this list are reserved and should be set to zero:

WCS_DEFAULT	Specifies that the new ICC profile contains the original WCS profile in a private ProfilesTag.
WCS_ICCONLY	Specifies that the new ICC profile does not contain either the ProfilesTag or the original WCS profile.

Returns new profile object.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd372239(v=vs.85).aspx

214.7.7 GetColorProfileElement(tag as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorProfileElement function copies data from a specified tagged profile element of a specified color profile into a buffer.

Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("sRGB Profile.icc")
Var w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox w.GetColorProfileElement(&h64657363) // that's the code for desc, the description
```

Notes: tag: Identifies the tagged element from which to copy.

This function will fail if Profile is not a valid International Color Consortium (ICC) profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust XML parsing libraries.

214.7.8 GetColorProfileElementTag(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorProfileElementTag function retrieves the tag name specified by dwIndex in the tag table of a given International Color Consortium (ICC) color profile, where Index is a one-based index into that table.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
Var w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
Var list(-1) as string
Var c as Integer = w.CountColorProfileElements-1

for i as Integer = 0 to c
list.Append DecodingFromHexMBS(hex(w.GetColorProfileElementTag(i)))
next

MsgBox "Tags: "+Join(list, ", ")
```

Notes: Index: Specifies the one-based index of the tag to retrieve.

This function will fail if Profile is not a valid ICC profile.

GetColorProfileElementTag can be used to enumerate all tags in a profile after getting the number of tags in the profile using GetCountColorProfileElements.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust XML parsing libraries.

214.7.9 GetNamedProfileInfo as WindowsICMNamedProfileInfoMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetNamedProfileInfo function retrieves information about the International Color Consortium (ICC) named color profile that is specified in the first parameter.
Notes: This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because named profiles are explicit ICC profile types.
Returns nil on any error.

214.7.10 GetProfileData as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Given valid color profile, the GetProfileData function will return the contents of the profile.
Notes: If the object is a Windows Color System (WCS) handle, then the DMP is returned and the CAMP and GMMP associated with the HPROFILE are ignored.

Returns the data or an empty string on any error.
See GetColorProfileFromHandle in MSDN documentation.

214.7.11 IsColorProfileTagPresent(tag as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IsColorProfileTagPresent function reports whether a specified International Color Consortium (ICC) tag is present in the specified color profile.
Notes: tag: Specifies the ICC tag to check.

Returns true if the tag is valid and false if not.

This function will fail if Profile is not a valid ICC profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust XML parsing libraries.

214.7.12 IsValid as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IsValid function reports whether the given profile is a valid ICC profile that can be used for color management.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
Var w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox "Valid: "+str(w.IsValid)
```

Notes: Returns true if the profile is valid.

Only the Windows default CMM is required to export this function; it is optional for all other CMMs.

If a CMM does not support this function, Windows uses the default CMM to validate the profile.

214.7.13 OpenProfileData(data as string, DesiredAccess as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The OpenColorProfile function opens or create a color profile.
Notes: file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

214.7.14 OpenProfileFile(file as folderitem, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The OpenColorProfile function opens or create a color profile.
Notes: file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

Value	Meaning
FILE_SHARE_READ	Other open operations can be performed on the profile for read access.
FILE_SHARE_WRITE	Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.

Value	Meaning
CREATE_NEW	Creates a new profile. Fails if the profile already exists.
CREATE_ALWAYS	Creates a new profile. Overwrites the profile if it exists.
OPEN_EXISTING	Opens the profile. Fails if it does not exist
OPEN_ALWAYS	Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.
TRUNCATE_EXISTING	Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILEs. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn't exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

214.7.15 OpenProfilePath(path as string, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The OpenColorProfile function opens or create a color profile.
Notes: file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

Value	Meaning
FILE_SHARE_READ	Other open operations can be performed on the profile for read access.
FILE_SHARE_WRITE	Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.

Value	Meaning
CREATE_NEW	Creates a new profile. Fails if the profile already exists.
CREATE_ALWAYS	Creates a new profile. Overwrites the profile if it exists.
OPEN_EXISTING	Opens the profile. Fails if it does not exist
OPEN_ALWAYS	Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.
TRUNCATE_EXISTING	Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILEs. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn't exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

214.7.16 SetColorProfileHeader(header as WindowsICMProfileHeaderMBS) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetColorProfileHeader function sets the header data in a specified ICC color profile.
Notes: Header: the profile header data to write to the specified profile.

Returns true on success.

This function will fail if Profile is not a valid ICC profile.

If the color profile was not opened with read/write permission, SetColorProfileHeader fails.

SetColorProfileHeader overwrites the current header in the ICC profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because

profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust XML parsing libraries.

214.7.17 Properties

214.7.18 ColorProfileHeader as WindowsICMProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorProfileHeader function retrieves or derives ICC header structure from either ICC color profile or WCS XML profile.
Notes: Drivers and applications should assume returning TRUE only indicates that a properly structured header is returned. Each tag will still need to be validated independently using either legacy ICM2 APIs or XML schema APIs.

To determine whether the header is derived from an ICC or DMP profile handle, check the header signature (header bytes 36-39). If the signature is "acsp" (big endian) then an ICC profile was used. If the signature is "cdmp" (big-endian) then a DMP was used.

The distinguishing features that identify a header as having been "synthesized" for a WCS DMP are:

WindowsICMProfileHeaderMBS.Signature = 'pmdc' (little endian = big endian 'cdmp')
WindowsICMProfileHeaderMBS.CMMType = '1scw' (little endian = big endian 'wcs1').
(Read only property)

214.7.19 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: Value is a HPROFILE.
(Read and Write property)

214.7.20 Constants

Creation Mode Constants

Constant	Value	Description
CREATE_ALWAYS	2	Creates a new profile. Overwrites the profile if it exists.
CREATE_NEW	1	Creates a new profile. Fails if the profile already exists.
OPEN_ALWAYS	4	Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.
OPEN_EXISTING	3	Opens the profile. Fails if it does not exist
TRUNCATE_EXISTING	5	Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

Profile sharing flags

Constant	Value	Description
FILE_SHARE_READ	1	Other open operations can be performed on the profile for read access.
FILE_SHARE_WRITE	2	Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

Profile access flags

Constant	Value	Description
PROFILE_READ	1	Opens the profile for read access.
PROFILE_READWRITE	2	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

CreateICCProfile Flags

Constant	Value	Description
WCS_DEFAULT	0	Specifies that the new ICC profile contains the original WCS profile in a private WcsProfilesTag.
WCS_ICCONLY	&h00010000	Specifies that the new ICC profile does not contain either the WcsProfilesTag or the original WCS profile.

214.8 class WindowsICMSetupMBS

214.8.1 class WindowsICMSetupMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class is made to query color matching setup information from the user.
Notes: This class contains information that the Setup function uses to initialize the ColorManagement dialog box. After the user closes the dialog box, Setup returns information about the user's selection in this class.
Blog Entries

- MBS Xojo Plugins, version 21.6pr3
- MBS Real Studio Plugins, version 11.1pr11

214.8.2 Methods

214.8.3 Setup as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Setup function creates a Color Management dialog box that lets the user choose whether to enable color management, and if so, provides control over the color profiles used and over the rendering intent.
Notes: Returns true if the user clicked OK and false on any error or when dialog was cancelled.

214.8.4 Properties

214.8.5 DisplayName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string naming the monitor to be used for color management.
Notes: If this is not the name of a valid monitor, the first enumerated monitor is used.
(Read and Write property)

214.8.6 Flags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A set of bit flags used to initialize the dialog box.
Notes: If set to 0 on entry, all controls assume their default states.

When the dialog box returns, these flags are set to indicate the user's input.

See CMS_* flag constants.
(Read and Write property)

214.8.7 MonitorProfile as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string in which to place the name of the user-selected monitor profile.
Notes: If the CMS_SETMONITORPROFILE flag is used, this flag can also be used to select a profile other than the monitor default when the dialog is first displayed.
(Read and Write property)

214.8.8 Parent as Variant

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop only.

Function: The parent window.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

214.8.9 PrinterName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string naming the printer on which the image is to be rendered.
Notes: If this is not a valid printer name, the default printer is used and named in the dialog.
(Read and Write property)

214.8.10 PrinterProfile as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string in which to place the name of the user-selected printer profile.
Notes: If the CMS_SETPRINTERPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed.
(Read and Write property)

214.8.11 ProofingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of color management desired for the proofed image.
Notes: Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=vs.85).aspx
(Read and Write property)

214.8.12 RenderIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of color management desired.
Notes: Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=vs.85).aspx
(Read and Write property)

214.8.13 SourceName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: An application-specified string which describes the source profile of the item for which color management is to be performed.
Notes: If this is "", the Image Source control displays the name of the Windows default color profile.
(Read and Write property)

214.8.14 TargetProfile as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string in which to place the name of the user-selected target profile for proofing.
Notes: If the CMS_SETTARGETPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed.
(Read and Write property)

214.8.15 Events

214.8.16 Apply

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This event is invoked when the Apply button of the Color Management dialog box is selected.

214.8.17 Idle

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This event is called regularly if the CMS_USEHOOK flag is used.

214.8.18 Constants

Flag Constants

Constant	Value	Description
CMS_DISABLEICM	1	If set on entry, this flag indicates that the "Enable Color Management" ch box is cleared, disabling all other controls. If set on exit, it means that the u does not wish color management performed.
CMS_DISABLEINTENT	1024	
CMS_DISABLERENDERINTENT	2048	
CMS_ENABLEPROOFING	2	If set on entry, this flag indicates that the Proofing controls are to be enabl and the Proofing check box is checked. If set on exit, it means that the u wishes to perform color management for a different target device than selected printer.
CMS_SETMONITORPROFILE	16	If set on entry, this flag indicates that the color management profile namec the MonitorProfile member is to be the initial selection in the monitor pro control. If the specified profile is not associated with the monitor, this flag ignored, and the default profile for the monitor is used.
CMS_SETPRINTERPROFILE	32	If set on entry, this flag indicates that the color management profile namec the PrinterProfile member is to be the initial selection in the printer pro control. If the specified profile is not associated with the printer, this flag ignored, and the default profile for the printer is used.
CMS_SETPROOFINTENT	5	Ignored unless CMS_ENABLEPROOFING is also set. If set on entry, a CMS_ENABLEPROOFING is also set, this flag indicates that the Proofi Intent member is to be used to initialize the Target Rendering Intent cont Otherwise, the control defaults to Picture rendering. This flag is set on exi proofing is enabled.
CMS_SETRENDERINTENT	4	If set on entry, this flag indicates that the RenderIntent member contains value to use to initialize the Rendering Intent control. Otherwise, the cont defaults to Picture rendering. This flag is set on exit if WCS is enabled.
CMS_SETTARGETPROFILE	64	If set on entry, this flag indicates that the color profile named in the Targ Profile member is to be the initial selection in the target profile control. If specified profile is not installed, this flag is ignored, and the default profile the printer is used. If the printer has no default profile, then the first profil alphabetical order will be displayed.
CMS_USEAPPLYCALLBACK	256	If set on entry, this flag indicates that the SetupColorMatching function sho call the Apply event.
CMS_USEDESCRIPTION	512	If set on entry, this flag instructs the Setup function to retrieve the pro description contained in the profile description tags (See ICC Profile Forn Specification v3.4). It will insert them into the Monitor Profile, Printer Prof Emulated Device Profile edit boxes in the Color Management common dia box.
CMS_USEHOOK	128	The idle event is called regularly if this flag is set.

Rendering Intent Constants

Constant	Value	Description
INTENT_ABSOLUTE_COLORIMETRIC	3	Maintain the white point. Match the colors to their nearest color i nation gamut.
INTENT_PERCEPTUAL	0	Maintain contrast. Used for photographs and natural images.
INTENT_RELATIVE_COLORIMETRIC	1	Maintain colorimetric match. Used for graphic designs and named
INTENT_SATURATION	2	Maintain saturation. Used for business charts and other situatio undithered colors are required.

214.9 class WindowsICMTransformMBS

214.9.1 class WindowsICMTransformMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a color transformation.
Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

214.9.2 Methods

214.9.3 CheckColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, Results() as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CheckColors function determines whether the colors in an array lie within the output gamut of a specified transform.
Notes: InputColors: an array of colors.
ctInput: Specifies the input color type.
Results: An array of nColors bytes that receives the results of the test.

If this function succeeds, the return value is TRUE.

If this function fails, the return value is FALSE. For extended error information, call GetLastError.

Remarks

If the input color type is not compatible with the color transform, CheckColors fails.

The function places results of the tests in the array pointed to by paResult. Each byte in the array corresponds to a COLOR element in the array pointed to by paInputColors and has an unsigned value between 0 and 255. The value 0 denotes that the color is in gamut, while a nonzero value denotes that it is out of gamut. For any integer n such that 0 <n <255, a result value of n+1 indicates that the corresponding color is at least as far out of gamut as would be indicated by a result value of n.

The out-of-gamut information in the gamut tags created in WCS use the perceptual color distance in CIECAM02, which is the mean square root in CIECAM02 Jab space. The distance in the legacy ICC profile gamut tags is the mean square root in CIELAB space. We recommend that you use the CIECAM02 space when it is available because it provides more perceptually accurate distance metrics.

214.9.4 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer)

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateColorTransform function creates a color transform that applications can use to perform color management.
Notes: LogColorSpace: The input colorspace.

DestProfile: The profile of the destination device. The function determines whether the profile contains International Color Consortium (ICC) or Windows Color System (WCS) profile information.

TargetProfile: The profile of the target device. The function determines whether the profile contains ICC or WCS profile information.

Flags: Specifies flags to used control creation of the transform. See Remarks.

On success the handle property is not zero.

If the target profile is nil, the transform goes from the source logical color space to the destination profile. If the target profile is given, the transform goes from the source logical color space to the target profile and then to the destination profile. This allows previewing output meant for the target device on the destination device.

The values in Flags are intended as hints only. The color management module must determine the best way to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

PRESERVEBLACK	If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.
SEQUENTIAL_TRANSFORM	If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform. Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.
WCS_ALWAYS	If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types

of transforms, except for FAST_TRANSLATE, which only works in a pure ICC-to-ICC transform.

The CreateColorTransform function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

The B2Ax tags are required for any profile that is the target of a transform.

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS_ALWAYS set:

Non-RGB ColorSpace profiles
NamedColor profiles
n-channel profiles (where n >8)
DeviceLink profiles
Abstract profiles
See also:

- 214.9.5 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer) 24388

214.9.5 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer)

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateMultiProfileTransform function accepts an array of profiles or a single device link profile and creates a color transform that applications can use to perform color mapping.
Notes: Profiles: An array of profiles to be used. The function determines whether the HPROFILEs contain International Color Consortium (ICC) or Windows Color System (WCS) profile information and processes them appropriately. When valid WCS profiles are returned by OpenColorProfile, these profiles contain the combination of DMP, CAMP, and GMMP profiles.
Intent: An array of intents to use. Each intent is one of the following values:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

GMMPs are a generalization of intents. There are two possible sources of intents: the "destination" profile and the intent list parameter to CreateMultiProfileTransform. The term "destination" is not used since all but two of the profiles in the profile list parameter will serve as first destination and then source.

For more information, see Rendering Intents.

nIntents
Specifies the number of elements in the intents array: can either be 1 or the same value as nProfiles. For profile arrays that contain any WCS profiles, the first rendering intent is ignored and only nProfiles -1 elements are used for these profile arrays. The maximum number of nIntents is 10.

Flags: Specifies flags used to control creation of the transform.

indexPreferredCMM: Specifies the one-based index of the color profile that indicates what color management module (CMM) to use. The application developer may allow Windows to choose the CMM by setting this parameter to INDEX_DONT_CARE. See Using Color Management Modules (CMM) Third party CMMs are only available for ICC workflows. Profile arrays containing WCS profiles will ignore this flag. It is also ignored when only ICC profiles are used and when the WCS_ALWAYS flag is used.

On success the handle property is not zero.

If a device link profile is being used, the function will fail if Profiles contains more than one value.

The array of intents specifies how profiles should be combined. The nth intent is used for combining the nth profile in the array. If only one intent is specified, it is used for the first profile, and all other profiles are combined using Match intent.

The values in Flags are intended as hints only. The color management module must determine the best way to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

PRESERVEBLACK	If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.
SEQUENTIAL_TRANSFORM	If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform. Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.
WCS_ALWAYS	If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types of transforms, except for FAST_TRANSLATE and USE_RELATIVE_COLORIMETRIC, which only work

in a pure ICC-to-ICC transform.

The CreateMultiProfileTransform function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

We recommend that there be only one GMMP between a source and destination DMP. Gamut boundary descriptions (GBDs) are created from the DMP/CAMP combinations. The subsequent GMMPs use the GDBs prior to them in the processing chain until there exists a DMP/CAMP GBD next in the sequence to be used. For example, assume a sequence DMP1, CAMP1, GMMP1, GMMP2, GMMP3, DMP2, CAMP2, GMMP4, GMMP5, CAMP3, DMP3. Then GMMP1, GMMP2 use GBD1 as their source and destination. Then GMMP3 uses GBD1 as source and GBD2 as destination. Then GMMP4 uses GBD2 as source and destination. Finally GMMP5 uses GBD2 as source and GBD3 as destination. This assumes no GMMP is identical to one next to it.

For WCS profiles, we recommend that the rendering intents be set to DWORD_MAX in order to use the GMMP within the WCS profile handle. This is because the array of rendering intents takes precedence over the rendering intents or gamut mapping models specified or contained in the profiles specified by the PROFILEs. The array of rendering intents references the default GMMP for those rendering intents. Ideally, only one gamut mapping is performed between a source and destination device by setting one or the other GMMP to NULL when creating the HPROFILE with WCS profile information. Any legacy application that uses a WCS DMP will invoke a sequence of GMMPs. GDBs are chosen based on DMPs and CAMPs. For intermediate GMMP gamut boundaries, the source and destination GBDs are used.

In summary, if ubound(Intents)=0, then the first GMM is set based on the GMMP that is set as default* for the padwIntent value, unless that value is DWORD_MAX, in which case the embedded GMM information from the second profile is used (The embedded GMM information is either a GMMP or, in the case of an ICC profile, the baseline GMM corresponding to** the intent from the profile header). The remainder of the GMMs are set based on the GMMP that is set as default* for RelativeColorimetric.

If ubound(Intents) = ubound(Profiles) - 1, then each GMM is set based on the GMMP that is set as default* for the value in the padwIntent array at the corresponding index, except where padwIntent values are DWORD_MAX. For values in the padwIntent array that are DWORD_MAX, the GMMs at corresponding positions are set based on the embedded GMM information from the second of the two profiles whose gamuts are mapped by the GMM. (Again, the embedded GMM information is either a GMMP or, in the case of an ICC profile, the baseline GMM corresponding to** the intent from the profile header).

If ubound(Intents) = ubound(Profiles), then first intent is ignored and funtion behaves as it does in the case when ubound(Intents) = ubound(Profiles) - 1.

Any other combination of padwIntents and nIntents will return an error.

- ”set as default” means that the default GMMP is queried using WcsGetDefaultColorProfile with

its profileManagementScope parameter set to WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER. This may return either current-user or system-wide defaults as described in the documentation for WcsGetDefaultColorProfile.

- "GMM corresponding to" does not mean "GMM from the GMMP set as default for". Instead it means "a constant association between ICC profile intents and baseline GMM algorithms."

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS_ALWAYS set:

- Non-RGB ColorSpace profiles
- NamedColor profiles
- n-channel profiles (where n >8)
- DeviceLink profiles
- Abstract profiles

See also:

- 214.9.4 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer) 24387

214.9.6 GetCMMInfo(what as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetCMMInfo function retrieves various information about the color management module (CMM) that created the specified color transform.
Notes: what: Specifies the information to be retrieved. This parameter can take one of the following constant values.

Value	Meaning
CMM_WIN_VERSION	Retrieves the version of Windows targeted by the color management module (CMM).
CMM_DLL_VERSION	Retrieves the version number of the CMM.
CMM_IDENT	Retrieves the CMM signature registered with the International Color Consortium (ICC).

If this function succeeds, the return value is the information specified in What.
If this function fails, the return value is zero.

214.9.7 TranslateBitmapBits(SrcBits as memoryblock, InputType as Integer, Width as Integer, Height as Integer, InputRowBytes as Integer, DestBits as memoryblock, DestType as Integer, DestRowBytes as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.
Notes: SrcBits: Pointer to the bitmap to translate.
InputType: Specifies the format of the input bitmap. Use one of the BM_* constants.
Width: Specifies the number of pixels per scan line in the input bitmap.
Height: Specifies the number of scan lines in the input bitmap.
InputRowBytes: Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the input bitmap; if set to zero, the function assumes that scan lines are padded so as to be DWORD-aligned.
DestBits: Pointer to the buffer in which to place the translated bitmap.
DestType: Specifies the format of the output bitmap. Use one of the BM_* constants.
DestRowBytes: Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the output bitmap; if set to zero, the function assumes that scan lines should be padded to be DWORD-aligned.

If this function succeeds, the return value is TRUE.
If this function fails, the return value is FALSE.

Remarks

If the input and output formats are not compatible with the color transform, this function fails.

When either of the floating point BMFORMATs, BM_32b_scARGB or BM_32b_scRGB are used, the color data being translated should not contain NaN or infinity. NaN and infinity are not considered to represent legitimate color component values, and the result of translating pixels containing NaN or infinity is meaningless in color terms. NaN or infinity values in the color data being processed will be handled silently, and an error will not be returned.

214.9.8 TranslateColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, OutputColors() as WindowsICMColorMBS, ctOutput as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TranslateColors function translates an array of colors from the source color space to the destination color space as defined by a color transform.

Notes: InputColors: The input color.
ctInput: Specifies the input color type.
OutputColors: The output color.
ctOutput: Specifies the output color type.

Returns true on success and false on failure.

214.9.9 TranslatePictures(InputPicture as picture, OutputPicture as picture) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.
Notes: InputPicture: input picture
OutputPicture: output picture

If this function succeeds, the return value is TRUE.
If this function fails, the return value is FALSE.

Make sure the pictures have the same size.

If the input and output formats are not compatible with the color transform, this function fails.

214.9.10 Properties

214.9.11 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle for the transformation.
Notes: (Read and Write property)

214.9.12 Events

214.9.13 Progress(Maximum as Integer, Current as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The progress event for long operations.

214.9.14 Constants

Constants

Constant	Value	Description
CMM_DLL_VERSION	3	One of the values for the GetCMMInfo function. Retrieves the version number of the CMM.
CMM_IDENT	1	One of the values for the GetCMMInfo function. Retrieves the CMM signature registered with the International Color Consortium (ICC).
CMM_WIN_VERSION	0	One of the values for the GetCMMInfo function. Retrieves the version of Windows targeted by the color management module (CMM).
INDEX_DONT_CARE	0	A special value for index in constructor. The application developer may allow Windows to choose the CMM by setting the indexPreferredCMM parameter to INDEX_DONT_CARE for the constructor.
WCS_ALWAYS	&h200000	One of the flags passed when creating a transformation. If this bit is set, even all-ICC transforms will use the WCS code path.

Transform creation Flags

Constant	Value	Description
BEST_MODE	3	Transform will be used for the display of the highest-quality imag the target device.
ENABLE_GAMUT_CHECKING	&h10000	Use this transform for gamut checking.
FAST_TRANSLATE	&h40000	Look up color only. Do not interpolate the color.
NORMAL_MODE	2	Transform will be used for normal image display. Average image
PRESERVEBLACK	&h100000	If this bit is set, the transform engine inserts the appropriate blac GMMP as the last GMMP in the transform sequence. This flag o a pure WCS transform.
PROOF_MODE	1	Transform will be used to preview the image. Low image quality.
SEQUENTIAL_TRANSFORM	&h80800000	If this bit is set, each step in the WCS processing pipeline is p every pixel in the image and no optimized color transform is bui only works in a pure WCS transform. Restrictions: A transform created with the SEQUENTIAL_TR flag set may only be used in the thread on which it was created one color translation call at a time. COM must be initialized prio the sequential transform and must remain initialized for the lif transform object.
USE_RELATIVE_COLORIMETRIC	&h20000	

Bitmap Format Constants

Constant	Value	Description
BM_10b_G3CH	&h0404	32 bits per pixel. 10 bits are used for each color channel. The 2 most significa bits are ignored.
BM_10b_Lab	&h0403	32 bits per pixel. 10 bits are used for each color channel. The 2 most significa bits are ignored.
BM_10b_RGB	9	32 bits per pixel. 10 bits are used for each color channel. The 2 most significa bits are ignored.
BM_10b_XYZ	&h0401	32 bits per pixel. 10 bits are used for each color channel. The 2 most significa bits are ignored.
BM_10b_Yxy	&h0402	32 bits per pixel. 10 bits are used for each color channel. The 2 most significa bits are ignored.
BM_16b_G3CH	&h0504	64 bits per pixel. 16 bits are used for the gray-scale value. Each of the thr color channels uses 16 bits.
BM_16b_GRAY	&h0505	64 bits per pixel. 16 bits are used for the gray-scale value. All other bits a ignored.
BM_16b_Lab	&h0503	64 bits per pixel. 16 bits are used for the gray-scale value. Each of the thr color channels uses 16 bits.
BM_16b_RGB	10	64 bits per pixel. 16 bits are used for the gray-scale value. Each of the thr color channels uses 16 bits.
BM_16b_XYZ	&h0501	64 bits per pixel. 16 bits are used for the gray-scale value. Each of the thr color channels uses 16 bits.
BM_16b_Yxy	&h0502	64 bits per pixel. 16 bits are used for the gray-scale value. Each of the thr color channels uses 16 bits.
BM_32b_scARGB	&h0602	128 bits per pixel. 32 bits are used for each color channel, as defined by t IEEE 32-bit floating point standard.
BM_32b_scRGB	&h0601	96 bits per pixel. 32 bits are used for each color channel, as defined by t IEEE 32-bit floating point standard.
BM_565RGB	1	16 bits per pixel. 5 bits are used for red, 6 for green, and 5 for blue.
BM_5CHANNEL	&h0205	40 bits per pixel. 8 bits apiece are used for each channel.
BM_6CHANNEL	&h0206	48 bits per pixel. 8 bits apiece are used for each channel.
BM_7CHANNEL	&h0207	56 bits per pixel. 8 bits apiece are used for each channel.
BM_8CHANNEL	&h0208	64 bits per pixel. 8 bits apiece are used for each channel.
BM_BGRTRIPLETS	4	24 bits per pixel maximum. For three channel colors, such as red, green, a blue, the total size is 24 bits per pixel. For single channel colors, such as gra the total size is 8 bits per pixel.
BM_CMYKQUADS	&h0020	32 bits per pixel. 8 bits are used for each color channel.
BM_G3CHTRIPLETS	&h0204	24 bits per pixel maximum. For three channel values, the total size is 24 b per pixel. For single channel gray scale, the total size is 8 bits per pixel.
BM_GRAY	&h0209	32 bits per pixel. Only the 8 bit gray-scale value is used.
BM_KYMCQUADS	&h0305	32 bits per pixel. 8 bits are used for each color channel.
BM_LabTRIPLETS	&h0203	24 bits per pixel maximum. For three channel, L, a, and b values, the tot size is 24 bits per pixel. For single channel gray scale, the total size is 8 b per pixel.
BM_NAMED_INDEX	&h0405	32 bits per pixel. Named color indices. Index numbering begins at one.
BM_R10G10B10A2	&h0701	Only in Windows Vista.
BM_R10G10B10A2_XR	&h0702	Only in Windows Vista.
BM_R16G16B16A16_FLOAT	&h0703	Only in Windows Vista.
BM_RGBTRIPLETS	2	24 bits per pixel maximum. For three channel colors, such as red, green, a blue, the total size is 24 bits per pixel. For single channel colors, such as gra the total size is 8 bits per pixel.
BM_S2DOT13FIXED_scARGB	&h0604	64 bits per pixel. Color data is stored as one 16-bit word per channel, with fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for t sign, 2 bits for the integer portion, and 13 bits for the fractional portion.
BM_S2DOT13FIXED_scRGB	&h0603	48 bits per pixel. Color data is stored as one 16-bit word per channel, with fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for t sign, 2 bits for the integer portion, and 13 bits for the fractional portion.
BM_x555G3CH	&h0104	16 bits per pixel. G3CH color space. 5 bits per channel. The most significa bit is ignored.
BM_x555Lab	&h0103	16 bits per pixel. Lab color space. 5 bits per channel. The most significant b

Info selectors for GetInfo

Constant	Value	Description
CMM_DESCRIPTION	5	A text string that describes the color management module.
CMM_DRIVER_VERSION	2	
CMM_FROM_PROFILE	0	
CMM_LOGOICON	6	The logo icon for this CMM.
CMM_VERSION	4	Version of Windows supported.
CMM_WINDOWS_DEFAULT	&h57696E20	

Rendering Intent Constants

Constant	Value	Description
INTENT_ABSOLUTE_COLORIMETRIC	3	Maintain the white point. Match the colors to their nearest color i nation gamut.
INTENT_PERCEPTUAL	0	Maintain contrast. Used for photographs and natural images.
INTENT_RELATIVE_COLORIMETRIC	1	Maintain colorimetric match. Used for graphic designs and named
INTENT_SATURATION	2	Maintain saturation. Used for business charts and other situatio undithered colors are required.

Chapter 215

Windows Location

215.1 class WindowsLocationExceptionMBS

215.1.1 class WindowsLocationExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for errors in the Windows Location API.
Notes: Subclass of the RuntimeException class.
Blog Entries

- News from the MBS Xojo Plugins Version 20.4
- MBS Xojo Plugins, version 20.4pr2

215.2 class WindowsLocationManagerMBS

215.2.1 class WindowsLocationManagerMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for accessing Location API on Windows.
Notes: You may need to StartEvents to later query location or receive events.

see MSDN for details:
https://docs.microsoft.com/en-us/windows/win32/locationapi/windows-location-api-portal

See CLLocationManagerMBS class for macOS.

215.2.2 Methods

215.2.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

215.2.4 RequestPermissions(win as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Opens a system dialog box to request user permission to enable location devices.
Notes: win: the parent window for the dialog.
See also:

- 215.2.5 RequestPermissions(win as window)

215.2.5 RequestPermissions(win as window)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Opens a system dialog box to request user permission to enable location devices.
Notes: win: the parent window for the dialog.
See also:

- 215.2.4 RequestPermissions(win as DesktopWindow) 24398

215.2.6 StartEvents(RequestedReportInterval as Integer = 0)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts events.
Notes: Should be called once to start events and get LocationChanged or StatusChanged to work.

215.2.7 StopEvents

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stop events.

215.2.8 Properties

215.2.9 DesiredAccuracy as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current requested accuracy setting.
Notes: See kLocationDesiredAccuracyHigh and kLocationDesiredAccuracyDefault constants.
(Read and Write property)

215.2.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

215.2.11 Report as WindowsLocationMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a location report.
Notes: When Report is called, it may result in a notification being displayed in the taskbar, and a Location Activity event being logged in Event Viewer, if it is the application's first use of location.
(Read only property)

215.2.12 ReportInterval as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The requested amount of time, in milliseconds, between report events.
Notes: If this value is set to zero, no minimum interval is specified and your application receives events at the location sensor's default interval.
(Read and Write property)

215.2.13 ReportStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the status for the specified report type.
Notes: (Read only property)

215.2.14 Events

215.2.15 LocationChanged(Report as WindowsLocationMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when a new location report is available.
Notes: If the application calls LocationChanged as a result of its first use of location, the call might cause a notification to appear in the taskbar, and cause a Location Activity event to be logged in Event Viewer.

215.2.16 StatusChanged(Status as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called when a report status changes.
Notes: This event provides report status for new reports. The most recent reports remain available through

GetReport, regardless of the status reported by this event.

215.2.17 Constants

Location Desired Accuracy

Constant	Value	Description
kLocationDesiredAccuracyDefault	0	The sensor should use the accuracy for which it can optimize power use an other cost considerations.
kLocationDesiredAccuracyHigh	1	The sensor should deliver the most accurate report possible. This include using services that might charge money, or consuming higher levels of batter power or connection bandwidth.

Location Report Status

Constant	Value	Description
kLocationReportStatusAccessDenied	2	No permissions have been granted to access this report type. Call Request missions.
kLocationReportStatusError	1	There was an error when creating the report, or location providers for requested type are unable to provide any data. Location providers migh currently unavailable, or location providers cannot obtain any data. For ex ple, this state may occur when a GPS sensor is indoors and no satellites a view.
kLocationReportStatusInitializing	3	The report is being initialized.
kLocationReportStatusNotSupported	0	The requested report type is not supported by the API. No location prov of the requested type are installed.
kLocationReportStatusRunning	4	The report is running. New location data for the requested report ty available.

215.3 class WindowsLocationMBS

215.3.1 class WindowsLocationMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: WindowsLocationMBS represents a location report that contains information in the form of latitude and longitude.
Notes: Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 20.4pr2

Xojo Developer Magazine

- 22.2, page 67: Find Yourself, How to determine the location of devices with MBS under Windows and Mac by Stefanie Juchmes-Simonis

215.3.2 Methods

215.3.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

215.3.4 Properties

215.3.5 Altitude as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the altitude, in meters.
Notes: Altitude is relative to the reference ellipsoid.

The Altitude property retrieves the altitude relative to the reference ellipsoid that is defined by the latest revision of the World Geodetic System (WGS 84), rather than the altitude relative to sea level.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

215.3.6 AltitudeError as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the altitude error, in meters.
Notes: Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

215.3.7 DateTime as DateTime

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the date and time when the report was generated.
Notes: Time stamps are provided as Coordinated Universal Time (UTC).
(Read only property)

215.3.8 ErrorRadius as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a distance from the reported location, in meters.
Notes: Combined with the location reported as the origin, this radius describes the circle in which the actual location is probably located.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

215.3.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

215.3.10 Latitude as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the latitude, in degrees.
Notes: The latitude is between -90 and 90, where north is positive.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

215.3.11 Longitude as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the longitude, in degrees.
Notes: The longitude is between -180 and 180, where East is positive.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

215.3.12 SensorID as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the ID of the sensor that generated the location report.
Notes: Provided as formatted UUID.
Maybe all zero if ID is not provided by OS.
(Read only property)

215.3.13 Timestamp as Date

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the date and time when the report was generated.
Notes: Time stamps are provided as Coordinated Universal Time (UTC).
(Read only property)

Chapter 216

Windows Media Foundation

216.1 class MFPMediaItemMBS

216.1.1 class MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An item to playback.
Notes: Can be loaded asynchronously before playing, so you can preload the next file while another is playing.
For Windows 7, Windows Server 2008 R2 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 19.6pr4

216.1.2 Methods

216.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

216.1.4 PresentationAttribute(UUID as String) as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the media item for a presentation attribute.
Notes: see
https://docs.microsoft.com/windows/win32/medfound/presentation-descriptor-attributes

If needed a future MBS Plugin version could include explicit properties for some of those values.

216.1.5 StreamAttribute(index as Integer, UUID as String) as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the media item for a stream attribute.
Notes: see
https://docs.microsoft.com/windows/win32/medfound/stream-descriptor-attributes

216.1.6 Properties

216.1.7 AudioBitsPerSample as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of bits per audio sample in an audio media type.
Notes: e.g. 16
(Read only property)

216.1.8 AudioChannels as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of audio channels in an audio media type.
Notes: e.g. 1
(Read only property)

216.1.9 AudioSamplesPerSecond as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of audio samples per second in an audio media type.
Notes: e.g. 44100
(Read only property)

216.1.10 CanPause as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media item can pause.
Notes: If this flag is absent, the Pause method will likely fail.
(Read only property)

216.1.11 CanSeek as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media item supports seeking.
Notes: If this flag is absent, setting the Position property will fail.
(Read only property)

216.1.12 Duration as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the duration of the media item.
Notes: (Read only property)

216.1.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

216.1.14 HasAudio as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains an audio stream.
Notes: Returns the value true if the media item contains at least one audio stream, or false otherwise.

(Read only property)

216.1.15 HasAudioSelected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains an audio stream.
Notes: Returns the value true if at least one audio stream is selected, or false otherwise.

To select or deselect streams before playback starts, set StreamSelection(index).
(Read only property)

216.1.16 HasSlowSeek as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Seeking can take a long time.
Notes: For example, the source might download content through HTTP.
(Read only property)

216.1.17 HasVideo as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains a video stream.
Notes: Returns the value true if the media item contains at least one video stream, or false otherwise.
(Read only property)

216.1.18 HasVideoSelected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains a video stream.
Notes: Returns the value true if at least one video stream is selected, or false otherwise.

To select or deselect streams before playback starts, set StreamSelection(index).
(Read only property)

216.1.19 IsLive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media item represents a live data source, such as video camera.
Notes: If playback is stopped and then restarted, there will be a gap in the content.
(Read only property)

216.1.20 IsProtected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains protected content.
Notes: If true then the media item contains protected content. Attempting to play this media item will cause a playback error.
(Read only property)

216.1.21 Metadata as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a dictionary that contains metadata for the source, such as author or title.
Notes: (Read only property)

216.1.22 NumberOfStreams as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of streams (audio, video, and other) in the media item.
Notes: (Read only property)

216.1.23 StartPosition as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The start time for the media item.
Notes: The adjusted start and stop times are used the next time that SetMediaItem is called with this media item. If the media item is already set on the player, the change does not happen unless you call SetMediaItem again.
(Read and Write property)

216.1.24 StopPosition as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The stop time for the media item.
Notes: The adjusted start and stop times are used the next time that SetMediaItem is called with this media item. If the media item is already set on the player, the change does not happen unless you call SetMediaItem again.
(Read and Write property)

216.1.25 Tag as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The tag value associated with this plugin object.
Notes: Can be used freely by you.
(Read and Write property)

216.1.26 URL as String

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the URL that was used to create the media item.
Notes: (Read only property)

216.1.27 VideoFrameRate as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Frame rate of a video media type, in frames per second.
Notes: The frame rate is expressed as a ratio. The upper 32 bits of the attribute value contain the numerator and the lower 32 bits contain the denominator. For example, if the frame rate is 30 frames per second (fps), the ratio is 30/1. If the frame rate is 29.97 fps, the ratio is 30,000/1001.

e.g. 2147483648016679, which gives with BitWise.ShiftRight(v, 32) the value 500000 and with BitWise-And(v, &hFFFFFFFF) the value 16679. 500000/16679 gives 29.97.
(Read only property)

216.1.28 StreamSelection(index as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects or deselects a stream.
Notes: Zero-based index of the stream. To get the number of streams, call NumberOfStreams.

Set to true: The stream is selected. During playback, this stream will play.
Set to false: The stream is not selected. During playback, this stream will not play.
(Read and Write computed property)

216.2 class MFPMediaPlayerExceptionMBS

216.2.1 class MFPMediaPlayerExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an error with MFPMediaPlayerMBS class.
Notes: See ErrorCode and Message properties.
Subclass of the RuntimeException class.

216.3.2 Methods

216.3.3 ClearMediaItem

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears the current media item.
Notes: This method stops playback and releases the player object's references to the current media item. This method completes asynchronously. When the operation completes, the MediaItemCleared event is invoked. The event type is

216.3.4 Constructor(URL as String = """, StartPlayback as Boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the MFPlay player object for audio only.
Notes: URL: The string that contains the URL of a media file to open (or file path). This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Please call this in main thread of application only.
See also:

- 216.3.5 Constructor(URL as String, StartPlayback as Boolean, control as DesktopControl) 24414
- 216.3.6 Constructor(URL as String, StartPlayback as Boolean, control as RectControl) 24415

- 216.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window) 24417

216.3.5 Constructor(URL as String, StartPlayback as Boolean, control as DesktopControl)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes: URL: The string that contains the URL of a media file to open (or file path). This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Control: A reference to a control where the video will appear. For audio-only playback, this parameter can be nil.

The control specified is used for the first selected video stream in the source.
If control is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 216.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window) 24417

216.3.6 Constructor(URL as String, StartPlayback as Boolean, control as RectControl)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes: URL: The string that contains the URL of a media file to open (or file path). This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Control: A reference to a control where the video will appear. For audio-only playback, this parameter can be nil.

The control specified is used for the first selected video stream in the source.
If control is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 216.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window) 24417

216.3.7 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the MFPlay player object.
Notes: URL: The string that contains the URL of a media file to open (or file path). This parameter can

be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Handle: A handle to a window or control where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 216.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window) 24417

216.3.8 Constructor(URL as String, StartPlayback as Boolean, win as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes: URL: The string that contains the URL of a media file to open (or file path). This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Win: A reference to a window where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 216.3.7 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer) 24415
- 216.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window) 24417

216.3.9 Constructor(URL as String, StartPlayback as Boolean, win as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes: URL: The string that contains the URL of a media file to open (or file path). This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Win: A reference to a window where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.
See also:

- 216.3.4 Constructor(URL as String = """, StartPlayback as Boolean = false) 24413
- 216.3.5 Constructor(URL as String, StartPlayback as Boolean, control as DesktopControl) 24414
- 216.3.6 Constructor(URL as String, StartPlayback as Boolean, control as RectControl) 24415

- 216.3.8 Constructor(URL as String, StartPlayback as Boolean, win as DesktopWindow) 24416

216.3.10 CreateMediaItemFromURL(URL as String, Sync as Boolean = true, tag as Variant = nil) as MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a media item from a URL.
Notes: URL: String that contains the URL of a media file (or file path).
Sync: If true, the method blocks until it completes. If false, the method does not block and completes asynchronously.

If fSync is true, we return the item on success.

This method does not queue the media item for playback. To queue the item for playback, set MediaItem property.

The CreateMediaItemFromURL method can be called either synchronously or asynchronously:

If Sync is true, the method completes synchronously and returns the new item.
If Sync is false, the method completes asynchronously. When the operation completes, the MediaItemCreated event is invoked. The event call passes the new media item.

If you make multiple asynchronous calls to CreateMediaItemFromURL, they are not guaranteed to complete in the same order. Use the tag to pass data to the event.

Currently, this method raises an error if the URL specifies any of the following protocols: rtsp*, mms*, or mcast.

216.3.11 FrameStep

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Steps forward one video frame.
Notes: This method completes asynchronously. When the operation completes, the FrameStepped event is raised.

The player object does not support frame stepping during reverse playback (that is, while the playback rate is negative).

216.3.12 GetVideoSourceRect(byref Left as Single, byref Top as Single, byref Right as Single, byref Bottom as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the video source rectangle.
Notes: This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).
If the source rectangle is { 0, 0, 1, 1 } , the entire image is displayed. This is the default value.

216.3.13 InsertEffect(CLSID as String, isOptional as boolean = false) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies an audio or video effect to playback.
Notes: Please pass class id of a Media Foundation transform (MFT) that implements the effect. MFTs expose the IMFTransform interface.

isOptional specifies whether the effect is optional.

Value	Meaning
True	The effect is optional. If the MFPlay player object cannot add the effect, it ignores the effect and continues playback.
False	If the MFPlay player object cannot add the effect, a playback error occurs.

Returns index of the effect, which you pass for RemoveEffect later if needed.

The effect is applied to any media items set after the method is called. It is not applied to the current media item.

For each media item, the effect is applied to the first selected stream of the matching type (audio or video). If a media item has two selected streams of the same type, the second stream does not receive the effect. The effect is ignored if the media item does not contain a stream that matches the effect type. For example, if you set a video effect and play a file that contains just audio, the video effect is ignored, although no error is raised.

The effect is applied to all subsequent media items, until the application removes the effect. To remove an effect, call RemoveEffect or RemoveAllEffects.

If you set multiple effects of the same type (audio or video), they are applied in the same order in which you

call InsertEffect.

Remote Playback Optimizations

Audio and video effects might be incompatible with optimizations that are used for remote playback. The following remarks apply only to audio or video effects that are actually used during playback:
If you mark an audio or video effect as required, by setting fOptional to false, MFPlay disables remote playback optimizations.
Otherwise, if all audio/video effects are marked as optional, MFPlay might drop the effects, in order to enable remote playback optimizations.
In other words, required effects have priority over remote optimizations, but optional effects do not.

Non-audio, non-video effects do not affect remote optimizations. Also, if you insert a required effect but the source does not contain any streams of that type, remote optimizations are not disabled.

216.3.14 Pause

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses playback.
Notes: While playback is paused, the most recent video frame is displayed, and audio is silent.

This method completes asynchronously. When the operation completes, the application's Paused event is invoked.

216.3.15 Play

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts playback.
Notes: This method completes asynchronously. When the operation completes, the Started event is raised.

216.3.16 RemoveAllEffects

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes all effects that were added with the InsertEffect method.
Notes: The change applies to the next media item that is set on the player. The effects are not removed from the current media item.

216.3.17 RemoveEffect(Handle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes an effect that was added with the InsertEffect method.
Notes: Please pass the number returned by InsertEffect.

The change applies to the next media item that is set on the player. The effect is not removed from the current media item.

216.3.18 SetVideoSourceRect(Left as Single, Top as Single, Right as Single, Bottom as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the video source rectangle.
Notes: MFPlay clips the video to this rectangle and stretches the rectangle to fill the video window.

This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).

To display the entire image, set the source rectangle to { 0, 0, 1, 1 } . This is the default value.

MFPlay stretches the source rectangle to fill the entire video window. By default, MFPlay maintains the source's correct aspect ratio, letterboxing if needed. The letterbox color is controlled by the BorderColor property.

This method fails if no media item is currently set, or if the current media item does not contain video.
To set the video position before playback starts, call this method inside your MediaItemSet event.

216.3.19 Shutdown

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Shuts down the MFPlay player object and releases any resources the object is using.
Notes: After this method is called, most IMFPMediaPlayer methods raise exception about shutdown. Also, any media items created from this instance of the player object are invalidated and most IMFPMediaItem methods also raise exceptions.

The player object automatically shuts itself down when its reference count reaches zero. You can use the Shutdown method to shut down the player before all of the references have been released.

216.3.20 Stop

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops playback.
Notes: This method completes asynchronously. When the operation completes, the Stopped event is raised.

216.3.21 UpdateVideo

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Updates the video frame.
Notes: This method makes sure the video is updated now, not later.

216.3.22 Properties

216.3.23 AspectRatioMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current aspect-ratio correction mode.
Notes: This mode controls whether the aspect ratio of the video is preserved during playback.
See VideoARMode* constants.
(Read and Write property)

216.3.24 Balance as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current audio balance.
Notes: The value can be any number in the following range (inclusive).

Value	Meaning
-1.0	The left channel is at full volume; the right channel is silent.
+1.0	The right channel is at full volume; the left channel is silent.

If the value is zero, the left and right channels are at equal volumes. The default value is zero.
(Read and Write property)

216.3.25 BorderColor as Color

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current color of the video border.
Notes: The border color is used to letterbox the video.
(Read and Write property)

216.3.26 Duration as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the playback duration of the current media item.
Notes: This method calculates the playback duration, taking into account the start and stop times for the media item. To set the start and stop times, use StartPosition and StopPosition properties on the media item. To get the actual duration of the underlying media file, regardless of start and stop times, use Duration property on the item.

For example, suppose that you load a 30-second audio file and set the start time equal to 2 seconds and stop time equal to 10 seconds. The MFPMediaItemMBS.Duration method will return 30 seconds, but the MFPMediaPlayerMBS.Duration method will return 8 seconds.
(Read only property)

216.3.27 FastestSupportedRateForward as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the fastest supported forward playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

216.3.28 FastestSupportedRateReverse as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the fastest supported reverse playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

216.3.29 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

216.3.30 IdealVideoMaxHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum height of video size that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

216.3.31 IdealVideoMaxWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum width of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

216.3.32 IdealVideoMinHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum height of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

216.3.33 IdealVideoMinWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum width of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

216.3.34 Looping as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to loop video.
Notes: If set to true, the plugin will call Play automatically when playback ended.
(Read and Write property)

216.3.35 MediaItem as MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Current media item.
Notes: Setting the MediaItem property is asynchronous. Therefore, while set is pending, get will not return the media item that was just set. Instead, the application should implement MediaItemSet event to know when it is done.
(Read and Write property)

216.3.36 Mute as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the audio is muted.
Notes: (Read and Write property)

216.3.37 NativeVideoAspectRateHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The picture aspect ratio of the video.
Notes: (Read only property)

216.3.38 NativeVideoAspectRateWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The picture aspect ratio of the video.
Notes: (Read only property)

216.3.39 NativeVideoHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the video, in pixels.
Notes: (Read only property)

216.3.40 NativeVideoWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the video, in pixels.
Notes: (Read only property)

216.3.41 Position as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The playback position.
Notes: If you call this method while playback is stopped, the new position takes effect after playback resumes.

This method completes asynchronously. When the operation completes, the PositionSet event is raised.
If playback was started before SetPosition is called, playback resumes at the new position. If playback was paused, the video is refreshed to display the current frame at the new position.

If you make two consecutive calls to SetPosition, and the second call is made before the first call has completed, the second call supersedes the first. The status code for the superseded call is set to false in the event data for that call. This behavior prevents excessive latency from repeated calls to SetPosition, as each call may force the media source to perform a relatively lengthy seek operation.
(Read and Write property)

216.3.42 Rate as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current playback rate.
Notes: The playback rate is expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read and Write property)

216.3.43 SlowestSupportedRateForward as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the slowest supported forward playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

216.3.44 SlowestSupportedRateReverse as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the slowest supported reverse playback rates.
Notes: Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

216.3.45 State as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current playback state of the MFPlay player object.
Notes: See State* constants.

This property can be read after the player object has been shut down.

Many of the player methods complete asynchronously. While an asynchronous operation is pending, the current state is not updated until the operation completes. When the operation completes, the application receives an event.

(Read only property)

216.3.46 VideoWindow as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the window where the video is displayed.
Notes: Returns HWND as integer.
(Read only property)

216.3.47 Volume as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The audio volume.
Notes: Volume is expressed as an attenuation level, where 0.0 indicates silence and 1.0 indicates full volume (no attenuation).

If you call this method before playback starts, the setting is applied after playback starts.
This method does not change the master volume level for the player's audio session. Instead, it adjusts the per-channel volume levels for audio stream(s) that belong to the current media item. Other streams in the audio session are not affected.
(Read and Write property)

216.3.48 Events

216.3.49 Ended

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has ended.
Notes: The player object sends this event when playback reaches the end of the media file.

216.3.50 Error

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A playback error has occurred.

216.3.51 FrameStepped

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A frame-step operation has completed.
Notes: This event is sent when the FrameStep method completes.

216.3.52 MediaItemCleared

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current media item was cleared.
Notes: This event is sent when the ClearMediaItem method completes.

216.3.53 MediaItemCreated(MediaItem as MFPMediaItemMBS, Tag as variant)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A new media item was created.
Notes: This event is sent when the CreateMediaItemFromURL method completes.

216.3.54 MediaItemSet

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: A media item is ready for playback.
Notes: This event is sent when the SetMediaItem method completes.

216.3.55 Paused

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has paused.
Notes: This event is sent when the Pause method completes.

216.3.56 PositionSet

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MFPlay player object has seeked to a new playback position.
Notes: This event is sent when the Position setter completes.

216.3.57 RateSet(rate as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The playback rate has changed.
Notes: This event is sent when the rate setter completes.

216.3.58 Started

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has started.
Notes: This event is sent when the Play method completes.

216.3.59 Stopped

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Playback has stopped.
Notes: This event is sent when the Stop method completes.

216.3.60 Constants

States

Constant	Value	Description
StateEmpty	0	Initial state. No media items have been set on the player object.
StatePaused	3	Playback is paused.
StatePlaying	2	Playback is in progress.
StateShutdown	4	The player object was shut down. This state is returned after the application calls Shutdown method.
StateStopped	1	Playback is stopped.

Aspect Ratio Modes

Constant	Value	Description
VideoARModeMask	7	Bitmask to validate flag values. This value is not a valid flag.
VideoARModeNone	0	Do not maintain the aspect ratio of the video. Stretch the video to fit the output rectangle.
VideoARModeNonLinearStretch	4	Apply a non-linear horizontal stretch if the aspect ratio of the destination rectangle does not match the aspect ratio of the source rectangle. The non-linear stretch algorithm preserves the aspect ratio in the middle of the picture and stretches (or shrinks) the image progressively more toward the left and right. This mode is useful when viewing 4:3 content full-screen on a 16:9 display, instead of pillar-boxing. Non-linear vertical stretch is not supported, because the visual results are generally poor. This mode may cause performance degradation. If this flag is set, you must also set the VideoARModePreservePixel and VideoARModePreservePicture flags.
VideoARModePreservePicture	1	Preserve the aspect ratio of the video by letterboxing or within the output rectangle.
VideoARModePreservePixel	2	Correct the aspect ratio if the physical size of the display device does not match the display resolution. For example, if the native resolution of the monitor is 1600 by 1200 (4:3) but the display resolution is 1280 by 1024 (5:4), the monitor will display non-square pixels. If this flag is set, you must also set the VideoARModePreservePicture flag.

Chapter 217

Windows Mutex

217.1 class WindowsMutexMBS

217.1.1 class WindowsMutexMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for a mutex.
Notes: As a mutex must have a unique name you can use this class to find out if an application is allready running.
Try to create a mutex with an unique name and if it allready exists your application was launched twice.

See also MutexMBS class.

217.1.2 Methods

217.1.3 close

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

217.1.4 Create(name as string)

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new mutex.
Notes: The name must be unique and should not contain a backslash.
Use only ASCII strings for this.
Lasterror is set.

217.1.5 Lock

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Locks the
Notes: Blocks until we got the lock.
Lasterror is set.

217.1.6 Open(name as string)

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Trys to open a mutex with the given name.
Notes: Fails if the mutex does not exist.
Lasterror is set.

217.1.7 TryLock as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Tries to lock the mutex.
Notes: Returns true if we got the lock or false if not.
Lasterror is set.

217.1.8 Unlock

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Unlocks the mutex.
Notes: Lasterror is set.

217.1.9 Properties

217.1.10 Handle as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the Mutex for use with Declares.
Notes: (Read and Write property)

217.1.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: A windows error code.
Or 0 for okay and -1 for "Function not available or parameters wrong."
(Read and Write property)

217.1.12 Name as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name used to create or open the mutex.
Notes: (Read only property)

Chapter 218

Windows OCR

218.1 class WindowsOCREngineMBS

218.1.1 class WindowsOCREngineMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides optical character recognition (OCR) functionality.
Notes: Requires Windows 10 (introduced in 10.0.10240.0)

o use the OCR capabilities of the OcrEngineMBS class in your app, call the RecognizeAsync method. When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object, which contains the recognized text and its size and position. The result is split into lines, and the lines are split into words.

- The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS.
- Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
- Each WindowsOCRWordMBS object specifies the text, size, and position information of the word in the image.

Our plugin class allows you to run the OCR operation either synchronously or asynchronously. The asynchronous operation runs in the background on a separated preemptive thread, so your application GUI is not blocked and this is the preferred way.

Alternatively, you can use the synchronous versions, which block the GUI.

218.1.2 Methods

218.1.3 Available as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this class is available.
Example:

```
If WindowsOCREngineMBS.Available Then
// okay
Else
MessageBox "Only for Windows 10 and newer."
End If
```

Notes: Returns false on Windows 8.x.
Reports true on Windows 10240 or later.

218.1.4 AvailableRecognizerLanguages as WindowsOCRLanguageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an array of all available OCR languages on the device.
Example:

```
Var languages() As WindowsOCRLanguageMBS = WindowsOCREngineMBS.AvailableRecognizerLanguages

For Each n As WindowsOCRLanguageMBS In languages
MessageBox n.DisplayName+", "+n.LanguageTag
Next
```

218.1.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the OcrEngine class.
Example:

```
Var Recognizer As New WindowsOCREngine

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: If any language from GlobalizationPreferences.Languages can be resolved to any of the available OCR languages returns new instance of OcrEngine class, otherwise otherwise raises UnsupportedOperationException.
See also:

- 218.1.6 Constructor(Language as WindowsOCRLanguageMBS) 24439

218.1.6 Constructor(Language as WindowsOCRLanguageMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the OcrEngine class.
Example:

```
Var Recognizer As New WindowsOCREngine("de-DE")

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: If the specified language can be resolved to any of the OCR languages available on the device, returns new instance of OcrEngine class, otherwise raises UnsupportedOperationException.

Raises PlatformNotSupportedException when called on macOS or Linux.
See also:

- 218.1.5 Constructor 24439

218.1.7 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.1.8 IsLanguageSupported(Language as WindowsOCRLanguageMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if a specified language can be resolved to any of the available OCR languages.
Notes: True, if the specified language can be resolved to any of the available OCR languages; otherwise, false.

218.1.9 RecognizeAsync(ImageFile as FolderItem)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image file and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 218.1.10 RecognizeAsync(Picture as Picture) 24440
- 218.1.11 RecognizeAsync(PictureData as MemoryBlock) 24440
- 218.1.12 RecognizeAsync(PictureData as String) 24441

218.1.10 RecognizeAsync(Picture as Picture)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We build a bitmap from the picture for Windows and then run OCR.
Calls event RecognizeCompleted later.
See also:

- 218.1.9 RecognizeAsync(ImageFile as FolderItem) 24440
- 218.1.11 RecognizeAsync(PictureData as MemoryBlock) 24440
- 218.1.12 RecognizeAsync(PictureData as String) 24441

218.1.11 RecognizeAsync(PictureData as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data provided and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 218.1.9 RecognizeAsync(ImageFile as FolderItem) 24440
- 218.1.10 RecognizeAsync(Picture as Picture) 24440
- 218.1.12 RecognizeAsync(PictureData as String) 24441

218.1.12 RecognizeAsync(PictureData as String)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data provided and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 218.1.9 RecognizeAsync(ImageFile as FolderItem) 24440
- 218.1.10 RecognizeAsync(Picture as Picture) 24440
- 218.1.11 RecognizeAsync(PictureData as MemoryBlock) 24440

218.1.13 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image file and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 218.1.14 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 24441
- 218.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 24442
- 218.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 24442

218.1.14 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We build a bitmap from the picture for Windows and then run OCR.

Calls event RecognizeCompleted later.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 218.1.13 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 24441
- 218.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 24442
- 218.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 24442

218.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.

- 218.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 24442

218.1.16 RecognizeSync(PictureData as String) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes: We will ask Windows to load image from the image data and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.

- 218.1.13 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 24441
- 218.1.14 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 24441
- 218.1.15 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 24442

218.1.17 Properties

218.1.18 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.1.19 MaxImageDimension as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum image pixel dimensions supported by the OCR engine.
Example:

```
MessageBox Recognizer.MaxImageDimension.ToString
```

Notes: The maximum image pixel dimensions supported by the OCR engine.
(Read only property)

218.1.20 RecognizerLanguage as WindowsOCRLanguageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the language being used for text recognition.
Example:

```
Var Recognizer As New WindowsOCREngine

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: (Read only property)

218.1.21 Yield as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield to other Xojo threads.
Notes: If true allows other cooperative threads to run in the background.
(Read and Write property)

218.1.22 Events

218.1.23 RecognizeCompleted(ErrorMessage as String, ErrorCode as Integer, Result as WindowsOCRResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The event called when the recognize process completes.
Notes: ErrorMessage: The error we report on what went wrong.
ErrorCode: The Windows error code, zero if successful.
Result: The result of the OCR that was initiated by the OcrEngine object.

218.1.24 Stopped(Error as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called by the engine in case it had to stop.
Notes: Provides Windows error code for the reason.

218.2 class WindowsOCRExceptionMBS

218.2.1 class WindowsOCRExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The class for an exception in the OCR classes.
Notes: Subclass of the RuntimeException class.

- MBS Xojo Plugins, version 23.1pr1

218.3 class WindowsOCRLanguageMBS

218.3.1 class WindowsOCRLanguageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class that provides information related to BCP-47 language tags such as the language name and the script.
Blog Entries

- New in MBS Xojo Plugins in version 23.1
- Windows OCR for Xojo
- MBS Xojo Plugins, version 23.1pr1

Xojo Developer Magazine

- 21.3, page 48: Windows OCR, Working with Windows' built-in OCR library by Stefanie Juchmes

218.3.2 Methods

218.3.3 Constructor(languageTag as String)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Language object.
Notes: Pass a BCP-47 language tag.

218.3.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.3.5 Properties

218.3.6 CurrentInputMethodLanguageTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the BCP-47 language tag for the currently enabled keyboard layout or Input Method Editor (IME).

Notes: This property returns a value for the currently active input method on the thread with keyboard input focus. Calling this on a background thread may not return the expected results.
(Read only property)

218.3.7 DisplayName as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a localized string that is suitable for display to the user for identifying the language.
Notes: (Read only property)

218.3.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.3.9 LanguageTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the normalized BCP-47 language tag for this language.
Notes: e.g. de-DE for Germany
(Read only property)

218.3.10 NativeName as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the language in the language itself.
Notes: (Read only property)

218.3.11 Script as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the four-letter ISO 15924 script code of the language.
Notes: (Read only property)

218.4 class WindowsOCRLineMBS

218.4.1 class WindowsOCRLineMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single line of text recognized by the OCR engine and returned as part of the WindowsOCRResultMBS.
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

218.4.2 Methods

218.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

218.4.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.4.5 Words as WindowsOCRWordMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of WindowsOCRWordMBS objects that represents the words detected in the current line of text by the RecognizeAsync method.

218.4.6 Properties

218.4.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.4.8 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the text of the recognized line.
Notes: (Read only property)

218.5 class WindowsOCRResultMBS

218.5.1 class WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the results of Optical Character Recognition (OCR).
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

218.5.2 Methods

218.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

218.5.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.5.5 Lines as WindowsOCRLineMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of WindowsOCRLineMBS objects that represents the lines of text detected in the image by the RecognizeAsync method.
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.

218.5.6 Properties

218.5.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.5.8 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the recognized text.
Notes: (Read only property)

218.5.9 TextAngle as Double

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the clockwise rotation of the recognized text, in degrees, around the center of the image.
Notes: The clockwise rotation of the recognized text, in degrees, around the center of the image. If the angle of the text can't be detected, the value of this property is null. If the image contains text at different angles, only part of the text will be recognized correctly.

Use the TextAngle property to overlay recognition results correctly on the original image. If the value of the TextAngle property is not null or 0 (zero), then to overlay the recognized text correctly on the original image, you either have to rotate the original image by the detected angle in a counter-clockwise direction, or rotate the recognized text by the detected angle in a clockwise direction.
(Read only property)

218.6 class WindowsOCRWordMBS

218.6.1 class WindowsOCRWordMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single word in a line of text recognized by the OCR engine and returned as part of the WindowsOCRLineMBS.
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

218.6.2 Methods

218.6.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

218.6.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

218.6.5 Properties

218.6.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

218.6.7 Height as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the size in pixels of the recognized word.
Notes: (Read only property)

218.6.8 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the text of the recognized word.
Notes: (Read only property)

218.6.9 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the size in pixels of the recognized word.
Notes: (Read only property)

218.6.10 X as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the position in pixels of the recognized word from the top left corner of image when the value of TextAngle property is 0 (zero).
Notes: (Read only property)

218.6.11 Y as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the position in pixels of the recognized word from the top left corner of image when the value of TextAngle property is 0 (zero).
Notes: (Read only property)

Chapter 219

Windows PDF

219.1 class WindowsPDFDocumentMBS

219.1.1 class WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a Portable Document Format (PDF) document.
Notes: Methods of this class return an STG_E_READFAULT error if there is a problem in reading the Portable Document Format (PDF) document.

219.1.2 Methods

219.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 219.1.4 Constructor(other as WindowsPDFDocumentMBS) 24456

219.1.4 Constructor(other as WindowsPDFDocumentMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 219.1.3 Constructor 24456

219.1.5 ConvertImage(ImageData as String) as String

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts a picture to PNG.
Example:

```
// read in a HEIC image
Var f as FolderItem = SpecialFolder.Desktop.Child("IMG_4609.HEIC")
Var b as BinaryStream = BinaryStream.Open(f)
Var s as string = b.Read(b.Length)

// convert to PNG
Var p as string = WindowsPDFDocumentMBS.ConvertImage(s)

// and write out as PNG file
Var o as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var c as BinaryStream = BinaryStream.Create(o, true)
c.Write p
c.close

o.Launch
```

Notes: This is a little utility function to use Windows' built-in image encoders and decoders to convert various image formats like HEIF/HEIC to a PNG image.
Returns new image as string with bytes of PNG image.

219.1.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

219.1.7 LoadFromData(data as MemoryBlock, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in Memoryblock synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.
See also:

- 219.1.8 LoadFromData(data as String, Password as String = "") as WindowsPDFDocumentMBS 24457

219.1.8 LoadFromData(data as String, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in string synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.
See also:

- 219.1.7 LoadFromData(data as MemoryBlock, Password as String = "") as WindowsPDFDocumentMBS 24457

219.1.9 LoadFromDataAsync(data as MemoryBlock, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in MemoryBlock asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.
See also:

- 219.1.10 LoadFromDataAsync(data as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "") 24458

219.1.10 LoadFromDataAsync(data as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in string asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.
See also:

- 219.1.9 LoadFromDataAsync(data as MemoryBlock, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "") 24458

219.1.11 LoadFromFile(File as FolderItem, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from folderitem synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.

219.1.12 LoadFromFileAsync(File as FolderItem, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from folderitem asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.

219.1.13 LoadFromPath(Path as String, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from path synchronously.
Notes: Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.

219.1.14 LoadFromPathAsync(Path as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from path asynchronously.
Notes: Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.

219.1.15 Page(Index as Integer) as WindowsPDFPageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a page from a Portable Document Format (PDF) document.
Notes: The location of the Portable Document Format (PDF) page relative to its parent document. Starts at zero.

219.1.16 Properties

219.1.17 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

219.1.18 IsPasswordProtected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets whether the Portable Document Format (PDF) document is password-protected.
Notes: True if the Portable Document Format (PDF) document is password-protected; otherwise, false. (Read only property)

219.1.19 PageCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of pages in the Portable Document Format (PDF) document.
Notes: (Read only property)

219.1.20 Yield as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield to other Xojo threads.
Notes: If true allows other cooperative threads to run in the background.
(Read and Write property)

219.1.21 Delegates

219.1.22 WindowsPDFDocumentLoadedMBS(ErrorMessage as String, ErrorCode as Integer, document as WindowsPDFDocumentMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate called when loading finished.

219.2 class WindowsPDFExceptionMBS

219.2.1 class WindowsPDFExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The class for exceptions in PDF engine.
Notes: Subclass of the RuntimeException class.

Xojo Developer Magazine

- 21.5, pages 72 to 73: Windows PDF, New MBS classes let you work with PDFS on Windows. by Stefanie Juchmes

219.3.2 Methods

219.3.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

219.3.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

219.3.5 Properties

219.3.6 ArtBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries art box.
Notes: Gets the size of a rectangle that contains the Portable Document Format (PDF) page's contents, including any meaningful surrounding white space, as intended by the Portable Document Format (PDF)

page's creator.
(Read only property)

219.3.7 BleedBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries bleed box.
Notes: Gets the size of a rectangle that specifies the clipped region of a Portable Document Format (PDF) page's contents when it is displayed.
(Read only property)

219.3.8 CropBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries crop box.
Notes: Gets the size of a rectangle that specifies the cropped region of a Portable Document Format (PDF) page's contents when it is displayed.
(Read only property)

219.3.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

219.3.10 MediaBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries media box.
Notes: Gets the size of a rectangle that defines the boundaries of the area that the Portable Document Format (PDF) page will be displayed or printed to.
(Read only property)

219.3.11 TrimBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries trim box.
Notes: Gets the size of a rectangle that specifies the intended dimensions of the Portable Document Format (PDF) page after it has been trimmed.
(Read only property)

219.4 class WindowsPDFPageMBS

219.4.1 class WindowsPDFPageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single page in a Portable Document Format (PDF) document.

Xojo Developer Magazine

- 21.5, pages 72 to 73: Windows PDF, New MBS classes let you work with PDFS on Windows. by Stefanie Juchmes

219.4.2 Methods

219.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 219.4.4 Constructor(other as WindowsPDFPageMBS) 24466

219.4.4 Constructor(other as WindowsPDFPageMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

• 219.4.3 Constructor 24466

219.4.5 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

219.4.6 RenderToMemory(Handler as RenderToMemoryFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Requests asynchronous rendering of the page.
Notes: Calls the handler delegate later with results (or error code).
Produces a MemoryBlock with image data, which you can pass to Picture.FromData to get as picture.

Asynchronous mode will perform the work on a different thread in the background.
See also:

• 219.4.7 RenderToMemory(Options as WindowsPDFPageRenderOptionsMBS = nil) as MemoryBlock 24467

219.4.7 RenderToMemory(Options as WindowsPDFPageRenderOptionsMBS = nil) as MemoryBlock

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Outputs a stream of data, which represents a Portable Document Format (PDF) page's contents as image.
Notes: Takes a set of display settings, applies them to the output of a Portable Document Format (PDF) page's contents, and creates a stream with the customized, rendered output as an synchronous action. This asynchronous action can be used to create a customized display image of the Portable Document Format (PDF) page.

Please call RenderToStream if you need image as string, call RenderToMemory if you need a MemoryBlock and call RenderToPicture if you need a picture.
See also:

• 219.4.6 RenderToMemory(Handler as RenderToMemoryFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil) 24467

219.4.8 RenderToPicture(Options as WindowsPDFPageRenderOptionsMBS = nil) as Picture

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Outputs a stream of data, which represents a Portable Document Format (PDF) page's contents as image.
Example:

```
Var page As WindowsPDFPageMBS = List.RowTagAt(index)
Var options As New WindowsPDFPageRenderOptionsMBS

if out.Width >out.Height then
options.DestinationWidth = out.Width * 2
else
options.DestinationHeight = out.Height * 2
end if

options.setBitmapEncoderJPEG

currentimage = page.RenderToPicture(options)
out.Refresh // refresh canvas to show the picture
```

Notes: Takes a set of display settings, applies them to the output of a Portable Document Format (PDF) page's contents, and creates a stream with the customized, rendered output as an synchronous action. Provides the resulting stream as picture for Xojo.

Please call RenderToStream if you need image as string, call RenderToMemory if you need a MemoryBlock and call RenderToPicture if you need a picture.

219.4.9 RenderToStream(Handler as RenderToStreamFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Requests asynchronous rendering of the page.
Example:

```
Var page As WindowsPDFPageMBS // current page
page.RenderToStream AddressOf RenderToStreamFinished
```

Notes: Calls the handler delegate later with results (or error code).
Produces a string with the image data.

Asynchronous mode will perform the work on a different thread in the background.

See also:

- 219.4.10 RenderToStream(Options as WindowsPDFPageRenderOptionsMBS = nil) as String 24469

219.4.10 RenderToStream(Options as WindowsPDFPageRenderOptionsMBS = nil) as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Outputs a stream of data, which represents a Portable Document Format (PDF) page's contents as image.
Example:

```
Var page As WindowsPDFPageMBS // your page
Var options As New WindowsPDFPageRenderOptionsMBS

if out.Width >out.Height then
options.DestinationWidth = out.Width * 2
else
options.DestinationHeight = out.Height * 2
end if

options.setBitmapEncoderJPEG

Var data as string = page.RenderToStream(options)
if data.Bytes >0 then
currentimage = Picture.FromData(data)
out.Refresh // refresh canvas to show the picture
end if
```

Notes: Takes a set of display settings, applies them to the output of a Portable Document Format (PDF) page's contents, and creates a stream with the customized, rendered output as an synchronous action. This asynchronous action can be used to create a customized display image of the Portable Document Format (PDF) page.

Please call RenderToStream if you need image as string, call RenderToMemory if you need a MemoryBlock and call RenderToPicture if you need a picture.
See also:

- 219.4.9 RenderToStream(Handler as RenderToStreamFinishedMBS, Options as WindowsPDFPageRenderOptionsMBS = nil) 24468

219.4.11 Properties

219.4.12 Dimensions as WindowsPDFPageDimensionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the group of dimension properties for a single page in a Portable Document Format (PDF) document.
Notes: (Read only property)

219.4.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

219.4.14 Index as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the relative position of the Portable Document Format (PDF) page within its parent Portable Document Format (PDF) document.
Notes: Return the position of the Portable Document Format (PDF) page relative to its parent Portable Document Format (PDF) document.

The first page of a Portable Document Format (PDF) document is index 0 (zero).
(Read only property)

219.4.15 IsRendering as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if some page is rendering.
Notes: This checks if one of the various Render functions is active.
(Read only property)

219.4.16 PreferredZoom as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Portable Document Format (PDF) page's preferred magnification factor.
Notes: (Read only property)

219.4.17 Rotation as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the constant that the Portable Document Format (PDF) page will be rotated when it's displayed or printed.
Notes: See RotationRotate* constants.
Degrees are expressed relative to a clockwise rotation. Degrees are expressed in multiples of 90.
(Read only property)

219.4.18 RotationAngle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of degrees that the Portable Document Format (PDF) page will be rotated when it's displayed or printed.
Notes: Returns angle from 0 to 360¬∞.
(Read only property)

219.4.19 Size as WindowsPDFSizeMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Portable Document Format (PDF) page's size based on its related CropBox, MediaBox, and Rotation property values.
Notes: (Read only property)

219.4.20 Yield as Boolean

MBS WinFrameworks Plugin, Plugin Version: 25.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to yield to other Xojo threads.
Notes: If true allows other cooperative threads to run in the background.
(Read and Write property)

219.4.21 Constants

Rotations

Constant	Value	Description
RotationNormal	0	No rotation.
RotationRotate180	2	A 180-degree rotation.
RotationRotate270	3	A 270-degree rotation.
RotationRotate90	1	A 90-degree rotation.

219.4.22 Delegates

219.4.23 RenderToMemoryFinishedMBS(ErrorMessage as String, ErrorCode as Integer, Data as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate called when rendering of a page finished.

219.4.24 RenderToStreamFinishedMBS(ErrorMessage as String, ErrorCode as Integer, Data as String)

MBS WinFrameworks Plugin, Plugin Version: 24.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate called when rendering of a page finished.

219.5 class WindowsPDFPageRenderOptionsMBS

219.5.1 class WindowsPDFPageRenderOptionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents display settings for a single page of a Portable Document Format (PDF) document, such as the page's background color and its encoding type.

219.5.2 Methods

219.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Creates and initializes a new instance of display settings for a single page of a Portable Document Format (PDF) document.

219.5.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

219.5.5 setBitmapEncoderBMP

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to BMP.

219.5.6 setBitmapEncoderJPEG

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to JPEG.

219.5.7 setBitmapEncoderPNG

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to PNG.

219.5.8 setBitmapEncoderTIFF

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to TIFF.

219.5.9 Properties

219.5.10 BackgroundColor as Color

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the Portable Document Format (PDF) page's background color.
Notes: The default background color is White.
(Read and Write property)

219.5.11 BitmapEncoderId as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the Portable Document Format (PDF) page's encoding type to be used while the page is being converted to a bitmap.
Notes: (Read and Write property)

219.5.12 DestinationHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the final size of the rendering of the Portable Document Format (PDF) page in device-independent pixels (DIPs).
Notes: The value for DestinationHeight is the final size of the rendered page. If DestinationHeight is not specified, the page's aspect ratio is maintained relative to the destination width.
(Read and Write property)

219.5.13 DestinationWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the final size of the rendering of the Portable Document Format (PDF) page in device-independent pixels (DIPs).
Notes: The value for DestinationWidth is the final size of the rendered page. If DestinationWidth is not specified, the page's aspect ratio is maintained relative to the destination height.
(Read and Write property)

219.5.14 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

219.5.15 IsIgnoringHighContrast as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets whether the Portable Document Format (PDF) page uses the system's high contrast display setting.
Notes: (Read and Write property)

219.5.16 SourceRect as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets a portion of the Portable Document Format (PDF) page to be displayed.
Notes: (Read and Write property)

219.6 class WindowsPDFRectMBS

219.6.1 class WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a rectangle.

219.6.2 Properties

219.6.3 Height as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height of rectangle.
Notes: (Read and Write property)

219.6.4 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width of rectangle.
Notes: (Read and Write property)

219.6.5 X as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The x origin position.
Notes: (Read and Write property)

219.6.6 Y as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The y origin position.
Notes: (Read and Write property)

219.7 class WindowsPDFSizeMBS

219.7.1 class WindowsPDFSizeMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a size.

219.7.2 Properties

219.7.3 Height as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height of rectangle.
Notes: (Read and Write property)

219.7.4 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width of rectangle.
Notes: (Read and Write property)

Chapter 220

Windows Photos

220.1 class WinPhotoAcquireDeviceSelectionDialogMBS

220.1.1 class WinPhotoAcquireDeviceSelectionDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Provides a dialog box for selecting the device to acquire images from.
Blog Entries

220.1.2 Methods

220.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

220.1.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.1.5 ShowModal(Window as DesktopWindow, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes: The function returns when the user selects a device using the modal dialog box.

Window: The parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.
See also:

- 220.1.6 ShowModal(Window as Window, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 24480
- 220.1.7 ShowModal(WindowHandle as Integer, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 24481

220.1.6 ShowModal(Window as Window, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes: The function returns when the user selects a device using the modal dialog box.

Window: The parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.
See also:

- 220.1.5 ShowModal(Window as DesktopWindow, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 24480

220.1.7 ShowModal(WindowHandle as Integer, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes: The function returns when the user selects a device using the modal dialog box.

WindowHandle: Handle to a parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.
See also:

- 220.1.5 ShowModal(Window as DesktopWindow, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 24480
- 220.1.6 ShowModal(Window as Window, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 24480

220.1.8 Properties

220.1.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.1.10 SubmitButtonText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text displayed in the dialog box that prompts the user to select a device.
Notes: (Read and Write property)

220.1.11 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of the device selection dialog box.
Notes: (Read and Write property)

220.1.12 Constants

Device Flags

Constant	Value	Description
DeviceFlagAllDevices	&hFFFF	Show all devices.
DeviceFlagCPLMode	&h10000	Show CPL devices.
DeviceFlagDVDevices	64	Show digital video camera devices.
DeviceFlagFSDevices	32	Show removable storage devices, such as CD drives or card readers.
DeviceFlagShowOffline	&h20000	Show devices that are offline. Not supported by all device types.
DeviceFlagSTIDevcies	8	Show devices of type Still Image Architecture (STI).
DeviceFlagTWAINDevices	16	Show TWAIN devices.
DeviceFlagWIACameras	2	Show cameras of type Windows Image Acquisition (WIA).
DeviceFlagWIAScanners	4	Show scanners of type Windows Image Acquisition (WIA).
DeviceFlagWPDDevices	1	Show devices of type Windows Portable Devices (WPD).

Device Types

Constant	Value	Description
DeviceTypeDV	6	DV device.
DeviceTypeFS	5	Specifies that the selected device is a removable drive in the file system.
DeviceTypeSTI	3	Specifies that the type of the selected device is Still Image Architecture (STI).
DeviceTypeTWAIN	4	TWAIN device
DeviceTypeUnknown	0	pecifies that the type of the selected device is unknown.
DeviceTypeWIA	2	Specifies that the type of the selected device is Windows Image Acquisition (WIA).
DeviceTypeWPD	1	Specifies that the type of the selected device is Windows Portable Devices (WPD).

220.2 class WinPhotoAcquireItemMBS

220.2.1 class WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireItemMBS interface provides methods for working with items as they are acquired from a device.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

220.2.2 Methods

220.2.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

220.2.4 Data as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Reads the data from the file and returns it.

220.2.5 Delete

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Delete method deletes an item.

220.2.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.2.7 PropertyKeyCameraSequenceNumber as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The camera sequence number.

220.2.8 PropertyKeyDuplicateDetectionID as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The duplicate detection ID.

220.2.9 PropertyKeyFinalFilename as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The final file name.

220.2.10 PropertyKeyGroupTag as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The group tag.

220.2.11 PropertyKeyIntermediateFile as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The intermediate path name.

220.2.12 PropertyKeyOriginalFilename as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The original path name.

220.2.13 PropertyKeyRelativePathname as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The relative path name.

220.2.14 PropertyKeySkipImport as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: Whether to skip import.

220.2.15 PropertyKeyTransferResult as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The transfer result.

220.2.16 SubItem(Index as Integer) as WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves a subitem of an item, given the index of the subitem.
Notes: Index: Integer containing the index of the item. Range from 0 to SubItemCount-1.

220.2.17 Thumbnail(width as Integer, Height as Integer) as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the thumbnail provided for an item.
Notes: Width and height specify the size of the thumbnail.

220.2.18 Properties

220.2.19 CanDelete as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The CanDelete method indicates whether an item may be deleted.
Notes: Indicates that the item can be deleted.
(Read only property)

220.2.20 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.2.21 ItemName as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the file name for an item.
Notes: The file name consists of the display name and the extension, even if the Hide extensions for known file types setting is checked in the Windows Folder Options dialog box.
(Read only property)

220.2.22 SubItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the number of subitems contained in an item.
Notes: (Read only property)

220.2.23 PropertyValue(key as string) as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Get or set a property for an item.
Notes: key: Specifies a key for the property to set.

The value is converted to/from variant.
(Read and Write computed property)

220.3 class WinPhotoAcquireMBS

220.3.1 class WinPhotoAcquireMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: This class provides methods for acquiring photos from a device.

- MonkeyBread Software Releases the MBS Xojo Plugins in version 20.3
- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

220.3.2 Methods

220.3.3 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as DesktopWindow, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes: PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
Window: The parent window.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.

- 220.3.4 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

- 220.3.5 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindowHandle as Integer, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS) 24489

220.3.4 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes: PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
Window: The parent window.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.

220.3.5 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindowHandle as Integer, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes: PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device

from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
WindowHandle: The parent window handle.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.
See also:

- 220.3.3 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as DesktopWindow, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS) 24488
- 220.3.4 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS) 24489

220.3.6 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

220.3.7 CreatePhotoSource(Device as String) as WinPhotoAcquireSourceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: CreatePhotoSource method initializes an WinPhotoAcquireSourceMBS object to pass to Acquire method.
Notes: Device: The device name/ID.

Returns the initialized photo source to acquire photos from.

220.3.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.3.9 Results as String()

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the paths of all files successfully transferred during the most recent call to Acquire.
Notes: If the file transfer is aborted before any files are transferred, the result is nil.

220.3.10 Properties

220.3.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.4 class WinPhotoAcquireOptionsDialogMBS

220.4.1 class WinPhotoAcquireOptionsDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The standard dialog to show for options.
Notes: The WinPhotoAcquireOptionsDialogMBS interface is used to display an options dialog box in which the user can select photo acquisition settings such as file name formats, as well as whether or not to rotate images, to prompt for a tag name, or to erase photos from the camera after importing.

220.4.2 Methods

220.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Please call Initialize.

220.4.4 Create(Window as DesktopWindow) as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes: This method is for advanced users, which can position the new window via declares.

Window: The parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 220.4.5 Create(Window as Window) as Integer 24493
- 220.4.6 Create(WindowHandle as Integer) as Integer 24493

220.4.5 Create(Window as Window) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes: This method is for advanced users, which can position the new window via declares.

Window: The parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 220.4.4 Create(Window as DesktopWindow) as Integer 24492
- 220.4.6 Create(WindowHandle as Integer) as Integer 24493

220.4.6 Create(WindowHandle as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes: This method is for advanced users, which can position the new window via declares.

WindowHandle: Handle to the parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 220.4.4 Create(Window as DesktopWindow) as Integer 24492
- 220.4.5 Create(Window as Window) as Integer 24493

220.4.7 Destroy

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Destroy method closes and destroys the modeless dialog box created with the Create method.
Notes: If you destroy the parent window, the child window will automatically be destroyed.

220.4.8 Initialize(RegistryRoot as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Initializes the options dialog box and reads any saved options from the registry.
Notes: Initialize must be called prior to calling Create or DoModal. Failure to do so will cause Create or DoModal to fail.
If Initialize is called while the options dialog box is already displayed, an error will be returned.

RegistryRoot: (optional) String containing the registry root of a custom location to read the acquisition settings from. If this parameter is set to "", the default location will be used.

220.4.9 SaveData

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The SaveData method saves acquisition settings from the options dialog box to the registry so that a subsequent instance of the dialog can be initialized with the same settings.

220.4.10 ShowModal(Window as Window) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DoModal method creates and displays the options dialog box as a modal dialog box.
Notes: Window: The dialog's parent window.
Returns the code returned when the window is closed.

The modal dialog displayed by DoModal will have OK and Cancel buttons, whereas the OK and Cancel buttons of the modeless dialog displayed by Create must be provided by the parent window.
See also:

- 220.4.11 ShowModal(WindowHandle as Integer) as Integer 24495

220.4.11 ShowModal(WindowHandle as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DoModal method creates and displays the options dialog box as a modal dialog box.
Notes: WindowHandle: Handle to the dialog's parent window.
Returns the code returned when the window is closed.

The modal dialog displayed by DoModal will have OK and Cancel buttons, whereas the OK and Cancel buttons of the modeless dialog displayed by Create must be provided by the parent window.
See also:

- 220.4.10 ShowModal(Window as Window) as Integer 24494

220.4.12 Properties

220.4.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.5 class WinPhotoAcquireProgressCallBackMBS

220.5.1 class WinPhotoAcquireProgressCallBackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireProgressCallBackMBS interface may be implemented if you wish to do extra processing at various stages in the acquisition process.
Blog Entries

- Windows Photos Acquire

220.5.2 Methods

220.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

220.5.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.5.5 Properties

220.5.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.5.7 Events

220.5.8 Cancelled(byref Cancelled as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Cancelled method provides extended functionality when a cancellation occurs during an acquisition session.
Notes: The application provides the implementation of the Cancelled method.

Cancelled: a flag that, when set to true, indicates that the operation was canceled.

220.5.9 DirectoryCreated(Directory as String)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DirectoryCreated method provides extended functionality when a destination directory is created during the acquisition process.
Notes: The application provides the implementation of the DirectoryCreated method.

Directory: containing the directory.

220.5.10 EndDelete(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndDelete method provides extended functionality when deletion of files from the image source is complete.
Notes: The application provides the implementation of the EndDelete method.

Result: Specifies the result of the delete operation.

220.5.11 EndEnumeration(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndEnumeration method provides extended functionality when enumeration of files from the image source is complete.
Notes: The application provides the implementation of the EndEnumeration method.
Result: Specifies the result of the enumeration operation.

220.5.12 EndItemDelete(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndItemDelete method provides extended functionality each time a file is deleted from the image source.
Notes: The application provides the implementation of the EndItemDelete method.

ItemIndex: Integer value containing the item index.
Item: To the deleted WinPhotoAcquireItemMBS object.
Result: Specifies the result of the delete operation.

220.5.13 EndItemTransfer(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndItemTransfer method provides extended functionality each time a file is transferred from the image source.
Notes: The application provides the implementation of the EndItemTransfer method.

ItemIndex: Integer value containing the item index.
Item: Pointer to a photo acquire item object.
Result: Specifies the result of the transfer operation.

220.5.14 EndSession(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndSession method provides extended functionality when an acquisition session is completed.
Notes: The application provides the implementation of the EndSession method.

220.5.15 EndTransfer(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The EndTransfer method provides extended functionality when the transfer of all files is complete.
Notes: The application provides the implementation of the EndTransfer method.

Result: Specifies the result of the transfer.

220.5.16 ErrorAdvise(Result as Integer, ErrorMessage as String, MessageType as Integer, byref ErrorAdviseResult as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The ErrorAdvise method provides custom error handling for errors that occur during acquisition.
Notes: The application provides the implementation of the ErrorAdvise method.

Result: Specifies the error that occurred.
ErrorMessage: the error message.
MessageType: What type of message. May be one of the following:

Value	Description
AdviseMessageTypeSkipRetryCancel	Specifies that the error that occurred requires a Skip, Retry, or Cancel response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultSkip, AdviseResultSkipAll, AdviseResultRetry, or AdviseResultAbort.
AdviseMessageTypeRetryCancel	Specifies that the error that occurred requires a Retry or Cancel response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultRetry or AdviseResultAbort.
AdviseMessageTypeYesNo	Specifies that the error that occurred requires a Yes or No response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultYes or AdviseResultNo.
AdviseMessageTypeOK	Specifies that the error that occurred requires an OK response. The ErrorAdviseResult parameter must be set to AdviseResultOK.

ErrorAdviseResult: an integer value containing the error advise result. The result should be one of the acceptable types indicated by the MessageType parameter, and must be one of the following:

Value	Description
AdviseResultYes	Specifies a Yes response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultNo	Specifies a No response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultOK	Specifies an OK response. Valid if MessageType is AdviseMessageTypeOK.
AdviseResultSkip	Specifies a Skip response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultSkipAll	Specifies a Skip All response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultRetry	Specifies a Retry response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.
AdviseResultAbort	Specifies a Cancel response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.

220.5.17 FoundItem(Item as WinPhotoAcquireItemMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The FoundItem method provides extended functionality each time an item is found during enumeration of items from the device.
Notes: This method can be used to exclude an item from the list of items to acquire. The application provides the implementation of the FoundItem method.

Return true to exclude the item from the results of the enumeration. This would allow the caller to exclude videos or camera raw files, for instance.

220.5.18 GetDeleteAfterAcquire(byref DeleteAfterAcquire as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The GetDeleteAfterAcquire method returns a value indicating whether photos should be deleted after acquisition.
Notes: DeleteAfterAcquire: When set to true, indicates that photos should be deleted after acquisition.

220.5.19 GetUserInput(UserInput as WinUserInputStringMBS, byref Result as Variant, DefaultValue as Variant)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The GetUserInput method overrides the default functionality that displays a message prompting the user for string input during acquisition.
Notes: The application provides the implementation of the GetUserInput method.

Result: Variant representing the descriptive input to be obtained.
DefaultValue: Variant representing the default value of the input being requested.

If this method is implemented, the implementation should copy the value of the DefaultValue argument to the Result parameter.

If the progress dialog box is suppressed in Acquire, this method must be implemented in order to assign a default value to the Result parameter. Normally a value is supplied to Result in the course of prompting the user with the default dialog, but when the dialog is suppressed, the application must copy the value of the DefaultValue argument to the Result parameter.

220.5.20 StartDelete(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartDelete method provides extended functionality when deletion of items from the device begins.
Notes: The implementation of StartDelete is provided by the application.

Source: the WinPhotoAcquireSourceMBS that items are being deleted from.

220.5.21 StartEnumeration(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartEnumeration method provides extended functionality when the enumeration of items to acquire begins.
Notes: The application provides the implementation of the StartEnumeration method.

Source: the WinPhotoAcquireSourceMBS object that items are being enumerated from.

220.5.22 StartItemDelete(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartItemDelete method provides extended functionality each time the deletion of an individual item from the device begins.
Notes: The application provides the implementation of the StartItemDelete method.

ItemIndex: Integer value containing the item index in the list of items to delete.
Item: The WinPhotoAcquireItemMBS object that is being deleted.

220.5.23 StartItemTransfer(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartItemTransfer method provides extended functionality each time the transfer of an item begins.
Notes: The application provides the implementation of the StartItemTransfer method.

ItemIndex: Integer value containing the item index in the list of items to transfer.
Item: the WinPhotoAcquireItemMBS object that is to be transferred.

220.5.24 StartTransfer(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The StartTransfer method provides additional processing when transfer of items from the device begins.
Notes: The application provides the implementation of the StartTransfer method.

220.5.25 UpdateDeletePercent(Percent as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The UpdateDeletePercent method provides extended functionality when the percentage of items deleted changes.
Notes: The application provides the implementation of the UpdateDeletePercent method.

Percent: Integer value containing the percentage of items deleted.

220.5.26 UpdateTransferPercent(Overall as Boolean, Percent as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The UpdateTransferPercent method provides extended functionality when the percentage of items transferred changes.
Notes: The application provides the implementation of the UpdateTransferPercent method.

Overall: Flag that, when set to TRUE, indicates that the value contained in nPercent is a percentage of the overall transfer progress, rather than a percentage of an individual item's progress.
Percent: Integer value containing the percentage of items transferred.

220.5.27 Constants

Advise Message Types

Constant	Value	Description
AdviseMessageTypeOK	3	Specifies that the error that occurred requires an OK response. The Error viseResult parameter must be set to AdviseResultOK.
AdviseMessageTypeRetryCancel	1	Specifies that the error that occurred requires a Skip, Retry, or Cancel respo The ErrorAdviseResult parameter must be set to one of the following: Ad eResultSkip, AdviseResultSkipAll, AdviseResultRetry, or AdviseResultAb
AdviseMessageTypeSkipRetryCancel	0	Specifies that the error that occurred requires a Retry or Cancel response. ErrorAdviseResult parameter must be set to one of the following: Advise sultRetry or AdviseResultAbort.
AdviseMessageTypeYesNo	2	Specifies that the error that occurred requires a Yes or No response. The E rAdviseResult parameter must be set to one of the following: AdviseResul or AdviseResultNo.

Advise Results

Constant	Value	Description
AdviseResultAbort	6	Specifies a Cancel response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.
AdviseResultNo	1	Specifies a No response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultOK	2	Specifies an OK response. Valid if MessageType is AdviseMessageTypeOK.
AdviseResultRetry	5	Specifies a Retry response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.
AdviseResultSkip	3	Specifies a Skip response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultSkipAll	4	Specifies a Skip All response. Valid if MessageType is AdviseMessageTypeRetryCancel.
AdviseResultYes	0	Specifies a Yes response. Valid if MessageType is AdviseMessageTypeYesNo.

220.6 class WinPhotoAcquireSettingsMBS

220.6.1 class WinPhotoAcquireSettingsMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireSettingsMBS interface is used to work with image acquisition settings, such as file name format.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 20.3
- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

220.6.2 Methods

220.6.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

220.6.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.6.5 InitializeFromRegistry(RegistryKey as String)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Specifies a registry key from which to initialize settings.

220.6.6 Properties

220.6.7 AcquisitionDateTime as DateTime

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The acquisition time explicitly.
Notes: This property is typically used to force two sessions to show the same acquisition time. If not explicitly set, acquisition time defaults to the current machine time.
(Read and Write property)

220.6.8 AcquisitionTime as Date

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The acquisition time explicitly.
Notes: This property is typically used to force two sessions to show the same acquisition time. If not explicitly set, acquisition time defaults to the current machine time.
(Read and Write property)

220.6.9 Flags as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The photo acquire flags.
Notes: (Read and Write property)

220.6.10 GroupTag as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The group tag for an acquisition session.
Notes: The group tag is stored as a keyword in each file's metadata. It is also used in the file name if the $ (GroupTag) token is present in the format string passed to OutputFileNameTemplate.
(Read and Write property)

220.6.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.

Notes: (Read only property)

220.6.12 OutputFilenameTemplate as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Specifies a format string (template) that specifies the format of file names.
Notes: Format strings contain a mix of path literals and tokens. A format string looks like the following:

$ (MyPicturesFolder)\$ (DateAcquired), $ (EventName)\$ (EventName) $ (SequenceNumber).$ (OriginalExtension)

The token format looks like the following, where OptionalPrefix and OptionSuffix are suppressed if the replacement for the TokenIdentifier yields a zero-length string:

$ ([OptionalPrefix] TokenIdentifier:SubToken [OptionalSuffix] | AlternateString)

The caret ("^") is an escape character, so "^$ " would yield "$ " in the final path.
Parentheses and brackets are not allowed as literals within tokens, but can be used outside of tokens. This means you cannot use " [", "] ", "(", or ")" within the OptionalString sub-token unless they are escaped with a caret ("^").
There are a few different classes of tokens, including the following:
SHGetSpecialFolder variables such as the following. These must be the first token, and can only occur once, at most:

- MyPicturesFolder
- MyDocumentsFolder

Session variables such as the following:

- SequenceNumber (The sequence number is used to avoid filename collisions; if it exists, it must be in the file name portion of the path.)
- DateAcquired
- EventName
- UserName
- MachineName

File and metadata variables such as the following:

- DateTaken
- OriginalFilename
- OriginalExtension
- CameraModel
- Width
- Height

Since these tokens are not intended to be visible to users, they will not be localized. For example, $ (DateTaken) will be the same on all versions of Microsoft Windows, regardless of locale or language settings.
As an example, suppose EventName is "Meghan's Birthday" and the naming pattern is as follows:

$ (MyPicturesFolder)\$ (DateAcquired)$ ([,] EventName)\$ (EventName [ ])$ (SequenceNumber).$ (OriginalExtension)
The resulting files would be named as follows:

C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 001.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 002.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 003.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 004.jpg
(Read and Write property)

220.6.13 SequencePaddingWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating how wide sequential fields in filenames will be.
Notes: If the value passed to SetSequencePaddingWidth is nonzero and the format string specified in SetOutputFileNameTemplate contains a sequential token, this method sets the width allotted for the sequential token. For example, given the template $ (GroupTag)$ (AcquisitionSequence).$ (OriginalExtension), if padding is set to 0, a file name might appear as

"Image1.jpg"

If padding is set to 3, the file name may appear as

"Image 1.jpg"
(Read and Write property)

220.6.14 SequenceZeroPadding as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether zeros or spaces are used to pad sequential file names.
Notes: Flag that, if set to true, indicates that zeros pad sequential file names.
(Read and Write property)

220.6.15 Constants

Flags

Constant	Value	Description
kFlagsAbortOnSettingsUpdate	&h00000800	Abort on settings update.
kFlagsDeleteAfterAcquire	&h00000020	Delete after acquire.
kFlagsDisableAutoRotate	&h00000002	Disable auto rotate.
kFlagsDisableDbIntegration	&h00000010	Disable DB integration.
kFlagsDisableDuplicateDetection	&h00000040	Disable duplicate detection.
kFlagsDisableGroupTagPrompt	&h00000008	Disable group tag prompt.
kFlagsDisableMetadataWrite	&h00000100	Disable metadata write.
kFlagsDisablePlugins	&h00000004	Disable plugins.
kFlagsDisableSettingsLink	&h00000400	Disable settings link.
kFlagsDisableThumbnailProgress	&h00000200	Disable thumbmail progress.
kFlagsEnableThumbnailCaching	&h00000080	Enable thumbnail caching. On by default.
kFlagsImportVideoAsMultipleFiles	&h00001000	Import videos as multiple files.
kFlagsNoGalleryLaunch	&h00000001	Suppresses the explorer window launched after acquisition.

220.7 class WinPhotoAcquireSourceMBS

220.7.1 class WinPhotoAcquireSourceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: This class is used for acquisition of items from a device.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 22.1pr2
- Windows Photos Acquire
- MBS Xojo Plugins, version 20.3pr6

220.7.2 Methods

220.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

220.7.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.7.5 InitializeItemList(ForceEnumeration as Boolean, PhotoAcquireProgress as WinPhotoAcquireProgressCallBackMBS, byref ItemCount as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The InitializeItemList method enumerates transferable items on the device and passes each item to the optional progress callback, if it is supplied.
Notes: ForceEnumeration: Flag that, if set to true, indicates that enumeration will be repeated even if the item list has already been initialized. If set to false, this flag indicates that repeated calls to InitializeItemList after the item list has already been initialized will not enumerate items again.
PhotoAcquireProgress: Optional. Pointer to an WinPhotoAcquireProgressCallBackMBS object for events.

ItemCount: Returns the number of items found.

If Acquire is called without first calling InitializeItemList, initialization of the item list is done implicitly. The first time the item list is initialized—either implicitly through Acquire or explicitly by calling InitializeItemList—each item is enumerated. During enumeration, if an WinPhotoAcquireProgressCallBackMBS object is passed to InitializeItemList, its implementation of StartEnumeration, FoundItem, and EndEnumeration may be used to apply further filtering or control to the list of items to be transferred.

220.7.6 Item(Index as Integer) as WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the WinPhotoAcquireItemMBS object at the given index in the list of items.
Notes: Index: The index from 0 to ItemCount-1.

220.7.7 Properties

220.7.8 DeviceId as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the identifier (ID) of the device.
Notes: (Read only property)

220.7.9 FriendlyName as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the name of the device, formatted for display.
Notes: (Read only property)

220.7.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.7.11 ItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the number of items found by the InitializeItemList method.
Notes: (Read only property)

220.7.12 PhotoAcquireSettings as WinPhotoAcquireSettingsMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Obtains an IPhotoAcquireSettings object for working with acquisition settings.
Notes: (Read only property)

220.8 class WinPhotoExceptionMBS

220.8.1 class WinPhotoExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The class for exceptions in the Windows Photo classes.
Notes: Subclass of the RuntimeException class.

220.9 class WinPhotoProgressActionCallbackMBS

220.9.1 class WinPhotoProgressActionCallbackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The class for an action callback.
Blog Entries

- MBS Xojo Plugins, version 20.3pr6

220.9.2 Methods

220.9.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

220.9.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.9.5 Properties

220.9.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.9.7 Events

220.9.8 DoAction(WindowHandle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Run the action for the progress action.

220.10 class WinPhotoProgressDialogMBS

220.10.1 class WinPhotoProgressDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Provides the progress dialog box that may be displayed when enumerating or importing images.
Notes: The dialog box is modal and runs in its own thread.
Blog Entries

220.10.2 Methods

220.10.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

220.10.4 Create(ParentWindow as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.
Notes: ParentWindow: The parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 220.10.5 Create(ParentWindow as Window) 24515
- 220.10.6 Create(ParentWindowHandle as Integer) 24516

220.10.5 Create(ParentWindow as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.

Notes: ParentWindow: The parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 220.10.4 Create(ParentWindow as DesktopWindow) 24515
- 220.10.6 Create(ParentWindowHandle as Integer) 24516

220.10.6 Create(ParentWindowHandle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.
Notes: ParentWindowHandle: Handle of the parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 220.10.4 Create(ParentWindow as DesktopWindow) 24515
- 220.10.5 Create(ParentWindow as Window) 24515

220.10.7 Destroy

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Closes and disposes of the progress dialog box shown during image enumeration and acquisition.
Notes: Calling Destroy is the only way to close the progress dialog box. If Destroy is not called, the dialog box will remain open. The dialog box is not automatically closed when the operation in progress completes.

220.10.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.10.9 IsCheckboxChecked(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The check box in the progress dialog box (typically indicating whether to delete files after transfer) is selected.
Notes: Index: Integer value containing the check box identifier (ID).

220.10.10 Properties

220.10.11 ActionLinkCallback as WinPhotoProgressActionCallbackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The callback object to receive action callback.
Notes: (Read and Write property)

220.10.12 ActionLinkText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The link text for the action item.
Notes: (Read and Write property)

220.10.13 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The caption of the progress dialog box.
Notes: The caption text is displayed above the progress indicator bar in the dialog box.
(Read and Write property)

220.10.14 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.10.15 IsCancelled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The IsCancelled method indicates whether the operation has been canceled via the progress dialog box.
Notes: Returns true to indicate the action has been canceled.
(Read only property)

220.10.16 PercentComplete as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating the completed portion of the current operation.
Notes: Integer value indicating the percentage of the operation that has completed. This value may be between 0 and 100 only.

If you pass ProgressIndeterminate to PercentComplete, the progress bar will not progress from left to right (from 0 to 100%), but will instead animate to indicate that an operation with an indeterminate end is taking place.
(Read and Write property)

220.10.17 Picture as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The thumbnail image displayed in the progress dialog box.
Notes: A bitmap thumbnail (up to 128 x 128 pixels, although it will be scaled to fit if it is too large).
(Read and Write property)

220.10.18 ProgressText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the progress bar in the progress dialog box.
Notes: (Read and Write property)

220.10.19 ShowsActionLink as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show an action link.
Notes: (Read and Write property)

220.10.20 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of the progress dialog box.
Notes: (Read and Write property)

220.10.21 WindowHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The window handle for the dialog.
Notes: (Read only property)

220.10.22 CheckboxCheck(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether the checkbox is checked.
Notes: (Read and Write computed property)

220.10.23 CheckboxText(Index as Integer = 0) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the check box in the progress dialog box indicating whether to delete images after transfer.
Notes: Index: Integer containing the check box identifier (ID).
(Read and Write computed property)

220.10.24 CheckboxTooltip(Index as Integer = 0) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The tooltip text for the check box in the progress dialog box.
Notes: Index: Integer containing the check box identifier (ID).
(Read and Write computed property)

220.10.25 CheckboxVisible(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether the checkbox is visible.
Notes: (Read and Write computed property)

220.10.26 Constants

Constants

Constant	Value	Description
ProgressDialogCheckboxIDDefault	0	The ID of the default checkbox.
ProgressIndeterminate	-1	The progress value for indeterminate.

220.11 class WinUserInputStringMBS

220.11.1 class WinUserInputStringMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The object created when asking the user for a string—for example, when obtaining the name of a tag.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 20.3pr6

220.11.2 Methods

220.11.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

220.11.4 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

220.11.5 MRUEntry(Index as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The entry at the given index in the most recently used list.
Notes: Index from 0 to MRUCount-1.

220.11.6 Properties

220.11.7 Default as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The default string used to initialize an edit control (or equivalent).
Notes: (Read only property)

220.11.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

220.11.9 MaxLength as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The maximum string length the user interface (UI) should allow.
Notes: The maximum string length in characters.
(Read only property)

220.11.10 MRUCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The number of items in the list of most recently used items.
Notes: (Read only property)

220.11.11 Prompt as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of a prompt if the prompt is a modal dialog box.
Notes: (Read only property)

220.11.12 StringId as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The unlocalized canonical name for the requested string.
Notes: For example, when requesting a tag name, the canonical name might be ”TagName”.
(Read only property)

220.11.13 StringType as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating the type of string to obtain from the user.
Notes: A value indicating the type of string to obtain from the user.

See UserInputDefault and UserInputPathElement constants.
(Read only property)

220.11.14 SubmitButtonText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the submit button.
Notes: (Read only property)

220.11.15 TooltipText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The tooltip text displayed for a control.
Notes: (Read only property)

220.11.16 Constants

Types

Constant	Value	Description
UserInputDefault	0	Specifies that any string is allowed.
UserInputPathElement	1	Specifies that the string will not accept characters that are illegal in file or directory names (such as * or /).

Chapter 221

Windows Registry

221.1 class RegistryFileTypeMBS

221.1.1 class RegistryFileTypeMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: An easy way to register an document icon for Windows.
Notes: You set up the properties of this class and than you call create.
I suggest that you do it like QuickTime or Winzip. Ask the user on first run if he want's your application to register its file types.
And also provide two buttons in the Preferencesdialog to register or unregister the types.

This class works on Windows 7 only if you run the app as administrator.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr5
- Plugin notes

221.1.2 Methods

221.1.3 Create as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates this file type.
Example:

```
Var r as RegistryFileTypeMBS
' set properties for r
Var errorcode as Integer
errorcode=r.create
```

Notes: Returns:

-1 - Run on Mac OS
0 - OK
1 - Failed to create main extension key.
2 - Failed to create the description key for file type.
3 - Failed to create the key for the icon.
4 - Failed to create the key for the open description.
5 - Required parameters not provided.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

221.1.4 Remove as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes this file type.
Example:

```
Var r as RegistryFileTypeMBS
Var errorcode as Integer

errorcode=r.remove
```

Notes: Returns:

-1 - Run on Mac OS or parameters bad.
0 - OK
x - A Windows error code like 5 for permissions denied.

Note: The return values changed in MBS Plugin 3.2 to now return Windows error codes!

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

221.1.5 Properties

221.1.6 AppFile as FolderItem

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The application to launch to open the file.
Example:

```
Var r as new RegistryFileTypeMBS
r.Appfile=app.applicationfilembs // it is my file ;-)
```

Notes: (Read and Write property)

221.1.7 Description as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description for this file type.
Example:

```
Var r as new RegistryFileTypeMBS
r.description="Monkeybread File"
```

Notes: The text to show in the explorer in column view.
(Read and Write property)

221.1.8 Extension as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The extension for this file type.
Example:

```
Var r as new RegistryFileTypeMBS
```

r.extension=".MBS"

Notes: The extension should start with a dot follow by 3 uppercase letters and it should be unique. But as there are more file types than combinations of 3 letters this may be difficult...
(Read and Write property)

221.1.9 FileType as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A internal unique signature for this file type.
Example:

```
Var r as new RegistryFileTypeMBS

r.FileType="MBSFile"
```

Notes: May contain any character except chr(0) and should be ANSI encoded.
(Read and Write property)

221.1.10 Iconfile as FolderItem

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file with the icon.
Example:

```
Var r as new RegistryFileTypeMBS

r.iconfile=app.applicationfileMBS // it is my file ;-)
```

Notes: You can get the icon out of your application (ID 0 is the default icon).
But you can also use DLL files like "Shell32.dll" for some nice icons.
Last but not least you can use an ICO file which Iconographer can create for you from your Mac Icons.
(Read and Write property)

221.1.11 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the Icon to use.
Example:

```
Var r as new RegistryFileTypeMBS

r.iconid=3
```

Notes: Your icon file may contain more than one icon. Here you can specify which one to use. First is ID 0.
(Read and Write property)

221.1.12 OpenDescription as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text to show in the context menu for Open.
Example:

```
Var r as new RegistryFileTypeMBS

r.OpenDescription="Open MBS file"
```

Notes: If you don't provide an OpenDescription you'll get "Open".
Here you can describe the default action.
e.g. Stuffit Expander could say "Expand file".
(Read and Write property)

221.2 class RegistryKeyMBS

221.2.1 class RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to a Windows Registry Key.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 17.4
- MBS Xojo Plugins, version 17.4pr6
- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr11

221.2.2 Methods

221.2.3 CopyTree(keyname as string, Dest as RegistryKeyMBS) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies the specified registry key, along with its values and subkeys, to the specified destination key.
Notes: Returns true on success and false on failure.

221.2.4 CreateKey(name as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new subkey.
Notes: If the key is allready present it is just opened.
Returns a registry key or nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

221.2.5 Delete(keyname as string) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the specified subkey key.
Notes: Windows 95: The Delete function deletes a subkey and all its descendants.

Windows NT: The Delete function deletes the specified subkey. The subkey to be deleted must not have subkeys.

With plugin version 3.2 the NT behavior is worked around to match the Windows 95 behavior. So all sub keys are deleted!

221.2.6 DeleteTree(keyname as string) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the subkeys and values of the specified key recursively.
Example:

```
Var t as RegistryKeyMBS = RegistryMBS.CurrentUser

// create some keys
Var n as RegistryKeyMBS = t.CreateKey("Hello")
Var w as RegistryKeyMBS = n.CreateKey("World")

w.Value("Test").asString = "Hello"

break // see in regedit

// delete it
if t.DeleteTree("Hello") then
MsgBox "deleted. ok"
else
MsgBox "delete failed"
end if
```

Notes: Returns true on success and false on failure.

221.2.7 Flush

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes all the attributes of the specified open key into the RegistryMBS.

221.2.8 Item(index as Integer) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the key at the specified index.
Notes: May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 221.2.9 Item(name as string) as RegistryKeyMBS 24532

221.2.9 Item(name as string) as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the key with the specified name.
Notes: May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 221.2.8 Item(index as Integer) as RegistryKeyMBS 24531

221.2.10 ItemName(index as Integer) as string

MBS Win Plugin, Plugin Version: 6.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the key at the specified index.
Notes: May return "" on any error.

221.2.11 Value(index as Integer) as RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value at the specified index.
See also:

- 221.2.12 Value(name as string) as RegistryValueMBS 24532

221.2.12 Value(name as string) as RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value item with the specified name.
Notes: The value must not exists. So use this function to make a new key.
Use an empty name (e.g. "") for the default key value.

This method was named ValueItem in plugin version before 10.4.
See also:

• 221.2.11 Value(index as Integer) as RegistryValueMBS 24532

221.2.13 ValueName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the value with the given index.
Notes: May return "" on any error.

221.2.14 Properties

221.2.15 ItemCount as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the count of subkeys.
Example:

```
Var i,c as Integer
Var key as RegistryKeyMBS // the registry item

c=key.ItemCount-1
for i=0 to c
// do something
next
```

Notes: This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)

221.2.16 name as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the Key.
Notes: (Read only property)

221.2.17 ValueCount as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the count of values.
Example:

```
Var i,c as Integer
Var key as RegistryKeyMBS

c=key.ValueCount
for i=1 to c
// do something
next
```

Notes: This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)

221.3 class RegistryMBS

221.3.1 class RegistryMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to the Windows Registry.
Notes: Please send me an email if you need some functions which are now not included.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr10

- MBS REALbasic Plugins, version 10.4pr11

221.3.2 Methods

221.3.3 classesRoot as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the ClassesRoot Tree.

221.3.4 CurrentConfig as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the CurrentConfig Tree.

221.3.5 CurrentUser as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the CurrentUser Tree.

221.3.6 getBinaryValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as Memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you a Memoryblock of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
Var r as new RegistryMBS
msgBox "This OS is: "+r.getBinaryValue(path, "ProductName").cstring(0)
```

Notes: Returns nil on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

221.3.7 getStringValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you a String of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
Var r as new RegistryMBS
msgBox "This OS is: "+r.getStringValue(path, "ProductName")
```

Notes: Returns "" on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

221.3.8 Key(keypath as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the given path of a key.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
Var r as new RegistryMBS
msgBox r.Key(path).Name
```

Notes: If you need you can recreate this function in Xojo code to have some error checking. This function here will return nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

221.3.9 LocalMachine as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the LocalMachine Tree.

221.3.10 PerformanceData as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the PerformanceData Tree.

221.3.11 Users as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the Users Tree.

221.4 class RegistryValueMBS

221.4.1 class RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to a value of a RegistryMBS Key.
Blog Entries

- MBS REALbasic Plugins, version 10.4pr11

221.4.2 Methods

221.4.3 Delete as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes this value.
Notes: The RegistryValueMBS object should be destroyed after deleting.

221.4.4 SetBinaryMem(typ as Integer,data as Memoryblock)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value to the content of the memoryblock.
Notes: Type may be one of this values:

221.4.5 SetBinaryStr(typ as Integer,data as String)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value to the content of the string.
Notes: Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

221.4.6 Properties

221.4.7 asBinary as Memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a memoryblock.
Notes: Can also be used to set the value.
(Read and Write property)

221.4.8 asBinaryString as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a string with binary content.
Notes: This string may include chr(0).
Can also be used to set the value.
(Read and Write property)

221.4.9 asLong32 as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a 32bit integer.
Notes: Can also be used to set the value.
(Read and Write property)

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

221.4.10 asLong64 as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a 64bit integer.
Example:

```
Var v as RegistryValueMBS
v.aslong64=v.aslong64+1 // add one
```

Notes: Can also be used to set the value.
(Read and Write property)

221.4.11 asString as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a string.
Notes: Can also be used to set the value.
(Read and Write property)

221.4.12 isBinary as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is binary data.
Notes: (Read only property)

221.4.13 isLong32 as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a 32 bit integer.
Notes: (Read only property)

221.4.14 isLong64 as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a 64 bit Integer.
Notes: (Read only property)

221.4.15 isString as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a string.
Notes: (Read only property)

221.4.16 name as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the Value.
Notes: (Read only property)

221.4.17 size as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the size of this value.
Notes: (Read only property)

221.4.18 type as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the type of the value.
Notes: Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

(Read only property)

Chapter 222

Windows Shortcuts

222.1 class WindowsInternetShortcutMBS

222.1.1 class WindowsInternetShortcutMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create internet shortcuts on Windows.
Example:

```
#if targetwin32
Var w as WindowsInternetShortcutMBS

w=new WindowsInternetShortcutMBS

w.URL="http://www.monkeybreadsoftware.de"
w.Command=3
w.Icon=windowsSystemFolder.child("shell32.dll")
w.iconID=41
w.Location=SpecialFolder.Desktop.child("A new link to explorer.lnk")
w.Working=volume(0)

if w.CreateInternetShortCut then
if w.AddInternetShortCutIcon then
msgBox "Shortcut created."
else
msgBox "Failed to add icon."
end if
else
msgBox "Failed to create shortcut."
end if
#endif
```

222.1.2 Methods

222.1.3 CreateInternetShortCut as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a shortcut on the specified location.
Notes: Version 10.1: Now adds the icon, too.

222.1.4 Properties

222.1.5 Command as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code for the showing of the application.
Notes: Use e.g. 3 for full screen.
(Read and Write property)

222.1.6 Icon as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the icon file.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

222.1.7 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the icon inside the icon file.
Notes: (Read and Write property)

222.1.8 Location as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location where the shortcut is created or modified.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

222.1.9 url as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The URL where the shortcut will point to.
Notes: (Read and Write property)

222.1.10 WorkingDirectory as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The working directory for the browser.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

222.2 class WindowsShortCutMBS

222.2.1 class WindowsShortCutMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create shortcuts on Windows.
Example:

```
Var w as WindowsShortCutMBS

w = new WindowsShortCutMBS

w.Arguments = ""
w.Command = 3
w.Icon = specialfolder.system.child("shell32.dll").NativePath
w.iconID = 41
w.Location = SpecialFolder.Desktop.child("A new link to explorer.lnk").NativePath
w.Target = SpecialFolder.Windows.child("explorer.exe").NativePath
w.WorkingDirectory = volume(0).NativePath

if w.CreateShortCut then
msgBox "Shortcut created."
else
msgBox "Failed to create shortcut."
end if
```

Blog Entries

- MBS Xojo Plugins, version 21.6pr3

222.2.2 Methods

222.2.3 CreateShortCut as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a shortcut on the specified location.
Notes: Returns true on success and false on any error.
Version 10.1: Now adds the icon, too.

222.2.4 ResolveShortCut(DisableGUI as boolean=false, DisableSearch as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resolves the shortcut.
Notes: Fills the properties target, description, Argument, WorkingDirectory, Icon and IconID.
Returns false on any error.

Parameters added in plugin version 7.4:

DisableGUI:
Do not display a dialog box if the link cannot be resolved. The time-out duration will be set to the default value of 3,000 milliseconds (3 seconds).

DisableSearch:
Do not execute the search heuristics.

For more details check this page in Microsoft's documentation:
http://msdn.microsoft.com/en-us/library/bb774952(v=vs.85).aspx

222.2.5 Properties

222.2.6 Arguments as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Arguments to the application which is linked to the shortcut.
Notes: (Read and Write property)

222.2.7 Command as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code for the showing of the application.
Notes: Constants which may be useful:

(Read and Write property)

SW_HIDE	= 0
SW_NORMAL	= 1
SW_SHOWMINIMIZED	= 2
SW_SHOWMAXIMIZED	= 3
SW_MAXIMIZE	= 3
SW_SHOWNOACTIVATE	= 4
SW_SHOW	= 5
SW_MINIMIZE	= 6
SW_SHOWMINNOACTIVE	= 7
SW_SHOWNA	= 8
SW_RESTORE	= 9
SW_SHOWDEFAULT	= 10
SW_FORCEMINIMIZE	= 11

222.2.8 Description as String

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description of the shortcut.
Notes: (Read and Write property)

222.2.9 Icon as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the icon file.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

222.2.10 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the icon inside the icon file.
Notes: (Read and Write property)

222.2.11 Location as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location where the shortcut is created or modified.
Notes: (Changed from FolderItem to String in plugin version 3.4)

(Read and Write property)

222.2.12 ParentWindow as Variant

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop only.

Function: The parent window used when a dialog must be opened.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

222.2.13 Target as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The target where the shortcut will point to.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

222.2.14 WorkingDirectory as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The working directory of this shortcut.
Notes: (Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

Chapter 223

Windows Store

223.1 class WindowsStoreAppLicenseMBS

223.1.1 class WindowsStoreAppLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides license info for the current app, including licenses for products that are offered by the app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

223.1.2 Methods

223.1.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.1.4 Properties

223.1.5 AddOnLicenses as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the collection of licenses for durable add-ons for which the user has entitlements to use.
Notes: This property does not include licenses for consumable add-ons.

Returns a map of key and value pairs, where each key is the Store ID of an add-on SKU from the Microsoft Store catalog and each value is a StoreLicense object that contains license info for the add-on.

This collection contains durable add-on licenses that are currently valid. When a license is expired or no longer valid, it will no longer be available in this collection.
(Read only property)

223.1.6 ExpirationDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the expiration date and time for the app license.
Notes: The expiration date and time for the app license, relative to the system clock.

For usage-limited trials, the expiration date is December 31, 9999. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

223.1.7 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete license data in JSON format.
Notes: Use the ExtendedJsonData property to access the complete data for the StoreAppLicense object as a JSON-formatted string in your code.
(Read only property)

223.1.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.

Notes: (Read only property)

223.1.9 IsActive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the license is valid and provides the current user an entitlement to use the app.
Notes: (Read only property)

223.1.10 IsTrial as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the license is a trial license.
Notes: (Read only property)

223.1.11 IsTrialOwnedByThisUser as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement for the usage-limited trial that is associated with this app license.
Notes: This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

223.1.12 SkuStoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of the licensed app SKU from the Microsoft Store catalog.
Notes: (Read only property)

223.1.13 TrialTimeRemaining as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the remaining time for the usage-limited trial that is associated with this app license.
Notes: This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.

Value is in seconds.
(Read only property)

223.1.14 TrialUniqueId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a unique ID that identifies the combination of the current user and the usage-limited trial that is associated with this app license.
Notes: This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

223.2 class WindowsStoreContextMBS

223.2.1 class WindowsStoreContextMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The base class for Windows Store APIs.
Example:

Var context as New WindowsStoreContextMBS(Window1)

Notes: Provides members you can use to access and manage Microsoft Store-related data for the current app. For example, you can use members of this class to get Microsoft Store listing and license info for the current app, purchase the current app or products that are offered by the app, or download and install package updates for the app.

Requires Windows 10 Anniversary Edition (introduced in 10.0.14393.0)

Uses delegates, so only available for Xojo 2013 or newer.

223.2.2 Methods

223.2.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.
See also:

- 223.2.4 Constructor(Parent as DesktopWindow) 24556
- 223.2.5 Constructor(Parent as Window) 24556

223.2.4 Constructor(Parent as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Initializes store and sets parent window to use for dialogs.
See also:

- 223.2.3 Constructor 24555
- 223.2.5 Constructor(Parent as Window) 24556

223.2.5 Constructor(Parent as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Initializes store and sets parent window to use for dialogs.
See also:

- 223.2.3 Constructor 24555
- 223.2.4 Constructor(Parent as DesktopWindow) 24556

223.2.6 GetAppLicenseAsync(CompletionHandler as GetAppLicenseCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets license info for the current app, including licenses for add-ons for the current app.
Example:

```
Var context as New WindowsStoreContextMBS(Window1)
context.GetAppLicenseAsync AddressOf GetAppLicenseCompleted
```

Notes: Asynchronous version, which returns quickly and calls the given delegate later when done.

The StoreAppLicense object returned by this method provides access to licenses for add-ons and other info, such as whether the license is active. If this method is called while the device is offline, it returns the cached value of the current licenses on the device.

223.2.7 GetAppLicenseSync as WindowsStoreAppLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets license info for the current app, including licenses for add-ons for the current app.
Notes: Synchronous version, which waits for the result.

The StoreAppLicense object returned by this method provides access to licenses for add-ons and other info, such as whether the license is active. If this method is called while the device is offline, it returns the cached value of the current licenses on the device.

223.2.8 GetAssociatedStoreProductsAsync(productKinds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store info for the add-ons of the current app for which the user has purchased.
Notes: productKinds: An array of strings that specify the types of add-ons for which you want to retrieve info.

223.2.9 GetStoreProductForCurrentAppAsync(CompletionHandler as GetStoreProductForCurrentAppCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store listing info for the current app and provides access to a method that you can use to purchase the app for the current user.
Example:

```
Var context as New WindowsStoreContextMBS(Window1)
context.GetStoreProductForCurrentAppAsync AddressOf GetStoreProductForCurrentAppCompleted
```

223.2.10 GetStoreProductsAsync(productKinds() as String, storeIds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store listing info for the specified products that are associated with the current app.
Example:

```
// please change ID for the item to find

Var StoreIds() As String = Array("12345", "67890")
Var ProductKinds() As String = Array("**Application**", "**Game**", "**Consumable**", "**UnmanagedConsumable**", "**Durable**")
```

```
context.GetStoreProductsAsync ProductKinds, StoreIds, AddressOf GetStoreProductsAsyncCompleted
```

Notes: productKinds: An array of strings that specify the types of products for which you want to retrieve listing info.
storeIds: An array of the Store ID strings for the products for which you want to retrieve listing info.

223.2.11 GetUserCollectionAsync(productKinds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store info for the add-ons of the current app for which the user has purchased.
Notes: productKinds: An array of strings that specify the types of add-ons for which you want to retrieve info.

223.2.12 RequestPurchaseAsync(CompletionHandler as RequestPurchaseCompletedMBS, StoreID as String, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Example:

```
Var context as New WindowsStoreContextMBS(Window1)

// please change ID for the item to purchase
Const StoreID = "9NCMFFPJRVHC"

context.RequestPurchaseAsync AddressOf RequestPurchaseCompleted, StoreID
```

Notes: This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

223.2.13 RequestRateAndReviewAppAsync(CompletionHandler as RequestRateAndReviewAppCompletedMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the user to rate and review the app.
Example:

```
Var context as New WindowsStoreContextMBS(Window1)
context.RequestRateAndReviewAppAsync AddressOf RequestRateAndReviewAppCompleted
```

Notes: This method will display the UI for the user to select a Store rating and add an optional Store review for the product.
The delegate will later be called with the result.

223.2.14 Properties

223.2.15 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.2.16 Parent as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The parent window for dialogs.
Notes: Can reference a Window or DesktopWindow object.
(Read and Write property)

223.2.17 Events

223.2.18 OfflineLicensesChanged

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Raised when the status of the app's license changes (for example, the trial period has expired or the user has purchased the full version of the app).
Notes: When this event is raised, you can get the latest app license from the Microsoft Store by calling the GetAppLicenseAsync method. The WindowsStoreAppLicenseMBS object returned by this method also

contains the latest add-on licenses for the app in the AddOnLicenses property.

223.2.19 Constants

Asynchronous Status

Constant	Value	Description
kAsyncStatusCanceled	2	The operation was canceled.
kAsyncStatusCompleted	1	The operation has completed.
kAsyncStatusError	3	The operation has encountered an error.
kAsyncStatusStarted	0	The operation has started.

223.2.20 Delegates

223.2.21 GetAppLicenseCompletedMBS(ErrorCode as Integer, appLicense as WindowsStoreAppLicenseMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate called when app license data was retrieved.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

223.2.22 GetStoreProductForCurrentAppCompletedMBS(ErrorCode as Integer, result as WindowsStoreProductResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate called when query is done.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

223.2.23 GetStoreProductsCompletedMBS(ErrorCode as Integer, result as WindowsStoreProductQueryResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate for receiving results from product query calls.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

223.2.24 RequestPurchaseCompletedMBS(ErrorCode as Integer, result as WindowsStorePurchaseResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The purchase completed and you can query the status.
Notes: ErrorCode: The Windows error code in case of a failure.
Blog Entries

- MBS Xojo Plugins, version 23.1pr3

223.2.25 RequestRateAndReviewAppCompletedMBS(ErrorCode as Integer, result as WindowsStoreRateAndReviewResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate used for RequestRateAndReviewAppAsync method.
Notes: ErrorCode: The Windows error code in case of a failure.

223.4.2 Methods

223.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.4.4 Properties

223.4.5 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the caption for the image.
Notes: (Read only property)

223.4.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.4.7 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the height of the image, in pixels.
Notes: (Read only property)

223.4.8 ImagePurposeTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the tag for the image.
Notes: (Read only property)

223.4.9 Uri as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URI of the image.
Notes: (Read only property)

223.4.10 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the width of the image, in pixels.
Notes: (Read only property)

223.5 class WindowsStoreLicenseMBS

223.5.1 class WindowsStoreLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Provides license info for a durable add-on that is associated with the current app.
Notes: To retrieve StoreLicense objects for the durable add-ons for the current app, use the WindowsStoreAppLicenseMBS.AddOnLicenses property. This property contains only the add-on licenses that are still valid and provide the current user with an entitlement to use the add-on. When an add-on license expires or is longer valid, it will no longer be available in the WindowsStoreAppLicenseMBS.AddOnLicenses collection. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.5.2 Methods

223.5.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.5.4 Properties

223.5.5 ExpirationDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the expiration date and time for the add-on license.
Notes: (Read only property)

223.5.6 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets complete license data in JSON format.
Notes: (Read only property)

223.5.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.5.8 InAppOfferToken as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of the licensed add-on SKU from the Microsoft Store catalog.
Notes: (Read only property)

223.5.9 IsActive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: This property is reserved for future use, and it is not intended to be used in the current release.
Notes: Currently, it always returns true.
(Read only property)

223.5.10 SkuStoreId as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets in the product ID for the add-on.
Notes: (Read only property)

223.6 class WindowsStorePriceMBS

223.6.1 class WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Contains pricing info for a product listing in the Microsoft Store.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.6.2 Methods

223.6.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.6.4 Properties

223.6.5 CurrencyCode as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the ISO 4217 currency code for the market of the current user.
Notes: (Read only property)

223.6.6 FormattedBasePrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the base price for the product with the appropriate formatting for the market of the current user.
Notes: (Read only property)

223.6.7 FormattedPrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the purchase price for the product with the appropriate formatting for the market of the current user.
Notes: (Read only property)

223.6.8 FormattedRecurrencePrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the recurring price for the product with the appropriate formatting for the market of the current user, if recurring billing is enabled for this product.
Notes: (Read only property)

223.6.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.6.10 IsOnSale as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the product is on sale.
Notes: (Read only property)

223.6.11 SaleEndDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the end date for the sale period for the product, if the product is on sale.
Notes: (Read only property)

223.7 class WindowsStoreProductMBS

223.7.1 class WindowsStoreProductMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Represents a product that is available in the Microsoft Store.
Notes: Products in the Store are organized in a hierarcy of product, SKU, and availability objects. Products are represented by StoreProduct objects. The SKUs for each product are represented by StoreSku objects, and the availabilities for each SKU are represented by StoreAvailability objects. For more information, see In-app purchases and trials.
To retrieve a StoreProduct object for the current app, use the GetStoreProductForCurrentAppAsync method.
To retrieve StoreProduct objects for products that can be purchased from within the current app, use these methods.

- GetAssociatedStoreProductsAsync
- GetAssociatedStoreProductsWithPagingAsync
- GetStoreProductsAsync
- GetUserCollectionAsync
- GetUserCollectionWithPagingAsync

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.7.2 Methods

223.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.7.4 GetIsAnySkuInstalledAsync(CompletionHandler as GetIsAnySkuInstalledAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Indicates whether any SKU of this product is installed on the current device.
Notes: This method is intended to be used for products that have downloadable content (DLC).

Starts an asynchronous operation that, on successful completion, returns true if a SKU of this product is installed on the current device; otherwise, false.

223.7.5 Images as WindowsStoreImageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the images from the Windows Store listing for the product.
Notes: Returns a collection of WindowsStoreImageMBS objects that represent the images from the Windows Store listing for the product.

223.7.6 Keywords as String()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the keywords that are associated with the product in Partner Center.
Notes: This property only applies to StoreProduct objects that represent add-ons. These strings correspond to the value of the Keywords field in the properties page for the add-on in Partner Center.

223.7.7 RequestPurchaseAsync(CompletionHandler as WindowsStoreContextMBS.RequestPurchaseCompletedMBS, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Notes: This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

223.7.8 SKUs as WindowsStoreSKUMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the list of available SKUs for the product.

223.7.9 Videos as WindowsStoreVideoMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the videos from the Windows Store listing for the product.
Notes: Returns a collection of WindowsStoreVideoMBS objects that represent the videos from the Windows Store listing for the product.

223.7.10 Properties

223.7.11 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product description from the Microsoft Store listing.
Notes: (Read only property)

223.7.12 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete data for the product from the Store in JSON format.
Notes: Use the ExtendedJsonData property to access the complete data for the StoreProduct object as a JSON-formatted string in your code.
(Read only property)

223.7.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.7.14 HasDigitalDownload as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the product has optional downloadable content (DLC).
Notes: (Read only property)

223.7.15 InAppOfferToken as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the product ID for this product, if the current StoreProduct represents an add-on.
Notes: Returns the product ID for this product, if the current StoreProduct represents an add-on.
(Read only property)

223.7.16 IsInUserCollection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement to use the default SKU of the product.
Notes: (Read only property)

223.7.17 Language as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the language for the data in the Microsoft Store listing for the product.
Notes: (Read only property)

223.7.18 LinkURI as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the URI to the Microsoft Store listing for the product.
Notes: An example URI is https://www.microsoft.com/store/apps/<Store ID for the product>. If there is no listing page for the product, this link resolves to the Microsoft Store home page.
(Read only property)

223.7.19 Price as WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the price for the default SKU and availability for the product.
Notes: (Read only property)

223.7.20 ProductKind as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the type of the product.
Notes: These values are currently supported: Application, Game, Consumable, UnmanagedConsumable, and Durable.

see
https://docs.microsoft.com/en-us/uwp/api/windows.services.store.storeproduct.productkind?view=winrt-19041#Windows_
(Read only property)

223.7.21 StoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID for this product.
Notes: For an app, this property corresponds to the Store ID that is available on the App identity page for the app in Partner Center.
(Read only property)

223.7.22 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product title from the Microsoft Store listing.
Notes: (Read only property)

223.7.23 Delegates

223.7.24 GetIsAnySkuInstalledAsyncCompletedMBS(ErrorCode as Integer, Installed as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The delegate triggered by GetIsAnySkuInstalledAsync when completed.

223.8 class WindowsStoreProductQueryResultMBS

223.8.1 class WindowsStoreProductQueryResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to retrieve details about products that can be purchased from within the current app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.8.2 Methods

223.8.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.8.4 Properties

223.8.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the collection of products returned by the request.
Notes: A dictionary of key and value pairs, where each key is a Store ID for the add-on and the value is a StoreProduct object that represents the add-on.
(Read only property)

223.8.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.8.7 Products as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

223.9 class WindowsStoreProductResultMBS

223.9.1 class WindowsStoreProductResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to retrieve details about the current app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.9.2 Methods

223.9.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.9.4 Properties

223.9.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

223.9.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.9.7 Product as WindowsStoreProductMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets info about the current app.
Notes: (Read only property)

223.10 class WindowsStorePurchasePropertiesMBS

223.10.1 class WindowsStorePurchasePropertiesMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Contains additional details that you can pass to a purchase request for a product, including the product name to display to the user during the purchase.
Notes: The RequestPurchaseAsync methods of the WindowsStoreContextMBS, WindowsStoreProductMBS, WindowsStoreSkuMBS, and WindowsStoreAvailabilityMBS classes have overloads that accept an argument of this type.
Blog Entries

223.10.2 Methods

223.10.3 Constructor(Name as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Initializes a new instance of the StorePurchaseProperties class.
Notes: Optionally pass name.

223.10.4 Properties

223.10.5 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets or sets a JSON-formatted string that contains extended data to pass with the purchase request to the Microsoft Store.
Notes: Use the ExtendedJsonData property to access the complete data for the StorePurchaseProperties object as a JSON-formatted string in your code. For more information about the structure of the data, see Data schemas for Store products.
If you want to associate the purchase request with a custom campaign, you can add a field named DevOfferId to the JSON string that is returned by this property and then assign the updated string to this property. You can then retrieve this value later by accessing the DeveloperOfferId property of a StoreCollectionData object. Here is an example JSON string that includes a DevOfferId field: " { \"DevOfferId\": \"your campaign ID\" } ".
(Read and Write property)

223.10.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.10.7 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets or sets the product name that is displayed to the user during the purchase.
Notes: The specified name appears in the title bar of the purchase UI.
(Read and Write property)

223.11 class WindowsStorePurchaseResultMBS

223.11.1 class WindowsStorePurchaseResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to purchase an app or product that is offered by the app.
Notes: The RequestPurchaseAsync methods of the StoreContext, StoreProduct, StoreSku, or StoreAvailability classes return an object of this type.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.11.2 Methods

223.11.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.11.4 Properties

223.11.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the purchase request, if the operation encountered an error.
Notes: (Read only property)

223.11.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.11.7 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the status of the purchase request.
Notes: (Read only property)

223.11.8 Constants

Purchase Status

Constant	Value	Description
kStatusAlreadyPurchased	1	The current user has already purchased the specified app or add-on.
kStatusNetworkError	3	The purchase request did not succeed because of a network connectivity error.
kStatusNotPurchased	2	The purchase request did not succeed.
kStatusServerError	4	The purchase request did not succeed because of a server error returned by the Microsoft Store.
kStatusSucceeded	0	The purchase request succeeded.

223.12 class WindowsStoreRateAndReviewResultMBS

223.12.1 class WindowsStoreRateAndReviewResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to rate and review the product.
Notes: Requires Windows 10, version 1809 (introduced in 10.0.17763.0)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.12.2 Methods

223.12.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.12.4 Properties

223.12.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

223.12.6 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the complete result data for a rate and review request in JSON format.
Notes: This includes information to determine if a user aborted the dialog and error details if the call was not successful.

Use the ExtendedJsonData property to access the complete data for the StoreRateAndReviewResult object as a JSON-formatted string in your code.
JSON Schema:

{ "type": "object", "properties": { "status": { "enum": ["success", "aborted"] } , "data": { "type": "object", "properties": { "updated": { "type": "boolean" } } , "required": ["updated"] } , "errorDetails": { "type": "string" } } , "required": ["status", "errorDetails"] }
(Read only property)

223.12.7 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.12.8 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the status for the rate and review request for the product.
Notes: (Read only property)

223.12.9 WasUpdated as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the request to rate and review had a successful updated.
Notes: (Read only property)

223.12.10 Constants

Review Status

Constant	Value	Description
kStatusCanceledByUser	1	The request was canceled by the user.
kStatusError	3	The request encountered an error.
kStatusNetworkError	2	The request encountered a network error.
kStatusSucceeded	0	The request was successful.

223.13 class WindowsStoreSKUMBS

223.13.1 class WindowsStoreSKUMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides info for a stock keeping unit (SKU) of a product in the Microsoft Store.
Notes: A SKU is a code that uniquely identifies a particular version of a product or service. It is a very common term used in the field of inventory management. Products in the Store are organized in a hierarcy of product, SKU, and availability objects. Products are represented by StoreProduct objects. The SKUs for each product are represented by StoreSku objects, and the availabilities for each SKU are represented by StoreAvailability objects. For more information, see In-app purchases and trials.
To access the SKUs for a product, use the Skus property of the StoreProduct for the product in which you are interested.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

223.13.2 Methods

223.13.3 BundledSKUs as String()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the list of Store IDs for the apps or add-ons that are bundled with this product SKU.

223.13.4 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.13.5 GetIsInstalledAsync(CompletionHandler as GetIsInstalledAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Indicates whether this product SKU is installed on the current device.
Notes: Starts an asynchronous operation that, on successful completion, returns true if this product SKU is installed on the current device; otherwise, false.

223.13.6 Images as WindowsStoreImageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the images from the Microsoft Store listing for the product SKU.
Notes: Returns a collection of WindowsStoreImageMBS objects that represent the images from the Microsoft Store listing for the product SKU.

223.13.7 RequestPurchaseAsync(CompletionHandler as WindowsStoreContextMBS.RequestPurchaseCompletedMBS, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Notes: This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

223.13.8 Videos as WindowsStoreVideoMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the videos from the Microsoft Store listing for the product SKU.
Notes: Returns a collection of WindowsStoreVideoMBS objects that represent the videos from the Microsoft Store listing for the product SKU.

223.13.9 Properties

223.13.10 CustomDeveloperData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the custom developer data string (also called a tag) that contains custom information about the add-on that this product SKU represents.
Notes: The custom developer data provides a way for developers to associate custom contextual information with an add-on. For more information about setting this value for an add-on, see Enter add-on properties.
(Read only property)

223.13.11 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product SKU description from the Microsoft Store listing.
Notes: (Read only property)

223.13.12 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete data for the current product SKU from the Store in JSON format.
Notes: Use the ExtendedJsonData property to access the complete data for the StoreSku object as a JSON-formatted string in your code.
(Read only property)

223.13.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.13.14 IsInUserCollection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement to use the current product SKU.
Notes: (Read only property)

223.13.15 IsSubscription as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current product SKU is a subscription with recurring billing.
Notes: For more information about the subscription, see the WindowsStoreSubscriptionInfoMBS class and SubscriptionInfo property.
(Read only property)

223.13.16 IsTrial as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current product SKU is a trial SKU.
Notes: (Read only property)

223.13.17 Language as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the language for the data in the Microsoft Store listing for the product SKU.
Notes: (Read only property)

223.13.18 Price as WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the price of the default availability for this product SKU.
Notes: (Read only property)

223.13.19 StoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of this product SKU.
Notes: The Store ID returned by this property has the format <product Store ID>/<SKU Store ID>, where:

- <product Store ID>is a 12-character alpha-numeric string, such as 9NBLGGH69M0B. This Store ID

is available in Partner Center, and it is returned by the StoreId property of the related StoreProduct object.

- <SKU Store ID>is a 4-character alpha-numeric string that identifies the SKU. An example complete Store ID returned by this property is 9NBLGGH69M0B/000N.

(Read only property)

223.13.20 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product SKU title from the Microsoft Store listing.
Notes: (Read only property)

223.13.21 Delegates

223.13.22 GetIsInstalledAsyncCompletedMBS(ErrorCode as Integer, Installed as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The delegate triggered by GetIsInstalledAsync when finished.

223.14 class WindowsStoreVideoMBS

223.14.1 class WindowsStoreVideoMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Represents a video that is associated with a product listing in the Microsoft Store.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

223.14.2 Methods

223.14.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

223.14.4 Properties

223.14.5 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the caption for the video.
Notes: (Read only property)

223.14.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

223.14.7 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the height of the video, in pixels.
Notes: (Read only property)

223.14.8 PreviewImage as WindowsStoreImageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the preview image that is displayed for the video.
Notes: (Read only property)

223.14.9 Uri as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URI of the video.
Notes: (Read only property)

223.14.10 VideoPurposeTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the tag for the video.
Notes: (Read only property)

223.14.11 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the width of the video, in pixels.
Notes: (Read only property)

Chapter 224

Windows System Tray

224.1 Globals

224.1.1 HIconFromFileMBS(IconFile as FolderItem, IconID as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Windows Icon Handle for an icon loaded fromt he given icon file.
Notes: What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.
Returns 0 on failure.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.
This function is useful for declares where you have to pass a HICON parameter.

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr2

224.1.2 HIconFromPicturesMBS(Icon as picture, Mask as picture) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Windows Icon Handle with the given pictures.
Notes: What image depths are used and supported depends on the Windows version.
Returns 0 on failure.
This function is useful for declares where you have to pass a HICON parameter.

224.2 class WindowsSystemTrayMBS

224.2.1 class WindowsSystemTrayMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create an item in the system tray.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr10
- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr8

224.2.2 Methods

224.2.3 Add as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds the item to the system tray.
Example:

```
Var e as WindowsSystemTrayMBS // your system tray object

if e.add then
list.addrow "Added icon."
else
list.addrow "Failed to add icon."
end if
```

Notes: Returns true if successfull.
You can change the Icon&Mask or the Tooltip string.

224.2.4 Available as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the system tray functions are available.
Notes: Returns true on Windows 95 and newer.

Returns false on Mac OS and Linux.

224.2.5 Modify as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Modifies the item to the system tray.
Notes: Returns true if successfull.
You can change the Icon&Mask or the Tooltip string.

224.2.6 Remove as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the item from the system tray.
Notes: Returns true if successfull.

224.2.7 SetFocus as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method resets focus back to the system try area.
Notes: May be useful to call as cleanup after some context menu was shown.

224.2.8 SetIconFile(IconFile as FolderItem, IconID as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads an icon from the given file.
Example:

```
Var wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconFile(file,1)
```

Notes: Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.

224.2.9 SetIconPicture(Icon as picture, Mask as picture) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads the icon from the given picture with mask.
Example:

```
Var myicon as picture // your picture
Var mymask as picture // the mask for the picture
Var wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconPicture(myicon, mymask)
```

Notes: Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.

224.2.10 Properties

224.2.11 BalloonMode as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon mode.
Example:

```
Var s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes: 0 is Error, 1 is Info and 2 is warning.
(Read and Write property)

224.2.12 BalloonText as string

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon text to show.
Example:

```
Var wst as WindowsSystemTrayMBS // your system tray object
```

```
wst.BalloonTitle="Warning"
wst.BalloonText="You have not clicked on me the last 10 minutes."
call wst.modify
```

Notes: If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

224.2.13 BalloonTimeout as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon timeout in milliseconds.
Example:

```
Var s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
s.BalloonTimeout = 30000
```

Notes: A value between 10000 and 30000.
Note that Timeout is valid only in Windows 2000 and Windows XP.
(Read and Write property)
See also:

- 224.2.22 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer) 24599

224.2.14 BalloonTitle as string

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The title of the balloon tooltip.
Example:

```
Var s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes: If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

224.2.15 IconHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The icon handle currently used for the tray object.
Notes: zero if no handle is there.
(Read and Write property)

224.2.16 ID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: If you have more than one icon in the system tray, use this ID to see which one is referred to inside an event.
Notes: (Read and Write property)

224.2.17 Tooltip as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The help string for the tooltip.
Example:

```
Var e as WindowsSystemTrayMBS // global

e=new WindowsSystemTrayMBS
e.ID=12345678
e.Tooltip="some text"
e.BalloonText="some text"
e.BalloonTitle="some text"
e.BalloonMode=0
```

Notes: Limited to 63 characters.
(Read and Write property)

224.2.18 UsingNewEvents as Boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the new events are enabled.
Notes: The plugin tries to enable new events if possible. That will only work on Windows 2000 or newer.

New events are:
BalloonTimeout
PopupOpen
ContextMenu
BalloonHide
KeySelected
BalloonUserClick
BalloonShow
Selected
(Read only property)

224.2.19 Events

224.2.20 BalloonHide(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon has been hidden.

224.2.21 BalloonShow(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon was shown.
Notes: You will get one balloon event when it disappears: BalloonHide, BalloonUserClick or BalloonTimeout.

224.2.22 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon was removed because of a timeout.
See also:

- 224.2.13 BalloonTimeout as Integer 24597

224.2.23 BalloonUserClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The user clicked on the balloon to make it away.

224.2.24 ContextMenu(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: You should show a context menu.

224.2.25 KeySelected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The system tray item was selected by the keyboard.

224.2.26 MouseLeftButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the left mouse button is pressed for a double click on the system tray icon.

224.2.27 MouseLeftButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the left mouse button is pressed on the system tray icon.

224.2.28 MouseLeftButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the left mouse button is released on the system tray icon.

224.2.29 MouseMiddleButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the middle mouse button is pressed for a double click on the system tray icon.

224.2.30 MouseMiddleButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the middle mouse button is pressed on the system tray icon.

224.2.31 MouseMiddleButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the middle mouse button is released on the system tray icon.

224.2.32 MouseMove(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the mouse is moved over the system tray icon.

224.2.33 MouseRightButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the right mouse button is pressed for a double click on the system tray icon.

224.2.34 MouseRightButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the right mouse button is pressed on the system tray icon.

224.2.35 MouseRightButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Called if the right mouse button is pressed on the system tray icon.

224.2.36 PopupOpen(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: You should show a popup menu on the mouse position.

224.2.37 Selected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The system tray item was selected.

Chapter 225

Windows Taskbar State

225.1 class WindowsTaskbarStateMBS

225.1.1 class WindowsTaskbarStateMBS

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for information about the settings for the Windows taskbar.
Blog Entries

- MBS Real Studio Plugins, version 12.2pr6

225.1.2 Properties

225.1.3 AlwaysOnTop as Boolean

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if the taskbar should be always on the top.
Notes: Value is false on any error.
Settable in plugin version 12.2 and newer.
(Read and Write property)

225.1.4 AutoHide as Boolean

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if the taskbar automatically hides itself.
Notes: Value is false on any error.

Settable in plugin version 12.2 and newer.
(Read and Write property)

225.1.5 Bottom as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The bottom value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

225.1.6 Height as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

225.1.7 Left as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

225.1.8 Right as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The right value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

225.1.9 Top as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

225.1.10 Width as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width value of the taskbar dimensions.
Notes: Value is 0 on any error.
(Read and Write property)

Chapter 226

WindowsML

226.1 class WindowsMLExceptionMBS

226.1.1 class WindowsMLExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The exception class for Windows runtime exceptions in WindowsML Plugin part.
Notes: All exceptions should have the HRESULT as errorNumber and the message set.
Subclass of the RuntimeException class.

226.2 class WinLearningModelBindingMBS

226.2.1 class WinLearningModelBindingMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Used to bind values to named input and output features.
Blog Entries

- News from the MBS Xojo Plugins Version 20.5
- Playing with Machine Learning on Windows

226.2.2 Methods

226.2.3 BindWithDouble(name as string, shape() as Integer, values() as Double = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 64-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.4 BindWithFloat(name as string, shape() as Integer, values() as Single = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 32-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.5 BindWithFloat16(name as string, shape() as Integer, values() as Single = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 16-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.6 BindWithImage(name as string, file as folderItem)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given image file.
Notes: Maybe used with features needing image or tensor data.
See also:

- 226.2.7 BindWithImage(name as string, Path as String) 24609

226.2.7 BindWithImage(name as string, Path as String)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given image file.
Notes: Maybe used with features needing image or tensor data.
See also:

- 226.2.6 BindWithImage(name as string, file as folderItem) 24609

226.2.8 BindWithInt16(name as string, shape() as Integer, values() as Int16 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 16-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.9 BindWithInt32(name as string, shape() as Integer, values() as Int32 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 32-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.10 BindWithInt64(name as string, shape() as Integer, values() as Int64 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 64-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.11 BindWithInt8(name as string, shape() as Integer, values() as Int8 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 8-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.12 BindWithUInt16(name as string, shape() as Integer, values() as UInt16 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 16-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.13 BindWithUInt32(name as string, shape() as Integer, values() as UInt32 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 32-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.14 BindWithUInt64(name as string, shape() as Integer, values() as UInt64 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 64-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.15 BindWithUInt8(name as string, shape() as Integer, values() as UInt8 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes: This is for 8-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

226.2.16 Clear

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Remove all bindings.

226.2.17 Constructor(Session as WinLearningModelSessionMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Creates a WinLearningModelBindingMBS from the specified WinLearningModelSessionMBS.

226.2.18 HasKey(key as string) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Determines whether the map view contains the specified key.
Notes: Returns true if the map view contains the specified key; otherwise, false.

226.2.19 SetDefaults

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Fills all tensor arrays with empty arrays.

226.2.20 Properties

226.2.21 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

226.2.22 Session as WinLearningModelSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The related session.
Notes: (Read only property)

226.3 class WinLearningModelEvaluationResultMBS

226.3.1 class WinLearningModelEvaluationResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Get the results of the evaluation.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Playing with Machine Learning on Windows

226.3.2 Methods

226.3.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

226.3.4 GetTensorBoolean(name as string) as Boolean()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor boolean array.

226.3.5 GetTensorDouble(name as string) as Double()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor double array.

226.3.6 GetTensorFloat(name as string) as Single()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor float array.

226.3.7 GetTensorFloat16(name as string) as Single()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16-bit float array.

226.3.8 GetTensorInt16(name as string) as Int16()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16 bit signed integer array.

226.3.9 GetTensorInt32(name as string) as Int32()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 32 bit signed integer array.

226.3.10 GetTensorInt64(name as string) as Int64()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 64 bit signed integer array.

226.3.11 GetTensorInt8(name as string) as Int8()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 8 bit signed integer array.

226.3.12 GetTensorUInt16(name as string) as UInt16()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16 bit unsigned integer array.

226.3.13 GetTensorUInt32(name as string) as UInt32()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 32 bit unsigned integer array.

226.3.14 GetTensorUInt64(name as string) as UInt64()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 64 bit unsigned integer array.

226.3.15 GetTensorUInt8(name as string) as UInt8()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 8 bit unsigned integer array.

226.3.16 OutputNames as String()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Gets the output feature names of the model.

226.3.17 Properties

226.3.18 CorrelationId as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The optional string that was passed to Evaluate function.
Notes: (Read only property)

226.3.19 ErrorStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: If the evaluation failed, returns an error code for what caused the failure.
Notes: (Read only property)

226.3.20 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

226.3.21 Succeeded as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: True if the evaluation completed successfully; otherwise, false.
Notes: (Read only property)

226.4 class WinLearningModelFeatureDescriptorMBS

226.4.1 class WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Describes the common properties that all features have.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

226.4.2 Methods

226.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

226.4.4 Properties

226.4.5 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A description of what this feature is used for in the model.
Notes: (Read only property)

226.4.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

226.4.7 Kind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The kind of feature; use this to know which derived class to use.
Notes: Or use IsA operator in Xojo to determinate which subclass the plugin used.

(Read only property)

226.4.8 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name you use to bind values to this feature.
Notes: (Read only property)

226.4.9 Required as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: If true, you must bind a value to this feature before calling Evaluate.
Notes: (Read only property)

226.4.10 Constants

Kinds

Constant	Value	Description
KindImage	3	The feature is an image, so use WinLearningModelImageFeatureDescriptorMBS class.
KindMap	2	The feature is a map, so use WinLearningModelMapFeatureDescriptorMBS class.
KindSequence	1	The feature is a sequence, so use WinLearningModelSequenceFeatureDescriptorMBS class.
KindTensor	0	The feature is a tensor, so use WinLearningModelTensorFeatureDescriptorMBS class.

Tensor Kind

Constant	Value	Description
TensorKindBoolean	9	The tensor type is Boolean.
TensorKindComplex128	15	Invalid type.
TensorKindComplex64	14	Invalid type.
TensorKindDouble	11	The tensor type is 64-bit floating point.
TensorKindFloat	1	The tensor type is 32-bit floating point.
TensorKindFloat16	10	The tensor type is 16-bit floating point.
TensorKindInt16	5	The tensor type is 16-bit signed integer.
TensorKindInt32	6	The tensor type is 32-bit signed integer.
TensorKindInt64	7	The tensor type is 64-bit signed integer.
TensorKindInt8	3	The tensor type is 8-bit signed integer.
TensorKindString	8	The tensor type is String.
TensorKindUInt16	4	The tensor type is 16-bit unsigned integer.
TensorKindUInt32	12	The tensor type is 32-bit unsigned integer.
TensorKindUInt64	13	The tensor type is 64-bit unsigned integer.
TensorKindUInt8	2	The tensor type is 8-bit unsigned integer.
TensorKindUndefined	0	Invalid type.

226.5 class WinLearningModelImageFeatureDescriptorMBS

226.5.1 class WinLearningModelImageFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Describes the properties of the image the model is expecting.
Notes: Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

226.5.2 Properties

226.5.3 BitmapAlphaMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the expected alpha mode of the image.
Notes: (Read only property)

226.5.4 BitmapPixelFormat as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the expected pixel format (channel ordering, bit depth, and data type).
Notes: (Read only property)

226.5.5 Height as UInt32

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The expected image height.
Notes: (Read only property)

226.5.6 Width as UInt32

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The expected image width.
Notes: (Read only property)

226.5.7 Constants

Alpha Modes

Constant	Value	Description
BitmapAlphaModeIgnore	2	The alpha value is ignored.
BitmapAlphaModePremultiplied	0	The alpha value has been premultiplied. Each color is first scaled by the alpha value.
BitmapAlphaModeStraight	1	The alpha value has not been premultiplied. The alpha channel indicates the transparency of the color.

Bitmap Formats

Constant	Value	Description
BitmapPixelFormatBgra8	87	The pixel format is B8G8R8A8 unsigned integer.
BitmapPixelFormatGray16	57	The pixel format is 16 bpp grayscale.
BitmapPixelFormatGray8	62	The pixel format is 8 bpp grayscale.
BitmapPixelFormatNv12	103	The pixel format is NV12.
BitmapPixelFormatP010	104	The pixel format is P010.
BitmapPixelFormatRgba16	12	The pixel format is R16B16G16A16 unsigned integer.
BitmapPixelFormatRgba8	30	The pixel format is R8G8B8A8 unsigned integer.
BitmapPixelFormatUnknown	0	The pixel format is unknown.
BitmapPixelFormatYuy2	107	The pixel format is YUY2.

226.6 class WinLearningModelMapFeatureDescriptorMBS

226.6.1 class WinLearningModelMapFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The descriptor for a map, which is a collection of (key, value) pairs.
Notes: Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

226.6.2 Properties

226.6.3 KeyKind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Map keys can be tensor kinds.
Notes: (Read only property)

226.6.4 ValueDescriptor as WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Map values can be feature kinds.
Notes: (Read only property)

226.7 class WinLearningModelMBS

226.7.1 class WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Represents a trained machine learning model.
Example:

```
Var ModelFile as FolderItem =SpecialFolder.Desktop.Child("SqueezeNet.onnx")

if not ModelFile.Exists then
MsgBox "Please download model first!"
quit
end if

Var model as WinLearningModelMBS = WinLearningModelMBS.LoadFromFile(ModelFile)

if model = nil then
msgbox "Failed to load model!"
// Check path and you need Windows 10
quit
end if
```

Notes: This is the main object you use to interact with Windows ML. You use it to load, bind, and evaluate trained ONNX models:

- Load the model using one of the Load method.
- Enumerate the InputFeatures and OutputFeatures and bind to your model.
- Create a LearningModelSessionMBS and evalaute.

Requires Windows 10.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

226.7.2 Methods

226.7.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

226.7.4 InputFeatures as WinLearningModelFeatureDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A list of the model's input features.
Example:

```
Var model as WinLearningModelMBS // your model

Var inputFeatures() as WinLearningModelFeatureDescriptorMBS = model.InputFeatures
for each feature as WinLearningModelFeatureDescriptorMBS in inputFeatures

list.AddRow feature.Name

next
```

226.7.5 LoadFromFile(File as FolderItem) as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Loads a model for Windows Machine Learning.
Example:

```
Var ModelFile as FolderItem =SpecialFolder.Desktop.Child("SqueezeNet.onnx")

if not ModelFile.Exists then
MsgBox "Please download model first!"
quit
end if

Var model as WinLearningModelMBS = WinLearningModelMBS.LoadFromFile(ModelFile)

if model = nil then
msgbox "Failed to load model!"
// Check path and you need Windows 10
quit
end if
```

Notes: Please use an onnx file as you find them on various websites, e.g. start here:
https://docs.microsoft.com/en-us/windows/ai/windows-ml/get-onnx-model

Will rasie an exception about unregistered class if called on older Windows versions before 10.

226.7.6 LoadFromFilePath(Path as String) as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Loads a model for Windows Machine Learning.
Notes: Please use an onnx file as you find them on various websites, e.g. start here:
https://docs.microsoft.com/en-us/windows/ai/windows-ml/get-onnx-model

Will rasie an exception about unregistered class if called on older Windows versions before 10.

226.7.7 OutputFeatures as WinLearningModelFeatureDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A list of the model's output features.
Example:

```
Var model as WinLearningModelMBS // your model

Var OutputFeatures() as WinLearningModelFeatureDescriptorMBS = model.OutputFeatures
for each feature as WinLearningModelFeatureDescriptorMBS in OutputFeatures

list.AddRow feature.Name

next
```

226.7.8 Properties

226.7.9 Author as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name of the model author.
Notes: (Read only property)

226.7.10 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A description of the model.
Notes: (Read only property)

226.7.11 Domain as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The domain of the model.
Notes: (Read only property)

226.7.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

226.7.13 Metadata as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The metadata from the ONNX model.
Notes: (Read only property)

226.7.14 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name of the model.
Notes: (Read only property)

226.7.15 Version as Int64

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The version of the model.
Notes: (Read only property)

226.8 class WinLearningModelSequenceFeatureDescriptorMBS

226.8.1 class WinLearningModelSequenceFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A descriptor for a sequence with an array of elements.
Notes: Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

226.8.2 Properties

226.8.3 ElementDescriptor as WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The feature descriptor for this sequence element.
Notes: (Read only property)

226.9 class WinLearningModelSessionMBS

226.9.1 class WinLearningModelSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Used to evaluate machine learning models.
Blog Entries

- Playing with Machine Learning on Windows

226.9.2 Methods

226.9.3 Constructor(model as WinLearningModelMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Creates a session using the default device.
Notes: model: The trained machine learning model for this session.

226.9.4 Evaluate(bindings as WinLearningModelBindingMBS, correlationId as string = "") as WinLearningModelEvaluationResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Evaluate the machine learning model using the feature values bound in bindings.
Notes: bindings: Holder for associations between model inputs and variable instances.
correlationId: Optional user-supplied string to connect the output results.

MBS Plugins don't support all possible input/output combinations, so if you need something more, please let us know.

226.9.5 Properties

226.9.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

226.9.7 Model as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The trained machine learning model for this session.
Notes: (Read only property)

226.10 class WinLearningModelTensorFeatureDescriptorMBS

226.10.1 class WinLearningModelTensorFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Tensors are multi-dimensional arrays of values.
Notes: The layout of tensors is row-major, with tightly packed contiguous data representing each dimension. The total size of a tensor is the product of the size of each dimension.
Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

226.10.2 Methods

226.10.3 Shape as Integer()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The count and size of each dimension.

226.10.4 Properties

226.10.5 TensorKind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The data type of the tensor.
Notes: (Read only property)

Chapter 227

WiringPi

227.1 module WiringPiMBS

227.1.1 module WiringPiMBS

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The module to work with wiring pi library.
Notes: Deprecated as underlaying C library is deprecated.

Xojo Developer Magazine

- 24.1, page 9: News

227.1.2 Methods

227.1.3 analogRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the value read on the supplied analog input pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard, quick2Wire analog board, etc.

227.1.4 analogWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This writes the given value to the supplied analog pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard.

227.1.5 Board40Pin as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Checks if the current Raspberry Pi model uses the 40-pin GPIO header.
Notes: Returns 1 if the board has a 40-pin header, 0 otherwise.

Added in WiringPi Interface v3.7.

227.1.6 delay(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This causes program execution to pause for at least howLong milliseconds.
Notes: Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer or approximately 49 days.

227.1.7 delayMicroseconds(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This causes program execution to pause for at least howLong microseconds.
Notes: Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer microseconds or approximately 71 minutes.

Delays under 100 microseconds are timed using a hard-coded loop continually polling the system time, Delays over 100 microseconds are done using the system nanosleep() function –You may need to consider the

implications of very short delays on the overall performance of the system, especially if using threads.

227.1.8 digitalRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This function returns the value read at the given pin.
Notes: It will be kHIGH or kLOW (1 or 0) depending on the logic level at the pin.

227.1.9 digitalReadByte as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Reads the state of the first 8 GPIO pins (0–7) and returns them as a bitfield.
Notes: Returns 8-bit value representing each pin,Äôs digital level (1 = HIGH, 0 = LOW).

227.1.10 digitalWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes the value kHIGH or kLOW (1 or 0) to the given pin which must have been previously set as an output.
Notes: WiringPi treats any non-zero number as kHIGH, however 0 is the only representation of kLOW.

227.1.11 digitalWriteByte(value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This writes the 8-bit byte supplied to the first 8 GPIO pins.
Notes: It,Äôs the fastest way to set all 8 bits at once to a particular value, although it still takes two write operations to the Pi,Äôs GPIO hardware.

227.1.12 GlobalMemoryAccess as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Checks whether WiringPi has access to the global /dev/mem memory interface, allowing unrestricted hardware control.
Notes: Return:
1 if full memory access is available (root or elevated privileges).

0 if restricted to user-level access (via /dev/gpiomem).
Version: Introduced in Interface v3.3.
Notes: Some advanced features (e.g., hardware PWM, clock outputs) require global access.

227.1.13 gpioClockSet(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets the clock.

227.1.14 GpioLayout as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the GPIO layout type of the Raspberry Pi board (e.g., revision 1, 2, 3, etc.).
Notes: Returns an integer identifying the board,Äôs GPIO layout number (used internally to map pins).

This is the recommended way to determine board layout; supersedes piBoardRev().

227.1.15 I2CRead(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes: Some devices present data when you read them without having to do any register transactions.
If the return value is negative then an error has happened and you should consult errno.

227.1.16 I2CReadReg16(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes: Some devices present data when you read them without having to do any register transactions.
Read a 16-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

227.1.17 I2CReadReg8(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes: Some devices present data when you read them without having to do any register transactions.
Read an 8-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

227.1.18 I2CSetup(devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This initialises the I2C system with your given device identifier.
Notes: The ID is the I2C number of the device and you can use the i2cdetect program to find this out. I2CSetup() will work out which revision Raspberry Pi you have and open the appropriate device in /dev.

The return value is the standard Linux filehandle, or -1 if any error –in which case, you can consult errno as usual.

E.g. the popular MCP23017 GPIO expander is usually device Id 0x20, so this is the number you would pass into wiringPiI2CSetup().

227.1.19 I2CSetupInterface(device as string, devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This initialises the I2C system with your given device identifier and name.

227.1.20 I2CWrite(fd as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes: Some devices accept data this way without needing to access any internal registers.
If the return value is negative then an error has happened and you should consult errno.

227.1.21 I2CWriteReg16(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes: Some devices accept data this way without needing to access any internal registers.
Write a 16-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

227.1.22 I2CWriteReg8(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes: Some devices accept data this way without needing to access any internal registers.
Write a 8-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

227.1.23 LoadLibrary(File as FolderItem) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes: Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 227.1.24 LoadLibrary(Path as string) as boolean 24638

227.1.24 LoadLibrary(Path as string) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes: Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 227.1.23 LoadLibrary(File as FolderItem) as boolean 24638

227.1.25 MemorySize(Index as Integer) as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the memory sizes.
Notes: Looks up memory size in an array.
Index is 0 to 7.

227.1.26 micros as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns a number representing the number of microseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after approximately 71 minutes.

227.1.27 millis as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns a number representing the number of milliseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after 49 days.

227.1.28 physPinToGpio(physPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the BCM_GPIO pin number of the supplied physical pin on the P1 connector.

227.1.29 piBoardId(byref model as Integer, byref Rev as Integer, byref Mem as Integer, byref Maker as Integer, byref OverVolted as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries board identifiers.
Notes: Mem is memory in Megabytes.
Maker, Model and Rev are value which match the constants in this module.

227.1.30 piBoardRev as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the board revision of the Raspberry Pi.
Notes: It will be either 1 or 2. Some of the BCM_GPIO pins changed number and function when moving from board revision 1 to 2, so if you are using BCM_GPIO pin numbers, then you need to be aware of the differences.

227.1.31 piHiPri(pri as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This attempts to shift your program (or thread in a multi-threaded program) to a higher priority and enables a real-time scheduling.
Notes: The priority parameter should be from 0 (the default) to 99 (the maximum). This won,Äôt make your program go any faster, but it will give it a bigger slice of time when other programs are running. The priority parameter works relative to others –so you can make one program priority 1 and another priority 2 and it will have the same effect as setting one to 10 and the other to 90 (as long as no other programs are running with elevated priorities)

The return value is 0 for success and -1 for error. If an error is returned, the program should then consult the errno global variable, as per the usual conventions.

Note: Only programs running as root can change their priority. If called from a non-root program then nothing happens.

227.1.32 piLock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Locks a synchronization lock.
Notes: These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a ,Äúkey,Äù. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread –otherwise it,Äôs possible that the thread could wake-up halfway during your data copy and change the data –so the data you end up copying is incomplete, or invalid.

227.1.33 piMakerNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps maker numbers to names.

227.1.34 piModelNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps model numbers to names.

227.1.35 pinMode(pin as Integer, mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the mode of a pin to either INPUT, OUTPUT, PWM_OUTPUT or GPIO_CLOCK.
Notes: Note that only wiringPi pin 1 (BCM_GPIO 18) supports PWM output and only wiringPi pin 7 (BCM_GPIO 4) supports CLOCK output modes.

This function has no effect when in Sys mode. If you need to change the pin mode, then you can do it with the gpio program in a script before you start your program.

227.1.36 piRevisionNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps revision numbers to names.

227.1.37 piUnlock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Unlocks a synchronization lock.
Notes: These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a ,Äúkey,Äù. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread –otherwise it,Äôs possible that the thread could wake-up halfway during your

data copy and change the data –so the data you end up copying is incomplete, or invalid.

227.1.38 Processor(Index as Integer) as String

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the process name.
Notes: Looks up processor name in an array.
Index is 0 to 4.

227.1.39 pullUpDnControl(pin as Integer, pud as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the pull-up or pull-down resistor mode on the given pin, which should be set as an input.
Notes: Unlike the Arduino, the BCM2835 has both pull-up an down internal resistors. The parameter pud should be; kPUD_OFF, (no pull up/down), kPUD_DOWN (pull to ground) or kPUD_UP (pull to 3.3v) The internal pull up/down resistors have a value of approximately 50KŒ© on the Raspberry Pi.

This function has no effect on the Raspberry Pi,Äôs GPIO pins when in Sys mode. If you need to activate a pull-up/pull-down, then you can do it with the gpio program in a script before you start your program.

227.1.40 pwmSetClock(divisor as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the divisor for the PWM clock.

227.1.41 pwmSetMode(mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The PWM generator can run in 2 modes –,Äúbalanced,Äù and ,Äúmark:space,Äù.
Notes: The mark:space mode is traditional, however the default mode in the Pi is ,Äúbalanced,Äù. You can switch modes by supplying the parameter: kPWM_MODE_BAL or kPWM_MODE_MS.

227.1.42 pwmSetRange(range as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the range register in the PWM generator.
Notes: The default is 1024.

227.1.43 pwmToneWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes a tone.

227.1.44 pwmWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes the value to the PWM register for the given pin.
Notes: The Raspberry Pi has one on-board PWM pin, pin 1 (BMC_GPIO 18, Phys 12) and the range is 0-1024. Other PWM devices may have other PWM ranges.

This function is not able to control the Pi,Äôs on-board PWM when in Sys mode.

227.1.45 Read(fd as Integer, count as UInt64) as Memoryblock

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Read attempts to read count bytes of data from the object referenced by the descriptor fildes into a buffer.
Notes: Returns the memoryblock on success (if we got more than zero bytes).
Errno is set in case of error.

227.1.46 RP1Model as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the Raspberry Pi RP1 I/O controller model version (used on Pi 5 and newer).
Notes: Return: Integer code identifying the RP1 revision.
Version: Added in WiringPi Interface v3.14.

227.1.47 serialClose(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Closes the device identified by the file descriptor given.

227.1.48 serialDataAvail(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the number of characters available for reading, or -1 for any error condition, in which case errno will be set appropriately.

227.1.49 serialFlush(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This discards all data received, or waiting to be send down the given device.

227.1.50 serialGetchar(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the next character available on the serial device.
Notes: This call will block for up to 10 seconds if no data is available (when it will return -1)

227.1.51 serialOpen(device as String, Baud as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This opens and initialises the serial device and sets the baud rate.
Notes: It sets the port into ,Äúraw,Äù mode (character at a time and no translations), and sets the read timeout to 10 seconds. The return value is the file descriptor or -1 for any error, in which case errno will be set as appropriate.

227.1.52 serialPutchar(fd as Integer, c as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the single byte to the serial device identified by the given file descriptor.

227.1.53 serialPutData(fd as Integer, data as Memoryblock)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with any encoding.

227.1.54 serialPuts(fd as Integer, text as string)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with UTF-8 encoding.

227.1.55 setPadDrive(group as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the ,Äústrength,Äù of the pad drivers for a particular group of pins.
Notes: There are 3 groups of pins and the drive strength is from 0 to 7. Do not use this unless you know what you are doing.

227.1.56 setPadDrivePin(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets the drive strength for a specific GPIO pin.
Notes: Parameters:
pin: GPIO pin number.
value: drive strength (2–16 mA).
Version: Introduced in Interface v3.0.

227.1.57 SetupGpioDevice(PinType as Integer) as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes WiringPi using the /dev/gpiomem or /dev/mem device interface and the specified pin numbering system.

Notes: pinType: pin numbering mode (kWPI_PIN_WPI, kWPI_PIN_BCM, or kWPI_PIN_PHYS constants).

Returns 0 on success, -1 on failure.

Version: Introduced in Interface v3.3.

Notes:
Preferred for modern Raspberry Pi models using the RP1 I/O controller (Pi 5+).
Provides consistent device-level access with correct pin mappings.

227.1.58 SetupPinType(PinType as Integer) as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes WiringPi using a specified pin numbering type.
Notes: pinType:

- kWPI_PIN_WPI (WiringPi numbering)
- kWPI_PIN_BCM (Broadcom numbering)
- kWPI_PIN_PHYS (Physical pin numbering)

Return: 0 on success, -1 on failure.
Version: Added in Interface v3.3.
Notes: A flexible initializer replacing older mode-specific setup functions.

227.1.59 SPIDataRW(channel as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This performs a simultaneous write/read transaction over the selected SPI bus.
Notes: Data that was in your buffer is overwritten by data returned from the SPI bus.

That,Äôs all there is in the helper library. It is possible to do simple read and writes over the SPI bus using the standard read() and write() system calls though –write() may be better to use for sending data to chains of shift registers, or those LED strings where you send RGB triplets of data. Devices such as A/D and D/A converters usually need to perform a concurrent write/read transaction to work.

227.1.60 SPIGetFd(channel as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the file descriptor for a channel.

227.1.61 SPISetup(channel as Integer, speed as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes: The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

227.1.62 SPISetupMode(channel as Integer, speed as Integer, mode as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes: The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

227.1.63 UserLevelAccess as Integer

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: The user level access.
Notes: Returns:
1 if running under /dev/gpiomem (non-root, limited hardware control).
0 if using full /dev/mem access.

Notes: Complements wiringPiGlobalMemoryAccess(); both indicate runtime privilege mode.

227.1.64 Version(byref major as Integer, byref minor as Integer)

MBS Linux Plugin, Plugin Version: 25.5, Platform: Linux, Targets: Desktop, Console & Web.

Function: Retrieves the version number of the installed WiringPi library.
Notes: major: filled with the major version number.
minor: filled with the minor version number.

227.1.65 wiringPiSetup as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: This initialises wiringPi and assumes that the calling program is going to be using the wiringPi pin numbering scheme. This is a simplified numbering scheme which provides a mapping from virtual pin numbers 0 through 16 to the real underlying Broadcom GPIO pin numbers. See the pins page for a table which maps the wiringPi pin number to the Broadcom GPIO pin number to the physical location on the edge connector.

This function needs to be called with root privileges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

227.1.66 wiringPiSetupGpio as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: This is identical to wiringPiSetup, however it allows the calling programs to use the Broadcom GPIO pin numbers directly with no re-mapping.

As above, this function needs to be called with root privileges, and note that some pins are different from revision 1 to revision 2 boards.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

227.1.67 wiringPiSetupPhys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: Identical to wiringPiSetup, however it allows the calling programs to use the physical pin numbers on the P1 connector only.

As above, this function needs to be called with root priviliges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

227.1.68 wiringPiSetupSys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes: This initialises wiringPi but uses the /sys/class/gpio interface rather than accessing the hardware directly. This can be called as a non-root user provided the GPIO pins have been exported before-hand using the gpio program. Pin numbering in this mode is the native Broadcom GPIO numbers –the same as wiringPiSetupGpio() above, so be aware of the differences between Rev 1 and Rev 2 boards.

Note: In this mode you can only use the pins which have been exported via the /sys/class/gpio interface before you run your program. You can do this in a separate shell-script, or by using the system() function from inside your program to call the gpio program.

Also note that some functions have no effect when using this mode as they,Äôre not currently possible to action unless called with root privileges. (although you can use system() to call gpio to set/change modes if needed)

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

227.1.69 wpiPinToGpio(wpiPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the BCM_GPIO pin number of the supplied wiringPi pin.
Notes: It takes the board revision into account.

227.1.70 Write(fd as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Write to a file descriptor.
Notes: Write attempts to write bytes to the object referenced by the descriptor fildes from the memoryblock pointed to by data.
Upon successful completion the number of bytes which were written is returned. Otherwise, a -1 is returned and the global variable errno is set to indicate the error.

227.1.71 Properties

227.1.72 ErrNo as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error code from the underlaying linux functions.
Notes: must be called directly after a function to have the result from that function.
Calling any other function including writing a debug log, may cause this value to be reset.
(Read only property)

227.1.73 LoadError as String

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the last load error.
Notes: (Read only property)

227.1.74 Constants

Constants

Constant	Value	Description
kHIGH	1	The constant for high value.
kLOW	0	The constant for low value.

Pin Modes

Constant	Value	Description
kGPIO_CLOCK	3	Configures the pin as a clock output driven by the GPIO hardware clock.
kINPUT	0	Sets the pin as a digital input, used to read HIGH or LOW signals.
kOUTPUT	1	Sets the pin as a digital output, used to write HIGH or LOW signals.
kPM_OFF	7	Resets the pin to input mode, effectively turning off or releasing the line.
kPWM_BAL_OUTPUT	9	Configures PWM in balanced mode, distributing on/off times evenly for certain applications.
kPWM_MS_OUTPUT	8	Configures PWM in mark-space (traditional) mode for stable duty cycles.
kPWM_OUTPUT	2	PWM Output
kPWM_TONE_OUTPUT	6	Tone Output
kSOFT_PWM_OUTPUT	4	Enables software-driven PWM output, useful when hardware PWM is unavailable.
kSOFT_TONE_OUTPUT	5	Enables software-generated square wave tones on the pin.

GPIO Layouts

Constant	Value	Description
kGPIO_LAYOUT_DEFAULT	2	Default
kGPIO_LAYOUT_PI1_REV1	1	Pi 1 A/B Revision 1, 1.1, CM

Interrupt Levels

Constant	Value	Description
kINT_EDGE_BOTH	3	Both
kINT_EDGE_FALLING	1	Failing
kINT_EDGE_RISING	2	Rising
kINT_EDGE_SETUP	0	Setup

Models

Constant	Value	Description
kPI_ALPHA	5	Early pre-production prototype board (,ÄúAlpha,Äù) used for internal testing.
kPI_MODELS_MAX	27	Maximum number of recognized Raspberry Pi model identifiers.
kPI_MODEL_2	4	Raspberry Pi 2 Model B —upgraded to a quad-core CPU and 1GB RAM.
kPI_MODEL_3AP	14	Raspberry Pi 3 Model A+ —smaller version of 3B+ with fewer ports but same CPU.
kPI_MODEL_3B	8	Raspberry Pi 3 Model B —integrated Wi-Fi, Bluetooth, and a faster 64-bit processor.
kPI_MODEL_3BP	13	Raspberry Pi 3 Model B+ —improved networking, CPU speed, and thermal performance.
kPI_MODEL_400	19	Raspberry Pi 400 —keyboard-integrated Pi based on Pi 4 hardware.
kPI_MODEL_4B	17	Raspberry Pi 4 Model B —major upgrade with USB 3.0, dual HDMI, and up to 8GB RAM.
kPI_MODEL_5	23	Raspberry Pi 5 —next-generation model with significant performance and I/O improvements.
kPI_MODEL_500	25	Raspberry Pi 500 —all-in-one keyboard computer version of the Pi 5.
kPI_MODEL_A	0	Original Raspberry Pi Model A —early, low-cost version with fewer USB ports and no Ethernet.
kPI_MODEL_AP	2	Raspberry Pi Model A+ —improved power efficiency and smaller form factor than Model A.
kPI_MODEL_B	1	Original Raspberry Pi Model B —added more RAM, Ethernet, and extra USB ports.
kPI_MODEL_BP	3	Model BP
kPI_MODEL_CM	6	Compute Module (CM1) —compact version designed for embedded applications.
kPI_MODEL_CM3	10	Compute Module 3 —based on Raspberry Pi 3 architecture for embedded systems.
kPI_MODEL_CM3P	16	Compute Module 3+ —enhanced version of CM3 with improved thermal management.
kPI_MODEL_CM4	20	Compute Module 4 —modular version of Pi 4 for embedded use with eMMC and I/O flexibility.
kPI_MODEL_CM4S	21	Compute Module 4S —variant of CM4 compatible with CM3 form factor for easier upgrades.
kPI_MODEL_CM5	24	Compute Module 5 —embedded variant of Raspberry Pi 5.
kPI_MODEL_CM5L	26	Compute Module 5 Lite —cost-reduced version of CM5 without onboard eMMC storage.
kPI_MODEL_ZERO	9	Raspberry Pi Zero —ultra-small, low-cost version with minimal connectivity.
kPI_MODEL_ZERO_2W	18	Raspberry Pi Zero 2 W —upgraded Zero with quad-core CPU and wireless connectivity.
kPI_MODEL_ZERO_W	12	Raspberry Pi Zero W —Zero with built-in Wi-Fi and Bluetooth.

Makers

Constant	Value	Description
kPI_MAKER_EGOMAN	1	Egoman
kPI_MAKER_EMBEST	2	Indicates the board was made by Embest (another authorized producer of Pi boards).
kPI_MAKER_SONY	0	Indicates the board was manufactured by Sony (the primary official manufacturer).
kPI_MAKER_UNKNOWN	3	Used when the manufacturer cannot be identified from the board,Äôs revision code.

Versions

Constant	Value	Description
kPI_VERSION_1	0	Identifies the original Raspberry Pi Model 1 (revision 1) board version.
kPI_VERSION_1_1	1	Identifies Raspberry Pi Model 1 revision 1.1, with minor hardware updates.
kPI_VERSION_1_2	2	Identifies Raspberry Pi Model 1 revision 1.2, which added mounting holes and other small changes.
kPI_VERSION_2	3	Identifies Raspberry Pi 2 or later generation boards with upgraded CPU and memory.

Pull Up/Down

Constant	Value	Description
kPUD_DOWN	1	pull to ground
kPUD_OFF	0	no pull up/down
kPUD_UP	2	pull to 3.3v

PWM Modes

Constant	Value	Description
kPWM_MODE_BAL	1	Balanced
kPWM_MODE_MS	0	Mark:Space

wiringPi modes

Constant	Value	Description
kWPI_MODE_GPIO	1	Uses Broadcom (BCM) GPIO pin numbering as used by the SoC.
kWPI_MODE_GPIO_DEVICE_BCM	5	Uses BCM numbering but through the /dev/gpiomem or /dev/mem interface.
kWPI_MODE_GPIO_DEVICE_PHYS	7	Uses physical pin numbering through the GPIO device interface.
kWPI_MODE_GPIO_DEVICE_WPI	6	Uses WiringPi pin numbering through the GPIO device interface.
kWPI_MODE_GPIO_SYS	2	(Deprecated since 3.2) Used system GPIO interface via /sys/class/ access without root.
kWPI_MODE_PHYS	3	Uses the physical pin numbers on the Raspberry Pi header (1–40).
kWPI_MODE_PIFACE	4	Configures access to the PiFace Digital I/O board.
kWPI_MODE_PINS	0	Uses WiringPi,Äôs own pin numbering scheme (0–16), unique to the l
kWPI_MODE_UNINITIALISED	-1	Indicates that WiringPi has not been initialized or that no mode has yet.

Pin Numbering System

Constant	Value	Description
kWPI_PIN_BCM	1	Refers to the Broadcom (BCM) GPIO numbering used by the Raspberry Pi SoC.
kWPI_PIN_PHYS	3	Refers to the physical pin numbers on the Raspberry Pi,Äôs 40-pin GPIO header.
kWPI_PIN_WPI	2	Refers to the WiringPi,Äôs own internal pin numbering scheme.

Chapter 228

Wordfile

228.1 class WordFileMBS

228.1.1 class WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Word file editing.
Example:

```
Var f as FolderItem = GetFolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes: This is a class for reading word files and replacing text to customize document files.
Works for xml and docx files. Does not support old doc file format.

Please report document files where plugin corrupted file or failed to replace text.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

228.1.2 Methods

228.1.3 addMediaFile(name as string, content as string)

MBS Tools Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a media file image.
Notes: You can use this function to add a new image.
You need to add the reference in XML yourself to let the image appear somewhere in the document.

228.1.4 Append(other as WordFileMBS, AddPageBreak as boolean = false) as Boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends one word file text to other.
Notes: This function takes document part from other word file and copies it,Äôs xml nodes to the current document.
Please only copy from one document to other if they both are made from same template, so internal IDs for styles match.
Returns true on success or false on failure.

Added AddPageBreak parameter in version 19.2. If true, we add a page break between the old and new parts.

228.1.5 AppendTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicates a table row containing a placeholder.
Notes: If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on the end of the table.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

228.1.6 Constructor

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The private constructor.

228.1.7 Contains(findText as string) as boolean

MBS Tools Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if some text exists in the document.
Notes: This is like HasTag function, but doesn't require markers around the text in the document.

228.1.8 DuplicateTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicates a table row containing a placeholder.
Notes: If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on just after the row to copy.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

228.1.9 FieldNames as String()

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries field names in the file.
Notes: This looks for form fields in a word file.

228.1.10 GetFieldText(fieldName as string, byref text as String) as boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries field value.
Notes: The plugin looks for the field with given name and queries it's text.
Returns true if field was found.

228.1.11 HasTag(tag as string) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a tag exists.
Notes: The place holder in the document must start with ¬´ and end with ¬ª characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the ¬´ and ¬ª markers (or whatever is configured) within the same font style.

228.1.12 MediaFiles as String()

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Lists the media files in the word document.
Example:

```
// read a word file:
Var file As New FolderItem("c:\tmp\test.docx", folderitem.PathModes.Native)
Var wordStream As BinaryStream = BinaryStream.Open(file)
Var wordData As String = wordStream.Read(wordStream.Length)
wordStream.close
Var word As WordFileMBS = WordFileMBS.OpenData(wordData)

// now show list of files in message box
Var MediaFiles() As String = word.MediaFiles
MessageBox Join(MediaFiles, EndOfLine)
```

Notes: e.g. image1.png

228.1.13 OpenData(Data as MemoryBlock) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens data as document.
Notes: You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 228.1.14 OpenData(Data as String) as WordFileMBS 24659

228.1.14 OpenData(Data as String) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens data as document.
Example:

```
Var f as FolderItem = GetFolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes: You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 228.1.13 OpenData(Data as MemoryBlock) as WordFileMBS 24659

228.1.15 OpenXML(XML as String) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens XML file from text string.
Notes: Returns nil in case of error.

228.1.16 Parts as String()

MBS Tools Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries names of the parts of the document.
Example:

```
Var f as FolderItem = GetFolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

MsgBox w.XML("footer1")
```

Notes: This may tell you how many headers/footers we found in a docx file.
e.g. "footer1", "header1", "document".

228.1.17 RemoveTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a table row containing a placeholder.
Notes: If you have tables in your template word file and you only fill some rows, you can remove superfluous rows using this function.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

228.1.18 ReplaceTag(tag as string, text as string = "", All as boolean = false) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces a placeholder with text.
Example:

```
Var f as FolderItem = GetFolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes: The place holder in the document must start with ¬´ and end with ¬ª characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.
If you need to replace multi line text like addresses, please use several placeholders, at least one per line.

Version 17.0 and newer can handle multi line text better for normal paragraphs with Chr(13). It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the ¬´ and ¬ª markers (or whatever is configured) within the same font style.

228.1.19 SetFieldText(fieldName as string, text as String) as boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field value.
Notes: The plugin looks for the field with given name and sets it's text.
Returns true if field was found.

228.1.20 SetMarkers(openMarker as String, closeMarker as String) as boolean

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the markers to look for before/after a tag.
Notes: Default are ¬´ and ¬ª.
Should be different and not empty.
Returns true on success or false on failure.

228.1.21 Substitute(findText as string, replaceText as string = """, All as boolean = false) as boolean

MBS Tools Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces some text in the document with new text.
Notes: Like ReplaceTag function, but without markers around the tag.

Handles multi line text better for normal paragraphs with Chr(13). It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the find text, it will not be recognized. So please keep all text

within the same font style.

228.1.22 Tags as String()

MBS Tools Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of tags.
Notes: Depends on the start/end markers set with OpenMarker/CloseMarker properties.

Can be very useful for debugging to query list of tags found in the document.

228.1.23 WriteFile(path as folderItem) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a file to disk.
Example:

```
Var f as FolderItem = GetFolderItem("test.docx")
Var b as BinaryStream = BinaryStream.Open(f)
Var d as string = b.Read(b.Length)
Var w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes: File extension should be correct, either docx or xml depending on what you loaded.

228.1.24 Properties

228.1.25 Caseless as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to compare tag names case insensitive.

Notes: Set to true for case insensitive comparison of ASCII characters.
Default is false.
(Read and Write property)

228.1.26 CloseMarker as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The close marker text.
Notes: Default value is "¬ª".
(Read only property)

228.1.27 OpenMarker as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The open marker text.
Notes: Default value is "¬´".
(Read only property)

228.1.28 SkipDeletedText as Boolean

MBS Tools Plugin, Plugin Version: 25.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to skip deleted text.
Example:

WordFileMBS.SkipDeletedText = true

Notes: If the word file contains changes, it may log what text was deleted.
We skip deleted text by default.
(Read and Write property)

228.1.29 Text as String

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts text of word file.
Notes: Plugin inserts a few newline characters for detected line ends.

May not give all text. If you miss something, please send us test files.
(Read only property)

228.1.30 XML as String

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XML found in the document.
Notes: (Read and Write property)
See also:

- 228.1.33 XML(part as String) as String 24666

228.1.31 MediaFile(name as string) as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or replaces the content of a media file.
Example:

```
Var word As WordFileMBS // open word document

// name one
Var name As String = "image1.jpg"

// or pick from list
'Var MediaFiles() As String = word.MediaFiles
'Var name As String = MediaFiles(0) // first one

// load image
Var ImageFile As FolderItem = SpecialFolder.Desktop.Child("new.jpg")
Var ImageStream As BinaryStream = BinaryStream.Open(ImageFile)
Var ImageData As String = ImageStream.Read(ImageStream.Length)

word.MediaFile(name) = ImageData
```

Notes: You can use this to extract images from word file.
Or to replace a placeholder image with the real image.
For replacement please make sure file type and dimensions match.
Raises KeyNotFoundException if media file with given name is not found.
(Read and Write computed property)

228.1.32 PropertyValue(field as string) as String

MBS Tools Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set a metadata property.
Notes: The field name can be title, subject, creator, keywords, description, lastModifiedBy, revision, created or modified.

Raises a KeyNotFoundException if the field is not found on setting.
(Read and Write computed property)

228.1.33 XML(part as String) as String

MBS Tools Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries/Sets XML for a part.
Notes: See Parts array for possible parts.
(Read and Write computed property)
See also:

- 228.1.30 XML as String 24665

Chapter 229

XL

229.1 class XLAutoFilterMBS

229.1.1 class XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for auto filter.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.1.2 Methods

229.1.3 AddSort(columnIndex as Integer, descending as boolean) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the sorted column in AutoFilter by zero-based index and its sort order.
Notes: Used for multiple level sorting.
Returns false on error and true on success. Get error info with XLBookMBS.errorMessage.

229.1.4 Column(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the AutoFilter column by zero-based index.
Notes: Creates it if it doesn't exist.

229.1.5 ColumnByIndex(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the specified AutoFilter column which have a filter information by index.

229.1.6 Constructor

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

229.1.7 GetRef(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the cell range of AutoFilter with header.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

229.1.8 GetSort(byref columnIndex as Integer, byref descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the zero-based index of sorted column in AutoFilter and its sort order.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

229.1.9 GetSortRange(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the whole range of data to sort.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

229.1.10 SetRef(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the cell range of AutoFilter with header.

229.1.11 SetSort(columnIndex as Integer, descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the sorted column in AutoFilter by zero-based index and its sort order.
Notes: Returns false on error and true on success. Get error info with XLBookMBS.errorMessage.

229.1.12 Properties

229.1.13 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: The owning book object.
(Read only property)

229.1.14 ColumnSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of specified AutoFilter columns which have a filter information.
Notes: (Read only property)

229.1.15 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.2 class XLBookMBS

229.2.1 class XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The central class for a workbook.
Example:

```
// create new Excel file, pass true for XLSX format or false for older XLS format
Var book As New XLBookMBS(True)

// add sheet
Var sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Var file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes: The MBS Xojo XL Plugin is based on LibXL, a powerful library to handle Excel files.

You'll need your own license for LibXL. For more information go here:
https://www.monkeybreadsoftware.de/xojo/plugin-xls.shtml

When you have obtained license file inside your XOJO project place XLBookMBS.SetKeyGlobal call with LibXL license in app.open.

229.2.2 Methods

229.2.3 AddConditionalFormat as XLConditionalFormatMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new conditional format to the workbook for using with conditional formatting rules.
Example:

```
// create a rule to make cells starting with A to be bold
Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.Font.bold = true

Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(2, 10, 1, 1)
cf.addRule(cf.FormatTypeBeginWith, cFormat, "a")
```

Notes: Only for xlsx files.
Requires LibXL in version 4.x

229.2.4 AddCustomNumFormat(customNumFormat as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new custom number format to the workbook.
Notes: The format string customNumFormat indicates how to format and render the numeric value of a cell. See custom format strings guidelines (in FAQ). Returns the custom format identifier. It's used in XLFormatMBS.NumFormat. Returns 0 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.2.5 AddFont(initFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new font to the workbook, initial parameters can be copied from other font.
Notes: Returns nil if error occurs.

The initFont can be from another book.

229.2.6 AddFormat(initFormat as XLFormatMBS = nil) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new format to the workbook, initial parameters can be copied from other format.
Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes: Returns nil if error occurs.

The initFormat can be from another book.

229.2.7 AddFormatFromStyle(style as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new format to the workbook from the predefined style.
Notes: Returns nil if error occurs.
Please note that after loading a file it will be removed.

See kCellStyle* constants.

229.2.8 AddPicture(path as folderitem) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Supports BMP, DIB, PNG, JPG and WMF picture formats.
For XLSX files you can embed SVG graphics with LibXL 4.2 or newer.
See also:

- 229.2.9 AddPicture(path as string) as Integer 24674

229.2.9 AddPicture(path as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Supports BMP, DIB, PNG, JPG and WMF picture formats.
For XLSX files you can embed SVG graphics with LibXL 4.2 or newer.
See also:

- 229.2.8 AddPicture(path as folderitem) as Integer 24674

229.2.10 AddPictureData(data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook from memory buffer:
Notes: Returns a picture identifier. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Supports BMP, DIB, PNG, JPG and WMF picture formats.
For XLSX files you can embed SVG graphics with LibXL 4.2 or newer.

229.2.11 AddRichString as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new rich string to be used in the book.

229.2.12 AddSheet(name as string, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new sheet to this book, returns the sheet.
Example:

```
// create new Excel file, pass true for XLSX format or false for XLS
Var book As New XLBookMBS(True)

// add sheet
Var sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Var file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes: Use initSheet parameter if you wish to copy an existing sheet.
Must be from the same book to copy sheet.

Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.2.13 AddStyledText(StyledText as StyledText) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds styled text to the book to later assign to a cell.
Notes: We convert attributes like bold, italic, underline, color, font name and size.

229.2.14 available as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library is available.
Notes: Returns false on PPC targets.

229.2.15 BookRemoveVBA as boolean

MBS XL Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: NRemoves all VBA scripts (macros) from the workbook.
Notes: It should be called after loading xlsm or xlsb files. Returns true if VBA scripts were found and removed.
Returns true on success and false on failure.

229.2.16 BookVersion as Integer

MBS XL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the version number of this book.
Example:

```
Var b as new XLBookMBS
Var v as Integer = b.BookVersion

Var h as Integer = v \256 \256 \256
Var m as Integer = v \256 \256 mod 256
Var l as Integer = v \256 mod 256

MsgBox "libXL "+str(h)+"."+str(m)+"."+str(l)
```

Notes: Version number is encoded as hex number with major version, minor version and bugfix.

229.2.17 Clear

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all data from a workbook.

229.2.18 ConditionalFormat(index as integer) as XLConditionalFormatMBS

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a conditional format with defined index.
Notes: Index must be less than return value of conditionalFormatSize property.

229.2.19 ConditionalFormats as XLConditionalFormatMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all conditional formats of the book.

229.2.20 Constructor(xml as boolean = false)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new XLBookMBS object.
Notes: xml: If true, creates a book in xlsx format (xml), else one in xls format (binary).

229.2.21 CopyContent(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies all content from one book to other book.
Notes: The plugin loops through all sheets and creates matching sheets on new book.
Formats and fonts are created on the fly.

This allows you to convert from XLS to XLSX or back.
Please report if something is not copied. Of course plugin can only copy what libXL supports, so stuff like movies or diagrams are not copied.

229.2.22 CoreProperties as XLCorePropertiesMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns workbook properties.

229.2.23 CustomNumFormat(fmt as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a custom format string for specified custom format identifier fmt.
Notes: See custom format string guidelines (in FAQ). Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.2.24 DefaultFont(byref fontSize as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a default font name and size for this workbook.
Notes: Returns "" if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.2.25 DelSheet(index as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes a sheet with specified index.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.2.26 Font(index as Integer) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a font with defined index.
Notes: Index must be less than return value of fontCount method.

229.2.27 FontCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of fonts in this book.

229.2.28 Fonts as XLFontMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all defined fonts.

229.2.29 Format(index as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a format with defined index.
Notes: Index must be less than return value of formatCount method.

229.2.30 FormatCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of formats in this book.

229.2.31 Formats as XLFormatMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all defined formats.

229.2.32 InsertSheet(index as Integer, name as string = """, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a new sheet to this book at position index, returns the sheet.
Notes: Use initSheet parameter if you wish to copy an existing sheet. Must be from the same book to copy sheet.

Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.2.33 LibVersion as string

MBS XL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of library as string.
Example:

MsgBox XLBookMBS.LibVersion

Notes: Returns for example "3.8.0".
With plugin version 17.4 or newer, this returns 4 numbers, so you may see another .0 on the end.

229.2.34 LibVersionNumber as Integer

MBS XL Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of library as number.
Example:

MsgBox str(XLBookMBS.LibVersionNumber)

Notes: Returns for example 3 * 256*256*256 + 8 * 256*256 + 0 * 256 + 0.

229.2.35 Load(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file into memory.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 229.2.36 Load(path as string) as boolean 24680

229.2.36 Load(path as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file into memory.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 229.2.35 Load(path as folderitem) as boolean 24680

229.2.37 Load2(path as folderitem) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 229.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 24681
- 229.2.39 Load2(path as string) as XLBookMBS 24682
- 229.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 24683

229.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
Var e as string
Var b as XLBookMBS = XLBookMBS.Load2(f,e)

if b = nil then
MsgBox e
Return
end if

Var s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 229.2.37 Load2(path as folderitem) as XLBookMBS 24681
- 229.2.39 Load2(path as string) as XLBookMBS 24682
- 229.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 24683

229.2.39 Load2(path as string) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
Var b as XLBookMBS = XLBookMBS.Load2(f)

if b = nil then
MsgBox e
Return
end if

Var s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 229.2.37 Load2(path as folderitem) as XLBookMBS 24681
- 229.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 24681
- 229.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 24683

229.2.40 Load2(path as string, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Notes: Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.

- 229.2.38 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 24681
- 229.2.39 Load2(path as string) as XLBookMBS 24682

229.2.41 LoadError as String

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message from LoadLibrary call.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.dylib")

if XLBookMBS.LoadLibrary(f) then
MsgBox "OK"
else
MsgBox XLBookMBS.LoadError
end if
```

229.2.42 LoadInfo(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file.
Example:

```
Var f As New FolderItem("/Users/cs/Desktop/test.xlsx", folderitem.PathModes.Native)
Var b As New XLBookMBS(True)

If b.LoadInfo(f) Then

var names() as string
```

```
Var c As Integer = b.SheetCount
For i As Integer = 0 To c-1
names.add b.SheetName(i)
Next

MessageBox Join(names, EndOfLine)

End If
```

Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 229.2.43 LoadInfo(path as string) as boolean 24684

229.2.43 LoadInfo(path as string) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file.
Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 229.2.42 LoadInfo(path as folderitem) as boolean 24683

229.2.44 LoadInfoRaw(data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file in memory.
Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 229.2.45 LoadInfoRaw(data as string) as boolean 24684

229.2.45 LoadInfoRaw(data as string) as boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads metadata from an Excel file in memory.
Notes: Loads only information about sheets.
Afterwards you can call SheetCount() and SheetName(index).
Returns false if error occurs. Get an error info with the errorMessage property.
See also:

- 229.2.44 LoadInfoRaw(data as MemoryBlock) as boolean 24684

229.2.46 LoadLibrary(File as FolderItem) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the libXL library file.
Example:

```
MsgBox "Version before: "+XLBookMBS.LibVersion

Var f as FolderItem = SpecialFolder.Desktop.Child("libxl.dylib")

if XLBookMBS.LoadLibrary(f) then
MsgBox "Version after: "+XLBookMBS.LibVersion
else
MsgBox XLBookMBS.LoadError
end if
```

Notes: Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

- 229.2.47 LoadLibrary(Path as string) as boolean 24685

229.2.47 LoadLibrary(Path as string) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the libXL library file.
Notes: Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

- 229.2.46 LoadLibrary(File as FolderItem) as boolean 24685

229.2.48 LoadMT(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads from file.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.2.49 LoadMT(path as string) as boolean 24686

229.2.49 LoadMT(path as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads from file.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.2.48 LoadMT(path as folderitem) as boolean 24686

229.2.50 LoadPartially(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Returns false if error occurs or true on success.. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.
See also:

- 229.2.51 LoadPartially(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean 24687

229.2.51 LoadPartially(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Returns false if error occurs or true on success.. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.
See also:

- 229.2.50 LoadPartially(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean 24686

229.2.52 LoadPartiallyUsingTempFile(path as folderitem, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as folderitem, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success.. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.

This is more a thing for 32-bit applications loading huge files where memory limits may be hit. On 64-bit applications you may not need a temporary file.
See also:

- 229.2.53 LoadPartiallyUsingTempFile(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as String, keepAllSheets as Boolean = false) as boolean 24687

229.2.53 LoadPartiallyUsingTempFile(path as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, TempFile as String, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file only with specified sheet index and row range into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success.. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.

This is more a thing for 32-bit applications loading huge files where memory limits may be hit. On 64-bit applications you may not need a temporary file.

229.2.62 LoadRawPartially(data as MemoryBlock, sheetIndex as Integer, firstRow as Integer, lastRow as Integer, keepAllSheets as Boolean = false) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file from user's memory buffer.
Notes: data: Data buffer
sheetIndex: loads a file only with specified sheet index, -1 loads all sheets
firstRow: the first row of loaded range, -1 loads all rows until lastRow
lastRow: the last row of loaded range, -1 loads all rows after firstRow.
Returns false if error occurs or true on success. Get error info with errorMessage function.

keepAllSheets parameter new in 14.2:
If this is true, all sheets are saved back with XL.Book.Save function,
But only one specified sheet is available for processing, thus LibXL can save more memory. It works only for xlsx files, LibXL ignores this flag for xls files.

229.2.64 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an entire file into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 229.2.65 LoadUsingTempFile(path as string, TempFile as String) as boolean 24692

229.2.65 LoadUsingTempFile(path as string, TempFile as String) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an entire file into memory.
Notes: Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 229.2.64 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean 24692

229.2.66 MoveSheet(SourceIndex as integer, DestIndex as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Takes a sheet with SourceIndex and insert it in front of a sheet with DestIndex.
Notes: Returns false if error occurs and true on success.

229.2.67 PackColor(ColorValue as color) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs red, green and blue components in color type.
Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

- 229.2.68 PackColor(red as Integer, green as Integer, blue as Integer) as Integer 24693

229.2.68 PackColor(red as Integer, green as Integer, blue as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs red, green and blue components in color type.
See also:

- 229.2.67 PackColor(ColorValue as color) as Integer 24693

229.2.69 PackDate(d as date) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Packs date and time information into double type.
See also:

- 229.2.70 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double 24694

229.2.70 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs date and time information into double type.
See also:

- 229.2.69 PackDate(d as date) as Double 24694

229.2.71 PackDateTime(d as dateTime) as double

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs date and time information into double type.

229.2.72 Picture(index as Integer, byref data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a picture at position index in memory buffer.
Notes: Parameters:
index: position in the workbook
data: reference to buffer

Returns type of picture. See PictureType* constants.

229.2.73 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of pictures in this workbook.

229.2.74 RemoveAllPhonetics

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes all phonetics data (furigana) from a workbook.

229.2.75 RemovePrinterSettings as boolean

MBS XL Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all printer settings from the workbook.
Notes: It should be called after loading an Excel file. Returns true if printer settings were found and removed.
Returns true on success and false on failure.

229.2.76 Save(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into xls-file.
Example:

```
// create new Excel file, pass true for XLSX format or false for older XLS format
Var book As New XLBookMBS(True)

// add sheet
Var sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Var file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 229.2.77 Save(path as folderitem, UseTempFile as Boolean) as boolean 24696
- 229.2.78 Save(path as string) as boolean 24696
- 229.2.79 Save(path as string, UseTempFile as Boolean) as boolean 24696

229.2.77 Save(path as folderitem, UseTempFile as Boolean) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into the file.
Notes: Use a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 229.2.76 Save(path as folderitem) as boolean 24695
- 229.2.78 Save(path as string) as boolean 24696
- 229.2.79 Save(path as string, UseTempFile as Boolean) as boolean 24696

229.2.78 Save(path as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into xls-file.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 229.2.76 Save(path as folderitem) as boolean 24695
- 229.2.77 Save(path as folderitem, UseTempFile as Boolean) as boolean 24696
- 229.2.79 Save(path as string, UseTempFile as Boolean) as boolean 24696

229.2.79 Save(path as string, UseTempFile as Boolean) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into the file.
Notes: Use a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 229.2.76 Save(path as folderitem) as boolean 24695
- 229.2.77 Save(path as folderitem, UseTempFile as Boolean) as boolean 24696
- 229.2.78 Save(path as string) as boolean 24696

229.2.80 SaveMT(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to file on disk.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.2.81 SaveMT(path as string) as boolean 24697

229.2.81 SaveMT(path as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to file on disk.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.2.80 SaveMT(path as folderitem) as boolean 24697

229.2.82 SaveRaw(byref data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a xls-file to internal memory buffer.
Notes: Returns false if error occurs. Get error info with errorMessage property.
See also:

- 229.2.83 SaveRaw(byref data as string) as boolean 24697

229.2.83 SaveRaw(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves a xls-file to internal memory buffer.
Notes: Returns false if error occurs. Get error info with errorMessage property.
See also:

- 229.2.82 SaveRaw(byref data as MemoryBlock) as boolean 24697

229.2.84 SaveRawMT(byref data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to memoryblock.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.2.85 SaveRawMT(byref data as string) as boolean 24698

229.2.85 SaveRawMT(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to string.
Notes: Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 229.2.84 SaveRawMT(byref data as MemoryBlock) as boolean 24698

229.2.86 SetDefaultFont(fontName as string, fontSize as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a default font name and size for this workbook.

229.2.87 SetKey(name as string, key as string)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets customer's license key.
Notes: Call this once for each XLBookMBS object and before you read or write data.

If you have keys for more than one platform, please use #if condition to make sure you pass right key for current platform.

229.2.88 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Private method to avoid you call this on an object.
Notes: Please call shared method in app.open.
Because if you make a new object and set key, it's too late.
See also:

- 229.2.89 SetKeyGlobal(name as string, key as string) 24699

229.2.89 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets customer's license key.
Example:

```
// add this to app.open

#if TargetMacOS then
// Mac license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
#elseif TargetLinux then
// Linux license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
#elseif TargetWin32 then
// Win license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
#else
// missing
#endif
```

Notes: You can call this before using the other plugin functions to set key on application startup. Simply call it in app.open event.

If you have keys for more than one platform, please use #if condition to make sure you pass right key for current platform.
See also:

- 229.2.88 SetKeyGlobal(name as string, key as string) 24699

229.2.90 SetLocale(locale as string)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the locale.
Example:

```
Var book as new XLBookMBS(false)
book.SetLocale "en_US.UTF-8"
```

Notes: Sets the locale for this library. It has no effect for unicode projects.

229.2.91 SetPassword(Password as String)

MBS XL Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the password for reading an encrypted book.
Example:

```
var file as new FolderItem("test.xlsx")
Var doc As New XLBookMBS(True)

doc.SetPassword "secret"

If doc.Load(file) Then
MessageBox "Okay"
Else
MessageBox "Failed to load"+EndOfLine+EndOfLine+doc.ErrorMessage
End If
```

Notes: Must be called on the book before calling the load functions.

229.2.92 Sheet(index as Integer) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the sheet with specified index.
Notes: Returns nil if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.2.93 SheetCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of sheets in this book.

229.2.94 SheetName(index as integer) as String

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the name of the sheet.
Notes: To be used with the LoadInfo functions.

229.2.95 Sheets as XLSheetMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all sheets.
Example:

```
Function SheetByName(book as XLBookMBS, name as string) As XLSheetMBS
Var sheets() as XLSheetMBS = book.Sheets
for each s as XLSheetMBS in sheets
if s.Name = name then
Return s
end if
next
End Function
```

229.2.96 SheetType(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries type of the sheet.

229.2.97 UnpackColor(ColorValue as Integer) as color

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks color type to red, green and blue components.
See also:

- 229.2.98 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer)

229.2.98 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks color type to red, green and blue components.
See also:

- 229.2.97 UnpackColor(ColorValue as Integer) as color 24701

229.2.99 UnpackDate(Value as Double) as date

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Unpacks date and time information from double type.
Notes: Returns nil if error occurs.
See also:

- 229.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 24702
- 229.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 24703
- 229.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 24703

229.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 229.2.99 UnpackDate(Value as Double) as date 24702
- 229.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 24703
- 229.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 24703

229.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 229.2.99 UnpackDate(Value as Double) as date 24702
- 229.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 24702
- 229.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 24703

229.2.102 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 229.2.99 UnpackDate(Value as Double) as date 24702
- 229.2.100 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 24702
- 229.2.101 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 24703

229.2.103 UnpackDateTime(Value as double) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns nil if error occurs.

229.2.104 Properties

229.2.105 ActiveSheet as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Active sheet index in this workbook.
Notes: (Read and Write property)

229.2.106 BiffVersion as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns BIFF version of binary file.
Notes: Used for xls format only.
(Read only property)

229.2.107 CalcMode as integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The calculation mode of workbook.
Notes: Cal be manual, auto or automatic except for data tables.
See CalcMode* constants.
(Read and Write property)

229.2.108 ConditionalFormatSize as Integer

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of conditional formats in this book.
Notes: (Read only property)

229.2.109 ErrorCode as Integer

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last error code.
Notes: See kError* constants.
(Read only property)

229.2.110 ErrorMessage as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last error message.
Notes: (Read only property)

229.2.111 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.2.112 IsDate1904 as boolean

MBS XL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether dates are 1904 based.
Notes: A boolean value that indicates whether the date systems used in the workbook starts in 1904.
True indicates the date system starts in 1904, where January 1, 1904 is the first day in the system.
False indicates the workbook uses the 1900 date system, where January 1, 1900 is the first day in the system.
(Read and Write property)

229.2.113 IsTemplate as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the workbook is template.
Notes: The template flag: true - workbook is template, false - workbook is not template (default).
This flag must have a value "true" for template files (xlt and xltx).
(Read and Write property)

229.2.114 IsWriteProtected as Boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns whether the workbook is marked as read-only.
Notes: (Read only property)

229.2.115 RefR1C1 as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the R1C1 reference mode is active.
Notes: (Read and Write property)

229.2.116 RgbMode as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the RGB mode is active. Used for xlsx format only.
Notes: true - RGB mode, false - Index mode (default).
In RGB mode use PackColor() and UnpackColor() methods for getting/setting colors. Used for xlsx format only.
(Read and Write property)

229.2.117 Constants

Call Modes

Constant	Value	Description
CalcModeAuto	1	automatic calculation
CalcModeAutoNoTable	2	automatic except for data tables
CalcModeManual	0	manual calculation

Cell Styles

Constant	Value	Description
kCellstyle20Accent1	19	
kCellstyle20Accent2	23	
kCellstyle20Accent3	27	
kCellstyle20Accent4	31	
kCellstyle20Accent5	35	
kCellstyle20Accent6	39	
kCellstyle40Accent1	20	
kCellstyle40Accent2	24	
kCellstyle40Accent3	28	
kCellstyle40Accent4	32	
kCellstyle40Accent5	36	
kCellstyle40Accent6	40	
kCellstyle60Accent1	21	
kCellstyle60Accent2	25	
kCellstyle60Accent3	29	
kCellstyle60Accent4	33	
kCellstyle60Accent5	37	
kCellstyle60Accent6	41	
kCellstyleAccent1	22	
kCellstyleAccent2,	26	
kCellstyleAccent3	30	
kCellstyleAccent4,	34	
kCellstyleAccent5	38	
kCellstyleAccent6,	42	
kCellstyleBad	1	Bad, usually red text on a light red background.
kCellstyleCalc	4	
kCellstyleCheckcell	5	
kCellstyleComma	43	Comma
kCellstyleComma0	44	Comma [0]
kCellstyleCurrency	45	Currency
kCellstyleCurrency0	46	Currency [0]
kCellstyleExplanatory	6	
kCellstyleGood	2	
kCellstyleHeading1	14	
kCellstyleHeading2	15	
kCellstyleHeading3	16	
kCellstyleHeading4	17	
kCellstyleHyperlink	9	
kCellstyleInput	7	Input field style
kCellstyleLinkedCell	10	Linked Cell style.
kCellstyleNeutral	3	Bad, usually brown text on a light orange background.
kCellstyleNormal	0	Normal.
kCellstyleNote	11	Note style
kCellstyleOutput,	8	Output field style
kCellstylePercent	47	Percent
kCellstyleTitle	13	Title style
kCellstyleTotal,	18	Total value style
kCellstyleWarning	12	

Errors

Constant	Value	Description
kErrorActiveCellNotFound	76	Active cell is not found.
kErrorAutofilterNull	22	AutoFilter can't be NULL.
kErrorAutofitError	80	Can't calculate the cell's width.
kErrorBiffrecError	26	Workbook is corrupted, error in BIFF record.
kErrorCellNotFound	40	Cell is not found.
kErrorCellNotMerged	41	Cell is not in merged cells.
kErrorCellTypeIncorrect	42	Cell doesn't contain the requested type.
kErrorCharNotAllowed	39	Some particular symbols are not allowed here.
kErrorColorInvalid	52	Color is invalid.
kErrorColOutOfRange	3	Column is out of range.
kErrorConsistencyError	28	Data inconsistency was found.
kErrorControlNotFound	79	Control is not found.
kErrorConvError	67	String conversion error, probably incorrect locale.
kErrorDataValidNotFound	75	Data validations are not found.
kErrorDateInvalid	65	Date is not recognized.
kErrorDirEntryIncorrectName	62	Found an incorrect name in the directory entry inside xls file.
kErrorException	83	STL exception error.
kErrorFileFormatNotSupported	14	File isn't an Excel file or it is not supported.
kErrorFileNameInvalid	11	File name can't be NULL.
kErrorFileNotAvailable	13	Can't open file or path is incorrect.
kErrorFilterColumnNull	72	Filter column is NULL.
kErrorFilterNotFound	74	Filter is not found.
kErrorFilterValueNotFound	73	Filter value is not found.
kErrorFontNotFound	34	Font is not found.
kErrorFontSizeOutOfRange	18	Font size is out of range.
kErrorFormatNotFound	32	Format is not found.
kErrorFormatNull	31	Format is NULL.
kErrorFormulaSyntaxError	9	Error in formula expression.
kErrorFuncNotSupportedForXls	15	This function is not supported for xls files.
kErrorFuncNotSupportedForXlsx	16	This function is not supported for xlsx files.
kErrorHeightTooHigh	43	Height is too big.
kErrorHyperlinkNotFound	77	Cell doesn't have a hyperlink.
kErrorIgnoredErrAlreadyExist	59	Ignored error already exists.
kErrorIncorrectPassword	1	Incorrect password for encrypted workbook.
kErrorIndexNoSense	5	Indexes are meaningless for this function.
kErrorIndexOutOfRange	4	Index is out of range.
kErrorIOError	27	Can't read or write.
kErrorLastSheet	6	Workbook must contain at least one visible worksheet.
kErrorLoadedInlyInfo	17	Only workbook information was loaded.
kErrorLocaleError	24	Can't apply the specified locale.
kErrorNameAlreadyExist	12	Workbook already contains such a sheet name.
kErrorNamecutoff	8	Name was truncated.
kErrorNamedRangeNotFound	54	Named range is not found.
kErrorNamedRangeskipped	55	Some parts of named range were skipped.
kErrorNoFonts	19	Workbook doesn't have fonts.
kErrorNoFreeColorIndex	51	There is no free color index for xls format.
kErrorNoId	71	ID is not found.
kErrorNoStyles	70	Styles are not found.
kErrorOK	0	Everything was fine.
kErrorOutlineLevelExceeded	23	Exceeded outline level for groups.
kErrorOutOfMemory	29	Not enough memory.
kErrorOverlap	60	Range overlap was detected.
kErrorPageBreakAlreadyExist	56	Page break already exists.
kErrorPageBreakLimit	58	Number of page breaks exceeds the limit.
kErrorPageBreakNotFound	57	Page break is not found.
kErrorParentFormatNotFound	33	Parent format is not found.
kErrorPicError	44	Picture is corrupted or it has unknown format.
kErrorPicNotFound	46	Picture is not found.

Picture Format Constants

Constant	Value	Description
PictureTypeDIB	4	DIB format
PictureTypeEMF	5	EMF format
PictureTypeError	&hFF	Error. Check XLBookMBS.ErrorMessage method.
PictureTypeGIF	2	GIF format.
PictureTypeJPEG	1	JPEG format
PictureTypePICT	6	Mac PICT format.
PictureTypePNG	0	PNG format
PictureTypeSVG	8	SVG format
PictureTypeTIFF	7	TIFF format
PictureTypeWMF	3	WMF format

Sheet Types

Constant	Value	Description
SheetTypeChart	1	Sheet is a chart.
SheetTypeSheet	0	This is a normal sheet.
SheetTypeUnknown	2	Type is unknown.

229.3 class XLConditionalFormatMBS

229.3.1 class XLConditionalFormatMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a format used with conditional formatting.
Example:

```
// highlighting alternating rows
book.RgbMode = true

Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.FillPattern = cFormat.FillPatternSolid
cFormat.PatternBackgroundColor = book.PackColor(240, 240, 240)

Var cFormatting As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cFormatting.addRange(4, 20, 1, 10)
cFormatting.addRule(cFormatting.FormatTypeExpression, cFormat, "=MOD(ROW(),2)=0")

For row As Integer = 4 To 19
For col As Integer = 1 To 9
Call sheet.WriteNumber(row, col, row + col)
Next
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.3.2 Methods

229.3.3 Constructor

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.3.4 SetBorder(style as Integer = 1)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the border style.
Notes: Sets all four sides. Defaults to thin border.

229.3.5 SetBorderColor(color as Integer)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the border color.

229.3.6 Properties

229.3.7 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object.
Notes: The owning book object.
(Read only property)

229.3.8 BorderBottom as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The bottom border style.
Notes: (Read and Write property)

229.3.9 BorderBottomColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the bottom border.
Notes: (Read and Write property)

229.3.10 BorderLeft as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The left border style.
Notes: (Read and Write property)

229.3.11 BorderLeftColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the left border.
Notes: (Read and Write property)

229.3.12 BorderRight as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The right border style.
Notes: (Read and Write property)

229.3.13 BorderRightColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the right border.
Notes: (Read and Write property)

229.3.14 BorderTop as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The top border style.
Notes: (Read and Write property)

229.3.15 BorderTopColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The color of the top border.
Notes: (Read and Write property)

229.3.16 CustomNumFormat as String

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Custom number format.
Notes: The format string customNumFormat indicates how to format and render the numeric value of a cell. See custom format strings guidelines.
https://www.libxl.com/custom-format.html
(Read and Write property)

229.3.17 FillPattern as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The fill pattern.
Notes: (Read and Write property)

229.3.18 Font as XLFontMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the pointer to the current used font for this conditional format.
Notes: (Read only property)

229.3.19 Handle as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.3.20 NumFormat as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number format identifier.
Notes: The identifier must be a valid built-in number format identifier.

(Read and Write property)

229.3.21 PatternBackgroundColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The background color of the fill pattern.
Notes: (Read and Write property)

229.3.22 PatternForegroundColor as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The foreground color of the fill pattern.
Notes: (Read and Write property)

229.3.23 Constants

Border Style Constants

Constant	Value	Description
BorderStyleDashdot	9	dash and dot
BorderStyleDashdotdot	11	dash and dots
BorderStyleDashed	3	dashed
BorderStyleDotted	4	dotted
BorderStyleDouble	6	double
BorderStyleHair	7	hair style
BorderStyleMedium	2	medium
BorderStyleMediumdashdot	10	medium dash and dot
BorderStyleMediumdashdotdot	12	medium dash and dots
BorderStyleMediumdashed	8	medium dashed
BorderStyleNone	0	no border
BorderStyleSlantdashdot	13	medium dash and dot
BorderStyleThick	5	thick
BorderStyleThin	1	thin

Fillpattern Style Constants

Constant	Value	Description
FillPatternDiagcrosshatch	9	Diagonal cross hatch
FillPatternDiagstripe	8	Diagonal stripes
FillPatternGray12P5	17	Gray dots
FillPatternGray25	4	25% Gray
FillPatternGray50	2	50% Gray
FillPatternGray6P25	18	More gray dots
FillPatternGray75	3	75% Gray
FillPatternHorstripe	5	Horizontal stripes
FillPatternNone	0	No filling
FillPatternRevdiagstripe	7	Reverse diagonal stripes
FillPatternSolid	1	Solid fill
FillPatternThickdiagcrosshatch	10	Thick diagonal cross hatch
FillPatternThindiagcrosshatch	16	Thin diagonal cross hatch
FillPatternThindiagstripe	14	Thin diagonal stripes
FillPatternThinhorcrosshatch	15	Thin horizontal cross hatch
FillPatternThinhorstripe	11	Thin horizontal stripes
FillPatternThinrevdiagstripe	13	Thin vertical diagonal stripes
FillPatternThinverstripe	12	Thin vertical stripes
FillPatternVerstripe	6	Vertical stripes

Number Format Constants

Constant	Value	Description
NumformatAccount	41	account value: 5,000
NumformatAccountcur	42	account value with currency symbol: $ 5,000
NumformatAccountD2	43	account value with decimal point: 5,000.00
NumformatAccountD2Cur	44	account value with currency symbol and decimal point: $ 5,000.00
NumformatCurrencyD2Negbra	7	monetary value with decimal point, negative in brackets: ($ 1000.00)
NumformatCurrencyD2NegbraRed	8	monetary value with decimal point, negative is red in brackets: ($ 1000.0
NumformatCurrencyNegbra	5	monetary value, negative in brackets: (1000$)
NumformatCurrencyNegbraRed	6	monetary value, negative is red in brackets: (1000$)
NumformatCustom000P0EPlus0	48	custom value: 15.2E+3
NumformatCustomDMon	16	custom date value: 11-Mar
NumformatCustomDMonYY	15	custom date value: 11-Mar-09
NumformatCustomH0MMSS	46	custom time value: 20:30:55
NumformatCustomHMM	20	custom date value: 8:30
NumformatCustomHMMAM	18	custom date value: 8:30 AM
NumformatCustomHMMSS	21	custom date value: 8:30:00
NumformatCustomHMMSSAM	19	custom date value: 8:30:00 AM
NumformatCustomMDYYYYHMM	22	custom datetime value: 3/11/2009 8:30
NumformatCustoMMMSS	45	custom time value: 30:55
NumformatCustoMMMSS0	47	custom time value: 30:55.0
NumformatCustomMonYY	17	custom date value: Mar-09
NumformatDate	14	date value, depends on OS settings: 3/11/2009
NumformatFractionOneDig	12	fraction value, one digit: 10 1/2
NumformatFractionTwoDig	13	fraction value, two digits: 10 23/95
NumformatGeneral	0	general format
NumformatNumber	1	general number: 1000
NumformatNumberD2	2	number with decimal point: 1000.00
NumformatNumberD2SepNegbra	39	number with thousands separator and decimal point, negative in brac (4,000.00)
NumformatNumberD2SepNegbraRed	40	number with thousands separator and decimal point, negative is red in brac (4,000.00)
NumformatNumberSep	3	number with thousands separator: 100,000
NumformatNumberSepD2	4	number with decimal point and thousands separator: 100,000.00
NumformatNumberSepNegbra	37	number with thousands separator, negative in brackets: (4,000)
NumformatNumberSepNegbraRed	38	number with thousands separator, negative is red in brackets: (4,000)
NumformatPercent	9	percent value, multiply the cell value by 100: 75%
NumformatPercentD2	10	percent value with decimal point, multiply the cell value by 100: 75.00%
NumformatScientificD2	11	scientific value with E character and decimal point: 10.00E+1
NumformatText	49	text value

229.4 class XLConditionalFormattingMBS

229.4.1 class XLConditionalFormattingMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a conditional formatting rule set.
Example:

```
// create a rule to make cells starting with A to be bold
Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.Font.bold = true

Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(2, 10, 1, 1)
cf.addRule(cf.FormatTypeBeginWith, cFormat, "a")
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 24.2pr1

229.4.2 Methods

229.4.3 Add2ColorScaleFormulaRule(minColor as Integer, maxColor as Integer, minType as Integer = 2, minValue as String = "", maxType as Integer = 2, maxValue as String = "", stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 2-color scale on the cells.
Notes: minColor: the color for minimum;
maxColor: the color for maximum;
minType: the type of minValue, see values above;
minValue: the formula expression for minimum;
maxType: the type of maxValue, see values above;
maxValue: the formula expression for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.4 Add2ColorScaleRule(minColor as Integer, maxColor as Integer, minType as Integer = 0, minValue as Double = 0, maxType as Integer = 1, maxValue as Double = 0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 2-color scale on the cells.
Example:

```
// creating a gradated Color scale on the cells
Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(3, 10, 2, 2)
cf.add2ColorScaleRule(book.PackColor(&hFF, &h71, &h28), book.PackColor(&hFF, &hEF, &h9C))
```

Notes: minColor: the color for minimum;
maxColor: the color for maximum;
minType: the type of minValue, see values below;
minValue: the numeric value for minimum;
maxType: the type of maxValue, see values below;
maxValue: the numeric value for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.5 Add3ColorScaleFormulaRule(minColor as Integer, midColor as Integer, maxColor as Integer, minType as Integer = 2, minValue as String = ””, midType as Integer = 2, midValue as String = ””, maxType as Integer = 2, maxValue as String = ””, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 3-color scale on the cells.
Notes: minColor: the color for minimum;
minColor: the color for midpoint;
maxColor: the color for maximum;
minType: the type of minValue, see values above;
minValue: the formula expression for minimum;
midType: the type of midValue, see values above;
midValue: the formula expression for midpoint;
maxType: the type of maxValue, see values above;
maxValue: the formula expression for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.6 Add3ColorScaleRule(minColor as Integer, midColor as Integer, maxColor as Integer, minType as Integer = 0, minValue as Double = 0, midType as Integer = 5, midValue as Double = 0, maxType as Integer = 1, maxValue as Double = 0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that creates a gradated 3-color scale on the cells.
Notes: minColor: the color for minimum;
minColor: the color for midpoint;
maxColor: the color for maximum;
minType: the type of minValue, see values above;
minValue: the numeric value for minimum;
midType: the type of midValue, see values above;
midValue: the numeric value for midpoint;
maxType: the type of maxValue, see values above;
maxValue: the numeric value for maximum;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.7 AddAboveAverageRule(format as XLConditionalFormatMBS, aboveAverage as Boolean = true, equalAverage as Boolean = false, stdDev as Integer = 0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells that are above or below the average for all values in the range.
Notes: Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
aboveAverage: true for [above average] rule, false for [below average] rule;
equalAverage: true for inclusive of the average itself, false for exclusive of that value, valid only for [above average] rule;
stdDev: the number of standard deviations to include above or below the average, valid only for [above average] rule;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.8 AddOpNumRule(op as Integer, format as XLConditionalFormatMBS, value1 as double, value2 as double = 0.0, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values are compared with a calculated result, using an operator.
Example:

```
// highlighting cells that more than the specified value

const COLOR_LIGHTGREEN = 42

Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.FillPattern = cFormat.FillPatternSolid
cFormat.PatternBackgroundColor = COLOR_LIGHTGREEN

Var cf As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cf.addRange(3, 10, 2, 2)
cf.addOpNumRule(cf.FormatOperatorGreaterThan, cFormat, 90)
```

Notes: op: the operator in the conditional formatting rule, see the list of operators below;
Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value1: the numeric value for the expression with the specified operator;
value2: the numeric second optional value for the expression only for some operators;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.9 AddOpStrRule(op as Integer, format as XLConditionalFormatMBS, value1 as String = """, value2 as String = """, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values are compared with a calculated result, using an operator.
Notes: op: the operator in the conditional formatting rule, see the list of operators above;
Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value1: the string value for the expression with the specified operator;
value2: the string second optional value for the expression only for some operators;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.10 AddRange(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a range to these conditional formatting rules.

229.4.11 AddRule(FormatType as Integer, format as XLConditionalFormatMBS, value as String = """, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values correspond to the specified criteria.
Example:

```
// highlighting alternating rows
book.RgbMode = true

Var cFormat As XLConditionalFormatMBS = book.addConditionalFormat()
cFormat.FillPattern = cFormat.FillPatternSolid
cFormat.PatternBackgroundColor = book.PackColor(240, 240, 240)

Var cFormatting As XLConditionalFormattingMBS = sheet.addConditionalFormatting()
cFormatting.addRange(4, 20, 1, 10)
cFormatting.addRule(cFormatting.FormatTypeExpression, cFormat, "=MOD(ROW(),2)=0")

For row As Integer = 4 To 19
For col As Integer = 1 To 9
Call sheet.WriteNumber(row, col, row + col)
Next
Next
```

Notes: FormatType: the conditional format rule type, see the list of types below, see constants;
format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value: specifies the criteria for the conditional formatting rule;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true;

229.4.12 AddTimePeriodRule(format as XLConditionalFormatMBS, timePeriod as Integer, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells containing dates in the specified time period.
Notes: Format: the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
timePeriod: the applicable time period, see the list of values below;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.13 AddTopRule(format as XLConditionalFormatMBS, value as Integer, bottom as Boolean = false, percent as Boolean = false, stopIfTrue as Boolean = false)

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a conditional formatting rule that highlights cells whose values fall in the [top N] or [bottom N] bracket.
Notes: Format - the conditional format used for highlighting cells, use the addConditionalFormat() for adding conditional formats;
value: specifies the [top N] or [bottom N] bracket;
bottom: true for a [bottom N] rule, false for a [top N] rule
percent: true for a percent top/bottom rule;
stopIfTrue: if true, no rules with lower priority may be applied over this rule, when this rule is true.

229.4.14 Constructor

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.4.15 Properties

229.4.16 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent object.
Notes: The owning book object.
(Read only property)

229.4.17 Handle as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.4.18 RuleCount as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of rules added.
Notes: For debugging we count up the rules.
(Read only property)

229.4.19 Constants

Operators

Constant	Value	Description
FormatOperatorBeginsWith	10	'Begins with' operator
FormatOperatorBetween	6	'Between' operator
FormatOperatorContainsText	8	'Contains' operator
FormatOperatorEndsWith	11	'Ends with' operator
FormatOperatorEqual	2	'Equal to' operator
FormatOperatorGreaterThan	5	'Greater than' operator
FormatOperatorGreaterThanOrEqual	4	'Greater than or equal to' operator
FormatOperatorLessThan	0	'Less than' operator
FormatOperatorLessthanOrEqual	1	'Less than or equal to' operator
FormatOperatorNotBetween	7	'Not between' operator
FormatOperatorNotContains	9	'Does not contain' operator
FormatOperatorNotEqual	3	'Not equal to' operator

Time Periods

Constant	Value	Description
FormatTimePeriodLast7Days	0	a date in the last seven days
FormatTimePeriodLastMonth	1	a date occuring in the last calendar month
FormatTimePeriodLastWeek	2	a date occuring last week
FormatTimePeriodNextMonth	3	a date occuring in the next calendar mont
FormatTimePeriodNextWeek	4	a date occuring next week
FormatTimePeriodThisMonth	5	a date occuring in this calendar month
FormatTimePeriodThisWeek	6	a date occuring this week
FormatTimePeriodToday	7	today's date
FormatTimePeriodTomorrow	8	tomorrow's date
FormatTimePeriodYesterday	9	yesterday's date

Format Types

Constant	Value	Description
FormatTypeBeginWith	0	highlights cells that begin with the given text
FormatTypeContainsBlanks	1	highlights cells that are completely blank
FormatTypeContainsErrors	2	highlights cells with formula errors
FormatTypeContainsText	3	highlights cells containing given text
FormatTypeDuplicateValues	4	highlights duplicated values
FormatTypeEndsWith	5	highlights cells ending with given text
FormatTypeExpression	6	highlights cells when the formula result is true
FormatTypeNotContainsBlanks	7	highlights cells that are not blank
FormatTypeNotContainsErrors	8	highlights cells without formula errors
FormatTypeNotContainsText	9	highlights cells that do not contain given text
FormatTypeUniqueValues	10	highlights unique values in the range

Value Operators

Constant	Value	Description
FormatValueOperatorFormula	2	the minimum/midpoint/maximum value for the gradient is determined by a formula
FormatValueOperatorMax	1	indicates that the maximum value in the range shall be used as the maximum value for the gradient
FormatValueOperatorMin	0	indicates that the minimum value in the range shall be used as the minimum value for the gradient
FormatValueOperatorNumber	3	indicates that the minimum/midpoint/maximum value for the gradient is specified by a constant numeric value
FormatValueOperatorPercent	4	value indicates a percentage between the minimum and maximum values in the range shall be used as the minimum/midpoint/maximum value for the gradient
FormatValueOperatorPercentile	5	value indicates a percentile ranking in the range shall be used as the minimum/midpoint/maximum value for the gradient

229.5 class XLCopyOptionsMBS

229.5.1 class XLCopyOptionsMBS

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The options for copying.
Blog Entries

- LibXL Extras for Xojo

229.5.2 Methods

229.5.3 Constructor

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Initializes object and sets all properties to true.

229.5.4 Properties

229.5.5 CopyColHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy column hidden flags.
Notes: Defaults to true.
(Read and Write property)

229.5.6 CopyComments as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy comments.
Notes: Defaults to true.
(Read and Write property)

229.5.7 CopyFormat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy formats.
Notes: Defaults to true.
(Read and Write property)

229.5.8 CopyHorPageBreak as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy horizontal page breaks.
Notes: Defaults to true.
(Read and Write property)

229.5.9 CopyMerge as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy merge cells.
Notes: Defaults to true.
(Read and Write property)

229.5.10 CopyNamedRanges as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy named ranges.
Notes: Defaults to true.
(Read and Write property)

229.5.11 CopyPicture as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy pictures.
Notes: Defaults to true.
(Read and Write property)

229.5.12 CopyPrintArea as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print area.
Notes: Defaults to true.
(Read and Write property)

229.5.13 CopyPrintFit as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print fit settings.
Notes: Defaults to true.
(Read and Write property)

229.5.14 CopyPrintRepeat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print repeat settings.
Notes: Defaults to true.
(Read and Write property)

229.5.15 CopyRowHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy row hidden flags.
Notes: Defaults to true.
(Read and Write property)

229.6 class XLCorePropertiesMBS

229.6.1 class XLCorePropertiesMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for core properties in an Excel file.
Example:

```
Var book As New XLBookMBS(True)
Var cp As XLCorePropertiesMBS = book.CoreProperties
cp.Title = "The title"
cp.Subject = "Test document"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.6.2 Methods

229.6.3 Constructor

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.6.4 RemoveAll

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Remove all workbook properties.

229.6.5 Properties

229.6.6 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent book.
Notes: (Read only property)

229.6.7 Categories as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "categories" property of the workbook.
Notes: (Read and Write property)

229.6.8 Comments as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "comments" property of the workbook.
Notes: (Read and Write property)

229.6.9 Created as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "created" property of the workbook.
Notes: (Read and Write property)

229.6.10 CreatedAsDouble as Double

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "created" property of the workbook.
Notes: Use the dateUnpack() for extract date/time parts from double.
(Read and Write property)

229.6.11 Creator as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "creator" property of the workbook.
Notes: (Read and Write property)

229.6.12 Handle as Integer

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.6.13 LastModifiedBy as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "lastModifiedBy" property of the workbook.
Notes: (Read and Write property)

229.6.14 Modified as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "modified" property of the workbook.
Notes: (Read and Write property)

229.6.15 ModifiedAsDouble as Double

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "modified" property of the workbook.
Notes: Use the dateUnpack() for extract date/time parts from double.
(Read and Write property)

229.6.16 Subject as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "subject" property of the workbook.
Example:

```
Var book As New XLBookMBS(True)
Var cp As XLCorePropertiesMBS = book.CoreProperties
cp.Subject = "Test document"
```

Notes: (Read and Write property)

229.6.17 Tags as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "tags" property of the workbook.
Notes: (Read and Write property)

229.6.18 Title as String

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The "title" property of the workbook.
Example:

```
Var book As New XLBookMBS(True)
Var cp As XLCorePropertiesMBS = book.CoreProperties
cp.Title = "The title"
```

Notes: (Read and Write property)

229.7 class XLFilterColumnMBS

229.7.1 class XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for filter column.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- LibXL Extras for Xojo
- MBS Xojo Plugins, version 18.4pr9

229.7.2 Methods

229.7.3 AddFilter(Filter as String)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the filter value.

229.7.4 Clear

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear the filter criteria.

229.7.5 Constructor

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

229.7.6 Filter(index as Integer) as String

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the filter value by index.

229.7.7 GetCustomFilterEx(byref Op1 as Integer, byref Value1 as String, byref Op2 as Integer, byref Value2 as String, byref andOp as Boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the custom filter criteria:
Notes: op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;
Value12 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".
Returns false if error. Get error info with XLBookMBS.errorMessage.

229.7.8 GetTop10(byref value as Double, byref top as boolean, byref percent as boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of top or bottom items:
Notes: value - number of items;
top - top items if true otherwise bottom items;
percent - using percent instead of number items.
Returns false if error. Get error info with XLBookMBS.errorMessage.

229.7.9 SetCustomFilter(Op as Integer, Value as String)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the custom filter criteria:
Notes: op - operator used by the filter comparison in the filter criteria;
Value - value used in the filter criteria;

229.7.10 SetCustomFilterEx(Op1 as Integer, Value1 as String, Op2 as Integer, Value2 as String, andOp as Boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the custom filter criteria:
Notes: op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;

Value2 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".

229.7.11 SetTop10(value as Double, top as boolean = true, percent as boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the number of top or bottom items:
Notes: value - number of items;
top - top items if true otherwise bottom items;
percent - using percent instead of number items.

229.7.12 Properties

229.7.13 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The owner object.
Notes: (Read only property)

229.7.14 FilterSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of filter values.
Notes: (Read only property)

229.7.15 FilterType as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the filter type of this AutoFilter column.
Notes: can be constants FilterColor, FilterCustom, FilterDynamic, FilterExt, FilterIcon, FilterNotSet, FilterTop10 or FilterValue.
(Read only property)

229.7.16 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.7.17 Index as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of this AutoFilter column.
Notes: (Read only property)

229.7.18 Constants

Filter Types

Constant	Value	Description
FilterColor	4	Specifies the color to filter by.
FilterCustom	2	Custom filter with specified criteria.
FilterDynamic	3	Specifies dynamic filter criteria.
FilterExt	6	Defines flexible storage extensions.
FilterIcon	5	Specifies the icon to filter by.
FilterNotSet	7	No filter.
FilterTop10	1	The top N (percent or number of items) to filter by.
FilterValue	0	Filter by specified values.

Compare Operators

Constant	Value	Description
OperatorEqual	0	Equal
OperatorGreaterThan	1	Greater than
OperatorGreaterThanOrEqual	2	Greater than or equal
OperatorLessThan	3	Less than
OperatorLessThanOrEqual	4	Less than or equal
OperatorNotEqual	5	Not equal

229.8 class XLFontMBS

229.8.1 class XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a font definition.
Example:

```
Var book as XLBookMBS // your book
Var textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.name = "Century Gothic"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 24.2pr1
- LibXL Extras for Xojo
- StyledText for Excel files with LibXL 3.9 in Xojo
- MBS Xojo Plugins, version 18.4pr9

229.8.2 Methods

229.8.3 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

229.8.4 Operator_Compare(other as XLFontMBS) as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two font objects.
Notes: Compares handle instead of Xojo object pointers to make sure that two Xojo objects pointing to the same font are considered equal in Xojo.

229.8.5 Properties

229.8.6 Bold as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is bold.
Notes: (Read and Write property)

229.8.7 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The owner object.
Notes: As a font is only valid with the owning book, we keep a back reference here.
(Read only property)

229.8.8 ColorRGB as Color

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font color as color value.
Notes: While ColorValue may return indexed color, this property converts to a Xojo color value.
(Read and Write property)

229.8.9 ColorValue as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the font.
Example:

```
Var book as XLBookMBS // your book
Var textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.ColorValue = XLFontMBS.ColorGray25
```

Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

(Read and Write property)

229.8.10 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.8.11 Italic as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is italic.
Notes: If italic doesn't show, maybe check whether the chosen font supports italic.
(Read and Write property)

229.8.12 Name as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the font.
Notes: Default name is "Arial".
(Read and Write property)

229.8.13 Script as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The script style of the font.
Notes: (Read and Write property)

229.8.14 Size as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the font in points.
Notes: (Read and Write property)

229.8.15 StrikeOut as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is strikeout.
Notes: (Read and Write property)

229.8.16 Underline as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The underline style of the font.
Notes: See Underline* constants.
(Read and Write property)

229.8.17 Constants

Color Constants

Constant	Value	Description
ColorAqua	49	
ColorAuto	&h7Fff

UnderlineNone	0	
UnderlineSingle	1	
UnderlineSingleacc	&H21	

229.9 class XLFormatMBS

229.9.1 class XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a format.
Example:

```
Var book as XLBookMBS // your book
// add font
Var boldFont as XLFontMBS = book.addFont()
boldFont.StrikeOut = true

// add format
Var boldFormat as XLFormatMBS = book.addFormat
boldFormat.font = boldFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", boldFormat)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 20.5, page 73: Create and Read Excel Spreadsheets, Using LibXL with Xojo by Stefanie Juchmes

229.9.2 Methods

229.9.3 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

229.9.4 Operator_Compare(other as XLFontMBS) as Integer

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two format objects.
Notes: Compares handle instead of Xojo object pointers to make sure that two Xojo objects pointing to the same format are considered equal in Xojo.

229.9.5 SetBorder(border as Integer = 1)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border style.
Notes: See BorderStyle* constants.

229.9.6 SetBorderColor(ColorValue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border color.
Notes: If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

229.9.7 SetFont(font as XLFontMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font for the format.
Notes: To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.9.8 SetRotation(rotation as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the text rotation.
Notes: Must be a value from the following table:

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

229.9.9 Properties

229.9.10 AlignH as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal alignment.
Notes: See AlignH* constants.
(Read and Write property)

229.9.11 AlignV as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical alignment.
Notes: See AlignV* constants.
(Read and Write property)

229.9.12 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object owning this format object.
Notes: As a format is only valid with the owning book, we keep a back reference here.
(Read only property)

229.9.13 BorderBottom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom border style.
Notes: See BorderStyle* constants.
(Read and Write property)

229.9.14 BorderBottomColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the bottom border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

229.9.15 BorderDiagonal as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diagonal border.
Notes: see BorderDiagonal* constants.
(Read and Write property)

229.9.16 BorderDiagonalColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the diagonal border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

229.9.17 BorderDiagonalStyle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diagonal border style.
Notes: See BorderDiagonal* constants.
(Read and Write property)

229.9.18 BorderLeft as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left border style.
Notes: See BorderStyle* constants.
(Read and Write property)

229.9.19 BorderLeftColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the left border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

229.9.20 BorderRight as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right border style.
Notes: See BorderStyle* constants.
(Read and Write property)

229.9.21 BorderRightColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the right border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

229.9.22 BorderTop as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top border style.
Notes: See BorderStyle* constants.
(Read and Write property)

229.9.23 BorderTopColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the top border.
Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

229.9.24 FillPattern as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fill pattern.
Notes: See fill pattern constants.
(Read and Write property)

229.9.25 Font as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font for the format.
Example:

```
// your book
Var book as XLBookMBS

// add font
Var StrikeOutFont as XLFontMBS = book.addFont()
StrikeOutFont.StrikeOut = true

// add format
Var StrikeOutFormat as XLFormatMBS = book.addFormat
```

```
StrikeOutFormat.font = StrikeOutFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", StrikeOutFormat)
```

Notes: To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
(Read and Write property)

229.9.26 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.9.27 Hidden as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the hidden protection property is set to true.
Notes: (Read and Write property)

229.9.28 Indent as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text indentation level.
Notes: Must be less than or equal to 15.
(Read and Write property)

229.9.29 Locked as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the locked protection property is set to true.
Notes: Needs to be used together with XLSheetMBS.Protect property and XLSheetMBS.SetProtectEx method to prevent editing in locked cells.
(Read and Write property)

229.9.30 NumFormat as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number format identifier.
Notes: The identifier must be a valid built-in number format identifier or the identifier of a custom number format. To create a custom format use XLBookMBS.addCustomNumFormat(). Or use one of the NumFormat* constants.
(Read and Write property)

229.9.31 PatternBackgroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The background color of the fill pattern.
Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

229.9.32 PatternForegroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The foreground color of the fill pattern.

Example:

```
// define a format for red fill
Var redBackgroundFormat As XLFormatMBS = book.AddFormat
Var c As Color = &cFF0000
// will give back numeric value of color for RGB mode or color index
Var n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Var row As Integer = 5 // 6th row
Var col As Integer = 1 // Column B
Var value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes: If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

229.9.33 Rotation as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the text rotation.
Notes: Must be a value from the following table:

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

(Read only property)

229.9.34 ShrinkToFit as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the cell is shrink-to-fit.
Notes: (Read and Write property)

229.9.35 Wrap as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the cell text is wrapped.
Notes: (Read and Write property)

229.9.36 Constants

Horizontal Alignment Constants

Constant	Value	Description
AlignHCenter	2	Center
AlignHDistributed	7	Distributed
AlignHFill	4	Fill
AlignHGeneral	0	Default
AlignHJustify	5	Justify
AlignHLeft	1	Left
AlignHMerge	6	Center over several cells.
AlignHRight	3	Right

Vertical Alignment Constants

Constant	Value	Description
AlignVBottom	2	Bottom
AlignVCenter	1	Center
AlignVDistributed	4	Distributed
AlignVJustify	3	Justify
AlignVTop	0	Top

Diagonal Border Style Constants

Constant	Value	Description
BorderDiagonalBoth	3	
BorderDiagonalDown	1	
BorderDiagonalNone	0	
BorderDiagonalUp	2	

Border Style Constants

Constant	Value	Description
BorderStyleDashdot	9	dash and dot
BorderStyleDashdotdot	11	dash and dots
BorderStyleDashed	3	dashed
BorderStyleDotted	4	dotted
BorderStyleDouble	6	double
BorderStyleHair	7	hair style
BorderStyleMedium	2	medium
BorderStyleMediumdashdot	10	medium dash and dot
BorderStyleMediumdashdotdot	12	medium dash and dots
BorderStyleMediumdashed	8	medium dashed
BorderStyleNone	0	no border
BorderStyleSlantdashdot	13	dash and dot
BorderStyleThick	5	thick
BorderStyleThin	1	thin

Fillpattern Style Constants

Constant	Value	Description
FillPatternDiagcrosshatch	9	Diagonal cross hatch
FillPatternDiagstripe	8	Diagonal stripes
FillPatternGray12P5	17	Gray dots
FillPatternGray25	4	25% Gray
FillPatternGray50	2	50% Gray
FillPatternGray6P25	18	More gray dots
FillPatternGray75	3	75% Gray
FillPatternHorstripe	5	Horizontal stripes
FillPatternNone	0	No filling
FillPatternRevdiagstripe	7	Reverse diagonal stripes
FillPatternSolid	1	Solid fill
FillPatternThickdiagcrosshatch	10	Thick diagonal cross hatch
FillPatternThindiagcrosshatch	16	Thin diagonal cross hatch
FillPatternThindiagstripe	14	Thin diagonal stripes
FillPatternThinhorcrosshatch	15	Thin horizontal cross hatch
FillPatternThinhorstripe	11	Thin horizontal stripes
FillPatternThinrevdiagstripe	13	Thin vertical diagonal stripes
FillPatternThinverstripe	12	Thin vertical stripes
FillPatternVerstripe	6	Vertical stripes

Number Format Constants

Constant	Value	Description
NumformatAccount	41	account value: 5,000
NumformatAccountcur	42	account value with currency symbol: $ 5,000
NumformatAccountD2	43	account value with decimal point: 5,000.00
NumformatAccountD2Cur	44	account value with currency symbol and decimal point: $ 5,000.00
NumformatCurrencyD2Negbra	7	monetary value with decimal point, negative in brackets: ($ 1000.00)
NumformatCurrencyD2NegbraRed	8	monetary value with decimal point, negative is red in brackets: ($ 1000.0
NumformatCurrencyNegbra	5	monetary value, negative in brackets: (1000$)
NumformatCurrencyNegbraRed	6	monetary value, negative is red in brackets: (1000$)
NumformatCustom000P0EPlus0	48	custom value: 15.2E+3
NumformatCustomDMon	16	custom date value: 11-Mar
NumformatCustomDMonYY	15	custom date value: 11-Mar-09
NumformatCustomH0MMSS	46	custom time value: 20:30:55
NumformatCustomHMM	20	custom date value: 8:30
NumformatCustomHMMAM	18	custom date value: 8:30 AM
NumformatCustomHMMSS	21	custom date value: 8:30:00
NumformatCustomHMMSSAM	19	custom date value: 8:30:00 AM
NumformatCustomMDYYYYHMM	22	custom datetime value: 3/11/2009 8:30
NumformatCustomMMSS	45	custom time value: 30:55
NumformatCustomMMSS0	47	custom time value: 30:55.0
NumformatCustomMonYY	17	custom date value: Mar-09
NumformatDate	14	date value, depends on OS settings: 3/11/2009
NumformatFractionOneDig	12	fraction value, one digit: 10 1/2
NumformatFractionTwoDig	13	fraction value, two digits: 10 23/95
NumformatGeneral	0	general format
NumformatNumber	1	general number: 1000
NumformatNumberD2	2	number with decimal point: 1000.00
NumformatNumberD2SepNegbra	39	number with thousands separator and decimal point, negative in brac (4,000.00)
NumformatNumberD2SepNegbraRed	40	number with thousands separator and decimal point, negative is red in brac (4,000.00)
NumformatNumberSep	3	number with thousands separator: 100,000
NumformatNumberSepD2	4	number with decimal point and thousands separator: 100,000.00
NumformatNumberSepNegbra	37	number with thousands separator, negative in brackets: (4,000)
NumformatNumberSepNegbraRed	38	number with thousands separator, negative is red in brackets: (4,000)
NumformatPercent	9	percent value, multiply the cell value by 100: 75%
NumformatPercentD2	10	percent value with decimal point, multiply the cell value by 100: 75.00%
NumformatScientificD2	11	scientific value with E character and decimal point: 10.00E+1
NumformatText	49	text value

229.10 class XLFormControlMBS

229.10.1 class XLFormControlMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to represent various form controls on an Excel sheet.
Notes: This allows you to batch pre-fill form fields in an Excel document.
You may need Excel to create the template with the form fields.

New in LibXL 4.0.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.10.2 Methods

229.10.3 AddItem(value as String)

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the item to a list box or drop-down form control.

229.10.4 ClearItems

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clears all items from a list box or drop-down form control.

229.10.5 Constructor

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.10.6 FromAnchor(byref Col as Integer, byref ColOff as Integer, byref Row as Integer, byref RowOff as Integer) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the top left location of a control within a document.

229.10.7 InsertItem(Index as Integer, value as String)

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the item to the specified position to a list box or drop-down form control.

229.10.8 Item(Index as Integer) as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the item by index from a list box or drop-down form control.
Notes: Index in range from zero to ItemCount-1.

229.10.9 ToAnchor(byref Col as Integer, byref ColOff as Integer, byref Row as Integer, byref RowOff as Integer) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the bottom right location of a control within a document.

229.10.10 Properties

229.10.11 AltText as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative text for the object.
Notes: (Read only property)

229.10.12 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The book reference.
Notes: (Read only property)

229.10.13 Checked as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether a check box is selected or a radio button is selected.
Notes: This attribute only applies to check box and radio button form controls.

See CheckType* constants.
(Read and Write property)

229.10.14 DefaultSize as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is at its default size.
Notes: (Read only property)

229.10.15 Disabled as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is allowed to run an attached macro.
Notes: (Read only property)

229.10.16 DropLines as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of lines in the drop-down before scroll bars are added.
Notes: This attribute only applies to drop-down form controls.
This value must be at least 0 and at most 30000.
(Read and Write property)

229.10.17 Dx as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the width of the scroll bar in pixels.
Notes: This attribute only applies to list boxes, scroll bars, spin boxes and drop-downs.
(Read and Write property)

229.10.18 FirstButton as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is the first button in a set of radio buttons.
Notes: This attribute only applies to radio button form controls.
(Read and Write property)

229.10.19 FmlaGroup as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference in a group box is linked to.
Notes: Only applies to group box form controls.
(Read and Write property)

229.10.20 FmlaLink as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference is linked to.
Notes: Only applies to check boxes, radio buttons, scroll bars, spin boxes, drop-downs and list boxes.
(Read and Write property)

229.10.21 FmlaRange as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference with range of source data cells.
Notes: This attribute only applies to list box and drop-down form controls.
(Read and Write property)

229.10.22 FmlaTxbx as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference with the source data that the form control object's data is linked to.
Notes: This attribute applies only to label and edit box form controls.
Any cell range can be specified but only the first cell in the range is considered.
(Read and Write property)

229.10.23 Handle as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.10.24 Horiz as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether the scroll bar is horizontal.
Notes: This attribute only applies to scroll bar form controls.
(Read and Write property)

229.10.25 Inc as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The change in the current value of a scroll bar or a spin box form control as a result of on an increment click.
Notes: It must be at least 0 and at most 30000. This attribute applies only to scroll bar or spin box form controls.
(Read and Write property)

229.10.26 ItemCount as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of items in a list box or drop-down form control.
Notes: (Read only property)

229.10.27 LinkedCell as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The worksheet range linked to the control's value.
Notes: (Read only property)

229.10.28 ListFillRange as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The range of source data cells used to populate the list box.
Notes: (Read only property)

229.10.29 Locked as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is locked when the sheet is protected.
Notes: (Read only property)

229.10.30 Macro as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The custom function associated with the object.
Notes: (Read only property)

229.10.31 Max as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The maximum value generated by the scroll bar or by the spin box.
Notes: It must be at least 0 and at most 30000. This attribute only applies to scroll bars and spin boxes. (Read and Write property)

229.10.32 Min as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The minimum value generated by the scroll bar or by the spin box.
Notes: It must be at least 0 and at most 30000. This attribute only applies to scroll bars and spin box.
(Read and Write property)

229.10.33 MultiSel as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The indices of selected items as a comma-delimited list.
Notes: The list indices are one-based.
This attribute is valid only if the attribute selType has the value "multi".
This attribute applies only to list box form controls.
(Read and Write property)

229.10.34 Name as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name for this embedded control.
Notes: (Read only property)

229.10.35 ObjectType as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the form control object type.
Notes: See ObjectType constants.
(Read only property)

229.10.36 Print as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is printed when the document is printed.
Notes: (Read only property)

229.10.37 Sel as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The index of the selected item.
Notes: The index is one-based.
If set to a value of 0, no items are selected.
This attribute applies only to list box and drop-down form controls.
(Read and Write property)

229.10.38 Constants

Check State

Constant	Value	Description
CheckedTypeChecked	1	Object is checked or selected.
CheckedTypeMixed	2	Mixed selection. Applies only to check boxes.
CheckedTypeUnchecked	0	Object is unchecked or unselected.

Object Types

Constant	Value	Description
ObjectTypeButton	1	Button control
ObjectTypeCheckbox	2	Check-box control
ObjectTypeDialog	11	Dialog control
ObjectTypeDrop	3	Drop-down (combo box) control
ObjectTypeEditbox	10	Edit box control
ObjectTypeGbox	4	Group box control
ObjectTypeLabel	5	Label control
ObjectTypeList	6	List box control
ObjectTypeRadio	7	Radio button control
ObjectTypeScroll	8	Scroll bar control
ObjectTypeSpin	9	Spin box control
ObjectTypeUnknown	0	Unknown control

229.11 class XLRichStringMBS

229.11.1 class XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the rich text.
Notes: This class allows to have more than one font within one cell.

229.11.2 Methods

229.11.3 AddFont(templateFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new font to the RichString for using with the addText() method.
Notes: templateFont parameter added for version 20.3.

229.11.4 AddStyledText(StyledText as StyledText)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds styled text to the rich string.
Notes: We convert attributes like bold, italic, underline, color, font name and size.

229.11.5 AddText(text as String, font as XLFontMBS = nil)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a piece of text (run) with the specified font to the RichString for mixing different fonts in a single cell.

229.11.6 Constructor(book as XLBookMBS)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new rich text to be used in the book.

229.11.7 Text(Index as Integer) as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a piece of text (run) with the specified index from the RichString.
See also:

- 229.11.13 Text as String 24765
- 229.11.8 Text(Index as Integer, byref font as XLFontMBS) as String 24764

229.11.8 Text(Index as Integer, byref font as XLFontMBS) as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a piece of text (run) and font with the specified index from the RichString.
See also:

- 229.11.13 Text as String 24765
- 229.11.7 Text(Index as Integer) as String 24764

229.11.9 Properties

229.11.10 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reference to the owning book.
Notes: (Read only property)

229.11.11 Handle as Integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.11.12 StyledText as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries styled text with attributes of the rich string.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
(Read only property)

229.11.13 Text as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all text from the rich string.
Notes: (Read only property)
See also:

- 229.11.7 Text(Index as Integer) as String 24764
- 229.11.8 Text(Index as Integer, byref font as XLFontMBS) as String 24764

229.11.14 TextCount as Integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of text (run) in the RichString.
Notes: (Read only property)

229.12 class XLSheetMBS

229.12.1 class XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an Excel worksheet.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

229.12.2 Methods

229.12.3 AddConditionalFormatting(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer) as XLConditionalFormattingMBS

MBS XL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a conditional formatting rules to the sheet.
Notes: Only for xlsx files.

Requires LibXL in version 4.x.

Since version 5.1 you need to pass the first area range as parameter.

229.12.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range (only for xlsx files).
Notes: type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;
value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
See also:

- 229.12.5 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0) 24767

229.12.5 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range (only for xlsx files).
Notes: type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;

value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
allowBlank: a boolean value indicating whether the data validation treats empty or blank entries as valid, 'true' means empty entries are OK and do not violate the validation constraints;
hideDropDown: a boolean value indicating whether to display the dropdown combo box for a list type data validation (ValidationTypeList);
showInputMessage: a boolean value indicating whether to display the input prompt message;
showErrorMessage: a boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified;
promptTitle: title bar text of input prompt;
prompt: message text of input prompt;
errorTitle: title bar text of error alert;
error: message text of error alert;
errorStyle: the style of error alert used for this data validation:
See also:

- 229.12.4 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String) 24767

229.12.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
Notes: See parameters in the addDataValidation() method.
See also:

- 229.12.7 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0) 24768

229.12.7 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
Notes: See parameters in the addDataValidation() method.
See also:

- 229.12.6 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double) 24768

229.12.8 AddHyperlink(hyperlink as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the new hyperlink.

229.12.9 AddIgnoredError(rowFirst as Integer, colFirst as Integer, rowLast as Integer, colLast as Integer, iError as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the ignored error for specified range.
Notes: It allows to hide green triangles on left sides of cells. For example, if a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won't be treated as a number, for example, in calculations. It is possible to combine a few IgnoredError values with operator | .

Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

229.12.10 AddrToRowCol(addr as string, byref row as Integer, byref col as Integer, byref rowRelative as boolean, byref colRelative as boolean)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a cell reference to row and column.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

Var row, col as Integer
Var rowRelative, colRelative as boolean
```

```
sheet.AddrToRowCol("F7", row, col, rowRelative, colRelative)
MsgBox str(row)+" "+str(col) // shows 6 5
```

229.12.11 AddSelectionRange(sqref as string)

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a range to the selection.

229.12.12 AddTable(Name as String, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, hasHeaders as Boolean, tableStyle as Integer) as XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a table to the sheet with the specified name, range and style.
Notes: Only for xlsx files.

name - the name of the table;
rowFirst - the first row of the table;
rowLast - the last row of the table;
rowLast - the last row of the table;
colFirst - the first column of the table;
colLast - the last column of the table;
hasHeaders - does the specified range include headers or not;
tableStyle - the table style.

See the style table here to see what constant name has what look:
https://www.libxl.com/table.html

Returns the table if successed, nil if failed.

229.12.13 ApplyFilter

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies the AutoFilter to the sheet.
See also:

- 229.12.14 ApplyFilter(AutoFilter as XLAutoFilterMBS)

229.12.14 ApplyFilter(AutoFilter as XLAutoFilterMBS)

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies only the specified AutoFilter to the sheet.
Notes: Only for xlsx files.
See also:

- 229.12.13 ApplyFilter 24770

229.12.15 CellType(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns cell's type.
Notes: See CellType constants.

229.12.16 Clear(rowFirst as Integer = 0, rowLast as Integer = 1048575, colFirst as Integer = 0, colLast as Integer = 16383) as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears cells in specified area.

229.12.17 ClearPrintArea

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the print area.

229.12.18 ClearPrintRepeats

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears repeated rows and columns on each page.

229.12.19 ColFormat(col as integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column's format.

229.12.20 ColWidth(col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column width.

229.12.21 ColWidthPx(col as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column width in pixels.

229.12.22 ConditionalFormatting(index as integer) as XLConditionalFormattingMBS

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns conditional formatting rules with the specified index (only for xlsx files).
Notes: The index must be less than the return value of the conditionalFormattingSize() method.

229.12.23 ConditionalFormattings as XLConditionalFormattingMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all conditional formattings of the sheet.

229.12.24 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

229.12.25 CopyCell(rowSrc as Integer, colSrc as Integer, rowDst as Integer, colDst as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies cell with format from (rowSrc, colSrc) to (rowDst, colDst).
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.26 CopyCellValue(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer, SourceColumn as Integer, DestColumn as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a cell from one sheet to another.
Notes: Source and destination sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

If source and dest sheet are the same, does same as CopyCell function.

229.12.27 CopyColumn(dest as XLSheetMBS, SourceColumn as Integer, DestColumn as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a column from one sheet to another.
Notes: Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

229.12.28 CopyRow(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a row from one sheet to another.
Notes: Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

229.12.29 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a sheet to the other book.
Notes: This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.
See also:

- 229.12.30 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil) 24774

229.12.30 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the sheet content to the other sheet.
Notes: This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.
See also:

- 229.12.29 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil) 24774

229.12.31 DelHyperlink(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes hyperlink by index.
Notes: Index: The index from 0 to HyperlinkSize.

229.12.32 DelMerge(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes merged cells.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.33 DelMergeByIndex(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes merged cells by index.
Notes: Index: From 0 to MergeSize-1.

229.12.34 DelNamedRange(name as string, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes the named range by name.
Notes: Returns false if error occurs. Get error info with XLBookMBS.errorMessage().
scopeId - index of sheet for local named range or ScopeWorkbook for global named range.

229.12.35 FormControl(index as integer) as XLFormControlMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a form control with the specified index.
Notes: The index must be less than the return value of the FormControlCount property.
This allows you to batch pre-fill form fields in an Excel document.
You may need Excel to create the template with the form fields.

229.12.36 FormControls as XLFormControlMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all form controls of the sheet.

229.12.37 GetActiveCell(byref row as integer, byref col as integer) as boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an active cell of the sheet.
Notes: Returns true if an active cell is found otherwise returns false.

229.12.38 GetHorPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row with horizontal page break at position index.

229.12.39 GetMerge(row as Integer, col as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets merged cells for cell at row, col.
Notes: Result is written in rowFirst, rowLast, colFirst, colLast.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.40 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by name.
Notes: Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 229.12.41 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean 24776

229.12.41 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by name.
Notes: scopeId - index of sheet for local named range or SCOPE_WORKBOOK for global named range.
hidden - true if named range is hidden and false if isn't.
Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.errorMessage.
See also:

- 229.12.40 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean 24776

229.12.42 GetPicture(index as Integer, byref rowTop as Integer, byref colLeft as Integer, byref rowBottom as Integer, byref colRight as Integer, byref width as Integer, byref height as Integer, byref offsetX as Integer, byref offsetY as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a workbook picture index at position index in worksheet.
Notes: Output parameters:
(rowTop, colLeft) - top left position of picture;
(rowBottom, colRight) - bottom right position of picture;
width - width of picture in pixels;
height - height of picture in pixels;
offset_x - horizontal offset of picture in pixels;
offset_y - vertical offset of picture in pixels.

Use XLBookMBS.getPicture() for extracting binary data of picture by workbook picture index.
Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.43 GetPrintArea(byref rowFirst as Integer, byref colFirst as Integer, byref rowLast as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the print area.
Notes: Returns false if print area isn't found.

229.12.44 GetPrintFit(byref wPages as Integer, byref hPages as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns whether fit to page option is enabled.
Notes: Output parameters:
wPages - number of pages the sheet width is fit to;
hPages - number of pages the sheet height is fit to.

229.12.45 GetPrintRepeatCols(byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets repeated columns on each page from colFirst to colLast.
Notes: Returns false if repeated columns aren't found.

229.12.46 GetPrintRepeatRows(byref rowFirst as Integer, byref rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets repeated rows on each page from rowFirst to rowLast.
Notes: Returns false if repeated rows aren't found.

229.12.47 GetTabRgbColor(byref red as Integer, byref green as Integer, byref blue as Integer) as Boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the sheet's tab RGB color.
Notes: Returns true if the values have been returned.

229.12.48 GetTopLeftView(byref row as Integer, byref col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")
```

```
// set top left view
sheet.SetTopLeftView(2,3)

// read values
Var col, row as Integer
sheet.GetTopLeftView(row, col)

MsgBox str(Row)+", "+str(col) // shows 2, 3
```

229.12.49 GetVerPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column with vertical page break at position index.

229.12.50 GroupCols(colFirst as Integer, colLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Groups columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.51 GroupRows(rowFirst as Integer, rowLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Groups rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.52 Hyperlink(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as String

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the hyperlink and its coordianates by index.

229.12.53 HyperlinkIndex(row as integer, col as integer) as Integer

MBS XL Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if the cell contains a hyperlink.
Notes: Returns an index of hyperlink if exists, -1 if there is no hyperlink in this cell.

229.12.54 InsertCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

229.12.55 InsertColAndKeepRanges(colFirst as integer, colLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

229.12.56 InsertRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

229.12.57 InsertRowAndKeepRanges(rowFirst as integer, rowLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

229.12.58 IsAutoFilter as boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this sheet has an auto filter.
Notes: Returns true if there is an auto filter, otherwise false.

229.12.59 IsDate(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that cell contains a date or time value.

229.12.60 IsFormula(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that cell contains a formula.

229.12.61 IsRichString(row as integer, col as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that the cell contains a rich string with multiple fonts.
Notes: If return value is true read it with the readRichString() method.

229.12.62 Merge(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the merged cells by index.

229.12.63 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by index.
See also:

- 229.12.64 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string 24782

229.12.64 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by index.
Notes: scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
hidden - true if named range is hidden and false if isn't.
See also:

- 229.12.63 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string 24781

229.12.65 ReadBlank(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads format from blank cell.
Notes: Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.66 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 24782

229.12.66 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads format from blank cell.
Notes: Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.65 ReadBlank(row as Integer, col as Integer) as boolean 24782

229.12.67 ReadBoolean(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a boolean value and its format from cell.
Notes: If nil format is returned then an error occured. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.68 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 24783

229.12.68 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a boolean value and its format from cell.
Notes: If nil format is returned then an error occured. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.67 ReadBoolean(row as Integer, col as Integer) as boolean 24783

229.12.69 ReadComment(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a comment from specified cell.
Notes: Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.70 ReadDate(row as Integer, col as Integer) as date

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.71 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date 24784

229.12.71 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.70 ReadDate(row as Integer, col as Integer) as date 24783

229.12.72 ReadDateTime(row as integer, col as integer) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.73 ReadDateTime(row as integer, col as integer, byref format as XLFormatMBS) as dateTime 24784

229.12.73 ReadDateTime(row as integer, col as integer, byref format as XLFormatMBS) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a date/time and its format from cell.
Notes: Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.

If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.72 ReadDateTime(row as integer, col as integer) as dateTime 24784

229.12.74 ReadError(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads error from cell.
Notes: See ErrorType* constants.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.75 ReadFormula(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a formula string and its format from cell.
Notes: Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.76 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string 24785

229.12.76 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a formula string and its format from cell.
Notes: Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.75 ReadFormula(row as Integer, col as Integer) as string 24785

229.12.77 ReadNumber(row as Integer, col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a number or date/time and its format from cell.
Notes: Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.78 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double 24786

229.12.78 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a number or date/time and its format from cell.
Notes: Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

- 229.12.77 ReadNumber(row as Integer, col as Integer) as Double 24786

229.12.79 ReadRichString(row as integer, col as integer) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a rich string with multiple fonts and its format from the cell.
Notes: It's possible to check if the specified cell contains a rich string with the isRichString() method.
Returns nil if the specified cell doesn't contain a string or error occurs.
Get error info with XLBookMBS.ErrorMessage property.
See also:

- 229.12.80 ReadRichString(row as integer, col as integer, byref format as XLFormatMBS) as XLRichStringMBS 24786

229.12.80 ReadRichString(row as integer, col as integer, byref format as XLFormatMBS) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a rich string with multiple fonts and its format from the cell.
Notes: It's possible to check if the specified cell contains a rich string with the isRichString() method.
Returns nil if the specified cell doesn't contain a string or error occurs.
Get error info with XLBookMBS.ErrorMessage property.
See also:

- 229.12.79 ReadRichString(row as integer, col as integer) as XLRichStringMBS 24786

229.12.81 ReadString(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a string and its format from cell.
Notes: Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.82 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string 24787

229.12.82 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a string and its format from cell.
Notes: Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 229.12.81 ReadString(row as Integer, col as Integer) as string 24787

229.12.83 ReadStyledText(row as integer, col as integer) as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads rich string of a cell and converts to StyledText.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
See also:

- 229.12.84 ReadStyledText(row as integer, col as integer, byref format as XLFormatMBS) as StyledText 24788

229.12.84 ReadStyledText(row as integer, col as integer, byref format as XLFormatMBS) as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads rich string from a cell and returns as StyledText.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
See also:

- 229.12.83 ReadStyledText(row as integer, col as integer) as StyledText 24787

229.12.85 ReadValue(row as integer, col as integer) as Variant

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a value value from a cell.
Notes: Depending on content we return number, boolean, text or date.
Returns nil for empty, error or blank cells.
See also:

- 229.12.86 ReadValue(row as integer, col as integer, byref format as XLFormatMBS) as Variant 24788

229.12.86 ReadValue(row as integer, col as integer, byref format as XLFormatMBS) as Variant

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a value value from a cell.
Notes: Depending on content we return number, boolean, text or date.
Returns nil for empty, error or blank cells.
See also:

- 229.12.85 ReadValue(row as integer, col as integer) as Variant 24788

229.12.87 RemoveCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

229.12.88 RemoveColAndKeepRanges(colFirst as integer, colLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

229.12.89 RemoveComment(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a comment from the cell (only for xls format).

229.12.90 RemoveConditionalFormatting(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes conditional formatting rules with the specified index for the sheet (only for xlsx files).
Notes: The index must be less than the return value of the conditionalFormattingSize() method.
Returns true on success and false on failure.

229.12.91 RemoveDataValidations

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all data validations for the sheet (only for xlsx files).

229.12.92 RemoveFilter

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the AutoFilter from the sheet.

229.12.93 RemovePicture(row as integer, col as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a picture in the specified position.
Notes: Returns false if an error occurs.

229.12.94 RemovePictureByIndex(index as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a picture by specified index. Returns false if an error occurs.

229.12.95 RemoveRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

229.12.96 RemoveRowAndKeepRanges(rowFirst as integer, rowLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes rows from rowFirst to rowLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

229.12.97 RemoveSelection

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all selection.

229.12.98 RowColToAddr(row as Integer, col as Integer, rowRelative as boolean = true, colRelative as boolean = true) as string

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts row and column to a cell reference.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

MsgBox sheet.RowColToAddr(5,5) // shows F6
MsgBox sheet.RowColToAddr(5,5,false,false) // shows $ F$ 6
```

229.12.99 RowFormat(row as integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row's format.

229.12.100 RowHeight(row as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row height.

229.12.101 RowHeightPx(row as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row height in pixels.

229.12.102 SelectionRange as string

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a range of the selection.

229.12.103 SetActiveCell(row as integer, col as integer)

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an active cell of the sheet.

229.12.104 SetAutoFitArea(rowFirst as Integer = 0, colFirst as Integer = 0, rowLast as Integer = -1, colLast as Integer = -1)

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the borders for autofit column widths feature.
Notes: The method setCol with -1 width value will affect only to the specified limited area.

229.12.105 SetBorder(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, borderStyle as Integer, borderColor as Integer)

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border in the specified range of cells.
Notes: rowFirst - the first row of range;
rowLast - the last row of range;
colFirst - the first column of range;
colLast - the last column of range;
borderStyle - the border style;
borderColor - the border color.

229.12.106 SetCol(colFirst as Integer, colLast as Integer, width as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets column width and format for all columns from colFirst to colLast.
Notes: If format is nil then format is ignored. Columns may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style's font. Value -1 is used for autofit column widths. If format equals 0 then format is ignored. Columns may be hidden.

229.12.107 SetColPx(colFirst as integer, colLast as integer, width as integer, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets column width in pixels and format for all columns from colFirst to colLast.
Notes: Value -1 is used for autofit column widths.
If format equals nil then format is ignored. Columns may be hidden.
Returns false if error occurs. Get an error info with the errorMessage function in XLBookMBS class.

229.12.108 SetFooter(footer as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the footer text for the sheet when printed.
Notes: The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. See setHeader for details. Margin is specified in inches.

229.12.109 SetHeader(header as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the header text of the sheet when printed.
Notes: The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("&"). Margin is specified in inches.

229.12.110 SetHorPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets/removes a horizontal page break.
Example:

```
// new document
Var x as new XLBookMBS

// add a sheet
```

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

```
Var s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.111 SetMerge(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

Function: Sets merged cells for range: rowFirst - rowLast, colFirst - colLast.
Example:

```
// create new xls file
Var book As New XLBookMBS(True)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

// create a format with border
Var borderFormat As XLFormatMBS = book.AddFormat
borderFormat.SetBorder 2
borderFormat.SetBorderColor &hFF0000

// now fill a cell and merge a few more cells.
Var r1 As Boolean = sheet.WriteString(2, 2, "Hello World", borderFormat)
Var r2 As Boolean = sheet.SetMerge(2, 4, 2, 4)

// write file
Var file As FolderItem = SpecialFolder.Desktop.Child("Generate.xlsx")
```

```
if book.Save(file) then
file.Launch
else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
end if
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.112 SetNamedRange(name as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the named range.
Notes: scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

229.12.113 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a picture with pictureId identifier at position row and col with scale factor.
Notes: Use XLBookMBS.addPicture() for getting picture identifier.

scale = 0 means the picture is stretched inside the specified cell or merged area.
See also:

- 229.12.114 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0) 24796

229.12.114 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a picture with pictureId identifier at position row and col with custom size.
Notes: Use XLBookMBS.addPicture() for getting a picture identifier.

Width and height can be -1 for default size of picture.
See also:

- 229.12.113 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0) 24796

229.12.115 SetPrintArea(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the print area.

229.12.116 SetPrintFit(wPages as Integer, hPages as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fits sheet width and sheet height to wPages and hPages respectively.

229.12.117 SetPrintRepeatCols(colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets repeated columns on each page from colFirst to colLast.

229.12.118 SetPrintRepeatRows(rowFirst as Integer, rowLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets repeated rows on each page from rowFirst to rowLast.

229.12.119 SetProtectEx(protect as boolean = true, password as string = "", enhancedProtection as Integer = -1)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Protects/unprotects the sheet with password and enchanced parameters below.
Notes: It is possible to combine a few EnhancedProtection values with operator BitwiseOr.

229.12.120 SetRow(row as Integer, height as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets row height and format.
Notes: If format is nil then format is ignored. Row may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Height is in points. If you want to convert from pixels to points you can use this calculation: points = pixels * 72 / 96. So for a height of 72 pixel, you pass 54 points.

229.12.121 SetRowPx(row as integer, height as integer, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets row height in pixels.
Notes: If format equals nil then format is ignored. Row may be hidden. Returns false if error occurs. Get an error info with the errorMessage function in XLBookMBS class.

229.12.122 SetTabColor(colorValue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color for the sheet's tab.

229.12.123 SetTabRgbColor(red as Integer, green as Integer, blue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color for the sheet's tab.

229.12.124 SetTopLeftView(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
Var book as new XLBookMBS(false)

// create sheet
Var sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
Var col, row as Integer
sheet.GetTopLeftView(row, col)

MsgBox str(Row)+", "+str(col) // shows 2, 3
```

229.12.125 SetVerPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets/removes a vertical page break.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.126 Split(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splits a sheet at position (row, col).
Notes: Splits a sheet at position (row, col) or specifies the position of frozen pane. This function allows to freeze a header at top position or freeze some columns on the right.

229.12.127 SplitInfo(byref row as Integer, byref col as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the split information (position of frozen pane) in the sheet.
Notes: row: vertical position of the split;
col: horizontal position of the split.
Returns true on success.

229.12.128 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the table parameters by index.
Notes: headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.
Returns a string representing the name of the table.
See also:

- 229.12.129 Table(name as string, byref rowFirst as integer, byref rowLast as integer, byref ColFirst as integer, byref ColLast as integer, byref headerRowCount as integer, byref totalsRowCount as integer) as Boolean 24800

229.12.129 Table(name as string, byref rowFirst as integer, byref rowLast as integer, byref ColFirst as integer, byref ColLast as integer, byref headerRowCount as integer, byref totalsRowCount as integer) as Boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the table parameters by name.
Notes: headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.

Returns true if the table is found.
See also:

- 229.12.128 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string 24800

229.12.130 TableByIndex(index as Integer) as XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a table by the specified index.
Notes: Only for xlsx files.

Returns the table if successed, nil if failed.

229.12.131 TableByName(Name as String) as XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a table by the specified name.
Notes: Only for xlsx files.
Returns the table if successed, nil if failed.

229.12.132 Tables as XLTableMBS()

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all tables of the sheet.

229.12.133 WriteBlank(row as Integer, col as Integer, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes blank cell with specified format.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.134 WriteBoolean(row as Integer, col as Integer, value as boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a bool value into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteBoolean(2, 5, true, format)
```

Notes: If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.135 WriteComment(row as Integer, col as Integer, value as string, author as string, width as Integer, height as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a comment to the cell.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteComment(2, 5, "Sales Worldwide", "Peter", 30, 10)
```

Notes: row and col: cell's position
value: comment string
author: author string
width: width of text box in pixels
height: height of text box in pixels

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.136 WriteDate(row as Integer, col as Integer, value as date, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a date/time into cell with specified format.
Notes: If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.137 WriteDateTime(row as integer, col as integer, value as dateTime, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a date/time into cell with specified format.
Notes: If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.138 WriteError(row as Integer, col as Integer, Error as Integer, format as XLFormatMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes error into the cell with specified format.
Notes: If format equals nil then format is ignored.

229.12.139 WriteFormula(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteFormula(2, 5, "SUM(E16:E38)", format)
```

Notes: If format is nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
As LibXL does not calculate the result of the formula, it will not encode the result in the Excel file. It does only store the formula, so an app opening the file will have to do the calculation. But QuickLook on Mac OS X does not calculate, so results do not show there.
Examples for formulas are: "TODAY()", "IF(C1>0;ABS(C1*D1);"""")", "SUM(E16:E38)" or "E39+E39*E40".

229.12.140 WriteFormulaBool(row as Integer, col as Integer, Expression as string, value as Boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated bool value into cell with specified format.
Notes: If format equals nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

229.12.141 WriteFormulaNum(row as Integer, col as Integer, Expression as string, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated double value into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteFormulaNum(2, 5, "SUM(E16:E38)", 123.45, format)
```

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

229.12.142 WriteFormulaString(row as Integer, col as Integer, Expression as string, value as String, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated string value into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var DollarFormat as XLFormatMBS // the format to use

Var Success as Boolean = Sheet.WriteFormulaNum(2, 5, "SUM(E16:E38)", "$ 123.45"", DollarFormat)
```

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

229.12.143 WriteNumber(row as Integer, col as Integer, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a number or date/time into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteNumber(2, 5, 123.45, format)
```

Notes: If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.144 WriteRichString(row as integer, col as integer, RichString as XLRichStringMBS, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a rich string with multiple fonts into the cell with the specified format.
Notes: Add a new rich string with the addRichString() method. If format equals nil then format is ignored.
Returns false if an error occurs. Get error info with XLBookMBS.ErrorMessage property.

229.12.145 WriteString(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a string into cell with specified format.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteString(2, 5, "Hello World", format)
```

Notes: If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.

Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.146 WriteStringAsNumber(row as integer, col as integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a number into cell with specified format and passes it as text.
Example:

```
Var Sheet as XLSheetMBS // your current sheet
Var format as XLFormatMBS // optional format

Var Success as Boolean = Sheet.WriteStringAsNumber(2, 5, "123.45", format)
```

Notes: Please pass number as text here to avoid running into rounding errors with floating point numbers.

If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

229.12.147 WriteStyledText(row as integer, col as integer, StyledText as StyledText, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a styled text to a cell.
Notes: Same as building a rich string based in the StyledText and assigning it to the cell.

We convert attributes like bold, italic, underline, color, font name and size.

229.12.148 Properties

229.12.149 AutoFilter as XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the AutoFilter.
Notes: Creates it if it doesn't exist.

Only for xml based files.
(Read only property)

229.12.150 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent book.
Notes: As a sheet is only valid with the owning book, we keep a back reference here.
(Read only property)

229.12.151 ConditionalFormattingSize as Integer

MBS XL Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of conditional formatting rules in this worksheet (only for xlsx files).
Notes: (Read only property)

229.12.152 DefaultRowHeight as Double

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default row height measured in point size.
Notes: (Read and Write property)

229.12.153 DisplayGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the gridlines are displayed.
Notes: True if gridlines are displayed and false if aren't.
(Assigning a value to this property calls setDisplayGridlines internally)
(Read and Write property)

229.12.154 FirstCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first column in the sheet that contains a used cell.
Notes: (Read only property)

229.12.155 FirstFilledCol as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first column in the sheet that contains a filled cell.
Notes: (Read only property)

229.12.156 FirstFilledRow as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first row in the sheet that contains a filled cell.
Notes: (Read only property)

229.12.157 FirstRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first row in the sheet that contains a used cell.
Notes: (Read only property)

229.12.158 Footer as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The footer text of the sheet when printed.
Notes: The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Margin is specified in inches.

(Read only property)

229.12.159 FooterMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The footer margin in inches.
Notes: (Read only property)

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

229.12.160 FormControlCount as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of form controls in this worksheet.
Notes: (Read only property)

229.12.161 GetHorPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of horizontal page breaks in the sheet.
Example:

```
// new document
Var x as new XLBookMBS
```

```
// add a sheet
Var s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: (Read only property)

229.12.162 GetVerPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of vertical page breaks in the sheet.
Notes: (Read only property)

229.12.163 GroupSummaryBelow as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether grouping rows summary is below.
Notes: True if summary is below and false if isn't.
(Read and Write property)

229.12.164 GroupSummaryRight as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether grouping columns summary is right.
Notes: Returns true if summary is right and false if isn't.
(Read and Write property)

229.12.165 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

229.12.166 HCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the sheet is centered horizontally when printed.
Notes: (Read and Write property)

229.12.167 Header as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The header text of the sheet when printed.
Notes: The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("&"). Margin is specified in inches.

(Read only property)

229.12.168 HeaderMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The header margin in inches.
Notes: (Read only property)

229.12.169 Hidden as Integer

MBS XL Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the visible state of this sheet.
Notes: See constants: SheetStateHidden, SheetStateVeryHidden, SheetStateVisible.
(Read and Write property)

Code	Description
&L	specifies the beginning of the left section
&P	specifies the current page number
&N	specifies the total number of pages
&\d { 1,3 }	specifies the text font size, where font size is measured in points, for example: &9 or &36
&S	specifies whether the strikethrough text style is on or off
&X	specifies whether the superscript text style is on or off
&Y	specifies whether the subscript text style is on or off
&C	specifies the beginning of the center section
&D	specifies a date
&T	specifies a time
&G	specifies a picture
&U	specifies whether the single underline text style is on or off
&E	specifies whether the double underline text style is on or off
&R	specifies the beginning of the right section
&Z	specifies a workbook file path
&F	specifies a workbook file name
&A	specifies a sheet name
&"fontname"	specifies the text font, for example: &"Comic Sans MS"
&B	specifies whether the bold text style is on or off
&I	specifies whether the italic text style is on or off
&&	specifies an ampersand character (&)

229.12.170 HyperlinkSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of hyperlinks in the sheet.
Notes: (Read only property)

229.12.171 Landscape as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to use landscape or portrait mode for printing.
Notes: true - pages are printed using landscape mode, false - pages are printed using portrait mode.
(Read and Write property)

229.12.172 LastCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the column after the last column in the sheet that contains a used cell.
Example:

```
Var book as XLBookMBS // your book instance

// get first sheet
Var sheet as XLSheetMBS = book.Sheet(0)

// show index of last column
Var LastCol as Integer = sheet.LastCol

MsgBox "LastCol: " + str(LastCol)
```

Notes: (Read only property)

229.12.173 LastFilledCol as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the column after the last column in the sheet that contains a filled cell.
Notes: (Read only property)

229.12.174 LastFilledRow as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the row after the last row in the sheet that contains a filled cell.
Notes: (Read only property)

229.12.175 LastRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the row after the last row in the sheet that contains a used cell.
Example:

```
Var book as XLBookMBS // your book instance
```

```
// get first sheet
Var sheet as XLSheetMBS = book.Sheet(0)

// show index of last row
Var LastRow as Integer = sheet.LastRow

MsgBox "LastRow: " + str(LastRow)
```

Notes: (Read only property)

229.12.176 MarginBottom as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom margin of the sheet in inches.
Notes: (Read and Write property)

229.12.177 MarginLeft as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left margin of the sheet in inches.
Notes: (Read and Write property)

229.12.178 MarginRight as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right margin of the sheet in inches.
Notes: (Read and Write property)

229.12.179 MarginTop as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top margin of the sheet in inches.
Notes: (Read and Write property)

229.12.180 MergeSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of merged cells in this worksheet.
Notes: (Read only property)

229.12.181 Name as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the sheet.
Notes: (Read and Write property)

229.12.182 NamedRangeCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of named ranges in the sheet.
Notes: (Read only property)

229.12.183 Paper as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The paper size.
Notes: See Paper* constants.
(Read and Write property)

229.12.184 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of pictures in this worksheet.
Notes: (Read only property)

229.12.185 PrintGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the gridlines are printed.
Notes: True if gridlines are printed and false if aren't.
(Read and Write property)

229.12.186 PrintRowCol as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the row and column headers are printed.
Notes: (Read and Write property)

229.12.187 PrintZoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scaling factor for printing as a percentage.
Notes: (Read and Write property)

229.12.188 Protect as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether sheet is protected.
Notes: (Read and Write property)

229.12.189 RightToLeft as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the text is displayed in right-to-left mode.
Notes: true - the text is displayed in right-to-left mode,
false - the text is displayed in left-to-right mode.
(Read and Write property)

229.12.190 TabColor as Integer

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sheet's tab color.
Notes: For use with documents using indexed colors.

(Read and Write property)

229.12.191 TableSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of tables in the sheet.
Notes: (Read only property)

229.12.192 VCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the sheet is centered vertically when printed.
Notes: (Read and Write property)

229.12.193 Zoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The zoom level of the current view.
Notes: 100 is a usual view.
(Read and Write property)

229.12.194 CellFormat(row as Integer, col as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The cell's format.
Notes: (Read and Write computed property)

229.12.195 ColHidden(col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether column is hidden.
Notes: (Read and Write computed property)

229.12.196 RowHidden(row as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether row is hidden.
Notes: (Read and Write computed property)

229.12.197 Constants

Cell Type Constants

Constant	Value	Description
CellTypeBlank	4	blank
CellTypeBoolean	3	boolean value
CellTypeEmpty	0	empty
CellTypeError	5	error
CellTypeNumber	1	number value
CellTypeStrictDate	6	strict date
CellTypeString	2	string value

Error Type Constants

Constant	Value	Description
ErrorTypeDiv0	7	DIV/0!
ErrorTypeNA	&h2A	N/A
ErrorTypeName	&h1D	NAME?
ErrorTypeNoError	&hFF	No Error.
ErrorTypeNull	0	NULL!
ErrorTypeNum	&h24	NUM!
ErrorTypeRef	&h17	REF!
ErrorTypeValue	&h0F	VALUE!

Ignore Errors

Constant	Value	Description
IgnoreErrorDataValidation	128	Ignore errors when a cell's value in a Table does not comply with the Data Validation rules specified.
IgnoreErrorEmptyCellref	2	Ignore errors when formulas refer to empty cells.
IgnoreErrorEvalError	1	Ignore errors when cells contain formulas that result in an error.
IgnoreErrorInconsistFormula	16	Ignore errors when a formula in a region of your worksheet differs from other formulas in the same region.
IgnoreErrorInconsistRange	8	Ignore errors when formulas omit certain cells in a region.
IgnoreErrorNoError	0	No error.
IgnoreErrorNumberStoredAsText	4	Ignore errors when numbers are formatted as text or are preceded by an apostrophe.
IgnoreErrorTwodigTextyear	32	Ignore errors when formulas contain text formatted cells with years represented as 2 digits.
IgnoreErrorUnlockFormula	64	Ignore errors when unlocked cells contain formulas.

Paper Format Constants

Constant	Value	Description
Paper10X11	45	
Paper10X14	16	10 x 14 in
Paper10X17	17	11 x 17 in
Paper12X11	90	
Paper15X11	46	
Paper9X11	44	
PaperA2	66	
PaperA3	8	A3 297 x 420 mm
PaperA3Extra	63	
PaperA3ExtraTransverse	68	
PaperA3Rotated	76	
PaperA3Transverse	67	
PaperA4	9	A4 210 x 297 mm
PaperA4Extra	53	
PaperA4Plus	60	
PaperA4Rotated	77	
PaperA4Small	10	A4 Small 210 x 297 mm
PaperA4Transverse	55	
PaperA5	11	A5 148 x 210 mm
PaperA5Extra	64	
PaperA5Rotated	78	
PaperA5Transverse	61	
PaperA6	70	
PaperA6Rotated	83	
PaperB4	12	B4 (JIS) 250 x 354
PaperB4Iso	42	
PaperB4Rotated	79	
PaperB5	13	B5 (JIS) 182 x 257 mm
PaperB5Extra	65	
PaperB5Rotated	80	
PaperB5Transverse	62	
PaperB6	88	
PaperB6Rotated	89	
PaperCSize	24	C size sheet
PaperDefault	0	Default paper size
PaperDoubleJapanesePostcardRotated	82	
PaperDSize	25	D size sheet
PaperEnvelope	36	Envelope 110 x 230 mm
PaperEnvelope10	20	US Envelope #10 4 1/8 x 9 1/2
PaperEnvelope11	21	US Envelope #11 4 1/2 x 10 3/8
PaperEnvelope12	22	US Envelope #12 4 3/4 x 11
PaperEnvelope14	23	US Envelope #14 5 x 11 1/2
PaperEnvelope9	19	US Envelope #9 3 7/8 x 8 7/8
PaperEnvelopeB4	33	Envelope B4 250 x 353 mm
PaperEnvelopeB5	34	Envelope B5 176 x 250 mm
PaperEnvelopeB6	35	Envelope B6 176 x 125 mm
PaperEnvelopeC3	29	Envelope C3 324 x 458 mm
PaperEnvelopeC4	30	Envelope C4 229 x 324 mm
PaperEnvelopeC5	28	Envelope C5 162 x 229 mm
PaperEnvelopeC6	31	Envelope C6 114 x 162 mm
PaperEnvelopeC65	32	Envelope C65 114 x 229 mm
PaperEnvelopeDL	27	Envelope DL 110 x 220mm
PaperEnvelopeInvite	47	
PaperEnvelopeMonarch	37	US Envelope Monarch 3.875 x 7.5 in
PaperESize	26	E size sheet
PaperExecutive	7	US Executive 7 1/4 x 10 1/2 in
PaperFanfold	39	US Std Fanfold 14 7/8 x 11 in
PaperFolio	14	Folio 8 1/2 x 13 in

Protection Levels

Constant	Value	Description
ProtectAll	0	Nothing is allowed except cell selections.
ProtectAutofilter	4096	Autofilters are allowed when the sheet is protected.
ProtectDefault	-1	Default protection.
ProtectDeleteColumns	256	Deleting columns is allowed when the sheet is protected.
ProtectDeleteRows	512	Deleting rows is allowed when the sheet is protected.
ProtectFormatCells	4	Formatting cells is allowed when the sheet is protected.
ProtectFormatColumns	8	Formatting columns is allowed when the sheet is protected.
ProtectFormatRows	16	Formatting rows is allowed when the sheet is protected.
ProtectInsertColumns	32	Inserting columns is allowed when the sheet is protected.
ProtectInsertHyperlinks	128	Inserting hyperlinks is allowed when the sheet is protected.
ProtectInsertRows	64	Inserting rows is allowed when the sheet is protected.
ProtectObjects	1	Objects are locked when the sheet is protected.
ProtectPivottables	8192	Pivot tables are allowed when the sheet is protected.
ProtectScenarios	2	Scenarios are locked when the sheet is protected.
ProtectSelLockedCells	1024	Selection of locked cells is locked when the sheet is protected.
ProtectSelUnlockedCells	16384	Selection of unlocked cells is locked when the sheet is protected.
ProtectSort	2048	Sorting is allowed when the sheet is protected.

Scopes

Constant	Value	Description
ScopeUndefined	-2	Undefined scope
ScopeWorkbook	-1	Workbook scope.

Visible State Constants

Constant	Value	Description
SheetStateHidden	1	Sheet is hidden, but can be shown via the user interface.
SheetStateVeryHidden	2	Sheet is hidden and cannot be shown in the user interface.
SheetStateVisible	0	Sheet is visible

Table Styles

Constant	Value	Description
TableStyleDark1	50	Dark 1
TableStyleDark10	59	Dark 10
TableStyleDark11	60	Dark 11
TableStyleDark2	51	Dark 2
TableStyleDark3	52	Dark 3
TableStyleDark4	53	Dark 4
TableStyleDark5	54	Dark 5
TableStyleDark6	55	Dark 6
TableStyleDark7	56	Dark 7
TableStyleDark8	57	Dark 8
TableStyleDark9	58	Dark 9
TableStyleLight1	1	Light 1
TableStyleLight10	10	Light 10
TableStyleLight11	11	Light 11
TableStyleLight12	12	Light 12
TableStyleLight13	13	Light 13
TableStyleLight14	14	Light 14
TableStyleLight15	15	Light 15
TableStyleLight16	16	Light 16
TableStyleLight17	17	Light 17
TableStyleLight18	18	Light 18
TableStyleLight19	19	Light 19
TableStyleLight2	2	Light 2
TableStyleLight20	20	Light 20
TableStyleLight21	21	Light 21
TableStyleLight3	3	Light 3
TableStyleLight4	4	Light 4
TableStyleLight5	5	Light 5
TableStyleLight6	6	Light 6
TableStyleLight7	7	Light 7
TableStyleLight8	8	Light 8
TableStyleLight9	9	Light 9
TableStyleMedium1	22	Medium 1
TableStyleMedium10	31	Medium 10
TableStyleMedium11	32	Medium 11
TableStyleMedium12	33	Medium 12
TableStyleMedium13	34	Medium 13
TableStyleMedium14	35	Medium 14
TableStyleMedium15	36	Medium 15
TableStyleMedium16	37	Medium 16
TableStyleMedium17	38	Medium 17
TableStyleMedium18	39	Medium 18
TableStyleMedium19	40	Medium 19
TableStyleMedium2	23	Medium 2
TableStyleMedium20	41	Medium 20
TableStyleMedium21	42	Medium 21
TableStyleMedium22	43	Medium 22
TableStyleMedium23	44	Medium 23
TableStyleMedium24	45	Medium 24
TableStyleMedium25	46	Medium 25
TableStyleMedium26	47	Medium 26
TableStyleMedium27	48	Medium 27
TableStyleMedium28	49	Medium 28
TableStyleMedium3	24	Medium 3
TableStyleMedium4	25	Medium 4
TableStyleMedium5	26	Medium 5
TableStyleMedium6	27	Medium 6
TableStyleMedium7	28	Medium 7

Data Validation Error Styles

Constant	Value	Description
ValidationErrstyleInformation	2	This data validation error style uses an information icon in the error alert.
ValidationErrstyleStop	0	This data validation error style uses a stop icon in the error alert.
ValidationErrstyleWarning	1	This data validation error style uses a warning icon in the error alert.

Validation Operations

Constant	Value	Description
ValidationOpBetween	0	Data validation which checks if a value is between two other values.
ValidationOpEqual	2	Data validation which checks if a value is equal to a specified value.
ValidationOpGreaterthan	6	Data validation which checks if a value is greater than a specified value.
ValidationOpGreaterthanorequal	7	Data validation which checks if a value is greater than or equal to a specified value.
ValidationOpLessthan	4	Data validation which checks if a value is less than a specified value.
ValidationOpLessthanorequal	5	Data validation which checks if a value is less than or equal to a specified value.
ValidationOpNotbetween	1	Data validation which checks if a value is not between two other values.
ValidationOpNotequal	3	Data validation which checks if a value is not equal to a specified value.

Data Validation Types

Constant	Value	Description
ValidationTypeCustom	7	Data validation which uses a custom formula to check the cell value.
ValidationTypeDate	4	Data validation which checks for date values satisfying the given condition.
ValidationTypeDecimal	2	Data validation which checks for decimal values satisfying the given condition.
ValidationTypeList	3	Data validation which checks for a value matching one of list of values.
ValidationTypeNone	0	No data validation.
ValidationTypeTextLength	6	Data validation which checks for text values, whose length satisfies the given condition.
ValidationTypeTime	5	Data validation which checks for time values satisfying the given condition.
ValidationTypeWhole	1	Data validation which checks for whole number values satisfying the given condition.

229.13 class XLTableMBS

229.13.1 class XLTableMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a table within an Excel sheet.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

229.13.2 Methods

229.13.3 Constructor

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

229.13.4 Properties

229.13.5 AutoFilter as XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the AutoFilter of the table.
Notes: (Read only property)

229.13.6 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reference to the parent book.
Notes: (Read only property)

229.13.7 ColumnSize as Integer

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of columns in the table.
Notes: (Read only property)

229.13.8 Handle as Integer

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

229.13.9 Name as String

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the table.
Notes: (Read and Write property)

229.13.10 Ref as String

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The range on the sheet for this table.
Notes: (Read and Write property)

229.13.11 ShowColumnStripes as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether column stripe formatting is applied.
Notes: (Read and Write property)

229.13.12 ShowFirstColumn as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the first column in the table should have the style applied.
Notes: (Read and Write property)

229.13.13 ShowLastColumn as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the last column in the table should have the style applied.
Notes: (Read and Write property)

229.13.14 ShowRowStripes as Boolean

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether row stripe formatting is applied.
Notes: (Read and Write property)

229.13.15 Style as Integer

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The table style.
Notes: See the style table here to see what constant name has what look:
https://www.libxl.com/table.html
(Read and Write property)

229.13.16 ColumnName(columnIndex as Integer) as String

MBS XL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The unique name of the table column with the specified index.
Notes: Please note that if you write the name of the column with the WriteString in SheetMBS class, the workbook will be corrupted, because the WriteString() doesn't check if the specified cell belongs to a table.
(Read and Write computed property)

Chapter 230

XML

230.1 class XMLAttributeMBS

230.1.1 class XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLAttributeMBS class refers to an attribute of an XML element.
Notes: Typically the allowable values for the attribute are defined in a documenttype definition.
XMLAttributeMBS objects inherit the XMLNodeMBS interface, but since attributes are not actually child nodes of the elements they are associated with, the DOM does not consider them part of the document tree. Thus, the XMLNodeMBS attributes parentNode, previousSibling, and nextSibling have a null value for XMLAttributeMBS objects. The DOM takes the view that attributes are properties of elements rather than having a separate identity from the elements they are associated with; this should make it more efficient to implement such features as default attributes associated with all elements of a given type. Furthermore, attribute nodes may not be immediate children of a DOMDocumentFragment. However, they can be associated with XMLElementMBS nodes contained within a DOMDocumentFragment. In short, users of the DOM need to be aware that XMLAttributeMBS nodes have some things in common with other objects inheriting the XMLNodeMBS interface, but they also are quite distinct.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.1.2 Methods

230.1.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.1.4 Properties

230.1.5 isId as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this attribute is known to be of type ID or not.
Notes: When it is and its value is unique, the ownerElement of this attribute can be retrieved using getElementById on XMLDocumentMBS.
(Read only property)

230.1.6 Name as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the name of this attribute.
Notes: (Read only property)

230.1.7 OwnerElement as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLElementMBS node this attribute is attached to or nil if this attribute is not in use.
Notes: (Read only property)

230.1.8 SchemaTypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type information associated with this attribute.
Notes: the XMLTypeInfoMBS associated with this attribute.
(Read only property)

230.1.9 Specified as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is specified.
Notes: Returns true if the attribute received its value explicitly in the XML document, or if a value was assigned programatically with the setValue function. Returns false if the attribute value came from the default value declared in the document's DTD.
(Read only property)

230.1.10 Value as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the value of the attribute.
Notes: The value of the attribute is returned as a string. Character and general entity references are replaced with their values.

Assign something to set the value of the attribute. A text node with the unparsed contents of the string will be created.
(Read and Write property)

230.2 class XMLCDATASectionMBS

230.2.1 class XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: CDATA sections are used to escape blocks of text containing characters that would otherwise be regarded as markup.
Notes: The only delimiter that is recognized in a CDATA section is the "]] >" string that ends the CDATA section. CDATA sections cannot be nested. Their primary purpose is for including material such as XML fragments, without needing to escape all the delimiters.

The data attribute of the XMLTextMBS node holds the text that is contained by the CDATA section. Note that this may contain characters that need to be escaped outside of CDATA sections and that, depending on the character encoding ("charset") chosen for serialization, it may be impossible to write out some characters as part of a CDATA section.

The XMLCDATASectionMBS interface inherits from the XMLCharacterDataMBS interface through the XMLTextMBS interface. Adjacent XMLCDATASectionMBS nodes are not merged by use of the normalize method of the XMLNodeMBS interface. Because no markup is recognized within a XMLCDATASectionMBS, character numeric references cannot be used as an escape mechanism when serializing. Therefore, action needs to be taken when serializing a XMLCDATASectionMBS with a character encoding where some of the contained characters cannot be represented. Failure to do so would not produce well-formed XML.One potential solution in the serialization process is to end the CDATA section before the character, output the character using a character reference or entity reference, and open a new CDATA section for any further characters in the text node. Note, however, that some code conversion libraries at the time of writing do not return an error or exception when a character is missing from the encoding, making the task of ensuring that data is not corrupted on serialization more difficult.
Subclass of the XMLTextMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.2.2 Methods

230.2.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.3 class XMLCharacterDataMBS

230.3.1 class XMLCharacterDataMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for character data.
Notes: The XMLCharacterDataMBS interface extends XMLNodeMBS with a set of attributes and methods for accessing character data in the DOM. For clarity this set is defined here rather than on each object that uses these attributes and methods. No DOM objects correspond directly to XMLCharacterDataMBS, though XMLTextMBS and others do inherit the interface from it. All offsets in this interface start from 0.

As explained in the DOM spec, text strings in the DOM are represented in UTF-16, i.e. as a sequence of 16-bit units. In the following, the term 16-bit units is used whenever necessary to indicate that indexing on XMLCharacterDataMBS is done in 16-bit units.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.3.2 Methods

230.3.3 appendData(data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Append the string to the end of the character data of the node.
Notes: Upon success, data provides access to the concatenation of data.

230.3.4 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.3.5 deleteData(offset as Integer, count as Integer)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Remove a range of characters from the node.
Notes: Upon success, data and length reflect the change.

offset: The offset from which to remove characters. Zero based.

count: The number of characters to delete.

If the sum of offset and count exceeds length then all characters from offset to the end of the data are deleted.

230.3.6 insertData(offset as Integer, data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Insert a string at the specified character offset.
Notes: offset: The character offset at which to insert. Zero based.

230.3.7 replaceData(offset as Integer, count as Integer, data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replace the characters starting at the specified character offset with the specified string.
Notes: offset: The offset from which to start replacing.
count: The number of characters to replace.

If the sum of offset and count exceeds length, then all characters to the end of the data are replaced (i.e., the effect is the same as a remove method call with the same range, followed by an append method invocation).

230.3.8 substringData(offset as Integer, count as Integer) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extracts a range of data from the node.
Notes: offset: Start offset of substring to extract. Zero based.
count: The number of characters to extract.

The specified substring. If the sum of offset and count exceeds the length, then all characters to the end of the data are returned.

230.3.9 Properties

230.3.10 Data as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The data content.
Notes: Returns the character data of the node that implements this interface.
The DOM implementation may not put arbitrary limits on the amount of data that may be stored in a XMLCharacterDataMBS node. However, implementation limits may mean that the entirety of a node's data may not fit into a single XMLCh* String. In such cases, the user may call substringData to retrieve the data in appropriately sized pieces.

Can be assigned with new data.
(Read and Write property)

230.3.11 Length as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of characters that are available through data and the substringData method below.
Notes: (Read only property)

230.4 class XMLCommentMBS

230.4.1 class XMLCommentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a comment in a xml document.
Notes: This interface inherits from CharacterData and represents the content of a comment, i.e., all the characters between the starting '<!–' and ending '–>'.
Subclass of the XMLCharacterDataMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.4.2 Methods

230.4.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.5 class XMLConfigurationMBS

230.5.1 class XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLConfigurationMBS interface represents the configuration of a document and maintains a table of recognized parameters.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
Var config As XMLConfigurationMBS = serializer.DOMConfig
serializer.NewLine = EndOfLine
config.SpaceFirstLevelElements = False
config.FormatPrettyPrint = True

// and output to string
Var s1 As String = serializer.writeToString(doc)

// options
config.FormatPrettyPrint = False

// and output to string
Var s2 As String = serializer.writeToString(doc)

Break // compare in debugger
```

Notes: Using the configuration, it is possible to change Document.normalizeDocument behavior, such as replacing CDATASection nodes with Text nodes or specifying the type of the schema that must be used when the validation of the Document is requested. XMLConfigurationMBS objects are also used in [DOM Level 3 Load and Save] in the XMLParserMBS and XMLSerializerMBS interfaces.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.5.2 Methods

230.5.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.5.4 Properties

230.5.5 ByteOrderMark as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include byte order mark byte in output.
Notes: (Read and Write property)

230.5.6 CanonicalForm as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to use canonical form.
Notes: true: Canonicalize the document according to the rules specified in [Canonical XML] . Note that this is limited to what can be represented in the DOM. In particular, there is no way to specify the order of the attributes in the DOM.
false: (default) Do not canonicalize the document.
(Read and Write property)

230.5.7 CDataSections as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep CData sections in the document.
Notes: true: (default) Keep CDATASection nodes in the document.
false: Transform CDATASection nodes in the document into Text nodes. The new Text node is then combined with any adjacent Text node.
(Read and Write property)

230.5.8 Comments as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep comments.
Notes: true: (default) Keep Comment nodes in the document.
false: Discard Comment nodes in the Document.
(Read and Write property)

230.5.9 DataTypeNormalization as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Wether to perform data type normalization.
Notes: true: Exposed normalized values in the tree.
false: (default) Do not perform normalization on the tree.
(Read and Write property)

230.5.10 DiscardDefaultContent as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to discard default content.
Notes: true: (default) Use whatever information available to the implementation (i.e. XML schema, DTD, the specified flag on Attr nodes, and so on) to decide what attributes and content should be discarded or not. Note that the specified flag on Attr nodes in itself is not always reliable, it is only reliable when it is set to false since the only case where it can be set to false is if the attribute was created by the implementation. The default content won't be removed if an implementation does not have any information available.
false: Keep all attributes and all content.
(Read and Write property)

230.5.11 elementcontentwhitespace as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep all white spaces.
Example:

```
Var parser As New XMLParserMBS

// configure the parser
Var DOMConfig As XMLConfigurationMBS = p.DOMConfig
DOMConfig.ElementContentWhitespace=False

// prepare XML input
Var Input As New XMLInputMBS
Input.InputString = kXML2

// and parse
Var xml1 As XMLDocumentMBS = p.parse(Input)

Break
```

Notes: true: (default) Keep all white spaces in the document.

false: Discard white space in element content while normalizing. The implementation is expected to use the isWhitespaceInElementContent flag on Text nodes to determine if a text node should be written out or not.
(Read and Write property)

230.5.12 Entities as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Keep entities in the document.
Notes: true: Keep EntityReference and Entity nodes in the document.
false: (default) Remove all EntityReference and Entity nodes from the document, putting the entity expansions directly in their place. Text nodes are into "normal" form. Only EntityReference nodes to non-defined entities are kept in the document.
(Read and Write property)

230.5.13 FormatPrettyPrint as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to pretty print XML.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
Var config As XMLConfigurationMBS = serializer.DOMConfig
serializer.NewLine = EndOfLine
config.SpaceFirstLevelElements = False
config.FormatPrettyPrint = True

// and output to string
Var s1 As String = serializer.writeToString(doc)

// options
config.FormatPrettyPrint = False

// and output to string
Var s2 As String = serializer.writeToString(doc)

Break // compare in debugger
```

Notes: For serializing XML.

Formatting the output by adding whitespace to produce a pretty-printed, indented, human-readable form. The exact form of the transformations is not specified by this specification.
Pretty-printing changes the content of the document and may affect the validity of the document, validating implementations should preserve validity.
(Read and Write property)

230.5.14 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.5.15 ignoreunknowncharacterdenormalizations as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to ignore unknown character normalizations.
Notes: For serializing XML.

If, while verifying full normalization when [XML 1.1] is supported, a character is encountered for which the normalization properties cannot be determined, then raise a "unknown-character-denormalization" warning (instead of raising an error, if this parameter is not set) and ignore any possible denormalizations caused by these characters.

Set to false to report a fatal error if a character is encountered for which the processor cannot determine the normalization properties.
(Read and Write property)

230.5.16 InfoSet as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to only keep the information defined in the XML Information Set.
Notes: true: Only keep in the document the information defined in the XML Information Set [XML Information set] . This forces the following features to false: namespace-declarations, validate-if-schema, entities, datatype-normalization, cdata-sections. This forces the following features to true: whitespace-in-element-content, comments, namespaces. Other features are not changed unless explicitly specified in the description of the features. Note that querying this feature with getFeature returns true only if the individual features

specified above are appropriately set.
false: Setting infoset to false has no effect.
(Read and Write property)

230.5.17 namespacedeclarations as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include namespace declaration attributes.
Notes: true: (default) Include namespace declaration attributes, specified or defaulted from the schema or the DTD, in the document. See also the section Declaring Namespaces in [XML Namespaces] .
false: Discard all namespace declaration attributes. The Namespace prefixes are retained even if this feature is set to false.
(Read and Write property)

230.5.18 NameSpaces as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to do namespace processing.
Notes: true: (default) Perform the namespace processing as defined in [XML Namespaces] .
false: Do not perform the namespace processing.
(Read and Write property)

230.5.19 normalizecharacters as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to do character normalization.
Notes: true: Perform the W3C Text Normalization of the characters [CharModel] in the document.
false: (default) Do not perform character normalization.
(Read and Write property)

230.5.20 SpaceFirstLevelElements as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to space first level elements for pretty print.
Notes: If true, this adds an extra line feed between the elements that are children of the document root.
(Read and Write property)

230.5.21 splitcdatasections as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to split the CData Sections.
Notes: true: (default) Split CDATA sections containing the CDATA section termination marker ']] >'. When a CDATA section is split a warning is issued.
false: Signal an error if a CDATASection contains an unrepresentable character.
(Read and Write property)

230.5.22 Validate as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to validate against a schema.
Notes: true: Require the validation against a schema (i.e. XML schema, DTD, any other type or representation of schema) of the document as it is being normalized as defined by [XML 1.0] . If validation errors are found, or no schema was found, the error handler is notified. Note also that normalized values will not be exposed to the schema in used unless the feature datatype-normalization is true.
Note: validate-if-schema and validate are mutually exclusive, setting one of them to true will set the other one to false.
false: (default) Only XML 1.0 non-validating processing must be done. Note that validation might still happen if validate-if-schema is true.
(Read and Write property)

230.5.23 validateifschema as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to validate only if a declaration for the document element can be found.
Notes: true: Enable validation only if a declaration for the document element can be found (independently of where it is found, i.e. XML schema, DTD, or any other type or representation of schema). If validation errors are found, the error handler is notified. Note also that normalized values will not be exposed to the schema in used unless the feature datatype-normalization is true.
Note: validate-if-schema and validate are mutually exclusive, setting one of them to true will set the other one to false.
false: (default) No validation should be performed if the document has a schema. Note that validation must still happen if validate is true.
(Read and Write property)

230.5.24 xmldeclaration as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include declaration.
Notes: For serializing XML.

If a XMLDocumentMBS, XMLElementMBS, or XMLEntityMBS node is serialized, the XML declaration, or text declaration, should be included. The version (xmlVersion if the document is a Level 3 document and the version is non-null, otherwise use the value "1.0"), and the output encoding (see write methods for details on how to find the output encoding) are specified in the serialized XML declaration.

Do not serialize the XML and text declarations. Report a "xml-declaration-needed" warning if this will cause problems (i.e. the serialized data is of an XML version other than [XML 1.0] , or an encoding would be needed to be able to re-parse the serialized data).
(Read and Write property)

230.6 class XMLDocumentFragmentMBS

230.6.1 class XMLDocumentFragmentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLDocumentFragmentMBS is a "lightweight" or "minimal" XMLDocumentMBS object.
Notes: It is very common to want to be able to extract a portion of a document's tree or to create a new fragment of a document. Imagine implementing a user command like cut or rearranging a document by moving fragments around. It is desirable to have an object which can hold such fragments and it is quite natural to use a XMLNodeMBS for this purpose. While it is true that a XMLDocumentMBS object could fulfill this role, a XMLDocumentMBS object can potentially be a heavyweight object, depending on the underlying implementation. What is really needed for this is a very lightweight object. XMLDocumentFragmentMBS is such an object.

Furthermore, various operations – such as inserting nodes as children of another XMLNodeMBS – may take XMLDocumentFragmentMBS objects as arguments; this results in all the child nodes of the XMLDocumentFragmentMBS being moved to the child list of this node.
The children of a XMLDocumentFragmentMBS node are zero or more nodes representing the tops of any sub-trees defining the structure of the document. XMLDocumentFragmentMBS nodes do not need to be well-formed XML documents (although they do need to follow the rules imposed upon well-formed XML parsed entities, which can have multiple top nodes). For example, a XMLDocumentFragmentMBS might have only one child and that child node could be a XMLTextMBS node. Such a structure model represents neither an HTML document nor a well-formed XML document.

When a XMLDocumentFragmentMBS is inserted into a XMLDocumentMBS (or indeed any other XMLNodeMBS that may take children) the children of the XMLDocumentFragmentMBS and not the XMLDocumentFragmentMBS itself are inserted into the XMLNodeMBS. This makes the XMLDocumentFragmentMBS very useful when the user wishes to create nodes that are siblings; the XMLDocumentFragmentMBS acts as the parent of these nodes so that the user can use the standard methods from the XMLNodeMBS interface, such as insertBefore() and appendChild().
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.6.2 Methods

230.6.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.7 class XMLDocumentMBS

230.7.1 class XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLDocumentMBS interface represents the entire XML document.
Example:

```
// parse it
Var doc as new XMLDocumentMBS("<test id=123>abc</test>")

// and make a string:
Var s as string = doc.toString

Break // see in debugger
```

Notes: Conceptually, it is the root of the document tree, and provides the primary access to the document's data.

Since elements, text nodes, comments, processing instructions, etc. cannot exist outside the context of a XMLDocumentMBS, the XMLDocumentMBS interface also contains the factory methods needed to create these objects. The XMLNodeMBS objects created have a ownerDocument attribute which associates them with the XMLDocumentMBS within whose context they were created.

All methods can raise a XMLExceptionMBS object in case of a problem.
Subclass of the XMLNodeMBS class.

230.7.2 Methods

230.7.3 adoptNode(node as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Changes the ownerDocument of a node, its children, as well as the attached attribute nodes if there are any.
Notes: If the node has a parent it is first removed from its parent child list. This effectively allows moving a subtree from one document to another.
Should not be needed in Xojo apps.

230.7.4 ClearCache

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Frees the node cache for this document.
Notes: You should usually not need to use this method.

230.7.5 Close

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Explicitly close document.
Notes: This frees memory for all nodes and the XML document now.
You should usually not need to use this method.

230.7.6 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor to create a blank document.
Example:

```
// create blank document
Var doc as new XMLDocumentMBS

Var testNode as XMLElementMBS = doc.createElement("test")

System.DebugLog "doc.append"
call doc.appendChild testNode

System.DebugLog "testNode.append"
call testNode.appendChild doc.createTextNode("Hello World")

// and make a string:
Var s as string = doc.toString

Break // see in debugger
```

- 230.7.9 Constructor(file as FolderItem) 24847
- 230.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 24847

230.7.7 Constructor(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience function to parse a document from a memoryblock.
See also:

- 230.7.6 Constructor 24845
- 230.7.8 Constructor(data as String) 24847
- 230.7.9 Constructor(file as FolderItem) 24847
- 230.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 24847

230.7.8 Constructor(data as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience function to parse a document from a string.
Example:

```
// parse it
Var doc as new XMLDocumentMBS("<test id=123>abc</test>")

// and make a string:
Var s as string = doc.toString

Break // see in debugger
```

See also:

- 230.7.7 Constructor(data as MemoryBlock) 24846
- 230.7.9 Constructor(file as FolderItem) 24847
- 230.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 24847

230.7.9 Constructor(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initializes by loading an XML file.
See also:

- 230.7.6 Constructor 24845
- 230.7.7 Constructor(data as MemoryBlock) 24846
- 230.7.8 Constructor(data as String) 24847
- 230.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 24847

230.7.10 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMDocument object of the specified type with its document element.
Notes: namespaceURI: The namespace URI of the document element to create.

qualifiedName: The qualified name of the document element to be created.
DocumentType: The type of document to be created or nil. When doctype is not nil, its ownerDocument attribute is set to the document being created.
See also:

- 230.7.6 Constructor 24845
- 230.7.7 Constructor(data as MemoryBlock) 24846
- 230.7.8 Constructor(data as String) 24847
- 230.7.9 Constructor(file as FolderItem) 24847

230.7.11 Create as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a blank document.
See also:

- 230.7.12 Create(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) as XMLDocumentMBS 24848

230.7.12 Create(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMDocument object of the specified type with its document element.
Notes: namespaceURI: The namespace URI of the document element to create.
qualifiedName: The qualified name of the document element to be created.
DocumentType: The type of document to be created or nil. When doctype is not nil, its ownerDocument attribute is set to the document being created.

Returns a new XMLDocumentMBS object.
See also:

- 230.7.11 Create as XMLDocumentMBS 24848

230.7.13 createAttribute(Name as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an XMLAttributeMBS of the given name.
Notes: Note that the XMLAttributeMBS instance can then be set on an XMLElementMBS using the setAttributeNode method.
To create an attribute with a qualified name and namespace URI, use the

createAttributeNS method.

name: The name of the attribute.

Returns a new XMLAttributeMBS object with the nodeName attribute set to name, and localName, prefix, and namespaceURI set to "". The value of the attribute is the empty string.

230.7.14 createAttributeNS(namespaceURI as String, qualifiedName as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an attribute of the given qualified name and namespace URI.
Notes: namespaceURI: The namespace URI of the attribute to create.
qualifiedName: The qualified name of the attribute to instantiate.

230.7.15 createCDATASection(Data as String) as XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLCDATASectionMBS node whose value is the specified string.

230.7.16 createComment(Text as String) as XMLCommentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMComment node given the specified string.

230.7.17 createDocumentFragment as XMLDocumentFragmentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an empty XMLDocumentFragmentMBS object.

230.7.18 createDocumentType(Name as String, PublicID as String = "", SystemID as String = "") as XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a XMLDocumentTypeMBS node.

230.7.19 createElement(Name as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an element of the type specified.
Example:

```
Var doc As New XMLDocumentMBS

Var testNode As XMLElementMBS = doc.createElement("test")
Call doc.appendChild testNode

MessageBox doc.toString
```

Notes: Note that the instance returned implements the XMLElementMBS interface, so attributes can be specified directly on the returned object.

In addition, if there are known attributes with default values, XMLAttributeMBS nodes representing them are automatically created and attached to the element.

To create an element with a qualified name and namespace URI, use the createElementNS method.
tagName The name of the element type to instantiate. For XML, this is case-sensitive.
A new XMLElementMBS object with the nodeName attribute set to tagName, and localName, prefix, and namespaceURI set to "".

230.7.20 createElementNS(namespaceURI as String, qualifiedName as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an element of the given qualified name and namespace URI.
Notes: namespaceURI: The namespace URI of the element to create.
qualifiedName: The qualified name of the element type to instantiate.

230.7.21 createEntity(Name as String) as XMLEntityMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new entity.

Notes: name: The name of the entity to instantiate.

230.7.22 createEntityReference(Text as String) as XMLEntityReferenceMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an XMLEntityReferenceMBS object.
Notes: In addition, if the referenced entity is known, the child list of the XMLEntityReferenceMBS node is made the same as that of the corresponding XMLEntityMBS node.If any descendant of the XMLEntityMBS node has an unbound namespace prefix, the corresponding descendant of the created XMLEntityReferenceMBS node is also unbound; (its namespaceURI is nil). The DOM Level 2 does not support any mechanism to resolve namespace prefixes.

name: The name of the entity to reference.

Returns the new XMLEntityReferenceMBS object.

230.7.23 createNodeIterator(root as XMLNodeMBS = nil, whatToShow as Integer = &hFFFF, entityReferenceExpansion as boolean = false, filter as XMLNodeFilterMBS = nil) as XMLNodeIteratorMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a NodeIterator object.
Notes: NodeIterators are used to step through a set of nodes, e.g. the set of nodes in a NodeList, the document subtree governed by a particular node, the results of a query, or any other set of nodes. The set of nodes to be iterated is determined by the implementation of the NodeIterator. DOM Level 2 specifies a single NodeIterator implementation for document-order traversal of a document subtree. Instances of these iterators are created by calling createNodeIterator().

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the iterator. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.

root: The root node of the DOM tree
whatToShow: This attribute determines which node types are presented via the iterator.
filter: The filter used to screen nodes .
entityReferenceExpansion: The value of this flag determines whether the children of entity reference nodes are visible to the iterator. If false, they will be skipped over.

230.7.24 createNotation(Name as String) as XMLNotationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a Notation.
Notes: name: The name of the notation to instantiate

Returns a XMLNotationMBS that references the newly created XMLNotationMBS node.

230.7.25 createProcessingInstruction(Target as String, Data as string) as XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLProcessingInstructionMBS node given the specified name and data strings.
Notes: target: The target part of the processing instruction.
data: The data for the node.

230.7.26 createTextNode(Text as String) as XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLTextMBS node given the specified string.
Example:

```
Var doc As New XMLDocumentMBS
Var element As XMLElementMBS = doc.createElement("test")

Call doc.appendChild element
Call element.appendChild doc.createTextNode("Hello World")

MessageBox doc.toString
```

230.7.27 createTreeWalker(root as XMLNodeMBS = nil, whatToShow as Integer = &hFFFF, entityReferenceExpansion as boolean = false, filter as XMLNodeFilterMBS = nil) as XMLTreeWalkerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a TreeWalker object.
Notes: TreeWalker objects are used to navigate a document tree or subtree using the view of the document defined by its whatToShow flags and any filters that are defined for the TreeWalker. Any function which

performs navigation using a TreeWalker will automatically support any view defined by a TreeWalker.

Omitting nodes from the logical view of a subtree can result in a structure that is substantially different from the same subtree in the complete, unfiltered document. Nodes that are siblings in the TreeWalker view may be children of different, widely separated nodes in the original view. For instance, consider a Filter that skips all nodes except for XMLTextMBS nodes and the root node of a document. In the logical view that results, all text nodes will be siblings and appear as direct children of the root node, no matter how deeply nested the structure of the original document.

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the TreeWalker. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false

root: The root node of the DOM tree
whatToShow: This attribute determines which node types are presented via the tree-walker.
filter: The filter used to screen nodes
entityReferenceExpansion: The value of this flag determines whether the children of entity reference nodes are visible to the tree-walker. If false, they will be skipped over.

230.7.28 ElementsByTagName(TagName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an array of all the XMLElementMBS(s) with a given local name and namespace URI in the order in which they are encountered in a preorder traversal of the XMLDocumentMBS tree.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)

Var elements() As XMLElementMBS = doc.ElementsByTagName("f")

Break
```

Notes: TagName: The tag name of the elements to match on. The special value "*" matches all local names.

Returns a new array object containing all the matched XMLElementMBS(s).

230.7.29 ElementsByTagNameNS(namespaceURI as string, localName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an array of all the XMLElementMBS(s) with a given local name and namespace URI in the order in which they are encountered in a preorder traversal of the XMLDocumentMBS tree.
Notes: namespaceURI: The namespace URI of the elements to match on. The special value "*" matches all namespaces.
localName: The local name of the elements to match on. The special value "*" matches all local names.

Returns a new array object containing all the matched XMLElementMBS(s).

230.7.30 evaluate(expression as String, contextNode as XMLNodeMBS, type as Integer) as XMLXPathResultMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Evaluates an XPath expression string and returns a result of the specified type if possible.
Notes: expression: The XPath expression string to be parsed and evaluated.
contextNode: The context is context node for the evaluation of this XPath expression. Must be owned by the same document and must be a XMLDocumentMBS, XMLElementMBS, XMLAttributeMBS, XMLTextMBS, XMLCDATASectionMBS, DOMComment, XMLProcessingInstructionMBS, or XPathNamespace node.
type: If a specific type is specified, then the result will be returned as the corresponding type. This must be one of the codes of the XMLXPathResultMBS clas constants.

Retruns result of the evaluation of the XPath expression as XMLXPathResultMBS class.

Raises exception if the expression is not legal according to the rules of the DOMXPathEvaluator.
Raises exception if the result cannot be converted to return the specified type.

230.7.31 getElementById(elementId as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the XMLElementMBS whose ID is given by elementId.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test id=""1"">abc</test><test id=""2"">def</test></doc>")

// we mark this id attribute to be the id
Var d1 As XMLElementMBS = doc.DocumentElement.FirstElementChild
```

```
Call d1.SetIdAttribute("id", True)

// now search for it
Var element1 As XMLElementMBS = doc.getElementById("1")
Var element2 As XMLElementMBS = doc.getElementById("2") // not marked!

Break
```

Notes: If no such element exists, returns nil.
Behavior is not defined if more than one element has this ID. The DOM implementation must have information that says which attributes are of type ID. Attributes with the name "ID" are not of type ID unless so defined. Implementations that do not know whether attributes are of type ID or not are expected to return nil.

elementId: The unique id value for an element.

Returns the matching element.

230.7.32 importNode(node as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Imports a node from another document by cloning it to the current document.
Notes: You don't need to do this manually as the plugin will do it for you in methods as appendChild, replaceChild and insertBefore.

230.7.33 IterateElementsByTagName(TagName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test id=""1""">abc</test><test id=""2""">def</test></doc>")

For Each e As XMLElementMBS In doc.IterateElementsByTagName("test")
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

230.7.34 IterateElementsByTagNameNS(namespaceURI as string, localName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Notes: For use with For Each Loops in Xojo.

230.7.35 LoadXml(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads XML from data.
Notes: Replaces current document with the new one.
See also:

- 230.7.36 LoadXml(data as String) 24856
- 230.7.37 LoadXml(file as FolderItem) 24856

230.7.36 LoadXml(data as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml from data.
Notes: Replaces current document with the new one.
See also:

- 230.7.35 LoadXml(data as MemoryBlock) 24856
- 230.7.37 LoadXml(file as FolderItem) 24856

230.7.37 LoadXml(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml file.
Notes: Replaces current document with the new one.
This may reference other files in same folder.
See also:

- 230.7.35 LoadXml(data as MemoryBlock) 24856
- 230.7.36 LoadXml(data as String) 24856

230.7.38 LoadXmlMT(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads XML from data.
Notes: Replaces current document with the new one.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 230.7.39 LoadXmlMT(data as String) 24857
- 230.7.40 LoadXmlMT(file as FolderItem) 24857

230.7.39 LoadXmlMT(data as String)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml from data.
Notes: Replaces current document with the new one.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 230.7.38 LoadXmlMT(data as MemoryBlock) 24857
- 230.7.40 LoadXmlMT(file as FolderItem) 24857

230.7.40 LoadXmlMT(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml file.
Notes: Replaces current document with the new one.
This may reference other files in same folder.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 230.7.38 LoadXmlMT(data as MemoryBlock) 24857

- 230.7.39 LoadXmlMT(data as String) 24857

230.7.41 NodeFromHandle(Handle as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a node (or subclass) object based on a handle.
Notes: Raises exception if this handle doesn't belong to this document.

230.7.42 normalizeDocument

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Normalizes the document.
Notes: This method acts as if the document was going through a save and load cycle, putting the document in a "normal" form. The actual result depends on the features being set. See XMLConfigurationMBS for details.

Noticeably this method normalizes XMLTextMBS nodes, makes the document "namespace wellformed", according to the algorithm described below in pseudo code, by adding missing namespace declaration attributes and adding or changing namespace prefixes, updates the replacement tree of XMLEntityReferenceMBS nodes, normalizes attribute values, etc.
Mutation events, when supported, are generated to reflect the changes occurring on the document. Note that this is a partial implementation. Not all the required features are implemented. Currently XMLAttributeMBS and XMLTextMBS nodes are normalized. Features to remove XMLCommentMBS and XMLCDATASectionMBS work.

230.7.43 renameNode(node as XMLNodeMBS, namespaceURI as String, qualifiedName as String) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Rename an existing node.
Notes: When possible this simply changes the name of the given node, otherwise this creates a new node with the specified name and replaces the existing node with the new node as described below. This only applies to nodes of type ELEMENT_NODE and ATTRIBUTE_NODE.

When a new node is created, the following operations are performed: the new node is created, any registered event listener is registered on the new node, any user data attached to the old node is removed from that node, the old node is removed from its parent if it has one, the children are moved to the new node, if the renamed node is an XMLElementMBS its attributes are moved to the new node, the new node is inserted at the position the old node used to have in its parent's child nodes list if it has one, the user data that was attached to the old node is attach to the new node, the user data event NODE_RENAMED is fired.

When the node being renamed is an XMLAttributeMBS that is attached to an XMLElementMBS, the node is first removed from the XMLElementMBS attributes map. Then, once renamed, either by modifying the existing node or creating a new one as described above, it is put back.

node: The node to rename.
namespaceURI: The new namespaceURI.
qualifiedName: The new qualified name.

230.7.44 Properties

230.7.45 DocType as XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the document type.
Notes: The Document Type Declaration (see XMLDocumentTypeMBS) associated with this document. For XML documents without a document type declaration this returns nil.
The DOM Level 2 does not support editing the Document Type Declaration. docType cannot be altered in any way, including through the use of methods inherited from the XMLNodeMBS interface, such as insertNode or removeNode.
(Read only property)

230.7.46 DocumentElement as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a convenience attribute that allows direct access to the child node that is the root element of the document.
Notes: (Read only property)

230.7.47 DocumentURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The location of the document or "" if undefined.
Notes: Beware that when the XMLDocumentMBS supports the feature "HTML" , the href attribute of the HTML BASE element takes precedence over this attribute.
(Read and Write property)

230.7.48 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The configuration used when normalizeDocument is invoked.
Notes: (Read only property)

230.7.49 InputEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input encoding.
Example:

```
Var xml As String

xml = "<?xml version='1.0' encoding='ISO-8859-1'?>" +_
EndOfLine.UNIX +_
"<doc><test>tr√§nen√ºberstr√mt</test></doc>"

// make sure the variable has the encoding declared above!
xml = ConvertEncoding(xml, encodings.ISOLatin1)

Var doc As New XMLDocumentMBS(xml)

MessageBox doc.InputEncoding
```

Notes: An attribute specifying the encoding used for this document at the time of the parsing. This is "" when it is not known, such as when the XMLDocumentMBS was created in memory.
(Read only property)

230.7.50 StrictErrorChecking as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether errors checking is enforced or not
Notes: An attribute specifying whether errors checking is enforced or not. When set to false, the implementation is free to not test every possible error case normally defined on DOM operations, and not raise any XMLExceptionMBS. In case of error, the behavior is undefined. This attribute is true by defaults.
(Read and Write property)

230.7.51 XmlEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the XML declaration, the encoding of this document.
Notes: This is "" when unspecified or when it is not known, such as when the XMLDocumentMBS was created in memory.
(Read only property)

230.7.52 XmlStandalone as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is a standalone document.
Notes: An attribute specifying, as part of the XML declaration, whether this document is standalone. This is false when unspecified.
(Read and Write property)

230.7.53 XmlVersion as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the XML declaration, the version number of this document.
Notes: This is "" when unspecified.
(Read and Write property)

230.7.54 Constants

Show Values

Constant	Value	Description
ShowAll	&hFFFF	Show all XMLNodeMBS(s).
ShowAttribute	2	Show XMLAttributeMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with an attribute node as its root; in this case, it means that the attribute node will appear in the first position of the iteration or traversal. Since attributes are never children of other nodes, they do not appear when traversing over the document tree.
ShowCDataSection	8	Show XMLCDATASectionMBS nodes.
ShowComment	&h80	Show DOMComment nodes.
ShowDocument	&h100	Show XMLDocumentMBS nodes.
ShowDocumentFragment	&h400	Show XMLDocumentFragmentMBS nodes.
ShowDocumentType	&h200	Show XMLDocumentTypeMBS nodes.
ShowElement	1	Show XMLElementMBS nodes.
ShowEntity	&h20	Show XMLEntityMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with an XMLEntityMBS node as its root; in this case, it means that the XMLEntityMBS node will appear in the first position of the traversal. Since entities are not part of the document tree, they do not appear when traversing over the document tree.
ShowEntityReference	&h10	Show XMLEntityReferenceMBS nodes.
ShowNotation	&h800	Show XMLNotationMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with a XMLNotationMBS node as its root; in this case, it means that the XMLNotationMBS node will appear in the first position of the traversal. Since notations are not part of the document tree, they do not appear when traversing over the document tree.
ShowProcessingInstruction	&h40	Show XMLProcessingInstructionMBS nodes.
ShowText	4	Show XMLTextMBS nodes.

230.8 class XMLDocumentTypeMBS

230.8.1 class XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a document type.
Notes: Each XMLDocumentMBS has a doctype attribute whose value is either nil or a XMLDocumentTypeMBS object. The XMLDocumentTypeMBS interface in the DOM Core provides an interface to the list of entities that are defined for the document, and little else because the effect of namespaces and the various XML schema efforts on DTD representation are not clearly understood as of this writing.

The DOM Level 2 doesn't support editing XMLDocumentTypeMBS nodes.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.8.2 Methods

230.8.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.8.4 Entities as XMLEntityMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A array containing the general entities, both external and internal, declared in the DTD. Parameter entities are not contained.
Notes: Duplicates are discarded. For example in: <!DOCTYPE
ex SYSTEM "ex.dtd" [<!ENTITY foo "foo"><!ENTITY bar
"bar"><!ENTITY bar "bar2"><!ENTITY % baz "baz">
] ><ex/>

the interface provides access to foo and the first declaration of bar but not the second declaration of bar or baz. Every node in this map also implements the XMLEntityMBS interface.

The DOM Level 2 does not support editing entities, therefore entities cannot be altered in any way.

230.8.5 Notations as XMLNotationMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries array of notations.
Notes: A named node map containing the notations declared in the DTD. Duplicates are discarded. Every node in this map also implements the XMLNotationMBS interface.

The DOM Level 2 does not support editing notations, therefore notations cannot be altered in any way.

230.8.6 Properties

230.8.7 InternalSubset as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal subset as a string, or empty if there is none.
Notes: This is does not contain the delimiting square brackets.The actual content returned depends on how much information is available to the implementation. This may vary depending on various parameters, including the XML processor used to build the document.
(Read only property)

230.8.8 Name as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of DTD; i.e., the name immediately following the DOCTYPE keyword.
Notes: (Read only property)

230.8.9 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the public identifier of the external subset.
Notes: (Read only property)

230.8.10 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the system identifier of the external subset.
Notes: (Read only property)

230.9 class XMLDOMParserMBS

230.9.1 class XMLDOMParserMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to customize the parser and run it.
Example:

```
Var xml As String = "<test id=""123""></test>"
Var parser As New XMLDOMParserMBS

Parser.ExitOnFirstFatalError = True
parser.DoNamespaces = True
parser.DoSchema = true

// parse it
Var doc As XMLDocumentMBS = Parser.Parse(xml)
// and make a string:
Var s As String = doc.toString

Break
```

Notes: This class wraps XercesDOMParser.

This class implements the Document Object Model (DOM) interface. It should be used by applications which choose to parse and process the XML document using the DOM api's. This implementation also allows the applications to install an error and an entity handler (useful extensions to the DOM specification).

It can be used to instantiate a validating or non-validating parser, by setting a member flag.

230.9.2 Methods

230.9.3 Constructor

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

230.9.4 Parse(data as MemoryBlock) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a XML in MemoryBlock.
Notes: Returns new document on success.
See also:

- 230.9.5 Parse(data as string) as XMLDocumentMBS 24867

230.9.5 Parse(data as string) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a XML string.
Example:

```
Var xml As String = "<test id=""123""></test>"
Var parser As New XMLDOMParserMBS

// parse it
Var doc As XMLDocumentMBS = Parser.Parse(xml)
// and make a string:
Var s As String = doc.toString

Break
```

Notes: Returns new document on success.
See also:

- 230.9.4 Parse(data as MemoryBlock) as XMLDocumentMBS 24867

230.9.6 Reset

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reset the parser.
Notes: This method resets the state of the DOM driver and makes it ready for a fresh parse run.

230.9.7 Properties

230.9.8 CreateEntityReferenceNodes as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'include entity references' flag.
Notes: This method allows the user to specify whether the parser should create entity reference nodes in the DOM tree being produced. When the 'create' flag is true, the parser will create EntityReference nodes in the DOM tree.
The EntityReference nodes and their child nodes will be read-only.
When the 'create' flag is false, no EntityReference nodes will be created.

The replacement text of the entity is included in either case, either as a child of the Entity Reference node or in place at the location of the reference.

The default value is 'true'.
(Read and Write property)

230.9.9 DoNamespaces as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'do namespaces' flag
Notes: This method allows users to enable or disable the parser's namespace processing. When set to true, parser starts enforcing all the constraints and rules specified by the NameSpace specification.

The parser's default state is: false.
(Read and Write property)

230.9.10 DoSchema as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'do schema' flag.
Notes: This method allows users to enable or disable the parser's schema processing. When set to false, parser will not process any schema found.

The parser's default state is: false.

Note: If set to true, namespace processing must also be turned on.
(Read and Write property)

230.9.11 ExitOnFirstFatalError as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'exit on first error' flag.
Notes: This method allows users to set the parser's behaviour when it encounters the first fatal error. If set to true, the parser will exit at the first fatal error. If false, then it will report the error and continue processing.

The default value is 'true' and the parser exits on the first fatal error.
(Read and Write property)

230.9.12 ExternalSchemaLocation as String

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows the user to specify a list of schemas to use.
Notes: If the targetNamespace of a schema specified using this method matches the targetNamespace of a schema occurring in the instance document in the schemaLocation attribute, or if the targetNamespace matches the namespace attribute of the "import" element, the schema specified by the user using this method will be used (i.e., the schemaLocation attribute in the instance document or on the "import" element will be effectively ignored).

The syntax is the same as for schemaLocation attributes in instance documents: e.g, "http://www.example.com file_name.xsd". The user can specify more than one XML Schema in the list.
(Read and Write property)

230.9.13 GenerateSyntheticAnnotations as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'generate synthetic annotations' flag.
Notes: A synthetic XSAnnotation is created when a schema component has non-schema attributes but has no child annotations so that the non-schema attributes can be recovered under PSVI.
(Read and Write property)

230.9.14 Handle as Integer

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.9.15 IdentityConstraintChecking as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows users to enable or disable the parser's identity constraint checks.
Notes: By default, the parser does identity constraint checks.
The default value is true.</p>
(Read and Write property)

230.9.16 IncludeIgnorableWhitespace as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'include ignorable whitespace' flag
Notes: This method allows the user to specify whether a validating parser should include ignorable whitespaces as text nodes. It has no effect on non-validating parsers which always include non-markup text.
When set to true (also the default), ignorable whitespaces will be added to the DOM tree as text nodes. The method DOMText.isIgnorableWhitespace() will return true for those text
nodes only.
When set to false, all ignorable whitespace will be discarded and no text node is added to the DOM tree. Note: applications intended to process the "xml:space" attribute should not set this flag to false.
And this flag also overrides any schema datateye whitespace facets, that is, all ignorable whitespace will be discarded even though 'preserve' is set in schema datatype whitespace facets.
(Read and Write property)

230.9.17 Threaded as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to run Parse threaded.
Notes: If true, the parsing is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
(Read only property)

230.9.18 ValidateAnnotations as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'validlate annotations' flag.
Notes: The value for specifying whether Annotations should be validated or not.
(Read and Write property)

230.9.19 ValidationConstraintFatal as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parser's behaviour when it encounters a validation constraint error.
Notes: If set to true, and the the parser will treat validation error as fatal and will exit depends on the state of "getExitOnFirstFatalError". If false, then it will report the error and continue processing.

Note: setting this true does not mean the validation error will be printed with the word "Fatal Error". It is still printed as "Error", but the parser will exit if "setExitOnFirstFatalError" is set to true.
The default value is 'false'.
(Read and Write property)

230.9.20 ValidationSchemaFullChecking as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows the user to turn full Schema constraint checking on/off.
Notes: Only takes effect if Schema validation is enabled.
If turned off, partial constraint checking is done.

Full schema constraint checking includes those checking that may be time-consuming or memory intensive. Currently, particle unique attribution constraint checking and particle derivation restriction checking are controlled by this option.

The parser's default state is: false.
(Read and Write property)

230.9.21 ValidationScheme as Integer

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The validation scheme to be used by this parser.

Notes: The value is one of the ValSchemes enumerated values defined by this class:

ValidateNever	turn off validation
ValidateAlways	turn on validation
ValidateAuto	turn on validation if any internal/external DTD subset have been seen

The parser's default state is: ValidateNever
(Read and Write property)

230.9.22 Constants

Validation

Constant	Value	Description
ValidateAlways	1	The parser will always report validation errors.
ValidateAuto	2	The parser will report validation errors only if a grammar is specified.
ValidateNever	0	Do not report validation errors.

230.10 class XMLElementMBS

230.10.1 class XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a XML element.
Notes: By far the vast majority of objects (apart from text) that authors encounter when traversing a document are XMLElementMBS nodes.

Assume the following XML document:

<elementExample id="demo">
<subelement1/>
<subelement2><subsubelement/></subelement2>
</elementExample>

When represented using DOM, the top node is an XMLElementMBS node for "elementExample", which contains two child XMLElementMBS nodes, one for "subelement1" and one for "subelement2". "subelement1" contains no child nodes.

Elements may have attributes associated with them; since the XMLElementMBS interface inherits from XMLNodeMBS, the generic XMLNodeMBS interface method getAttributes may be used to retrieve the set of all attributes for an element. There are methods on the XMLElementMBS interface to retrieve either an XMLAttributeMBS object by name or an attribute value by name. In XML, where an attribute value may contain entity references, an XMLAttributeMBS object should be retrieved to examine the possibly fairly complex sub-tree representing the attribute value. On the other hand, in HTML, where all attributes have simple string values, methods to directly access an attribute value can safely be used as a convenience.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 21.2, pages 65 to 69: XML for Beginners, Using XML with the MBS Plugin by Stefanie Juchmes

230.10.2 Methods

230.10.3 AttributeNode(Name as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an XMLAttributeMBS node by name.
Notes: name: The name (nodeName) of the attribute to retrieve.

The XMLAttributeMBS node with the specified name (nodeName) or null if there is no such attribute.

230.10.4 AttributeNodeNS(namespaceURI as string, localName as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an XMLAttributeMBS node by local name and namespace URI.
Notes: namespaceURI: The namespace URI of the attribute to retrieve.
localName: The local name of the attribute to retrieve.

The XMLAttributeMBS node with the specified attribute local name and namespace URI or nil if there is no such attribute.

230.10.5 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.10.6 Element(Index as Integer) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries element with given index.
Notes: Returns nil if index is out of index.

230.10.7 ElementsByTagName(TagName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a DOMNodeList of all descendant elements with a given tag name, in the order in which they would be encountered in a preorder traversal of the XMLElementMBS tree.
Notes: name: The name of the tag to match on. The special value "*" matches all tags.

A list of matching XMLElementMBS nodes.

230.10.8 ElementsByTagNameNS(namespaceURI as string, localName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a nodes of all the DOMElements with a given local name and namespace URI in the order in which they would be encountered in a preorder traversal of the XMLDocumentMBS tree, starting from this node.
Notes: namespaceURI: The namespace URI of the elements to match on. The special value "*" matches all namespaces.
localName: The local name of the elements to match on. The special value "*" matches all local names.

230.10.9 HasAttribute(Name as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether an attribute exists.
Notes: Returns true when an attribute with a given name is specified on this element or has a default value, false otherwise.

name: The name of the attribute to look for.

Returns true if an attribute with the given name is specified on this element or has a default value, false otherwise.

230.10.10 HasAttributeNS(namespaceURI as string, localName as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether an attribute exists.
Notes: Returns true when an attribute with a given local name and namespace URI is specified on this element or has a default value, false otherwise.

namespaceURI: The namespace URI of the attribute to look for.
localName: The local name of the attribute to look for.
true: if an attribute with the given local name and namespace URI is specified or has a default value on this element, false otherwise.

230.10.11 IterateElements as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements.
Example:

```
Var doc As New XMLDocumentMBS("<doc><other>abc</other><test>def</test></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateElements
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

230.10.12 IterateElementsByTagName(TagName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test id=""1""">abc</test><test id=""2""">def</test></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateElementsByTagName("test")
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

230.10.13 IterateElementsByTagNameNS(namespaceURI as string, localName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Notes: For use with For Each Loops in Xojo.

230.10.14 RemoveAttribute(Name as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes an attribute by name.
Example:

```
Var xml As String = "<test>test</test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

DocumentElement.AttributeValue("a") = "123"

MessageBox DocumentElement.toString

DocumentElement.RemoveAttribute("a")

MessageBox DocumentElement.toString
```

Notes: If the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

To remove an attribute by local name and namespace URI, use the removeAttributeNS method.

230.10.15 RemoveAttributeNode(Node as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the specified attribute node.
Notes: If the removed XMLAttributeMBS has a default value it is immediately replaced. The replacing attribute has the same namespace URI and local name, as well as the original prefix, when applicable.

230.10.16 RemoveAttributeNS(namespaceURI as string, localName as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes an attribute by local name and namespace URI.
Notes: If the removed attribute has a default value it is immediately replaced. The replacing attribute has

the same namespace URI and local name, as well as the original prefix.

namespaceURI: The namespace URI of the attribute to remove.
localName: The local name of the attribute to remove.

230.10.17 SetAttributeNode(AttributeNode as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a new attribute.
Notes: If an attribute with that name (nodeName) is already present in the element, it is replaced by the new one.
AttributeNode: The XMLAttributeMBS node to add to the attribute list.
If the AttributeNode attribute replaces an existing attribute, the replaced XMLAttributeMBS node is returned, otherwise null is returned.

If the new attribute is from another document, we clone it first.

230.10.18 SetAttributeNodeNS(AttributeNode as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a new attribute.
Notes: If an attribute with that local name and namespace URI is already present in the element, it is replaced by the new one.

AttributeNode: The XMLAttributeMBS node to add to the attribute list.
If the newAttr attribute replaces an existing attribute with the same local name and namespace URI, the replaced XMLAttributeMBS node is returned, otherwise nil is returned.

If the new attribute is from another document, we clone it first.

230.10.19 SetIdAttribute(name as string, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets ID attribute.
Notes: If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of XMLAttributeMBS::isId and the behavior of ElementById in XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the SchemaTypeInfo XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the

parameter isId to undeclare an attribute for being a user-determined ID attribute. To specify an XMLAttributeMBS by local name and namespace URI, use the setIdAttributeNS method.

name: The name of the XMLAttributeMBS.
isId: Whether the attribute is of type ID.

230.10.20 SetIdAttributeNode(idAttr as XMLAttributeMBS, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the id attribute node.
Notes: If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of isId of XMLAttributeMBS and the behavior of getElementById of XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the SchemaTypeInfo of XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the parameter isId to undeclare an attribute for being a user-determined ID attribute.

idAttr: The XMLAttributeMBS node.
isId: Whether the attribute is of type ID.

If the new attribute is from another document, we clone it first.

230.10.21 SetIdAttributeNS(namespaceURI as string, localName as string, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets id attribute.
Notes: If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of isId of XMLAttributeMBS and the behavior of getElementById of XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the getSchemaTypeInfo of XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the parameter isId to undeclare an attribute for being a user-determined ID attribute.

namespaceURI: The namespace URI of the XMLAttributeMBS.
localName: The local name of the XMLAttributeMBS.
isId: Whether the attribute is of type ID.

230.10.22 Properties

230.10.23 ChildElementCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of child nodes that are of type XMLElementMBS.
Notes: Note: the count is computed every time this function is invoked

The number of XMLElementMBS objects that are direct children of this object (nested elements are not counted), or 0 if there is none.
(Read only property)

230.10.24 FirstElementChild as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The first child of type XMLElementMBS.
Notes: The XMLElementMBS object that is the first element node among the child nodes of this node, or nil if there is none.
(Read only property)

230.10.25 LastElementChild as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last child of type XMLElementMBS.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements backwards, skips e.g. text nodes and comments
Var node As XMLElementMBS = DocumentElement.LastElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousElementSibling
// loop ends when there is no next one
Wend
```

Notes: The XMLElementMBS object that is the last element node among the child nodes of this node, or nil if there is none.
(Read only property)

230.10.26 NextElementSibling as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The next sibling node of type XMLElementMBS.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements skips e.g. text nodes and comments
Var node As XMLElementMBS = DocumentElement.FirstElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextElementSibling
// loop ends when there is no next one
Wend
```

Notes: The XMLElementMBS object that is the next sibling element node in document order, or nil if there is none.
(Read only property)

230.10.27 PreviousElementSibling as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The previous sibling node of type XMLElementMBS.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements backwards, skips e.g. text nodes and comments
Var node As XMLElementMBS = DocumentElement.LastElementChild
While node <>Nil
```

```
// show each child
MessageBox node.toString

node = node.PreviousElementSibling
// loop ends when there is no next one
Wend
```

Notes: The XMLElementMBS object that is the previous sibling element node in document order, or nil if there is none.
(Read only property)

230.10.28 SchemaTypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type information associated with this element.
Notes: (Read only property)

230.10.29 TagName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the element.
Notes: For example, in: <elementExample id="demo">... </elementExample>, tagName has the value "elementExample". Note that this is case-preserving in XML, as are all of the operations of the DOM.
(Read only property)

230.10.30 AttributeValue(Name as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an attribute value by name.
Example:

```
Var doc As New XMLDocumentMBS
Var node As XMLElementMBS = doc.createElement("Hello")

node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

Var attrs() As XMLAttributeMBS = node.AttributeNodes
For Each a As XMLAttributeMBS In attrs
```

MessageBox a.Name+": "+a.Value
Next

Notes: name: The name of the attribute to retrieve.
The XMLAttributeMBS value as a string, or the empty string if that attribute does not have a specified or default value.

If assigned, adds/sets a new attribute.
If an attribute with that name is already present in the element, its value is changed to be that of the value parameter. This value is a simple string, it is not parsed as it is being set. So any markup (such as syntax to be recognized as an entity reference) is treated as literal text, and needs to be appropriately escaped by the implementation when it is written out. In order to assign an attribute value that contains entity references, the user must create an XMLAttributeMBS node plus any XMLTextMBS and XMLEntityReferenceMBS nodes, build the appropriate subtree, and use setAttributeNode to assign it as the value of an attribute.
(Read and Write computed property)

230.10.31 AttributeValueNS(namespaceURI as string, localName as string) as string

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an attribute value by local name and namespace URI.
Notes: namespaceURI The namespace URI of the attribute to retrieve.
localName The local name of the attribute to retrieve.

Returns the XMLAttributeMBS value as a string, or an "" if that attribute does not have a specified or default value.

Adds a new attribute when assigned.
If an attribute with the same local name and namespace URI is already present on the element, its prefix is changed to be the prefix part of the qualifiedName, and its value is changed to be the value parameter. This value is a simple string, it is not parsed as it is being set. So any markup (such as syntax to be recognized as an entity reference) is treated as literal text, and needs to be appropriately escaped by the implementation when it is written out. In order to assign an attribute value that contains entity references, the user must create an XMLAttributeMBS node plus any XMLTextMBS and XMLEntityReferenceMBS nodes, build the appropriate subtree, and use setAttributeNodeNS or setAttributeNode to assign it as the value of an attribute.

namespaceURI: The namespace URI of the attribute to create or alter.
qualifiedName: The qualified name of the attribute to create or alter.
value: The value to set in string form.
(Read and Write computed property)

230.11 class XMLEntityMBS

230.11.1 class XMLEntityMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents an entity, either parsed or unparsed, in an XML document.
Notes: Note that this models the entity itself not the entity declaration. XMLEntityMBS declaration modeling has been left for a later Level of the DOM specification.
The nodeName attribute that is inherited from XMLNodeMBS contains the name of the entity.
An XML processor may choose to completely expand entities before the structure model is passed to the DOM; in this case there will be no XMLEntityReferenceMBS nodes in the document tree.
XML does not mandate that a non-validating XML processor read and process entity declarations made in the external subset or declared in external parameter entities. This means that parsed entities declared in the external subset need not be expanded by some classes of applications, and that the replacement value of the entity may not be available. When the replacement value is available, the corresponding XMLEntityMBS node's child list represents the structure of that replacement text. Otherwise, the child list is empty.
The DOM Level 2 does not support editing XMLEntityMBS nodes; if a user wants to make changes to the contents of an XMLEntityMBS, every related XMLEntityReferenceMBS node has to be replaced in the structure model by a clone of the XMLEntityMBS's contents, and then the desired changes must be made to each of those clones instead. XMLEntityMBS nodes and all their descendants are readonly.
An XMLEntityMBS node does not have any parent.If the entity contains an unbound namespace prefix, the namespaceURI of the corresponding node in the XMLEntityMBS node subtree is null. The same is true for XMLEntityReferenceMBS nodes that refer to this entity, when they are created using the createEntityReference method of the XMLDocumentMBS interface. The DOM Level 2 does not support any mechanism to resolve namespace prefixes.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.11.2 Methods

230.11.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.11.4 Properties

230.11.5 InputEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying the encoding used for this entity at the time of parsing, when it is an

external parsed entity.
Notes: This is empty if it an entity from the internal subset or if it is not known.
(Read only property)

230.11.6 NotationName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: For unparsed entities, the name of the notation for the entity.
Notes: For parsed entities, this is empty.
(Read only property)

230.11.7 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The public identifier associated with the entity, if specified.
Notes: If the public identifier was not specified, this is empty.
(Read only property)

230.11.8 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier associated with the entity, if specified.
Notes: If the system identifier was not specified, this is empty.
(Read only property)

230.11.9 XmlEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the text declaration, the encoding of this entity, when it is an external parsed entity.
Notes: This is empty otherwise.
(Read only property)

230.11.10 XmlVersion as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the text declaration, the version number of this entity, when it is an external parsed entity.
Notes: This is empty otherwise.
(Read only property)

230.12 class XMLEntityReferenceMBS

230.12.1 class XMLEntityReferenceMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an entity reference.
Notes: XMLEntityReferenceMBS objects may be inserted into the structure model when an entity reference is in the source document, or when the user wishes to insert an entity reference. Note that character references and references to predefined entities are considered to be expanded by the HTML or XML processor so that characters are represented by their Unicode equivalent rather than by an entity reference. Moreover, the XML processor may completely expand references to entities while building the structure model, instead of providing XMLEntityReferenceMBS objects. If it does provide such objects, then for a given XMLEntityReferenceMBS node, it may be that there is no XMLEntityMBS node representing the referenced entity. If such an XMLEntityMBS exists, then the subtree of the XMLEntityReferenceMBS node is in general a copy of the XMLEntityMBS node subtree. However, this may not be true when an entity contains an unbound namespace prefix. In such a case, because the namespace prefix resolution depends on where the entity reference is, the descendants of the XMLEntityReferenceMBS node may be bound to different namespace URIs.
As for XMLEntityMBS nodes, XMLEntityReferenceMBS nodes and all their descendants are readonly.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.12.2 Methods

230.12.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.13 class XMLExceptionMBS

230.13.1 class XMLExceptionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for exceptions in the XML world.
Notes: Subclass of the RuntimeException class.

230.14 class XMLInputMBS

230.14.1 class XMLInputMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents a single input source for an XML entity.
Example:

```
Var xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Var parser As New XMLParserMBS
Var doc As XMLDocumentMBS = parser.parse(Input)

// inspect document in debugger
MessageBox doc.toString
```

Notes: This interface allows an application to encapsulate information about an input source in a single object, which may include a public identifier, a system identifier, a byte stream (possibly with a specified encoding), and/or a character stream.

There are two places that the application will deliver this input source to the parser: as the argument to the parse method, or as the return value of the XMLResourceResolverMBS.resolveResource method.

The XMLParserMBS will use the XMLInputMBS object to determine how to read XML input. If there is a character stream available, the parser will read that stream directly; if not, the parser will use a byte stream, if available; if neither a character stream nor a byte stream is available, the parser will attempt to open a URI connection to the resource identified by the system identifier.

A XMLInputMBS object belongs to the application: the parser shall never modify it in any way (it may modify a copy if necessary).

230.14.2 Methods

230.14.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

230.14.4 Properties

230.14.5 BaseURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The base URI to be used for resolving relative URIs to absolute URIs.
Notes: If the baseURI is itself a relative URI, the behavior is implementation dependent.
(Read and Write property)

230.14.6 Encoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The encoding which will be required for use with the XML text read via a stream opened by this input source.
Example:

```
Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = "<test id=""123""></test>"
```

Notes: This is usually not set, allowing the encoding to be sensed in the usual XML way. However, in some cases, the encoding in the file is known to be incorrect because of intermediate transcoding, for instance encapsulation within a MIME document.
(Read and Write property)

230.14.7 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.14.8 InputMemory as MemoryBlock

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input memoryblock.
Notes: (Read and Write property)

230.14.9 InputString as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input string.
Example:

```
Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = "<test id=""123""">Hello</test>"
```

Notes: (Read and Write property)

230.14.10 IssueFatalErrorIfNotFound as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Indicates if the parser should issue fatal error if this input source is not found.
Notes: If set to false, the parser issue warning message instead.
Default: true
(Read and Write property)

230.14.11 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The public identifier for this input source.
Notes: The public identifier is always optional: if the application writer includes one, it will be provided as part of the location information.
(Read and Write property)

230.14.12 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier for this input source.
Notes: The system id is always required. The public id may be used to map to another system id, but the system id must always be present as a fall back.
If the system ID is a URL, it must be fully resolved.
(Read and Write property)

230.15 class XMLIterateAttributeNodesMBS

230.15.1 class XMLIterateAttributeNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the iterator over attribute nodes.
Example:

```
Var doc As New XMLDocumentMBS("<doc id=""123"" value=""test""></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLAttributeMBS In root.IterateAttributeNodes
MessageBox e.Name+": "+e.Value
Next
```

Notes: Used internally for for each loops.

Requires Xojo 2019r2 or newer.

Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Function: The private constructor.

230.15.4 Iterator as Iterator

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the iterator.

230.15.5 MoveNext as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next attribute.
Notes: Returns true on success or false when the iterator has no more elements.

230.15.6 Value as Variant

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.

230.16 class XMLIterateChildNodesMBS

230.16.1 class XMLIterateChildNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the iterator over child nodes.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test>abc</test><test>def</test></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateChildNodes
MessageBox e.toString
Next
```

Notes: Used internally for for each loops.

Requires Xojo 2019r2 or newer.

Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Function: The private constructor.

230.17.4 Iterator as Iterator

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the iterator.

230.17.5 MoveNext as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next element.
Notes: Returns true on success or false when the iterator has no more elements.

230.17.6 Value as Variant

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.

230.18 class XMLNodeFilterMBS

230.18.1 class XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Filters are objects that know how to "filter out" nodes.
Notes: If a XMLNodeIteratorMBS or XMLTreeWalkerMBS is given a XMLNodeFilterMBS, it applies the filter before it returns the next node. If the filter says to accept the node, the traversal logic returns it; otherwise, traversal looks for the next node and pretends that the node that was rejected was not there.

The DOM does not provide any filters. XMLNodeFilterMBS is just an class that users can implement to provide their own filters by filling in the event.

XMLNodeFilterMBSs do not need to know how to traverse from node to node, nor do they need to know anything about the data structure that is being traversed. This makes it very easy to write filters, since the only thing they have to know how to do is evaluate a single node. One filter may be used with a number of different kinds of traversals, encouraging code reuse.

230.18.2 Methods

230.18.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

230.18.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

230.18.5 Events

230.18.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Test whether a specified node is visible in the logical view of a XMLTreeWalkerMBS or XMLNodeIteratorMBS.
Notes: This event will be called by the implementation of XMLTreeWalkerMBS and XMLNodeIteratorMBS; it is not normally called directly from user code. (Though you could do so if you wanted to use the same filter to guide your own application logic.)
node: The node to check to see if it passes the filter or not.

A constant to determine whether the node is accepted, rejected, or skipped, as defined above.

230.18.7 Constants

Filter Results

Constant	Value	Description
FilterAccept	1	Accept the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will return this node.
FilterReject	2	Reject the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For XMLTreeWalkerMBS, the children of this node will also be rejected. XMLNodeIteratorMBSs treat this as a synonym for FilterSkip.
FilterSkip	3	Skip this single node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For both XMLNodeIteratorMBS and XMLTreeWalkerMBS, the children of this node will still be considered.

230.19 class XMLNodeIteratorMBS

230.19.1 class XMLNodeIteratorMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates a list of nodes.
Notes: XMLNodeIteratorMBSs are used to step through a set of nodes, e.g. the set of nodes in a DOMNodeList, the document subtree governed by a particular XMLNodeMBS, the results of a query, or any other set of nodes. The set of nodes to be iterated is determined by the implementation of the XMLNodeIteratorMBS. DOM Level 2 specifies a single XMLNodeIteratorMBS implementation for document-order traversal of a document subtree. Instances of these XMLNodeIteratorMBSs are created by calling createNodeIterator().

Implements Iterable and Iterator interfaces.

This class is hidden for auto complete as you don't need to use it manually. Please use it using for each loops.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- New XML Plugin for Xojo

230.19.2 Methods

230.19.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.19.4 nextNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the next node in the set and advances the position of the XMLNodeIteratorMBS in the set.
Notes: After a XMLNodeIteratorMBS is created, the first call to nextNode() returns the first node in the set.

The next XMLNodeMBS in the set being iterated over, or null if there are no more members in that set. @exception DOMException INVALID_STATE_ERR: Raised if this method is called after the detach method was invoked.

230.19.5 previousNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the previous node in the set and moves the position of the XMLNodeIteratorMBS backwards in the set.
Notes: The previous XMLNodeMBS in the set being iterated over, or null if there are no more members in that set.

230.19.6 Properties

230.19.7 Current as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current node.
Notes: Starts with the root node.
(Read only property)

230.19.8 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The owning document.
Notes: (Read only property)

230.19.9 ExpandEntityReferences as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the expandEntityReferences flag.
Notes: The value of this flag determines whether the children of entity reference nodes are visible to the XMLNodeIteratorMBS. If false, these children and their descendants will be rejected. Note that this rejection takes precedence over whatToShow and the filter. Also note that this is currently the only situation where XMLNodeIteratorMBSs may reject a complete subtree rather than skipping individual nodes.

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the XMLNodeIteratorMBS. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.
(Read only property)

230.19.10 Filter as XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLNodeFilterMBS used to screen nodes.
Notes: (Read only property)

230.19.11 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.19.12 Root as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root node of the XMLNodeIteratorMBS, as specified when it was created.
Notes: (Read only property)

230.19.13 WhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return which node types are presented via the iterator.
Notes: This attribute determines which node types are presented via the XMLNodeIteratorMBS. The available set of constants is defined in the XMLNodeFilterMBS interface. Nodes not accepted by whatToShow will be skipped, but their children may still be considered. Note that this skip takes precedence over the filter, if any.

Default is ShowAll.
(Read only property)

230.20 class XMLNodeMBS

230.20.1 class XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLNodeMBS interface is the primary datatype for the entire Document Object Model.
Notes: It represents a single node in the document tree. While all objects implementing the XMLNodeMBS interface expose methods for dealing with children, not all objects implementing the XMLNodeMBS interface may have children. For example, XMLTextMBS nodes may not have children, and adding children to such nodes results in a XMLExceptionMBS being raised.

The attributes nodeName, nodeValue and attributes are included as a mechanism to get at node information without casting down to the specific derived interface. In cases where there is no obvious mapping of these attributes for a specific nodeType (e.g., nodeValue for an XMLElementMBS or attributes for a XMLCommentMBS), this returns nil. Note that the specialized interfaces may contain additional and more convenient mechanisms to get and set the relevant information.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.20.2 Methods

230.20.3 appendChild(newChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the node newChild to the end of the list of children of this node.
Notes: If the newChild is already in the tree, it is first removed.
newChild The node to add. If it is a XMLDocumentFragmentMBS object, the entire contents of the document fragment are moved into the child list of this node.

If the new node is from another document, we clone it first.

Returns the newly added node.

230.20.4 AttributeNode(Index as Integer) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries attribute node by index.
Notes: Index is zero based up to AttributeCount-1.

230.20.5 AttributeNodes as XMLAttributeMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries an array with all attributes.
Example:

```
Var doc As New XMLDocumentMBS
Var node As XMLElementMBS = doc.createElement("Hello")

// add some attributes
node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

// now show them all in message dialogs
Var attrs() As XMLAttributeMBS = node.AttributeNodes
For Each a As XMLAttributeMBS In attrs
MessageBox a.Name+": "+a.Value
Next
```

Notes: Gets a array containing the attributes of this node (if it is an XMLElementMBS) or null otherwise.

230.20.6 Child(Index as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries child node with given index.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
```

```
Var node As XMLElementMBS = doc.DocumentElement

Var count As Integer = node.ChildCount
Var node0 As XMLNodeMBS = node.Child(0)
Var node1 As XMLNodeMBS = node.Child(1)
Var node2 As XMLNodeMBS = node.Child(2)
Var node3 As XMLNodeMBS = node.Child(3)
'Var node4 As XMLNodeMBS = node.Child(4) // out of bounds exception
Break // see debugger
```

Notes: Index is zero based up to ChildCount-1.

230.20.7 ChildNodes as XMLNodeMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a DOMNodeList that contains all children of this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

Var children() As XMLNodeMBS = DocumentElement.ChildNodes
For Each node As XMLNodeMBS In children
MessageBox node.toString
Next
```

Notes: If there are no children, this is a array containing no nodes.

The array is a static snapshot of the content of the node.

230.20.8 Clone(deep as Boolean) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a duplicate of this node.
Notes: Pass true for deep parameter to copy all sub objects as well.

This function serves as a generic copy constructor for nodes.

The duplicate node has no parent (parentNode returns nil.).

Cloning an XMLElementMBS copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child XMLTextMBS node. Cloning any other type of node simply returns a copy of this node.
deep If true, recursively clone the subtree under the specified node; if false, clone only the node itself (and its attributes, if it is an XMLElementMBS).

230.20.9 compareDocumentPosition(other as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two nodes for their position in the document.
Notes: Compares the reference node, i.e. the node on which this method is being called, with a node, i.e. the one passed as a parameter, with regard to their position in the document and according to the document order.

other: The node to compare against this node.

Returns how the given node is positioned relatively to this node.

230.20.10 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.20.11 insertBefore(newChild as XMLNodeMBS, refChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the node newChild before the existing child node refChild.
Notes: If refChild is nil, insert newChild at the end of the list of children.

If newChild is a XMLDocumentFragmentMBS object, all of its children are inserted, in the same order, before refChild. If the newChild is already in the tree, it is first removed. Note that a XMLNodeMBS that has never been assigned to refer to an actual node is == nil.
newChild The node to insert.

refChild The reference node, i.e., the node before which the new node must be inserted.

If the new node is from another document, we clone it first.

Returns the new node.

230.20.12 isDefaultNamespace(namespaceURI as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method checks if the specified namespaceURI is the default namespace or not.
Notes: namespaceURI: The namespace URI to look for.
Returns true if the specified namespaceURI is the default namespace, false otherwise.

230.20.13 isEqualNode(other as XMLNodeMBS) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tests whether two nodes are equal.
Notes: This method tests for equality of nodes, not sameness (i.e., whether the two nodes are pointers to the same object) which can be tested with XMLNodeMBS::isSameNode. All nodes that are the same will also be equal, though the reverse may not be true.

Two nodes are equal if and only if the following conditions are satisfied: The two nodes are of the same type.The following string attributes are equal: nodeName, localName, namespaceURI, prefix, nodeValue , baseURI. This is: they are both null, or they have the same length and are character for character identical. The attributes node maps are equal. This is: they are both nil, or they have the same length and for each node that exists in one map there is a node that exists in the other map and is equal, although not necessarily at the same index.The childNodes node lists are equal. This is: they are both nil, or they have the same length and contain equal nodes at the same index. This is true for XMLAttributeMBS nodes as for any other type of node. Note that normalization can affect equality; to avoid this, nodes should be normalized before being compared.

For two XMLDocumentTypeMBS nodes to be equal, the following conditions must also be satisfied: The following string attributes are equal: publicId, systemId, internalSubset. The entities node maps are equal. The notations node maps are equal.

On the other hand, the following do not affect equality: the ownerDocument attribute, the specified attribute for XMLAttributeMBS nodes, the isWhitespaceInElementContent attribute for XMLTextMBS nodes, as well as any user data or event listeners registered on the nodes.

other: The node to compare equality with.
If the nodes, and possibly subtrees are equal, true otherwise false.

230.20.14 isSameNode(other as XMLNodeMBS) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this node is the same node as the given one.
Notes: This method provides a way to determine whether two XMLNodeMBS references returned by the implementation reference the same object. When two XMLNodeMBS references are references to the same object, even if through a proxy, the references may be used completely interchangeably, such that all attributes have the same values and calling the same DOM method on either reference always has exactly the same effect.

other: The node to test against.

Returns true if the nodes are the same, false otherwise.

230.20.15 IterateAttributeNodes as XMLIterateAttributeNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the attributes.
Example:

```
Var doc As New XMLDocumentMBS("<doc id=""123"" value=""test""></doc>")

Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLAttributeMBS In root.IterateAttributeNodes
MessageBox e.Name+": "+e.Value
Next
```

Notes: For use with For Each Loops in Xojo.

230.20.16 IterateChildNodes as XMLIterateChildNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the child nodes.
Example:

```
Var doc As New XMLDocumentMBS("<doc><test>abc</test><test>def</test></doc>")
```

```
Var root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateChildNodes
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

230.20.17 lookupNamespaceURI(prefix as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Look up the namespace URI associated to the given prefix, starting from this node.
Notes: The prefix to look for. If this parameter is null, the method will return the default namespace URI if any.
Returns the associated namespace URI or null if none is found.

230.20.18 lookupPrefix(namespaceURI as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Look up the prefix associated to the given namespace URI, starting from this node.
Notes: The default namespace declarations are ignored by this method.

namespaceURI: The namespace URI to look for.

Returns an associated namespace prefix if found, null if none is found. If more than one prefix are associated to the namespace prefix, the returned namespace prefix is implementation dependent.

230.20.19 Normalize

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Normalizes the node tree.
Notes: Puts all XMLTextMBS nodes in the full depth of the sub-tree underneath this XMLNodeMBS, including attribute nodes, into a "normal" form where only markup (e.g., tags, comments, processing instructions, CDATA sections, and entity references) separates XMLTextMBS nodes, i.e., there are neither adjacent XMLTextMBS nodes nor empty XMLTextMBS nodes. This can be used to ensure that the DOM view of a document is the same as if it were saved and re-loaded, and is useful when operations (such as XPointer lookups) that depend on a particular document tree structure are to be used.

Note: In cases where the document contains CDATASections, the normalize operation alone may not be sufficient, since XPointers do not differentiate between XMLTextMBS nodes and XMLCDATASectionMBS nodes.

230.20.20 removeChild(Node as XMLNodeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the child node indicated by oldChild from the list of children.
Notes: Returns the old node.

230.20.21 replaceChild(newChild as XMLNodeMBS, oldChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replaces the child node oldChild with newChild in the list of children, and returns the oldChild node.
Notes: If newChild is a XMLDocumentFragmentMBS object, oldChild is replaced by all of the XMLDocumentFragmentMBS children, which are inserted in the same order.

If the newChild is already in the tree, it is first removed.
newChild The new node to put in the child list.
oldChild The node being replaced in the list.

If the new node is from another document, we clone it first.

Returns the old node.

230.20.22 Properties

230.20.23 AttributeCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of attributes.
Example:

```
Var doc As New XMLDocumentMBS
Var node As XMLElementMBS = doc.createElement("Hello")
```

```
node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

MessageBox node.AttributeCount.ToString // shows 3
```

Notes: (Read only property)

230.20.24 BaseURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The absolute base URI of this node or "" if undefined.
Notes: This value is computed according to. However, when the XMLDocumentMBS supports the feature "HTML" , the base URI is computed using first the value of the href attribute of the HTML BASE element if any, and the value of the documentURI attribute from the XMLDocumentMBS interface otherwise.

When the node is an XMLElementMBS, a XMLDocumentMBS or a a XMLProcessingInstructionMBS, this attribute represents the properties [base URI] defined in . When the node is a XMLNotationMBS, an XMLEntityMBS, or an XMLEntityReferenceMBS, this attribute represents the properties [declaration base URI] .
(Read only property)

230.20.25 ChildCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of child nodes.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var node As XMLElementMBS = doc.DocumentElement

MessageBox node.ChildCount.ToString+" Children"
```

Notes: (Read only property)

230.20.26 FirstChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the first child of this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

Var node As XmlNodeMBS = DocumentElement.FirstChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextSibling
// loop ends when there is no next one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

230.20.27 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.20.28 hasAttributes as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this node (if it is an element) has any attributes.
Notes: Returns true if this node has any attributes, false otherwise.
(Read only property)

230.20.29 hasChildren as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a convenience method to allow easy determination of whether a node has any children.
Example:

```
Var xml As String = "<test>test</test>"
```

```
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

MessageBox "HasChildren: "+DocumentElement.hasChildren.ToString // shows true

DocumentElement.removeChild DocumentElement.FirstChild

MessageBox "HasChildren after removal: "+DocumentElement.hasChildren.ToString // shows false
```

Notes: Returns true if the node has any children, false if the node has no children.
(Read only property)

230.20.30 LastChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the last child of this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// loop over nodes backwards
Var node As XmlNodeMBS = DocumentElement.LastChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousSibling
// loop ends when there is no previous one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

230.20.31 LocalName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the local part of the qualified name of this node.
Notes: For nodes created with a DOM Level 1 method, such as createElement from the XMLDocumentMBS interface, it is "".

(Read only property)

230.20.32 NamespaceURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The namespace URI.
Notes: Get the namespace URI of this node, or "" if it is unspecified.
This is not a computed value that is the result of a namespace lookup based on an examination of the namespace declarations in scope. It is merely the namespace URI given at creation time.

For nodes of any type other than element and attribute and nodes created with a DOM Level 1 method, such as createElement from the XMLDocumentMBS interface, this is always "".
(Read only property)

230.20.33 NextSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the node immediately following this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

Var node As XmlNodeMBS = DocumentElement.FirstChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextSibling
// loop ends when there is no next one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

230.20.34 NodeName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of this node, depending on its type.
Notes: This property can also be used with name "Name".
(Read only property)

230.20.35 NodeType as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type of this node.
Example:

```
Var xml As String = "<test id=""123""></test>"
Var doc As New XMLDocumentMBS(xml)

MessageBox doc.DocumentElement.NodeType.ToString // shows 1 for element
```

Notes: See Type* constants.
(Read only property)

230.20.36 NodeValue as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the value of this node, depending on its type.
Notes: Sets the value of the node.

Any node which can have a nodeValue will also accept requests to set it to a string. The exact response to this varies from node to node – Attribute, for example, stores its values in its children and has to replace them with a new Text holding the replacement value.

For most types of Node, value is null and attempting to set it will throw XMLExceptionMBS. This will also be thrown if the node is read-only.

This property can also be used with name Value.
(Read and Write property)

230.20.37 OwnerDocument as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the XMLDocumentMBS object associated with this node.

Notes: This is also the XMLDocumentMBS object used to create new nodes.
When this node is a XMLDocumentMBS or a XMLDocumentTypeMBS which is not used with any XMLDocumentMBS yet, this is nil.
(Read only property)

230.20.38 ParentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the parent of this node.
Notes: All nodes, except XMLDocumentMBS, XMLDocumentFragmentMBS, and XMLAttributeMBS may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, a null XMLNodeMBS is returned.
(Read only property)

230.20.39 Prefix as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the namespace prefix of this node, or "" if it is unspecified.
Notes: Can be set.
Note that setting this attribute, when permitted, changes the nodeName attribute, which holds the qualified name, as well as the tagName and name attributes of the XMLElementMBS and XMLAttributeMBS interfaces, when applicable.

Note also that changing the prefix of an attribute, that is known to have a default value, does not make a new attribute with the default value and the original prefix appear, since the namespaceURI and localName do not change.
(Read and Write property)

230.20.40 PreviousSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the node immediately preceding this node.
Example:

```
Var xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var doc As New XMLDocumentMBS(xml)
Var DocumentElement As XMLElementMBS = doc.DocumentElement

// loop over nodes backwards
Var node As XmlNodeMBS = DocumentElement.LastChild
```

```
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousSibling
// loop ends when there is no previous one
Wend
```

Notes: If there is no such node, this returns nil.
(Read only property)

230.20.41 ReferenceCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reference count.
Notes: Helps us to debug memory leaks.
(Read only property)

230.20.42 toString as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an UTF-8 encoded text representation of the XML.
Example:

```
Var xml As String = "<test id=""123""></test>"
Var doc As New XMLDocumentMBS(xml)

MessageBox doc.toString
```

Notes: Convenience function to use XMLSerializerMBS class internally.
(Read only property)

230.20.43 Constants

Document Positions

Constant	Value	Description
DocumentPositionContainedBy	16	The node is contained by the reference node. A node which is con always following, too.
DocumentPositionContains	8	The node contains the reference node. A node which contains is alv ceding, too.
DocumentPositionDisconnected	1	The two nodes are disconnected. Order between disconnected nodes implementation-specific.
DocumentPositionFollowing	4	The node follows the reference node.
DocumentPositionImplementationSpecific	32	The determination of preceding versus following is implementation-sp
DocumentPositionPreceding	2	The second node precedes the reference node.

Types

Constant	Value	Description
TypeAttribute	2	Attribute Node
TypeCDataSection	4	CDataSection Node
TypeComment	8	Comment Node
TypeDocument	9	Document Node
TypeDocumentFragment	11	Document Fragment
TypeDocumentType	10	Document Type Node
TypeElement	1	Element Node
TypeEntity	6	Entity Node
TypeEntityReferenceNode	5	Entity Reference Node
TypeNotation	12	Notation Node
TypeProcessingInstruction	7	Processing Instruction Node
TypeText	3	Text Node

230.21 class XMLNotationMBS

230.21.1 class XMLNotationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents a notation declared in the DTD.
Notes: A notation either declares, by name, the format of an unparsed entity (see section 4.7 of the XML 1.0 specification), or is used for formal declaration of Processing Instruction targets (see section 2.6 of the XML 1.0 specification). The nodeName attribute inherited from XMLNodeMBS is set to the declared name of the notation.
The DOM Level 1 does not support editing XMLNotationMBS nodes; they are therefore readonly.
A XMLNotationMBS node does not have any parent.
Subclass of the XMLNodeMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.21.2 Properties

230.21.3 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the public identifier of this notation.
Notes: If the public identifier was not specified, this is "".
(Read only property)

230.21.4 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the system identifier of this notation.
Notes: If the system identifier was not specified, this is "".
(Read only property)

230.22 class XMLOutputMBS

230.22.1 class XMLOutputMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents an output destination for data.
Example:

```
Var output As New XMLOutputMBS
output.Encoding = "UTF-8"

// now pass to write method in XMLSerializerMBS class
```

230.22.2 Methods

230.22.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

230.22.4 Properties

230.22.5 Encoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The encoding which will be required for use with the XML text read via a stream opened by this input source.
Example:

```
Var output As New XMLOutputMBS
output.Encoding = "UTF-8"

// now pass to write method in XMLSerializerMBS class
```

Notes: This is usually not set, allowing the encoding to be sensed in the usual XML way. However, in some cases, the encoding in the file is known to be incorrect because of intermediate transcoding, for instance encapsulation within a MIME document.

Pass the name of the encoding to force, e.g. "UTF-8".
(Read and Write property)

230.22.6 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.22.7 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier for this input source.
Notes: The system id is always required. The public id may be used to map to another system id, but the system id must always be present as a fall back.

If the system ID is a URL, it must be fully resolved.
(Read and Write property)

230.23 class XMLParserFilterMBS

230.23.1 class XMLParserFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XML parser filter class.
Notes: The XMLParserFilterMBS class provide applications the ability to examine nodes as they are being created during the parse process.
And it lets the application decide what nodes should be in the output DOM tree or not.

230.23.2 Methods

230.23.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

230.23.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

230.23.5 Events

230.23.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This eventn will be called by the parser at the completion of the parsing of each node.
Notes: The node and all of its descendants will exist and be complete. The parent node will also exist, although it may be incomplete, i.e. it may have additional children that have not yet been parsed. Attribute nodes are never passed to this function. From within this method, the new node may be freely modified - children may be added or removed, text nodes modified, etc. The state of the rest of the document outside this node is not defined, and the affect of any attempt to navigate to, or to modify any other part of the document is undefined. For validating parsers, the checks are made on the original document, before any modification by the filter. No validity checks are made on any document modifications made by the filter. If this new node is rejected, the parser might reuse the new node and any of its descendants.

node: The newly constructed element. At the time this method is called, the element is complete - it has all of its children (and their children, recursively) and attributes, and is attached as a child to its parent.

Return one of the Filter* constants.

230.23.7 getWhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tells the XMLParserMBS what types of nodes to show to the acceptNode event.
Notes: If a node is not shown to the filter using this attribute, it is automatically included in the DOM document being built. See XMLDocumentMBS for definition of the constants.

230.23.8 startElement(node as XMLElementMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parser will call this method after each XMLElementMBS start tag has been scanned, but before the remainder of the XMLElementMBS is processed.
Notes: The intent is to allow the element, including any children, to be efficiently skipped. Note that only element nodes are passed to the startElement function. The element node passed to startElement for filtering will include all of the attributes, but none of the children nodes. The XMLElementMBS may not yet be in place in the document being constructed (it may not have a parent node.) A startElement filter function may access or change the attributes for the XMLElementMBS. Changing namespace declarations will have no effect on namespace resolution by the parser.

node: The newly encountered element. At the time this method is called, the element is incomplete - it will have its attributes, but no children.

Return one of the Filter* constants.

230.23.9 Constants

Filter Actions

Constant	Value	Description
FilterAccept	1	Accept the node.
FilterInterrupt	4	Interrupt the normal processing of the document.
FilterReject	2	Reject the node and its children.
FilterSkip	3	Skip this single node. The children of this node will still be considered.

230.24 class XMLParserMBS

230.24.1 class XMLParserMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLParserMBS class provides an API for parsing XML documents and building the corresponding DOM document tree.
Example:

```
Var p As New XMLParserMBS
Var f As FolderItem = SpecialFolder.Desktop.Child("test.xml")

Var doc As XMLDocumentMBS = p.parseFile(f)

// inspect document in debugger
MessageBox doc.NodeName
```

Notes: Please note that asynchronous mode is not yet supported in MBS Plugin.
Blog Entries

Xojo Developer Magazine

- 20.6, page 8: News

230.24.2 Methods

230.24.3 abort

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Abort the loading of the document that is currently being loaded by the XMLParserMBS.
Notes: If the XMLParserMBS is currently not busy, a call to this method does nothing.
invoking this method will remove the installed filter

230.24.4 Constructor(Asynchronous as Boolean = false, schemaType as string = "")

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new XMLParserMBS.
Notes: The newly constructed parser may then be configured by means of its XMLConfigurationMBS ob-

ject, and used to parse documents by means of its parse method.

async: The mode argument is either synchronous or asynchronous, if async is true then the XMLParserMBS that is created will operate in synchronous mode, if async is false then the XMLParserMBS that is created will operate in asynchronous mode.

schemaType: An absolute URI representing the type of the schema language used during the load of a XMLDocumentMBS using the newly created XMLParserMBS. Note that no lexical checking is done on the absolute URI. In order to create a XMLParserMBS for any kind of schema types (i.e. the XMLParserMBS will be free to use any schema found), use the value "".

Note: For W3C XML Schema [XML Schema Part 1] , applications must use the value "http://www.w3.org/2001/XMLSchema For XML DTD [XML 1.0] , applications must use the value "http://www.w3.org/TR/REC-xml". Other Schema languages are outside the scope of the W3C and therefore should recommend an absolute URI in order to use this method.

230.24.5 parse(inputSource as XMLInputMBS) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML document from a resource identified by a XMLInputMBS.
Example:

```
Var xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Var parser As New XMLParserMBS
Var doc As XMLDocumentMBS = parser.parse(Input)

// inspect document in debugger
MessageBox doc.toString
```

Notes: The parser owns the returned XMLDocumentMBS. It will be deleted when the parser is released.

source: The XMLInputMBS from which the source of the document is to be read.

If the XMLParserMBS is a synchronous XMLParserMBS the newly created and populated XMLDocumentMBS is returned.
If the XMLParserMBS is asynchronous then nil is returned since the document object may not yet be constructed when this method returns.

230.24.6 parseFile(file as FolderItem) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a file.
Example:

```
Var p As New XMLParserMBS
Var f As FolderItem = SpecialFolder.Desktop.Child("test.xml")

Var doc As XMLDocumentMBS = p.parseFile(f)

// inspect document in debugger
MessageBox doc.NodeName
```

230.24.7 parseURI(URI as String) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML document from a location identified by a URI reference [IETF RFC 2396] .
Notes: If the URI contains a fragment identifier (see section 4.1 in [IETF RFC 2396]), the behavior is not defined by this specification, future versions of this specification may define the behavior.

The parser owns the returned XMLDocumentMBS. It will be deleted when the parser is released.

uri: The location of the XML document to be read (in Unicode)

If the XMLParserMBS is a synchronous XMLParserMBS the newly created and populated XMLDocumentMBS is returned.
If the XMLParserMBS is asynchronous then nil is returned since the document object is not yet parsed when this method returns.

230.24.8 parseWithContext(inputSource as XMLInputMBS, contextNode as XMLNodeMBS, Action as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML fragment from a resource identified by a XMLInputMBS and insert the content into an existing document at the position specified with the context and action arguments.
Example:

```
Var xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Var Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Var parser As New XMLParserMBS

Var doc As New XMLDocumentMBS("", "MyDocument")

// load new test node into the MyDocument
Var newNode As XMLNodeMBS = parser.parseWithContext(Input, doc.DocumentElement, parser.Action-
AppendAsChildren)

// inspect document in debugger
MessageBox doc.toString
```

Notes: When parsing the input stream, the context node (or its parent, depending on where the result will be inserted) is used for resolving unbound namespace prefixes. The context node's ownerDocument node (or the node itself if the node of type document) is used to resolve default attributes and entity references. As the new data is inserted into the document, at least one mutation event is fired per new immediate child or sibling of the context node. If the context node is a XMLDocumentMBS node and the action is ActionReplaceChildren, then the document that is passed as the context node will be changed such that its xmlEncoding, documentURI, xmlVersion, inputEncoding, xmlStandalone, and all other such attributes are set to what they would be set to if the input source was parsed using parse(). This method is always synchronous, even if the XMLParserMBS is asynchronous (when Async() returns true). If an error occurs while parsing, the caller is notified through the ErrorHandler instance associated with the "error-handler" parameter of the XMLConfigurationMBS. When calling parseWithContext, the values of the following configuration parameters will be ignored and their default values will always be used instead: "validate", "validate-if-schema" "element-content-whitespace". Other parameters will be treated normally, and the parser is expected to call the XMLParserMBSFilter just as if a whole document was parsed.

source: The XMLInputMBS from which the source document is to be read. The source document must be an XML fragment, i.e. anything except a complete XML document (except in the case where the context node of type DOCUMENT_NODE, and the action is ActionReplaceChildren), a DOCTYPE (internal subset), entity declaration(s), notation declaration(s), or XML or text declaration(s).

contextNode: The node that is used as the context for the data that is being parsed. This node must be a XMLDocumentMBS node, a XMLDocumentFragmentMBS node, or a node of a type that is allowed as a child of an XMLElementMBS node, e.g. it cannot be an XMLAttributeMBS node.

action: This parameter describes which action should be taken between the new set of nodes being inserted and the existing children of the context node. The set of possible actions is defined in action constants.

Return the node that is the result of the parse operation. If the result is more than one top-level node, the

first one is returned.

230.24.9 resetCachedGrammarPool

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clear the cached grammar pool.

230.24.10 resetDocumentPool

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reset the documents vector pool and release all the associated memory back to the system.
Notes: When parsing a document using a DOM parser, all memory allocated for a DOM tree is associated to the DOM document.

If you do multiple parse using the same DOM parser instance, then multiple DOM documents will be generated and saved in a vector pool. All these documents (and thus all the allocated memory) won't be deleted until the parser instance is destroyed.

If you don't need these DOM documents anymore and don't want to destroy the DOM parser instance at this moment, then you can call this method to reset the document vector pool and release all the allocated memory back to the system.

It is an error to call this method if you are in the middle of a parse (e.g. in the mid of a progressive parse).

230.24.11 URIText(ID as Integer) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the string corresponding to a URI id from the URI string pool.
Notes: ID: id of the string in the URI string pool.

Returns the URI string corresponding to the URI id.

230.24.12 Properties

230.24.13 Asynchronous as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return whether the parser is asynchronous.
Notes: Value is true if the XMLParserMBS is asynchronous and false if it is synchronous.
(Read only property)

230.24.14 Busy as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return whether the parser is busy parsing.
Notes: Value is true if the XMLParserMBS is currently busy loading a document, otherwise false.
(Read only property)

230.24.15 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get a pointer to the XMLConfigurationMBS object used when parsing an input source.
Example:

```
Var parser As New XMLParserMBS

// configure the parser
Var DOMConfig As XMLConfigurationMBS = p.DOMConfig
DOMConfig.ElementContentWhitespace=False

// prepare XML input
Var Input As New XMLInputMBS
Input.InputString = kXML2

// and parse
Var xml1 As XMLDocumentMBS = p.parse(Input)

Break
```

Notes: This XMLConfigurationMBS is specific to the parse operation.
No parameter values from this XMLConfigurationMBS object are passed automatically to the XMLConfigurationMBS object on the XMLDocumentMBS that is created, or used, by the parse operation. The DOM application is responsible for passing any needed parameter values from this XMLConfigurationMBS object

to the XMLConfigurationMBS object referenced by the XMLDocumentMBS object.
(Read only property)

230.24.16 Filter as XMLParserFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parse filter.
Notes: When the application provides a filter, the parser will call out to the filter at the completion of the construction of each XMLElementMBS node. The filter implementation can choose to remove the element from the document being constructed or to terminate the parse early. The filter is invoked after the operations requested by the XMLConfigurationMBS parameters have been applied. For example, if "validate" is set to true, the validation is done before invoking the filter.

Currently filter can only work in synchronous mode.
(Read and Write property)

230.24.17 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.24.18 SrcOffset as Int64

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the current src offset within the input source.
Notes: (Read only property)

230.24.19 Constants

Actions

Constant	Value	Description
ActionAppendAsChildren	1	Append the result of the parse operation as children of the context node. For this action to work, the context node must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionInsertAfter	4	Insert the result of the parse operation as the immediately following sibling of the context node. For this action to work the context node's parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionInsertBefore	3	Insert the result of the parse operation as the immediately preceding sibling of the context node. For this action to work the context node's parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionReplace	5	Replace the context node with the result of the parse operation. For this action to work, the context node must have a parent, and the parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.
ActionReplaceChildren	2	Replace all the children of the context node with the result of the parse operation. For this action to work, the context node must be a XMLElementMBS, a XMLDocumentMBS, or a XMLDocumentFragmentMBS.

230.25 class XMLProcessingInstructionMBS

230.25.1 class XMLProcessingInstructionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The DOMProcessingInstruction interface represents a "processing instruction", used in XML as a way to keep processor-specific information in the text of the document.
Notes: Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.25.2 Methods

230.25.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.25.4 Properties

230.25.5 Data as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content of this processing instruction.
Notes: This is from the first non white space character after the target to the character immediately preceding the ?<.

Can be set to put in new instruction.
(Read and Write property)

230.25.6 Target as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The target of this processing instruction.
Notes: XML defines this as being the first token following the markup that begins the processing instruction.
(Read only property)

230.26 class XMLSerializerFilterMBS

230.26.1 class XMLSerializerFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLSerializerMBSFilter provide applications the ability to examine nodes as they are being serialized.
Notes: XMLSerializerMBSFilter lets the application decide what nodes should be serialized or not.
The XMLDocumentMBS, XMLDocumentTypeMBS, XMLNotationMBS, and XMLEntityMBS nodes are not passed to the filter.

230.26.2 Methods

230.26.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

230.26.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

230.26.5 Events

230.26.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Test whether a specified node is visible in the logical view of a XMLTreeWalkerMBS or XMLNodeIteratorMBS.
Notes: This event will be called by the implementation of XMLTreeWalkerMBS and XMLNodeIteratorMBS; it is not normally called directly from user code. (Though you could do so if you wanted to use the same filter to guide your own application logic.)
node: The node to check to see if it passes the filter or not.

A constant to determine whether the node is accepted, rejected, or skipped, as defined above.

230.26.7 getWhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tells the XMLSerializerMBS what types of nodes to show to the filter.
Notes: See XMLNodeFilterMBS for definition of the constants. The constant SHOW_ATTRIBUTE is meaningless here, attribute nodes will never be passed to a XMLSerializerMBSFilter.

The constants of what types of nodes to show.
Default is ShowAll if event is not implemented.

230.26.8 Constants

Filter Results

Constant	Value	Description
FilterAccept	1	Accept the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will return this node.
FilterReject	2	Reject the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For XMLTreeWalkerMBS, the children of this node will also be rejected. XMLNodeIteratorMBSs treat this as a synonym for FilterSkip.
FilterSkip	3	Skip this single node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For both XMLNodeIteratorMBS and XMLTreeWalkerMBS, the children of this node will still be considered.

230.27 class XMLSerializerMBS

230.27.1 class XMLSerializerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLSerializerMBS provides an API for serializing (writing) a DOM document out in an XML document.
Notes: The XML data is written to an output stream, the type of which depends on the specific language bindings in use. During serialization of XML data, namespace fixup is done when possible.

XMLSerializerMBS accepts any node type for serialization. For nodes of type Document or Entity, well formed XML will be created if possible. The serialized output for these node types is either as a Document or an External Entity, respectively, and is acceptable input for an XML parser. For all other types of nodes the serialized form is not specified, but should be something useful to a human for debugging or diagnostic purposes. Note: rigorously designing an external (source) form for stand-alone node types that don't already have one defined in seems a bit much to take on here.
Within a Document or Entity being serialized, Nodes are processed as follows Documents are written including an XML declaration and a DTD subset, if one exists in the DOM. Writing a document node serializes the entire document. Entity nodes, when written directly by write defined in the XMLSerializerMBS interface, output the entity expansion but no namespace fixup is done. The resulting output will be valid as an external entity. Entity References nodes are serializes as an entity reference of the form "&entityName;") in the output. Child nodes (the expansion) of the entity reference are ignored. CDATA sections containing content characters that can not be represented in the specified output encoding are handled according to the "split-cdata-sections" feature.If the feature is true, CDATA sections are split, and the unrepresentable characters are serialized as numeric character references in ordinary content. The exact position and number of splits is not specified. If the feature is false, unrepresentable characters in a CDATA section are reported as errors. The error is not recoverable - there is no mechanism for supplying alternative characters and continuing with the serialization. All other node types (XMLElementMBS, XMLTextMBS, etc.) are serialized to their corresponding XML source form.

Within the character data of a document (outside of markup), any characters that cannot be represented directly are replaced with character references. Occurrences of '<' and '&' are replaced by the predefined entities < and &. The other predefined entities (>, ', etc.) are not used; these characters can be included directly. Any character that can not be represented directly in the output character encoding is serialized as a numeric character reference.

Attributes not containing quotes are serialized in quotes. Attributes containing quotes but no apostrophes are serialized in apostrophes (single quotes). Attributes containing both forms of quotes are serialized in quotes, with quotes within the value represented by the predefined entity ". Any character that can not be represented directly in the output character encoding is serialized as a numeric character reference.

Within markup, but outside of attributes, any occurrence of a character that cannot be represented in the output character encoding is reported as an error. An example would be serializing the element with the encoding="us-ascii".

When requested by setting the normalize-characters feature on XMLSerializerMBS, all data to be serialized, both markup and character data, is W3C Text normalized according to the rules defined in . The W3C Text normalization process affects only the data as it is being written; it does not alter the DOM's view of the document after serialization has completed.
Namespaces are fixed up during serialization, the serialization process will verify that namespace declarations, namespace prefixes and the namespace URIs associated with Elements and Attributes are consistent. If inconsistencies are found, the serialized form of the document will be altered to remove them. The algorithm used for doing the namespace fixup while seralizing a document is a combination of the algorithms used for lookupNamespaceURI and lookupPrefix. previous paragraph to be defined closer here.
Any changes made affect only the namespace prefixes and declarations appearing in the serialized data. The DOM's view of the document is not altered by the serialization operation, and does not reflect any changes made to namespace declarations or prefixes in the serialized output.
While serializing a document the serializer will write out non-specified values (such as attributes whose specified is false) if the output-default-values feature is set to true. If the output-default-values flag is set to false and the use-abstract-schema feature is set to true the abstract schema will be used to determine if a value is specified or not, if use-abstract-schema is not set the specified flag on attribute nodes is used to determine if attribute values should be written out.
Ref to Core spec (1.1.9, XML namespaces, 5th paragraph) entity ref description about warning about unbound entity refs. Entity refs are always serialized as &foo;, also mention this in the load part of this spec.
When serializing a document the XMLSerializerMBS checks to see if the document element in the document is a DOM Level 1 element or a DOM Level 2 (or higher) element (this check is done by looking at the localName of the root element). If the root element is a DOM Level 1 element then the XMLSerializerMBS will issue an error if a DOM Level 2 (or higher) element is found while serializing. Likewise if the document element is a DOM Level 2 (or higher) element and the XMLSerializerMBS sees a DOM Level 1 element an error is issued. Mixing DOM Level 1 elements with DOM Level 2 (or higher) is not supported.
XMLSerializerMBSs have a number of named features that can be queried or set. The name of XMLSerializerMBS features must be valid XML names. Implementation specific features (extensions) should choose an implementation dependent prefix to avoid name collisions.
Here is a list of properties that must be recognized by all implementations.

"normalize-characters"

true: [optional] (default) Perform the W3C Text Normalization of the characters in document as they are written out. Only the characters being written are (potentially) altered. The DOM document itself is unchanged.
false: [required] do not perform character normalization.

"split-cdata-sections"

true: [required] (default) Split CDATA sections containing the CDATA section termination marker ']] >' or characters that can not be represented in the output encoding, and output the characters using numeric character references. If a CDATA section is split a warning is issued.
false: [required] Signal an error if a CDATASection contains an unrepresentable character.

"validation"

true: [optional] Use the abstract schema to validate the document as it is being serialized. If validation errors are found the error handler is notified about the error. Setting this state will also set the feature use-abstract-schema to true.
false: [required] (default) Don't validate the document as it is being serialized.

"expand-entity-references"

true: [optional] Expand EntityReference nodes when serializing.
false: [required] (default) Serialize all EntityReference nodes as XML entity references.

"whitespace-in-element-content"

true: [required] (default) Output all white spaces in the document.
false: [optional] Only output white space that is not within element content. The implementation is expected to use the isWhitespaceInElementContent flag on Text nodes to determine if a text node should be written out or not.

"discard-default-content"

true: [required] (default) Use whatever information available to the implementation (i.e. XML schema, DTD, the specified flag on Attr nodes, and so on) to decide what attributes and content should be serialized or not. Note that the specified flag on Attr nodes in itself is not always reliable, it is only reliable when it is set to false since the only case where it can be set to false is if the attribute was created by a Level 1 implementation.
false: [required] Output all attributes and all content.

"format-canonical"

true: [optional] This formatting writes the document according to the rules specified in . Setting this feature to true will set the feature "format-pretty-print" to false.
false: [required] (default) Don't canonicalize the output.

"format-pretty-print"

true: [optional] Formatting the output by adding whitespace to produce a pretty-printed, indented, human-readable form. The exact form of the transformations is not specified by this specification. Setting this feature to true will set the feature "format-canonical" to false.
false: [required] (default) Don't pretty-print the result.

"byte-order-mark"

false: [optional] (default) Setting this feature to true will output the correct BOM for the specified encoding.
true: [required] Don't generate a BOM.

"space-first-level-elements"

true: [optional] (default) Setting this feature to true will add an extra line feed between the elements that are children of the document root.
false: [required] Don't add the extra line feed.

- MBS Xojo Plugins, version 24.2pr1

230.27.2 Methods

230.27.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

230.27.4 writeToBuffer(Node as XMLNodeMBS, output as XMLOutputMBS) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
serializer.NewLine = EndOfLine.macOS

Var output As New XMLOutputMBS
output.Encoding = "UTF-8"

// and output to string
Var s As String = serializer.writeToBuffer(doc, output)
```

Notes: Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
output: The output for the data to be written.

Returns XML if node was successfully serialized and false in case a failure occured and the failure wasn't canceled by the error handler.

We internally create a memory buffer to output to and return you the output.

230.27.5 writeToFile(Node as XMLNodeMBS, File as FolderItem) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

Var file As FolderItem = SpecialFolder.Desktop.Child("test.xml")

// and output to string
Var r As Boolean = serializer.writeToFile(doc, file)
```

Notes: Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
uri: The destination for the data to be written.

Returns true if node was successfully serialized and false in case a failure occured and the failure wasn't canceled by the error handler.

230.27.6 writeToString(Node as XMLNodeMBS) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Serialize the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

// options
serializer.NewLine = EndOfLine.macOS

// and output to string
Var s As String = serializer.writeToString(doc)
```

Notes: The result of serializing the node is returned as a string. Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The node to be written.

Returns the serialized data, or "" in case a failure occured and the failure wasn't canceled by the error handler. The returned string is always marked as UTF-16.

230.27.7 writeToURI(Node as XMLNodeMBS, URI as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Var doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Var serializer As New XMLSerializerMBS

Var file As FolderItem = SpecialFolder.Desktop.Child("test.xml")

// and output to string
```

Var r As Boolean = serializer.writeToURI(doc, file.NativePath)

Notes: Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
uri: The destination for the data to be written.

Returns true if node was successfully serialized and false in case a failure occured and the failure wasn't canceled by the error handler.

230.27.8 Properties

230.27.9 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLConfigurationMBS object used by the Serializer when serializing a DOM node.
Notes: (Read only property)

230.27.10 Filter as XMLSerializerFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The filter to decide which elements to output.
Notes: When the application provides a filter, the serializer will call out to the filter before serializing each Node. Attribute nodes are never passed to the filter. The filter implementation can choose to remove the node from the stream or to terminate the serialization early.

filter: The writer filter to be used.
(Read and Write property)

230.27.11 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.27.12 NewLine as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The end-of-line sequence of characters to be used in the XML being written out.
Notes: The only permitted values are these: ""
Use a default end-of-line sequence. DOM implementations should choose the default to match the usual convention for text files in the environment being used. Implementations must choose a default sequence that matches one of those allowed by 2.11 "End-of-Line Handling". However, Xerces-C++ always uses LF when this property is set to nil since otherwise automatic translation of LF to CR-LF on Windows for text files would result in such files containing CR-CR-LF. If you need Windows-style end of line sequences in your output, consider writing to a file opened in text mode or explicitly set this property to CR-LF.

The default value for this attribute is "" to use default.
(Read and Write property)

230.28 class XMLTextMBS

230.28.1 class XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a piece of XML text.
Notes: The XMLTextMBS interface inherits from XMLCharacterDataMBS and represents the textual content (termed character data in XML) of an XMLElementMBS or XMLAttributeMBS. If there is no markup inside an element's content, the text is contained in a single object implementing the XMLTextMBS interface that is the only child of the element. If there is markup, it is parsed into the information items (elements, comments, etc.) and XMLTextMBS nodes that form the list of children of the element.

When a document is first made available via the DOM, there is only one XMLTextMBS node for each block of text. Users may create adjacent XMLTextMBS nodes that represent the contents of a given element without any intervening markup, but should be aware that there is no way to represent the separations between these nodes in XML or HTML, so they will not (in general) persist between DOM editing sessions. The normalize() method on XMLNodeMBS merges any such adjacent XMLTextMBS objects into a single node for each block of text.
Subclass of the XMLCharacterDataMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 21.2, pages 68 to 69: XML for Beginners, Using XML with the MBS Plugin by Stefanie Juchmes

230.28.2 Methods

230.28.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.28.4 splitText(Offset as Integer) as XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Breaks this node into two nodes at the specified offset, keeping both in the tree as siblings.
Notes: After being split, this node will contain all the content up to the offset point. A new node of the same type, which contains all the content at and after the offset point, is returned. If the original node had a parent node, the new node is inserted as the next sibling of the original node. When the offset is equal to the length of this node, the new node has no data.
offset: The 16-bit unit offset at which to split, starting from 0.

Returns the new node, of the same type as this node.

Raises exception in case of error.

230.28.5 Properties

230.28.6 IsElementContentWhitespace as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this text node contains element content whitespace, often abusively called "ignorable whitespace".
Notes: The text node is determined to contain whitespace in element content during the load of the document or if validation occurs while using normalizeDocument().
(Read only property)

230.28.7 WholeText as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns all text of DOMText nodes logically-adjacent text nodes to this node, concatenated in document order.
Notes: When assigned, substitutes the a specified text for the text of the current node and all logically-adjacent text nodes.
(Read and Write property)

230.29 class XMLTreeWalkerMBS

230.29.1 class XMLTreeWalkerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allows you to walk over a xml tree.
Notes: XMLTreeWalkerMBS objects are used to navigate a document tree or subtree using the view of the document defined by their whatToShow flags and filter (if any). Any function which performs navigation using a XMLTreeWalkerMBS will automatically support any view defined by a XMLTreeWalkerMBS.
Omitting nodes from the logical view of a subtree can result in a structure that is substantially different from the same subtree in the complete, unfiltered document. Nodes that are siblings in the XMLTreeWalkerMBS view may be children of different, widely separated nodes in the original view. For instance, consider a XMLNodeFilterMBS that skips all nodes except for XMLTextMBS nodes and the root node of a document. In the logical view that results, all text nodes will be siblings and appear as direct children of the root node, no matter how deeply nested the structure of the original document.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins in version 22.4
- New XML Plugin for Xojo

Xojo Developer Magazine

- 20.6, page 9: News

230.29.2 Methods

230.29.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.29.4 firstChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the first visible child of the current node, and returns the new node.
Notes: If the current node has no visible children, returns null, and retains the current node.
The new node, or null if the current node has no visible children in the XMLTreeWalkerMBS's logical view.

230.29.5 lastChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the last visible child of the current node, and returns the new node.
Notes: If the current node has no visible children, returns null, and retains the current node.
The new node, or null if the current node has no children in the XMLTreeWalkerMBS's logical view.

230.29.6 nextNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the next visible node in document order relative to the current node, and returns the new node.
Notes: If the current node has no next node, or if the search for nextNode attempts to step upward from the XMLTreeWalkerMBS's root node, returns null, and retains the current node.
The new node, or null if the current node has no next node in the XMLTreeWalkerMBS's logical view.

230.29.7 nextSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the next sibling of the current node, and returns the new node.
Notes: If the current node has no visible next sibling, returns null, and retains the current node.
The new node, or null if the current node has no next sibling. in the XMLTreeWalkerMBS's logical view.

230.29.8 ParentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to and returns the closest visible ancestor node of the current node.
Notes: If the search for parentNode attempts to step upward from the XMLTreeWalkerMBS's root node, or if it fails to find a visible ancestor node, this method retains the current position and returns null.
The new parent node, or null if the current node has no parent in the XMLTreeWalkerMBS's logical view.

230.29.9 previousNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the previous visible node in document order relative to the current node, and returns the new node.
Notes: If the current node has no previous node, or if the search for previousNode attempts to step upward from the XMLTreeWalkerMBS's root node, returns null, and retains the current node.
The new node, or null if the current node has no previous node in the XMLTreeWalkerMBS's logical view.

230.29.10 previousSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the previous sibling of the current node, and returns the new node.
Notes: If the current node has no visible previous sibling, returns null, and retains the current node.
The new node, or null if the current node has no previous sibling. in the XMLTreeWalkerMBS's logical view.

230.29.11 Properties

230.29.12 CurrentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the node at which the XMLTreeWalkerMBS is currently positioned.
Notes: Can be assigned to move:
The node at which the XMLTreeWalkerMBS is currently positioned.
Alterations to the DOM tree may cause the current node to no longer be accepted by the XMLTreeWalkerMBS's associated filter. currentNode may also be explicitly set to any node, whether or not it is within the subtree specified by the root node or would be accepted by the filter and whatToShow flags. Further traversal occurs relative to currentNode even if it is not part of the current view, by applying the filters in the requested direction; if no traversal is possible, currentNode is not changed.
(Read and Write property)

230.29.13 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The owning document.
Notes: (Read only property)

230.29.14 ExpandEntityReferences as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The value of this flag determines whether the children of entity reference nodes are visible to the XMLTreeWalkerMBS.
Notes: If false, these children and their descendants will be rejected. Note that this rejection takes precedence over whatToShow and the filter, if any.
To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the XMLTreeWalkerMBS. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.
(Read only property)

230.29.15 Filter as XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The filter used to screen nodes.
Notes: (Read only property)

230.29.16 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.29.17 Root as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root node of the DOMTreeWalker, as specified when it was created.
Notes: (Read only property)

230.29.18 WhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This attribute determines which node types are presented via the DOMTreeWalker.
Notes: The available set of constants is defined in the DOMNodeFilter interface. Nodes not accepted by whatToShow will be skipped, but their children may still be considered. Note that this skip takes precedence over the filter, if any.
Default is ShowAll.

(Read only property)

230.30 class XMLTypeInfoMBS

230.30.1 class XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLTypeInfoMBS interface represent a type used by XMLElementMBS or XMLAttributeMBS nodes, specified in the schemas associated with the document.
Notes: The type is a pair of a namespace URI and name properties, and depends on the document's schema. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.30.2 Methods

230.30.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.30.4 isDerivedFrom(typeNamespaceArg as String, typeNameArg as String, derivationMethod as Integer) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method returns if there is a derivation between the reference type definition, i.e. the XMLTypeInfoMBS on which the method is being called, and the other type definition, i.e. the one passed as parameters.
Notes: typeNamespaceArg: The namespace of the other type definition.
typeNameArg: The name of the other type definition.
derivationMethod: The type of derivation and conditions applied between two types, as described in the list of constants provided in this interface.

If the document's schema is a DTD or no schema is associated with the document, this method will always return false.
If the document's schema is an XML Schema, the method will true if the reference type definition is derived from the other type definition according to the derivation parameter. If the value of the parameter is 0 (no bit is set to 1 for the derivationMethod parameter), the method will return true if the other type definition can be reached by recursing any combination of { base type definition } , { item type definition } , or { member type definitions } from the reference type definition.

230.30.5 Properties

230.30.6 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

230.30.7 TypeName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns The name of a type declared for the associated XMLElementMBS or XMLAttributeMBS, or "" if unknown.
Notes: (Read only property)

230.30.8 TypeNamespace as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The namespace of the type declared for the associated XMLElementMBS or XMLAttributeMBS or "" if the XMLElementMBS does not have declaration or if no namespace information is available.
Notes: (Read only property)

230.30.9 Constants

DerivationMethods

Constant	Value	Description
DerivationExtension	2	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the derivation by extension. The reference type definition is derived by extension from the other type definition if the other type definition can be reached recursively following the { base type definition } property from the reference type definition, and at least one of the derivation methods involved is an extension.
DerivationList	8	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the list. The reference type definition is derived by list from the other type definition if there exists two type definitions T1 and T2 such as the reference type definition is derived from T1 by DerivationRestriction or DerivationExtension, T2 is derived from the other type definition by DerivationRestriction, T1 has { variety } list, and T2 is the { item type definition } . Note that T1 could be the same as the reference type definition, and T2 could be the same as the other type definition.
DerivationRestriction	1	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the derivation by restriction if complex types are involved, or a restriction if simple types are involved. The reference type definition is derived by restriction from the other type definition if the other type definition is the same as the reference type definition, or if the other type definition can be reached recursively following the { base type definition } property from the reference type definition, and all the derivation methods involved are restriction.
DerivationUnion	4	If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the union if simple types are involved. The reference type definition is derived by union from the other type definition if there exists two type definitions T1 and T2 such as the reference type definition is derived from T1 by DerivationRestriction or DerivationExtension, T2 is derived from the other type definition by DerivationRestriction, T1 has { variety } union, and one of the { member type definitions } is T2. Note that T1 could be the same as the reference type definition, and T2 could be the same as the other type definition.

230.31 class XMLValidatorMBS

230.31.1 class XMLValidatorMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the XML validator.
Example:

```
Var ValidXMLLines(), InvalidXMLLines(), schemaLines() As String

// we build a scheme and two XML files:
schemaLines.add "<xs:schema xmlns:xs=""http://www.w3.org/2001/XMLSchema"" elementFormDefault=""qualified"">"
schemaLines.add ""
schemaLines.add " <xs:element name=""person"">"
schemaLines.add " <xs:complexType>"
schemaLines.add " <xs:sequence>"
schemaLines.add " <xs:element name=""name"" type=""xs:string""/>"
schemaLines.add " <xs:element name=""age"" type=""xs:int""/>"
schemaLines.add " <xs:element name=""email"" type=""xs:string""/>"
schemaLines.add " </xs:sequence>"
schemaLines.add " </xs:complexType>"
schemaLines.add " </xs:element>"
schemaLines.add ""
schemaLines.add "</xs:schema>"

ValidXMLLines.add "<person>"
ValidXMLLines.add " <name>John Doe</name>"
ValidXMLLines.add " <age>30</age>"
ValidXMLLines.add " <email>john.doe@example.com</email>"
ValidXMLLines.add "</person>"

InvalidXMLLines.add "<person>"
InvalidXMLLines.add " <name>John Doe</name>"
InvalidXMLLines.add " <age>thirty</age>" // invalid: not an integer
InvalidXMLLines.add "</person>"

Var Schema As String = Join(schemaLines, EndOfLine)
Var ValidXML As String = Join(ValidXMLLines, EndOfLine)
var InvalidXML as string = Join(InvalidXMLLines, EndOfLine)

// let's validate them and see what results we get
Var validator As New XMLValidatorMBS(Schema)
Var r1 As Integer = validator.ValidateString(ValidXML)
// r1 is 0 for valid XML
Var r2 As Integer = validator.ValidateString(InvalidXML)
// r2 is 1871 as there is a mistake
```

Break

Notes: Using the validator in LibXML.

Xojo Developer Magazine

- 17.4, page 10: News

230.31.2 Methods

230.31.3 CanonicalXML(XML as String, Mode as Integer = 0) as String

MBS Util Plugin, Plugin Version: 24.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates the canonical version of the XML.
Example:

```
Var x1 As String = "<test id='123'><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Var x2 As String = XMLValidatorMBS.CanonicalXML(x1)
```

Break

Notes: Raises UnsupportedOperationException in case of a parse or serialization error.

The output mode:
Can be 0 for Original C14N 1.0 spec, 1 for Exclusive C14N 1.0 spec or 2 for C14N 1.1 spec.

230.31.4 Constructor(File as FolderItem)

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking file path to XML file.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("schema.xsd")
Var v As New XMLValidatorMBS(f)
```

Notes: May raise an XMLException if the XML can't be parsed or the validator can't be initialized.
XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 230.31.5 Constructor(XMLSchema as String) 24955

230.31.5 Constructor(XMLSchema as String)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking XML text.
Notes: May raise an XMLException if the XML can't be parsed or the validator can't be initialized.

For MBS Plugin 20.2 this function accepts also a file name/path to initialize.
XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 230.31.4 Constructor(File as FolderItem) 24955

230.31.6 Destructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

230.31.7 LoadIconvLibrary(path as String, byref Error as String) as boolean

MBS Util Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the iconv library.
Notes: The XML classes may use libiconv for text encoding conversion.

If you explicitly need, you can load the library on start of solution.

MBS Plugin may try to load iconv.dll/dylib/so automatically when first iconv function is called.

230.31.8 Message(index as Integer) as XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a message by index.
Notes: Index from 0 to MessageCount-1.

230.31.9 Messages as XMLValidatorMessageMBS()

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array of messages recorded while validating.

230.31.10 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes: The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

- 230.31.11 SetCurrentWorkingDirectory(path as String) as boolean 24956

230.31.11 SetCurrentWorkingDirectory(path as String) as boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes: The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

• 230.31.10 SetCurrentWorkingDirectory(path as folderitem) as boolean 24956

230.31.12 ValidateFile(file as FolderItem) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML file against a XML schema.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("schema.xsd")
Var v As New XMLValidatorMBS(f)

Var t As FolderItem = SpecialFolder.Desktop.Child("test.xml")
Var r As Integer = v.ValidateFile(t)
```

Notes: Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

• 230.31.13 ValidateFile(path as string) as Integer 24957

230.31.13 ValidateFile(path as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML file against a XML schema.
Notes: Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 230.31.12 ValidateFile(file as FolderItem) as Integer 24957

230.31.14 ValidateString(text as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML text against a XML schema.
Notes: Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.

230.31.15 Properties

230.31.16 MessageCount as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of messages we recorded in validation.
Notes: (Read only property)

230.31.17 SchemaHandle as Integer

MBS Util Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal schema handle.
Notes: (Read only property)

230.31.18 SchemaValidatorHandle as Integer

MBS Util Plugin, Plugin Version: 26.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal schema validator handle.
Notes: (Read only property)

230.31.19 Events

230.31.20 Error(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error event called for validation errors.

230.31.21 Warning(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The warning event called for validation warnings.

230.32 class XMLValidatorMessageMBS

230.32.1 class XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an error or warning message in XML validator.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- New XML Validator class for Xojo

230.32.2 Methods

230.32.3 Constructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The private constructor.

230.32.4 Destructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

230.32.5 Properties

230.32.6 Code as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code.
Notes: (Read only property)

230.32.7 FileName as String

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The filename if available.
Notes: (Read only property)

230.32.8 IsError as Boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this was reported as error and not as warning.
Notes: (Read only property)

230.32.9 IsWarning as Boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this was reported as warning and not as error.
Notes: (Read only property)

230.32.10 Line as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The line number in the XML file if available.
Notes: (Read only property)

230.32.11 Message as String

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The message text.
Notes: (Read only property)

230.33 class XMLXPathResultMBS

230.33.1 class XMLXPathResultMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an XPath result.
Notes: The DOMXPathResult interface represents the result of the evaluation of an XPath 1.0 or XPath 2.0 expression within the context of a particular node. Since evaluation of an XPath expression can result in various result types, this object makes it possible to discover and manipulate the type and value of the result.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

230.33.2 Methods

230.33.3 Constructor

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

230.33.4 iterateNext as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates and returns true if the current result is the next item from the sequence or false if there are no more items.
Notes: Returns True if the current result is the next item from the sequence or false if there are no more items.

Raises exception if ResultType is not ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or if ResultType is not ResultTypeIteratorResult (XPath 2.0).

230.33.5 snapshotItem(size as Integer) as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the current result to the indexth item in the snapshot collection.
Notes: If index is greater than or equal to the number of items in the list, this method returns false. Unlike the iterator result, the snapshot does not become invalid, but may not correspond to the current document if it is mutated.

Returns true if the current result is the next item from the sequence or false if there are no more items.

Raises exception if ResultType is not ResultTypeUnorderedNodeSnapshot or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if ResultType is not ResultTypeSnapshotResult (XPath 2.0).

230.33.6 Properties

230.33.7 BooleanValue as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the boolean value of this result.
Notes: Raises exception if ResultType is not ResultTypeBoolean (XPath 1.0) or if current result cannot be properly converted to boolean (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

230.33.8 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parent document used to create these results.
Notes: (Read only property)

230.33.9 IntegerValue as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the integer value of this result (XPath 2 only).
Notes: The value of this integer result.
Raises exception if current result cannot be properly converted to int (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).

(Read only property)

230.33.10 InvalidIteratorState as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Signifies that the iterator has become invalid.
Notes: True if ResultType is ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or ResultTypeIteratorResult (XPath 2.0) and the document has been modified since this result was returned.

Raises exception if ResultType is not ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or if ResultType is not ResultTypeIteratorResult (XPath 2.0).
(Read only property)

230.33.11 isNode as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the result has a current result and the value is a node (XPath 2 only).
Notes: This function is necessary to distinguish between a string value and a node of type string as returned by the TypeInfo() function.
(Read only property)

230.33.12 NodeValue as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the node value of this result.
Notes: The value of this node result, which may be nil.
Raises exception if ResultType is not ResultTypeAnyUnorderedNode, ResultTypeFirstOrderedNode, ResultTypeUnorderedNodeIterator, ResultTypeOrderedNodeIterator, ResultTypeUnorderedNodeSnapshot, or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if current result is not a node (XPath 2.0). Raises exception if there is no current result in the result object.
(Read only property)

230.33.13 NumberValue as Double

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number value of this result.
Notes: If the native double type of the DOM binding does not directly support the exact IEEE 754 result of the XPath expression, then it is up to the definition of the binding to specify how the XPath number is converted to the native binding number.
Raises exception if ResultType is not ResultTypeNumber (XPath 1.0) or if current result cannot be properly converted to double (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

230.33.14 ResultType as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the result type of this result.
Notes: A code representing the type of this result, as defined by the type constants.
(Read only property)

230.33.15 SnapshotLength as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of items in the result snapshot.
Notes: Valid values for snapshotItem indices are 0 to snapshotLength-1 inclusive.

Raises exception if ResultType is not ResultTypeUnorderedNodeSnapshot or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if ResultType is not ResultTypeSnapshotResult (XPath 2.0).
(Read only property)

230.33.16 StringValue as String

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the string value of this result.
Notes: The value of this string result.
Raises exception if ResultType is not ResultTypeString (XPath 1.0) or if current result cannot be properly converted to string (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

230.33.17 TypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the DOM type info of the current result node or value (XPath 2 only).
Notes: (Read only property)

230.33.18 Constants

Result Types

Constant	Value	Description
ResultTypeAny	0	[XPath 1.0] This code does not represent a specific type. An evaluatio an XPath expression will never produce this type. If this type is reques then the evaluation returns whatever type naturally results from evalua of the expression. If the natural result is a node set when ResultTypeA was requested, then ResultTypeUnorderedNodeIterator is always the resul type. Any other representation of a node set must be explicitly requested.
ResultTypeAnyUnorderedNode	8	[XPath 1.0] The result is a node set as defined by XPath 1.0 and wil accessed as a single node, which may be null if the node set is empty. Docum modification does not invalidate the node, but may mean that the result n no longer corresponds to the current document. This is a convenience t permits optimization since the implementation can stop once any node in resulting set has been found. If there is more than one node in the actual res the single node returned might not be the first in document order.
ResultTypeBoolean	3	[XPath 1.0] The result is a boolean as defined by XPath 1.0. Docum modification does not invalidate the boolean, but may mean that reevalua would not yield the same boolean.
ResultTypeFirstOrderedNode	9	[XPath 1.0] The result is a node set as defined by XPath 1.0 and wil accessed as a single node, which may be null if the node set is empty. Docum modification does not invalidate the node, but may mean that the result n no longer corresponds to the current document. This is a convenience t permits optimization since the implementation can stop once the first nod document order of the resulting set has been found. If there are more than node in the actual result, the single node returned will be the first in docum order.
ResultTypeFirstResult	100	[XPath 2.0] The result is a sequence as defined by XPath 2.0 and wil accessed as a single current value or there will be no current value if the quence is empty. Document modification does not invalidate the value, may mean that the result no longer corresponds to the current document. T is a convenience that permits optimization since the implementation can s once the first item in the resulting sequence has been found. If there is m than one item in the actual result, the single item returned might not be first in document order.
ResultTypeIteratorResult	101	[XPath 2.0] The result is a sequence as defined by XPath 2.0 that wil accessed iteratively. Document modification invalidates the iteration.
ResultTypeNumber	1	[XPath 1.0] The result is a number as defined by XPath 1.0. Docum modification does not invalidate the number, but may mean that reevalua would not yield the same number.
ResultTypeOrderedNodeIterator	5	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil accessed iteratively, which will produce document-ordered nodes. Docum modification invalidates the iteration.
ResultTypeOrderedNodeSnapshot	7	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil accessed as a snapshot list of nodes that will be in original document or Document modification does not invalidate the snapshot but may mean t reevaluation would not yield the same snapshot and nodes in the snapshot r have been altered, moved, or removed from the document.
ResultTypeSnapshotResult	102	[XPath 2.0] The result is a sequence as defined by XPath 2.0 that will be cessed as a snapshot list of values. Document modification does not invalid the snapshot but may mean that reevaluation would not yield the same sn shot and any items in the snapshot may have been altered, moved, or remo from the document.
ResultTypeString	2	[XPath 1.0] The result is a string as defined by XPath 1.0. Document m fication does not invalidate the string, but may mean that the string no lon corresponds to the current document.
ResultTypeUnorderedNodeIterator	4	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil accessed iteratively, which may not produce nodes in a particular order. D ument modification invalidates the iteration. This is the default type retur if the result is a node set and ResultTypeAny is requested.
ResultTypeUnorderedNodeSnapshot	6	[XPath 1.0] The result is a node set as defined by XPath 1.0 that wil

Chapter 231

XMP

231.1 class XMPAssertNotifyMBS

231.1.1 class XMPAssertNotifyMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class provides a way to get notified for Assertion.
Notes: Only one instance can be registered at a given time.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

231.1.2 Events

231.1.3 Assert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An assertion was reported.
Example:

```
Sub Assert(text as string)
MsgBox text
End Sub
```

Notes: Display it to the user or just log it for debugging.

231.2 class XMPDateTimeMBS

231.2.1 class XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The expanded type for a date and time.
Notes: Dates and time in the serialized XMP are ISO 8601 strings. The XMPDateTimeMBS class allows easy conversion with other formats.

DateTime values are occasionally used in cases with only a date or only a time component. A date without a time has zeros in the XMPDateTimeMBS class for all time fields. A time without a date has zeros for all date fields (year, month, and day).

231.2.2 Methods

231.2.3 ClearTimeZone

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the timezone by setting all time zone properties to zero.

231.2.4 Clone as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this date.
Notes: Not just a new reference to the same object, but a real copy.

231.2.5 Compare(other as XMPDateTimeMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compare the order of two date/time values.
Notes: Returns:
-1 if self is before other or other=nil
0 if self matches other
+1 if self is after other

231.2.6 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the current date and time.
Notes: The returned time is UTC, properly adjusted for the local time zone. The resolution of the time is not guaranteed to be finer than seconds.
See also:

- 231.2.7 Constructor(text as string) 24971

231.2.7 Constructor(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.
See also:

- 231.2.6 Constructor 24971

231.2.8 ConvertToLocalTime

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make sure a time is local.
Notes: If the time zone is not the local zone, the time is adjusted and the time zone set to be local.

231.2.9 ConvertToUTCTime

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make sure a time is UTC.
Notes: If the time zone is not UTC, the time is adjusted and the time zone set to be UTC.

231.2.10 IsDateOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether only the date is defined for this datetime object.

231.2.11 IsTimeOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether only the time is defined for this datetime object.

231.2.12 Operator_Convert as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.
See also:

- 231.2.13 Operator_Convert(text as string) 24972

231.2.13 Operator_Convert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.
See also:

- 231.2.12 Operator_Convert as string 24972

231.2.14 SetTimeZone

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the local time zone.
Notes: Any existing time zone value is replaced, the other date/time fields are not adjusted in any way.

231.2.15 Str as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.

231.2.16 Properties

231.2.17 Day as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The day of the month in the range 1..31.
Notes: (Read and Write property)

231.2.18 hasDate as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property to tell if the date is defined in this object.
Notes: (Read and Write property)

231.2.19 hasTime as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property to tell if the time is defined in this object.
Notes: (Read and Write property)

231.2.20 hasTimeZone as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether there is a time zone set.
Notes: (Read and Write property)

231.2.21 Hour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hour in the range 0..23.
Notes: (Read and Write property)

231.2.22 Minute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minute in the range 0..59.
Notes: (Read and Write property)

231.2.23 Month as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The month in the range 1..12.
Notes: (Read and Write property)

231.2.24 NanoSecond as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Nanoseconds within a second, often left as zero.
Notes: (Read and Write property)

231.2.25 Second as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second in the range 0..59.
Notes: (Read and Write property)

231.2.26 TimezoneHour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone hour in the range 0..23.
Notes: (Read and Write property)

231.2.27 TimezoneMinute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone minute in the range 0..59.
Notes: (Read and Write property)

231.2.28 TimezoneSign as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The "sign" of the time zone, 0 means UTC, -1 is west, +1 is east.
Notes: The "sign" of the time zone, kTimeIsUTC (0) means UTC, kTimeWestOfUTC (-1) is west, kTimeEastOfUTC (+1) is east.
(Read and Write property)

231.2.29 Year as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The year, can be negative.
Notes: (Read and Write property)

231.2.30 Constants

Constants

Constant	Value	Description
kXMP_TimeEastOfUTC	1	One of the constants for the TimezoneSign property. UTC time.
kXMP_TimeIsUTC	0	One of the constants for the TimezoneSign property. Time zone is east of UTC.
kXMP_TimeWestOfUTC	-1	One of the constants for the TimezoneSign property. Time zone is west of UTC.

231.3 class XMPExceptionMBS

231.3.1 class XMPExceptionMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class for the other XMP classes.
Notes: For current plugins (6.4): Windows and MachO works, Carbon/Classic PEF crashes on an exception. Linux not tested.

Nearly every method or function may raise this exception, so catch it!
Subclass of the RuntimeException class.

231.4 class XMPFilesMBS

231.4.1 class XMPFilesMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for access to the main (document-level) metadata in a file.
Notes: The Adobe XMP Toolkit's file handling component, XMPFiles, is a front end to a set of format-specific file handlers that support file I/O for XMP. The file handlers implement smart, efficient support for those file formats for which the means to embed XMP is defined in the XMP Specification. Where possible, this support allows:

- Injection of XMP where none currently exists
- Expansion of XMP without regard to existing padding
- Reconciliation of the XMP and other legacy forms of metadata.

TXMPFiles is designed for use by clients interested in the metadata and not in the primary file content; the Adobe Bridge application is a typical example. TXMPFiles is not intended to be appropriate for files authored by an application; that is, those files for which the application has explicit knowledge of the file format.

Supported file formats:
PDF, PostScript, EPS, JPEG, JPEG2K, TIFF, GIF, PNG, SWF, FLA, FLV, MOV, AVI, CIN, WAV, MP3, SES, CEL, MPEG, MPEG2, MPEG4, WMAV, AIFF, P2, XDCAM_FAM, XDCAM_SAM, XDCAM_EX, AVCHD, SonyHDV, HTML, XML, Text, Photoshop, Illustrator, InDesign, AEProject, AEProjTemplate, AEFilterPreset, EncoreProject, PremiereProject, PremiereTitle and UCF.

Based on the XMP-Toolkit-SDK from Adobe.

This constructor crashes on Linux with 14.0 plugins and Xojo 2011r1 and 2011r3. Some change in 2011r4 makes it work, so up to Xojo 2014 we don't see the crash.

231.4.2 Methods

231.4.3 CanPutXMP(xmpPacket as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CanPutXMP() reports whether this file can be updated with a specific XMP packet.
Notes: Use to determine if the file can probably be updated with a given set of XMP metadata. This depends on the size of the packet, the options with which the file was opened, and the capabilities of the handler for the file format. The function obtains the length of the serialized packet for the provided XMP, but does not keep it or modify it, and does not cause the file to be written when closed.
See also:

- 231.4.4 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean 24978

231.4.4 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function:

CanPutXMP() reports whether this file can be updated with a specific XMP packet,
passed in a string object.
See also:

- 231.4.3 CanPutXMP(xmpPacket as string) as boolean 24978

231.4.5 CheckFileFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CheckFileFormat() tries to determine the format of a file.
Notes: CheckFileFormat tries to determine the format of a file, returning an format value. It uses the same logic as OpenFile will use to select a smart handler.

path: The path for the file, appropriate for the local operating system. Passed as a UTF-8 string. The path is the same as would be passed to OpenFile.

Returns the file's format if a smart handler would be selected, otherwise kUnknownFile.

231.4.6 CheckPackageFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CheckPackageFormat() tries to determine the format of a "package" folder.
Notes: CheckPackageFormat tries to determine the format of a "package" given the name of the top level folder, returning an XMP_FileFormat value. Examples of recognized packages include the video formats P2, XDCAM, or Sony HDV. These packages contain collections of "clips", stored as multiple files in specific subfolders.

Path: The path for the top level folder, appropriate for the local operating
system. Passed as an UTF-8 string. The path is not the same as would be passed to OpenFile. For example the path passed to CheckPackageFormat might be ".../MyMovie", while the path passed to OpenFile would be ".../MyMovie/SomeClip".

Returns the package's format if a smart handler would be selected, otherwise kUnknownFile.

231.4.7 CloseFile(closeFlags as Integer)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CloseFile() explicitly closes an opened file.
Notes: Performs any necessary output to the file and closes it. Files that are opened for update are written to only when closing.

If the file is opened for read-only access (passing kOpenForRead), the disk
file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.

If the file is opened for update (passing kOpenForUpdate), the disk file remains
open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().

closeFlags: Option flags for optional closing actions. This bit-flag constant is
defined:

- kUpdateSafely - Write into a temporary file then swap for crash safety.

231.4.8 Constructor

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor initializes an object that is associated with no file.

Notes: The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 231.4.9 Constructor(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) 24980
- 231.4.10 Constructor(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) 24981

231.4.9 Constructor(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file for metadata access.
Notes: Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, appropriate for the local operating system.
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.

- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Throws an exception for serious problems.
See also:

- 231.4.8 Constructor 24979
- 231.4.10 Constructor(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) 24981

231.4.10 Constructor(path as string, format as Integer=&h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alternate constructor associates the new XMPFiles object with a specific file.
Notes: Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as an UTF-8 string. (use FolderItem.NativePath)
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning

- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 231.4.8 Constructor 24979
- 231.4.9 Constructor(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) 24980

231.4.11 GetFileInfo(byref path as string, byref openFlags as UInt32, byref format as UInt32, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetFileInfo() retrieves basic information about an opened file.
Notes: path: A buffer in which to return the path passed to OpenFile(). Can be null if value is not wanted.

openFlags: A variable in which to return the option flags passed to OpenFile.
format: A variable in which to return the file format.
handlerFlags: [out] A variable in which to return the handler's capability flags.

Returns true if the file object is in the open state; that is, OpenFile() has been called but CloseFile() has not. False otherwise. Even if the file object is open, the actual disk file might be closed in the host file-system sense; see OpenFile().

231.4.12 GetFormatInfo(format as Integer, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetFormatInfo() reports what features are supported for a specific file format.
Example:

```
Var flags as UInt32
if XMPFilesMBS.GetFormatInfo(XMPFilesMBS.kJPEGFile, flags) then

if BitwiseAnd(flags, XMPFilesMBS.kCanInjectXMP) <>0 then
MsgBox "Can inject first-time XMP into an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanExpand) <>0 then
```

```
MsgBox "Can expand XMP or other metadata in an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanRewrite) <>0 then
MsgBox "Can copy one file to another, writing new metadata (as in SaveAs)."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanReconcile) <>0 then
MsgBox "Supports reconciliation between XMP and other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kAllowsOnlyXMP) <>0 then
MsgBox "Allows access to just the XMP, ignoring other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsTNail) <>0 then
MsgBox "File handler returns native thumbnail information."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsRawPacket) <>0 then
MsgBox "File handler returns raw XMP packet information and string."
end if

end if
```

Notes: The file handlers for different file formats vary considerably in what features they support. Support depends on both the general capabilities of the format and the implementation of the handler for that format.

format: The file format whose support flags are desired.
handlerFlags: A variable in which to return a logical OR of option bit flags.
The following constants are defined:

- kCanInjectXMP - Can inject first-time XMP into an existing file.
- kCanExpand - Can expand XMP or other metadata in an existing file.
- kCanRewrite - Can copy one file to another, writing new metadata (as in SaveAs)
- kCanReconcile - Supports reconciliation between XMP and other forms.
- kAllowsOnlyXMP - Allows access to just the XMP, ignoring other forms.

This is only meaningful if kCanReconcile is set.

- kReturnsTNail - File handler returns native thumbnail information.

- kReturnsRawPacket - File handler returns raw XMP packet information and string.

Even if kReturnsRawPacket is set, the returned packet information might have an
offset of -1 to indicate an unknown offset. While all file handlers should be able to return the raw packet, some might not know the offset of the packet within the file. This is typical in cases where external libraries are used. These cases might not even allow return of the raw packet.

Returns true if the format has explicit "smart" support, false if the format is handled by the default packet scanning plus heuristics.

231.4.13 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetVersionInfo() retrieves version information for the XMPFiles component.

231.4.14 GetXMP(byref xmp as XMPMetaMBS, byref xmppacket as string, byref PacketInfo as XMPPacketInfoMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetXMP() retrieves the XMP metadata from an open file.
Notes: The function reports whether XMP is present in the file; you can choose to retrieve any or all of the parsed XMP, the raw XMP packet, or information about the raw XMP packet. The options provided when the file was opened determine if reconciliation is done with other forms of metadata.

xmp: An XMP object in which to return the parsed XMP metadata.
xmppacket: An string in which to return the raw XMP packet as stored in
the file. The encoding of the packet is given in the packetInfo. Returns an
empty string if the low level file handler does not provide the raw packet.
packetInfo: A packetinfo object in which to return the location and form of the raw XMP in the file. PacketInfo.charForm and PacketInfo.writeable reflect the
raw XMP in the file. The parsed XMP property values are always UTF-8. The writeable flag is taken from the packet trailer; it applies only to "format ignorant" writing. The PacketInfo object always reflects the state of the XMP in the file. The offset, length, and character form do not change as a result of calling PutXMP() unless the file is also written. Some file handlers might not return location or contents of the raw packet string. To determine whether one does, check the kReturnsRawPacket bit returned by GetFormatInfo(). If the low-level file handler does not provide the raw packet location, PacketInfo.offset and PacketInfo.length are both 0, PacketInfo.charForm is UTF-8, and PacketInfo.writeable is false.

231.4.15 OpenFile(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alternate constructor associates the new XMPFiles object with a specific file.
Notes: Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as folderitem.
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning
- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 231.4.16 OpenFile(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean 24985

231.4.16 OpenFile(path as string, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file for metadata access.
Notes: Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.

If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, specified as an UTF-8 string. (use FolderItem.NativePath)
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Returns true if the file is succesfully opened and attached to a file handler. False for anticipated problems, such as passing kOpenUseSmartHandler but not having an appropriate smart handler. Throws an exception for serious problems.
See also:

- 231.4.15 OpenFile(path as folderitem, format as Integer=&h20202020, OpenFlags as Integer=0) as boolean

231.4.17 PutXMP(xmpPacket as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: PutXMP() updates the XMP metadata in this object without writing out the file,
Notes: Overloads the basic form of the function, allowing you to pass the metadata as a string object instead of an XMP object. It is otherwise identical; see details in the canonical form.
See also:

- 231.4.18 PutXMP(xmpPacket as XMPMetaMBS) 24987

231.4.18 PutXMP(xmpPacket as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: PutXMP() updates the XMP metadata in this object without writing out the file.
Notes: This function supplies new XMP for the file. However, the disk file is not written until the object is closed with CloseFile(). The options provided when the file was opened determine if reconciliation is done with other forms of metadata.
See also:

- 231.4.17 PutXMP(xmpPacket as string) 24987

231.4.19 Events

231.4.20 Abort as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is called periodically to allow a user to cancel time-consuming operations.
Notes: The event should return true to signal an abort, which results in an
exception being thrown.

231.4.21 Constants

Constants

Constant	Value	Description
kAEFilterPresetFile	&h46465820	One of the constants to specify a file type.
kAEProjectFile	&h41455020	One of the constants to specify a file type.
kAEProjTemplateFile	&h41455420	One of the constants to specify a file type. After Effects Project Template
kAIFFFile	&h41494646	One of the constants to specify a file type.
kAllowsOnlyXMP	&h00000020	One of the option bit flags for GetFormatInfo Allows access to just the XMP, ignoring other forms.
kAllowsSafeUpdate	&h00000200	One of the option bit flags for GetFormatInfo The file handler allows crash-safe file updates.
kArrayLastItem	-1	The index constant for the last item.
kAVCHDFile	&h41564844	One of the constants to specify a file type.
kAVIFile	&h41564920	One of the constants to specify a file type. Cineon
kCanExpand	2	One of the option bit flags for GetFormatInfo Can expand XMP or other metadata in an existing file.
kCanInjectXMP	1	One of the option bit flags for GetFormatInfo Can inject first-time XMP into an existing file.
kCanReconcile	&h00000010	One of the option bit flags for GetFormatInfo Supports reconciliation between XMP and other forms.
kCanRewrite	4	One of the option bit flags for GetFormatInfo Can copy one file to another, writing new metadata.
kCELFile	&h43454C20	One of the constants to specify a file type. Audition loop
kChar16BitBig	2	One of the constants to define the character format. 16-bit big-endian
kChar16BitLittle	3	One of the constants to define the character format. 16-bit little-endian
kChar16BitMask	2	One of the constants to define the character format.
kChar32BitBig	4	One of the constants to define the character format. 32-bit big-endian
kChar32BitLittle	5	One of the constants to define the character format. 32-bit little-endian
kChar32BitMask	4	One of the constants to define the character format.
kChar8Bit	0	One of the constants to define the character format. 8-bit
kCharLittleEndianMask	1	One of the constants to define the character format.
kCharUnknown	1	One of the constants to define the character format. Variable or not-yet-known cases
kCINFile	&h43494E20	One of the constants to specify a file type.
kEncoreProjectFile	&h4E434F52	One of the constants to specify a file type.
kEPSFile	&h45505320	One of the constants to specify a file type. encapsulated PostScript
kFLAFile	&h464C4120	One of the constants to specify a file type.
kFLVFile	&h464C5620	One of the constants to specify a file type.
kFolderBasedFormat	&h00001000	One of the option bit flags for GetFormatInfo The format is folder oriented, for example the P2 video format.
kGIFFile	&h47494620	One of the constants to specify a file type.
kHandlerOwnsFile	&h00000100	One of the option bit flags for GetFormatInfo The file handler does the file open and close.
kHTMLFile	&h48544D4C	One of the constants to specify a file type.
kIllustratorFile	&h41492020	One of the constants to specify a file type.
kInDesignFile	&h494E4444	One of the constants to specify a file type.
kJPEG2KFile	&h4A505820	One of the constants to specify a file type. JPEG 2000, ISO 15444-1
kJPEGFile	&h4A504547	One of the constants to specify a file type.
kMOVFile	&h4D4F5620	One of the constants to specify a file type. Quicktime
kMP3File	&h4D503320	One of the constants to specify a file type.

231.5 class XMPIteratorMBS

231.5.1 class XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XMPIteratorMBS class provides a uniform means to iterate over several XMP data structures, including the schema and properties within an XMP object plus global tables such as registered namespaces.
Notes: Note: Only XMP object iteration is implemented at this time. There are no table iterators yet.

Iteration over the schema and properties within an XMP object is the most important and complex use of XMPIteratorMBS. It is helpful to have a thorough understanding of the XMP data tree. One way to learn this is to create some complex XMP and examine the output of XMPMetaMBS.DumpObject. This is also described in the XMP Specification, in the XMP Data Model chapter.
The top of the XMP data tree is a single root node. This does not explicitly appear in the dump and is never visited by an iterator (that is, it is never returned from XMPIteratorMBS.Next). Beneath the root are schema nodes. These are just collectors for top level properties in the same namespace. They are created and destroyed implicitly. Beneath the schema nodes are the property nodes. The nodes below a property node depend on its type (simple, struct, or array) and whether it has qualifiers.

A XMPIteratorMBS constructor defines a starting point for the iteration and options that control how it proceeds. By default the iteration starts at the root and visits all nodes beneath it in a depth first manner. The root node is not visited, the first visited node is a schema node. You can provide a schema name or property path to select a different starting node. By default this visits the named root node first then all nodes beneath it in a depth first manner.

The XMPIteratorMBS.Next method delivers the schema URI, path, and option flags for the node being visited. If the node is simple it also delivers the value. Qualifiers for this node are visited next. The fields of a struct or items of an array are visited after the qualifiers of the parent.

The options to control the iteration are:

kXMP_IterJustChildren	Visit just the immediate children of the root. Skip the root itself and all nodes below the immediate children. This omits the qualifiers of the immediate children, the qualifier nodes being below what they qualify.
kXMP_IterJustLeafNodes	Visit just the leaf property nodes and their qualifiers.
kXMP_IterJustLeafName	Return just the leaf component of the node names. The default is to return the full path name.
kXMP_IterIncludeAliases	Include aliases as part of the iteration. Since aliases are not actual nodes the default iteration does not visit them.
kXMP_IterOmitQualifiers	Do not visit the qualifiers of a node.

231.5.2 Methods

231.5.3 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Empty constructor which does nothing.
See also:

- 231.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0) 24990
- 231.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 24991
- 231.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0) 24991
- 231.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 24992

231.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes: options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.
See also:

- 231.5.3 Constructor 24990
- 231.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 24991

- 231.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 24992

231.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes: schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.

- 231.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0) 24991
- 231.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 24992

231.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes: schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

Note: Not yet implemented in the XMP SDK.
See also:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

- 231.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0) 24990
- 231.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 24991
- 231.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 24992

231.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the properties within an XMP object.
Notes: On success handle is not 0.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

231.5.8 NextItem() as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
See also:

- 231.5.9 NextItem(byref schemaNS as string) as boolean 24993
- 231.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 24993
- 231.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 24994
- 231.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 24995

231.5.9 NextItem(byref schemaNS as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 231.5.8 NextItem() as boolean 24993
- 231.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 24993

- 231.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 24995

231.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.

See also:

- 231.5.8 NextItem() as boolean 24993
- 231.5.9 NextItem(byref schemaNS as string) as boolean 24993
- 231.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 24994
- 231.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 24995

231.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.

See also:

- 231.5.8 NextItem() as boolean 24993
- 231.5.9 NextItem(byref schemaNS as string) as boolean 24993
- 231.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 24993
- 231.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 24995

231.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes: Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 231.5.8 NextItem() as boolean 24993
- 231.5.9 NextItem(byref schemaNS as string) as boolean 24993
- 231.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 24993
- 231.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 24994

231.5.13 Skip(options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skip some portion of the remaining iterations.
Notes: The available option flags are:

kXMP_IterSkipSubtree	= 1	Skip the subtree below the current node.
kXMP_IterSkipSiblings	= 2	Skip the subtree below and remaining siblings of the current node.

231.6 class XMPMetaMBS

231.6.1 class XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The main class for the Adobe XMP SDK.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

231.6.2 Methods

231.6.3 AppendArrayItem(schemaNS as string, arrayName as string, arrayOptions as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends an item to an array.
Notes: AppendArrayItem simplifies construction of an array by not requiring that you pre-create an empty array. The array that is assigned is created automatically if it does not yet exist. Each call to AppendArrayItem appends an item to the array. The corresponding parameters have the same use as SetArrayItem. The arrayOptions parameter is used to specify what kind of array. If the array exists, it must have the specified form.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be null or the empty string. Has the same namespace prefix usage as propPath in GetProperty.
arrayOptions	Option flags describing the array form. The only valid bits are those that are part of kXMP_PropArrayFormMask: kXMP_PropValueIsArray (&h200), kXMP_PropArrayIsOrdered (&h400), kXMP_PropArrayIsAlternate (&h800), or kXMP_PropArrayIsAltText (&h1000).
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
itemOptions	Option flags describing the item.

231.6.4 ApplyTemplate(WorkingXMP as XMPMetaMBS, template as XMPMetaMBS, actions as Integer)

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies an xmp template.

231.6.5 CatenateArrayItems(schemaNS as string, arrayName as string, separator as string, quotes as string, options as Integer) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a single edit string from an array of strings.
Notes:

xmpObj	The XMP object containing the array to be catenated.
schemaNS	The schema namespace URI for the array. Must not be an empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Each item in the array must be a simple string value.
separator	The string to be used to separate the items in the catenated string. Defaults to "; ", ASCII semicolon and space (U+003B, U+0020).
quotes	The characters to be used as quotes around array items that contain a separator. Defaults to '"', ASCII quote (U+0022).
options	Option flags to control the catenation.

returns the string with the catenated array items.

231.6.6 Clone as XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the XMPMeta Object.
Notes: Deep copy, not just a new reference.
Returns nil on any error.

231.6.7 ComposeArrayItemPath(schemaNS as string, arrayName as string, itemIndex as Integer) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for an item in an array.
Notes:

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.

Returns the composed path. This will be of the form <tt>ns:arrayName [i] </tt>, where "ns" is the prefix for schemaNS and "i" is the decimal representation of itemIndex. If the value of itemIndex is kXMP_ArrayLastItem, the path is <tt>ns:arrayName [last()] </tt>.

231.6.8 ComposeFieldSelector(schemaNS as string, arrayName as string, fieldNS as string, fieldName as string, fieldValue as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression to select an alternate item by a field's value.
Notes: The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeFieldSelector lets you select an item in an array of structs based on the value of one of the fields in the structs. The other form of content addressing is shown in ComposeLangSelector.

For example, consider a simple struct that has two fields, the name of a city and the URI of an FTP site in that city. Use this to create an array of download alternatives. You can show the user a popup built from the values of the city fields. You can then get the corresponding URI as follows:

path=ComposeFieldSelector (schemaNS, "Downloads", fieldNS, "City", chosenCity)
exists = GetStructField (schemaNS, path, fieldNS, "URI", uri)

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field used as the selector. Must not be an empty string.
fieldName	The name of the field used as the selector. Must be a simple XML name, must not be an empty string. It must be the name of a field that is itself simple.
fieldValue	The desired value of the field.

Returns the string with the composed path. This will be of the form <tt>ns:arrayName [fNS:field-

Name='fieldValue'] </tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

231.6.9 ComposeLangSelector(schemaNS as string, arrayName as string, langName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression to select an alternate item by language.
Notes: The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeLangSelector lets you select an item in an alt-text array based on the value of its <tt>xml:lang</tt>qualifier. The other form of content addressing is shown in ComposeFieldSelector.

ComposeLangSelector does not supplant SetLocalizedText or GetLocalizedText.
They should generally be used, as they provide extra logic to choose the appropriate language and maintain consistency with the 'x-default' value. ComposeLangSelector gives you an path expression that is explicitly and only for the language given in the langName parameter.

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
langName	The RFC 3066 code for the desired language.

Returns the composed path. This will be of the form <tt>ns:arrayName [\@xml:lang='langName'] </tt>, where "ns" is the prefix for schemaNS.

231.6.10 ComposeQualifierPath(schemaNS as string, structName as string, qualNS as string, qualName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for a qualifier.
Notes: schemaNS The namespace URI for the property to which the qualifier is attached. Must not be an empty string.
propName The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string.
qualNS The namespace URI for the qualifier. May be an empty string if the qualifier is in the XML empty namespace.
qualName The name of the qualifier. Must be a simple XML name, must not be an empty string.
Returns the composed path. This will be of the form <tt>ns:propName/?qNS:qualName</tt>, where "ns" is the prefix for schemaNS and "qNS" is the prefix for qualNS.

231.6.11 ComposeStructFieldPath(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for a field in a struct.
Notes:

schemaNS	The namespace URI for the struct. Must not be null or the empty string.
structName	The name of the struct. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field. Must not be an empty string.
fieldName	The name of the field. Must be a simple XML name, must not be an empty string.

Returns the composed path. This will be of the form <tt>ns:structName/fNS:fieldName</tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

231.6.12 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor, creates an empty object.
See also:

- 231.6.13 Constructor(data as memoryblock, Offset as Integer, Size as Integer) 25000
- 231.6.14 Constructor(data as string) 25001

231.6.13 Constructor(data as memoryblock, Offset as Integer, Size as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.
See also:

- 231.6.12 Constructor 25000

- 231.6.14 Constructor(data as string) 25001

231.6.14 Constructor(data as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.

- 231.6.12 Constructor 25000
- 231.6.13 Constructor(data as memoryblock, Offset as Integer, Size as Integer) 25000

231.6.15 ConvertFromBool(value as boolean) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from Boolean to string.

231.6.16 ConvertFromDate(value as XMPDateTimeMBS) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.

231.6.17 ConvertFromFloat(value as Double, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from floating point to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "%f".

231.6.18 ConvertFromInt(value as Integer, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "%d".

231.6.19 ConvertFromInt64(value as Int64, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "%d".

231.6.20 ConvertToBool(value as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to Boolean.

231.6.21 ConvertToDate(value as string) as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.

231.6.22 ConvertToFloat(value as string) as Double

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to floating point.

231.6.23 ConvertToInt(value as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to integer.

231.6.24 ConvertToInt64(value as string) as Int64

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to 64 bit integer.

231.6.25 CountArrayItems(schemaNS as string, arrayName as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts array items of given array.
Notes: Returns 0 on any error.

231.6.26 CurrentDateTime as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current date and time as a XMPDateTimeMBS object.
Notes: Returns nil on any error.

231.6.27 DecodeFromBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decode from Base64 encoded string to raw data.
Example:

```
Var x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.DecodeFromBase64("dGVzdA==") // test
```

Notes: This is a global method which does not need a valid handle.

231.6.28 DeleteArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteArrayItem deletes the given XMP subtree rooted at the given array item.
Notes: It is not an error if the array item does not exist.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

231.6.29 DeleteLocalizedText(schemaNS as string="", altTextName as string="", genericLang as string="", specificLang as string="")

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes localized text.

231.6.30 DeleteNamespace(namespaceURI as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes a namespace from the registry.
Notes: Not implemented?

Does nothing if the URI is not registered, or if the parameter is null or the empty string.

namespaceURI: The URI for the namespace.

231.6.31 DeleteProperty(schemaNS as string, propName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteProperty deletes the given XMP subtree rooted at the given property.
Notes: It is not an error if the property does not exist.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

231.6.32 DeleteQualifier(schemaNS as string, structName as string, qualNS as string, qualName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteQualifier deletes the given XMP subtree rooted at the given qualifier.
Notes: It is not an error if the qualifier does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be "" Has the same namespace prefix usage as the propName parameter.

231.6.33 DeleteStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteStructField deletes the given XMP subtree rooted at the given struct field.
Notes: It is not an error if the field does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

231.6.34 DoesArrayItemExist(schemaNS as string, arrayName as string, itemIndex as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesArrayItemExist tells if the array item exists.
Notes: Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

231.6.35 DoesPropertyExist(schemaNS as string, propName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesPropertyExist tells if the property exists.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

231.6.36 DoesQualifierExist(schemaNS as string, structName as string, qualNS as string, qualName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesQualifierExist tells if the qualifier exists.
Notes: Returns true if the qualifier exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be "". Has the same namespace prefix usage as the propName parameter.

231.6.37 DoesStructFieldExist(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesStructFieldExist tells if the struct field exists.
Notes: Returns true if the field exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

231.6.38 DumpNamespaces(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DumpNamespaces dumps the list of registered namespace URIs and prefixes.
Notes: This is a global method which does not need a valid handle.
Returns status code. (0=success and -1=error)

231.6.39 DumpObject(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DumpObject dumps the content of an XMP object.

Notes: Returns status code. (0=success and -1=error)

231.6.40 DuplicateSubtree(dest as XMPMetaMBS, sourceNS as string, sourceRoot as string, destNS as string="", destRoot as string="", options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replicate a subtree from one XMP object into another, possibly at a different location.
Notes: Parameters:

self	The source XMP object.
dest	The destination XMP object.
sourceNS	The schema namespace URI for the source subtree.
sourceRoot	The root location for the source subtree. May be a general path expression, must not be null or the empty string.
destNS	The schema namespace URI for the destination. Defaults to the source namespace.
destRoot	The root location for the destination. May be a general path expression. Defaults to the source location.
options	Option flags to control the separation.

231.6.41 EncodeToBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from raw data to Base64 encoded string.
Example:

```
Var x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.EncodeToBase64("test") // dGVzdA==
```

Notes: This is a global method which does not need a valid handle.

231.6.42 Erase

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Restores the object to a "just constructed" state.

231.6.43 GetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetArrayItem provides access to items within an array.
Notes: The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc.

Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.
itemValue	A string that is assigned the value of the array item, if the array item has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the array item.

231.6.44 GetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, byref actualLang as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetLocalizedText returns information about a selected item in an alt-text array.
Notes: The array item is selected according to the rules given above.

Returns true if an appropriate array item exists.

Parameters:

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag. May be "" if no generic language is wanted.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be null or the empty string.
actualLang	A string that is assigned the language of the selected array item, if an appropriate array item is found.
itemValue	A string that is assigned the value of the array item, if an appropriate array item is found.
options	An integer variable that is assigned option flags describing the array item.

231.6.45 GetNamespacePrefix(namespaceURI as string, byref namespacePrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the prefix for a registered namespace URI.
Notes: It is not an error if the namespace URI is not registered. The output namespacePrefix string is "" if the namespace URI is not registered.

Parameters:

namespaceURI	The URI for the namespace. Must not be null or the empty string.
namespacePrefix	Returns the prefix registered for this URI, with a terminating ':'.

Returns true if the namespace URI is registered.

This is a global method which does not need a valid handle.

231.6.46 GetNamespaceURI(namespacePrefix as string, byref namespaceURI as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the URI for a registered namespace prefix.
Notes: It is not an error if the namespace prefix is not registered. The output namespaceURI string is "" if the namespace prefix is not registered.

Parameters:

namespacePrefix	The prefix for the namespace. Must not be "".
namespaceURI	Returns the URI registered for this prefix.

Returns true if the namespace prefix is registered.

This is a global method which does not need a valid handle.

231.6.47 GetProperty(schemaNS as string, propName as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetProperty is the simplest property getter, mainly for top level simple properties or after using the path composition functions.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. May be an empty string if the first component of the propName path contains a namespace prefix. The URI must be for a registered namespace.
propName	The name of the property. May be a general path expression, must not be an empty string. Using a namespace prefix on the first component is optional. If present without a schemaNS value then the prefix specifies the namespace. The prefix must be for a registered namespace. If both a schemaNS URI and propName prefix are present, they must be corresponding parts of a registered namespace.
propValue	A string that is assigned the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the property.

231.6.48 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 231.6.49 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean 25012

231.6.49 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 231.6.48 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean 25012

231.6.50 GetPropertyDate(schemaNS as string, propName as string, byref propValue as XMPDateTimeMBS, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetProperty_Date returns the value of a date/time property as an XMPDateTimeMBS object.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A XMPDateTimeMBS variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

231.6.51 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 231.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean 25013

231.6.52 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 231.6.51 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean 25013

231.6.53 GetPropertyInt64Double(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInt64Double returns the value of a 64 bit integer property as a double value.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

231.6.54 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInteger returns the value of an integer property as an integer.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 231.6.55 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean 25015

231.6.55 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInteger returns the value of an integer property as an integer.
Notes: Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 231.6.54 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean 25014

231.6.56 GetPropertyInteger64(schemaNS as string, propName as string, byref propValue as Int64, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the value of an integer property as an Int64.
Notes: Reports whether a property exists, and retrieves its binary value and property type information.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be empty string; see GetProperty() for namespace prefix usage.

propValue: A variable in which to return the binary value.

options: A variable in which to return the option flags describing the property, a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following.

Returns true if the property exists.

231.6.57 GetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, byref qualValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetQualifier provides access to a qualifier attached to a property.
Notes: The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Note: Qualifiers are only supported for simple leaf properties at this time. (in the XMP SDK)

Returns true if the qualifier exists.

Parameters:

231.6.58 GetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	A string variable that is assigned the value of the qualifier, if the qualifier has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the qualifier.

Function: GetStructField provides access to fields within a nested structure.
Notes: The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Returns true if the field exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An string variable that is assigned the value of the field, if the field has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the field. May be null if the flags are not wanted.

231.6.59 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves runtime version information.

231.6.60 Iterator(schemaNS as string, propName as string, options as Integer) as XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an iterator for the properties within an XMP object.
Notes: Returns nil on failure.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= &h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= &h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= &h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= &h1000	Omit all qualifiers.

231.6.61 MergeFromJPEG(extendedXMP as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: merges standard and extended XMP retrieved from a JPEG file.
Notes: When an extended partition stores properties that do not fit into the JPEG file limitationof 64K bytes, this function integrates those properties back into the same XMP object with those from the standard XMP packet.

self: An XMP object which the caller has initialized from the standard XMP packet in a JPEG file. The extended XMP is added to this object.

extendedXMP: An XMP object which the caller has initialized from the extended XMP packet in a JPEG file.

231.6.62 PackageForJPEG(byref standardXMP as string, byref extendedXMP as string, byref extendedDigest as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: creates XMP serializations appropriate for a JPEG file.
Notes: The standard XMP in a JPEG file is limited to 64K bytes. This function serializes the XMP metadata in an XMP object into a string of RDF (see \c SerializeToBuffer) the data does not fit into the 64K byte limit, it creates a second packet string with the extended data.

self: The XMP object containing the metadata.
standardXMP: A string object in which to return the full standard XMP packet.

extendedXMP: A string object in which to return the serialized extended XMP, empty if not needed.

extendedDigest: A string object in which to return an MD5 digest of the serialized extended XMP, empty if not needed.

231.6.63 ParseFromBuffer(buffer as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: ParseFromBuffer parses RDF from a series of input buffers.
Notes: The buffers may be any length. The buffer boundaries need not respect XML tokens or even Unicode characters.

Parameters:

buffer	Input data buffer. Termination of an input loop is convenient by passing kXMP_ParseMoreBuffers (2) for all real input, then having a final call with a zero length and kXMP_NoOptions.
options	Options controlling the parsing.

The available options are:

kXMP_ParseMoreBuffers	= 2	This is not the last buffer of input, more calls follow.
kXMP_RequireXMPMeta	= 1	The x:xmpmeta XML element is required around rdf:RDF.
kXMP_StrictAliasing	= 4	Do not reconcile alias differences, throw an exception.

Note: The kXMP_StrictAliasing option is not yet implemented.

231.6.64 RegisterNamespace(namespaceURI as string, suggestedPrefix as string, byref registeredPrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register a namespace URI with a suggested prefix.
Example:

```
Var x as new XMPMetaMBS
Var registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer
```

Notes: It is not an error if the URI is already registered, no matter what the prefix is. If the URI is not registered but the suggested prefix is in use, a unique prefix is created from the suggested one. The actual registeed prefix is always returned. The function result tells if the registered prefix is the suggested one.

Parameters:

namespaceURI	The URI for the namespace. Must be a valid XML URI.
suggestedPrefix	The suggested prefix to be used if the URI is not yet registered. Must be a valid XML name.
registeredPrefix	Returns the prefix actually registered for this URI.

Returns true if the registered prefix matches the suggested prefix.

Note: No checking is presently done on either the URI or the prefix.

This is a global method which does not need a valid handle.

231.6.65 RemoveProperties(schemaNS as string="", propName as string="", options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove multiple properties from an XMP object.
Notes: RemoveProperties was created to support the File Info dialog's Delete button, and has been been generalized somewhat from those specific needs. It operates in one of three main modes depending on the schemaNS and propName parameters:
Non-empty schemaNS and propName - The named property is removed if it is an external property, or if the kXMPUI_DoAllProperties option is passed. It does not matter whether the named property is an actual property or an alias.
Non-empty schemaNS and empty propName - The all external properties in the named schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. In addition, aliases from the named schema will be removed if the kXMPUI_IncludeAliases option is passed.
Empty schemaNS and empty propName - All external properties in all schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. Aliases are implicitly handled because the associated actuals are.
It is an error to pass and empty schemaNS and non-empty propName.

xmpObj	The XMP object containing the properties to be removed.
schemaNS	Optional schema namespace URI for the properties to be removed.
propName	Optional path expression for the property to be removed.
options	Option flags to control the deletion. The defined flags are: kXMPUI_DoAllProperties - Do internal properties in addition to external properties. kXMPUI_IncludeAliases - Include aliases in the "named schema" case above.

231.6.66 SeparateArrayItems(schemaNS as string, arrayName as string, options as Integer, catedStr as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Separate a single edit string into an array of strings.
Notes: Parameters:

xmpObj	The XMP object containing the array to be updated.
schemaNS	The schema namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not an empty string. Each item in the array must be a simple string value.
options	Option flags to control the separation.
catedStr	The string to be separated into the array items.

231.6.67 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string=””, baseIndent as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SerializeToBuffer serializes an XMP object into a string as RDF.
Notes: Returns the serialized RDF.

Parameters:

options	Option flags to control the serialization.
padding	The amount of padding to be added if a writeable XML packet is created. If zero is passed (the default) an appropriate amount of padding is computed.
newline	The string to be used as a line terminator. If empty it defaults to linefeed, U+000A, the standard XML newline.
indent	The string to be used for each level of indentation in the serialized RDF. If empty it defaults to two ASCII spaces, U+0020.
baseIndent	The number of levels of indentation to be used for the outermost XML element in the serialized RDF. This is convenient when embedding the RDF in other text.

The available option flags are:

kXMP_OmitPacketWrapper	= &h10	Do not include an XML packet wrapper.
kXMP_ReadOnlyPacket	= &h20	Create a read-only XML packet wapper.
kXMP_UseCompactFormat	= &h40	Use a highly compact RDF syntax and layout.
kXMP_WriteAliasComments	= &h400	Include XML comments for aliases.
kXMP_IncludeThumbnailPad	= &h100	Include typical space for a JPEG thumbnail in the padding if no xmp:Thumbnails property is present.
kXMP_ExactPacketLength	= &h200	The padding parameter provides the overall packet length. The actual amount of padding is computed. An exception is thrown if the packet exceeds this length with no padding.

The specified options must be logically consistent, an exception is thrown if not. You cannot specify both kXMP_OmitPacketWrapper along with kXMP_ReadOnlyPacket, kXMP_IncludeThumbnailPad, or kXMP_ExactPacketLength.
In addition, one of the following encoding options may be included:

See also:

- 231.6.68 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string

kXMP_EncodeUTF8	= 0	Encode as UTF-8, the default.
kXMP_EncodeUTF16Big	= 2	Encode as big-endian UTF-16.
kXMP_EncodeUTF16Little	= 3	Encode as little-endian UTF-16.
kXMP_EncodeUTF32Big	= 4	Encode as big-endian UTF-32.
kXMP_EncodeUTF32Little	= 5	Encode as little-endian UTF-32.

231.6.68 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SerializeToBuffer serializes an XMP object into a string as RDF.
Example:

```
Var x as new XMPMetaMBS
Var registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer
```

Notes: Same as other SerializeToBuffer method, but with newline="", indent=0 and baseIndent=0.
See also:

- 231.6.67 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string="", baseIndent as Integer=0) as string 25022

231.6.69 SetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetArrayItem provides access to items within an array.
Notes: The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc. The array passed to SetArrayItem must already exist. See also AppendArrayItem.

In normal usage the selected array item is modified. A new item is automatically appended if the index is the array size plus 1. A new item may be inserted before or after any item by using one of the following option flags:

Parameters:

kXMP_InsertBeforeItem	= &h4000	Insert a new array item before the selected one.
kXMP_InsertAfterItem	= &h8000	Insert a new array item after the selected one.

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the item. See the earlier description.

231.6.70 SetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetLocalizedText modifies the value of a selected item in an alt-text array.
Notes: Creates an appropriate array item if necessary, and handles special cases for the x-default item.

If the selected item is from a match with the specific language, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a match with the generic language and there are no other generic matches, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a partial match with the generic language and there are other partial matches, a new item is created for the specific language. The x-default item is not modified.
If the selected item is from the last 2 rules then a new item is created for the specific language. If the array only had an x-default item, the x-default item is also modified. If the array was empty, items are created for the specific language and x-default.

Parameters:

231.6.71 SetProperty(schemaNS as string, propName as string, propValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be an empty string.
itemValue	An UTF-8 string that is the new value for the appropriate array item.
options	Option flags, none are defined at present.

Function: SetProperty is the simplest property setter, mainly for top level simple properties or after using the path composition functions.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An UTF-8 string that is the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	Option flags describing the property.

231.6.72 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 231.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer) 25026

231.6.73 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 231.6.72 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean) 25025

231.6.74 SetPropertyDate(schemaNS as string, propName as string, propValue as XMPDateTimeMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyDate sets the value of a date/time property from an XMPDateTimeMBS object.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The XMPDateTimeMBS object to be assigned to the property.
options	Option flags describing the property.

231.6.75 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyFloat sets the value of a floating point property from a double.
Notes: Parameters:

See also:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

- 231.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer) 25027

231.6.76 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyFloat sets the value of a floating point property from a double.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

See also:

- 231.6.75 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double) 25026

231.6.77 SetPropertyInt64Double(schemaNS as string, propName as string, propValue as Double, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInt64Double sets the value of a 64 bit integer property from a double.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double value to be assigned to the property.
options	Option flags describing the property.

231.6.78 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInteger sets the value of an integer property from an integer.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

See also:

- 231.6.79 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer) 25028

231.6.79 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInteger sets the value of an integer property from an integer.
Notes: Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

See also:

- 231.6.78 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer) 25028

231.6.80 SetPropertyInteger64(schemaNS as string, propName as string, propValue as Int64, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value of an integer property using an Int64.
Notes: Sets a property with a binary value, creating it if necessary.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be "" or the empty string; see GetProperty() for namespace prefix usage.
propValue: The new binary value.
options: Option flags describing the property; a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following. Must match the type of a property that already exists.

231.6.81 SetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, qualValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetQualifier provides access to a qualifier attached to a property.
Notes: The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields. See the introductory discussion of qualified properties for more information.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	An UTF-8 string that is the value of the qualifier, if the qualifier has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the qualifier.

231.6.82 SetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, fieldValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetStructField provides access to fields within a nested structure.
Notes: The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be null or the empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An UTF-8 string that is the value of the field, if the field has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the field.

231.6.83 Sort

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sorts the data model tree of an XMP object.
Notes: Use this function to sort the data model of an XMP object into a canonical order. This can be convenient when comparing data models, (e.g. by text comparison of DumpObject output).

At the top level the namespaces are sorted by their prefixes. Within a namespace, the top level properties are sorted by name. Within a struct, the fields are sorted by their qualified name, i.e. their XML prefix:local form. Unordered arrays of simple items are sorted by value. Language Alternative arrays are sorted by the xml:lang qualifiers, with the "x-default" item placed first.

231.6.84 Properties

231.6.85 GlobalOptions as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets or retrieves the set of global option flags.
Notes: (Read and Write computed property)

231.6.86 Name as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object name.
Notes: (Read and Write computed property)

231.6.87 Constants

Constants

Constant	Value	Description
kAllowCommas	&h10000000	One of the optic Used by Catena
kArrayLastItem	-1	The index const
kDeleteEmptyValues	4	One of the optic Delete propertie
kDeleteExisting	&h20000000	One of the cons Used by SetXyz

231.7 class XMPPacketInfoMBS

231.7.1 class XMPPacketInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for information about a xmp packet.
Blog Entries

- Tip of the day: Change EXIF metadata

231.7.2 Properties

231.7.3 CharForm as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Character format using the values kChar8Bit, kChar16BitBig, etc.
Notes: (Read and Write property)

231.7.4 HasWrapper as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if there is a packet wrapper, the "<?xpacket...>" XML processing instructions.
Notes: (Read and Write property)

231.7.5 Length as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet length in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

231.7.6 Offset as Int64

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet offset in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

231.7.7 PadSize as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet padding size in bytes, zero if unknown.
Notes: (Read and Write property)

231.7.8 Writeable as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if there is a packet wrapper and the trailer says writeable by dumb packet scanners.
Notes: (Read and Write property)

231.8 class XMPScannerMBS

231.8.1 class XMPScannerMBS

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to scan any file stream for XMP data.
Example:

```
Var c,n,i,l as Integer
Var xs as XMPScannerMBS
Var xn as XMPSnipMBS
Var s as string
Var x as XMPMetaMBS
Var b as BinaryStream
Var source as FolderItem

// get file
source=GetOpenFolderItem("any")
if source=nil then Return

b=source.OpenAsBinaryFile(false)

if b=nil then Return

// read file to memory
l=b.Length
s=b.Read(l)

// scan for xmp blocks
MsgBox "Scanning "+str(lenb(s))+" of "+str(l)+" bytes."

xs=new XMPScannerMBS(l)
xs.Scan(s,0)

MsgBox "Found "+str(xs.Report)+" blocks"

n=xs.Report-1

c=0
for i=0 to n

xn=xs.Snip(i)

if xn.State=3 then // found
if xn.Length>50 then
try
b.Position=xn.Offset
```

```
s=b.Read(xn.Length)

// debug output xmp data
'WriteInputXMP dest,s

// try to parse
x=new XMPMetaMBS(s)

// work with xmp meta data
catch r as XMPExceptionMBS
MsgBox "ExtractXMP failed on: "+r.message
end try
else
MsgBox "Found small xmp block? "+str(xn.Length)
end if
end if
next
```

231.8.2 Methods

231.8.3 Constructor

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor doing nothing.
See also:

- 231.8.4 Constructor(StreamLength as Integer) 25036

231.8.4 Constructor(StreamLength as Integer)

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor to create a XMPScanner which reads the given number of bytes.
See also:

- 231.8.3 Constructor 25036

231.8.5 Report as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Produces a report of what is known about the input stream.
Notes: The snipps found are saved in an array which you can access using the snip() function. Returns the

number of entries in this array.

231.8.6 Scan(Buffer as string, Offset as Int64)

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scans the given part of the input, incorporating it in to the known snips.
Notes: The Offset is the offset of this block of input relative to the entire stream.

231.8.7 Snip(index as UInt32) as XMPSnipMBS

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the snip with the given index.
Notes: index is zero based.
Returns nil on any error.
You must call Report before this method.

231.8.8 SnipCount as UInt32

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of snips found so far.

231.8.9 StreamAllScanned as boolean

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if all of the stream has been seen.

231.9 class XMPSnipMBS

231.9.1 class XMPSnipMBS

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the XMP Snips found by the XMPScannerMBS class.

231.9.2 Properties

231.9.3 Access as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The read-only/read-write access from the end attribute.
Notes: (Read and Write property)

231.9.4 BytesAttr as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the bytes attribute, -1 if not present.
Notes: (Read only property)

231.9.5 CharForm as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: How the packet is divided into characters.
Notes: The values allow easy testing for 16/32 bit and big/little endian.

eChar8Bit	= 0
eChar16BitBig	= 2
eChar16BitLittle	= 3
eChar32BitBig	= 4
eChar32BitLittle	= 5

(Read and Write property)

231.9.6 EncodingAttr as String

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the encoding attribute, if any, with nulls removed.
Notes: (Read and Write property)

231.9.7 Length as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length in bytes of this snip.
Notes: (Read only property)

231.9.8 Offset as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The byte offset of this snip within the input stream.
Notes: (Read only property)

231.9.9 OutOfOrder as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, this snip was seen before the one in front of it.
Notes: (Read and Write property)

231.9.10 State as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The state of this snip.
Notes: constants:

(Read and Write property)

eNotSeenSnip	0	This snip has not been seen yet.
ePendingSnip	1	This snip is an input buffer being processed.
eRawInputSnip	2	This snip is raw input, it doesn't contain any part of an XMP packet.
eValidPacketSnip	3	This snip is a complete, valid XMP packet.
ePartialPacketSnip	4	This snip contains the start of a possible XMP packet.
eBadPacketSnip	5	This snip contains a complete, but semantically incorrect XMP packet.

231.10 class XMPTextOutputMBS

231.10.1 class XMPTextOutputMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An event class for text output.
Notes: You may want to make a subclass which collects all the strings into one string or write them to a file.

231.10.2 Events

231.10.3 Output(text as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: New text arrived.
Notes: You may get more than one event per line.
Return 0 for success or something else for failure.

231.11 class XMPVersionInfoMBS

231.11.1 class XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XMP Version class.
Example:

```
Var v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

Notes: Constructor sets values.

231.11.2 Properties

231.11.3 Build as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A rolling build number, monotonically increasing in a release.
Notes: (Read and Write property)

231.11.4 Flags as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Individual feature implementation flags.
Notes: (Read and Write property)

231.11.5 IsDebug as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if this is a debug build.
Notes: (Read and Write property)

231.11.6 Major as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The primary release number, the "1" in version "1.2.3".
Notes: (Read and Write property)

231.11.7 Message as String

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A comprehensive version information string.
Example:

```
Var v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

Notes: (Read and Write property)

231.11.8 Micro as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tertiary release number, the "3" in version "1.2.3".
Notes: (Read and Write property)

231.11.9 Minor as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The secondary release number, the "2" in version "1.2.3".
Notes: (Read and Write property)

Chapter 232

XojoRuntime

232.1 Globals

232.1.1 AllObjectsOfClassMBS(ClassName as String) as Variant()

MBS Util Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Find all objects with given class using IsA operator.
Example:

```
Var AllWindows() As Variant = AllObjectsOfClassMBS("Window")
Var AllMenuItems() As Variant = AllObjectsOfClassMBS("MenuItem")
Var AllDictionary() As Variant = AllObjectsOfClassMBS("Dictionary")

Break
```

Notes: Similar to using Runtime.IterateObjects directly, loop over all objects and do a check with ISA operator on each one. The plugin is a bit more efficient doing this and returns matching items as array of variant.

Raises exception if class name is empty or not a known class to the Xojo runtime.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 21.1
- MBS Xojo Plugins, version 21.1pr4

232.1.2 ArrayDoubleMBS(paramArray values as Double) as Double()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Var a() As Double = ArrayDoubleMBS(1, 2, 3)

// failes
Var b() As Double = Array(1,2,3)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

232.1.3 ArrayInt64MBS(paramArray values as Int64) as Int64()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Var a() As Int64 = ArrayInt64MBS(1, 2, 3.0)

// failes
Var b() As Int64 = Array(1,2,3.0)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

232.1.4 ArrayIntegerMBS(paramArray values as Integer) as Integer()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Var a() As Integer = ArrayIntegerMBS(1, 2, 3.0)

// failes
Var b() As Integer = Array(1,2,3.0)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

232.1.5 ArrayIsAMBS(v as Variant, ClassName as string) as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if variant contains an array of the given class type.
Example:

```
Var w() as MouseCursor
w.Append System.Cursors.ArrowEastWest
w.Append System.Cursors.ArrowNorthSouth

Var v as Variant = w

if ArrayIsAMBS(w, "MouseCursor") then
MsgBox "OK"
end if
```

Notes: If the variant contains an array of some class, variant or object and has at least one value, the plugin checks this first value for being of type of the same class. Like an ISA check.
This helps to solve feedback case 12213.
Returns false if variant has no array, if variant is nil, if array is not an array of objects or if first object is nil.
Blog Entries

- Useful array and variant functions
- MBS Real Studio Plugins, version 12.3pr11

232.1.6 ArrayStringMBS(paramArray values as String) as String()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
Var a() As String = ArrayStringMBS("Hello", "World")
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

232.1.7 ArrayVariantMBS(paramArray values as Variant) as Variant()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
Var a() As Variant = ArrayVariantMBS(1, 2, 3.0, True, False)
```

Notes: With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

- 19.1, page 11: News

232.1.8 GetArrayAllocatedSizeMBS(v as variant) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries allocated array size in bytes.
Example:

```
Var a() As Integer // 8 byte per integer in 64-bit

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

Redim a(9) // changes to 80 bytes

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

Redim a(19) // changes to 160 bytes

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

a.Append 123

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))
// shows 288, adds space for 16 more values
```

Notes: This function uses internal knowledge of the array layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

Stopped working on Windows in recent Xojo versions, so we deprecated it.

232.1.9 GetArrayDataPointerMBS(v as variant) as Ptr

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries base pointer for the array data.
Notes: The pointer changes when append/insert/redim allocates new memory block.

This function uses internal knowledge of the array layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

232.1.10 GetAutoMemoryAddressMBS(o as auto) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries memory address of auto object.
Example:

```
Var t As Auto = "Hello World"
Var o As Auto = "Hello "

o = o + "World"

Var s As Auto = t

Var ta As Integer = GetAutoMemoryAddressMBS(t)
Var oa As Integer = GetAutoMemoryAddressMBS(o)
Var sa As Integer = GetAutoMemoryAddressMBS(s)

// s and t show same address, but o is different
MsgBox Hex(ta)+EndOfLine+Hex(oa)+EndOfLine+Hex(sa)

// and s and t show address in const segment in the app, while o is dynamically allocated and has an heap address
```

Notes: Allows you to compare if two variables refer same object.

232.1.11 GetDelegateParametersMBS(del as variant) as String

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries parameter signature of a delegate.
Example:

```
Var aDelegate As ADelegate
aDelegate = AddressOf someFunction

Var p As String = GetDelegateParametersMBS(aDelegate)
MsgBox p
```

Notes: This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.
Blog Entries

- Inside Delegates

232.1.12 GetDelegateTargetMBS(del as variant) as Variant

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries target object of a delegate.
Example:

```
Var aDelegate As ADelegate
aDelegate = AddressOf someFunction

Var target As Variant = GetDelegateTargetMBS(aDelegate)
MsgBox "target: "+Introspection.GetType(target).fullname
```

Notes: This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

232.1.13 GetDelegateWeakMBS(del as variant) as Boolean

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries weak flag of a delegate.
Example:

```
Var aDelegate As ADelegate
aDelegate = AddressOf someFunction

Var weak As Boolean = GetDelegateWeakMBS(aDelegate)
MsgBox "weak: "+Str(weak)
```

Notes: This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

232.1.14 GetObjectMemoryAddressMBS(o as object) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory address of object.
Example:

```
Var a As Integer = GetObjectMemoryAddressMBS(app)

// show address
MsgBox Hex(a)
```

Notes: Allows you to compare if two variables refer same object.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

232.1.15 GetObjectReferenceCountMBS(o as object) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries object reference count.
Example:

```
Var o As Object = window1

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

Var k as Object = o

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

Var v as Variant = o

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

v = Nil
k = nil

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))
```

Notes: This function uses internal knowledge of the object layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

232.1.16 GetStringMemoryAddressMBS(s as string) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory address of string.
Example:

```
Var t As String = "Hello World"
Var o As String = "Hello "

o = o + "World"

Var s As String = t

Var ta As Integer = GetStringMemoryAddressMBS(t)
Var oa As Integer = GetStringMemoryAddressMBS(o)
Var sa As Integer = GetStringMemoryAddressMBS(s)

// s and t show same address, but o is different
```

```
MsgBox Hex(ta)+EndOfLine+Hex(oa)+EndOfLine+Hex(sa)

// and s and t show address in const segment in the app, while o is dynamically allocated and has an heap address
```

Notes: Allows you to compare if two variables refer same string.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

232.1.17 GetStringReferenceCountMBS(s as string) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string reference count.
Example:

```
Var a As String = "World"
Var s As String = "Hello "+a // use + to make new string

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

Var k As String = s

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

Var v As Variant = s

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

v = ""
k = ""

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))
```

Notes: This function uses internal knowledge of the string layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

232.1.18 GetTextMemoryAddressMBS(s as text) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries memory address of text object.

Example:

```
Var t As Text = "Hello World"
Var n As Integer = GetTextMemoryAddressMBS(t)
MsgBox Hex(n)
```

Notes: Allows you to compare if two variables refer same text.

232.1.19 GetVariantArrayMBS(VariantContainingArray as Variant) as Variant()

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variant containing array for an array and returns it as an array of variant.
Example:

```
Var test() as Dictionary
test.Append new Dictionary

// this fails
Var vv As Variant = test
Var t() As Variant = vv

// this works!
Var v() as Variant = GetVariantArrayMBS(test)
Var dic as Dictionary = v(0)
Break
```

Notes: Works with all arrays of objects (any type).
Raises exception if the array can't be converted or the variant contains no array.

232.1.20 GetVariantArrayUboundMBS(v as Variant) as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array ubound for an array inside a variant.
Notes: If you have an array in the variant, you'd normally assign it to an array to query values from array. This function queries ubound directly.
Returns -3 if variant is nil and -2 if variant contains not an object array.
Updated in 13.5 plugins to raise exception is array is nil.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr8
- MBS Real Studio Plugins, version 13.0pr8

232.1.21 GetVariantArrayValueMBS(v as Variant, index as Integer) as Variant

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variant from an array inside a variant.
Example:

```
// some part of app builds an array
Var a() as pair
a.Append 1:"Hello"
a.Append 2:"World"

// passes it as Variant somewhere else

Var v as Variant = a

// and later you may want to get values back without knowing the array type

// this raises TypeMismatchException
'dim o() as Object = v

// so use plugin to get objects:
Var v1 as Variant = GetVariantArrayValueMBS(v, 0)
Var v2 as Variant = GetVariantArrayValueMBS(v, 1)

// now you can check type and cast to the object type
Var p1 as pair = v1
Var p2 as pair = v2
```

MsgBox p1.Right+" "+p2.Right

Notes: This function is to allow getting objects from an array inside a variant without known the class used to declare array.
Returns nil on any error.

Updated in 13.5 plugins to raise exception is array is nil.

Also updated in v13.5 to work with object, variant, string, date, integer, double, single, boolean, Int64 arrays. Other array types will raise exception.

232.1.22 GetVariantAsDictionaryArrayMBS(v as variant) as Dictionary()

MBS Util Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Casts a variant to a dictionary array.
Example:

```
Var d As New Dictionary
Var v() As Variant
v.Append d
v.Append Nil

Var va as Variant = v
'Dim dic() As Dictionary = va // type mismatch exception
Var dic() As Dictionary = GetVariantAsDictionaryArrayMBS(va) // works

Break
```

Notes: Raises exception if variant does not have an object/variant array.
If it contains a non-dictionary object, we raise an exception.

- MonkeyBread Software Releases the MBS Xojo Plugins in version 20.4
- MBS Xojo Plugins, version 20.4pr7

232.1.23 GetVariantTypeMBS(va as variant) as Integer

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries variant type.
Example:

```
Var i As Int32 = 5
Var u As UInt32 = 5
Var vi As Variant = i
Var vu As Variant = u
Var ti As Integer = vi.Type // 2
Var tu As Integer = vu.Type // 2
Var mi As Integer = GetVariantTypeMBS(vi) // 2
Var mu As Integer = GetVariantTypeMBS(vu) // 102

Break // check in debugger
```

Notes: Same as variant.type or VarType() function, but returns 102 for UInt32 and 103 for UInt64.
This way plugin functions internally can distinguish between variants with unsigned vs. signed data types.

232.1.24 ObjectIsAMBS(o as object, ClassName as string) as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a given object is of a given class.
Example:

```
// you must know exact name of class

Var v as Variant = window1

if ObjectIsAMBS(v, "window1.window1") then
MsgBox "OK"
end if

v = System.Cursors.MagnifyLarger

if ObjectIsAMBS(v, "MouseCursor") then
MsgBox "OK"
end if
```

Notes: Like ISA operator, but with class name as string.
Returns false if o is nil.
Blog Entries

- Useful array and variant functions
- MBS Real Studio Plugins, version 12.3pr11

232.1.25 SetVariantArrayValueMBS(v as Variant, index as Integer, value as Variant)

MBS Util Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an object from an array of objects inside a variant.
Example:

```
// some part of app builds an array
Var a() as pair

// passes it as Variant somewhere else

Var v as Variant = a

// and later you may want to put values in array without knowing object type for array

// this raises TypeMismatchException
'dim o() as Object = v
```

```
// so use plugin

SetVariantArrayValueMBS(v, 0, 1:"Hello")
SetVariantArrayValueMBS(v, 1, 2:"World")

MsgBox a(0).Right+" "+a(1).Right
```

Notes: This function is to allow setting objects in an array inside a variant without known the class used to declare array.
Also updated to work with object, variant, string, date, integer, double, single, boolean, Int64 arrays. Other array types will raise exception.
Be sure to only put objects of right class in the array! Else you risk crashes.

If index is 1 bigger than ubound, we append an element.

232.1.26 GetEncodingOfStringMBS(s as string) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the internal value for the encoding.
Example:

```
Var s as string = "Hello"

MsgBox hex(GetEncodingOfStringMBS(s)) // shows 8000100 for UTF8
```

Notes: Only useful on Xojo 4.5 and newer.
Some example values for encoding:

Renamed from GetStringEncoding to GetEncodingOfString in MBS Plugin 3.1.
Xojo Developer Magazine

- 2.4, page 43: Cross platform streams, We write our own binary stream to save our data by Christian Schmitz

MacRoman	0	Also for ASCII or binary data used.
WindowsLatin1	&h0500	ANSI codepage 1252
ISOLatin1	&h0201	ISO 8859-1
NextStepLatin	&h0B01	NextStep encoding
Unicode	&h0100	16 bit Unicode
UTF8	&h08000100	8 bit Unicode
Invalid	&hFFFFFFFF	(Binary)
Invalid	&hFFFF	(Binary)

232.1.27 SetEncodingOfStringMBS(s as string, encoding as UInt32)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the internal value for the encoding of this string.
Example:

```
Var s as string = "√§√√º"
Var t as string = ConvertEncoding(s, encodings.UTF16)
Var m as MemoryBlock = t // memoryblock has bytes from UTF16 string without knowning the encoding
Var u as string = m // convert back to a string without encoding

MsgBox u // shows wrong characters
SetEncodingOfStringMBS u, 256 // set to UTF-16
MsgBox u
```

Notes: Only useful on Xojo 4.5 and newer.
Some example values for encoding:

MacRoman	0	Also for ASCII or binary data used.
WindowsLatin1	&h0500	ANSI codepage 1252
ISOLatin1	&h0201	ISO 8859-1
NextStepLatin	&h0B01	NextStep encoding
Unicode	&h0100	16 bit Unicode
UTF8	&h08000100	8 bit Unicode
Invalid	&hFFFFFFFF	(Binary)
Invalid	&hFFFF	(Binary)

Renamed from SetStringEncoding to SetEncodingOfString in MBS Plugin 3.1.
Xojo Developer Magazine

232.1.28 GetArrayDimensionMBS(v as variant) as integer

MBS Util Plugin, Plugin Version: 26.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of dimensions in an array.
Example:

```
Var test3(7,7,7) As Integer

Var t As Integer = GetArrayDimensionMBS(test3)
MessageBox Str(t)+" dimensions" // shows 3
```

232.2.2 Methods

232.2.3 Compact

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Compacts memory.
Notes: Asks malloc to free empty pages to the OS.

232.2.4 Constructor

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: The constructor.
Notes: Initializes the properties.

232.2.5 MemoryStatistics as MemoryStatisticsMBS

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Queries statistics for malloc.

232.2.6 Properties

232.2.7 BytesFree as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Number of bytes free.
Notes: Memory used for objects, but now available for reuse with new objects.
And can't be freed usually as several objects share same memory page, so we keep the page.
(Read only property)

232.2.8 BytesTotal as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Total bytes allocated currently from OS.
Notes: Free and used blocks.
(Read only property)

232.2.9 BytesUsed as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Used bytes of memory.
Notes: Within total memory, the number of bytes currently in use.
This is what Xojo reports for Runtime.MemoryUsed.
(Read only property)

232.2.10 ChunksFree as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Number of free chunks.
Notes: Could be freed.
(Read only property)

232.2.11 ChunksUsed as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Number of chunks in use.
Notes: Not available on Linux.
(Read only property)

Chapter 234

The FAQ

234.0.1 Can anyone help me convert seconds to time in this format hh:mm:ss?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Sure, here's a routine I use (which has an advantage over the previously-posted Date-based solution in that you don't have to rely on the creation of an object – all that happens is some division and string concatenation):
Example:

```
Function SecsToTimeString(timeInSecs as Integer, padHours as boolean, padMinutes as boolean) as string
// Given an amount time (in seconds), generates a string representing that amount
// of time. The padHours and padMinutes parameters determine whether to display
// hours and minutes if their values are zero.

// Examples:
// timeInSecs = 90, padHours = true; returns "00:01:30"
// timeInSecs = 1, padHours = false, padMinutes = true; returns "00:01"
// timeInSecs = 3601, padMinutes = false; returns "01:00:01"

Var hours, minutes, seconds as Integer
Var hoursString, minutesString as string

hours = timeInSecs / 3600
minutes = (timeInSecs mod 3600) / 60
seconds = timeInSecs mod 60

if hours = 0 then
if padHours then
hoursString = "00:"
else
hoursString = ""
end if
```

```
else
hoursString = Format(hours, "##\:")
end if
if minutes = 0 then
if hours <>0 or padMinutes then
minutesString = "00:"
else
minutesString = ""
end if
else
minutesString = Format(minutes, "00\:")
end if

return hoursString + minutesString + Format(seconds, "00")
End Function
```

Notes: (from the rb mailinglist)

234.0.2 Do you have plugins for Android?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Since there is no plugin SDK for Android, we have no way to make a plugin for Android.
Notes: We support macOS, Windows, Linux and iOS.

234.0.3 How do I get the proper highlight color on Mac OS X for active/inactive selection?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use functions from NSColor to get proper highlight color in RGB:
Example:

```
Function ProperHighlightColor(active as Boolean) As Color
#if TargetCocoa
Var theColor As NSColorMBS
If active Then
theColor = NSColorMBS.alternateSelectedControlColor
Else
theColor = NSColorMBS.secondarySelectedControlColor
End If

Var rgbColor As NSColorMBS = theColor.colorUsingColorSpaceName(NSColorSpaceMBS.NSCalibratedRG-
BColorSpace)
```

```
If rgbColor <>Nil Then
Var red as Integer = rgbColor.redComponent * 255.0
Var green as Integer = rgbColor.greenComponent * 255.0
Var blue as Integer = rgbColor.blueComponent * 255.0
Return RGB(red, green, blue)
Else
Return HighlightColor
End If
#else
return HighlightColor
#endif
End Function
```

Notes: As you see we convert color to Calibrated RGB for best results.

234.0.4 How to catch delete key?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The following is the code in keydown event catches delete or backspace keys.
Example:

```
Function KeyDown(Key As String) As Boolean
if asc(key) = 8 or asc(key) = 127 then
MsgBox "Delete"
Return true
end if
End Function
```

- 234.0.9 How to refresh a htmlviewer on Windows? 25082

234.0.5 How to convert cmyk to rgb?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

The following is the code to convert cmyk values to an RGB color datatype.
It's just a basic estimate of the color values. If you are looking for completely color accurate solution, this is not it. It should work for most people. :)
Example:

```
Function CMYKToRGB(c as Integer, m as Integer, y as Integer, k as Integer) As color
// converts c,m,y,k values (0-100) to color data type RGB
// place this in a method. Supply C,M,Y,K values-
// it returns color datatype

Var color_RGB as color
Var r, g, b as Integer

r=255-round(2.55*(c+k))
if r<0 then
r=0
end if
g=255-round(2.55*(m+k))
if g<0 then
g=0
end if
b=255-round(2.55*(y+k))
if b<0 then
b=0
end if

color_RGB=RGB(r,g,b)

return color_RGB

End Function
```

234.0.6 How to delete a folder?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The following is the code deletes a folder recursively.
Example:

```
Sub deletefolder(f as folderitem)
Var files(-1) as FolderItem

if f=nil then Return

// delete single file
if f.Directory=false then
f.Delete
Return
end if

// get a list of all items in that folder
Var i,c as Integer
c=F.Count
for i=1 to c
files.Append f.TrueItem(i)
next

// delete each item
for each fo as FolderItem in files
if fo=nil then
' ignore
elseif fo.Directory then
deletefolder fo
fo.delete
else ' file
fo.Delete
end if
next

f.Delete
```

```
End Sub
```

- 234.0.9 How to refresh a htmlviewer on Windows? 25082

234.0.7 How to detect if CPU if 64bit processor?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Via CPUID you can ask CPU:
Example:

```
Var c as new CPUIDMBS

if c.Flags(CPUIDMBS.kFeatureLM) then
MsgBox "64-bit CPU"
else
MsgBox "32-bit CPU"
end if
```

Notes: Should work on all intel compatible CPUs.

- 234.0.4 How to catch delete key? 25077
- 234.0.5 How to convert cmyk to rgb? 25078
- 234.0.6 How to delete a folder? 25079
- 234.0.8 How to query variant type string for a variant? 25081
- 234.0.9 How to refresh a htmlviewer on Windows? 25082

234.0.8 How to query variant type string for a variant?

Plugin Version: 20.5, Platforms: macOS, Linux, Windows.

Answer: The following example function returns type string for variant.
Example:

```
Public Function VariantTypeString(v as Variant) as string
// Xojo's VarType doesn't know Unsigned integers
'Dim type As Integer = VarType(v)

// MBS VarType can detect unsigned integer
Var type As Integer = GetVariantTypeMBS(v)

Var IsArray As Boolean = BitwiseAnd(type, Variant.TypeArray) = Variant.TypeArray

// type without array
type = BitwiseAnd(type, Bitwise.OnesComplement(Variant.TypeArray))

// build a dictionary to map types on first call
Static TypeMap As Dictionary
If TypeMap = Nil Then
TypeMap = New Dictionary
TypeMap.Value(Variant.TypeBoolean) = "Boolean"
TypeMap.Value(Variant.TypeCFStringRef) = "CFStringRef"
TypeMap.Value(Variant.TypeColor) = "Color"
TypeMap.Value(Variant.TypeCString) = "CString"
TypeMap.Value(Variant.TypeCurrency) = "Currency"
TypeMap.Value(Variant.TypeDate) = "Date"
TypeMap.Value(Variant.TypeDateTime) = "DateTime"
TypeMap.Value(Variant.TypeDouble) = "Double"
TypeMap.Value(Variant.TypeInt32) = "Int32"
TypeMap.Value(Variant.TypeInt64) = "Int64"
TypeMap.Value(Variant.TypeInteger) = "Integer"
TypeMap.Value(Variant.TypeNil) = "Nil"
TypeMap.Value(Variant.TypeObject) = "Object"
TypeMap.Value(Variant.TypeOSType) = "OSType"
TypeMap.Value(Variant.TypePString) = "PString"
TypeMap.Value(Variant.TypePtr) = "Ptr"
TypeMap.Value(Variant.TypeSingle) = "Single"
TypeMap.Value(Variant.TypeString) = "String"
TypeMap.Value(Variant.TypeStructure) = "Structure"
TypeMap.Value(Variant.TypeText) = "Text"
TypeMap.Value(Variant.TypeWindowPtr) = "WindowPtr"
TypeMap.Value(Variant.TypeWString) = "WString"

// MBS extra types
TypeMap.Value(Variant.TypeInt32+100) = "UInt32"
TypeMap.Value(Variant.TypeInt64+100) = "UInt64"
```

```
End If

// lookup type

#if DebugBuild then
If Not TypeMap.HasKey(type) Then
Break // missing type
End If
#endif

If IsArray Then
Return "Array of " + TypeMap.Lookup(type,"?")
Else
Return TypeMap.Lookup(type,"?")
End If
End Function
```

234.0.9 How to refresh a htmlviewer on Windows?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can ask the browser to reload the website with this code line:
Example:

```
call htmlViewer1.IERunJavaScriptMBS("javascript:document.location.reload()")
```

234.0.10 Is there an example for vector graphics in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this example inside the paint event of a window:
Example:

```
Var v as Group2D
Var r as RectShape
Var s as StringShape

const pi=3.14

s=new StringShape
s.Text="Hello World!"
s.TextFont="Geneva"
s.TextSize=24
s.FillColor=rgb(0,0,255)
s.Italic=true
s.y=5
s.x=0

r=new RectShape

r.X=0
r.y=0
r.Height=100
r.Width=180
r.BorderColor=rgb(255,0,0)
r.FillColor=rgb(0,255,0)
r.BorderWidth=5
r.Border=50

v=new Group2d
v.Append r
v.Append s
v.Rotation=pi*-20.0/180.0
v.x=150
v.y=150

g.DrawObject v
```

234.0.11 Picture functions do not preserve resolution values?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, the picture functions return pictures with no/default resolution values.
Example:

```
Var l as Picture = LogoMBS(500)

l.HorizontalResolution = 300
l.VerticalResolution = 300

Var r as Picture = l.Rotate90MBS

MsgBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)

r.HorizontalResolution = l.HorizontalResolution
r.VerticalResolution = l.VerticalResolution

MsgBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)
```

Notes: So please fix them yourself after calling a function.

Maybe in the future this changes, but currently you can't really set this easily from plugin code.

234.0.12 A toolbox call needs a rect - how do I give it one?

Plugin Version: all, Platforms: macOS, Windows.

Answer: Fill a memoryblock like this:
Example:

```
Var MB As Memoryblock
MB = NewMemoryBlock(8)
MB.Short(0) = window1.Top
MB.Short(2) = window1.Left
MB.Short(4) = window1.Height+window1.Top // bottom
MB.Short(6) = window1.Width+window1.Left // right
```

234.0.13 API client not supported?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: If you get this exception message on SQLConnectionMBS.Connect, we may have a problem.

Notes: First case is that the given thing is not supported (e.g. MS SQL directly on Mac).
Second case is that the plugin compilation went wrong and the support for the database was not linked into the plugin. Like MySQL missing or MS SQL on Windows missing. In that case please contact us to fix the plugin.

234.0.14 Can I access Access Database with Java classes?

Plugin Version: all, Platform: Windows.

Answer: You can use ucanaccess to access databases created with Microsoft
Example:

```
Var options(-1) as string

// load all the jar files we have in a folder called java:

Var appFolder as FolderItem = GetFolderItem("")

Var count as Integer = appFolder.Parent.Child("java").Count
Var libjs() as string
For i as Integer = 1 to count
Var f As FolderItem = appFolder.Parent.Child("java").item(i)
If f <>Nil and f.Exists Then
libjs.append f.NativePath+";"
End If
Next

// now init virtual machine
Var librery as string = Join(libjs, "")
Var vm as new JavaVMMBS(librery)

if vm.Handle = 0 then
MsgBox "Failed to initialize virtual machine"
else
// now make a new database connection with ucanaccess
Var d as new JavaDatabaseMBS(vm,"net.ucanaccess.jdbc.UcanaccessDriver")
Var DbFile as FolderItem = appFolder.Parent.Child("Database11.accdb")
Var j as JavaConnectionMBS = d.getConnection("jdbc:ucanaccess://"+DbFile.NativePath)

// select and show values
Var r as JavaResultSetMBS = j.MySelectSQL("Select * From test")
while r.NextRecord
MsgBox r.getString("FirstName") +" "+ r.getString("LastName")
wend

end if
```

```
Exception e as JavaExceptionMBS
MsgBox e.message+" errorcode: "+str(e.ErrorNumber)
```

Notes: see website:
http://ucanaccess.sourceforge.net/site.html

234.0.15 Can I create PDF from Xojo Report using DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, we have a graphics class integration for DynaPDF.
Notes: Since MBS Plugin in version 19.2, we can integrate reports with Xojo.

234.0.16 Can I use AppleScripts in a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, but they run on the server, not on the client.
Example:

```
Var a as new AppleScriptMBS

// query my application name
a.Compile "tell application ""System Events"" to return name of current application"

// run
a.Execute

// show result
label1.text = a.Result

// shows something like "My Application.fcgi.debug"
```

Notes: This can be useful to control the server from remote, if and only if the your sever is running Mac OS X.

234.0.17 Can I use graphics class with DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Sorry, no. We can't provide a graphics subclass from plugin.
Notes: The is a feature request to allow graphics subclasses:

Feedback case 11391: feedback://showreport?report_id=11391

234.0.18 Can I use sockets on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, but they run on the server, not on the client.
Notes: You can use HTTPSocket, SMTPSocket, POP3Socket, SMTPSecureSocket, SecurePOP3Socket, EasyTCPSocket, EasyUDPSocket, AutoDiscovery, our Bonjour classes or our CURL* classes. But all of them work on the server, not on the client.

This means if you search for a printer with Bonjour, you can find the printers in the local network on your server hosting site. Using SMTPSocket may be a good idea for sending emails from the server like notifications.

234.0.19 Can I use your ChartDirector plugin on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, our ChartDirector plugin works just fine on the Xojo Web Edition.
Example:

```
// The data for the pie chart
Var data(-1) as Double=array(55.0, 18.0, 25.0, 22.0, 18.0, 30.0, 35.0)

// The labels for the pie chart, Words are choosen random to check font!
Var labels(-1) as string=array("Germany","Italy","France","Spain","UK","Poland","Russia")

// The colors to use for the sectors
Var colors(-1) as Integer

colors.Append &h66aaee
colors.Append &heebb22
colors.Append &hbbbbbb
colors.Append &h8844ff

if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype/msttcorefonts"
end if

// Create a PieChart object of size 360 x 300 pixels
Var c as new CDPieChartMBS(700, 600)

c.setBackground(c.linearGradientColor(0, 0, 0, c.getHeight(), &h0000cc, &h000044))
```

```
c.setRoundedFrame(&hffffff, 16)
Var tt as CDTextBoxMBS = c.addTitle("ChartDirector Demonstration", "timesbi.ttf", 18)
tt.setMargin(0, 0, 16, 0)
tt.setFontColor(&hFFFFFF)

// Set the center of the pie at (180, 140) and the radius to 100 pixels
c.setPieSize 350,300,150
// Set the sector colors
c.setColors(c.kDataColor, colors)

// Draw the pie in 3D with a pie thickness of 20 pixels
c.set3D(20)

Var t as CDTextBoxMBS = c.setLabelStyle("arialbd.ttf", 10, &h000000)
t.setBackground(CDPieChartMBS.kSameAsMainColor, CDPieChartMBS.kTransparent, CDPieChartMBS.soft-
Lighting(CDPieChartMBS.kRight, 0))
t.setRoundedCorners(8)

// Use local gradient shading for the sectors, with 5 pixels wide
// semi-transparent white (bbffffff) borders
c.setSectorStyle(CDPieChartMBS.kLocalGradientShading, &hbbffffff, 0)

// Set the pie data and the pie labels
c.setData data,labels
call c.setLabelStyle "arialbd.ttf",18

Var pic as picture = c.makeChartPicture
Var wp as new WebPicture(pic, Picture.FormatJPEG) // JPEG makes it smaller and faster

ImageView1.Picture=wp
```

Notes: Be aware that our plugin produces pictures for you, which you assign to ImageViews. Transferring those pictures takes time, so you can optimize that with using WebPicture class. There you can decide between different compressions to improve speed (use JPEG instead of PNG).

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

234.0.20 Can I use your DynaPDF plugin on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, our DynaPDF plugin works just fine on the Xojo Web Edition.
Notes: PDF files are created on the server. You may want to offer a preview to the user which uses reduced resolution images to reduce the time to download the PDF.

See our Create PDF example for the Xojo Web Edition.

234.0.21 Can I use your plugin controls on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: No.

234.0.22 Can you get an unique machine ID?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: There is nothing like an unique machine ID.
Notes: 1:
You can use the MAC IDs of the network interfaces.
This can be changed by the user with software tools.
And the list of network interfaces changes if user reorder the interfaces.

2:
You can use the system folder creation date/time.
This may stay equal after cloning machines or after migration to new PC.

3:
You can use the Mac Serialnumber.
Mac only and it can happen that a Mac does not have a serial number.

4:
You can use the x86 CPU ID.
This is x86 CPU only and does not avoid running on the same CPU in different PCs.

234.0.23 ChartDirector: Alignment Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Alignment Specification
Notes: In many ChartDirector objects, you may specify the alignment of the object's content relative to its boundary. For example, for a TextBox object, you may specify the text's alignment relative to the box

boundary by using TextBox.setAlignment.

The ChartDirector API defines several constants for the alignment options.

ConstantValueDescription

BottomLeft	1	The leftmost point on the bottom line.
BottomCenter	2	The center point on the bottom line.
BottomRight	3	The rightmost point on the bottom line.
Left	4	The leftmost point on the middle horizontal line.
Center	5	The center point on the middle horizontal line.
Right	6	The rightmost point on the middle horizontal line.
TopLeft	7	The leftmost point on the top line.
TopCenter	8	The center point on the top line.
TopRight	9	The rightmost point on the top line.
Bottom	2	The center point on the bottom line. Same as BottomCenter.
Top	8	The center point on the top line. Same as TopCenter.
TopLeft2	10	An alternative top-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopLeft2 refers to refers to the left of the top side, while TopLeft refers to the top of the left side. The reverse applies for a horizontal axis.
TopRight2	11	An alternative top-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopRight2 refers to refers to the right of the top side, while TopRight refers to the top of the right side. The reverse applies for a horizontal axis.
BottomLeft2	12	An alternative bottom-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomLeft2 refers to refers to the left of the bottom side, while BottomLeft refers to the bottom of the left side. The reverse applies for a horizontal axis.
BottomRight2	13	An alternative bottom-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomRight2 refers to refers to the right of the bottom side, while BottomRight refers to the bottom of the right side. The reverse applies for a horizontal axis.

234.0.24 ChartDirector: Color Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Color Specification
Notes: Many functions in the ChartDirector API accept colors as parameters. ChartDirector supports colors specified in web and HTML compatible ARGB format, in which ARGB refers to the Alpha transparency, Red, Green and Blue components of the color.

In addition to ARGB colors, ChartDirector supports ”dynamic” colors. A dynamic color is a color that changes depending on the position of the pixels. The ”dynamic” colors that ChartDirector supports include ”pattern colors”, ”metal colors”, ”gradient colors”, ”zone colors” and ”dash line colors”.

ChartDirector supports specifying colors indirectly using ”palette colors”. When a ”palette color” is used, the color is specified as an index to a palette. The actual color is looked up from the palette.ARGB Color
ARGB color consists of 4 components - alpha transparency, red, green and blue. The four components are encoded as a 32-bit number, with each component occupying 8 bits. In hexadecimal notation, it is AARRGGBB, where AA, RR, GG and BB are the alpha transparency, red, green and blue components.

Each component ranges from 00 - FF (0 - 255), representing its intensity. For example, pure red color is 00FF0000, pure green color is 0000FF00, and pure blue color is 000000FF. White color is 00FFFFFF, and black color is 00000000.

Most programming language requires you to put special prefix in front of hexadecimal characters. For C++, the prefix is ”0x”. For example, the syntax for the hexadecimal number 00FFFFFF is 0x00FFFFFF, or simply 0xFFFFFF.
For the alpha transparency component, a zero value means the color is not transparent all at. This is equivalent to traditional RGB colors. A non-zero alpha transparency means the the color is partially transparent. The larger the alpha transparency, the more transparent the color will be. If a partially transparent color is used to draw something, the underlying background can still be seen.

For example, 80FF0000 is a partially transparent red color, while 00FF0000 is a non-transparent red color.

Note that ChartDirector’s ARGB color is web and HTML compatible. For example, red is FF0000, the same as in HTML. There are many resources on the web that provide tables in which you can click a color and it will show its HTML color code. These color codes can be used in ChartDirector.

If alpha transparency is FF (255), the color is totally transparent. That means the color is invisible. It does not matter what the RGB components are. So in ChartDirector, only one totally transparent color is used - FF000000. All other colors of the form FFnnnnnn are reserved to represent palette colors and dynamic colors, and should not be interpreted as the normal ARGB colors.

The totally transparent color FF000000 is often used in ChartDirector to disable drawing something. For example, if you want to disable drawing the border of a rectangle, you can set the border color to totally transparent.

For convenience, ChartDirector defines a constant called Transparent, which is equivalent to FF000000.Pattern Color
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Pattern colors are created using BaseChart.patternColor, BaseChart.patternColor2, DrawArea.patternColor and DrawArea.patternColor2. The patternColor method creates pattern colors using an array of colors as a bitmap. The patternColor2 method creates pattern colors by loading the patterns from image files.

These methods return a 32-bit integer acting as a handle to the pattern color. The handle can be used in any ChartDirector API that expects a color as its input.Metal Color
A metal color is a color of which the brightness varies smoothly across the chart surface as to make the surface looks shiny and metallic. ChartDirector supports using any color as the base color of the metal color. In particular, using yellow and grey as the base colors will result in metal colors that look gold and silver.

Metal colors are most often used as background colors of charts. They are created using CDBaseChartMBS.metalColor, CDBaseChartMBS.goldColor and CDBaseChartMBS.silverColor. The first method allows you to specify an arbitrary base color. The second and third methods use yellow and grey as the base colors, resulting in gold and silver metal colors.

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.Gradient Color
A gradient color is a color that changes progressively across a direction.

Gradient colors are created using BaseChart.gradientColor, BaseChart.gradientColor2, DrawArea.gradientColor and DrawArea.gradientColor2. The gradientColor method creates a 2-point gradient color that changes from color A to color B. The gradientColor2 method creates a multi-point gradient colors that changes from color A to B to C ....

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.

One common use of multi-point gradient colors is to define colors that have metallic look and feel. Please refer to DrawArea.gradientColor2 for details.Dash Line Colors
A dash line color is a color that switches on and off periodically. When used to draw a line, the line will appear as a dash line.

Dash line colors are created using BaseChart.dashLineColor and DrawArea.dashLineColor. They accept a line color and a dash pattern code as arguments, and return a 32-bit integer acting as a handle to the dash line color. The handle can be used in any ChartDirector API that expects a color as its input.Zone Colors
A zone color is for XY charts only. It is a color that automatically changes upon reaching a data threshold value along the x-axis or y-axis. Zone colors are created using Layer.xZoneColor, Layer.yZoneColor, XYChart.xZoneColor or XYChart.yZoneColor.Palette Colors
Palette colors are colors of the format FFFFnnnn, where the least significant 16 bits (nnnn) are the index to the palette. A palette is simply an array of colors. For a palette color, the actual color is obtained by looking up the palette using the index. For example, the color FFFF0001 is the second color in the palette (first color is index 0).

The colors in the palette can be ARGB colors or ”dynamic” colors (pattern, gradient and dash line colors).

The first eight palette colors have special significance. The first three palette colors are the background color, default line color, and default text color of the chart. The 4th to 7th palette colors are reserved for future use. The 8th color is a special dynamic color that is equal to the data color of the ”current data set”.

The 9th color (index = 8) onwards are used for automatic data colors. For example, in a pie chart, if the sector colors are not specified, ChartDirector will automatically use the 9th color for the first sector, the 10th color for the second sector, and so on. Similarly, for a multi-line chart, if the line colors are not specified, ChartDirector will use the 9th color for the first line, the 10th color for the second line, and so on.

The ChartDirector API defines several constants to facilitate using palette colors.

Constant	Value	Description
Palette	FFFF0000	The starting point of the palette. The first palette color is (Palette + 0). The nth palette color is (Palette + n - 1).
BackgroundColor	FFFF0000	The background color.
LineColor	FFFF0001	The default line color.
TextColor	FFFF0002	The default text color.
[Reserved]	FFFF0003 - FFFF0006	These palette positions are reserved. Future versions of ChartDirector may use these palette positions for colors that have special significance.
SameAsMainColor	FFFF0007	A dynamic color that is equal to the data color of the current data set. This color is useful for objects that are associated with data sets. For example, in a pie chart, if the sector label background color is SameAsMainColor, its color will be the same as the corresponding sector color.
DataColor	FFFF0008	The starting point for the automatic data color allocation.

When a chart is created, it has a default palette. You may modify the palette using BaseChart.setColor, BaseChart.setColors, or BaseChart.setColors2.

The advantages of using palette colors are that you can change the color schemes of the chart in one place. ChartDirector comes with several built-in palettes represented by the following predefined constants.

Constant	Description
defaultPalette	An array of colors representing the default palette. This palette is designed for drawing charts on white backgrounds (or lightly colored backgrounds).
whiteOnBlackPalette	An array of colors useful for drawing charts on black backgrounds (or darkly colored backgrounds).
transparentPalette	An array of colors useful drawing charts on white backgrounds (or lightly colored backgrounds). The data colors in this palette are all semi-transparent.

234.0.25 ChartDirector: Font Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Font Specification
Notes: Font Name
In ChartDirector, the font name is simply the file name that contains the font. For example, under the Windows platform, the "Arial" font is "arial.ttf", while the "Arial Bold" font is "arialbd.ttf".

NOTE: Mac OS X Specific Information
In Mac OS X, in addition to ".ttf", ChartDirector also supports Mac OS X font file formats, such as Font Suitcase files and Datafork files (.dfont). These files often contain multiple fonts. For example, the "GillSans.dfont" file contains 6 fonts.

So in addition to the file name, an index is needed to determine the font. The index is specified by appending a " | " character to the font name, followed by the index number. For example, the third font in "GillSans.dfont" is denoted as "GillSans.dfont | 2". (Note: The first font starts at 0.) If no index number is provided, the first font is assumed.

ChartDirector also supports using Mac OS X Font Manager names. For example, one may use "Gill Sans Light Italic" instead of using "GillSans.dfont | 1" as the font name. However, the Mac OS X Font Manager is active only if someone has logged into the Mac GUI console, so this method is only recommended for developing applications that run on the GUI console.

The sample programs that come with ChartDirector are designed to run on all operating systems, so they use generic font file names (eg. "arial.ttf") instead of Mac OS X specific names. To allow them to run on Mac OS X, ChartDirector on Mac OS X has a built-in table to map common font file names to Mac OS X font names:

"arial.ttf", "arialbd.ttf", "ariali.ttf" and "arialbi.ttf" are mapped to "Arial | 0" (Arial), "Arial | 1" (Arial Bold), "Arial | 2" (Arial Italic) and "Arial | 3" (Arial Bold Italic)

"times.ttf", "timesbd.ttf", "timesi.ttf" and "timesbi.ttf" are mapped to "Times New Roman | 0" (Times New Roman), "Times New Roman | 1" (Times New Roman Bold), "Times New Roman | 2" (Times New Roman Italic) and "Times New Roman | 3" (Times New Roman Bold Italic)

"cour.ttf", "courbd.ttf", "couri.ttf" and "courbi.ttf" are mapped to "Courier New | 0" (Courier New), "Courier New | 1" (Courier New Bold), "Courier New | 2" (Courier New Italic) and "Courier New | 3" (Courier New Bold Italic)

Font Location
ChartDirector on Windows does not come with any font files. It relies on the operating system's font files in the " [windows] \Fonts" directory. To see what fonts are installed in your operating system and their file names, use the File Explorer to view that directory.

ChartDirector on Windows will also search for the font files in the ”fonts” subdirectory (if it exists) under the directory where the ChartDirector DLL ”chartdir.dll” is installed. This is useful for private fonts. Also, for some especially secure web servers, the web anonymous user may not have access to the ” [windows] \Fonts” directory. In this case, you may copy the font files to the above subdirectory.

ChartDirector on Mac OS X relies on operating system font files in ”/Library/Fonts” and ”/System/Library/Fonts”.

ChartDirector on Linux, FreeBSD and Solaris assume the fonts files are in the ”fonts” subdirectory under the directory where the ChartDirector shared object ”libchartdir.so” is installed. ChartDirector on Linux, FreeBSD and Solaris come with a number of font files in the ”fonts” subdirectory.

To keep the download size small, ChartDirector on Linux, FreeBSD and Solaris only come with some commonly used fonts. You may download additional fonts from the Internet. In particular, the Microsoft fonts at
http://sourceforge.net/project/showfiles.php?group_id=34153&release_id=105355
is highly recommended. Please refer to
http://www.microsoft.com/typography/faq/faq8.htm
on how you could use the fonts legally in your system.

ChartDirector supports True Type fonts (.ttf), Type 1 fonts (.pfa and .pfb) and Windows bitmap fonts (.fon). On Mac OS X, ChartDirector also supports Font Suitcase and Datafork (.dfont) files. On Linux, FreeBSD and Solaris, ChartDirector also supports Portable Compiled Fonts (.pcf fonts).

If you want ChartDirector to search other directories for the font files, you may list the directories in an environment variable called ”FONTPATH”.

If you specify an absolute path name for the font file, ChartDirector will use the absolute path name and will not search other directories.Artificial Boldening and Italicizing
Whereas most popular font comes with different styles for ”normal”, ”bold”, ”italic” and ”bold italic”, some fonts only come with one style (the normal style). For example, the Monotype Corsiva font that comes with MS Office only has the normal style (mtcorsva.ttf). For these cases, you may append the ”Bold” and/or ”Italic” words after the font file name (separated with a space) to ask ChartDirector to artificially bolden and/or italicize the font. For example, you may specify the font name as ”mtcorsva.ttf Bold”.Font List
Instead of specifying a single font file as the font name, you may specify a list of font files as the font name, separated by semi-colons. This is useful when using international characters that are only available in some fonts.

For example, if you would like to use the Arial font (”arial.ttf”) for western characters, and the MingLiu font ”mingliu.ttc” for Chinese characters (since the Arial font does not have Chinese characters), you may specify the font name as ”arial.ttf;mingliu.ttc”. In this case, ChartDirector will try the Arial font first. If it cannot find a certain character there, it will try the MingLiu font.Indirect Font Names

ChartDirector supports several special keywords for specifying the font name indirectly. When these keywords are used as font names, ChartDirector will look up the actual font names from a font table. The keywords are as follows:

Keywords	Description
"normal"	This default normal font, which is the first font in the font table. This is initially mapped to "arial.ttf" (Arial).
"bold"	The default bold font, which is the second font in the font table. This is initially mapped to "arialbd.ttf" (Arial Bold).
"italic"	The default italic font, which is the third font in the font table. This is initially mapped to "ariali.ttf" (Arial Italic).
"boldItalic"	The default bold-italic font, which is the fourth font in the font table. This is initially mapped to "arialbi.ttf" (Arial Bold Italic).
"fontN"	The (N + 1)th font in the font table (the first font is "font0").

The font table can be modified using BaseChart.setFontTable or DrawArea.setFontTable.

The advantage of using indirect font names is that you can change the fonts fonts in your charts in one place.Font Index
Most font files contain one font. However, it is possible a font file contains multiple fonts (that is, a font collection). For example, in True Type fonts, font files with extension ".ttc" may represent a font collection.

If a font file contains multiple font, the font index can be used to specify which font to use. By default, the font index is 0, which means the first font in the font file will be used.Font Size
The font size decides how big a font will appear in the image. The font size is expressed in a font unit called points. This is the same unit used in common word processors.

Instead of specifying font size, some ChartDirector API (eg. TextBox.setFontSize) allow you to specify font height and font width separately. You may use different point sizes for font height and font width to create special effects.Font Color
This is the color to draw the font. (See Color Specification on how colors are represented in ChartDirector.)Font Angle
This is the angle in degrees by which the font should be rotated anti-clockwise.Vertical Layout
By default, text are laid out horizontally, with characters being drawn from left to right.

ChartDirector also supports vertical layout, with characters being drawn from top to bottom. For example, you may use BaseChart.addText to add text that are laid out vertically. Vertical layout is common for oriental languages such as Chinese, Japanese and Korean.

234.0.26 ChartDirector: Mark Up Language

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Mark Up Language
Notes: ChartDirector Mark Up Language (CDML) is a language for including formatting information in text strings by marking up the text with tags.

CDML allows a single text string to be rendered using multiple fonts, with different colors, and even embed images in the text.Font Styles
You can change the style of the text by using CDML tags. For example, the line:

<*font=timesi.ttf,size=16,color=FF0000>Hello <*font=arial.ttf,size=12,color=8000*>world!
will result in the following text rendered:

In general, all tags in CDML are enclosed by <* and *>. Attributes within the tags determine the styles of the text following the tags within the same block.

If you want to include <* in text without being interpreted as CDML tags, use «* as the escape sequence.

The following table describes the supported font style attributes in CDML. See Font Specification for details on various font attributes.

Note that unlike HTML tags, no double or single quotes are used in the tags. It is because CDML tags are often embedded as string literals in source code. The double or single quotes, if used, will conflict with the string literal quotes in the source code. Therefore in CDML, no quotes are necessary and they must not be used.

Also, unlike HTML tags, CDML uses the comma character as the delimiter between attributes. It is because certain attributes may contain embed spaces (such as the font file name). So space is not used as the delimiter and the comma character is used instead.

Note the font attribute above starts a new style section, while other attributes just modify the current style section. You may use <*/font*>to terminate a style section, which will restore the font styles to the state before the style section.Blocks and Lines
In CDML, a text string may contain multiple blocks. A block may contain multiple lines of text by separating them with new line characters ("\n") or with <*br*>. The latter is useful for programming languages that cannot represent new line characters easily.

For example, the line:

<*size=15*><*block*><*color=FF*>BLOCK<*br*>ONE<*/*>and <*block*><*color=FF00*>BLOCK<*br*>TWO

Attribute	Description
font	Starts a new style section, and sets the font name. You may use this attribute without a value (that is, use ”font” instead of ”font=arial.ttf”) to create a new style section without modifying the font name.
size	The font size.
width	The font width. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
height	The font height. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
color	The text color in hex format.
bgColor	The background color of the text in hex format.
underline	The line width of the line used to underline the following characters. Set to 0 to disable underline.
sub	Set the following text to be in subscript style. This attribute does not need to have a value. (You may use ”sub” as the attribute instead of ”sub=1”.)
super	Set the following text to be in superscript style. Set the following text to be in superscript style. This attribute does not need to have a value. (You may use ”super” as the attribute instead of ”super=1”.)
xoffset	Draw the following the text by shifting the text horizontally from the original position by the specified offset in pixels.
yoffset	Draw the following the text by shifting the text vertically from the original position by the specified offset in pixels.
advance	Move the cursor forward (to the right) by the number of pixels as specified by the value this attribute.
advanceTo	Move the cursor forward (to the right) to the position as specified by the value this attribute. The position is specified as the number of pixels to the right of the left border of the block. If the cursor has already passed through the specified position, the cursor is not moved.

will result in the following text rendered:

The above example contains a line of text. The line contains two blocks with the characters ” and ” in between. Each block in turn contains two lines. The blocks are defined using <*block*>as the start tag and <*/*>as the end tag.

When a block ends, font styles will be restored to the state before entering the block.Embedding Images
CDML supports embedding images in text using the following syntax:

<*img=my_image_file.png*>
where my_image_file.png is the path name of the image file.

For example, the line:

<*size=20*>A <*img=sun.png*>day
will result in the following text rendered:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath or DrawArea.setSearchPath on the directory that ChartDirector will search for the file.

The <*img*>tag may optionally contain width and height attributes to specify its pixel width and height. In this case, ChartDirector will stretch or compress the image if necessary to the required width and height.Blocks Attributes
CDML supports nesting blocks, that is, a block can contain other sub-blocks. Attributes are supported in the <*block*>tag to control the alignment and orientation of the sub-blocks. The <*img=my_image_file.png*>is treated as a block for layout purposes.

For example, the line:

<*block,valign=absmiddle*><*img=molecule.png*><*block*>Hydrazino\nMolecule<*/*><*/*>
will result in the following text rendered:

The the above starts <*block,valign=absmiddle*>which specifies its content should align with each others in the vertical direction using the absolute middle alignment. The block contains an image, followed by a space characters, and then another block which has two lines of text.

The following table describes the supported attributes inside <*block*>tag:

234.0.27 ChartDirector: Parameter Substitution and Formatting

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Parameter Substitution and Formatting
Notes: ChartDirector charts often contain a lot of text strings. For example, sector labels in pie charts, axis labels for x and y axes, data labels for the data points, HTML image maps, etc, are all text strings.

ChartDirector uses parameter substitution to allow you to configure precisely the information contained in the text and their format.
Format Strings
In parameter substitution, format strings are used to specify the entities to be include into labels and how

to format numbers and dates.

For example, when drawing a pie chart with side label layout, the default sector label format string is:

" { label } ({ percent } %)"

When the sector label is actually drawn, ChartDirector will replace " { label } " with the sector name, and " { percent } " with the sector percentage. So the above label format will result is a sector label similar to "ABC (34.56%)".

You may change the sector label format by changing the format string. For example, you may change it to:

" { label } : US$ { value | 2 } K ({ percent } %)"

The sector label will then become something like "ABC: US$ 123.00 (34.56%)".

In general, in ChartDirector parameter substitution, parameters enclosed by curly brackets will be substituted with their actual values when creating the texts.

For parameters that are numbers or dates/times, ChartDirector supports a special syntax in parameter substitution to allow formatting for these values. Please refer to the Number Formatting and Date/Time Formatting sections below for details.

Parameter Expressions

ChartDirector supports numeric expressions in format strings. They are denoted by enclosing the expression with curly brackets and using "=" as the first character. For example:

"USD { value } (Euro { = { value } *0.9 })"

In the above, " { value } " will be substituted with the actual value of the sector. The expression " { = { value } *0.9 } " will be substituted with the actual value of the sector multiplied by 0.9.

ChartDirector parameter expressions support operators "+", "-", "*", "/", "%" (modulo) and "^" (exponentiation). Operators "*", "/", "%", "^" is computed first, followed by "+" and "-". Operators of the same precedence are computed from left to right). Parenthesis "(" and ")" can be used to change the computation order.

Parameters for Pie Charts

The following table describes the parameters available for pie charts.

Parameters for All XY Chart Layers

The followings are parameters that are apply to all XY Chart layers in general. Some layer types may have additional parameters (see below).

Note that certain parameters are inapplicable in some context. For example, when specifying the aggregate label of a stacked bar chart, the { dataSetName } parameter is inapplicable. It is because a stacked bar is composed of multiple data sets. It does not belong to any particular data set and hence does not have a data set name.

Additional Parameters for Line Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Trend Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Box-Whisker Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for HLOC and CandleStick Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Vector Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Parameters for All Polar Layers
The followings are parameters that are apply to all Polar Chart layers in general. Some layer types may have additional parameters (see below).

Additional Parameters for PolarVector Layers
The followings are parameters that are in additional to the parameters for all Polar Chart layers.

Parameters for Axis
The following table describes the parameters available for pie charts.

Number Formatting
For parameters that are numbers, ChartDirector supports a number of formatting options in parameter substitution.

For example, if you want a numeric field { value } to have a precision of two digits to the right of the decimal point, use ',' (comma) as the thousand separator, and use '.' (dot) as the decimal point, and you may use { value | 2,. } . The number 123456.789 will then be displayed as 123,456.79.

For numbers, the formatting options are specified using the following syntax:

{ [param] | [a] [b] [c] [d] }

where:

If this field starts with "E" or "e", followed by a number, it means formatting the value using scientific notation with the specified number of decimal places. If the "E" or "e" is not followed by a number, 3 is assumed.

For example, { value | E4 } will format the value 10.3 to 1.0300E+1, and { value | e4 } will format the same value to 1.0300e+1.

If this field starts with "G" or "g", followed by a number, it means formatting the value using the scientific notation only if the value is large and requires more than the specified number of digits, or the value is less than 0.001. If scientific notation is used, the number following "G" or "g" also specifies the number of significant digits to use. If the "G" or "g" is not followed by a number, 4 is assumed.

For example, consider the format string { value | G4 } . The value 10 will be formatted to 10. The value 100000 will be formatted to 1.000E+5. Similarly, for { value | g4 } , the value 10 will be formatted to 10, while the value 100000 will be formatted to 1.000e+5.

If you skip this argument, ChartDirector will display the exact value using at most 6 decimal places.

You may skip [b] [c] [d] . In this case, the default will be used.

Date/Time Formatting
For parameters that are dates/times, the formatting options can be specified using the following syntax:

{ [param] | [datetime_format_string] }

where [datetime_format_string] must start with an english character (A-Z or a-z) that is not "G", "g", "E" or "e", and may contain any characters except ' } '. (If it starts with "G", "g", "E" or "e", it will be considered as a number format string.)

Certain characters are substituted according to the following table. Characters that are not substituted will be copied to the output.

For example, a parameter substitution format of { value | mm-dd-yyyy } will display a date as something similar to 09-15-2002. A format of { value | dd/mm/yy hh:nn:ss a } will display a date as something similar to 15/09/02 03:04:05 pm.

If you want to include characters in the format string without substitution, you may enclose the characters

in single or double quotes.

For example, the format { value | mmm '<*color=dd0000*>'yyyy } will display a date as something like Jan <*color=dd0000*>2005 (the <*color=dd0000*>is a CDML tag to specify red text color). Note that the <*color=dd0000*>tag is copied directly without substitution, even it contains "dd" which normally will be substituted with the day of month.
Escaping URL/HTML/CDML characters
Parameter substitution is often used to create HTML image maps. In HTML, some characters has special meanings and cannot be used reliably. For example, the '>' is used to represent the end of an HTML tag.

Furthermore, if the field happens to be used as an URL, characters such as '?', '&' and '+' also have special meanings.

By default, ChartDirector will escape template fields used in URL and query parameters when generating image maps. It will modify URL special characters to the URL escape format "%XX" (eg. "?" will become "%3F"). After that, it will modify HTML special characters to the HTML escape format "&amps;#nn;" (eg. ">" will become "&amps;#62;".). Similarly, it will escape other attributes in the image map using HTML escape format (but not URL escape format).

In addition to escaping HTML and URL special characters, ChartDirector will also remove CDML fields in creating image maps. It is because CDML is only interpreted in ChartDirector, should not be useful outside of ChartDirector (such as in browser tool tips).

In some cases, you may not want ChartDirector to escape the special characters. For example, if the parameters have already been escaped before passing to ChartDirector, you may want to disable ChartDirector from escaping them again.

ChartDirector supports the following special fields to control the escape methods - " { escape_url } ", " { noescape_url } ", " { escape_html } ", " { noescape_html } ", " { escape_cdml } " and { noescape_cdml } ". These fields enable/disable the escape methods used in the template fields that follow them.

234.0.28 ChartDirector: Shape Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows.

Answer: ChartDirector: Shape Specification
Notes: Several ChartDirector API accept shape specification as arguments. For example, BarLayer.setBarShape and BarLayer.setBarShape2 can be used to specify shapes of bars in bar charts, while DataSet.setDataSymbol, DataSet.setDataSymbol4, PolarLayer.setDataSymbol and PolarLayer.setDataSymbol4 can be used to specify shapes for data symbols.

Note that in addition to shapes, in many cases ChartDirector also accepts images or custom draw objects for

data representation. For example, see DataSet.setDataSymbol2, DataSet.setDataSymbol3, PolarLayer.setDataSymbol2 and PolarLayer.setDataSymbol3.

Built-In Shapes

Built-in shapes are specified as integers. The integers can be explicit constants, or can be generated by a ChartDirector method for parameterized shapes. For example, a circle is represented by an explicit constant CircleShape (=7). On the other hand, the number representing a polygon depends on the number of sides the polygon has, so it is generated by using the PolygonShape method, passing in the number of sides as argument.

The following table illustrates the various ChartDirector shapes:

Custom Shapes

In ChartDirector, custom shapes are specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 1000 x 1000 units, in which the x-axis is from -500 to 500 going from left to right, and the y-axis is from 0 to 1000 going from bottom to top.

ChartDirector will automatically scale the polygon so that 1000 units will become to the pixel size as requested by the various ChartDirector API.

As an example, the shape of the standard diamond shape in ChartDirector is represented as an array with 8 numbers:

0, 0, 500, 500, 0, 1000, -500, 500

234.0.29 Copy styled text?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: How to quickly copy styled text from one textarea to another?
Example:

```
#if TargetWin32 then
TextArea1.WinRTFDataMBS = TextArea2.WinRTFDataMBS
#elseif TargetMacOS then
TextArea1.NSTextViewMBS.textStorage.setAttributedString TextArea2.NSTextViewMBS.textStorage
#else
```

```
TextArea1.StyledText = TextArea2.StyledText
#endif
```

Notes: The code above uses special plugin functions on Mac and Windows and falls back to framework for Linux.

234.0.30 Do you have code to validate a credit card number?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can check the checksum to tell if a credit card number is not valid.
Example:

```
Var strNumber As String
Var nLength as Integer
Var nValue as Integer
Var nChecksum as Integer
Var nIndex as Integer

strNumber = EditField1.Text
nLength = Len(strNumber)
nChecksum = 0

For nIndex = 0 To nLength - 2
nValue = Val(Mid(strNumber, nLength - (nIndex + 1), 1)) * (2 - (nIndex Mod 2))
If nValue <10 Then
nChecksum = nChecksum + nValue
Else
nChecksum = nChecksum + (nValue - 9)
End If
Next

If Val(Mid(strNumber, Len(strNumber), 1)) = (10 - (nChecksum Mod 10)) Mod 10 Then
MsgBox("The credit card number looks valid")
Else
MsgBox("The credit card number is invalid")
End IF
```

Notes: Here's some code that will validate the checksum for a credit card. It works for Visa, MasterCard, American Express and Discover. Not sure about others, but I imagine they use the same basic algorithm. Of course, this doesn't actually mean that the credit card is valid, it's only useful for helping the user catch typos.

The above code doesn't have any error checking and it expects that the credit card number will be entered without spaces, dashes or any other non-numeric characters. Addressing those issues will be an exercise left to the reader. :)

(From Mike Stefanik)

234.0.31 Do you have plugins for X-Rite EyeOne, eXact or i1Pro?

Plugin Version: all.

Answer: Our EyeOne plugin is available on request for licensees of the X-Rite SDKs.
Notes: Please first go to X-Rite and get a SDK license.
Than we can talk about the plugin.

234.0.32 Does SQL Plugin handle stored procedures with multiple result sets?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Yes, the plugin can work with multiple recordsets.
Notes: You need to use SQLCommandMBS class. When you get back results, you use FetchNext to walk over all records in the first result set. Than you simply start again with FetchNext to get the second record set.
Even the RecordSet functions should work, just use them twice to get all records from both record sets.

234.0.33 Does the plugin home home?

Plugin Version: all, Platform: macOS.

Answer: Yes, we like to know who is using the plugin, so the plugin may contact our server.
Notes: Please note that this does not affect your users as the plugin will only do this in the IDE and the relevant plugin part is never included in your applications.

The plugin if used for some hours, does contact our server to provide statistical data about Xojo version and OS versions. This way we know what versions are used. We can return the version number of the current plugin which may be visible in future versions somehow. And we transmit partial licenses data so we can track use of illegal license keys.

If you do not like to have this, you can block Xojo IDE from contacting our website via your Firewall.
Blocking the transfer will not disable the plugin or change the features.
Or contact us for a plugin version which explicitly does not contain this feature.

234.0.34 folderitem.absolutepath is limited to 255 chars. How can I get longer ones?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Paths on a Mac are not unique, so use them only to display them to the user.
Example:

```
Function AbsolutePath(f as FolderItem) As String
Var s as string
Var nf as FolderItem
nf = f
s = ""
while nf<>nil
s = nf.name + ":" + s
nf = nf.parent
wend
Return s
End Function
```

234.0.35 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window?

Platform: macOS.

Answer: This code implements animations for a tabpanel change:
Example:

```
// in a tabpanel.change event:

Var r as CGSTransitionRequestMBS
Var co as new CGSConnectionMBS
Var cw as CGSWindowMBS
Var ct as CGSTransitionMBS
static OldTab as Integer

cw=co.CGSWindow(window1)
If cw = Nil Then
return // 10.3...
End If
r=new CGSTransitionRequestMBS
r.TransitionType=r.CGSFlip
r.HasBackGround=false
r.HasBackColor=false
r.Win=cw
// watch the value of the clicked tab versus the last tab
```

```
if tabpanel1.Value=0 or tabpanel1.Value <OldTab then
r.TransitionOption=r.CGSLeft
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
else
MsgBox "Error creating the transition."
end if
else
r.TransitionOption=r.CGSRight
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
else
MsgBox "Error creating the transition."
end if
end if
// Keep track of the last tab clicked
OldTab = tabpanel1.Value
```

Notes: See CGS* classes for more details.

234.0.36 How can I detect whether an Intel CPU is a 64bit CPU?

Plugin Version: all.

Answer: Look on the CPU family returned by sysctl:
Example:

```
Function is64bit() As Boolean

#if TargetLittleEndian

Var m as MemoryBlock = NewMemoryBlock(8)
Var family as Integer
Var s as string

m=SystemControlNameToMIBMBS("hw.cpufamily")
m=SystemControlMBS(m)
```

```
if m<>nil then
m.LittleEndian=True
family=m.Long(0)

const CPUFAMILY_INTEL_6_14 = &h73d67300 //* "Intel Core Solo" and "Intel Core Duo" (32-bit Pentium-M with SSE3) */
const CPUFAMILY_INTEL_6_15 = &h426f69ef //* "Intel Core 2 Duo" */
const CPUFAMILY_INTEL_6_23 = &h78ea4fbc //* Penryn */
const CPUFAMILY_INTEL_6_26 = &h6b5a4cd2 //* Nehalem */

Select case family
case CPUFAMILY_INTEL_6_14
Return false
case CPUFAMILY_INTEL_6_15
Return true
case CPUFAMILY_INTEL_6_23
Return true
case CPUFAMILY_INTEL_6_26
Return true
// newer CPUs may be missing here
end Select

end if

#endif

Return false

Exception
Return false
End Function
```

Notes: This code is written for Mac OS X where you only have a limited number of possible CPUs.

234.0.37 How can I disable the close box of a window on Windows?

Plugin Version: all, Platform: Windows.

Answer: The following code will remove the close item from the system menu of the window.
Example:

```
#if TargetWin32 then
Declare Function GetSystemMenu Lib "user32" (hwnd as Integer, bRevert as Integer) as Integer
Declare Function RemoveMenu Lib "user32" (hMenu as Integer, nPosition as Integer, wFlags as Integer) as Integer
Var hSysMenu as Integer
```

```
hSysMenu = GetSystemMenu(me.WinHWND, 0)
RemoveMenu hSysMenu, &HF060, &H0
#endif
```

Notes: The window may not be updated directly.

234.0.38 How can I get all the environment variables from Windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
#if targetWin32
declare function GetEnvironmentStrings Lib "kernel32" () as ptr
Var m as memoryBlock
Var n as Integer

m=GetEnvironmentStrings()

n=0
do
msgBox m.cstring(n)
while m.byte(n)<>0
n=n+1
wend
n=n+1
loop until m.byte(n)=0
#endif
```

Notes: The MBS Plugin has an EnvironmentMBS class for this.

234.0.39 How can i get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application?

Plugin Version: all, Platform: macOS.

Answer: You need to get a media reservation.
Example:

```
Var d as DRDeviceMBS // get a device
d.AcquireMediaReservation
```

Notes: Use the plugin function AcquireMediaReservation and later release it using ReleaseMediaReservation.
See plugin examples on how to use it and check Apples DiscRecording framework documentation for more details.

234.0.40 How can I get text from a PDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Crossplatform you can use DynaPDF Pro.
Notes: On Mac OS X you can also use PDFKit for the same job.
While DynaPDF Pro gives you each bit of text with rotation, font information and encoding details, PDFKit gives you only the text string for a PDF page.

234.0.41 How can I get text from a Word Document?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: to get the text string from a doc file, use the NSAttributedStringMBS class.
Notes: The NSAttributedStringMBS class is Mac OS X only and we have currently no solution for Windows or Linux.

Use the NSAttributedStringMBS.initWithDocFormat(data as string) as boolean method.

234.0.42 How can I get the item string for a given file creator?

Plugin Version: all.

Answer: Try this function:
Example:

```
Sub pullNativeDocs(aCREA As string)
Var result as Integer
Var m, k as memoryBlock
Var f as folderItem
Var newType as string
Var anIcon As picture
Var ofs as Integer

result = GetDocumentKindString(Volume(0).MacVRefNum, newType, aCREA, k)
if result = 0 then
listBox1.cell(ofs,1) = k.pString(0)
ofs = ofs + 1
else
listBox1.cell(ofs,1) = "(unknown)"
end if

end if
loop

End Sub
```

Notes: Change "Translation" to "CarbonLib" for Mac OS X.

234.0.43 How can I launch an app using it's creator code?

Plugin Version: all, Platform: macOS.

Answer: Send an AppleEvent "odoc" with the creator code to the Finder ("MACS"):
Example:

```
Function LaunchByCreator(C As String) As Boolean
Var A As AppleEvent
A = NewAppleEvent("aevt","odoc","MACS")
A.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf",nil,C)
return A.Send
End Function
```

234.0.44 How can I learn what shared libraries are required by a plugin on Linux?

Plugin Version: all, Platform: macOS.

Answer: Please use the ldd command in the terminal.
Notes: You build an app on any platform, but for Linux.
For the resulting .so files in the libs folder, you can run the ldd command with the library path as parameter. It shows you references lib files and you can make sure you have those installed.

This is a sample run of our graphicsmagick plugin:

cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$ ldd libMBSGraphicsMagickPlugin17744.so
linux-gate.so.1 =>(0xb76ee000)

cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$

As you see all library have been found and their load address is printed behind the na,e.
If a library is missing, you usually see the address missing there or being zero.

234.0.45 How can I validate an email address?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can try this code:
Example:

```
Var re As RegEx
re = New RegEx
Var rm As RegExMatch

re.SearchPattern = " [ a-z0-9!#$ %&'*+/=?^_' { | }
textasciitilde - ] +(?:\. [ a-z0-9!#$ %&'*+/=?^_' { | }
textasciitilde - ] +)*@(?: [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?\.)+ [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?"
rm = re.Search(editField1.Text)

if rm = Nil Then
StaticText2.text = editField1.Text + " not valid email"
Else
StaticText2.Text = editField1.Text + " is valid"
End if
```

Notes: Adapted from:
http://www.regular-expressions.info/email.html

234.0.46 How do I decode correctly an email subject?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The following code can be used to decode an email subject including several encodings including Base 64.
Example:

```
Var src as string // input

Var theRegex as Regex
Var theRegexMatch as RegexMatch
Var result, infoCharset, encodedPart as string
Var theStart as Integer

if instr(src, "=?") >0 then
theRegex = new Regex
theRegex.Options.Greedy = false
theRegex.searchPattern = "(.*)=\?(.+)\?(Q | B)\?(.+)\?="
theRegexMatch = theRegex.search(src)
while theRegexMatch <>nil
theStart = theRegexMatch.subExpressionStartB(0) + len(theRegexMatch.subExpressionString(0))

result = result + theRegexMatch.subExpressionString(1)
infoCharset = theRegexMatch.subExpressionString(2)
encodedPart = theRegexMatch.subExpressionString(4)
if theRegexMatch.subExpressionString(3) = "B" then
encodedPart = DecodeBase64(encodedPart)
elseif theRegexMatch.subExpressionString(3) = "Q" then
encodedPart = DecodeQuotedPrintable(encodedPart)
end if
if right(result, 1) = " " then
result = mid(result, 1, len(result)-1)
end if
encodedPart = encodedPart.DefineEncoding(GetInternetTextEncoding(infoCharset))
result = result + encodedPart

theRegex.SearchStartPosition = theStart
theRegexMatch = theRegex.search()
wend

result = result + mid(src, theStart+1)

else
result = src
end if
// theRegexMatch = theRegex.search

msgbox result
```

Notes: May not look nice depending on the controls used.
This is no longer needed when using MimeEmailMBS class which decodes for you.

234.0.47 How do I enable/disable a single tab in a tabpanel?

Plugin Version: all, Platform: macOS.

Answer: Use the TabpanelEnabledMBS method.
Example:

```
TabpanelEnabledMBS(tabpanel1, 1, false)
```

Notes: Use Carbon for MachO and CarbonLib for Mac Carbon and AppearanceLib for Mac OS Classic as library.
For Cocoa, please use enabled property of NSTabViewItemMBS class.

234.0.48 How do I find the root volume for a file?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this function:
Example:

```
Function GetRootVolume(f as FolderItem) as FolderItem
Var root, dum as folderItem
if f <>nil then
root = f // f might be the volume
do
dum = root.parent
if dum <>nil then
root = dum
end if
loop until dum = nil
return root
end if
End Function
```

234.0.49 How do I get the current languages list?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var p as new CFPreferencesMBS
Var a as CFArrayMBS
Var s as CFStringMBS
Var o as CFObjectMBS
Var sa(-1) as string

o=p.CopyAppValue("AppleLanguages",".GlobalPreferences")

if o<>Nil then
a=CFArrayMBS(o)

Var i,c as Integer

c=a.Count-1
for i=0 to c
o=a.Item(i)

if o isa CFStringMBS then
s=CFStringMBS(o)
sa.Append s.str
end if
next
end if

MsgBox Join(sa,EndOfLine)
```

Notes: On Mac OS X you can get the list of current languages like this list:

de
en
ja
fr
es
it
pt
pt-PT
nl
sv
nb
da
fi
ru
pl
zh-Hans

zh-Hant
ko

Which has German (de) on the top for a German user.
This code has been tested on Mac OS X 10.5 only.

234.0.50 How do I get the Mac OS Version?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var i as Integer
if system.gestalt("sysv", i) then
//do this in an 'If' in case you don't get any value back at all and system.gestalt returns boolean
if i = &h750 then //If OS is 7.5
//do stuff
elseif i = &h761 then //If OS is 7.6.1
//do stuff
end if
end if
```

Notes: The MBS Plugin has a function SystemInformationMBS.OSVersionString for this.

234.0.51 How do I get the printer name?

Plugin Version: all.

Answer: For Mac OS Classic see the code below and for Mac OS X use the Carbon Print Manager Classes from the MBS Plugin.
Example:

```
Var s as String
Var i as Integer

s=app.ResourceFork.GetResource("STR ",-8192)
if s<>"" then
i=ascb(leftb(s,1))
s=mid(s,2,i)

MsgBox s
end if
```

Notes: A note from Craig Hoyt:

After looking at your example I had a little deja-vu experience. Several years ago I played around with this same code if FutureBasic. I discovered that it did not and still doesn't provide the 'Printer Name', it does return the print driver name. If it returns 'LaserWriter 8' as the print driver you can look into this file and get the 'PAPA' resource #-8192 to get the actual Printer Name. Unfortunately this does not hold true for other printers. My Epson and HP Printers (the Epson has an Ethernet Card and the HP is USB) do not provide this info in their drivers. As far as I can tell it only returns the name by polling the printer itself.

234.0.52 How do I make a metal window if RB does not allow me this?

Plugin Version: all, Platform: macOS.

Answer: The following declare turns any window on Mac OS X 10.2 or newer into a metal one.
Example:

```
declare sub ChangeWindowAttributes lib "Carbon" (win as windowptr, a as Integer, b as Integer)

ChangeWindowAttributes window1,256,0
```

Notes: May not look nice depending on the controls used.

234.0.53 How do I make a smooth color transition?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

I'd like to show in a report some bars, which start with color A and end with color B.

The color change should be very smooth.

My problem: If I would start from 255,0,0 and end by 0,0,0, I would have 255 different colors. If the bars are longer than 255 pixels, would this look nice?
Example:

```
// Window.Paint:
Sub Paint(g As Graphics)
```

```
Var w,w1,x,p as Integer
Var c1,c2,c as color
Var p1,p2 as Double

c1=rgb(255,0,0) // start color
c2=rgb(0,255,0) // end color

w=g.Width
w1=w-1

for x=0 to w1
p1=x/w1
p2=1.0-p1

c=rgb(c1.red*p1+c2.red*p2, c1.green*p1+c2.green*p2, c1.blue*p1+c2.blue*p2)

g.ForeColor=c
g.DrawLine x,0,x,g.Height

next
End Sub
```

Notes:

Try the code above in a window paint event handler.

234.0.54 How do I read the applications in the dock app?

Plugin Version: all, Platform: macOS.

Answer: Use CFPreferencesMBS class like in this example:
Example:

```
// Reads file names from persistent dock applications and puts them into the list

Var pref as new CFPreferencesMBS

Var persistentapps as CFStringMBS = NewCFStringMBS("persistent-apps")
Var ApplicationID as CFStringMBS = NewCFStringMBS("com.apple.dock")
Var tiledata as CFStringMBS = NewCFStringMBS("tile-data")
Var filelabel as CFStringMBS = NewCFStringMBS("file-label")

// get the array of persistent applications from dock preferences
Var o as CFObjectMBS = pref.CopyValue(persistentapps, ApplicationID, pref.kCFPreferencesCurrentUser,
pref.kCFPreferencesAnyHost)
```

```
if o isa CFArrayMBS then
Var a as CFArrayMBS = CFArrayMBS(o)

// walk over all items in array
Var c as Integer = a.Count-1
for i as Integer = 0 to c

// get dictionary describing item
o = a.Item(i)

if o isa CFDictionaryMBS then
Var d as CFDictionaryMBS = CFDictionaryMBS(o)

// and pick tile data dictionary
o = d.Value(tiledata)
if o isa CFDictionaryMBS then
d = CFDictionaryMBS(o)

// and pick there the file label
o = d.Value(filelabel)
if o isa CFStringMBS then
// and display it
Var name as string = CFStringMBS(o).str
List.AddRow name
end if
end if
end if

next

else
MsgBox "Failed to read dock preferences."
end if
```

Notes: You can use the CFPreferencesMBS.SetValue to change a value and CFPreferencesMBS.Synchronize to write the values to disc. You may need to restart the Dock.app if you modified things.

234.0.55 How do I truncate a file?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: In a binarystream you can set the length property to truncate.

234.0.56 How do update a Finder's windows after changing some files?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var f as folderitem // some file
Var ae as appleevent
ae=newappleevent("fndr","fupd","MACS")
ae.folderitemparam("—-")=f
if not ae.send then
//something went wrong
end if
```

Notes: The folderitem.finderupdate from the MBS Plugin does something like this.

234.0.57 How to access a USB device directly?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: First, it depends on the device.
Notes: Some devices can be talked directly from user mode code, but some require a kernel driver.

For some devices you can use plugins to access them like:

- Audio and Video sources using the QTGrabberClassMBS
- Mass storage devices using the folderitem class.
- Serial devices using the System.SerialPort function.
- HID USB devices can be used with MacHIDMBS, WinHIDMBS or LinuxHIDInterface class.
- Any USB device may be used with MacUSBMBS or WinUSBMBS classes.

In general it is always the best to take the most high level access to have others do the work for the details.

234.0.58 How to add icon to file on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use FolderItem.AddCustomIcon or NSWorkspaceMBS.setIcon functions.
Notes: Please close any open stream for the file you want to add an icon.

234.0.59 How to ask the Mac for the Name of the Machine?

Plugin Version: all, Platform: macOS.

Answer: Using Apple Events you can use this code:
Example:

```
Function Computername() As string

Var theEvent as AppleEvent
Var err as boolean

theEvent = newAppleEvent("mchn","getd","MACS")

err = theEvent.send

return theevent.ReplyString

End Function
```

Notes: Code above is for Mac OS 9!
Also the MBS Plugin has a function for this which may be faster and work also on Macs without Filesharing (which handles this event).

234.0.60 How to automatically enable retina in my apps?

Plugin Version: all, Platform: macOS.

Answer: You can run a build script on each build with this code:
Example:

```
Var App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSHighResolutionCapable""
YES")
```

Notes: This will set the NSHighResolutionCapable flag to YES.

234.0.61 How to avoid leaks with Cocoa functions?

Plugin Version: all, Platform: macOS.

Answer: You can try this code on Mac OS X:
Example:

```
// in a Timer Action event:
```

```
Sub Action()
static LastPool as NSAutoreleasePoolMBS = nil
static CurrentPool as NSAutoreleasePoolMBS = nil

LastPool = CurrentPool
CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

Notes: With Xojo 2009r4 the code above should not be needed as Xojo runtime does automatically handle the NSAutoreleasePools for you. For older Xojo versions you need to use code with a timer with the action event above to avoid memory leaks.

Please do not use Xojo 2009r4 and newer with plugins before version 9.5. You can get crashes there which typically show a line with a objc_msgSend call.

234.0.62 How to avoid trouble connecting to oracle database with SQL Plugin?

Plugin Version: all, Platform: macOS.

Answer: For oracle the most important thing is to point the plugin to the libraries from oracle.
Notes: In environment variables, the paths like ORACLE_HOME must be defined.
On Mac OS X you also need to define DYLD_LIBRARY_PATH to point to the dylib files from oracle.

For that you need to modify /etc/launchd.conf for Mac OS X 10.8 and newer.
In older versions those variables in .MacOSX/environment.plist file in user's home.

Another way for the case you bundle things inside your app is to use the LSEnvironment key in info.plist.
In info.plist it looks like this:

```
<key>LSEnvironment</key>
<dict>
<key>test</key>
<string>Hello World</string>
</dict>
```

234.0.63 How to avoid ___NSAutoreleaseNoPool console messages in threads?

Plugin Version: all, Platform: macOS.

Answer: You need to use your own NSAutoreleasePool on a thread like this:
Example:

```
sub MyThread.run
Var pool as new NSAutoreleasePoolMBS
// do work here

pool=nil
end sub
```

Notes: For more details read here:
http://developer.apple.com/mac/library/documentation/Cocoa/Reference/Foundation/Classes/NSAutoreleasePool_Class/Reference/Reference.html

234.0.64 How to bring app to front?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac you can use this code:
Example:

```
// First way:
app.FrontMostMBS = true

// second way:
Var p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess = true

// third way:
NSApplicationMBS.sharedApplication.activateIgnoringOtherApps(true)

// for Windows:
RemoteControlMBS.WinBringWindowToTop
```

Notes: This will bring a Mac app to the front layer.

234.0.65 How to bring my application to front?

Plugin Version: all, Platform: macOS.

Answer: This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
Var A As AppleEvent
A = NewAppleEvent("misc","actv","")
If Not A.Send then
```

```
Beep
end if
```

Notes: (Code is Mac only)

234.0.66 How to catch Control-C on Mac or Linux in a console app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use SignalHandlerMBS class for this.
Example:

```
// watch for Control-C on Mac
call SignalHandlerMBS.SetFlagHandler(2)

Var ende as boolean = false
do
if SignalHandlerMBS.IsFlagSet(2) then
Print "Flag 2 set. Existing..."
ende = true
end if

DoEvents 1
loop until ende
```

Notes: The signal is catched, a flag is set and you can ask later in your normal application flow for the result.

234.0.67 How to change name of application menu?

Plugin Version: all, Platforms: macOS, Windows.

Answer: Use this code to change the application menu name on Mac OS X:
Example:

```
Var mb as new MenubarMBS
Var m as MenuMBS = mb.item(1) // 1 is in my tests the app menu
if m<>Nil then
m.MenuTitle = "Hello World"
end if
```

Notes: This code is for Carbon only.

234.0.68 How to change the name in the menubar of my app on Mac OS X?

Plugin Version: all, Platform: macOS.

Answer:

You mean it screws up if the file name of the bundle itself is different than the name of the executable file in the MacOS folder within the bundle? If so, you should find something like this within your Info.plist file (or the 'plst' resource that the RB IDE builds for you):

```
<key>CFBundleExecutable</key>
<string>Executable file name here</string>
```

Just make sure that file name matches.

However, if your question involves how you can change the name of the app that appears in the menu and the dock, that's different. You can make this name different from the file name by changing the CFBundleName key:

```
<key>CFBundleName</key>
<string>Name for menu here</string>
```

Note that if you use my free AppBundler program, this second part is taken care of for you – just fill in a custom name in the right field. You can find AppBundler (from Thomas Reed) at http://www.bitjuggler.com/products/appbundler/ .

234.0.69 How to check if a folder/directory has subfolders?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this to check all items in a folder:
Example:

```
Function HasSubFolder(folder as FolderItem) As Boolean
Var c as Integer = folder.Count

for i as Integer = 1 to c
Var item as FolderItem = folder.TrueItem(i)

if item<>Nil and item.Directory then
Return true
end if
```

```
next

End Function
```

Notes: We use trueitem() here to avoid resolving alias/link files.
Also we check for nil as we may not have permission to see all items.
And if one is a directory, we return without checking the rest.

234.0.70 How to check if Macbook runs on battery or AC power?

Plugin Version: all, Platform: macOS.

Answer: Please use our IOPowerSourcesMBS class like this:
Example:

```
Function PowerSourceState() as Integer
Var p as new IOPowerSourcesMBS

// check all power sources
Var u as Integer = p.Count-1
for i as Integer = 0 to u
Var d as CFDictionaryMBS = p.Item(i)
if d<>nil then
// check if they have a power source state key:
Var o as CFObjectMBS = d.Value(NewCFStringMBS("Power Source State"))
if o isa CFStringMBS then
Var s as string = CFStringMBS(o).str

'MsgBox s

if s = "AC Power" then
Return 1
elseif s = "Battery Power" then
Return 2
end if
end if
end if
next
Return 0 // unknown
End Function
```

Notes: If you want to check the CFDictionaryMBS content, simply use a line like "dim x as dictionary = d.dictionary" and check the contents in the debugger.

234.0.71 How to check if Microsoft Outlook is installed?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: If you need Outlook for Scripting, you should simply check registry for the required Outlook.Application class:
Example:

```
Function OutlookInstalled() As Boolean
#if TargetWin32 then

try
Var r as new RegistryItem("HKEY_CLASSES_ROOT\Outlook.Application\CLSID", false)

Return true

catch r as RegistryAccessErrorException
// not installed
Return false

end try

#else

// Windows only, so false on other platforms
Return false

#endif

End Function
```

234.0.72 How to check on Mac OS which country or language is currently selected?

Plugin Version: all, Platform: macOS.

Answer: The code below returns a country value.
Example:

```
Var result as Integer

IF TargetMacOS THEN

CONST smScriptLang = 28
CONST smSystemScript = -1

DECLARE FUNCTION GetScriptManagerVariable LIB "Carbon" ( selector as Integer) as Integer
```

```
DECLARE FUNCTION GetScriptVariable LIB "Carbon" ( script as Integer, selector as Integer) as Integer

result=GetScriptVariable(smSystemScript, smScriptLang)

END IF
```

Notes: Returns values like:

For more values, check "Script.h" in the frameworks.

234.0.73 How to code sign my app with plugins?

Plugin Version: all, Platform: macOS.

Answer: When you try to code sign the application with plugin dylibs on Mac OS X, you may see error message that there is actually a signature included.
Notes: Please use the -f command line parameter with codesign utility to overwrite our MBS signature.
We sign our plugins for MacOS, iOS and Windows to make sure they have not been modified.

In terminal, you do like this:

```
cd <Path to folder of app>

xattr -cr <Appname>.app
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.dylib
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.framework
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app
```

Please use the name of your certificate (See keychain), the name of your app and the path to the app folder.
If you have helper apps you need to sign them first.
You can use a build step to automatically sign your app on build.

234.0.74 How to collapse a window?

Plugin Version: all, Platform: macOS.

Answer: Use this function (Mac only):
Example:

```
Sub CollapseRBwindow(w as window, CollapseStatus as boolean)
```

```
Var state, err as Integer
Var wh as MemoryBlock

Declare Function CollapseWindow Lib "Carbon" (window as Integer,collapse as Integer) as Integer

IF CollapseStatus THEN
state = 1
ELSE
state = 0
END IF

err = CollapseWindow(w.MacWindowPtr, state)

End Sub
```

Notes: Also the MBS Plugin has a window.collapsedmbs property you can set.
For Windows the MBS Plugin has a window.isiconicmbs property.

234.0.75 How to compare two pictures?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can try this code:
Example:

```
Function ComparePictures(p as picture,q as picture) as Integer
Var r,u as RGBSurface
Var x,y,n,m,h,w as Integer
Var w1,w2,h1,h2,d1,d2 as Integer
Var c1,c2 as color

h1=p.Height
h2=q.Height
w1=p.Width
w2=q.Width
d1=p.Depth
d2=q.Depth

if d1<>d2 then
Return 1
elseif w1<>w2 then
return 2
elseif h1<>h2 then
Return 3
else
r=p.RGBSurface
```

```
u=q.RGBSurface

if r=nil or u=nil then
Return -1
else
h=h1-1
w=w1-1
m=min(w,h)

for n=0 to m
c1=r.Pixel(n,n)
c2=u.Pixel(n,n)
if c1<>c2 then
Return 4
end if
next

for y=0 to h
for x=0 to w
c1=r.Pixel(x,y)
c2=u.Pixel(x,y)
if c1<>c2 then
Return 5
end if
next
next

// 0 for equal
// -1 for error (no RGBsurface)
// 1 for different depth
// 2 for different width
// 3 for different height
// 4 for different pixels (fast test)
// 5 for different pixels (slow test)
end if
end if

Exception
Return -1
End Function
```

Notes: Remember that this only works on bitmap pictures, so the picture.BitmapMBS function may be useful.

234.0.76 How to compile PHP library?

Plugin Version: all, Platform: macOS.

Answer: You have to download the source code and compile a static version of the library.
Notes: This instructions were written based on PHP 5.2.6 on Mac OS X:

- Best take a new Mac with current Xcode version installed.
- Download the source code archive. e.g. "php-5.2.6.tar.bz2"
- Expand that archive on your harddisc.
- Open terminal window
- change directory to the php directory. e.g. "cd /php-5.2.6"
- execute this two lines to define the supported CPU types and the minimum Mac OS X version:
- export CFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
- export CXXFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
- the command "./configure help" does show the configure options.
- use configure with a line like this:
- ./configure –enable-embed –with-curl -enable-ftp –enable-zip –enable-sockets –enable-static –enable-soap –with-zlib –with-bz2 –enable-exif –enable-bcmath –enable-calendar
- start the compilation with "make all"
- other option is to use "make install" which first does the same as "make all" and than does some installation scripts.
- you may get an error about a duplicate symbole _yytext. Search the file "zend_ini_scanner.c", search a line with "char *yytext;" and change it to "extern char *yytext;".
- On the end you get a lot of error messages, but you have a working library (named libphp5.so) file in the invisible ".libs" folder inside your php source folder.

Possible problems and solutions:

- If the path to your files has spaces, you can get into trouble. e.g. "/RB Plugins/PHP" is bad as files will be searched sometimes in "/RB".
- If you have in /usr/local/lib libraries which conflict with the default libraries, you can get into trouble.
- If you installed some open source tools which compiled their own libraries, you can get into conflicts.
- if you have to reconfigure or after a problem, you may need to use "make clean" before you start "make all" again.

Feel free to install additional libraries and add more packages to the configure line.

234.0.77 How to convert a BrowserType to a String with WebSession.Browser?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this:
Example:

```
Function GetBrowserName(s as WebSession.BrowserType) As string
Select case s
case WebSession.BrowserType.Android
Return "Andriod"
case WebSession.BrowserType.Blackberry
Return "Blackberry"
case WebSession.BrowserType.Chrome
Return "Chrome"
case WebSession.BrowserType.ChromeOS
Return "ChromeOS"
case WebSession.BrowserType.Firefox
Return "Firefox"
case WebSession.BrowserType.InternetExplorer
Return "InternetExplorer"
case WebSession.BrowserType.Opera
Return "Opera"
case WebSession.BrowserType.Safari
Return "Safari"
case WebSession.BrowserType.SafariMobile
Return "SafariMobile"
case WebSession.BrowserType.Unknown
Return "Unknown"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

234.0.78 How to convert a EngineType to a String with WebSession.Engine?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this:
Example:

```
Function GetRenderingEngineName(s as WebSession.EngineType) As string
Select case s
case WebSession.EngineType.Gecko
Return "Gecko"
case WebSession.EngineType.Presto
```

```
Return "Presto"
case WebSession.EngineType.Trident
Return "Trident"
case WebSession.EngineType.Unknown
Return "Unknown"
case WebSession.EngineType.WebKit
Return "WebKit"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

234.0.79 How to convert a PlatformType to a String with WebSession.Platform?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this:
Example:

```
Function GetPlatformName(s as WebSession.PlatformType) As string
Select case s
case WebSession.PlatformType.Blackberry
Return "Blackberry"
case WebSession.PlatformType.iPad
Return "iPad"
case WebSession.PlatformType.iPhone
Return "iPhone"
case WebSession.PlatformType.iPodTouch
Return "iPodTouch"
case WebSession.PlatformType.Linux
Return "Linux"
case WebSession.PlatformType.Macintosh
Return "Macintosh"
case WebSession.PlatformType.PS3
Return "PS3"
case WebSession.PlatformType.Unknown
Return "Unknown"
case WebSession.PlatformType.WebOS
Return "WebOS"
case WebSession.PlatformType.Wii
Return "Wii"
case WebSession.PlatformType.Windows
Return "Windows"
else
```

```
Return "Unkown: "+str(integer(s))
end Select

End Function
```

234.0.80 How to convert a text to iso-8859-1 using the TextEncoder?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.
Example:

```
Var outstring as string
Var theMac, thePC as textencoding
Var Mac2PC as textconverter

theMac = getTextEncoding(0) // MacRoman
thePC = getTextEncoding(&h0201) // ISOLatin1

Mac2PC = getTextConverter(theMac, thePC)
// if you wanted to do the opposite just create a converter
// PC2Mac = getTextConverter(thePC, theMac)

outstring = Mac2PC.convert("Bj√rn, this text should be converted")
Mac2PC.clear
```

Notes:

You have to call Mac2PC.clear after every conversion to reset the encoding engine.
See also newer TextConverterMBS class.

234.0.81 How to convert ChartTime back to Xojo date?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We have this example code:
Example:

```
Function ChartTimeToDate(ChartTime as Double) As date
static diff as Double = 0.0

if diff = 0.0 then
Var d2 as Double = CDBaseChartMBS.chartTime(2015, 1, 1)
```

```
Var da as new date(2015, 1, 1)
Var ts as Double = da.TotalSeconds

diff = ts - d2
end if

Var d as new date
d.TotalSeconds = diff + ChartTime

Return d
End Function
```

Notes: As you see we calculate the difference in base date from Date and ChartTime and later use difference to convert.

234.0.82 How to convert line endings in text files?

Plugin Version: all, Platform: macOS.

Answer: You can simply read file with TextInputStream and write with new line endings using TextOutputStream class.
Example:

```
Var inputfile as FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var outputfile as FolderItem = SpecialFolder.Desktop.Child("output.txt")
Var it as TextInputStream = TextInputStream.Open(inputfile)
Var ot as TextOutputStream = TextOutputStream.Create(outputfile)

ot.Delimiter = EndOfLine.Windows // new line ending
while not it.EOF
ot.WriteLine it.ReadLine
wend
```

Notes: TextInputStream will read any input line endings and with delimiter property in TextOutputStream you can easily define your new delimiter.

234.0.83 How to convert picture to string and back?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use this plugin functions:
Notes: JPEG:

JPEGStringToPictureMBS(buf as string) as picture
JPEGStringToPictureMBS(buf as string,allowdamaged as Boolean) as picture
PictureToJPEGStringMBS(pic as picture,quality as Integer) as string

PNG:

PictureToPNGStringMBS(pic as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string
PNGStringToPictureMBS(data as string, gamma as single) as picture
PNGStringToPNGPictureMBS(data as string, gamma as single) as PNGpictureMBS

Tiff:

TIFFStringToPictureMBS(data as string) as picture
TIFFStringToTiffPictureMBS(data as string) as TiffPictureMBS

BMP:

BMPStringtoPictureMBS(data as string) as picture
Picture.BMPDataMBS(ResolutionValueDPI as Integer=72) as string

GIF:

GifStringToGifMBS(data as string) as GIFMBS
GifStringToPictureMBS(data as string) as Picture

234.0.84 How to copy an array?

Plugin Version: all, Platform: macOS.

Answer: You can use a function like this to copy an array:
Example:

```
Function CopyArray(a() as Double) as Double()
Var r() as Double
for each v as Double in a
r.Append v
next
```

```
Return r
End Function
```

Notes: If needed make several copies of this method with different data types, not just double.
For a deep copy of an array of objects, you need to change code to also make a copy of those objects.

234.0.85 How to copy an dictionary?

Plugin Version: all, Platform: macOS.

Answer: You can use a function like this to copy a dictionary:
Example:

```
Function CopyDictionary(d as Dictionary) As Dictionary
Var r as new Dictionary
for each key as Variant in d.keys
r.Value(key) = d.Value(key)
next
Return r
End Function
```

Notes: If needed make several copies of this method with different data types, not just double.
For a deep copy of an dictionary of objects, you need to change code to also make a copy of those objects.

234.0.86 How to copy parts of a movie to another one?

Plugin Version: all, Platforms: macOS, Windows.

Answer: The code below copies ten seconds of the snowman movie to the dummy movie starting at the 5th second.
Example:

```
Var f as FolderItem
Var md as EditableMovie
Var ms as EditableMovie

f=SpecialFolder.Desktop.Child("Our First Snowman.mov")
ms=f.OpenEditableMovie

ms.SelectionStartMBS=5
ms.SelectionLengthMBS=10

f=SpecialFolder.Desktop.Child("dummy.mov")
md=f.CreateMovie
```

msgbox str(md.AddMovieSelectionMBS(ms))

Notes: If result is not 0, the method fails.

234.0.87 How to create a birthday like calendar event?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
// start a connection to the calendar database
Var s as new CalCalendarStoreMBS

// needed for the error details
Var e as NSErrorMBS

Var r as CalRecurrenceRuleMBS = CalRecurrenceRuleMBS.initYearlyRecurrence(1, nil) // repeat every year without end

Var a as new CalAlarmMBS // add alarm
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before

// create a new calendar
Var c as new CalEventMBS

Var d as new date(2011, 04, 20) // the date

Var calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="Test Birthday"
c.startDate=d
c.recurrenceRule = r
c.calendar=calendars(0) // add to first calendar
c.addAlarm(a)
c.endDate = d
c.isAllDay = true

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
```

```
MsgBox "New event was created."
end if
```

Notes: This adds an event to iCal for the given date with alarm to remember you and repeats it every year.

234.0.88 How to create a GUID?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the UUIDMBS class for this.

234.0.89 How to create a Mac picture clip file?

Plugin Version: all, Platform: Windows.

Answer: You can use code like this one.
Example:

```
Var f As FolderItem
Var p As Picture

f=SpecialFolder.Desktop.Child("Test.pictClipping")
if f=nil then Return

p=new Picture(300,200,32) 'Make a sample picture
p.Graphics.ForeColor=RGB(0,255,255)
p.Graphics.FillOval 0,0,99,99
p.Graphics.ForeColor=RGB(255,0,0)
p.Graphics.DrawOval 0,0,99,99

Var r As ResourceFork 'ResourceFork is needed for a clip file

// Please define a file type Any
r=f.CreateResourceFork("Any")

// get PICT data using plugin function
Var pictdata as string = p.PicHandleDataMBS
r.AddResource(pictdata,"PICT",256,"Picture")

Var m as new MemoryBlock(8)

m.LittleEndian = false
m.Int16Value(0) = 0
```

```
m.Int16Value(2) = 0
m.Int16Value(4) = p.Width
m.Int16Value(6) = p.Height

r.AddResource(m,"RECT",256,"")

'Values taken from a sample file and irrelevant to the problem
Var data as string = DecodeBase64("AQAAAAAAAAAAAAAAAAAACAFRDRVIAAAABAAAAAAAAAABUQ0lQAAAAA
r.AddResource(data,"drag",128,"") 'ditto
r.Close
```

Notes: In general Apple has deprecated this, but a few application still support clippings.

234.0.90 How to create a PDF file in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Check our DynaPDF plugin and the examples.
Notes: An alternative can be to use the CoreGraphics and Cocoa functions on Mac OS X.
For Windows, we can only suggest our DynaPDF plugin.

234.0.91 How to create EmailAttachment for PDF Data in memory?

Plugin Version: all, Platform: macOS.

Answer: You can use code like the one below:
Example:

```
Function EmailAttachmentFromPDFData(PDFData as string, filename as string) As EmailAttachment
Var a as new EmailAttachment

a.data = EncodeBase64(PDFData, 76)
a.ContentEncoding = "base64"
a.MIMEType = "application/pdf"
a.MacType = "PDF "
a.MacCreator = "prvw"
a.Name = filename

Return a
End Function
```

Notes: Compared to sample code from Xojo documentation, we set the mime type correct for PDF.
The MacType/MacCreator codes are deprecated, but you can still include them for older Mac email clients.
"prvw" is the creator code for Apple's preview app.

234.0.92 How to create PDF for image files?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use DynaPDF like this:
Example:

```
Function CreatePrintPDF(jpgFiles() as folderitem, pdfFile as FolderItem, PageWidth as Integer, PageHeight
as Integer) As Boolean
// have files?
If pdfFile = Nil Then Return False
If jpgFiles = Nil Then Return False

If jpgFiles.Ubound <0 Then Return False

// new DynaPDF
Var pdf As New MyDynapdfMBS

// page width/height in MilliMeter
Var pdfWidth as Integer = PageWidth * 72 / 25.4
Var pdfHeight as Integer = PageHeight * 72 / 25.4

// put your license here
Call pdf.SetLicenseKey "Starter"

// create pdf
Call pdf.CreateNewPDF pdfFile

// set a couple of options
Call pdf.SetPageCoords(MyDynaPDFMBS.kpcTopDown)
Call pdf.SetResolution(300)
Call pdf.SetUseTransparency(False)
Call pdf.SetSaveNewImageFormat(False)
Call pdf.SetGStateFlags(MyDynaPDFMBS.kgfUseImageColorSpace, False)
Call pdf.SetJPEGQuality(100)

// set page size
Call pdf.SetBBox(MyDynaPDFMBS.kpbMediaBox, 0, 0, pdfWidth, pdfHeight)
Call pdf.SetPageWidth(pdfWidth)
Call pdf.SetPageHeight(pdfHeight)

// append pages with one image per page
For i as Integer = 0 To jpgFiles.Ubound
Call pdf.Append
Call pdf.InsertImageEx(0, 0, pdfWidth, pdfHeight, jpgFiles(i), 1)
Call pdf.EndPage
```

```
Next

// close
Call pdf.CloseFile

Return True
End Function
```

Notes: This is to join image files in paper size to a new PDF.
e.g. scans in A4 into an A4 PDF.

234.0.93 How to CURL Options translate to Plugin Calls?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Below a few tips on how to translate command line CURL calls to plugin calls.
Notes: curl -vX PUT http://localhost:5984/appserials/78569238475/DocumentRegister.docx?rev=3-25634563456 –data-binary @DocumentRegister.docx -H "Content-Type: application/msword"

- The option -v means verbose. You can use OptionVerbose and listen for messages in the DebugMessage event.
- The option -X PUT means we want to do a HTTP PUT Request. So set OptionPut to true. Also you will want to set OptionUpload to true as you upload data.
- We have the URL which you put into OptionURL property.
- The –data-binary option tells CURL to pass the given data. With the @ before the data, it is intrepreted as a file name, so the data is read from the given file. You'll need to open this file and pass data with the Read event as needed. (See CURLS ftp file upload example project)
- The last option -H specifies an additional header for the upload. Pas this additional header with the SetOptionHTTPHeader method.

curl -X PUT http://127.0.0.1:5984/appserials/f2f4e540bf8bb60f61cfcd4328001c59 -d ' { "type":"Product","description":"Application Serial","acronym":"AppSerial","dateAdded":"2011-03-21 14:57:36" } '

- Option -X PUT like above.
- Pass the URL again in OptionURL
- This time data is passed in command line for CURL. You'd put this data in the quotes into a string and make it available in the Read event. (See CURLS ftp upload example project)

234.0.94 How to delete file with ftp and curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
Var d as CURLMBS // your curl object

// delete file
Var ws() As String
ws.Append "DELE Temp.txt"

d.SetOptionPostQuote(ws)
```

Notes: Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. To delete use DELE and the file path.

234.0.95 How to detect display resolution changed?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac OS X simply listen for display changed notifications.
Notes: Use the "Distribution Notification Center.rbp" example project as a base and use it to listen to notifications with the name "O3DeviceChanged".

234.0.96 How to detect retina?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use Window.BackingScaleFactorMBS to query the factor.
Example:

```
msgbox str(window1.BackingScaleFactorMBS)
```

234.0.97 How to disable force quit?

Plugin Version: all, Platform: macOS.

Answer:

Please visit this website and get the control panel for Mac OS 9 there:
http://www3.sk.sympatico.ca/tinyjohn/DFQ.html

For Mac OS X use the MBS Plugin with the SetSystemUIModeMBS method.
Notes:

Please use presentationOptions in NSApplicationMBS for Cocoa applications.

234.0.98 How to disable the error dialogs from Internet Explorer on javascript errors?

Plugin Version: all, Platform: Windows.

Answer: You can use this code in the htmlviewer open event:
Example:

```
if targetwin32 then
htmlviewer1._ole.Content.value("Silent") = True
end if
```

Notes: This disables the error dialogs from Internet Explorer.

234.0.99 How to display a PDF file in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac OS X you can use CoreGraphics or PDFKit to display a PDF.
Notes: An alternative can be to load the PDF into a htmlviewer so the PDF plugin can display it.
On Windows you may need to use the Acrobat ActiveX control from Adobe or launch Acrobat Reader.

234.0.100 How to do a lottery in RB?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this function:
Example:

```
Sub Lotto(max as Integer,count as Integer,z() as Integer)
// Lotto count numbers of max put into the array z beginning at index 0
Var n(0) as Integer ' all the numbers
Var m as Integer ' the highest field in the current array
Var i,a,b,d as Integer ' working variables

'fill the array with the numbers
m=max-1
```

```
redim n(m)

for i=0 to m
n(i)=i+1
next

' unsort them by exchanging random ones
m=max*10
for i=1 to m
a=rnd*max
b=rnd*max

d=n(a)
n(a)=n(b)
n(b)=d
next

' get the first count to the dest array
m=count-1
redim z(m)
for i=0 to m
z(i)=n(i)
next

'sort the result
z.sort
End Sub

Sub Open()
// Test it

Var za(0) as Integer ' the array of the numbers

lotto 49,6,za ' 6 of 49 in Germany

' and display them
staticText1.text=str(za(0))+chr(13)+str(za(1))+chr(13)+str(za(2))+chr(13)+str(za(3))+chr(13)+str(za(4))+chr(13)+str(za
End Sub
```

234.0.101 How to do an asycron DNS lookup?

Plugin Version: all, Platform: Windows.

Answer: use CFHostMBS class (Mac OS X only).
Notes: Xojo internal functions and plugin DNS functions are sycronized.

You can use DNSLookupThreadMBS class for doing them asyncron.

234.0.102 How to draw a dushed pattern line?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can try this code:
Example:

```
// call like this: DrawDushedPatternLine g,0,0,width,height,10

Sub DrawDushedPatternLine(g as graphics,x1 as Integer,y1 as Integer,x2 as Integer,y2 as Integer, partlen as Integer)
Var x,y,ox,oy as Double
Var dx,dy as Double
Var w,h,d as Double
Var b as Boolean

w=x2-x1
h=y2-y1

d=sqrt(w*w+h*h)

dx=w/d*partlen
dy=h/d*partlen

b=true
x=x1
while (x<x2) and (y<y2)
ox=x
oy=y

x=x+dx
y=y+dy

if b then
g.DrawLine ox,oy,x,y
end if

b=not b
wend

End Sub
```

Notes: It would be possible to add this to the plugin, but I think it's better if you do it in plain Xojo code,

so it even works on Windows.

234.0.103 How to draw a nice antialiased line?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.
Example:

```
Sub drawLine(xs as Integer, ys as Integer, xe as Integer, ye as Integer, face as RGBSurface, lineColor as color)
Var intX, intY, count, n, xDiff, yDiff as Integer
Var v, v1, floatX, floatY, xx, yy, xStep, yStep as Double
Var c as color

const st=1.0

xDiff=xe-xs
yDiff=ye-ys
count=max(abs(xDiff), abs(yDiff))
xStep=xDiff/count
yStep=yDiff/count
xx=xs
yy=ys
for n=1 to count
intX=xx
intY=yy
floatX=xx-intX
floatY=yy-intY

v=(1-floatX)*(1-floatY)*st
v1=1-v
c=face.pixel(intX, intY)
face.pixel(intX, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*(1-floatY)*st
v1=1-v
c=face.pixel(intX+1, intY)
face.pixel(intX+1, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=(1-floatX)*floatY*st
v1=1-v
c=face.pixel(intX, intY+1)
face.pixel(intX, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*floatY*st
v1=1-v
```

```
c=face.pixel(intX+1, intY+1)
face.pixel(intX+1, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)

xx=xx+xStep
yy=yy+yStep
next

End Sub
```

Notes:

PS: st should be 1 and face should be a RGBSurface or a Graphics object.

234.0.104 How to dump java class interface?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: In terminal you can use "javap -s <classname>" to display the class with the method names and parameters.
Notes: For example show ResultSet class: javap -s java.sql.ResultSet

234.0.105 How to duplicate a picture with mask or alpha channel?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this function:
Example:

```
Function Duplicate(extends p as Picture) As Picture
#if RBVersion >= 2011.04 then
if p.HasAlphaChannel then

// create nw picture and copy content:
Var q as new Picture(p.Width, p.Height)
q.Graphics.DrawPicture p,0,0

Return q

end if
#endif

// create new picture
Var q as new Picture(p.Width, p.Height, 32)

// get mask
```

```
Var oldMask as Picture = p.mask(false)
if oldMask = nil then
// no mask, so simple copy
q.Graphics.DrawPicture p,0,0
Return q
end if

// remove mask
p.mask = nil

// copy picture and mask
q.Graphics.DrawPicture p, 0, 0
q.mask.Graphics.DrawPicture oldMask,0,0

// restore mask
p.mask = oldmask

Return q
End Function
```

Notes: Simply copy it to a module and call it like this: q = p.duplicate.
The code above works with old Xojo versions because of the #if even if your RS version does not support alpha channel pictures. This way it's future proof.

234.0.106 How to enable assistive devices?

Plugin Version: all, Platform: macOS.

Answer: You can use AppleScript code like below:
Notes: tell application "System Events"
activate

set UI elements enabled to true

return UI elements enabled
end tell

You can run this with AppleScriptMBS class.

234.0.107 How to encrypt a file with Blowfish?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this:
Example:

```
Var fi as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")
Var fo as FolderItem = SpecialFolder.Desktop.Child("test.encrypted")

// read input
Var bi as BinaryStream = BinaryStream.Open(fi)
Var si as string = bi.Read(bi.Length)
bi.Close

// encrypt
Var so as string = BlowfishMBS.Encrypt("MyKey",si)

// write output
Var bo as BinaryStream = BinaryStream.Create(fo)
bo.Write so
bo.Close
```

Notes: Of course you can decrypt same way, just use Decrypt function and of course swap files.

234.0.108 How to extract text from HTML?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use both RemoveHTMLTagsMBS and DecodingFromHTMLMBS like this:
Example:

```
Var html as string = "<p><B>Gr&uuml;&szlig;e</B></P>"
Var htmltext as string = RemoveHTMLTagsMBS(html)
Var text as string = DecodingFromHTMLMBS(htmltext)

MsgBox text // shows: Gr√º√üe
```

Notes: You can use it together with RemoveHTMLTagsMBS to remove html tags. What you get will be the text without tags.
DecodingFromHTMLMBS turns HTML escapes back to unicode characters. Like ä to √§.

234.0.109 How to find empty folders in a folder?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Try this code:
Example:

```
Var folder as folderitem // your folder

Var c as Integer = folder.count
for i as Integer = 1 to c
Var item as folderitem = folder.trueitem(i)
if item = nil then
// ignore
elseif item.directory then
// folder
if item.count = 0 then
// found empty folder
end if
end if
next
```

234.0.110 How to find iTunes on a Mac OS X machine fast?

Plugin Version: all, Platform: macOS.

Answer: You can try Launch Services.
Example:

```
Var f as FolderItem

f=LaunchServicesFindApplicationForInfoMBS("hook","com.apple.iTunes","iTunes.app")

MsgBox f.NativePath
```

234.0.111 How to find network interface for a socket by it's name?

Plugin Version: all, Platform: macOS.

Answer: You can use our plugin to build a lookup table.
Example:

```
Function FindNetworkInterface(name as string) As NetworkInterface
name = name.trim

if name.len = 0 then Return nil

// search by IP/MAC
Var u as Integer = System.NetworkInterfaceCount-1
for i as Integer = 0 to u
Var n as NetworkInterface = System.GetNetworkInterface(i)
if n.IPAddress = name or n.MACAddress = name then
```

```
Return n
end if
next

// use MBS Plugin to build a mapping
Var interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces
Var map as new Dictionary

for each n as NetworkInterfaceMBS in interfaces
Var IPv4s() as string = n.IPv4s
Var IPv6s() as string = n.IPv6s

for each IPv4 as string in IPv4s
map.Value(IPv4) = n.Name
next
for each IPv6 as string in IPv6s
map.Value(IPv6) = n.Name
next
if n.MAC<>"" then
map.Value(n.MAC) = n.Name
end if
next

// now search interfaces by name, IPv4 or IPv6
for i as Integer = 0 to u
Var n as NetworkInterface = System.GetNetworkInterface(i)
if map.Lookup(n.IPAddress, "") = name then
Return n
end if

if map.Lookup(n.MACAddress, "") = name then
Return n
end if
next

End Function
```

Notes: The code above uses a lookup table build using NetworkInterfaceMBS class to find the network interface by name.

234.0.112 How to find version of Microsoft Word?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this:
Example:

```
// find Word
Var f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.microsoft.Word","")

// open bundle
Var c as new NSBundleMBS(f)

// read info
Var d as Dictionary = c.infoDictionary

// show version
MsgBox d.Lookup("CFBundleVersion","")
```

Notes: Older versions of Word can be found with creator code "MSWD".

234.0.113 How to fix CURL error 60/53 on connecting to server?

Plugin Version: all, Platform: macOS.

Answer: You probably connect with SSL and you have no valid certificate.
Example:

```
Var d as new CURLSMBS

// Disable SSL verification
d.OptionSSLVerifyHost = 0 // don't verify server
d.OptionSSLVerifyPeer = 0 // don't proofs certificate is authentic

// With SSL Verification:
Var cacert as FolderItem = Getfolderitem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2 // verify server
d.OptionSSLVerifyPeer = 1 // proofs certificate is authentic
```

Notes: You can either use the code above to disable the SSL verification and have no security.
Or you use the cacert file and enable the verification. Than you only get a connection if the server has a valid certificate.

see also:
http://curl.haxx.se/ca/

234.0.114 How to format double with n digits?

Plugin Version: all, Platform: macOS.

Answer: You can use the FormatMBS function for this.
Example:

```
Var d as Double = 123.4567890
listbox1.AddRow FormatMBS("%f", d)
listbox1.AddRow FormatMBS("%e", d)
listbox1.AddRow FormatMBS("%g", d)

listbox1.AddRow FormatMBS("%5.5f", d)
listbox1.AddRow FormatMBS("%5.5e", d)
listbox1.AddRow FormatMBS("%5.5g", d)

d = 0.000000123456
listbox1.AddRow FormatMBS("%f", d)
listbox1.AddRow FormatMBS("%e", d)
listbox1.AddRow FormatMBS("%g", d)

listbox1.AddRow FormatMBS("%5.5f", d)
listbox1.AddRow FormatMBS("%5.5e", d)
listbox1.AddRow FormatMBS("%5.5g", d)
```

Notes: see FormatMBS for details.
In general %f is normal style, %e is scientific and %g is whichever gives best result for given space.

234.0.115 How to get a time converted to user time zone in a web app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the WebSession.GMTOffset property.
Example:

```
Sub Open()
// current date on server
Var d as new date
Var s as string = d.LongTime

// adjust to client GMT offset
d.GMTOffset = d.GMTOffset + Session.GMTOffset

Var t as string = D.LongTime

MsgBox s+EndOfLine+t
End Sub
```

234.0.116 How to get an handle to the frontmost window on Windows?

Plugin Version: all, Platform: Windows.

Answer: This function returns a handle for the frontmost window:
Example:

```
Function GetForegroundWindowHandle() as Integer
#if targetwin32 then
declare function GetForegroundWindow Lib "user32.dll" as Integer
Return GetForegroundWindow()
#endif
End Function
```

234.0.117 How to get CFAbsoluteTime from date?

Plugin Version: all, Platforms: macOS, Windows.

Answer: Use code like this:
Example:

```
Var d as new date
Var t as CFTimeZoneMBS = SystemCFTimeZoneMBS
Var g as new CFGregorianDateMBS
g.Day = d.Day
g.Month = d.Month
g.Year = d.Year
g.Minute = d.Minute
g.Hour = d.Hour
g.Second = d.Second

Var at as CFAbsoluteTimeMBS = g.AbsoluteTime(t)
Var x as Double = at.Value

MsgBox str(x)
```

Notes: As you see we need a timezone and put the date values in a gregorian date record.
Now we can query absolute time for the given timezone.

234.0.118 How to get client IP address on web app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the WebSession.RemoteAddress property.
Example:

```
Sub Open()
Title = Session.RemoteAddress
End Sub
```

234.0.119 How to get fonts to load in charts on Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use the SetFontSearchPath method in the CDBaseChartMBS class to specify where your fonts are.
Example:

```
if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype;/usr/share/fonts/truetype/msttcorefonts"
else
// on Mac and Windows we use system fonts.
end if

// also you can later switch default fonts:

Var Chart as CDBaseChartMBS // your chart

#If TargetARM And TargetLinux Then
// use specific fonts on Linux on Raspberry Pi
Call Chart.setDefaultFonts("/usr/share/fonts/truetype/piboto/PibotoLt-Regular.ttf","/usr/share/fonts/truetype/piboto/Pi
#EndIf
```

Notes: On macOS, iOS and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

234.0.120 How to get fonts to load in DynaPDF on Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use the AddFontSearchPath method in the DynaPDFMBS class to specify where your fonts are.
Example:

```
Var d as new DynaPDFMBS
if TargetLinux then
call d.AddFontSearchPath "/usr/share/fonts/truetype", true
else
```

```
// on Mac and Windows we use system fonts.
end if
```

Notes: On Mac OS X and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

234.0.121 How to get GMT time and back?

Plugin Version: all, Platform: macOS.

Answer: You can use the date class and the GMTOffset property.
Example:

```
// now
Var d as new date

// now in GMT
Var e as new date
e.GMTOffset = 0

// show
MsgBox str(d.TotalSeconds,"0.0")+" "+str(e.TotalSeconds, "0.0")

Var GMTTimeStamp as Double = e.TotalSeconds

// restore
Var f as new date

// add GMT offset here
f.TotalSeconds = GMTTimeStamp + f.GMTOffset*3600
// because here it's removed
f.GMTOffset = f.GMTOffset

MsgBox d.ShortTime+" ("+str(d.GMTOffset)+") "+str(d.TotalSeconds,"0.0")+EndOfLine+_
e.ShortTime+" ("+str(e.GMTOffset)+") "+str(e.TotalSeconds,"0.0")+EndOfLine+_
f.ShortTime+" ("+str(f.GMTOffset)+") "+str(f.TotalSeconds,"0.0")
```

Notes: It's sometimes a bit tricky with the date class as setting one property often changes the others.

234.0.122 How to get good crash reports?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Check this website from the webkit website:
Notes: http://webkit.org/quality/crashlogs.html

234.0.123 How to get list of all threads?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use the runtime module like in this function:
Example:

```
Function Threads() As Thread()
#pragma DisableBackgroundTasks
Var t() as Thread

Var o as Runtime.ObjectIterator=Runtime.IterateObjects
While o.MoveNext
if o.Current isa Thread then
t.Append thread(o.current)
end if
Wend

Return t
End Function
```

Notes: This returns an array of all thread objects currently in memory.
The pragma is important here as it avoids thread switches which may cause a thread to be created or deleted.

234.0.124 How to get parameters from webpage URL in Xojo Web Edition?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the Webpage.ParametersReceived event.
Example:

```
Sub ParametersReceived(Variables As Dictionary)
for each key as Variant in Variables.keys
MsgBox key+" ->"+Variables.Value(key)
next
End Sub
```

Notes: The text encodings of this strings is not defined in Xojo 2010r5. Please use DefineEncoding.

234.0.125 How to get the color for disabled textcolor?

Plugin Version: all, Platform: macOS.

Answer: Ask the appearance manager:
Example:

```
Function GetThemeTextColor(inColor as Integer, inDepth as Integer, inColorDev as Boolean) As Color
declare function GetThemeTextColor lib "Carbon" (inColor as Integer, inDepth as Integer, inColorDev as Boolean, outColor as Ptr) as Integer

Var i as Integer
Var col as MemoryBlock

col = newMemoryBlock(6)

i = GetThemeTextColor(inColor, inDepth, inColorDev, col)

return RGB(col.UShort(0)\256, col.UShort(2)\256, col.UShort(4)\256)
End Function
```

Notes: The color for this is:

```
const kThemeTextColorDialogInactive = 2.

c = GetThemeTextColor(kThemeTextColorDialogInactive, Screen(0).Depth, true)
```

For Mac OS X you should use "CarbonLib" instead of "AppearanceLib" ...

234.0.126 How to get the current free stack space?

Plugin Version: all, Platform: macOS.

Answer: You can something like the code below:
Example:

```
Sub ShowStackSize()
Var threadid as Integer
Var size as Integer

declare function GetCurrentThread lib "Carbon" (byref threadid as Integer) as short
```

```
declare function ThreadCurrentStackSpace lib "Carbon" (threadid as Integer, byref size as Integer) as short

if GetCurrentThread(threadid)=0 then
if 0=ThreadCurrentStackSpace(threadid,size) then
MsgBox str(size)
end if
end if
End Sub
```

Notes: For Mac OS 9, use "ThreadLib" instead of "CarbonLib". You can use #if if you like for that.

234.0.127 How to get the current timezone?

Plugin Version: all, Platforms: macOS, Windows.

Answer:

You can use the TimeZoneMBS class or the CFTimeZoneMBS class.
Or code like below:
Example:

```
Function GMTOffsetInMinutes() as Integer
// Returns the offset of the current time to GMT in minutes.
// supports Mac OS and Windows, but not Linux yet (let me know if
// you have code for that, please)
//
// Note that the offset is not always an even multiple of 60, but
// there are also half hour offsets, even one 5:45h offset

// This version by Thomas Tempelmann (rb@tempel.org) on 25 Nov 2005
// with a fix that should also make it work with future Intel Mac targets.
//
// Using code from various authors found on the RB NUG mailing list

Var result, bias, dayLightbias as Integer
Var info as memoryBlock
Var offset as Integer

#if targetMacOS then

Declare Sub ReadLocation lib "Carbon" (location As ptr)

info = NewMemoryBlock(12)
ReadLocation info
if false then
// bad, because it does not work on Intel Macs:
```

```
'offset = info.short(9) * 256 + info.byte(11)
else
offset = BitwiseAnd (info.long(8), &hFFFFFF)
end

offset = info.short(9) * 256 + info.byte(11)
offset = offset \60
return offset

#endif

#if targetWin32 then

Declare Function GetTimeZoneInformation Lib "Kernel32" ( tzInfoPointer as Ptr ) as Integer
// returns one of
// TIME_ZONE_ID_UNKNOWN 0
// – Note: e.g. New Delhi (GMT+5:30) and Newfoundland (-3:30) return this value 0
// TIME_ZONE_ID_STANDARD 1
// TIME_ZONE_ID_DAYLIGHT 2

info = new MemoryBlock(172)
result = GetTimeZoneInformation(info)

bias = info.Long(0)
// note: the original code I found in the NUG archives used Long(84) and switched to Long(0)
// only for result=1 and result=2, but my tests found that Long(0) is also the right value for result=0

if result = 2 then
daylightBias = info.long(168)
end if
offset = - (bias + dayLightbias)
return offset

#endif

End Function
```

234.0.128 How to get the current window title?

Plugin Version: all, Platform: macOS.

Answer: The code below returns the current window title for the frontmost window on Mac OS X if Accessibilty services are
Example:

```
Function CurrentWindowTitle() As string
// your application needs permissions for accessibility to make this work!
```

```
Var SystemWideElement,FocusedApplicationElement,FocusedWindowElement as AXUIElementMBS
Var FocusedApplication,FocusedWindow,Title as AXValueMBS
Var s as String
Var cs as CFStringMBS

SystemWideElement=AccessibilityMBS.SystemWideAXUIElement
if SystemWideElement<>nil then
FocusedApplication=SystemWideElement.AttributeValue(AccessibilityMBS.kAXFocusedApplicationAttribute)
if FocusedApplication.Type=AccessibilityMBS.kAXUIElementMBSTypeID then
FocusedApplicationElement=new AXUIElementMBS
FocusedApplicationElement.Handle=FocusedApplication.Handle
FocusedApplicationElement.RetainObject

FocusedWindow=FocusedApplicationElement.AttributeValue(AccessibilityMBS.kAXFocusedWindowAttribute)

if FocusedWindow<>nil and AccessibilityMBS.kAXUIElementMBSTypeID=FocusedWindow.Type then

FocusedWindowElement=new AXUIElementMBS
FocusedWindowElement.Handle=FocusedWindow.Handle
FocusedWindowElement.RetainObject

Title=FocusedWindowElement.AttributeValue(AccessibilityMBS.kAXTitleAttribute)
if Title<>nil and Title.Type=kCFStringMBSTypeID then
cs=new CFStringMBS
cs.handle=Title.Handle
cs.RetainObject
Return cs.str
end if
end if
end if
end if
End Function
```

234.0.129 How to get the cursor blink interval time?

Plugin Version: all, Platform: macOS.

Answer: On Mac OS you can use GetCaretTime from the toolbox.
Example:

```
declare function GetCaretTime lib "Carbon" () as Integer

MsgBox str(GetCaretTime())+" ticks"
```

Notes: 60 ticks make one second.

234.0.130 How to get the list of the current selected files in the Finder?

Plugin Version: all, Platform: macOS.

Answer:

Use the AppleScript like this one:

```
tell application "finder"
return selection
end tell
```

Which translates into this AppleEvent:

```
Process("Finder").SendAE "core,getd,'—-':obj { form:prop, want:type(prop), seld:type(sele), from:'null'() }
"
```

and as Xojo code it looks like this:
Example:

```
Var ae as appleevent
Var o1 as appleeventObjectSpecifier
Var f as folderItem
Var aList as appleeventdescList
Var i as Integer
Var dateiname as string

// setup the AppleEvent
o1=getpropertyObjectDescriptor( nil, "sele")
ae= newappleEvent("core", "getd", "MACS")
ae.objectSpecifierParam("—-")=o1

// send it
if ae.send then
// got the list
alist=ae.replyDescList

// now show the list of filename into an editfield:

for i=1 to alist.count
f=alist.folderItemItem(i)

dateiname=f.name
// editfield1 with property "mulitline=true"!
```

```
editfield1.text=editfield1.text + dateiname + chr(13)
next
end if
```

234.0.131 How to get the Mac OS system version?

Plugin Version: all, Platform: macOS.

Answer: The following code queries the value and displays the version number:
Example:

```
Var first as Integer
Var second as Integer
Var third as Integer
Var l as Integer

if System.Gestalt("sysv",l) then

Third=Bitwiseand(l,15)
second=Bitwiseand(l\16,15)
first=Bitwiseand(l\256,15)+10*Bitwiseand(l\256\16,15)
end if

if First>=10 then
msgbox "Mac OS X "+str(First)+"."+str(Second)+"."+str(third)
else
msgbox "Mac OS "+str(First)+"."+str(Second)+"."+str(third)
end if
```

234.0.132 How to get the Mac OS Version using System.Gestalt?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var s As String
Var b As Boolean
Var i, resp as Integer

// Systemversion
b = System.Gestalt("sysv", resp)
If b then
s = Hex(resp)
```

```
For i =Len(s)-1 DownTo 1
s=Left(s,i)+"."+Mid(s,i+1)
Next
MsgBox "Systemversion: Mac OS " + s
end if
```

Notes: The MBS Plugin has a SystemInformationMBS.OSVersionString function for this.

234.0.133 How to get the screensize excluding the task bar?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Notes: Use the Screen class with the available* properties.

234.0.134 How to get the size of the frontmost window on Windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Notes: Make yourself a class for the WindowRect with four properties:

```
Bottom as Integer
Left as Integer
Right as Integer
Top as Integer
```

Add the following method to your class:

```
Sub GetWindowRect(windowhandle as Integer)
Var err as Integer
Var mem as memoryBlock
#if targetwin32 then
Declare Function GetWindowRect Lib "user32.dll" (hwnd as Integer, ipRect As Ptr) as Integer

mem = newmemoryBlock(16)
err = GetWindowRect(windowhandle, mem)
Left = mem.long(0)
Top = mem.Long(4)
Right = mem.Long(8)
Bottom = mem.Long(12)
#endif
```

End Sub

Good to use for the MDI Master Window!

234.0.135 How to get the source code of a HTMLViewer?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
// for Windows:

msgbox HTMLViewer1.IEHTMLTextMBS

// for MacOS with WebKit 2.x:

msgbox HTMLViewer1.WKWebViewMBS.HTMLText
```

234.0.136 How to get Xojo apps running Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You need to install some requuire packages.
Notes: You need CUPS as well as GTK packages. On 64 bit systems also the ia32-libs package.

Please note that you need a x86 compatible Linux. So no PPC, Power, ARM or other CPUs.

234.0.137 How to handle really huge images with GraphicsMagick or ImageMagick?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Sometimes it may be better to use an extra application to process images.
Notes: A typical 32 bit app made with Xojo can use around 1.8 GB on Windows and 3 GB on Mac OS X. Some images may be huge, so that processing them causes several copies of the image to be in memory. With a 500 MB image in memory, doing a scale or rotation may require a temp image. So with source, temp and dest images with each 500 MB plus your normal app memory usage, you may hit the limit of Windows with 1.8 GB.

In that case it may be worth running a tool like gm in the shell class. gm is the command line version

of GraphicsMagick. There you can run the 64 bit version which is not limited in memory like your own application. Also you can monitor progress and keep your app responsive.

234.0.138 How to handle tab key for editable cells in listbox?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this function:
Example:

```
Function HandleTabInList(list as listbox, row as Integer, column as Integer, key as String) As Boolean
// Handle tab character in Listbox.CellKeyDown event

Select case asc(key)
case 9
if Keyboard.AsyncShiftKey then
// back

// look for column left
for i as Integer = column-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next

// not found, so look in row before
row = row - 1
if row >= 0 then
for i as Integer = list.ColumnCount-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next
end if
else
// forward

// look for column right
for i as Integer = column+1 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next
```

```
// not found, so look in row below
row = row + 1
if row <list.ListCount then
for i as Integer = 0 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next
end if
end if
end Select
End Function
```

Notes: You call it from CellKeyDown event like this:

```
EventHandler Function CellKeyDown(row as Integer, column as Integer, key as String) As Boolean
if HandleTabInList(me, row, column, key) then Return true
End EventHandler
```

As you see in the code, we handle tab and shift + tab for moving back and forward. Also we wrap to previous/next row if needed. Feel free to extend this to wrap from last to first row or create a new row for editing.

234.0.139 How to hard link MapKit framework?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Our MapKit classes weak link the framework. If you need hard linking it for the App Store, you can add this method to a class:
Example:

```
Sub ReferenceMapKit()
// just put this in window or app class

#if TargetMachO and Target64Bit then
Declare sub testing Lib "MapKit" Selector "test" (id as ptr)
testing(nil)
#endif

End Sub
```

Notes: No need to call the method.
Just having it in a window or app, will cause the compiler to hard link the framework.

234.0.140 How to have a PDF downloaded to the user in a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use a WebHTMLViewer control and load the PDF file with the PDF plugin from the browser.
Example:

```
Var CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer
CurrentFile.ForceDownload = true

// start the download
showurl(CurrentFile.url)
```

Notes: See our Create PDF example for the Xojo Web Edition.

234.0.141 How to hide all applications except mine?

Platform: macOS.

Answer: The code below will on Mac OS hide all applications except your one:
Example:

```
Var p as new ProcessMBS

p.GetFirstProcess
do
if not p.FrontProcess then
p.Visible=false
end if
loop until not p.GetNextProcess
```

234.0.142 How to hide script errors in HTMLViewer on Windows?

Plugin Version: all, Platform: Windows.

Answer: Set Internet Explorer to silent mode with code like this:
Example:

```
htmlviewer1._ole.Content.value("Silent") = True
```

Notes: Simply put this code in the open event of your htmlviewer control (using me instead of htmlviewer1).

234.0.143 How to hide the grid/background/border in ChartDirector?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: If you want to hide something in a chart, simply assign the kTransparent constant as color.

234.0.144 How to hide the mouse cursor on Mac?

Plugin Version: all, Platform: macOS.

Answer: Try this declare:
Example:

```
Declare Sub HideCursor Lib "Carbon" () Inline68K("A852")

HideCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

234.0.145 How to insert image to NSTextView or TextArea?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: With NSTextViewMBS you can use this code to insert file:
Example:

```
// insert a file to textview

Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
// read to file
Var b as BinaryStream = BinaryStream.Open(f)
Var s as string = b.Read(b.Length)

// build wrapper
Var fileWrapper as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
fileWrapper.preferredFilename = f.name

// make attachment
Var fileAttachment as new NSTextAttachmentMBS(fileWrapper)
```

```
Var attributedString as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

// add to a NSTextViewMBS
textview.insertText attributedString

End Sub
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

234.0.146 How to jump to an anchor in a htmlviewer?

Plugin Version: all, Platforms: macOS, Windows.

Answer: You can use javascript to change the current window's location.
Example:

```
// load website
htmlviewer1.LoadURL "http://www.monkeybreadsoftware.net/addressbook-abpersonmbs.shtml"

// later jump to anchor named "16":

if TargetWin32 then
call HTMLViewer1.IERunJavaScriptMBS "window.location = ""#16"""
end if
```

234.0.147 How to keep a movieplayer unclickable?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: To keep the user away from clicking on a playing Movie you can just drop a Canvas in front of the Movieplayer and take the clicks there.
Example:

```
Function Canvas1.MouseDown(X as Integer, Y as Integer) as boolean
return true // take it and do nothing
End Function
```

234.0.148 How to keep my web app from using 100% CPU time?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Linux and MacOS you can use renice command in the terminal. On Windows use the task manager to reduce priority.
Notes: If you launch your app with nohup on Linux or Mac OS X like this from the terminal or a script:

nohup /webapps/MyApp/MyApp &

you can simply have a second line saying this:

renice 20 $!

which tells the system to lower priority to lowest value for the latest background process.

234.0.149 How to kill a process by name?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can kill a process (or application) by name if you loop over all the processes and kill the one you need.
Example:

```
Var p as new ProcessMBS
p.GetfirstProcess ' get first
do
if p.name = "TextEdit" then
call p.KillProcess
Return
end if
loop until not p.GetNextProcess
```

Notes: You may want to check the result of killProcess function. Not every user is allowed to kill every application.

234.0.150 How to know how many CPUs are present?

Plugin Version: all, Platform: macOS.

Answer: Try this function:
Example:

```
Function GetCPUCount() as Integer
Declare Function MPProcessors Lib "Carbon" () as Integer
```

```
Return MPProcessors()
End Function
```

Notes: Your app will than need that library to launch on Classic. To avoid this the MBS plugin checks if this library is available and return 1 if it's not available.

234.0.151 How to know the calling function?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: On Mac you can use a helper function like this this code:
Example:

```
Public Function CallingFunction() as string
// Query name of calling function of a function

#Pragma BreakOnExceptions false

try

// raise a dummy exception
Var r as new NilObjectException
raise r

catch x as NilObjectException

// get stack
Var stack() as string = x.Stack

// pick function name and return
Var name as string = stack(2)
Return name

end try
End Function
```

Notes: You need to include function names in your application.

234.0.152 How to launch an app using it's creator code?

Plugin Version: all, Platform: macOS.

Answer: Send an AppleEvent "oapp" with the creator code to the Finder ("MACS"):
Example:

```
Var a as AppleEvent
Var creator as string

creator = "MSIE" ' here the Internet Explorer

a = NewAppleEvent("aevt", "odoc", "MACS")
a.Timeout = -1

a.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf", nil, creator)

if not a.send then
msgBox "An error has occured"
else

end if
```

234.0.153 How to launch disc utility?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use this code:
Example:

```
Var f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.apple.DiskUtility","")

if f<>Nil then
f.Launch
end if
```

Notes: This works even if people renamed the disc utility or moved it to another folder.

234.0.154 How to list devices with CoreAudio?

Plugin Version: all, Platform: Windows.

Answer: You can query the list of devices and loop to ask for the name of each device:
Example:

```
var ids As MemoryBlock
var outSize As Integer
var deviceName As String
var outWriteable As Boolean

var c as New CoreAudioMBS
c.AudioHardwareGetPropertyInfo c.kAudioHardwarePropertyDevices, outSize, outWriteable
```

```
var numDevices as integer = outSize / 4

// Get the device IDs for each device
ids=c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDevices)

For i as integer = 0 To numDevices-1
var id as integer =ids.Long(i*4) // 4 bytes per integer
var m as MemoryBlock = c.AudioDeviceGetPropertyMemory(id, 0, False, c.kAudioDevicePropertyDeviceName)

If m<>Nil Then
deviceName=m.CString(0)
End If

System.DebugLog str(id)+": "+deviceName

Next
```

234.0.155 How to make a lot of changes to a REAL SQL Database faster?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You may try to embed your changes to the database between two transaction calls.
Example:

```
Var db as Database // some database

db.SQLExecute "BEGIN TRANSACTION"
// Do some Stuff
db.SQLExecute "END TRANSACTION"
```

Notes: This can increase speed by some factors.

234.0.156 How to make a NSImage object for my retina enabled app?

Plugin Version: all, Platform: macOS.

Answer: You can use code like this:
Example:

```
Function NewRetinaImage(pic as Picture, mask as Picture = nil) As NSImageMBS
// first make a NSImageMBS from it
Var n as new NSImageMBS(pic, mask)
```

```
// now set to half the size, so we have 2x pixels for the image
n.size = new NSSizeMBS(n.width/2, n.height/2)

// and return
Return n
End Function
```

Notes: The thing to do is to have 2x the pixels, but assign a size to the image which gives it the right size in points.
You can pass the NSImageMBS from here to NSMenuItemMBS. For Retina displays, the full resolution is used. For others it will be reduced.

234.0.157 How to make a window borderless on Windows?

Plugin Version: all, Platform: Windows.

Answer: Try this declares:
Example:

```
// Sets window to borderless popup type, and sets its initial dimensions.
// Call this method, then Win32SetBorderlessPos, and then RB's Show
// method. Use RB Frame type 7 (Global Floating Window).

Const SWP_NOMOVE = &H2
Const SWP_FRAMECHANGED = &H20
Const HWND_TOPMOST = -1
Const GWL_STYLE = -16
Const WS_POPUPWINDOW = &H80880000

Var styleFlags as Integer

#If TargetWin32 Then

Declare Function SetWindowLong Lib "user32" Alias "SetWindowLongA" (hwnd as Integer, nIndex as Integer, dwNewLong as Integer) as Integer
Declare Function SetWindowPos Lib "user32" (hwnd as Integer, hWndInstertAfter as Integer, x as Integer, y as Integer, cx as Integer, cy as Integer, flags as Integer) as Integer

styleFlags = SetWindowLong( w.WinHWND, GWL_STYLE, WS_POPUPWINDOW )
styleFlags = BitwiseOr( SWP_FRAMECHANGED, SWP_NOMOVE )
styleFlags = SetWindowPos( w.WinHWND, HWND_TOPMOST, 0, 0, wd, ht, styleFlags )

#EndIf
```

234.0.158 How to make an alias using AppleEvents?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Sub MakeAlias(folder as folderitem, target as folderitem, aliasname as string)
Var ev as AppleEvent
Var myResult as boolean
Var properties as AppleEventRecord

ev = NewAppleEvent("core","crel","MACS")
ev.MacTypeParam("kocl") = "alis"
ev.FolderItemParam("to ") = target
ev.FolderItemParam("insh") = folder

properties=new AppleEventRecord
properties.StringParam("pnam")=aliasname

ev.RecordParam("prdt")=properties

myResult = ev.send
// true on success, false on error
End Sub
```

Notes: Call it like this:
MakeAlias SpecialFolder.Desktop, SpecialFolder.Desktop.Child("Gif Copy.rb"), "test.rb alias"

Seems to not work on Mac OS X 10.6

234.0.159 How to make AppleScripts much faster?

Plugin Version: all, Platform: macOS.

Answer: use "ignoring application responses" like in this example:
Notes: on run { fn,fpx,fpy }
ignoring application responses
tell app "Finder" to set the position of folder fn to fpx,fpy
end ignoring
end run

234.0.160 How to make double clicks on a canvas?

Plugin Version: all, Platform: macOS.

Answer:

Update: Newer Xojo versions support DoubleClick event, so you don't need this code.

Here's my tip from the tips list on how to add a double-click event to the Canvas control. The technique could easily be used for a window or any Rectcontrol:

Because of its built-in drawing methods, the Canvas control is often used to create custom interface controls. But while the Canvas control has event handlers for most mouse events, it doesn't have an event handler for DoubleClick events. Fortunately, you can add a double-click event handler to a Canvas control easily. Basically, you're going to create a new class based on Canvas and add a double-click event to that. You can then use the new class anytime you need a Canvas with a double-click event.

To create a new Canvas class with a DoubleClick event handler, do this:

1. Add a new class to your project.
2. Set the Super property of the new class to "Canvas".
3. Change the name of this new class to "DoubleClickCanvas".

A double-click occurs when two clicks occur within the users double-click time (set in the Mouse control panel on both Macintosh and Windows) and within five pixels of each other. So, you'll need a few properties to store when and where the last click occurred.

4. Add a new property with the following declaration and mark it as private: lastClickTicks as Integer
5. Add a new property with the following declaration and mark it as private: lastClickX as Integer
6. Add a new property with the following declaration and mark it as private: lastClickY as Integer

Since the Canvas control doesn't have a DoubleClick event, you will need to add one.

7. Add a new event to your class by choosing New Event from the Edit menu and enter "DoubleClick" as the event name.

Double-clicks occur on MouseUp. In order for the mouseUp event to fire, you must return True in the MouseDown event.

8. In the MouseDown event, add the following code:
Return True

In the MouseUp event, you will need to determine what the users double-click time is. This value is represented on both the Mac and Windows in ticks. A tick is 1/60th of a second. Since there isn't a built-in function for this, you'll need to make a toolbox call. The mouseUp event code below makes the appropriate toolbox call for both Macintosh and Windows. It then compares the time of the users last click to the time of the current click and compares the location of the users last click to the location of the current click.

9. Add the following code to the MouseUp event:

```
Var doubleClickTime, currentClickTicks as Integer

#if targetMacOS then
Declare Function GetDblTime Lib "Carbon" () as Integer
doubleClickTime = GetDblTime()
#endif

#if targetWin32 then
Declare Function GetDoubleClickTime Lib "User32.DLL" () as Integer
doubleClickTime = GetDoubleClickTime()/60 // convert to ticks from milliseconds
#endif

currentClickTicks = ticks
//if the two clicks happened close enough together in time
if (currentClickTicks - lastClickTicks) <= doubleClickTime then
//if the two clicks occured close enough together in space
if abs(X - lastClickX) <= 5 and abs(Y - LastClickY) <= 5 then
DoubleClick //a double click has occured so call the event
end if
end if
lastClickTicks = currentClickTicks
lastClickX = X
lastClickY = Y
```

10. Now to test out your new DoubleClickCanvas, drag the class from the Project window to a window in your project to create an instance of it.

11. Double-click on the canvas you just added to your window to open the Code Editor. Notice that the canvas has a DoubleClick event handler. In this event handler, add the following code:

```
BEEP
```

234.0.161 How to make my Mac not sleeping?

Plugin Version: all, Platform: macOS.

Answer: Just inform the Mac OS about some system activity with code like this:

Example:

```
Sub UpdateSystemActivity()

#if TargetCarbon
declare function myUpdateSystemActivity lib "Carbon" alias "UpdateSystemActivity" (activity as Integer)
as short

const OverallAct = 0 // Delays idle sleep by small amount */
const UsrActivity = 1 // Delays idle sleep and dimming by timeout time */
const NetActivity = 2 // Delays idle sleep and power cycling by small amount */
const HDActivity = 3 // Delays hard drive spindown and idle sleep by small amount */
const IdleActivity = 4 // Delays idle sleep by timeout time */

Var e as Integer

e=myUpdateSystemActivity(UsrActivity)

// you may react on an error if e is not 0 after the call.

#endif
End Sub
```

Notes: You may use another constant if you prefer some different behavior.
Call it maybe every second.

234.0.162 How to make my own registration code scheme?

Plugin Version: all, Platform: Windows.

Answer: There are excellent articles about how to make a registratin code scheme, but you can also simply use our RegistrationEngineMBS class.
Notes: If you need a license text, why not use the one from Xojo as a starting point?

234.0.163 How to make small controls on Mac OS X?

Plugin Version: all, Platform: macOS.

Answer: You can try this code on Mac OS X:
Example:

```
'/*
'* Use the control's default drawing variant. This does not apply to
'* Scroll Bars, for which Normal is Large.
'*/
```

```
const kControlSizeNormal = 0

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Check Box, Combo Box, Radio Button, Scroll Bar, Slider and Tab
'* controls.
'*/
const kControlSizeSmall = 1

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Indeterminate Progress Bar, Progress Bar and Round Button
'* controls.
'*/
const kControlSizeLarge = 2

'/*
'* Control drawing variant determined by the control's bounds. This
'* ControlSize is only available with Scroll Bars to support their
'* legacy behavior of drawing differently within different bounds.
'*/
const kControlSizeAuto = &hFFFF

const kControlSizeTag = "size"

declare function SetControlData lib "Carbon" (controlhandle as Integer, part as short, tagname as OS-
Type, size as Integer, data as ptr) as short

Var m as MemoryBlock

m=NewMemoryBlock(2)
m.UShort(0)=kControlSizeSmall

Title=str(SetControlData(CheckBox1.Handle, 0, kControlSizeTag, 2, m))
```

234.0.164 How to mark my Mac app as background only?

Plugin Version: all, Platform: macOS.

Answer: You can run a build script on each build with this code:
Example:

```
Var App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSUIElement"" YES")
```

Notes: This will set the NSUIElement flag to YES.

234.0.165 How to move a file or folder to trash?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like below:
Example:

```
Function MoveToTrash(f as FolderItem) As Boolean
#if TargetMacOS then
Var r as FolderItem
Var e as Integer = MacFileOperationMBS.MoveObjectToTrashSync(f, r, MacFileOperationMBS.kFSFileOperationDefaultOptions)

if e = 0 then
Return true // Ok
end if

#elseif TargetWin32 then
Var w as new WindowsFileCopyMBS

Var flags as Integer = w.FileOperationAllowUndo + w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if

flags = w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if
#else
// Target not supported
break
Return false
#endif
End Function
```

Notes: If you want to move a file to trash, you could use f.movefileto f.trashfolder, but that will overwrite existing files in the trash. You can use our MacFileOperationMBS class to move a file on Mac to the trash. And it uses the same code as the Finder, so files are renamed when the same name is already in use in the trash:

On Windows we use WindowsFileCopyMBS class.
Requires Mac OS X 10.5.

234.0.166 How to move an application to the front using the creator code?

Plugin Version: all, Platform: macOS.

Answer: This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
Var a as appleevent

a=newappleEvent("misc","actv","ttxt")

if a.send then
end if
```

Notes: (Code is Mac only)

234.0.167 How to move file with ftp and curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
Var d as CURLMBS // your curl object

// rename/move file
Var ws() As String
ws.Append "RNFR Temp.txt"
ws.append "RNTO MyFile.txt"

d.SetOptionPostQuote(ws)
```

Notes: Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. So rename is two commands. First RNFR to tell where to rename from and second RNTO with the new file name. To delete use DELE and the file path.

234.0.168 How to normalize string on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like below:
Example:

```
Function Normalize(t as string) As string
const kCFStringNormalizationFormD = 0 // Canonical Decomposition
const kCFStringNormalizationFormKD = 1 // Compatibility Decomposition
const kCFStringNormalizationFormC = 2 // Canonical Decomposition followed by Canonical Composition
const kCFStringNormalizationFormKC = 3 // Compatibility Decomposition followed by Canonical Composition

Var s as CFStringMBS = NewCFStringMBS(t)
Var m as CFMutableStringMBS = s.Normalize(kCFStringNormalizationFormD)

Return m.str
End Function
```

Notes: This uses Apple's CFString functions to normalize unicode variants.

234.0.169 How to obscure the mouse cursor on Mac?

Plugin Version: all, Platform: macOS.

Answer: Try this declare:
Example:

```
Declare Sub ObscureCursor Lib "Carbon" ()

ObscureCursor
```

Notes: The MBS Plugin has this function, but it's not supported for Windows.

234.0.170 How to open icon file on Mac?

Plugin Version: all, Platform: macOS.

Answer: Use the NSImageMBS class like this:
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.ico")
Var n as new NSImageMBS(f)

window1.Backdrop = n.CopyPictureWithMask
```

234.0.171 How to open PDF in acrobat reader?

Plugin Version: all, Platform: macOS.

Answer: Try this code:
Example:

```
Var pdf as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open PDF in Acrobat Reader on Mac:

// find app
Var bundleID as string = "com.adobe.Reader"
Var app as FolderItem = LaunchServicesFindApplicationForInfoMBS("", bundleID, "")

if app<>nil then

// launch app with parameters

Var docs() as FolderItem
docs.Append pdf

Var param as new LaunchServicesLaunchParameterMBS
param.Defaults = true
param.Application = app

Var x as FolderItem = LaunchServicesOpenXMBS(docs, param)

// on failure, simply launch it
if x = nil then
pdf.Launch(true)
end if

else
pdf.Launch(true)
end if
```

Notes: On Windows, simply use pdf.launch or WindowsShellExecuteMBS.

234.0.172 How to open printer preferences on Mac?

Plugin Version: all, Platform: macOS.

Answer: You can use our OpenMacOSXPreferencesPaneMBS function like this:
Example:

```
Var e as Integer = OpenMacOSXPreferencesPaneMBS("PrintAndFax")
```

```
if 0 = e then
MsgBox "OK"
elseif e = -43 then
MsgBox "File not found."
else
MsgBox "Error: "+str(e)
end if
```

234.0.173 How to open special characters panel on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We have functions for that in Cocoa and Carbon.
Example:

```
Var a as new NSApplicationMBS
a.orderFrontCharacterPalette
```

Notes: For Cocoa, you can use orderFrontCharacterPalette method in NSApplicationMBS class.

Or simply for Carbon and Cocoa the ShowCharacterPaletteMBS method.

234.0.174 How to optimize picture loading in Web Edition?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the WebPicture class.
Notes: Take your picture and create a WebPicture object. Store this WebPicture in a property of the WebPage, Session or app (as global as possible). On the first time you use this picture on an user session, the browser will load it. Second time you use it, the browser will most likely pick it from the cache.
Having pictures in App or some module reuses the same picture for all sessions which reduces memory footprint.
This does not work well with pictures you change very often or use only for one webpage on one user.

If you like to see an example, check our Map example.

234.0.175 How to parse XML?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use code like this:
Example:

```
Var s as string = "<test><test /></test>"

try
Var x as new XmlDocument(s)
MsgBox "OK"
catch xe as XmlException
MsgBox "invalid XML"
end try
```

Notes: If you got an exception, you have a parse error.

234.0.176 How to play audio in a web app?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use the HTML5 audio tag and control it with javscript.
Notes: This is just another example app I made today. It plays a christmas song. The audio file is provided by the application to the server, so no external web server is needed and this application can run stand alone. To compile and run you need Xojo 2010r5.

In the open event we search the audio files and open them as binarystreams. We create the two webfile objects. Those webfiles are part of the app class, so we have them globally. There we set the data with the content of our streams. We also define file names and mime types. They are needed so browser know what we have here:

```
audioFileM4V = new WebFile
audioFileM4V.Data = bM.Read(BM.Length)
audioFileM4V.Filename = "music.m4a"
audioFileM4V.MIMEType = "audio/m4a"

audioFileOGG = new WebFile
audioFileOGG.Data = bO.Read(BO.Length)
audioFileOGG.Filename = "music.ogg"
audioFileOGG.MIMEType = "audio/ogg"
```

Next in the open event of the webpage we have a PageSource control. The location is set to be before content. In the open event we define the html code for this. First we pick the URLs for the audio files. Than we build the html to use the audio tag. As you see, we give it an ID for later use and have it preload automatically. If you add an autoplay tag, you can have the audio play right away. Inside the audio tag we have two sources so we provide audio for both Firefox (OGG) and Safari (MPEG4). Finally we have a text to display if HTML5 audio tag is not supported.

You can set the source in the EditSource event:

Var urlo as string = app.audioFileOGG.URL
Var urlm as string = app.audioFileM4V.URL
me.Source = ”<audio id=””mymusic”” preload=””auto””><source src=”””+urlo+””” type=””audio/ogg”” /><source src=”””+urlm+””” type=””audio/mpeg”” />Your browser does not support the audio element.</audio>”

Next in the Play button we execute code to play the audio. This is a short javascript code which searches in the html document for the element with the ID ”mymusic” which is the ID of our audio tag above. Once we got the object, we call it’s play method to start playback.

me.ExecuteJavaScript(”document.getElementById(’mymusic’).play();”)

same for pause:

me.ExecuteJavaScript(”document.getElementById(’mymusic’).pause();”)

and finally for changing volume:

me.ExecuteJavaScript(”document.getElementById(’mymusic’).volume=”+str(me.Value/100.0)+”;”)

234.0.177 How to pretty print xml?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use the XML Transform method with the right XLS.
Notes: Learn more here:
http://docs.xojo.com/index.php/XMLDocument.Transform

234.0.178 How to print to PDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: This code below shows how to redirect printing to a PDF file on Mac OS X.
Example:

```
// get Xojo printer setup
Var p as new PrinterSetup
```

```
// now put it into NSPrintInfo to manipulate
Var n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
Var g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

Notes: And you can use normal graphics class for that.

234.0.179 How to query Spotlight's Last Open Date for a file?

Plugin Version: all, Platform: macOS.

Answer: You can use a MDItemMBS objec to query this value:
Example:

```
Function LastOpenedDate(Extends F As FolderItem, DefaultOtherDates As Boolean = True) As Date
#If TargetMacOS Then
Var xMDItem as New MDItemMBS(F)
Var xDate as Variant

If xMDItem <>Nil Then
xDate = xMDItem.GetAttribute(xMDItem.kMDItemLastUsedDate).DateValue
If xDate IsA Date Then Return xDate
Else
If xDate <>Nil Then Break
End If
#EndIf

If DefaultOtherDates Then
If F.ModificationDate <>Nil Then Return F.ModificationDate
If F.CreationDate <>Nil Then Return F.CreationDate
End If
End Function
```

Notes: Thanks for Josh Hoggan for this example code.

234.0.180 How to quit windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
#if targetwin32 then
Var i1,i2,r as Integer
declare function ExitWindowsEx lib "user32" (uFlags as Integer, dwReserved as Integer) as Integer
i1 = 2
i2 = 0
r = ExitWindowsEx(i1,i2)
if r<>0 then
' Error()
end if

#endif
```

Notes: uFlags parameters:

'4 = EWX_Force
'0 = EWX_Logoff
'2 = EWX_Reboot
'1 = EWX_shutdown, should shut down computer

Also check the ExitWindowsMBS method.

234.0.181 How to read a CSV file correctly?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: With all the rules for quotes and delimiters, you can simply use the SplitCommaSeparatedValuesMBS method in our plugins like this:
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.csv")
Var t as TextInputStream = f.OpenAsTextFile

while not t.EOF
Var s as string = t.ReadLine(encodings.ASCII)

Var items() as string = SplitCommaSeparatedValuesMBS(s, ";", """")
```

```
List.AddRow ""
Var u as Integer = UBound(items)
for i as Integer = 0 to u
List.Cell(List.LastIndex,i) = items(i)
next

wend
```

Notes: Please make sure you choose the right text encoding.

234.0.182 How to read resourcefork with named path?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use ..namedfork in the file path.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var p As String = f.NativePath+"/..namedfork/rsrc"
var d as new FolderItem(p, FolderItem.PathModes.Native)
Var b As BinaryStream = BinaryStream.Open(d)
var a as string = b.Read(b.Length)
// see resource fork in debugger, if exists
Break
```

234.0.183 How to read the command line on windows?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
#if targetwin32 then
Var line as string
Var mem as MemoryBlock

Declare Function GetCommandLineA Lib "kernel32" () As Ptr

mem=GetCommandLineA()
s=mem.cstring(0)

#endif
```

Notes: Newer Xojo versions have a system.commandline property.

234.0.184 How to render PDF pages with PDF Kit?

Plugin Version: all, Platform: Windows.

Answer: Try this code:
Example:

```
// choose a file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open it as PDF Document
Var sourceFile as New PDFDocumentMBS(f)

if sourceFile.handle <>0 then // it is a PDF file

// get upper bound of pages
Var c as Integer = sourceFile.pageCount-1

// from first to last page
for n as Integer = 0 to c

// pick that page
Var page as PDFPageMBS = sourceFile.pageAtIndex(n)

// render to image
Var p as NSImageMBS = page.Render

// and convert to RB picture and display
Backdrop = p.CopyPictureWithMask

next

end if
```

Notes: PDFKit works only on Mac OS X.

234.0.185 How to restart a Mac?

Plugin Version: all, Platform: macOS.

Answer: Ask the Finder via Apple Events:
Example:

```
Var ae as appleevent
ae=newappleEvent("FNDR","rest","MACS")
if not ae.send then
msgBox "The computer couldn't be restarted."
end if
```

234.0.186 How to resume ftp upload with curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: CURL supports that and you simply need to set the right options.
Notes: First of course OptionUpload must be true. Second OptionFTPAppend must be true so the OptionResumeFrom is used. Store there (or in OptionResumeFromLarge) your start value.
Don't forget to implement the read event and return data there as requested.

234.0.187 How to rotate a PDF page with CoreGraphics?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: This code opens a PDF and draws the first page into a new PDF with 90¬∞ rotation.
Example:

```
// Rotate a PDF page

// our files
Var sourcefile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var destfile as FolderItem = SpecialFolder.Desktop.Child("rotated.pdf")

// open PDF
Var pdf as CGPDFDocumentMBS = sourcefile.OpenAsCGPDFDocumentMBS

// query media size of first page
Var r as CGRectMBS = pdf.MediaBox(1)

// create new PDF
Var c as CGContextMBS = destfile.NewCGPDFDocumentMBS(r,"title","Author","Creator")

// create rotated rectangle
Var nr as new CGRectMBS(0,0,r.Height,r.Width)

// create new page
c.BeginPage nr
c.SaveGState

const pi = 3.14159265
```

```
// rotate by 90¬∞
c.RotateCTM pi*1.5

// fix origin
c.TranslateCTM -r.width,0

// draw PDF
c.DrawCGPDFDocument pdf,r,1

// cleanup
c.RestoreGState
c.EndPage

c = nil

// show in PDF viewer
destfile.Launch
```

Notes: This code is Mac only as it needs CoreGraphics.

234.0.188 How to rotate image with CoreImage?

Plugin Version: all, Platform: macOS.

Answer: Use the code like the one below:
Example:

```
// Rotate image with CoreImage

// load image
Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var image as new CIImageMBS(f)

// rotate 45 degree
Var n as new NSAffineTransformMBS
n.rotateByDegrees(45)

Var TransformFilter as new CIFilterAffineTransformMBS
TransformFilter.inputImage = image
TransformFilter.inputTransform = n

// get result
Var resultImage as CIImageMBS = TransformFilter.outputImage

// for saving to file
```

```
Var outputImage as NSImageMBS = resultImage.RenderNSImage(false)

f = SpecialFolder.Desktop.Child("output.png")
Var b as BinaryStream = BinaryStream.Create(f, true)
b.Write outputImage.PNGRepresentation

// as Xojo picture object for display
Var pic as Picture = outputImage.CopyPictureWithMask

Backdrop = pic
```

234.0.189 How to run a 32 bit application on a 64 bit Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Install 32 bit compatibility libraries.
Notes: The package is called ia32-libs for ubuntu (and others).
Some applications need to be run on a 32 bit system as they need some hardware related libraries. Like libUSB or libHID for USB devices.

234.0.190 How to save HTMLViewer to PDF with landscape orientation?

Plugin Version: all, Platform: macOS.

Answer: You can use NSPrintInfoMBS to change the options for PrintToPDFFile function.
Example:

```
// make it landscape
Var n as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
n.orientation = n.NSLandscapeOrientation

// save html to file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
call HTMLViewer1.PrintToPDFFileMBS(f,10,30,10,30)
```

Notes: You may want to reset options later.
This code is only for Mac OS X.

234.0.191 How to save RTFD?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: With NSTextViewMBS you can use this code to save to RTFD:
Example:

```
// save text as RTFD including image attachments
Var f as FolderItem = GetSaveFolderItem(FileTypes1.ApplicationRtfd, "test.rtfd")

if f = nil then Return

Var a as NSAttributedStringMBS = textView.textStorage
Var w as NSFileWrapperMBS = a.RTFDFileWrapperFromRange(0, a.length, DocumentAttributes)

Var e as NSErrorMBS
if w.writeToFile(f, e) then

else
MsgBox e.LocalizedDescription
end if
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

234.0.192 How to save RTFD?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: How to load PDF to htmlviewer on desktop?
Example:

```
Public Sub LoadPDFData(viewer as HTMLViewer, PDFData as string)
Var base64string As String = EncodeBase64(PDFData)

// remove line endings to make it a big line
base64string = ReplaceLineEndings(base64string, "")

// build data URL
// https://en.wikipedia.org/wiki/Data_URI_scheme
Var dataURL As String = "data:application/pdf; base64," + base64string

// show in webviewer
HTMLViewer1.LoadURL(dataURL)

// may not work everywhere due to URL length limit
// for Web projects, use WebFile instead!
End Sub
```

Notes: This avoids a temporary file, which may also work.

For Web Apps, please use WebFile.

234.0.193 How to scale a picture proportionally with mask?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportinalScaledWithMask(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor

Var faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
Var w as Integer = Pic.Width * faktor
Var h as Integer = Pic.Height * faktor

// create new picture
Var NewPic as new Picture(w,h,32)

// check if we have a mask and clear it
Var m as picture = pic.mask(False)
pic.mask = nil

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

if m <>nil then
// restore mask and scale it
pic.mask = m
NewPic.mask.Graphics.DrawPicture m, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height
end if

// return result
Return NewPic
End Function
```

Notes: This version handles mask. As you see we actually have to remove mask in order to copy the picture part correctly.

234.0.194 How to scale a picture proportionally?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportionalScaled(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor

Var faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
Var w as Integer = Pic.Width * faktor
Var h as Integer = Pic.Height * faktor

// create new picture
Var NewPic as new Picture(w,h,32)

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

// return result
Return NewPic
End Function
```

Notes: This does not handle mask, but you can scale the mask the same way and assign it to the new picture.
(see other FAQ entry with mask)

234.0.195 How to scale/resize a CIImageMBS?

Plugin Version: all, Platform: Windows.

Answer: Use the CIFilterLanczosScaleTransform filter to scale down a picture to a specific size.
Example:

```
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = CIImageMBS.imageWithPicture(pic)

Var filter As New CIFilterLanczosScaleTransformMBS

Const targetWidth = 600.0
Const targetHeight = 400.0

Var scale As Double = targetHeight / image.Extent.Height
Var aspect As Double = targetWidth / (image.Extent.Width * scale)
```

```
filter.inputImage = image
filter.inputScale = scale
filter.inputAspectRatio = aspect

Var result As Picture = filter.outputImage.RenderPicture

Backdrop = result
```

Notes: This is same code as our scaleTo convenience method.

234.0.196 How to scale/resize a picture?

Plugin Version: all, Platform: Windows.

Answer: There are several ways to scale or resize a picture. The easiest way may be the ScaleMBS function in the Picture class.
Example:

```
Var Original,Scaled as Picture

Original=LogoMBS(500)
Scaled=Original.ScaleMBS(100,100,true)
```

Notes: The plugin ways:
- GraphicsMagick can scale/resize.
- CoreImage scale filter may result in the fastest and best images on Mac OS X 10.4.
- NSImageMBS can scale, but is Mac OS X only.
- CGImageMBS can scale, but is Mac OS X only.
- CIImageMBS can scale, but is Mac OS X only.
- QuickTime Graphics exporter and importer can be connected to scale. (this was used more often a few years ago)
- ImageMagick can scale very nice and crossplatform. But the ImageMagick libraries are big.
- The picture.ScaleMBS function is self written and results in equal output on Mac, Windows and Linux without any additional libraries installed.
- Picture.ScalingMBS does crossplatform scaling with several modes.

with pure Xojo:
- make a new picture and draw the old one with new size inside.

234.0.197 How to search with regex and use unicode codepoints?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can specify unicode characters in search string with backslash x and digits.
Example:

```
Var r as RegExMbs
Var s as string
Var c as Integer

s="123 √§√√º ABC 456"

r=new RegExMBS
if r.Compile(".√.") then
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if

r=new RegExMBS
if r.Compile(".\xF6.") then // finds √ using Unicode codepoint
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if
```

234.0.198 How to see if a file is invisible for Mac OS X?

Plugin Version: all, Platform: macOS.

Answer: Try this function:
Example:

```
Function Invisible(F As FolderItem) As Boolean
Var TIS As TextInputStream
Var S,All As String
Var I as Integer
Var g as folderitem

If Left(F.Name,1)="." or not f.visible Then
Return True
End If

g=F.Parent.Child(".hidden")
```

```
If g.Exists Then
TIS=g.OpenAsTextFile
if tis<>Nil then
All=TIS.ReadAll
For I=1 to CountFields(All,Chr(11))
S=NthField(All, Chr(11), I)
If S=F.name Then
Return True
End If
Next
end if
End if
End Function
```

234.0.199 How to set cache size for SQLite or REALSQLDatabase?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You use the pragma cache_size command on the database.
Example:

```
// set cache size to 20000 pages which is about 20 MB for default page size
Var db as REALSQLDatabase
db.SQLExecute "PRAGMA cache_size = 20000"
```

Notes: Default cache size is 2000 pages which is not much.
You get best performance if whole database fits in memory.
At least you should try to have a cache big enough so you can do queries in memory.
You only need to call this pragma command once after you opened the database.

234.0.200 How to set the modified dot in the window?

Plugin Version: all, Platform: macOS.

Answer: Try this declares:
Example:

```
window1.ModifiedMBS=true
```

234.0.201 How to show a PDF file to the user in a Web Application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use a WebHTMLViewer control and load the
Example:

```
Var CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer

// load into html viewer
HTMLViewer1.URL = CurrentFile.URL
```

Notes: See our Create PDF example for the Xojo Web Edition.

234.0.202 How to show Keyboard Viewer programmatically?

Platform: macOS.

Answer: Use Xojo or AppleScript to launch the KeyboardViewerServer.app.
Example:

```
Var a as new AppleScriptMBS
Var text as string
Var lines(-1) as string

lines.append "set theApplication to ""KeyboardViewerServer"""
lines.append "set thePath to ""/System/Library/Components/KeyboardViewer.component/Contents/Shared-Support/KeyboardViewerServer.app"""
lines.append ""
lines.append "set POSIXPath to ((POSIX file thePath) as string)"
lines.append "tell application ""System Events"" to set isRunning to 0 <(count (application processes whose name is theApplication))"
lines.append "if isRunning then tell application POSIXPath to quit"
lines.append "delay 0.15"
lines.append ""
lines.append "ignoring application responses"
lines.append " tell application POSIXPath to run"
lines.append "end ignoring"

text=join(lines,EndOfLine.macintosh)

a.Compile text
a.Execute
```

Notes: AppleScript code:

```
set theApplication to "KeyboardViewerServer"
set thePath to "/System/Library/Components/KeyboardViewer.component/Contents/SharedSupport/KeyboardViewerServer.app"

set POSIXPath to ((POSIX file thePath) as string)
tell application "System Events" to set isRunning to 0 <(count (application processes whose name is theApplication))
if isRunning then tell application POSIXPath to quit
delay 0.15

ignoring application responses
tell application POSIXPath to run
end ignoring
```

234.0.203 How to show the mouse cursor on Mac?

Plugin Version: all, Platform: macOS.

Answer: Try this declare:
Example:

```
Declare Sub ShowCursor Lib "Carbon" ()

ShowCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

234.0.204 How to shutdown a Mac?

Plugin Version: all, Platform: macOS.

Answer: Ask the Finder via Apple Events:
Example:

```
Var ae as appleevent
ae=newappleEvent("FNDR","shut","MACS")
if not ae.send then
msgBox "The computer couldn't be shutdown."
end if
```

Notes: Or toolbox call (Attention: This method will stop the computer immediataly: No document asked to be saved, all applications quitting without knowing).

```
Declare Sub ShutDwnPower Lib "Carbon" ()
ShutDwnPower
```

234.0.205 How to sleep a Mac?

Plugin Version: all, Platform: macOS.

Answer: Ask the Finder via Apple Events:
Example:

```
Var ae as appleevent
ae=newappleEvent("FNDR","slep","MACS")
if not ae.send then
msgBox "The computer doesn't want to sleep."
end if
```

234.0.206 How to speed up rasterizer for displaying PDFs with DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Here a few speed tips:
Notes:

- Use the DynaPDFRasterizerMBS function instead of our render functions.
- Reuse DynaPDFRasterizerMBS as long as the target picture size doesn't change.
- Import only the PDF pages you want to display.
- Let DynaPDF do zooming, rotating or other effects instead of you change it.

234.0.207 How to use PDFLib in my RB application?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The PDFlib plugin was discontinued in favor of our DynaPDF plugin.
Notes: If you need help to move, please contact us.

234.0.208 How to use quotes in a string?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Just double them.
Example:

msgbox "This String contains ""quotes""."

234.0.209 How to use Sybase in Web App?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use our MBS Xojo SQL Plugin to connect to a Sybase Database in your web application.
Notes: If you see db.Connect giving the error message "cs_ctx_alloc ->CS_MEM_ERROR", than some things are not setup right for Sybase.
The Apache process may not have all the SYBASE environment variables being set when the CGI was launched.

Adding these lines to /etc/httpd/conf/httpd.conf stopped the faux memory errors for us:

SetEnv LD_LIBRARY_PATH /opt/sybase/OCS-15_0/lib:/opt/sybase/OCS-15_0/lib3p64:/opt/sybase/OCS-15_0/lib3p:
SetEnv SYBROOT /opt/sybase
SetEnv SYBASE_OCS /opt/sybase
SetEnv SYBASE /opt/sybase

234.0.210 How to use the Application Support folder?

Plugin Version: all, Platform: macOS.

Answer:

I was saving a registration code for an app to the Preferencefolder.
People on the list have suggested that it would be better in
the ApplicationSupportFolder. How do I save the file called CWWPrefs
into that folder using MBS?

I have checked for examples and the docs but can't see how to apply it

//f = SpecialFolder.Preferences.child("CWWPrefs")
f = ApplicationSupportFolderMBS(-32768)
Example:

```
Var folder,file as FolderItem

folder = createApplicationSupportFolderMBS(-32763)

if folder=nil then
// Some very old Mac OS Versions may not support it
// or the plugin may fail for any reason
folder=SpecialFolder.Preferences
end if

file=folder.Child("CWWPrefs")

MsgBox file.NativePath
```

Notes:

You may not be able to write there with a normal user account!

234.0.211 How to use the IOPMCopyScheduledPowerEvents function in Xojo?

Plugin Version: all, Platform: macOS.

Answer: You can use the following code which does this using the SoftDeclareMBS class.
Example:

```
Sub Open()
Var c as CFDateMBS
Var t as CFAbsoluteTimeMBS

// get current date
c=NewCFDateMBS

// in absolute time (seconds since x)
t=c.AbsoluteTime

// add 600 seconds (= 10 Minutes)
t.Value=t.Value+600

// Make a Date from it
c=t.Date

// Schedule the event
// 0 on success
// E00002C1 for missing root rights
Title=hex(schedulePowerEvent(c, "wake"))
```

```
// Just for information, display the scheduled stuff
CFShowMBS CopyScheduledPowerEvents
End Sub

Function CopyScheduledPowerEvents() As cfarrayMBS
Var s as SoftDeclareMBS
Var m as MemoryBlock

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMCopyScheduledPowerEvents") then
if s.CallFunction(0,nil) then
Return NewCFArrayMBSHandle(s.Result,true)
else
MsgBox "Failed to Call IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOKit."
end if

Return nil
End Function

Function SchedulePowerEvent(time_to_wake as CFDateMBS, Type as CFStringMBS) as Integer
Var s as SoftDeclareMBS
Var m as MemoryBlock

'/*
'* Types of power event
'* These are potential arguments to IOPMSchedulePowerEvent().
'* These are all potential values of the kIOPMPowerEventTypeKey in the CFDictionaries
'* returned by IOPMCopyScheduledPowerEvents().
'*/
'/*!
'@define kIOPMAutoWake
'@abstract Value for scheduled wake from sleep.
'*/
'#define kIOPMAutoWake "wake"
'
'/*!
'@define kIOPMAutoPowerOn
'@abstract Value for scheduled power on from off state.
'*/
'#define kIOPMAutoPowerOn "poweron"
```

```
'
'/*!
'@define kIOPMAutoWakeOrPowerOn
'@abstract Value for scheduled wake from sleep, or power on. The system will either wake OR
'power on, whichever is necessary.
'*/
'
'#define kIOPMAutoWakeOrPowerOn "wakepoweron"
'/*!
'@define kIOPMAutoSleep
'@abstract Value for scheduled sleep.
'*/
'
'#define kIOPMAutoSleep "sleep"
'/*!
'@define kIOPMAutoShutdown
'@abstract Value for scheduled shutdown.
'*/
'
'#define kIOPMAutoShutdown "shutdown"

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMSchedulePowerEvent") then

m=NewMemoryBlock(12)
m.Long(0)=time_to_wake.handle
m.Long(4)=0 // nil
m.Long(8)=type.Handle

if s.CallFunction(3,m) then
Return s.Result
end if
end if
end if

End Function
```

Notes: Requires Mac OS X and to execute root rights.

234.0.212 How to validate a GUID?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use this function below which uses a regular expression to verify that the string is a valid

UUID/GUID:
Example:

```
Function IsGUID(guid as string) As Boolean
Var r as new RegEx

r.SearchPattern = "^(\{ { 0,1 } ( [ 0-9a-fA-F ] ) { 8 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 12 } \} { 0,1 } )$ "

Return r.Search(guid)<>nil
End Function
```

Notes: Simply parsing the GUID with CFUUIDMBS does not give the same result as CFUUIDMBS will also take a string like "DDDD".

234.0.213 How to walk a folder hierarchie non recursively?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Use code like this one:
Example:

```
Sub Walk(folder as FolderItem)
Var folders() as FolderItem

folders.Append folder

while UBound(folders)>=0

Var currentFolder as FolderItem = folders.pop

Var c as Integer = currentFolder.Count
for i as Integer = 1 to c
Var item as FolderItem = currentFolder.TrueItem(i)

if item = Nil then
// no permission
elseif item.Visible then // only visible

if item.Directory then
folders.Append item
else
// work with file here
end if

end if
```

```
next

wend
End Sub
```

Notes: As you see we go with a long loop which runs until we don't have more folders to process.
We ignore items we can't access due to permission limits.
And we only work visible items.
If you like, check folderitem.isBundleMBS on item to handle packages and applications better on Mac OS X.

234.0.214 I got this error: PropVal, QDPictMBS.Name (property value), Type mismatch error. Expected CGDataProviderMBS, but got Variant, Name:QDPictMBS

Plugin Version: all, Platform: macOS.

Answer: The plugins MacOSX and MacOSXCF belong together. If you use one part, please also install the other part.
Notes: We splitted the plugin because the Xojo IDE on Windows crashed on compilation.

234.0.215 I registered the MBS Plugins in my application, but later the registration dialog is shown.

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: There are two main reasons.
Notes: 1. you may use the plugin before registering them. This is often the case if you register in a window open event and use the plugin in a control open event.
On the console on Mac OS X or Windows, you may see a message like this "MBS Plugins were used by the application before the RegisterMBSPlugin function was called. Please fix this in your code!".

2. you may have mixed different plugin versions which are not compatible.
In this case you can see a message "Internal plugin registration error." on the console on Mac OS X. Newer plugins may show a message dialog reporting this. Older version simply think they are not registered.

If the installer just merges old and new applications, users may have libraries of older and newer plugin versions in the libs folder. If your application loads the wrong version, the registration fails.

If you use remote debugging, make sure you clear the tempory files there, too. Otherwise you may have old DLLs on your hard disc which may disturb your application.

You can run into issues if you use your registration code on different places of your app. Please register only once in app.open (or app Constructor). If you have several codes, simply call them one after the other.

Also check that you only call RegisterMBSPlugin with valid serial number. If you later call RegisterMBSPlugin with Demo like in example code above, you remove the license.

Next check if you can clear the Xojo caches and that helps. This includes the Xojo Scratch folder and the Plugins & Project caches. Simply locate those folders and delete them. For Windows look in hidden AppData folder in your user folder. For Mac, please check
textasciitilde /Library/Caches and your temp folders.

Finally make sure you use the right serial number. Not an older one or a misspelled one.

234.0.216 I want to accept Drag & Drop from iTunes

Plugin Version: all, Platform: macOS.

Answer: You need to accept AcceptMacDataDrop "itun" and Handle the DropObject.
Example:

```
Sub Open()
window1.AcceptMacDataDrop "itun"
End Sub

Sub DropObject(obj As DragItem)
Var s as string
Var f as folderItem
Var d as CFDictionaryMBS
Var o as CFObjectMBS
Var key as CFStringMBS
Var dl as CFDictionaryListMBS
Var i,c as Integer
Var u as CFURLMBS
Var file as FolderItem

if obj.MacDataAvailable("itun") then
s = obj.MacData("itun")

// Parse XML
o=NewCFObjectMBSFromXML(NewCFBinaryDataMBSStr(s))

// Make dictionary
if o isa CFDictionaryMBS then
```

```
d=CFDictionaryMBS(o)

// get Tracks Dictionary
key=NewCFStringMBS("Tracks")
o=d.Value(key)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)
dl=d.List

// Walk over all entries in the Tracks dictionary
c=dl.Count-1
for i=0 to c
o=dl.Value(i)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)

key=NewCFStringMBS("Location")
o=d.Value(key)
if o isa CFStringMBS then
u=NewCFURLMBSCFStringMBS(CFStringMBS(o),nil)

file=u.file
if file<>nil then
MsgBox file.NativePath
end if
end if
end if
next
end if
end if
end if
End Sub
```

Notes: The code above inside a window on Xojo 5.5 with MBS Plugin 5.3 will do it nice and show the paths.

234.0.217 I'm drawing into a listbox but don't see something.

Plugin Version: all.

Answer: If you draw this in a listbox cellbackground, you need to draw on the correct position
Example:

```
Function CellBackgroundPaint(g As Graphics, row as Integer, column as Integer) As Boolean
Var f as FolderItem
```

```
f=SpecialFolder.Desktop
f.DrawWideIconMBS(g,listbox1.left,listbox1.top+row*20,16)
Return true
End Function
```

Notes: Try this in a listbox. The Graphics object there has a cliping and an offset which the plugin doesn't know about.

234.0.218 I'm searching for a method or so to move a window from position x.y to somewhere else on the screen.

Platform: macOS.

Answer:

The code I produced in RB isn't smooth enough. Is there a call in MBS, if not, can it be done? The speed of it has to be like the show of a DrawerWindow.

Try the declare below for Carbon. With WindowLib it will work on Mac OS 8.5 and newer.
Notes:

See Window.Transition functions.

234.0.219 If I use one of your plug-ins under windows, would this then impose the use of dll after compilation or my would my compiled soft still be a stand-alone single file software?

Platforms: macOS, Linux, Windows.

Answer: Stand alone.
Notes: Xojo compiles all used plugins into the application binary.
Some plugin parts need external dlls but you will find that in the documentation. (e.g. pdflib for some classes)

234.0.220 Is the fn key on a powerbook keyboard down?

Plugin Version: all, Platform: macOS.

Answer: I am unable to figure out how or if it is possible to detect if the fn key is down on a powerbook keyboard. Is it possible?
Example:

```
' Window.Open Event of a blank project:
```

```
Var i as Integer

for i=0 to 127
if keyboard.asynckeydown(i) then
title=str(i) // found
return
end if
next
title="" // not found
```

Notes: This test application shows the keycode (decimal) 63 for the fn key.

234.0.221 Is there a case sensitive Dictionary?

Plugin Version: all.

Answer: The MBS Plugin has several classes which can work as a replacement.
Notes: First you could use VariantToVariantHashMapMBS or VariantToVariantOrderedMapMBS.
If you know that all keys are Strings or Integers only, you can use the specialized classes which are a little bit faster due to avoiding variants:

IntegerToIntegerHashMapMBS class
IntegerToIntegerOrderedMapMBS class
IntegerToStringHashMapMBS class
IntegerToStringOrderedMapMBS class
IntegerToVariantHashMapMBS class
IntegerToVariantOrderedMapMBS class
StringToStringHashMapMBS class
StringToStringOrderedMapMBS class
StringToVariantHashMapMBS class
StringToVariantOrderedMapMBS class

234.0.222 Is there a way to use the MBS plugin to get only the visible item and folder count on a volume?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can use the DirectorySizeMBS class for this as in the example below:
Example:

```
Var d as DirectorySizeMBS

d=new DirectorySizeMBS
```

```
// volume(1) as my boot volume is very full
if d.update(volume(1),true,0) then
MsgBox str(d.VisibleItemCount)+" visible items, "+str(d.HiddenItemCount)+" invisible items."
end if
```

Notes: Complete Question: Is there a way to use the MBS plugin to get only the visible item and folder count on a volume? The FileCount and FolderCount properties of VolumeInformationMBS seem to provide the total # of items including invisible items such as .DS_Store and more importantly .Trashes which is causing me a great amount of difficulty during a recursive scan of a volume. I've got a progress bar which uses the total of the filecount and foldercount properties as the maximum value, but my routine needs to filter out all invisible items, as it is creating a catalog of a volume for archiving purposes. Any thoughts how I could get accurate number.

234.0.223 Is there an easy way I can launch the Displays preferences panel?

Plugin Version: all, Platform: macOS.

Answer: Use the code below:
Example:

```
Var error as Integer

error=OpenMacOSXPreferencesPaneMBS("Displays")
if error<>0 then
MsgBox "Failed to launch QuickTime System Preferences panel."
end if
```

234.0.224 List of Windows Error codes?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We have a list of windows error codes on our website.
Notes: http://www.monkeybreadsoftware.de/xojo/winerror.shtml

234.0.225 Midi latency on Windows problem?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: The issue is system related, not a problem with RB or the plugin.
Notes: Two things will adversely affect the timing:

(1) latency of the software synthesizer output driver. The default Windows wavetable synthesizer has considerable latency. I don't know how many milliseconds, but it is noticeable.

(2) latency of the digital audio output driver. Different systems have different drivers for different audio hardware. My Dell laptop has a minimum 15ms latency in the audio driver.

These two things put together were causing a very sluggish MIDI response. I was able to verify these as the culprits by routing MIDI directly out of RB into a sample player, which only introduces the latency of (2) and does not include latency of (1).

I don't know how widely known are these facts, if not then you may want to add this information to the documentation, since Windows programmers using the MIDI plugin may not know those problems, and might mistakenly blame your plugin, as I did :) Sorry about that!

(From Aaron Andrew Hunt)

234.0.226 My Xojo Web App does not launch. Why?

Plugin Version: all, Platform: macOS.

Answer: Here is a list of checks to do for linux apache installations with Xojo or Xojo Web applications:
Notes: Just a list of checks to do for linux apache installations:

- You have 64bit linux? Than you need 32 bit compatibility libraries.
- The folder of your app is writable? Set permissions to 777.
- The cgi script is executable? Set permissions to 755.
- The app file itself is executable? Set permissions to 755.
- You uploaded cgi file as text, so it has unix line endings? (this often gives error "Premature end of script headers" in apache log)
- You uploaded config.cfg file and made it writable? Set permissions to 666.
- Your apache allows execution of cgi scripts? You enabled cgi for apache and uncommented addhandler command for CGI on a new apache installation?
- You uploaded the app file and libraries as binary files? Upload as text breaks them.
- You did upload the libs folder?
- You don't have code in app.open, session.open and other events which crashes app right at launch?

- You don"t have a print command in your app.open event? (see feedback case 23817)
- You allowed htaccess file to overwrite permissions?

234.0.227 SQLDatabase not initialized error?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Before you can use SQLDatabaseMBS, it must be initialized.
Example:

```
Var d as new SQLDatabaseMBS
```

Notes: This happens normally when you use "new SQLDatabaseMBS".
But if you just have a SQLConnectionMBS and get a recordset there, the initialization may not have happend, yet.
So please simply add a line "dim d as new SQLDatabaseMBS" to your app.open code after registration, so the plugin part can initialize and late provide recordsets.

234.0.228 Textconverter returns only the first x characters. Why?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

Some older Xojo versions limit the Textconverter to around 1024 characters in input and output.
This should be fixed with RB5.
Notes:

Xojo seems not to support Textconverters at all on Windows.

234.0.229 The type translation between CoreFoundation/Foundation and Xojo data types.

Plugin Version: all, Platform: macOS.

Answer: The plugin does conversion between Cocoa/Carbon data types and native Xojo data types. The following list help you knowing what the current plugins support:
Notes: Cocoa NSObject to Variant:

nil ->nil
NSDictionary ->Dictionary
NSData ->MemoryBlock
NSString ->String

NSAttributedString ->NSAttributedStringMBS
NSDate ->Date
NSNumber ->double/integer/Int64/UInt64/UInt32/Boolean
NSURL ->String
NSValue with NSRect ->NSRectMBS
NSValue with NSPoint ->NSPointMBS
NSValue with NSSize ->NSSizeMBS
NSValue with NSRange ->NSRangeMBS
NSValue with QTTime ->QTTimeMBS
NSValue with QTTimeRange ->QTTimeRangeMBS
NSArray ->Array of Variant
QuartzFilter ->QuartzFilterMBS

- ->*MBS

Variant to Cocoa NSObject:

nil ->nil
Dictionary ->NSDictionary
Boolean ->NSNumber
Integer ->NSNumber
Color ->NSColor
Int64 ->NSNumber
Single ->NSNumber
Double ->NSNumber
Date ->NSDate
MemoryBlock ->NSData
String ->NSString
NSImageMBS ->NSImage
NSAttributedStringMBS ->NSAttributedString
NSColorMBS ->NSColor
NSRectMBS ->NSValue with NSRect
NSSizeMBS ->NSValue with NSSize
NSPointMBS ->NSValue with NSPoint
NSRangeMBS ->NSValue with NSRange
NSBurnMBS ->NSBurn
NSViewMBS ->NSView
NSFontMBS ->NSFont
NSParagraphStyleMBS ->NSParagraphStyle
NSAttributedStringMBS ->NSAttributedString
WebPolicyDelegateMBS ->WebPolicyDelegate
WebUIDelegateMBS ->WebUIDelegate
WebFrameLoadDelegateMBS ->WebFrameLoadDelegate
WebResourceLoadDelegateMBS ->WebResourceLoadDelegate
NSIndexSetMBS ->NSIndexSet
QTTimeMBS ->QTTime

QTTimeRangeMBS ->QTTimeRange
Array of Variant ->NSArray
Array of String ->NSArray
CFStringMBS ->NSString
CFNumberMBS ->NSNumber
CFDataMBS ->NSData
CFURLMBS ->NSURL
CFArrayMBS ->NSArray
CFDictionaryMBS ->NSDictionary
CFBinaryDataMBS ->NSDate

Carbon CFTypeRef to Variant:

CFDictionaryRef ->Dictionary
CFStringRef ->String
CFDataRef ->String
CFURL ->String
CFNumber ->Integer/Double/Int64
CFArray ->Array
CFDate ->date
nil ->nil
CGColorSpace ->CGColorSpaceMBS
CGColor ->CGColorMBS
CGImage ->CGImageMBS
CF* ->CF*MBS

Variant to Carbon CFTypeRef:

Dictionary ->CFDictionaryRef
Boolean ->CFBooleanRef
Color ->CFNumberRef
Integer ->CFNumberRef
Int64 ->CFNumberRef
Single ->CFNumberRef
Double ->CFNumberRef
String ->CFStringRef
Color ->CGColorRef
Date ->CFDateRef
nil ->nil
Memoryblock ->CFDataRef
FolderItem ->CFURLRef
Dictionary ->CFDictionaryRef
Array of Variant/String/Date/Double/Single/Int64/Integer ->CFArray
CGRectMBS ->CGRect as CFDataRef
CGSizeMBS ->CGSize as CFDataRef

CGPointMBS ->CGPoint as CFDataRef
CGColorMBS ->CGColor
CGColorSpaceMBS ->CGColorSpace
CGImageMBS ->CGImage
CGDataConsumerMBS ->CGDataConsumer
CGDataProviderMBS ->CGDataProvider
CF*MBS ->CF*

Strings without encodings should be put into dictionaries as memoryblocks.

234.0.230 Uploaded my web app with FTP, but it does not run on the server!

Plugin Version: all, Platform: Windows.

Answer: If you see errors like a simple "Segmentation Fault" on Linux or some other wired errors, you may want to check your FTP upload mode. It must be binary for web apps. ASCII mode corrupts the application.

234.0.231 What classes to use for hotkeys?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use CarbonHotKeyMBS class on Mac and WindowsKeyFilterMBS on Windows.
Notes: CarbonHotKeyMBS will also work fine in Cocoa apps.

234.0.232 What do I need for Linux to get picture functions working?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: In order to get our plugins working on Linux systems without GUI, the plugin loads graphics libraries dynamically.
Notes: To get it working, the plugin tries to load gtk with this paths:

- libgtk-x11-2.0.so"
- libgtk-x11-2.0.so.0"
- /usr/lib/libgtk-x11-2.0.so"
- /usr/lib32/libgtk-x11-2.0.so"
- /usr/lib/libgtk-x11-2.0.so.0"
- /usr/lib32/libgtk-x11-2.0.so.0"

gdk is loaded with this paths:

- libgdk-x11-2.0.so"
- libgdk-x11-2.0.so.0"
- /usr/lib/libgdk-x11-2.0.so"
- /usr/lib32/libgdk-x11-2.0.so"
- /usr/lib/libgdk-x11-2.0.so.0"
- /usr/lib32/libgdk-x11-2.0.so.0"

For the paths without explicit path, the system will search in /lib, /usr/lib and all directories in the LD_LIBRARY_PATH environment variable.

234.0.233 What does the NAN code mean?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

234.0.234 What font is used as a 'small font' in typical Mac OS X apps?

Plugin Version: all, Platform: macOS.

Answer:

Xojo 4.5 has a constant "SmallSystem" to use for a font name.
For older versions try this code:
Example:

```
Sub GetThemeFont(fontType as Integer, ByRef fontName as String, ByRef fontSize as Integer, ByRef fontStyle as Integer)
Var err as Integer
Var theFont, theFontSize, theFontStyle as MemoryBlock

const smSystemScript = -1

Declare Function GetThemeFont Lib "Carbon" (inFontID as Integer, inScript as Integer, outFontName as Ptr, outFontSize as Ptr, outStyle as Ptr) as Integer

theFont = NewMemoryBlock(256) //Str255
theFontSize = NewMemoryBlock(2) //SInt16
theFontStyle = NewMemoryBlock(1) //Style
```

```
err = GetThemeFont(fontType, smSystemScript, theFont, theFontSize, theFontStyle)

if err = 0 then
fontName = theFont.PString(0)
fontSize = theFontSize.UShort(0)
fontStyle = theFontStyle.Byte(0)
else
fontName = ""
fontSize = 0
fontStyle = 0
end if
End Sub
```

234.0.235 What is last plugin version to run on Mac OS X 10.4?

Plugin Version: all, Platform: Windows.

Answer: Last Version with 10.4 support is version 15.4.
Notes: With version 15.4 you can build applications for OS X 10.4 and newer.
For Version 16.0 we disabled 10.4 and moved minimum to 10.5. We may be able to enable it again to build a version of 16.x, but may need to charge for this by hour.

234.0.236 What is last plugin version to run on PPC?

Plugin Version: all, Platform: Windows.

Answer: Last Version with PPC is 15.4.
Notes: With version 15.4 you can build PPC applications for OS X 10.4 and newer.
For Version 16.0 we disabled PPC. We may be able to enable it again to build a PPC version of 16.x, but may need to charge for this by hour.

234.0.237 What is last version of the plugins for macOS 32-bit?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use version 23.0 or older.
Notes: We stopped including 32-bit code for macOS in version 23.1.
Please us older versions if you use an old Xojo.

Xojo 2017r3 and newer load our 64-bit plugins.

234.0.238 What is the difference between Timer and WebTimer?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Time is server side and WebTimer client side.
Notes: Timer is the normal timer class in Xojo. It runs on the server. On the side the WebTimer runs on the client. It triggers a request to the server to perform the action. So a WebTimer is good to keep the connection running and the website updated regularly. A timer on the server is good to make regular jobs like starting a database backup every 24 hours.

234.0.239 What is the list of Excel functions?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Below a list of function names known by LibXL.
Notes: LibXL parses the functions and writes tokens to the excel file. So even if Excel can do more functions, we can only accept the ones known by LibXL.

ABS, ABSREF, ACOS, ACOSH, ACTIVE.CELL, ADD.BAR, ADD.COMMAND, ADD.MENU, ADD.TOOLBAR, ADDRESS, AND, APP.TITLE, AREAS, ARGUMENT, ASC, ASIN, ASINH, ATAN, ATAN2, ATANH, AVEDEV, AVERAGE, AVERAGEA, BAHTTEXT, BETADIST, BETAINV, BINOMDIST, BREAK, CALL, CALLER, CANCEL.KEY, CEILING, CELL, CHAR, CHECK.COMMAND, CHIDIST, CHIINV, CHITEST, CHOOSE, CLEAN, CODE, COLUMN, COLUMNS, COMBIN, CONCATENATE, CONFIDENCE, CORREL, COS, COSH, COUNT, COUNTA, COUNTBLANK, COUNTIF, COVAR, CREATE.OBJECT, CRITBINOM, CUSTOM.REPEAT, CUSTOM.UNDO, DATE, DATEDIF, DATESTRING, DATEVALUE, DAVERAGE, DAY, DAYS360, DB, DBCS, DCOUNT, DCOUNTA, DDB, DEGREES, DELETE.BAR, DELETE.COMMAND, DELETE.MENU, DELETE.TOOLBAR, DEREF, DEVSQ, DGET, DIALOG.BOX, DIRECTORY, DMAX, DMIN, DOCUMENTS, DOLLAR, DPRODUCT, DSTDEV, DSTDEVP, DSUM, DVAR, DVARP, ECHO, ELSE, ELSE.IF, ENABLE.COMMAND, ENABLE.TOOL, END.IF, ERROR, ERROR.TYPE, EVALUATE, EVEN, EXACT, EXEC, EXECUTE, EXP, EXPONDIST, FACT, FALSE, FCLOSE, FDIST, FILES, FIND, FINDB, FINV, FISHER, FISHERINV, FIXED, FLOOR, FOPEN, FOR, FOR.CELL, FORECAST, FORMULA.CONVERT, FPOS, FREAD, FREADLN, FREQUENCY, FSIZE, FTEST, FV, FWRITE, FWRITELN, GAMMADIST, GAMMAINV, GAMMALN, GEOMEAN, GET.BAR, GET.CELL, GET.CHART.ITEM, GET.DEF, GET.DOCUMENT, GET.FORMULA, GET.LINK.INFO, GET.MOVIE, GET.NAME, GET.NOTE, GET.OBJECT, GET.PIVOT.FIELD, GET.PIVOT.ITEM, GET.PIVOT.TABLE, GET.TOOL, GET.TOOLBAR, GET.WINDOW, GET.WORKBOOK, GET.WORKSPACE, GETPIVOTDATA, GOTO, GROUP, GROWTH, HALT, HARMEAN, HELP, HLOOKUP, HOUR, HYPERLINK, HYPGEOMDIST, IF, INDEX, INDIRECT, INFO, INITIATE, INPUT, INT, INTERCEPT, IPMT, IRR, ISBLANK, ISERR, ISERROR, ISLOGICAL, ISNA, ISNONTEXT, ISNUMBER, ISPMT, ISREF, ISTEXT, ISTHAIDIGIT, KURT, LARGE, LAST.ERROR, LEFT, LEFTB, LEN, LENB, LINEST, LINKS, LN, LOG, LOG10, LOGEST, LOGINV, LOGNORMDIST, LOOKUP, LOWER, MATCH, MAX, MAXA, MDETERM, MEDIAN, MID, MIDB, MIN, MINA, MINUTE, MINVERSE, MIRR, MMULT, MOD, MODE, MONTH, MOVIE.COMMAND, N, NA, NAMES, NEGBINOMDIST, NEXT, NORMDIST, NORMINV, NORMSDIST, NORMSINV, NOT, NOTE, NOW, NPER, NPV, NUMBERSTRING, ODD, OFFSET, OPEN.DIALOG, OPTIONS.LISTS.GET, OR, PAUSE, PEARSON, PERCENTILE, PERCENTRANK, PERMUT, PHONETIC, PI, PIVOT.ADD.DATA, PMT, POISSON, POKE, POWER, PPMT, PRESS.TOOL, PROB, PRODUCT,

PROPER, PV, QUARTILE, RADIANS, RAND, RANK, RATE, REFTEXT, REGISTER, REGISTER.ID, RELREF, RENAME.COMMAND, REPLACE, REPLACEB, REPT, REQUEST, RESET.TOOLBAR, RESTART, RESULT, RESUME, RETURN, RIGHT, RIGHTB, ROMAN, ROUND, ROUNDBAHTDOWN, ROUNDBAHTUP, ROUNDDOWN, ROUNDUP, ROW, ROWS, RSQ, RTD, SAVE.DIALOG, SAVE.TOOLBAR, SCENARIO.GET, SEARCH, SEARCHB, SECOND, SELECTION, SERIES, SET.NAME, SET.VALUE, SHOW.BAR, SIGN, SIN, SINH, SKEW, SLN, SLOPE, SMALL, SPELLING.CHECK, SQRT, STANDARDIZE, STDEV, STDEVA, STDEVP, STDEVPA, STEP, STEYX, SUBSTITUTE, SUBTOTAL, SUM, SUMIF, SUMPRODUCT, SUMSQ, SUMX2MY2, SUMX2PY2, SUMXMY2, SYD, T, TAN, TANH, TDIST, TERMINATE, TEXT, TEXT.BOX, TEXTREF, THAIDAYOFWEEK, THAIDIGIT, THAIMONTHOFYEAR, THAINUMSOUND, THAINUMSTRING, THAISTRINGLENGTH, THAIYEAR, TIME, TIMEVALUE, TINV, TODAY, TRANSPOSE, TREND, TRIM, TRIMMEAN, TRUE, TRUNC, TTEST, TYPE, UNREGISTER, UPPER, USDOLLAR, USERDEFINED, VALUE, VAR, VARA, VARP, VARPA, VDB, VIEW.GET, VLOOKUP, VOLATILE, WEEKDAY, WEIBULL, WHILE, WINDOW.TITLE, WINDOWS, YEAR and ZTEST.

234.0.240 What is the replacement for PluginMBS?

Plugin Version: all, Platform: macOS.

Answer: Use the SoftDeclareMBS class to load libraries dynamically.

234.0.241 What to do on Xojo reporting a conflict?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

I get an error like "This item conflicts with another item of the same name" when using one of the plugin functions.

Xojo just wants to tell you that you dropped something in the plugins folder what is not a plugin.
Notes:

Some users dropped the examples, the documentation or other files into the plugins folder. Don't do it.

234.0.242 What to do with a NSImageCacheException?

Plugin Version: all, Platforms: macOS, Windows.

Answer: You need to add exception handlers for NSExceptionMBS in order to catch this exception.
Notes: You may also add code to write the stack of the exception into a log file for later locating the error source.

A NSImage has several image representations in memory. So basicly you pass in the base image and for whatever size an image is needed, the NSImage class will create a cache image representation of the requested size so on the next query it can use that cache for the same requested size.

234.0.243 What to do with MySQL Error 2014?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: You can get this error on MySQL if you have a recordset open while you create another one.

234.0.244 What to do with SQL Plugin reporting Malformed string as error?

Plugin Version: all, Platform: macOS.

Answer: Please make sure the table and/or database fields have a text encoding set.
Notes: For Firebird our plugin tries to use UTF-8 encoding if possible and to correctly convert between various tables, the tables and their fields need to have a text encoding defined.
e.g. if the text field in the table is windows-1252 and the other ISO 8859-5, then the Firebird database can convert them to UTF-8 and deliver texts to the plugin.
If encoding is set to none, it may get confused for non-ascii text.

234.0.245 Where is CGGetActiveDisplayListMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetActiveDisplayList.

234.0.246 Where is CGGetDisplaysWithPointMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetDisplaysWithPoint.

234.0.247 Where is CGGetDisplaysWithRectMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetDisplaysWithRect.

234.0.248 Where is CGGetOnlineDisplayListMBS?

Plugin Version: all, Platform: Windows.

Answer: This is now CGDisplayMBS.GetOnlineDisplayList.

234.0.249 Where is GetObjectClassNameMBS?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Please use this replacement method:
Example:

```
Function GetObjectClassNameMBS(o as Object) As string
Var t as Introspection.TypeInfo = Introspection.GetType(o)
Return t.FullName
End Function
```

Notes: GetObjectClassNameMBS was removed from the plugins.

234.0.250 Where is NetworkAvailableMBS?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: We removed NetworkAvailableMBS some versions ago. It was not working right and basicly it's not useful. If you want to check whether you have a network, than do a DNS resolve:
Example:

```
// two independend domain names
const domain1 = "www.google.com"
const domain2 = "www.macsw.de"

// resolve IPs
Var ip1 as string = DNSNameToAddressMBS(Domain1)
Var ip2 as string = DNSNameToAddressMBS(Domain2)

// if we got IPs and not the same IPs (error/login pages)
if len(ip1)=0 or len(ip2)=0 or ip1=ip2 then
MsgBox "no connection"
else
MsgBox "have connection"
end if
```

Notes: This way you can detect whether you got something from DNS. And you can make sure that a DNS

redirection to a login page won't catch you.

234.0.251 Where is StringHeight function in DynaPDF?

Plugin Version: all, Platform: Windows.

Answer: Use the function GetFTextHeight or GetFTextHeightEx.
Notes: Be aware that GetFTextHeight works with format commands and you may want to escape your text if you don't use them.

234.0.252 Where is XLSDocumentMBS class?

Plugin Version: all, Platform: macOS.

Answer: This class has been removed in favor of XLBookMBS class.
Notes: This classes have been removed XLSCellMBS, XLSDocumentMBS, XLSFormatRecordMBS, XLSMerged-CellsMBS, XLSRowMBS and XLSSheetMBS.

234.0.253 Where to get information about file formats?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

Please visit this web page:
http://www.wotsit.org

234.0.254 Where to register creator code for my application?

Plugin Version: all, Platform: macOS.

Answer:

Register at Apple:
http://developer.apple.com/dev/cftype/information.html

234.0.255 Which Mac OS X frameworks are 64bit only?

Plugin Version: all, Platform: macOS.

Answer: Some frameworks from Mac OS X do not support 32 bit applications, so we can't provide plugins for Xojo until 64bit target is available.
Notes: For Mac OS X 10.8:

- Accounts
- EventKit
- GLKit
- Social

and in 10.9:

- Accounts
- AVKit
- EventKit
- GameController
- GLKit
- MapKit
- MediaLibrary
- Social
- SpriteKit

In general Apple makes all new frameworks being 64 bit only.

234.0.256 Which plugins are 64bit only?

Plugin Version: all, Platform: macOS.

Answer: Some of our plugins work only in 64 bit modes as operating systems do not provide 32 bit code.
Notes: This effects currently: EventKit, Accounts, Social frameworks from Apple and our matching plugins.

234.0.257 Why application doesn't launch because of a missing ddraw.dll!?

Plugin Version: all, Platform: Windows.

Answer: Some RB versions require that you install DirectX from Microsoft on your Windows.

234.0.258 Why application doesn't launch because of a missing shlwapi.dll!?

Plugin Version: all, Platform: Windows.

Answer: Some RB versions require that you install the Internet Explorer from Microsoft on your Windows.
Notes: This bug is for several older Windows 95 editions.

234.0.259 Why do I hear a beep on keydown?

Plugin Version: all, Platform: Windows.

Answer: When the user presses a key, RB goes through all keydown event handlers till on returns true.
Notes: If no keydown event handler returns true for the key, a beep is performed.

234.0.260 Why does folderitem.item return nil?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer: Because Xojo fails to make a folderitem for you. Reason may be an alias file which can't be resolved or simply that you don't have enough access rights to read the folder content.
Notes: A more rarely reason is that the directory changed and the file with the given index or name does no longer exist.

234.0.261 Why doesn't showurl work?

Plugin Version: all, Platforms: macOS, Linux, Windows.

Answer:

There are three main reasons:

1. showurl is not supported by Xojo in 68k applications.
2. there is now application defined for the protocol (e.g. http) in the Internet Control panel.
3. You don't have Internet Config installed.

You can use the InternetConfigMBS class to check for this stuff.

234.0.262 Why don't the picture functions not work on Linux?

Plugin Version: all, Platform: macOS.

Answer: Please make sure libcairo is installed.
Notes: For accessing pictures on Linux, the MBS Plugin relays on the cairo library.
Please install the package if you don't have it already.
Our plugin looks for library called libcairo.so or libcairo.so.2.

234.0.263 Why have I no values in my chart?

Plugin Version: all, Platforms: macOS, Windows.

Answer: You have no data points visible, there may be several reasons:
Notes: For example one of the data values may be infinite or invalid.
Or the scaling may be out of range, so you simply see nothing.

234.0.264 Will application size increase with using plugins?

Plugin Version: all, Platform: Windows.

Answer: All plugins used by your application will be included in the application.
Notes: If you use no plugins, your application will not change size.
And if you use one class from the plugins, your application size will increase by a few kilobytes.
The documentation of the plugins include a list of all plugin parts and their sizes for the different platforms.

234.0.265 XLS: Custom format string guidelines

Plugin Version: all, Platform: macOS.

Answer: You have to download the source code and compile a static version of the library.
Notes: Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. Four sections example:

#,###.00_); [Red] (#,###.00);0.00;"sales "@

The following table describes the different symbols that are available for use in custom number formats.

234.0.266 Xojo doesn't work with your plugins on Windows 98.

Plugin Version: all, Platform: Windows.

Answer: Please upgrade your Windows version.

234.0.267 Xojo or my RB application itself crashes on launch on Mac OS Classic. Why?

Plugin Version: all.

Answer:

You may check if the application has enough memory to be loaded.
RB should have on Mac OS Classic more than 20 MB of RAM.
I prefered to use 50 MB and for an application a 10 MB partition is a good way to start.

Attribute	Description
width	The width of the block in pixels. By default, the width is automatically determined to be the width necessary for the contents of the block. If the width attribute is specified, it will be used as the width of the block. If the width is insufficient for the contents, the contents will be wrapped into multiple lines.
height	The height of the block in pixels. By default, the height is automatically determined to be the height necessary for the contents of the block. If the height attribute is specified, it will be used as the height of the block.
maxwidth	The maximum width of the block in pixels. If the content is wider than maximum width, it will be wrapped into multiple lines.
truncate	The maximum number of lines of the block. If the content requires more than the maximum number of lines, it will be truncated. In particular, if truncate is 1, the content will be truncated if it exceeds the maximum width (as specified by maxwidth or width) without wrapping. The last few characters at the truncation point will be replaced with "...".
linespacing	The spacing between lines as a ratio to the default line spacing. For example, a line spacing of 2 means the line spacing is two times the default line spacing. The default line spacing is the line spacing as specified in the font used.
bgColor	The background color of the block in hex format.
valign	The vertical alignment of sub-blocks. This is for blocks that contain sub-blocks. Supported values are baseline, top, bottom, middle and absmiddle. The value baseline means the baseline of sub-blocks should align with the baseline of the block. The baseline is the underline position of text. This is normal method of aligning text, and is the default in CDML. For images or blocks that are rotated, the baseline is the same as the bottom. The value top means the top line of sub-blocks should align with the top line of the block. The value bottom means the bottom line of sub-blocks should align with the bottom line of the block. The value middle means the middle line of sub-blocks should align with the the middle line of the block. The middle line is the middle position between the top line and the baseline. The value absmiddle means the absolute middle line of sub-blocks should align with the absolute middle line of the block. The absolute middle line is the middle position between the top line and the bottom line.
halign	The horizontal alignment of lines. This is for blocks that contain multiple lines. Supported values are left, center and right. The value left means the left border of each line should align with the left border of the block. This is the default. The value center means the horizontal center of each line should align with the horizontal center of the block. The value right means the right border of each line should align with the right border of the block.
angle	Rotate the content of the block by an angle. The angle is specified in degrees in counter-clockwise direction.

Parameter	Description
sector	The sector number. The first sector is 0, while the nth sector is (n-1).
dataSet	Same as { sector } . See above.
label	The text label of the sector.
dataSetName	Same as { label } . See above.
value	The data value of the sector.
percent	The percentage value of the sector.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using BaseChart.addExtraField or BaseChart.addExtraField2.

Parameter	Description
x	The x value of the data point. For an enumerated x-axis (see Axis.setLabels on what is an enumerated axis), the first data point is 0, and the nth data point is (n-1).
xLabel	The bottom x-axis label of the data point.
x2Label	The top x-axis label of the data point.
value	The value of the data point.
accValue	The sum of values of all data points that are in the same x position and same data group as the current data point, and with data set number less than or equal to the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
totalValue	The sum of values of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
percent	The percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
accPercent	The accumulated percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
gpercent	The percentage of the data point based on the total value of all data points in a layer.
dataSet	The data set number to which the data point belongs. The first data set is 0. The nth data set is (n-1).
dataSetName	The name of the data set to which the data point belongs.
dataItem	The data point number within the data set. The first data point is 0. The nth data point is (n-1).
dataGroup	The data group number to which the data point belongs. The first data group is 0. The nth data group is (n-1).
dataGroupName	The name of the data group to which the data point belongs.
layerId	The layer number to which the data point belongs. The first layer is 0. The nth layer is (n-1).
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2. { fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.
diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by data set number. The Pth data set corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth data set corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
zx	The symbol scale in the x dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
zy	The symbol scale in the y dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
z	The symbol scale without distinguishing the dimension to use. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.

Parameter	Description
slope	The slope of the trend line.
intercept	The y-intercept of the trend line.
corr	The correlation coefficient in linear regression analysis.
stderr	The standard error in linear regression analysis.

Parameter	Description
top	The value of the top edge of the box-whisker symbol.
bottom	The value of the bottom edge of the box-whisker symbol.
max	The value of the maximum mark of the box-whisker symbol.
min	The value of the minimum mark of the box-whisker symbol.
med	The value of the median mark of the box-whisker symbol.

Parameter	Description
high	The high value.
low	The low value.
open	The open value.
close	The close value.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
radius	The radial value of the data point.
value	Same as { radius } . See above.
angle	The angular value of the data point.
x	Same as { angle } . See above.
label	The angular label of the data point.
xLabel	Same as { label } . See above.
name	The name of the layer to which the data point belongs.
dataSetName	Same as { name } . See above.
i	The data point number. The first data point is 0. The nth data point is (n-1).
dataItem	Same as { i } . See above.
z	The symbol scale. Applicable for layers with symbol scales set by PolarLayer.setSymbolScale.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2. { fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.
diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by layer index. The Pth layer corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth layer corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
value	The axis value at the tick position.
label	The axis label at the tick position.

Parameter	Description
[param]	The name of the parameter
[a]	If this field a number, it specifies the number of decimal places (digits to the right of the decimal point).

[b]

textasciitilde ' for no thousand separator. The default is '
textasciitilde ', which can be modified using BaseChart.setNumberFormat.

The thousand separator. Should be a non-alphanumeric character (not 0-9, A-Z, a-z). Use '

[c]

The decimal point character. The default is '.', which can be modified using BaseChart.setNumberFormat.

[d]

textasciitilde ' for no negative sign character. The default is '-', which can be modified using BaseChart.setNumberFormat.

The negative sign character. Use '

Parameter	Description
yyyy	The year in 4 digits (e.g. 2002)
yyy	The year showing only the least significant 3 digits (e.g. 002 for the year 2002)
yy	The year showing only the least significant 2 digits (e.g. 02 for the year 2002)
y	The year showing only the least significant 1 digits (e.g. 2 for the year 2002)
mmm	The month formatted as its name. The default is to use the first 3 characters of the english month name (Jan, Feb, Mar ...). The names can be configured using BaseChart.setMonthNames.
mm	The month formatted as 2 digits from 01 - 12, adding leading zero if necessary.
m	The month formatted using the minimum number of digits from 1 - 12.
MMM	The first 3 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
MM	The first 2 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
M	The first character of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
dd	The day of month formatted as 2 digits from 01 - 31, adding leading zero if necessary.
d	The day of month formatted using the minimum number of digits from 1 - 31.
w	The name of the day of week. The default is to use the first 3 characters of the english day of week name (Sun, Mon, Tue ...). The names can be configured using BaseChart.setWeekDayNames.
hh	The hour of day formatted as 2 digits, adding leading zero if necessary. The 2 digits will be 00 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
h	The hour of day formatted using the minimum number of digits. The digits will be 0 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
nn	The minute formatted as 2 digits from 00 - 59, adding leading zero if necessary.
n	The minute formatted using the minimum number of digits from 00 - 59.
ss	The second formatted as 2 digits from 00 - 59, adding leading zero if necessary.
s	The second formatted using the minimum number of digits from 00 - 59.
a	Display either 'am' or 'pm', depending on whether the time is in the morning or afternoon. The text 'am' and 'pm' can be modified using BaseChart.setAMPM.

Shape Id	Value	Description
SquareShape	1	Square shape. See (1, 1) above.
DiamondShape	2	Diamond shape. See (2, 1) above.
TriangleShape	3	Triangle shape pointing upwards. See (3, 1) above.
RightTriangleShape	4	Triangle shape pointing rightwards. See (4, 1) above.
LeftTriangleShape	5	Triangle shape pointing leftwards. See (5, 1) above.
InvertedTriangleShape	6	Triangle shape pointing downwards. See (1, 2) above.
CircleShape	7	Circle shape. See (2, 2) above.
StarShape	[Method]	Star shapes of various points. See (2, 3), (2, 4), (2, 5), (3, 1), (3, 2), (3, 3), (3, 4), (3, 5) above for stars with 3 to 10 points.
PolygonShape	[Method]	Polygon shapes symmetrical about a vertical axis with a vertex at the top center position. See (4, 1), (4, 3), (4, 5), (5, 1) for polygons of 5 to 8 sides.
Polygon2Shape	[Method]	Polygon shapes symmetrical about a vertical axis but without any vertex at the top center position. See (4, 2), (4, 4) for polygons of 5 and 6 sides.
CrossShape	[Method]	'+' shapes. See (5, 2), (5, 3), (5, 4), (5, 5), (6, 1), (6, 2), (6. 3) for '+' shape with arm width of 0.1 - 0.7.
Cross2Shape	[Method]	'X' shapes. See (6, 4), (6, 5), (7, 1), (7, 2), (7, 3), (7, 4), (7, 5) for 'X' shapes with arm width of 0.1 - 0.7.

langEnglish	0	Roman script

Nan	Meaning
1	Invalid square root (negative number, usually)
2	Invalid addition (indeterminate such as infinity + (-infinity))
4	Invalid division (indeterminate such as 0/0)
8	Invalid multiplication (indeterminate such as 0*infinity)
9	Invalid modulo such as (a mod 0)
17	Try to convert invalid string to a number like val(”x7”)
33	Invalid argument in a trig function
34	Invalid argument in an inverse trig function
36	Invalid argument in a log function
37	Invalid argument in Pow function
38	Invalid argument in toolbox financial function
40	Invalid argument in hyperbolic function
42	Invalid argument in a gamma function

Symbol	Description and result
0	Digit placeholder. For example, if the value 8.9 is to be displayed as 8.90, use the format #.00
