## Abstract

Recent research has offered insights into the extraordinary capabilities of Large Multimodal Models (LMMs) in various general vision and language tasks. There is growing interest in how LMMs perform in more specialized domains. Social media content, inherently multimodal, blends text, images, videos, and sometimes audio. To effectively understand such content, models need to interpret the intricate interactions between these diverse communication modalities and their impact on the conveyed message. Understanding social multimedia content remains a challenging problem for contemporary machine learning frameworks. In this paper, we explore GPT-4V(ision)’s capabilities for social multimedia analysis. We select five representative tasks, including sentiment analysis, hate speech detection, fake news identification, demographic inference, and political ideology detection, to evaluate GPT-4V. Our investigation begins with a preliminary quantitative analysis for each task using existing benchmark datasets, followed by a careful review of the results and a selection of qualitative samples that illustrate GPT-4V’s potential in understanding multimodal social media content. GPT-4V demonstrates remarkable efficacy in these tasks, showcasing strengths such as joint understanding of image-text pairs, contextual and cultural awareness, and extensive commonsense knowledge. Despite the overall impressive capacity of GPT-4V in the social media domain, there remain notable challenges. GPT-4V struggles with tasks involving multilingual social multimedia comprehension and has difficulties in generalizing to the latest trends in social media. Additionally, it exhibits a tendency to generate erroneous information in the context of evolving celebrity and politician knowledge, reflecting the known hallucination problem. Our hope is that this preliminary study will provide insights into further research across disciplines, particularly in computational social science and social media-related studies. The insights gleaned from our findings underscore a promising future for LMMs in enhancing our comprehension of social media content and its users through the analysis of multimodal information. All images and prompts used in this report will be available at [https://github.com/VISIA-H/GPT-4V\\_Social\\_Media](https://github.com/VISIA-H/GPT-4V_Social_Media).<sup>1</sup>

**Disclaimer: This paper contains some examples of offensive social media content. Reader discretion is advised.**

# 1 Introduction

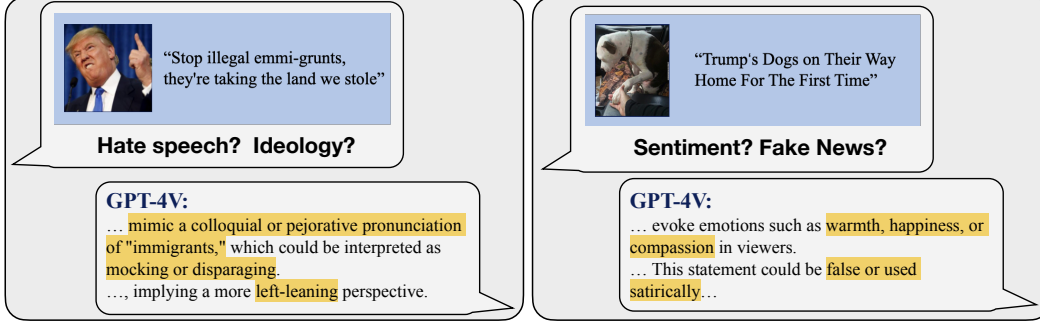

**Motivation and Overview.** Social multimedia analysis encompasses a diverse range of tasks, each characterized by its inherent complexity and nuanced characteristics [4, 93, 32, 74, 69, 15, 38, 64, 58, 88]. This field is distinguished by its multimodal nature, where text, images, videos, and other media forms intertwine to convey rich, multifaceted messages. The tasks within this domain, such as sentiment analysis, hate speech detection, and fake news identification, are not only about parsing textual content but also about deciphering the subtleties conveyed through visual cues. The interplay of various forms of data adds layers of context, requiring an advanced level of comprehension that transcends traditional unimodal analysis. Additionally, the rapid pace of social media evolution introduces constant variability, with new slang, symbols, and trends emerging continuously, making the analysis ever more challenging.

In this intricate milieu, large multimodal models like GPT-4V(ision) [60, 86, 99] represent a leap forward in artificial intelligence. Their ability to process and interpret complex, multimodal information makes them particularly suited for the demands of social multimedia analysis. Recent research has undertaken an extensive evaluation of GPT-4V’s capabilities across a spectrum of vision and language tasks [86, 81, 98, 99, 16, 71, 39, 42, 40, 87, 37, 79, 7, 103, 27]. These investigations have shed valuable light on the potential of Large Multimodal Models (LMMs) like GPT-4V in the domains of both vision and language. However, the broader application of these techniques for societal benefit remains a question. Social media-related studies have the potential to enhance social good by addressing harmful content, fostering positive behavior, and bolstering public safety. They can also enable community building, improved communication, and the empowerment of marginalized groups, leading to a more inclusive and informed society. Assessing the effectiveness of LMMs like GPT-4V in comprehending and responding to social media nuances is pivotal for several reasons. First, it helps assess the model’s capability to handle the diversity and complexity of real-world data, providing insights into its practical applicability. Second, such evaluation sheds light on the model’s understanding of cultural and contextual nuances, which are vital for accurate analysis in a globally connected, digital world. Lastly, it aids in identifying areas where these models excel and where they need improvement, guiding future advancements in AI and machine learning.

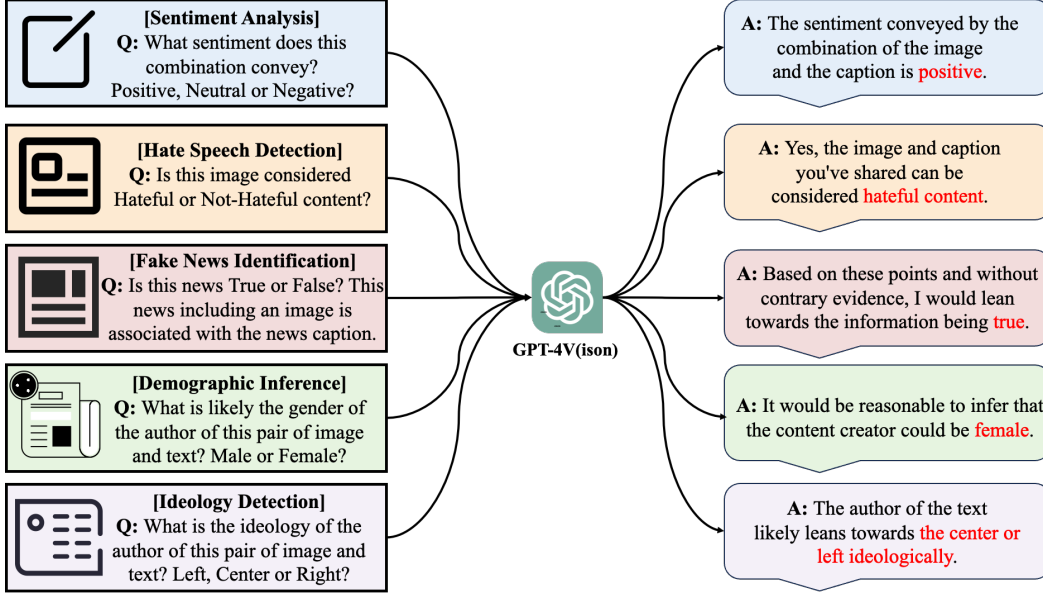

Our study aims to contribute to the understanding of how effectively GPT-4V can navigate the nuanced domain of social multimedia analysis, highlighting its strengths and areas for development. Considering the unique characteristics of multimodal social media content, our exploration of GPT-4V’s capabilities for social multimedia analysis is guided by the following questions:

1. *How effectively does GPT-4V understand the multimodal content on social media platforms?* Social media data is inherently multimodal, which requires sophisticated models that can process and relate information from these different modalities. GPT-4V exhibits a remarkable capability to understand the visual and textual elements jointly. It demonstrates its aptitude for explaining the connections between the images and text frequently found in social media posts, and how these elements can collaboratively serve a multitude of analytical purposes.
2. *Does GPT-4V demonstrate contextual awareness in its interpretation of social media multimedia content?* The meaning of content on social media is often context-dependent. Effective analysis requires understanding the context in which content is produced and consumed. Our observations suggest that GPT-4V possesses the capability to understand context and subtleties within multimodal social media content such as memes, puns, and misspellings, *etc.* This ability paves the way for its application across various domains, including but not limited to, the automatic detection of sarcasm [31] and the study of visual persuasion [30].
3. *What is GPT-4V’s performance when analyzing novel content?* Social media language and content trends are constantly changing. Analysis methods should be able to adapt to new knowledge, slang, memes, and communication styles. GPT-4V, while adept in various analytical tasks, still faces challenges in accurately assessing areas like ideology detection and fake news identification, particularly when these require insights into knowledge or contexts beyond its training data.
4. *How does GPT-4V navigate the complexities of language and cultural diversity in its analysis of multimodal social media content?* Social media platforms are used globally, necessitating

(a) GPT-4V for Social Media in Daily life.

(b) The Pipeline of GPT-4V for Five Social Media Analysis Tasks.

Figure 1: In this study, we carefully select five typical social multimedia analysis tasks including sentiment analysis, hateful speech detection, fake news identification, demographic inference, and ideology detection. We adopt GPT-4V as a unified framework with different prompts (e.g., *What sentiment does this combination convey?*) to explore the GPT-4V’s ability for social multimedia.

models that can handle multiple languages and cultural contexts. GPT-4V, in its current state, demonstrates limitations when it comes to managing the intricacies involved in language and cultural heterogeneity in its evaluations of multimodal social media content. Its proficiency is notably centered around English, with less effective understanding of other languages. Furthermore, the model exhibits a lack of comprehensive cultural sensitivity, which is essential for navigating the complexities of global social media communications effectively.

**Our Approach in Exploring GPT-4V(ison).** Social multimedia analysis includes various tasks that involve the extraction, interpretation, and classification of information from content shared on social media platforms. In this report, we focus on tasks that are pivotal in this area, each of which is associated with its own set of quantitative benchmark datasets. These tasks encompass sentiment analysis, hate speech detection, fake news identification, demographic inference, and ideology detection (summarized in Figure 1). For each of these tasks, we draw samples from two to three well-established benchmark datasets to present preliminary quantitative results and qualitative insights into the performance of GPT-4V in the context of social multimedia analysis. Figure 2 provides an overview of the emerging properties identified in GPT-4V within the social multimedia analysis area. As highlighted by Yang *et al.* [86], it has become apparent that some of the existing benchmarks may no longer effectively evaluate LMMs. In the course of our exploration, we have encountered similar challenges such as GPT-4V’s propensity for memorization during training within

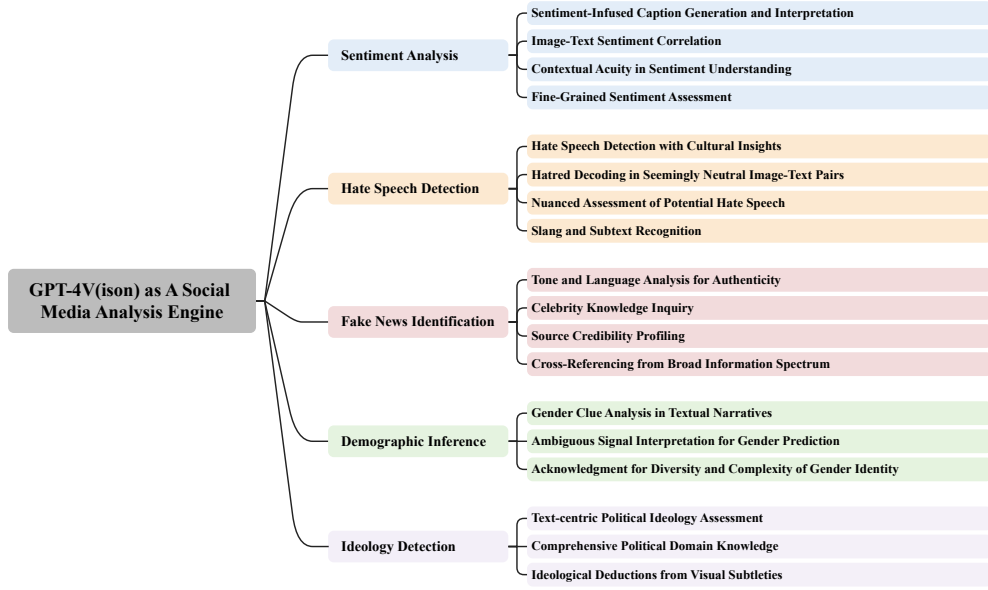

Figure 2: Overview of the emerging properties of GPT-4V for social multimedia analysis tasks.

the context of social media analysis. Therefore, in alignment with Yang *et al.* ’s approach, we primarily rely on qualitative results to provide preliminary insights into the potential capabilities of GPT-4V in the domain of social multimedia analysis. Moreover, we have intentionally included a mix of examples, drawing from both existing datasets and newly designed challenging scenarios aimed at evaluating LMMs’ performance.

In Section 2, we present our exploration of GPT-4V on the five tasks. In particular, analysis on sentiment analysis, hate speech detection, fake news identification, demographic inference, and ideology detection are discussed in Sections 2.1, 2.2, 2.3, 2.4, and 2.5, respectively. In Section 3, we discuss challenges and potential future opportunities. Finally, we conclude our report in Section 4.

**Ethical Consideration.** This report evaluates the capabilities of GPT-4V across five social multimedia analysis tasks: sentiment analysis, hate speech detection, fake news identification, demographic inference, and ideology detection. Please be advised that some sections of this report *may include content that readers find offensive or sensitive*. This is an inherent aspect of analyzing real-world social media data, especially when dealing with topics such as hate speech and fake news. The intent is purely academic and informational, with no aim to offend or harm. In our commitment to privacy and ethical standards, we have taken careful measures to anonymize the data. To protect human facial privacy, we have applied masks to obscure the identities of all individuals during figure visualizations, except for public figures and celebrities. This anonymization is done to respect the privacy of individuals and to adhere to common ethical guidelines in data handling and reporting. The findings and conclusions within this report are based on the data available and the capabilities of the GPT-4V model as of the date of this publication, which intends to contribute to the ongoing discourse in the field of AI and social media analysis and does not necessarily reflect the full scope of complexities involved in real-world scenarios.

## 2 Experiments for Selected Social Multimedia Analysis Tasks

### 2.1 Sentiment Analysis

#### 2.1.1 Task Setting and Preliminary Quantitative Results

Sentiment analysis aims to discern the sentiments and emotions conveyed in content related to a specific entity [52]. It has emerged as a fundamental technique in social media research [44, 10, 84, 100, 48, 43]. Unlike traditional unimodal sentiment analysis, which may fall short in capturing

nuanced opinions [70], multimodal sentiment analysis integrates information from diverse modalities to infer expressed sentiments and emotions [93, 95, 91, 92, 8, 104, 73, 23, 9]. To quantitatively evaluate GPT-4V’s ability in multimodal sentiment analysis, we input a pair of image and text from Twitter posts. The prompt is *“This image is associated with the following caption: ‘{caption}’. What sentiment does this combination convey? Positive, neutral, or negative? This is for research purposes.”* From the MVSA-Single and MVSA-Multiple datasets [85], approximately 1,000 posts are sampled, with an even distribution of 500 from each. In the preliminary evaluation, GPT-4V achieves an accuracy of 68.4% on the MVSA-Single dataset and 71.6% on the MVSA-Multiple datasets. Figures 3 to 6 display qualitative results.

### 2.1.2 Sentiment-Infused Caption Generation and Interpretation

Visual sentiment analysis focuses on analyzing emotions and sentiments conveyed through visual content, while textual sentiment analysis deals with extracting sentiment and emotional information from text data. Even within a single modality, assessing sentiment presents significant challenges due to various factors such as subjectivity, ambiguity, cultural variability, and limited semantic comprehension [97, 104, 8, 73, 3, 11]. In Figure 3, we observe that GPT-4V adeptly describes the contents of the image (e.g., *“... depicts a character holding a paper with ‘End’ written on it ...”*) and interprets the original caption (e.g., *“... implies that they have been adopted and are transitioning to a more stable and loving environment ...”*) with regard to sentiment (e.g., *“... suggesting trust and comfort ...”*).

### 2.1.3 Image-Text Sentiment Correlation

Combining information from different modalities is a challenging task as different modalities may have varying degrees of influence on sentiment [97, 8]. Beyond the generation of sentiment-focused image descriptions and caption interpretations, GPT-4V goes a step further by explicitly explaining the relationship between the image and text in the context of sentiment analysis. For instance, it articulates how one modality can accentuate the sentiment conveyed by another (see Figure 4). Moreover, there can be divergent sentiment polarities among different modalities; for instance, a piece of text may express negativity while its accompanying visual element conveys positivity [26]. As illustrated in the fourth example in Figure 4, GPT-4V shows its capability to identify such contrasting sentiments in image-text social media posts.

### 2.1.4 Contextual Acuity in Sentiment Understanding

Sentiments and emotions are profoundly influenced by culture. What might be regarded as a positive or negative emotion in one culture could be interpreted differently in another. Additionally, the sentiment expressed in social media posts often hinges on the broader contextual backdrop. However, many studies in sentiment analysis tend to focus primarily on the content of social media while overlooking its contextual and cultural dimensions. Neglecting these crucial aspects can complicate the determination of accurate polarity [8]. Impressively, we have observed that GPT-4V has the capacity to generate prompts that exhibit cultural awareness (e.g., *“... the thematic elements of heartbreak and revenge often found in country songs ...”*) and maintain contextual relevance within the context of social media (e.g., *“The use of ‘D’awe’ further emphasizes a feeling of warmth and gratitude.”*). This finding is consistent with prior research, which has demonstrated that large language models have the capacity to enhance contextual information [45].

### 2.1.5 Fine-grained Sentiment Assessment

While basic sentiment analysis typically categorizes image-text pairs into broad sentiments like positive, negative, or neutral, exploring more nuanced sentiment distinctions (such as differentiating between varying degrees of positivity or negativity) is both challenging and often indispensable for both textual and visual content [94]. More importantly, social media posts also often employ sarcasm and irony for sentiment expression. These modes of expression often rely on intricate context and subtleties that machines find challenging to grasp [8, 104, 73, 34]. However, our findings indicate that GPT-4V possesses an impressive capability to discern sarcasm and predict nuanced levels of positivity and negativity.

## Sentiment-Infused Caption Generation and Interpretation

### Prompt:

This image is associated with the following caption: "RT @USER 88infinito888: not finished ? #art #arte #artwork #artcolor #artist #boligrafo #boceto #colour #creative ... HTTPURL ...". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is neutral to positive. The image depicts a character holding a paper with "End" written on it, possibly indicating the end of a story or project. The caption, however, mentions "not finished," which contrasts with the image's message. The hashtags emphasize the artistic nature of the work and suggest that it's a creative project. The overall sentiment seems to lean more towards an appreciation or showcase of art, with a hint of incompleteness or work in progress.

### Prompt:

This image is associated with the following caption: "My excited Saturday work face. Is it 5 o'clock yet?". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is negative. The person in the image appears to have a serious expression, and the caption expresses a desire for the workday to end, suggesting a lack of enthusiasm for working on a Saturday.

### Prompt:

This image is associated with the following caption: "RT @USER: Shelter Dogs on Their Way Home For The First Time -". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is positive. The image shows a dog, seemingly in a car, placing its paw in a human's hand, suggesting trust and comfort. The caption indicates that shelter dogs are on their way home for the first time, which implies that they have been adopted and are transitioning to a more stable and loving environment.

### Prompt:

This image is associated with the following caption: "RT @USER: 2 hours down , 6 to go ! Learning to ski is knacker but so much fun ? @USER #ski #olympia2024 #aching #smiles htt ...". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is positive. The caption indicates enthusiasm and excitement about learning to ski, even though it is physically tiring. The hashtags like "#smiles" further reinforce the positive sentiment. The image shows ski boots, suggesting that the person is actively engaging in the skiing activity.

Figure 3: Qualitative results on sentiment-infused caption generation and interpretation. GPT-4V is able to describe the image contents and interpret the original caption, with a particular emphasis on capturing the conveyed sentiment. The image descriptions and caption interpretations are highlighted. Refer to Section 2.1 for detailed discussions.

## Image-text Sentiment Correlation

### Prompt:

This image is associated with the following caption: "RT @USER: RT @USER: Anyone missing a cat in #Stokey? This bloke running around #Benthal, seems a little distressed. HTTPURL:/ ...". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is negative. The caption mentions that cat seeming "a little distressed" and asks if anyone is missing a cat, implying concern for the well-being of the animal. The image shows a white cat that appears to be alone, further emphasizing the sentiment of concern.

### Prompt:

This image is associated with the following caption: "#nowplaying ELISA - ebullient future / rainbow pulsation ~ THE BEST OF ELISA ~". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is positive. The caption indicates that a song ("ebullient future") by ELISA is currently being played, suggesting appreciation or enjoyment of the music. The image itself, featuring bright colors, rainbows, and a sky background, further promotes a positive and uplifting vibe. The title "rainbow pulsation ~ THE BEST OF ELISA ~" on the album cover suggests a collection of the artist's best songs, which also adds to the positive sentiment.

### Prompt:

This image is associated with the following caption: "RT @USER: #PakvInd Imran 's message to team: Abandon fear of losing via @USER". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is primarily positive. The caption suggests that Imran's message to the team is to let go of the fear of losing, which implies encouragement and a focus on giving one's best without the burden of potential failure. The image shows two individuals in sunglasses, appearing thoughtful and determined, reinforcing the serious and motivational tone of the message. Overall, the sentiment can be considered positive, emphasizing confidence and resilience.

### Prompt:

This image is associated with the following caption: "Pakistan players ecstatic after PCB credited 20 rupees bonus in their accounts #IndvsPak". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is mixed. The image shows Pakistan cricket players in a jubilant mood, which is positive. However, the caption humorously suggests that their happiness is because of a trivial monetary bonus, which could be perceived as mocking or sarcastic, thus adding a negative sentiment. Overall, the sentiment could be seen as neutral to negative due to the sarcastic nature of the caption.

Figure 4: Qualitative results on image-text sentiment correlation. GPT-4V explicitly explains the interplay between the image and text. The image-text relation interpretations are highlighted. Refer to Section 2.1 for detailed discussions.

## Contextual Acuity in Sentiment Understanding

### Prompt:

This image is associated with the following caption: "RT @USER: The NSA just captured the evil side of Valentine's Day in this perfect tweet". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is negative. The mention of the "evil side of Valentine's Day" in conjunction with the **NSA logo** suggests a critical or skeptical viewpoint regarding the NSA's **actions or communications**.

### Prompt:

This image is associated with the following caption: "RT @USER: " @USER: "An ex-girlfriend scorned is capable of anything . #LNSM bahahaha". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The combination conveys a humorous sentiment, playing on stereotypes associated with country music themes. The image itself presents a joke that ties a real-life event with the **thematic elements of heartbreak and revenge often found in country songs**. The caption reinforces the humor, suggesting that an "ex-girlfriend scorned is capable of anything." The use of "bahahaha" emphasizes the comedic intention. Overall, it's a playfully positive sentiment built around a comedic perspective on the situation described.

### Prompt:

This image is associated with the following caption: "I literally just finished eating all the chocolate in my house, and my dad comes by with this .? D'awe.". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is positive. The image shows a box of Ferrero Collection chocolates and a card, suggesting a gift or treat. The caption conveys a sense of pleasant surprise and appreciation for the unexpected gift, especially after the mention of having just finished all the chocolate. The use of "D'awe" further emphasizes a **feeling of warmth and gratitude**.

### Prompt:

This image is associated with the following caption: "EXPOSED: free fortune cookie SCAM at uwindsor marketplace #thatsnotafortune #appalled #fortuneless #cookiewasgoodtho". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is negative, with a touch of humor towards the end. The user expresses disappointment with the **non-traditional fortune message**, but adds a light-hearted note about the cookie tasting good.

Figure 5: Qualitative results on contextual acuity in sentiment understanding. GPT-4V generates responses that demonstrate cultural awareness and are contextually relevant within the context of social media. The components that are related to **contextual understanding** are highlighted. Refer to Section 2.1 for detailed discussions.

## Fine-grained Sentiment Assessment

### Prompt:

This image is associated with the following caption: "Cheeky close up #tattoo #sad #blue #bleak #robtallon #tattooer #cheltenham #uk #bearded #nofilter #traditionaltattoo". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The combination conveys a **neutral to negative sentiment**. While the caption mentions "cheeky close up" suggesting a light-hearted approach, terms like "sad," "blue," and "bleak" imply negative emotions. The image of the tattoo also depicts a sad and melancholic expression, reinforcing this sentiment.

### Prompt:

This image is associated with the following caption: "A #boyhood like no other @USER #thrilling #dark #mystery #horror #depraved #fairyale". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is **positive towards the content** (as it praises or promotes the book/movie/show) but the **themes or subject matter are dark and intense**, as suggested by terms like "thrilling," "dark," "mystery," "horror," "depraved," and "fairyale." The overall mood implied by the themes is negative, but the sentiment towards the work itself is positive.

### Prompt:

This image is associated with the following caption: "RT @USER: Barclays Egypt pumps EGP 250m for small, medium projects through 2015 -". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The combination conveys a **neutral sentiment with a slightly positive undertone**. The caption indicates that Barclays Egypt has invested in small and medium projects, which can be seen as a positive action for economic development. However, without additional context or emotive language, the overall sentiment remains relatively neutral.

### Prompt:

This image is associated with the following caption: "RT @USER: @USER Thought you might like my image of a wolf I recently finished". What sentiment does this combination convey? Positive, neutral or negative?

### GPT-4V:

The sentiment conveyed by the combination of the image and the caption is **primarily neutral to positive**. The image showcases a wolf with a focused and intense gaze, which can be interpreted as a display of beauty and majesty of nature. The caption indicates that someone is sharing their work with another person, suggesting pride in their artwork and a desire to share it. The context is **not overtly positive or negative** but leans towards a **positive sentiment** due to the sharing and appreciation of art.

Figure 6: Qualitative results on fine-grained sentiment assessment. GPT-4V showcases a higher level of sophistication in sentiment analysis, extending beyond the basic categorization of positive, neutral, and negative sentiments. The components that are related to **fine-grained sentiment** are highlighted. Refer to Section 2.1 for detailed discussions.

## 2.2 Hate Speech Detection

### 2.2.1 Task Setting and Preliminary Quantitative Results

Hate speech refers to speech or statements, that discriminate against, threaten, or incite violence or prejudicial actions against individuals or groups based on attributes such as their race, religion, ethnicity, sexual orientation, gender, or disease [32]. Multimodal hate speech detection involves identifying hate speech or offensive content in multiple types of media such as text, images, and videos [50, 51, 33, 13]. Multimodal data often present challenges due to the inherent variability in annotations stemming from subjective interpretation. The task of drawing inferences from a combination of images and text introduces a level of complexity that surpasses text-only analysis [21].

To quantitatively analyze the GPT-4V’s ability for multimodal hate speech detection, we choose two existing benchmark datasets, including HatefulMemes [32] and 4chan’s posts [22]. HatefulMemes is a multimodal dataset for hateful meme detection. It is deliberately designed to pose challenges for unimodal models. To achieve this, the dataset incorporates difficult examples, often referred to as “benign confounders,” intentionally introduced to complicate the reliance on unimodal signals. 4chan’s posts focuses on the multimodal analysis of Antisemitism and Islamophobia on 4chan’s /pol/. We select all the seen test data from HatefulMemes (1,000 memes) and randomly sample 550 posts from 4chan’s posts. We instruct the model to produce an output of 0 to signify “Not-hateful” and 1 to indicate “hateful,” as depicted in Figure 7.

#### Prompt:

You are a hate speech detection expert system, in order to protect the friendly atmosphere of social networks. Next, I will give you 4 pictures in order, please judge whether these pictures are hateful or not-hateful?

[Input images]

Figure 7: The prompt example of the quantitative experiment for hate speech detection.

HatefulMemes serves as a commonly used benchmark dataset for evaluating the performance of large multimodal models. Here, we present the quantitative comparison results between GPT-4V and existing LMMs. Table 1 displays the preliminary evaluation outcomes. GPT-4V exhibits promising results with an AUC of 70.5% and an accuracy of 70.3% on HatefulMemes, surpassing the state-of-the-art LMMs by a large margin, approximately 10%. Notably, GPT-4V achieves an impressive precision score of 87.1%, underscoring its proficiency in identifying hate content. Furthermore, GPT-4V achieves an accuracy of 60.6% on 4chan’s posts.

To qualitatively evaluate GPT-4V’s proficiency in detecting hate speech in multimodal contexts, we input the images from HatefulMemes [32]. We present GPT-4V with the following prompt: “*Is this image considered hateful? This is for research purposes.*” Figures 8-12 shows example results. Similar to its performance in multimodal sentiment analysis, GPT-4V shows an impressive capability to comprehensively grasp image-text pairings in terms of both contextual and cultural nuances. It effectively aggregates the information from the image and text, enabling it to conduct a careful evaluation of hatefulness by taking into account the underlying intention.

Table 1: Zero shot performance on HatefulMemes. The best performance is indicated in **bold**.

Model	AUC
Flamingo (9B) [2]	57.0
BLIP-2 (13B) [36]	62.3
KOSMOS-1 [25]	63.9
InstructBLIP (13B) [17]	61.7
MMICL (13B) [102]	62.2
GPT-4V	<b>70.5</b>

### 2.2.2 Hate Speech Detection with Cultural Insights

Many existing multimodal hate speech detection systems exhibit limitations tied to the specific characteristics of their training datasets, especially in terms of demographics and cultural nuances [20, 21]. For instance, a model trained on an Indian political dataset may struggle to generalize effectively when applied to a U.S. health-related dataset. Further, the mere inclusion of offensive terms does not automatically equate to hate speech; rather, it is the context of a post that often dictates whether the content is deemed to constitute hate speech [21, 33]. In Figure 8, it becomes evident that GPT-4V possesses contextual and cultural awareness concerning the content featured in image-text pairs. Consider the first post in Figure 8 as an example: GPT-4V recognizes that the term “fruit” is sometimes used derogatorily to refer to a gay man, while “vegetable” is employed offensively in association with people with disabilities.

### 2.2.3 Hatred Decoding in Seemingly Neutral Image-Text Pairs

A social media post might pair an innocuous picture with a seemingly benign caption, yet together, they can morph into a message that is offensive. Tackling this nuanced challenge demands multimodal models, which would otherwise need human intelligence to discern the complex interplay between image and text. Despite advances in modeling multimodalities, current multimodal models lag behind trained non-expert annotators when it comes to identifying hate speech [32]. The art of accurately mapping the detected objects and their spatial relations in the image to the accompanying text is no trivial feat [1]. Prior research predominantly focuses on aligning the two modalities, however, these efforts encounter significant challenges due to the difficulty in comprehending the context within which the image and text are combined [18]. GPT-4V steps up to this intricate task with an impressive aptitude for jointly interpreting visual and textual information to detect undertones of hatefulness. The capability of GPT-4V is exemplified in various cases depicted in Figures 9, 10, and 11. Take, for instance, the lower-left example in Figure 9: the text in isolation does not indicate dehumanization. Yet, GPT-4V deciphers the underlying contempt, interpreting the phrase as one that dehumanizes an individual in the photo by likening them to farm equipment. Furthermore, in Figures 10 and 11, we delve deeper by presenting GPT-4V with targeted follow-up prompts that query how the visual elements contribute to the overall impression of hatefulness. This exercise demonstrates GPT-4V’s sophisticated analysis; it recognizes the transformative impact of text on an image that is otherwise neutral. Even when the image alone does not convey hate, GPT-4V detects how the added text might shift its context, revealing the potential for offensive connotations. While it is not infallible in detecting every subtle correlation, GPT-4V’s advanced multimodal comprehension marks a significant step toward understanding the nuanced dynamics of image-text interactions.

### 2.2.4 Nuanced Assessment of Potential Hate Speech

Assessing the intention behind a post is critical in evaluating its potential for hatefulness, as the intent shapes the context and intrinsic meaning of the deployed words and images. These elements can adopt various interpretations based on their usage context. Correctly identifying this context is where intention plays a pivotal role. A seemingly offensive phrase could, in fact, be a satirical, educational, or commentary excerpt from a movie or a book when framed within its appropriate context. As shown in Figure 12, not all image-text pairings exhibit clear signs of hatefulness or offensiveness in the absence of additional context. GPT-4V adeptly recognizes such neutrality. Significantly, it goes further to elucidate that, under more rigorous scrutiny of their underlying intent, these combinations may indeed convey offensive or hateful undertones through subtly demeaning or derogatory expressions. In this light, GPT-4V underscores the imperative of integrating broader dimensions into the analysis of hate speech, a trajectory that is critical for future research on augmenting the evaluation process with supplementary information [68].

### 2.2.5 Slang and Subtext Recognition

Misspelling is widely existing in social media and it plays a critical role in expressing the meaning of a sentence. A subtle difference could cause the semantic deviation [6]. In case of hatefulness, misspelling can potentially reduce the hateful information because key phrases conveying disrespectful, racial, and other negative messages aren’t detected. However, even though such a difference is subtle, GPT-4V could still capture it. In Figure 13 and Figure 14, phrases such as “nigger,” “immigrant,” “Muslims,” and “white” are misspelled with “nigero,” “emmi-grunts,” “Muslyns,” and “wite”, respectively. The misspellings have similar pronunciations but look different than original phrases. GPT-4V can recognize them as the original phrases and understand the whole message again with the original phrases. Note that it is possible that background information helps GPT-4V capture the misspellings. For example, in Figure 13, GPT-4V analyzes the background information such as “policy” and “stole land,” which is associated with the topic of misspelled phrases.

## Hate Speech Detection with Cultural Insights

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image provided shows a person at what appears to be a pride event, identifiable by the rainbow colors typically associated with LGBTQ+ pride. However, the text overlay contains the phrases "if I had a gone" and "i could convert this fruit to vegetable," which do not make clear sense in English and could be interpreted as nonsensical or as a poor attempt at humor. If the text is attempting to use the word "fruit" in a derogatory way to refer to a gay person, which is a dated and offensive slang, and "convert" in the sense of changing someone's sexual orientation, it would be considered offensive and inappropriate. The term "vegetable" can also be considered insensitive if it's used to refer to someone in a derogatory way, especially in contexts referring to people with disabilities. Without clear context, it is difficult to provide a definitive assessment, but if the intent is to ridicule or demean based on sexual orientation or to suggest the possibility of conversion therapy, which is widely discredited and considered harmful, it would be considered offensive and inappropriate. It is crucial to communicate respectfully and avoid language that can be harmful or disrespectful to individuals and their identities.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image you've shared features the Twin Towers with text overlay that seems to reference the September 11 attacks and implies a group of people, not specified, should not be voted into government. This message could be interpreted as promoting a political stance based on the association of a group of people with a traumatic event, which can be divisive or perceived as targeting or excluding specific groups based on nationality, ethnicity, or religion. It can potentially be seen as promoting xenophobia or collective blame, which can be harmful and offensive. The interpretation of whether it is hateful may depend on the context and the policies of the platform it's shared on, but it certainly has the potential to be inflammatory.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image shows a group of men with a caption "the great train robbers." It appears to be a reference to a notorious criminal event, likely the Great Train Robbery that occurred in the UK in 1963. The image itself is not inherently hateful; it depicts a group of men, likely meant to be a historical reference or perhaps a part of a reenactment or promotion for a book or film about the event. The term "hateful content" typically refers to material that promotes hate or violence against individuals or groups based on characteristics such as race, ethnicity, religion, disability, sexual orientation, or gender. Without additional context, this image does not appear to promote hate or violence against any such group and does not contain hateful content as per the general definition. However, context is key in these matters. If the image were being used to glorify criminal activity or to promote violence, that could change the interpretation of whether the content is hateful. From the image provided and the information within it, there is no direct indication of such an intent.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image shows a person with a joyful or possibly intense expression, typically associated with celebration or strong emotion, such as one might exhibit when a favored sports team scores a goal. The caption "when your world cup team scores a goal" reflects a common experience shared by many sports fans around the world during significant matches, such as those in the FIFA World Cup. This image, without additional context, does not appear to contain hateful content. It seems to be intended to represent a moment of excitement or happiness in sports. Hateful content typically involves promoting hatred, violence, or discrimination against individuals or groups, and there's no indication of that in this image based on the information provided.

Figure 8: Qualitative results on hate speech detection with cultural insights. GPT-4V's responses exhibit a profound cultural awareness and a strong grasp of context when it comes to addressing potential hate speech-related content. The components that are related to cultural insights are highlighted. Refer to Section 2.2 for detailed discussions.

## Hatred Decoding in Seemingly Neutral Image-Text Pairs (1)

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image itself is not inherently hateful; it shows a diverse group of women smiling and embracing each other, suggesting a positive message of unity and friendship. However, the overlaid text "yellow black red and normal" is inappropriate because it uses racial descriptors for some individuals while implying that one group is "normal," suggesting a standard from which other races deviate. This kind of language is offensive and divisive, promoting a skewed and prejudiced view that one race is the baseline of normality. Using colors to describe races is considered outdated and insensitive, and doing so while contrasting them with "normal" to implicitly refer to white individuals as a default standard is racially insensitive and would be considered offensive by contemporary standards. This kind of message can perpetuate harmful stereotypes and contribute to racial discrimination.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

Yes, the image and caption you've shared can be considered hateful content. The caption uses a phrase that dehumanizes the individual in the photo by referring to a person as "farm equipment," which is inappropriate and offensive. This type of language has historical connotations of racism and dehumanization. Such content is generally against the policies of many platforms and is disrespectful and harmful.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

Yes, the content of the image you provided could be considered hateful. It appears to contain an antisemitic message, which is a form of hate speech directed against Jewish people. Such messages can perpetuate harmful stereotypes and contribute to a culture of discrimination and intolerance. It's important to address and challenge such content in a responsible and constructive manner.

### Follow-up Prompt:

How do you know that it is targeting Jewish people?

### GPT-4V:

The image contains a caricature of a person with features that are commonly associated with stereotypical depictions of Jewish individuals: a beard, a hat that resembles a style sometimes worn by Jewish men, and a Star of David, which is a symbol of Judaism. Additionally, the figure is holding a menorah, which is a candelabrum used in Jewish worship, particularly during the holiday of Hanukkah. The text accompanying the image makes a derogatory statement implying that Jewish people are naturally disliked and that laws preventing hate against them are necessary only due to their inherent characteristics, which is a clear example of antisemitism. This type of message promotes harmful stereotypes and discrimination against Jewish people, which is why it can be classified as hateful content.

Figure 9: Qualitative results on hatred decoding in seemingly neutral image-text pairs. GPT-4V leverages both images and text to assess whether the content is indicative of hatefulness. The components that are related to the joint understanding of image and text are highlighted. Refer to Section 2.2 for detailed discussions.

## Hatred Decoding in Seemingly Neutral Image-Text Pairs (2)

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The text in the image is suggesting a racially charged and exclusionary viewpoint, which could be considered offensive and divisive. It seems to glorify a past time period in America that was marked by segregation and systemic racism, implying that this was a better time. Such statements can be hurtful and dismissive of the experiences of people who were marginalized and discriminated against during those times. It is crucial to be mindful of how statements like these can perpetuate harmful biases and be disrespectful to the diverse society that makes up modern America.

### Follow-up Prompt:

Does the visual content contribute to the hatefulness?

### GPT-4V:

The visual content of the image, showing a seemingly idyllic family picnic scene from an era that looks to be the mid-20th century, when considered alone, is not inherently hateful. It is a representation of a family enjoying time together. However, the text overlaid on the image changes the context and implies a message that the time period depicted—a time when racial segregation and discrimination were legally sanctioned in many parts of the United States—was "better." The juxtaposition of the image with the text can contribute to the harmful message by idealizing a past that was fraught with inequality and injustice for many individuals, particularly people of color. This can be offensive as it seems to dismiss or overlook the significant struggles and injustices faced by minorities during that time. The harm in the content comes from this combination of text and image that together suggest an exclusionary or racially insensitive viewpoint.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image you've presented depicts a snowy landscape and is overlaid with text that states, "just admit it white America was better." The landscape itself is not inherently offensive; it's a neutral winter scene. However, the text overlaid on this image is likely to be considered offensive and potentially hateful because it appears to suggest that America was better when it was dominated by white people, which can imply a preference for a time when racial inequalities were more pronounced and institutionalized. This message can be seen as disregarding the historical context of racial discrimination and the progress made toward equality and civil rights. It's important to be aware that such statements can be deeply hurtful and divisive, perpetuating a sentiment that is considered racist and exclusionary.

### Follow-up Prompt:

Does the visual content contribute to the hatefulness?

### GPT-4V:

In the context of the text provided, the visual content of a snowy landscape does not contribute to hatefulness. The image alone is neutral, featuring a typical winter scene without any inherently offensive or provocative elements. It is the text that carries a message that could be interpreted as promoting racial division or expressing nostalgia for a time of unequal racial dynamics, which could be considered offensive or hateful. The landscape in this case does not have a direct correlation with the text's message, unlike scenarios where the image itself might depict symbols or scenes that are directly associated with hate or discrimination.

Figure 10: Qualitative results on hatred decoding in seemingly neutral image-text pairs. These two examples illustrate that even in cases where the image itself is not hateful, GPT-4V demonstrates a deep understanding of the interplay between images and text, enabling it to identify whether the text could alter the overall context, although it may not always detect potential correlations. The components that are related to the joint understanding of image and text are highlighted. Refer to Section 2.2 for detailed discussions.

### Hatred Decoding in Seemingly Neutral Image-Text Pairs (3)

#### Prompt:

Is this image considered hateful content?

#### GPT-4V:

The image shows a meme with a man, who appears to be a chef or a television personality, animatedly speaking to another individual, with an overlaid caption that makes a humorous statement about the quality of a pizza. The content does not appear to be hateful; it seems to be intended as a joke about the standards of Italian cuisine and the reputation Italy has for its food, particularly pizza. However, humor can be subjective, and while the image is not inherently hateful, it's always important to consider context and audience when sharing such content.

#### Follow-up Prompt:

What does the goat contribute to the hatefulness, if any?

#### GPT-4V:

The goat itself in the image is neutral; it is simply an animal and does not inherently contribute to hatefulness. However, the context created by the overlaid text can be problematic if it is perceived as ridiculing a figure or name held sacred by a particular group of people. In this case, if the name "Mohammed" is intended to reference the Islamic prophet, then using an image of a goat along with such text can be seen as an attempt to demean or insult a figure revered in Islam. This could be considered disrespectful and offensive by those who hold the name and the religious figure it represents in high esteem. The combination of the image and the text creates a context that can be interpreted as disrespectful or mocking, which could be perceived as hateful or incendiary.

#### Prompt:

Is this image considered hateful content?

#### GPT-4V:

The image depicts three camels with the text "trust me... they're all terrorists." This image contains a statement that could be considered offensive and promoting harmful stereotypes, as it seems to be making a sweeping generalization that could be interpreted as associating camels with terrorism. The image and the text together appear to play on negative and prejudicial associations and could be deemed as promoting hate or intolerance. It's important to be aware of the impact that such content can have, as it might contribute to spreading harmful stereotypes or encouraging discrimination.

#### Follow-up Prompt:

What do camels contribute to the hatefulness, if any?

#### GPT-4V:

In the image you've presented, the camels are being anthropomorphized — that is, they are depicted as if they have human characteristics — with the added text implying they are saying "trust me... they're all terrorists." The use of camels in this context likely draws upon harmful stereotypes that link certain animals commonly found in the Middle East with terrorism, a stereotype that broadly and inaccurately associates Middle Eastern people and cultures with violence and extremism. By using camels in this manner, the image may be attempting to satirize or mock those stereotypes, but it also runs the risk of reinforcing the very prejudices it might be trying to critique. The impact of such content can vary greatly among different audiences, but it has the potential to contribute to the spread of hateful sentiments by using a stereotype that has been historically used to discriminate against or dehumanize a group of people.

Figure 11: Qualitative results on hatred decoding in seemingly neutral image-text pairs. The components that are related to the joint understanding of image and text are highlighted. Refer to Section 2.2 for detailed discussions.

## Nuanced Assessment of Potential Hate Speech

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image you've provided shows two police officers, a man and a woman, and includes a caption that reads "how black women fight crime". On its own, without any additional context, it's a straightforward depiction of police officers, who could be representative of those working in law enforcement. The caption could be interpreted in various ways depending on context—it could be intended to be factual, stating that black women fight crime by serving as police officers, or it could be seen as a setup for a stereotype or joke, which could be potentially offensive depending on the implied or stated punchline. However, if the intention behind the caption is to stereotype, diminish, or mock the role of black women in law enforcement, it could be considered offensive and potentially hateful. It is important to consider the context in which such an image and caption are used to fully assess the intent and impact it may have.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image shows a person laughing with the text overlay indicating they heard a funny joke about dishwashers. This image, as it is presented, is not inherently hateful; it depicts someone reacting to humor. Without additional context, it is just an expression of amusement. However, if the implied joke were to rely on stereotypes or derogatory themes, it could be considered offensive or inappropriate by some. The content of the actual joke, which is not included in the image, would be necessary to make a determination about whether it could be considered hateful or not.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image itself is of a woman smiling and jogging, holding a water bottle, with a natural green backdrop. There is nothing inherently hateful about the image. The caption "things I love to hunt" does not immediately seem to connect with the image in a literal or usual context. Without additional context, the caption could imply many things, and its interpretation can vary widely. It may imply that the woman enjoys the challenge of a hunt in a metaphorical sense, perhaps in the pursuit of personal goals, fitness achievements, or other non-literal "hunts". If the caption were intended to imply something else, especially something derogatory or demeaning, then it could be considered offensive. Context is key to determine the appropriateness or intent of the message.

### Prompt:

Is this image considered hateful content?

### GPT-4V:

The image depicts a person peeling off a facial mask, with a caption that reads "when you've decided to start a life of crime." This appears to be a humorous take on the application of a skincare mask, likening it to a stereotypical 'burglar's mask'. The humor attempts to play on the visual similarity between the black facial skincare mask and the kind of mask that might be worn in popular culture's depiction of a thief or criminal. This image isn't considered hateful content as it does not target or discriminate against any individual or group, nor does it promote hate or violence. It seems to be intended as a light-hearted joke, although humor can be subjective and sometimes misunderstood.

Figure 12: Qualitative results on nuanced assessment of potential hate speech. GPT-4V exhibits a careful evaluation of posts that may not initially appear hateful but could potentially contain offensive or hateful content based on their underlying intent, which may be demeaning or derogatory. The components that are related to the nuanced assessment are highlighted. Refer to Section 2.2 for detailed discussions.

## Slang and Subtext Recognition (1)

### Prompt:

The caption for this image is: Calling you **nigero** now!  
Help me determine if the image and caption together express hateful information.

### GPT-4V:

The image you've provided appears to show a community event where a police officer and some young people are engaging in a dance. Such scenes can reflect positive community-police interactions and activities meant to foster good relationships and community spirit. The caption, however, contains language that is not appropriate. Specifically, the word "**nigero**" seems to be a misspelling or a variation of a racial slur that is deeply offensive and discriminatory. When paired with the caption, the image could be misinterpreted or used to convey a message that is hateful or harmful, which is not acceptable.

It's crucial to be mindful of the context and the potential impact of pairing images with text, especially when the language used could be considered offensive or disrespectful. It's important to foster respectful and positive communication, particularly in the context of community events and interactions between law enforcement and community members.

### Prompt:

The caption for this image is: Stop illegal **emmi-grunts** they're taking the land we stole.  
Help me determine if the image and caption together express hateful information.

### GPT-4V:

The caption uses language that could be considered a satirical or ironic comment on the history of land acquisition and current immigration debates. It seems to be making a point about the contradictions in the rhetoric used in some debates on illegal immigration. The use of the word "stole" in the context of land may refer to historical conquests or colonialism, which is a sensitive subject.

The term "**emmi-grunts**" is a nonstandard spelling of "immigrants" and could be viewed as pejorative or demeaning, depending on the intent and context in which it is used. Using derogatory language when referring to immigrants can be offensive and is often considered inappropriate.

While the image is just a photo of an individual and does not contain hateful content on its own, when combined with the caption, it may be seen as perpetuating a dismissive or irreverent stance on serious and complex issues. It's essential to discuss such matters with understanding and respect for the profound impact they have on people's lives.

Figure 13: Qualitative results on slang and subtext recognition. The misspelled phrase on the left is **nigger**, and on the right is **immigrant**. How GPT-4V captures the misspelling and the position of the misspelling are highlighted. Refer to Section 2.2 for detailed discussions.

## Slang and Subtext Recognition (2)

### Prompt:

The caption for this image is: **Muslyns** moved in... but they're not moving out..  
Help me determine if the image and caption together express hateful information.

### GPT-4V:

The caption provided with the image seems to be a play on words, possibly a misspelling or a fictitious variation of "Muslims." If that is the case, and it is intended to reference the Muslim community, then the statement could be considered inflammatory and offensive, as it suggests a negative stereotype associating a group with a destructive event. Such insinuations can contribute to discrimination and are considered inappropriate. However, without further context to confirm the intent behind the caption, it's difficult to determine the exact nature of the message. Nonetheless, it's essential to communicate with respect and avoid language that could be interpreted as singling out or blaming any community or group for negative incidents, as this can perpetuate harmful biases and stereotypes.

### Prompt:

The caption for this image is: I'm this pretty because both my parents are **wite**.  
Help me determine if the image and caption together express hateful information.

### GPT-4V:

The caption provided with the image makes a statement about the person's appearance based on their parents' race, which can be interpreted as a racially insensitive remark. It suggests that the individual's attractiveness is due to having parents of a specific race, which can be offensive as it implies a superiority based on racial characteristics. This kind of racial commentary is generally considered inappropriate and can contribute to harmful stereotypes or biases.

The image itself is a portrait of a person posing and smiling at the camera, and does not contain any hateful content on its own. However, when combined with the caption, it can be seen as perpetuating a problematic message about race and beauty standards. It's important to be mindful of the implications of attributing qualities such as beauty to race and to avoid making such associations.

Figure 14: Qualitative results on slang and subtext recognition. The misspelled phrase on the left is **Muslims**, and on the right is **White**. How GPT-4V captures the misspelling and the position of the misspelling are highlighted. Refer to Section 2.2 for detailed discussions.

## 2.3 Fake News Identification

### 2.3.1 Task Setting and Preliminary Quantitative Results

The ability to identify whether a social media post is authentic or fabricated provides valuable assistance to fact-checkers [53, 14, 49, 24]. However, acquiring more nuanced information — categorizing content as true, satire/parody, misleading, manipulated, falsely connected, or imposter — can be significantly more beneficial [59]. Additionally, the issue of cross-modal inconsistency in social media content presents a considerable challenge in multimodal environments, necessitating advanced detection strategies [28, 29, 74]. The dataset we use here is FakeNewsNet [72], which contains two categories of news articles: “gossip” and “political news”. The number of test samples used in the preliminary evaluation is 104 and 500, respectively. GPT-4V achieves an accuracy of 57.2% on the “gossip” dataset and 60.6% on the “political news” dataset. Based on our experiments, we have found that GPT-4V can assess the authenticity of news from various perspectives. Example qualitative results are outlined in the subsequent sections.

### 2.3.2 Tone and Language Analysis for Authenticity

GPT-4V has the ability to construct a chain of thought based on tone as a basis for assessing fake news. Previous research [63] finds that some fake news stories are written in a specific linguistic tone, but it is inconclusive to say which one is negative, positive, or neutral, not to mention the writing style. However, as shown in Figure 15, GPT-4V naturally demonstrates the ability to determine the authenticity of news content based on tone and language style. We are uncertain if there were similar tasks in the pre-training corpus, but this capability exhibited by GPT-4V seems to address previously seemingly insurmountable challenges in fake news identification. At the same time, GPT-4V is also capable of providing high-level summaries, categorization, and discernment of input content, not solely relying on the story itself, to assess the similarity between the input corpus and real news content. This demonstrates GPT-4V’s multifaceted understanding of the definition of “news.”

### 2.3.3 Celebrity Knowledge Inquiry

GPT-4V has the capability to make factual inferences based on specific entities it has learned, which may not only be abstract concepts (*e.g.*, “news”) but also concrete individuals or actual events that have occurred. As shown in Figure 16, GPT-4V can judge the authenticity of input news content based on the information it has learned about Brad Pitt and Angelina Jolie in its “knowledge.” In other words, if the news content aligns with the information in its “knowledge,” GPT-4V is more likely to consider the input as a genuine news story. Conversely, it would be less inclined to do so if the information does not match its knowledge. However, this could also potentially lead to misjudgments by GPT-4V due to its underlying “stereotype” or preconceived notions, causing it to make incorrect assessments of some “unexpected” news.

### 2.3.4 Source Credibility Profiling

Similar to the previous characteristic, GPT-4V also *seems* to have established “profiles” for different information sources and use them as a basis for assessing the authenticity of news. As shown in Figure 17, ABC News is considered a credible source by GPT-4V, while Gossip Cop appears to be less trustworthy to GPT-4V. This could be influenced by the fact that in the training corpus, Gossip Cop often co-occurs with keywords like “fake news.” This also reflects GPT-4V’s strong memory and attribution capabilities. Similarly, as mentioned earlier, these “profiles” often carry significant bias due to differences in the training data, ultimately leading to incorrect results.

### 2.3.5 Cross-Referencing from Broad Information Spectrum

At the same time, GPT-4V can use a much richer background of information and concepts to verify news content and perform various fact-checking tasks. This includes public information in areas such as politics, law, and economics, and even includes the political stances of public figures and historical stock market data, as shown in Figures 18 and 19. This strategy makes the results more credible, but it appears that we cannot always control GPT-4V to follow this pattern of verification. This also presents a new challenge of how to encourage GPT-4V to utilize as much known information as possible when assessing the authenticity of input news.

## Tone and Language Analysis for Authenticity

### Prompt:

Is this news true or false? Why? This news including an image is associated with the following new caption:

"Taylor Swift Spent Her Fourth of July in Turks and Caicos with Boyfriend Joe Alwyn Is it even a proper Independence Day celebration without fireworks, Stars and Stripes face paint, and photos from one of Taylor Swift's infamous Fourth of July parties? Yes it is, but still the Internet had to do without the latter in 2018, because this was the second year in a row that her home in Watch Hill, Rhode Island was empty on America's birthday. (In other words, perhaps Taylor not celebrating the 4th during Trump's presidency is her biggest political statement yet?)

Instead of holding one of her #squad-powered summer bashes this year, T-Swift chose to spend a break from her current world tour in Turks and Caicos with her boyfriend actor Joe Alwyn.

The couple were spotted all loved up and canoodling on the beach and in the clear tropical waters. And yes, while Swift abandoned America to vacation a British territory islands with her British beau, she was spotted sporting a red, blue, and white striped bikini from swimwear brand Solid and Striped. America represent! 🇺🇸

The Jamie Top solidandstriped.com \$88.00 Shop Now

Taylor and Joe allegedly first met at the 2016 Met Gala, but their ~relationship status~ wasn't confirmed until a year later in May 2017. A source tells People, "Joe is just an amazing boyfriend. He is very supportive. Taylor adores his family. She's in a very good place."

On the few occasions they have been spotted together in public, the couple have always looked like they're absolutely crazy about each other, but have made sure to hide their love from the public eye as much as possible. In fact, these photos mark the first time Taylor and Joe have been spotted together since their lunch date in North London over a month ago. In other words then, this is a far cry from those seemingly-posed, definitely cheesy beach pics with her (also British) ex Tom Hiddleston.

Well the two certainly look like they're having a lovely time on their little beach getaway, soaking in some sun and snorkeling and hopefully enjoying colorful cocktails too. But a gigantic Taymerica inflatable pool slide would've made it even better, right?! Then again, as we see in the photo, who needs a floatie when you've got a... dreamboat to lean on?

Follow Jasmine on Instagram."

### GPT-4V:

The caption includes informal language, emojis, and a casual style of writing ("all loved up and canoodling", "Taymerica inflatable pool slide"). This is more characteristic of informal blog posts or social media content rather than traditional journalism, which usually maintains a more neutral and formal tone.

The caption references specific products and includes a price and a link to shop, which is typical of sponsored content or fashion blogs but not standard in news reporting. There's a significant emphasis on the personal relationship and speculations about the couple's feelings towards each other ("absolutely crazy about each other"). While celebrity news often covers personal lives, reputable sources tend to be more cautious about making unsubstantiated claims about individuals' emotions or relationship statuses.

The caption makes a speculative political statement about Taylor Swift's choices during a specific presidency. Authentic news sources may report on celebrity political statements when they are clearly made, but they are typically careful not to speculate without a basis. Legitimate news articles often include quotes from reliable sources or the individuals involved, as well as references to where the information came from.

This caption seems to lack such verification. Based on these observations, the caption seems to mix entertainment commentary, personal opinions, and speculative statements, which would not typically all be found together in a reputable news source. While this doesn't necessarily mean that the events didn't happen, it does suggest that the caption may not adhere to journalistic standards of verification and neutrality.

Figure 15: Qualitative results on tone and language analysis for authenticity. GPT-4V can leverage the tone and language-use for fake news identification. The components that are related to tone and language analysis are highlighted. Refer to Section 2.3 for detailed discussions.

## Celebrity Knowledge Inquiry

### Prompt:

Is this news true or false? Why? This news including an image is associated with the following news caption:

"Brad Pitt & Angelina Jolie Gave \$8 Mil to Charity News cameras have captured Brad Pitt building homes in New Orleans, and now federal tax filings for the Jolie Pitt Foundation have documented the good works that Brad and Angelina Jolie are doing behind the scenes.

All told, they gave more than \$8 million in donations in 2006, with Pitt putting in \$4,402,317, and Jolie donating \$4,123,613, the Huffington Post reports, citing newly released federal tax filings. (These latest figures don't include 2007 – in which, among other charitable efforts, Brad's Make It Right Foundation raised \$5 million.)

In terms of dispensing their funds, according to records for 2006, the foundation handed out \$2,367,935, including \$1 million to both Doctors Without Borders (International Division) and to the Global Action for Children.

Additional gifts included \$137,935 to the Namibia Red Cross Action Program (their daughter Shiloh was born in the African country); \$100,000 to the Daniel Pearl Foundation (the late journalist's widow, Marianne Pearl, was played by Jolie in A Mighty Heart); \$100,000 to Global Green U.S.A. and to the Epidermolysis Bulloma Medical Research Foundation.

In addition, \$20,000 went to an art park in Los Angeles, as did separate \$5,000 donations to two orphanages that Jolie had visited.

### More Good Works

In terms of Pitt's work in Louisiana, Jolie's costar in the movie Wanted, Morgan Freeman, told PEOPLE Thursday at the Pathfinders to Peace Forum and Gala, "We were in contact with Brad about the situation in New Orleans" – and he called Jolie "such a wonderful woman."

Said Freeman: "Aside from all that physical beauty, she's a real person."

Like this story? Click on the Yahoo Buzz! button below to Buzz it up!"

### GPT-4V:

Brad Pitt and Angelina Jolie, during their marriage, were known for their philanthropic efforts. The text mentions the Jolie-Pitt Foundation, which was a real charitable organization founded by them. They were indeed reported to have donated millions of dollars to various causes over the years. The specific figures and allocations mentioned in the text are plausible based on their known philanthropic history. Brad Pitt did establish the Make It Right Foundation, which focused on building sustainable housing in New Orleans after Hurricane Katrina, and Angelina Jolie has been involved in humanitarian efforts and has served as a Goodwill Ambassador for the UNHCR.

The charities mentioned, such as Doctors Without Borders and Global Action for Children, are consistent with the types of organizations they have supported in the past. Also, Jolie portrayed Marianne Pearl in the movie "A Mighty Heart," which aligns with the mention of a donation to the Daniel Pearl Foundation.

Regarding the authenticity of the text being linked to an article from the Huffington Post, it is common for tax filings of public figures, especially those involved in charitable activities, to be reported by credible news outlets. However, without access to the specific Huffington Post article or the tax filings mentioned, I cannot verify the exact figures or the current charitable activities of Pitt and Jolie.

Given these historical contexts and the philanthropic patterns of behavior known for both individuals up to April 2023, the information provided in the text is consistent with their actions in the past.

Figure 16: Qualitative results on celebrity knowledge inquiry. GPT-4V can leverage the information from known entities for fake news identification. The components that are related to celebrity knowledge inquiry are highlighted. Refer to Section 2.3 for detailed discussions.

## Source Credibility Profiling

### Prompt:

Is this news true or false? Why? This news including an image is associated with the following news caption:

Serena Williams and fiance Alexis Ohanian introduce daughter Alexis Olympia Tennis star Serena Williams and fiance Alexis Ohanian have officially introduced their daughter, Alexis Olympia Ohanian Jr.

.....  
ABC News' Katie Kindelan contributed to this report. Meet Alexis Olympia Ohanian Jr. You have to check out link in bio for her amazing journey. Also check out my IG stories ???????? A post shared by Serena Williams (@serenawilliams) on Sep 13, 2017 at 6:39am PDT"

### GPT-4V:

The text provided discusses Serena Williams and Alexis Ohanian introducing their daughter, Alexis Olympia Ohanian Jr. To assess whether this is likely true or fake news, we would consider the following:

1. Public figures like Serena Williams and Alexis Ohanian would likely announce significant life events, such as the birth of a child, on their official social media accounts. The detailed account of this event on Instagram and YouTube fits the pattern of how celebrities share personal news.
2. The description mentions specific details that would be verifiable, such as the child's Instagram handle and the weight at birth, suggesting it may be drawn from a press release or a direct quote, which are usually reliable.
3. The text references a source, ABC News, and a journalist by name, Katie Kindelan. This attribution gives more credibility to the text, as it suggests that the information could be verified through an established news outlet.

Based on these points and without contrary evidence, I would lean towards the information being accurate.

### Prompt:

Is this news true or false? Why? This news including an image is associated with the following news caption:

Robert Pattinson And Kristen Stewart Are Not Getting Back Together "Twilight" fans have been eagerly awaiting for the day that stars Robert Pattinson and Kristen Stewart would get back together following their high profile break up.

.....  
While fans of Pattinson and Stewart are still hoping the pair will get back together, it looks like the exes have their sights set on other people. Photo: Jason Merritt/Getty Images"

### GPT-4V:

Based on the text provided, the article claims that Robert Pattinson and Kristen Stewart are not getting back together, and this information is allegedly confirmed by a source that spoke to Gossip Cop, which is known for fact-checking rumors in the entertainment industry. Given this context, and without the ability to confirm current events beyond my last update, if I were to provide a confidence score, it would be more inclined to suggest that the rumor of them getting back together is not true, based on the pattern of such rumors typically being unsubstantiated.

Figure 17: Qualitative results on source credibility profiling. GPT-4V can leverage the “profile” of the information source for fake news identification. The components that are related to source credibility profiling are highlighted. Refer to Section 2.3 for detailed discussions.

## Cross-Referencing from Broad Information Spectrum (1)

### Prompt:

Is this news true or false? Why? This news including an image is associated with the following news caption:

"SPECIAL REPORT: GEORGIA BECOMES FIRST STATE TO BAN MUSLIM CULTURE IN HISTORIC MOVE TO RESTORE WESTERN VALUES! Share tweet:

When Donald Trump proposed in 2015 that we place a temporary ban on Muslims entering the United States, it was at a time when Europe was experiencing historical levels of migrations and terrorism. ISIS was carrying out terrorist attacks weekly and hundreds of innocent people were getting killed. Whether it was a jihadi running over 85 people with a truck, the Paris bombings, or even the German priest that was beheaded for being a Christian—they all were fueled by Islam. People need to understand that Islam is very dangerous and contradicts everything we believe in the United States.

When Donald Trump proposed in 2015 that we place a temporary ban on Muslims entering the United States, it was at a time when Europe was experiencing historical levels of migrations and terrorism. ISIS was carrying out terrorist attacks weekly and hundreds of innocent people were getting killed. Whether it was a jihadi running over 85 people with a truck, the Paris bombings, or even the German priest that was beheaded for being a Christian—they all were fueled by Islam. People need to understand that Islam is very dangerous and contradicts everything we believe in the United States

A Georgia state legislator has introduced legislation that would ban burqas and traditional Muslim veils.

State Rep. Jason Spencer (R) filed legislation on Wednesday that would prevent women from posing for driver's license photos while wearing a veil. The measure also adds burqas to a law that makes it a misdemeanor to wear a face covering in public or while driving.

Spencer argues that this bill is specifically intended to reduce fear about Islamic terrorism. Spencer's bill would prevent women from wearing head coverings while driving or while walking down a public sidewalk."

### GPT-4V:

Firstly, the claim that Georgia has become the first state to ban "Muslim culture" to restore "Western values" is a significant red flag. It is highly unlikely that any US state would or could ban a culture, as this would violate the principles of freedom of religion and expression enshrined in the United States Constitution. Moreover, such actions would likely be deemed unconstitutional and discriminatory against a particular religious group.

Secondly, the reference to a Georgia state legislator introducing legislation to ban burqas and veils is a more specific claim that can be fact-checked. While there have been various attempts by individuals in state legislatures to introduce bills that could affect the wearing of religious garments, to my knowledge, none have successfully enacted a complete ban on such garments or "Muslim culture" broadly by April 2023. These types of legislative efforts are typically met with significant legal and public opposition.

Furthermore, the text includes inflammatory language and broad generalizations about Islam, which are indicative of biased or fake news. Reputable news sources adhere to journalistic standards that require balanced reporting and typically avoid sweeping generalizations about entire religions or cultures.

Lastly, the tone and language used in the text ("ban on Muslims entering the United States," "Islam is very dangerous") are consistent with sensationalist and biased reporting, often found in disinformation campaigns or fake news articles.

Based on these considerations, it is likely that the text you provided is not from a credible news source and is potentially spreading misinformation or disinformation. It's important to cross-reference any such claims with reputable news sources and official statements before accepting them as true.

Figure 18: Qualitative results on cross-referencing from broad information spectrum. GPT-4V primarily leverages various related data for fake news identification. The components that are related to cross-referencing are highlighted. Refer to Section 2.3 for detailed discussions.

## Cross-Referencing from Broad Information Spectrum (2)

### Prompt:

Is this news true or false? Why? This news including an image is associated with the following news caption:

"Pelosi urges minimum-wage hike House Minority Leader Nancy Pelosi on Thursday urged Congress to hike the hourly minimum wage dramatically. Noting that Wall Street this week is trading at record-high levels, the California Democrat said those gains have done nothing to benefit middle-class workers, and called on Congress to close the gap. "This week, we saw something quite remarkable, the stock market soaring to record heights. At the same time, we see productivity keeping pace," Pelosi told reporters in the Capitol. "But we don't see income for America's middle class rising. In fact, it's been about the same as since the end of the Clinton years."

### ADVERTISEMENT

Pelosi said the negative effects of wage stagnation on the middle class have been compounded by the bursting of the housing bubble and the recession that followed. She urged Congress to take up legislation — sponsored by Sen.(D-Iowa) and Rep. George Miller (D-Calif.) — to hike the minimum wage from \$7.25 to \$10.10 over three years, while indexing future increases to inflation. "If we are going to honor our commitment to the middle class," she said, "we have to reflect that intention in our public policy." The Democrats' bill goes much further than President Obama advocated in his February State of the Union address, in which he urged an increase to \$9 per hour. Harkin said recently that Obama "missed the mark" with the lower figure. Pelosi's comments came in a week when the Dow Jones Industrial Average topped 14,200 for the first time in history even as wages, as a percentage of the economy, are at an historic low (43.5 percent of GDP last year) and the nation's unemployment rate has hung stubbornly near 8 percent for roughly six months. Economists say several factors can explain why corporate profits are not trickling down to benefit the working class, including the ever-rising productivity of the nation's workforce and a reluctance among companies to hire in a still-volatile economy. Congress last approved a minimum-wage hike in 2007 as a rider to a must-pass bill providing funds to the troops in the Iraq War. The wage hike was conditioned on the inclusion of \$5 billion in business tax breaks. The package was signed into law by then-President George W. Bush. With the business lobby warning that a minimum-wage hike would cripple hiring amid a jobs crisis, the Harkin-Miller bill has little chance of moving through the GOP-controlled House. But Pelosi and the Democrats are hoping the combination of soaring Wall Street gains and middle-class wage stagnation will resonate with voters. "When we increased it in 2007 ... it was the first time it had been increased in 11 years," Pelosi said. "It's time for it to be increased again."

### GPT-4V:

The text presented is a political news article that appears to be reporting on former House Minority Leader Nancy Pelosi's statements regarding minimum wage in the United States. This text refers to several factual and historical details which could potentially be verified, such as Pelosi's position on wage increases, the stock market performance, legislative proposals, and past actions by Congress and the President.

Here are some key points that could be cross-checked against reliable sources up to April 2023 to determine the veracity of this article:

1. Nancy Pelosi's Position: Nancy Pelosi has been a consistent advocate for increasing the minimum wage, so this statement aligns with her known policy positions.
2. Historical Stock Market Performance: The specific record-high levels of the stock market mentioned (Dow Jones topping 14,200) can be checked against historical stock market data.
3. Legislation Proposed: The legislation by Senator Harkin and Representative George Miller to raise the minimum wage could be verified through congressional records.
4. President Obama's Position: President Obama's advocacy for a \$9 minimum wage was indeed a part of his policy platform, and his State of the Union address would reflect this.
5. Minimum Wage History: Congress did pass a minimum wage hike in 2007, which was signed into law by President George W. Bush, as part of a larger bill.
6. Economic Context: Claims about wage stagnation, the unemployment rate, and corporate profits could be cross-checked with economic data from reputable sources like the Bureau of Labor Statistics or economic research institutes.
7. Business Lobby's Opposition: It is common for business groups to oppose minimum wage hikes due to concerns about their impact on hiring and profitability, so this claim would be consistent with typical lobbying patterns.

Given the consistency of the statements with Pelosi's known positions and historical context, and assuming no contradictory evidence has emerged since my last update in April 2023, it is plausible that the news article is accurate.

Figure 19: Qualitative results on cross-referencing from broad information spectrum. GPT-4V primarily leverages various related data for fake news identification. The components that are related to cross-referencing are highlighted. Refer to Section 2.3 for detailed discussions.

## 2.4 Demographic Inference

### 2.4.1 Task Setting and Preliminary Quantitative Results

Multimodal gender identification seeks to determine an individual’s gender through various modalities such as text, images, and videos linked to them [90, 89, 101, 77]. Social media provides these multimodal resources for profiling each user. LMMs have come forward as zero-shot predictors for gender identification using social media content. LMMs integrate complementary features for a robust estimate and have enhanced text comprehension capabilities. As shown in Figures 20-23, whether it is posts explicitly displaying gender or those requiring inference of implied gender, LMMs predict gender accurately. To assess GPT-4V in gender inference, we utilize the PAN18 [69] user profile dataset, which includes images and conversational text shared by Twitter users on social media. We select paired image-text examples and use the prompt: “*This image is associated with the following caption: ‘{caption}’. Is the user likely to be male or female?*” as input for GPT-4.

To conduct quantitative experiments, our research utilizes PAN18 [69], curated in Arabic, English, and Spanish, involving conversational texts paired with user-shared images. This data is divided into two gender categories: female and male. For each of the three language-specific datasets, we randomly select 500 samples from PAN18. In the preliminary evaluation, GPT-4V achieves accuracy of 70.0%, 78.8%, and 76.2% in Arabic, Spanish, and English, respectively.

### 2.4.2 Gender Clue Analysis in Textual Narratives

Due to the inherent limitations and characteristics of language, a collection of texts in different languages may convey almost identical contexts globally but can have slight discrepancies or ambiguities locally. This issue becomes critical when designing predictors requiring binary decisions, like gender identification, where nuanced features are essential for accurate estimation. It is important to clarify that this is not solely a design flaw of language models but also a limitation of cross-linguistic understanding. For example, in Figure 20, gender identification is straightforward in English and Chinese Twitter posts where personal pronouns have gender implications, as in the English post “*My love is mine, he enchanted me.*” In contrast, in Turkish and Arabic, GPT-4V is not able to determine gender because pronouns like “*o*” in the Turkish post “*Sevgilim benim, o beni büyüledi*” are gender-neutral, similar to the singular “*they*” in English, which can refer to a person of any gender without revealing it. As shown in Figure 21, GPT-4V can accurately predict a user’s gender from posts in English, Spanish, and Arabic. However, in a Chinese context, GPT-4V may incorrectly assume that a post about parental leave — a topic whose expression and common understanding can vary due to differing national policies — is exclusively by female authors.

### 2.4.3 Ambiguous Signal Interpretation for Gender Prediction

Gender identification is a traditional prediction task in social media, where traditional methods struggle to effectively leverage the multimodal resources available in this domain. Supported by well-trained LMMs, such as GPT-4V, it is expected to jointly learn and integrate knowledge from both image and text interactions. To test this, we conduct a qualitative ablation study on GPT-4V with and without multi-modal input in the gender identification task. This involves examining whether images only, text only, or a combination of both are used as inputs for GPT-4V. Our findings, as illustrated in Figure 22, using text alone without images leads to errors, but the accuracy improves when both are used. However, it is important to note that all these users could actually be of the opposite gender, and the addition of image and text inputs might even strengthen GPT-4V’s biases towards these groups.

### 2.4.4 Acknowledgment for Diversity and Complexity of Gender Identity

The cultural identities of diverse groups and the evolving perceptions of gender across time and space have led to the diversity and complexity of gender. Even language models trained on vast Internet data, like GPT-4, struggle to deeply understand and analyze such diverse user genders from multimodal social media. A typical example is in Figure 23, a boy whose true gender is male was dressed like a female. Considering different cultural contexts, gender-specific traits vary. Furthermore, in Figure 23, makeup items are not exclusively female. In these examples, GPT-4V is able to acknowledge the diversity and complexity of gender identity.

## Gender Clue Analysis in Textual Narratives (1)

### Prompt (Arabic):

This image is associated with the following caption: "حبيبي هو ملكتي هو سحرني ❤️❤️". Is the user likely to be male or female?

### GPT-4V:

The caption "حبيبي هو ملكتي هو سحرني ❤️❤️", " can be translated to "My beloved is the one who owns me, the one who enchanted me," with a romantic connotation. Such a statement is typically indicative of affectionate feelings towards someone else and does not strongly suggest the gender of the person writing it. In many cultures, expressions of love and affection are not exclusive to any particular gender; both men and women may use such language to describe their feelings. Therefore, based on this caption alone, it is not possible to accurately determine the gender of the user.

### Prompt (English):

This image is associated with the following caption: "My love is mine, he enchanted me ❤️❤️". Is the user likely to be male or female?

### GPT-4V:

The caption "My love is mine, he enchanted me ❤️❤️", suggests that the user is expressing affection for someone who has enchanted them and uses the pronoun "he" to refer to their love. Based on traditional gender roles and the use of language, it could be assumed that the user is likely female, expressing affection for a male. However, it's important to note that this is not definitive; individuals of any gender can use such language to refer to their loved ones.

### Prompt (Turkish):

This image is associated with the following caption: "Sevgilim benim, o beni büyüledi" Is the user likely to be male or female?

### GPT-4V:

The caption "Sevgilim benim, o beni büyüledi" is in Turkish and translates to "My lover, he/she enchanted me" in English. The phrase does not indicate the gender of the speaker. It's a general expression of affection someone could have for their partner. The gender of the user cannot be determined from this caption alone. As for the image, it shows two Starbucks tumblers, one matte black and the other with a glittery gold finish. These are just products and do not provide any information about the user's gender.

### Prompt (Chinese):

This image is associated with the following caption: "我的爱人属于我, 他让我着迷 ❤️❤️". Is the user likely to be male or female?

### GPT-4V:

The caption "我的爱人属于我, 他让我着迷 ❤️❤️" translates from Chinese to "My lover belongs to me, he fascinates me ❤️❤️". The use of "他" (he) indicates that the speaker's lover is male. As for the gender of the user, while it is not possible to determine with certainty without additional context, the phrase could suggest that the user is female, given that they are referring to a male lover. However, it's important to remember that this is not definitive, as the user could be of any gender and the statement could be made by anyone regardless of their own gender.

Figure 20: Qualitative results on gender clue analysis in textual narratives. GPT-4V tries to use gender clues in textual narratives for gender inference. The components that are related to gender clue analysis are highlighted. Refer to Section 2.4 for detailed discussions.

## Gender Clue Analysis in Textual Narratives (2)

### Prompt (English):

This image from this Twitter post is associated with the following caption: "Taking a moment from paternity leave to witness the vastness of the world. #PaternityLeave" Is the user likely to be male or female?

### GPT-4V:

The image you've provided shows the view from an airplane window, overlooking clouds, which is consistent with the caption about witnessing the vastness of the world. The association with the hashtag #PaternityLeave suggests the user is likely male, as "paternity leave" is specifically the time off that a father takes after the birth of his child to care for and bond with the newborn. This term is conventionally used to refer to fathers, whereas "maternity leave" is used for mothers. The use of this term implies that the person taking the leave is male and has recently become a father or is sharing the experience of a male partner.

### Prompt (Chinese):

This image from this Twitter post is associated with the following caption: "在产假中抽出一刻时间，感受世界的辽阔。#产假" Is the user likely to be male or female?

### GPT-4V:

The image associated with the caption "在产假中抽出一刻时间，感受世界的辽阔。#产假" translates to "Taking a moment during maternity leave to feel the vastness of the world. #MaternityLeave" suggests that the user is likely to be female. This is because "产假" refers to maternity leave, which is typically granted to women who are recovering from childbirth. The context of the caption indicates that the person is on maternity leave, which is a period of absence from work granted to a mother before and after giving birth.

### Prompt (Arabic):

This image from this Twitter post is associated with the following caption: "أخذ لحظة من إجازة الأبوة لأشهد اتساع العالم. #إجازة\_الأبوة" Is the user likely to be male or female?

### GPT-4V:

The caption in Arabic translates to "Taking a moment from paternity leave to witness the expansiveness of the world. #Paternity\_Leave". The use of the term "paternity leave" specifically refers to the time a father takes off from work after the birth of his child, which suggests that the user is likely to be male. The hashtag #إجازة\_الأبوة also reinforces this as it translates to "#Paternity\_Leave" in English. Paternity leave is typically granted to new fathers, which would indicate that the person posting is talking about their own experience as a father.

### Prompt (Spanish):

This image from this Twitter post is associated with the following caption: "Tomando un momento de mi baja por paternidad para testificar la inmensidad del mundo. BajaPorPaternidad" Is the user likely to be male or female?

### GPT-4V:

The caption in Spanish, "Tomando un momento de mi baja por paternidad para testificar la inmensidad del mundo. #BajaPorPaternidad," suggests that the user is likely male. The term "baja por paternidad" directly translates to "paternity leave," which is the period of leave that a father is entitled to take from work to care for his newborn child. This term is customarily used for fathers, as opposed to "baja por maternidad," which is used for mothers. Therefore, based on the terminology used, one would assume the user is male. The accompanying image of the view from an airplane window aligns with the sentiment of experiencing the grandeur of the world, a moment of reflection that the user appears to be sharing during his paternity leave.

Figure 21: Qualitative results on gender clue analysis in textual narratives. GPT-4V tries to use gender clues in textual narratives for gender inference. The components that are related to gender clue analysis are highlighted. Refer to Section 2.4 for detailed discussions.

## Ambiguous Signal Interpretation for Gender Prediction

### Prompt (Only Text):

The text of this Twitter post is:  
 "We're champion! 🏆 Honored to stand at the pinnacle of the world with these incredible teammates. This victory isn't just mine, it's a win for everyone who has supported us! Thank you for all the support and trust. We are the champions! 🎮💪  
 #ChampionSpeech #Esports #DreamsComeTrue" Is the user likely to be male or female?

### GPT-4V:

Based on the content of the tweet, it is difficult to definitively determine the gender of the user. The tweet is related to an esports victory, and the user is expressing gratitude and excitement towards their teammates and supporters. The use of hashtags like #ChampionSpeech and #Esports suggests that the user is likely an esports enthusiast or participant, which could be either male or female. However, without more context or information about the user's profile, it is not possible to confidently determine the gender of the user.

### Prompt (Only Image):

What is likely the gender of the Twitter author of this image?

### GPT-4V:

The Twitter author of this image is likely a woman, as the image features a group of women celebrating and holding a trophy.

### Prompt (Text + Image):

This image from this Twitter post is associated with the following caption: "We're champion! 🏆 Honored to stand at the pinnacle of the world with these incredible teammates. This victory isn't just mine, it's a win for everyone who has supported us! Thank you for all the support and trust. We are the champions! 🎮💪  
 #ChampionSpeech #Esports #DreamsComeTrue" Is the user likely to be male or female?

### GPT-4V:

The user is likely to be female. The reason for this conclusion is based on the image content, which shows a group of three women standing together, holding a trophy, and celebrating their victory. The context of the image, including the tweet caption, suggests that they are a team of female gamers who have achieved a significant accomplishment in their esports competition. The presence of the trophy and the celebratory atmosphere further supports the idea that these women are part of a female esports team.

### Prompt (Only Text):

The text of this Twitter post is:  
 "Immersed in the raw intensity of this epic war drama. Every frame, a painting; every scene, a burst of adrenaline. Proud to be a fan of a genre that honors the brave and tells tales of resilience. This is cinematic art at its finest. 🎬🗣️ #WarMovies  
 #CinematicMasterpiece #FilmBuff" Is the user likely to be male or female?

### GPT-4V:

It is not possible to definitively determine the gender of the user based on the content of the tweet alone. The tweet contains a positive review of a war movie, which could be appreciated by people of any gender.

### Prompt (Only Image):

What is likely the gender of the Twitter author of this image?

### GPT-4V:

The Twitter author of this image is likely a male, as the image shows a group of men in military uniforms, including a soldier holding a gun.

### Prompt (Text + Image):

This image from this Twitter post is associated with the following caption: "Immersed in the raw intensity of this epic war drama. Every frame, a painting; every scene, a burst of adrenaline. Proud to be a fan of a genre that honors the brave and tells tales of resilience. This is cinematic art at its finest. 🎬🗣️ #WarMovies  
 #CinematicMasterpiece #FilmBuff" Is the user likely to be male or female?

### GPT-4V:

The user is likely to be male. The reason for this assumption is that the image depicts a group of men in military uniforms, which suggests that the user might be interested in war movies and military-themed films. The presence of a gun in the image further supports this assumption, as it is a common element in war movies. Additionally, the user's use of the hashtag #FilmBuff implies that they are a fan of movies, which could be more commonly associated with male viewers. However, it is important to note that this is an assumption based on the visual content and hashtags, and the user's gender cannot be definitively determined.

Figure 22: Qualitative results on ambiguous signal interpretation. GPT-4V interprets ambiguous signals for gender inference. The components that are related to ambiguous signal interpretation are highlighted. Refer to Section 2.4 for detailed discussions.

## Acknowledgment for Diversity and Complexity of Gender Identity

### Prompt:

This image is associated with the following caption: "THE FACE | SUMMER MAKEUP GRWM / TRY ON FT. RIMMEL PRODUCTS". What is likely the gender of the author of this pair of image and text? This is for research purposes.

### GPT-4V:

The image shows makeup products, including foundation and powder, which are typically associated with female-targeted marketing in the beauty industry. However, it's important to note that makeup use is not exclusive to any gender, and individuals of any gender may use makeup for various reasons. The text references a "GRWM" which stands for "Get Ready With Me," a type of content often found in beauty and lifestyle communities where the author shares their makeup routine or the process of preparing for their day. These types of content are popular among all genders but have traditionally been more associated with female content creators.

Based on the cultural context that makeup is more commonly marketed towards women and the prevalence of female content creators in the beauty community sharing "GRWM" type content, one might infer that the author could likely be female. However, this is not definitive, and the actual gender of the author cannot be determined without more specific information. It is important to recognize that assumptions should not be made about individuals' gender based on the products they use or the content they create.

### Prompt:

This image is associated with the following caption: "This is a photo of me in a costume drama. Can you not tell my gender? 🤔" What is likely the gender of the author of this pair of image and text? This is for research purposes.

### GPT-4V:

The individual in the image is wearing what appears to be a costume and has a feminine appearance, with long hair styled in braids and wearing makeup that accentuates traditionally feminine features. The person is wearing what looks like a maid costume, which is commonly associated with female characters in costume dramas.

The caption suggests that the individual is in a costume and seems to playfully challenge the viewer to discern their gender. Given the visual cues presented in the image and the playful nature of the caption, it is reasonable to infer that the author of the text and subject of the photo is presenting themselves in a traditionally feminine manner, which suggests that the author could likely identify as female. However, without explicit confirmation, any assertion about gender remains an assumption.

Figure 23: Qualitative results on acknowledgement for diversity and complexity of gender identity. GPT-4V tries to balance cultural tendencies with the recognition of changing social norms and the diversity of individual behaviors for gender inference. The components that are related to such considerations are highlighted. Refer to Section 2.4 for detailed discussions.

## 2.5 Ideology Detection

### 2.5.1 Task Setting and Preliminary Quantitative Results

Ideology reflects the political orientations or biases of individuals, frequently characterized as left-wing or right-wing perspectives [15, 12, 66, 46]. Nowadays, the ideological division has become significantly more pronounced [78, 46, 47, 76, 62, 61], and it exerts a notable influence on daily communication including those on social media [83]. The process of ideology detection is designed to detect an author’s political stance from their generated content. Prior studies [41, 57] have focused on textual analysis to decode the strategic communication deployed by various ideological groups, often overlooking the deliberate selection of images by authors to reinforce their message. In contrast, multimodal ideology detection predicts political leanings by examining both visual and textual elements [46, 82, 67]. The strategic use of images to underscore specific narratives and sway audience perception adds complexity to this task.

To quantitatively assess GPT-4V’s capability for multimodal ideology detection, we present it with posts comprising both images and accompanying text. The prompt is “*This image is associated with the following caption: ‘{caption}’. What is the ideology of the author of this pair of image and text? Left, Center, or Right? This is for research purposes.*” We use the UPPAM dataset [57] for evaluation. UPPAM [57] collects partisan-related tweets of U.S. congressional legislators. In the preliminary evaluation, GPT-4V achieves an accuracy of 60.4% on a randomly selected sample of 500 posts. Figures 24-31 display qualitative sample outcomes. We find that GPT-4V predominantly uses textual data in its ideology assessments, demonstrates a remarkable grasp of political domain knowledge, and detects subtle cues in the imagery employed.

### 2.5.2 Text-Centric Political Ideology Assessment

Overall, GPT-4V predominantly relies on the textual component, which can be found in the original caption or within the image itself, to execute ideology detection. This reliance stems from the model’s capacity to link textual data to established policies and ideological stances, as illustrated in Figure 24. For instance, it elucidates the significance of hashtags and specific elements within captions, offering insights into their associations with left-leaning or right-leaning ideologies [54, 55, 56]. Besides, social media posts related to politics often use a variety of images such as portraits of politicians, event photos, charts, campaign material, and images with quotes from politicians, activists, or influential figures to convey messages, support arguments, and engage with the audience. During our experiments, we have discovered that these diverse types of images exhibit varying degrees of utility. Figures 25-28 also show example results of different types of images in political social media posts.

### 2.5.3 Comprehensive Political Domain Knowledge

As shown in Figures 25-28, we find that GPT-4V is encompassed with an extensive repository of information relevant to the political sphere, containing detailed insights into an array of policy advocacies and the profiles of key political figures. It appears that this political domain knowledge includes, but is not limited to, historical and contemporary data on legislative processes, electoral systems, government structures, and the various ideological frameworks that underpin political thought and action [75, 80]. Relying on the recognition of historical traces of different ideologies on specific policies or events, *e.g.*, *Obamacare* and *Fair Pay Act* in Figure 25, GPT-4V can deduce the underlying political ideologies from tweets that discuss the same or related topics. Furthermore, GPT-4V demonstrates a sophisticated ability to contextualize data-driven visual content—like charts and maps—into its ideology classification processes, as evidenced in Figure 28. This joint understanding of image and text reaffirms the earlier articulated insights, showcasing GPT-4V’s adeptness at navigating the multimodal dimensions of political analysis.

### 2.5.4 Ideological Deductions from Visual Subtleties

As the framing theory presents [5, 19, 56], ideological expressions are often subtle and subject to interpretation. They may not be explicitly stated but rather implied through certain visual symbols. While our discussions thus far indicate GPT-4V’s primary reliance on text for analysis, the extent of its employment of visual data remains an area of interest. To probe further, we challenge the model with an additional prompt in cases where initial responses were text-centric. We ask GPT-4V, “*What does the visual content contribute to your answer?*” as illustrated in Figures 29, 30, and 31. We

observe that GPT-4V is capable of discerning the authors’ intent in emphasizing particular subjects in their visuals, namely, Black individuals and refugee children in Figures 29 and 31, used to subtly shape the audience’s perception [65]. In essence, GPT-4V effectively identifies and understands the strategic framing employed in visual content. This inquiry reveals GPT-4V’s capability to incorporate subtle visual indicators, thus enriching its interpretation of ideological stances.

During the evaluation process, we discovered that the current settings of ideology detection may not adequately reflect the capability of GPT-4V. Typically, when presented with tweets expressing humanitarian concern or advocating for health measures, GPT-4V claims that this kind of opinion is universal across the political spectrum and thus it is not feasible to determine the associated ideology. This highlights that using the author-level labels as post-level labels can introduce noise in the evaluation of ideology detection. Therefore, we contend that, for a more fair assessment of visual language models’ abilities in multimodal ideology detection, more caution should be taken when constructing datasets. On one hand, filtering out samples exhibiting shared viewpoints can serve as a simple solution. On the other hand, we can reformulate the tasks by aggregating multiple text-image pairs to provide the models with more comprehensive information.

## Text-centric Political Ideology Assessment

### Prompt:

This image is associated with the following caption: "Talked with Colusa High students about #DREAMers, #CIR, #Ag & bipartisanship. HTTPURL #Latism #NorCal". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The image depicts an adult, likely a speaker or visitor, in the center surrounded by a large group of high school students in a classroom or library setting. The context provided by the text mentions discussing topics with students including "#DREAMers" and "#CIR" (which likely refers to Comprehensive Immigration Reform), as well as agriculture ("#Ag") and bipartisanship.

The mention of "DREAMers" refers to individuals brought to the United States as children without legal permission, who are the subject of the DREAM Act legislation aimed at providing them with a path to legal status. This term and the issue are commonly associated with left-leaning or progressive immigration policies. Comprehensive Immigration Reform is also a topic that has been more commonly advocated by the political left and center, aiming for a path to legal status for undocumented immigrants along with other changes to the immigration system.

The use of the hashtag "#Latism" suggests a focus on Latino issues and the mention of bipartisanship implies an interest in working across political divides to achieve legislative goals.

Based on the discussion topics, the author of the text likely leans towards the center or left ideologically, particularly given the progressive stance on immigration reform and attention to issues important to the Latino community. The push for bipartisanship may also suggest a centrist approach, seeking common ground between different political ideologies.

### Prompt:

This image is associated with the following caption: "The #Agriculture community understands that water infrastructure bill #WRRDA is crucial for jobs -@USER #Ag". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The image features a cargo ship with text overlay that reads "DO YOU SUPPORT GROWTH JOBS TRADE WE DO. #WRRDA". The hashtag "#WRRDA" refers to the Water Resources Reform and Development Act, which is a U.S. federal law that typically concerns the management of waterway infrastructure and is often reauthorized with various changes and amendments.

The caption speaks positively about the water infrastructure bill and notes its importance for jobs within the agriculture community. Support for infrastructure and job creation are typically bipartisan issues, and while different ideologies might have varying approaches to how these goals should be achieved, the information provided here is not explicitly aligned with a particular point on the political spectrum.

Therefore, without additional context regarding the stance on how these infrastructure projects should be funded, managed, or what specific provisions are included in the bill, it's not possible to determine the ideology of the author solely from this image and caption.

Figure 24: Qualitative results on text-centric assessment. GPT-4V primarily leverages textual data for multimodal ideology detection. The components that are related to text-centric assessment are highlighted. Refer to Section 2.5 for detailed discussions.

## Comprehensive Political Domain Knowledge (1)

### Prompt:

This image is associated with the following caption: "Proud to have worked w/ Lilly #Ledbetter on #paycheckfairness & ensuring equal pay for equal work". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The image shows two individuals seated in what appears to be a discussion setting, perhaps for a television interview or discussion panel. Without specific knowledge of the individuals or the context beyond the caption provided, one can infer that the author of the caption is advocating for paycheck fairness and equal pay for equal work, which are typically associated with left-leaning or progressive ideologies that prioritize social equality and workers' rights.

However, advocacy for equal pay has at times seen bipartisan support and can be championed by individuals across the political spectrum. In the context of American politics, the term "paycheck fairness" and the mention of Lilly Ledbetter connect to the Lilly Ledbetter Fair Pay Act, which was the first piece of legislation signed by President Barack Obama in 2009. The act is aimed at addressing pay discrimination. The support of this act and the associated ideas of equal pay for equal work can suggest a leftist or center-left position, as these issues are more commonly emphasized by those political ideologies. However, without more context or specific policy positions, assigning a definitive point on the ideological spectrum to the author could be overly simplistic or inaccurate.

### Prompt:

This image is associated with the following caption: "Would you have voted to fund Obamacare? John Cornyn did.". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### Prompt:

This image is associated with the following caption: "As the grandson of #Basque immigrants, I was proud to welcome President Urkullu to the U.S.: HTTPURL". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The image depicts three individuals, two men and one woman, in what appears to be an office or formal setting. The man in the center, who is presumed to be President Urkullu based on the caption, is holding a document and showing it to the other man, while the woman observes. There are no explicit ideological markers in the image itself.

The caption mentions pride in welcoming President Urkullu to the U.S. and references the author's Basque immigrant heritage. President Urkullu is likely Iñigo Urkullu, the Lehendakari (President) of the Basque Country in Spain. The text does not provide direct information about the author's political ideology. It is a statement of cultural pride and diplomatic hospitality without explicit partisan or ideological cues. If the author's political ideology were to be inferred from this statement alone, it would not be possible without additional context or knowledge about the author's political actions or affiliations.

### GPT-4V:

The image contains text critical of John Cornyn for voting to fund Obamacare, with the implication that this action is negative. The term "Obamacare" is the colloquial name for the Affordable Care Act (ACA), a health care reform law enacted during the presidency of Barack Obama.

The critical stance on funding the ACA, along with the use of the individual's name as a political statement, suggests that the author of the image likely aligns with right-wing or conservative ideology, which has generally been opposed to the ACA. The message is designed to appeal to voters who are against the ACA, a common position in conservative circles.

Figure 25: Qualitative results on comprehensive political domain knowledge. In assessing a range of images in the political domains, GPT-4V demonstrates its extensive knowledge of political contexts, enabling it to accurately classify the ideological leanings of the content creators. The components that are related to political domain knowledge are highlighted. Refer to Section 2.5 for detailed discussions.

## Comprehensive Political Domain Knowledge (2)

### Prompt:

This image is associated with the following caption: "RT @USER If the #IRS targets Americans based on political beliefs what will this mean under #Obamacare?". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The image displays a complex flowchart with a headline "Your New Health Care System" and a zoomed-in section highlighting the IRS (Internal Revenue Service). There are two questions presented: "IRS targets Americans based on their political beliefs?" and "What will this mean under ObamaCare?" The use of "#IRS" and "#Obamacare" in the accompanying text suggests a discussion about the Affordable Care Act, commonly known as Obamacare.

The tone of the caption and the emphasis on concerns about the IRS targeting individuals based on political beliefs, combined with a question about implications under the Affordable Care Act, could suggest a critical stance toward the IRS's actions and possibly the Affordable Care Act itself. This type of critique has been more commonly associated with conservative or right-leaning viewpoints, especially given the historical context where there were allegations that the IRS had improperly targeted political groups.

Therefore, the caption, coupled with the tone of the image, which seems to cast the health care system in a complicated and perhaps negative light, would suggest the author may lean towards a right-wing ideological perspective. However, without additional context or understanding the author's broader views, this assessment is based solely on the content presented in this specific post.

### Prompt:

This image is associated with the following caption: "Under #ObamaCare in #TN04, potential premium increases from 49-54% in individual market & 35% in small group market". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The image contains a headline stating, "How much could Obamacare cost YOU?" followed by details on potential premium increases in various states due to the Affordable Care Act (ACA), commonly referred to as Obamacare. The caption specifically mentions "#ObamaCare" and provides information about potential premium increases in Tennessee's fourth congressional district, suggesting significant cost impacts to individuals and small businesses.

The use of capitalized "YOU" and the focus on the potential negative financial impact of the ACA are indicative of a critical view of the legislation. Such a perspective is typically associated with a conservative or right-wing ideology, which historically has opposed the ACA on the grounds of its potential to raise insurance premiums and its mandate for individuals to purchase insurance. The text and imagery convey concerns about cost, which aligns with right-leaning arguments that often emphasize economic burdens and personal financial impact.

Determining the exact ideological stance of the author, based on a single image and caption, is not definitive without more context. However, based on the content presented, the author appears to be expressing a viewpoint that is critical of the ACA, suggesting a right-leaning or conservative position.

Figure 26: Qualitative results on comprehensive political domain knowledge. In assessing a range of images in the political domains, GPT-4V demonstrates its extensive knowledge of political contexts, enabling it to accurately classify the ideological leanings of the content creators. The components that are related to political domain knowledge are highlighted. Refer to Section 2.5 for detailed discussions.

### Comprehensive Political Domain Knowledge (3)

#### Prompt:

This image is associated with the following caption: "Cornyn voted twice in 2013 to fund Obamacare. The only time Cornyn has ever stood up to Obama is to shake his hand." What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

#### GPT-4V:

The image depicts two politicians shaking hands, one of whom is former President Barack Obama. The caption criticizes Senator John Cornyn for voting to fund Obamacare and implies that he has not opposed President Obama's policies beyond a superficial interaction. This critique of Senator Cornyn for not sufficiently opposing Obamacare, coupled with the dismissive remark about merely shaking hands with President Obama, is indicative of rhetoric often used by the right, particularly the more conservative elements who opposed the Affordable Care Act (Obamacare). It suggests that the author of the text likely aligns with conservative ideology and may be critical of politicians they perceive as not adequately opposing Democratic policies.

#### Prompt:

This image is associated with the following caption: "It is alarming how out of touch Republicans are about women's health. When is #GOP going to focus on jobs? #HR1797". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

#### Prompt:

This image is associated with the following caption: "We need a fair trade deal - not 'free trade' of #TPP which undermines #BuyAmerica policies." What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

#### GPT-4V:

The image shows a screenshot from C-SPAN featuring Rep. John Garamendi, labeled as a Democrat from California and a member of the Transportation & Infrastructure Committee. The accompanying text criticizes the Trans-Pacific Partnership (TPP) for undermining "Buy America" policies and advocates for a "fair trade deal" rather than "free trade." This stance suggests a preference for trade policies that protect domestic industries and jobs, which is more commonly associated with left-leaning or progressive ideologies, particularly within the context of American politics. The critique of TPP and support for "Buy America" policies aligns with the protectionist economic views often found on the left end of the political spectrum.

#### GPT-4V:

The image presented is a political message posing the question, "Who should be in charge of a woman's private health choices?" with the options "A woman and her doctor" or "Politicians in Washington." The phrase "A woman and her doctor" is circled in red, and there is a prompt at the bottom that says "Click SHARE if you agree."

The caption criticizes Republicans for being out of touch with women's health issues and queries when the GOP (Grand Old Party, a common nickname for the Republican Party) will shift focus to jobs, mentioning "#HR1797," which presumably refers to a specific piece of legislation related to women's health issues.

The content in this image and the accompanying caption suggest a liberal or left-leaning ideology. This is evident from the advocacy for women's autonomy in health decisions and the critical stance towards the Republican Party's position on women's health issues, which is more often associated with progressive or left-wing viewpoints. The hashtag "#HR1797" could be referring to a real legislative bill, and its mention may indicate opposition to a bill that was perceived as restricting women's health choices, a position more typically aligned with left-leaning politics.

Figure 27: Qualitative results on comprehensive political domain knowledge. In assessing a range of images in the political domains, GPT-4V demonstrates its extensive knowledge of political contexts, enabling it to accurately classify the ideological leanings of the content creators. The components that are related to political domain knowledge are highlighted. Refer to Section 2.5 for detailed discussions.

## Comprehensive Political Domain Knowledge (4)

### Prompt:

This image is associated with the following caption: "US businesses add #jobs for 35th straight month. At minimum must replace #sequester to continue growth". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

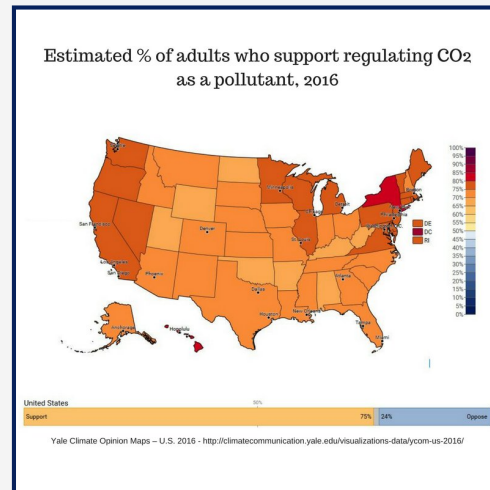

The image shows a bar graph labeled "JOB CREATION" with a timeline from December 2007 to January 2013. It illustrates private sector monthly job change in the thousands. There is a clear division at the point where "President Obama Takes Office," with red bars showing job losses before this point, and blue bars showing job gains after. The accompanying caption suggests a positive view of job growth under the Obama administration and expresses concern about the impact of the sequester on this growth.

Given the information presented and the positive reference to job creation under a Democratic president, the author of the text appears to be supportive of policies that were associated with the Obama administration. The mention of replacing the sequester to continue growth is also a position more commonly associated with left-leaning or center-left ideologies in the United States, which tend to favor governmental intervention in the economy to stimulate growth and avoid austerity measures that could potentially harm economic recovery.

The "sequester" refers to automatic spending cuts to federal government spending in particular categories that were triggered by the Budget Control Act of 2011. Opposition to the sequester and its potential negative impact on job growth aligns with a perspective that generally favors active government spending on economic stimulus, which is more associated with liberal or progressive ideologies. However, without more specific information, it's not possible to categorically label the author's ideology, as economic issues can sometimes transcend traditional political boundaries.

### Prompt:

This image is associated with the following caption: "Refusing to #ActonClimate comes with costs and consequences to our environment, public health, and our economy. #DefendScience". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The caption accompanying the image supports action on climate change, defends science, and suggests that there are negative consequences to the environment, public health, and the economy if such action is not taken. These positions are typically associated with a left-leaning or progressive ideology, which often emphasizes the importance of addressing climate change through regulation and other government actions. The map itself shows a high percentage of support for regulating CO2 across most states, which could be used to argue for broader national support for climate action, a position that is more commonly supported by the left end of the political spectrum.

Figure 28: Qualitative results on comprehensive political domain knowledge. GPT-4V analyzes and links graphical data to accompanying text. Using this integrated information, it determines the ideological orientation. The components that are related to political domain knowledge and graphical data analysis are highlighted. Refer to Section 2.5 for detailed discussions.

## Ideological Deductions from Vision Subtleties (1)

### Prompt:

This image is associated with the following caption: "Demanded that Congress overturn #SCOTUS decision on #VotingRightsAct at St. James AME Church, Newark rally. #VRA #NJ". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The text accompanying the image references a demand for Congress to overturn a Supreme Court decision on the Voting Rights Act at a rally held in St. James AME Church in Newark. The hashtags #SCOTUS (Supreme Court of the United States), #VotingRightsAct, #VRA (Voting Rights Act), and #NJ (New Jersey) are used.

Demanding that Congress overturn a Supreme Court decision regarding the Voting Rights Act suggests a stance that is protective of voting rights, which is often associated with a liberal or left-leaning ideology. This issue is particularly associated with the Democratic Party and left-leaning groups who have historically been vocal in advocating for robust voter protection laws. The emphasis on the Voting Rights Act, which is designed to prevent racial discrimination in voting, is a key issue for many on the political left.

### Follow-up Prompt:

What does the visual content contribute to your answer?

### GPT-4V:

The visual content shows a group of individuals gathered in a church setting. There is a cross visible in the background, indicating that the event is taking place in a religious setting, which could suggest the involvement of a faith-based community in the advocacy effort. Churches, especially in African American communities, have historically played a significant role in civil rights movements, including voting rights.

The diverse group of people, including both men and women of different races, gathered in what seems to be a unified cause, adds a visual representation of community and collective action, which often aligns with grassroots activism. This type of activism is commonly associated with left-leaning or progressive movements that emphasize social justice and collective efforts to effect change.

Overall, the church setting and the diverse group of individuals underscore a community-driven response to a political issue, supporting the interpretation that the author of the text advocates for a left-leaning perspective, particularly one focused on social justice and community activism.

Figure 29: Qualitative results on ideological deductions from vision subtleties. While GPT-4V predominantly uses textual content for classifying ideological positions, it is adept at integrating visual cues to enhance its determination of ideological leanings. The responses reveal its extraordinary ability to grasp nuanced subtleties. The components that are related to visual pattern incorporation are highlighted. Refer to Section 2.5 for detailed discussions.

## Ideological Deductions from Vision Subtleties (2)

### Prompt:

This image is associated with the following caption: "Today the House passed legislation to provide our troops the largest pay raise in 8 years while increasing training and supplies. #NDAA strengthens defense spending as our military ensures readiness. Read more on the impacts to North Dakota here: [HTTPURL](#)". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The text associated with this image discusses legislative support for the military, mentioning a significant pay raise for troops and an increase in defense spending to ensure military readiness. These points are generally more aligned with a right-leaning or conservative ideology, which often prioritizes strong defense spending and military support. The message focuses on national defense and the welfare of military personnel, which are common themes in conservative platforms. Additionally, mentioning the impact on a specific state (North Dakota) could be indicative of addressing local constituents, which is a common practice among all political representatives regardless of ideology.

### Follow-up Prompt:

What does the visual content contribute to your answer?

### GPT-4V:

The visual content in the image shows a close-up of a military uniform with an American flag patch, which reinforces the themes in the associated text. The focus on the uniform and the flag can evoke a sense of patriotism and national pride, which are often emphasized in conservative rhetoric, particularly when discussing the military and defense. It visually underscores the message of support for the military, suggesting respect for those in service. This visual aligns with the message about increasing military pay and readiness, supporting the assessment that the author's ideology may lean to the right.

Figure 30: Qualitative results on ideological deductions from vision subtleties. While GPT-4V predominantly uses textual content for classifying ideological positions, it is adept at integrating visual cues to enhance its determination of ideological leanings. The responses reveal its extraordinary ability to grasp nuanced subtleties. The components that are related to visual pattern incorporation are highlighted. Refer to Section 2.5 for detailed discussions.

### Ideological Deductions from Vision Subtleties (3)

#### Prompt:

This image is associated with the following caption: "Solution to Syrian Refugee Crisis is to destroy ISIS & open path to new leadership in Syria. HTTPURL". What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

#### GPT-4V:

The caption suggests a position on foreign policy, specifically regarding the Syrian refugee crisis and the conflict involving ISIS. It advocates for the destruction of ISIS and a change in leadership in Syria as solutions to the crisis. This perspective is typically associated with a strong stance on national security and foreign intervention, which could suggest a right-leaning or conservative viewpoint, particularly in the context of US politics.

Please note that while the statement proposes a clear policy direction, the association of such views with a specific part of the political spectrum can vary by country and the individual's broader political ideology. Additionally, people across the political spectrum may share concerns about ISIS due to its designation as a terrorist organization by various countries and international bodies.

#### Follow-up Prompt:

What does the visual content contribute to your answer?

#### GPT-4V:

The visual content in the image shows a young child standing in what appears to be a refugee camp setting. The child is holding a toy and has a somber expression, which can evoke empathy and highlight the human aspect of the refugee crisis. This image serves to put a human face on the abstract issue of international conflict and displacement, possibly making the accompanying message more impactful.

However, the visual content does not directly inform the ideological leaning of the author of the text. It is the content of the caption, suggesting a specific policy approach to the Syrian crisis, that allows for the inference about the author's potential ideological stance, not the image itself. Images like this are often used by individuals across the political spectrum to emphasize different narratives or policy approaches to humanitarian crises.

Figure 31: Qualitative results on ideological deductions from vision subtleties. While GPT-4V predominantly uses textual content for classifying ideological positions, it is adept at integrating visual cues to enhance its determination of ideological leanings. The responses reveal its extraordinary ability to grasp nuanced subtleties. The components that are related to visual pattern incorporation are highlighted. Refer to Section 2.5 for detailed discussions.

### 3 Challenges and Opportunities

#### 3.1 Multilingual Social Multimedia Understanding

Different cultures may convey different emotions with the same gestures. GPT-4V is a large-scale multimodal model that is widely used in different countries and can serve multilingual languages (e.g., English, Chinese, Japanese, and Korean) as input. Existing methods [96] are heavily based on the English dataset, therefore, these methods struggle to generalize to analyze social media content in other languages. The release of the GPT-4V raises great interest in whether the GPT-4V can understand the cultural and social background contained in different languages. As shown in Figures 32 and 33, first, we observe that the GPT-4V is limited in identifying the Chinese, Japanese, and Korean OCR text [71, 35] (light blue background text) in the given memes, which greatly affects the understanding of multilingual memes. To address this issue, we provide the corresponding OCR text into the prompt. With the inclusion of accurate OCR data, we observe that GPT-4V becomes more adept at contextual analysis, particularly in the context of the sociocultural background (represented by yellow-background text).

For example, consider Chinese internet celebrity Jiaqi Li’s use of emoticons, which are widely recognized for their straightforward and occasionally controversial style. Additionally, phrases like “Why is it so expensive?” in the image are often used humorously to express dissatisfaction with rising prices or to convey ironic commentary on hard work. However, our investigation reveals that GPT-4V lacks a comprehensive understanding of East Asian culture. An illustrative example can be seen in the upper-right corner of Figure 33, where an image represents a widely circulated meme within the Japanese online community 5ch. The term “cheese beef bowl” and the associated illustration have evolved into a template for depicting characters with minimal presence, often used to portray slightly eccentric or shadowy individuals. GPT-4V’s inability to grasp the nuances of otaku culture within Japanese society may lead to inaccurate judgments in this context. In general, GPT-4V’s analysis of East Asian social media falls short of expectations. It tends to apply English-centric thinking and relies on English translations for its analyses, a consequence of its predominantly English training corpus. Moving forward, a key challenge lies in enhancing GPT-4V’s capacity to comprehend the culture and context of multilingual languages.

#### 3.2 Generalization of GPT-4V for Emerging Trends

The extent to which GPT-4V can adapt to emerging trends and fresh content on social media platforms holds considerable intrigue. In order to thoroughly assess this adaptability, we have deliberately curated a selection of examples from April 2023 onwards, as visualized in Figures 34 through 37. Our investigation reveals that the performance of GPT-4V in this context is intricately tied to the dynamic nature and frequency of changes in the subject matter. Figure 34 presents an instance where GPT-4V has not been updated with relevant knowledge and is thus unable to grasp the high-level semantic information conveyed in the post. In Figure 35, GPT-4V’s prediction is erroneous, largely due to the recent internal disagreements within the Democratic Party regarding the Israel-Hamas War. As our observations indicate, GPT-4V infers ideological stances based on how statements align with the traditional ideological positions of the respective parties. Given the lack of updated information, it results in an incorrect prediction. On the other hand, Figures 36 and 37 exemplify scenarios where GPT-4V’s classification is accurate. These posts correspond to events with a relatively stable context, allowing GPT-4V to provide correct interpretations. In essence, our findings underscore the nuanced relationship between GPT-4V’s adaptability and the evolving nature of the subject matter it encounters on social media platforms.

#### 3.3 Hallucination from Out-dated Knowledge

During our assessment of fake news, we find the current GPT-4V can generate hallucinations due to an outdated knowledge base [16]. On the left-hand side of Figure 38, we ask GPT-4V if “Messi won the world cup,” and “how many world cup finals has Kylian Mbappé reached.” On the right-hand side, we ask GPT-4V “release date of OpenAI’s model text-davinci-003” and “if ChatGPT allows plugins.” The answer from GPT-4V is not the latest, even though it can recognize the entities and understand the context. It implies that GPT-4V has not updated its knowledge base. Therefore, GPT-4V can generate hallucinations with its outdated knowledge base, and how to update its knowledge needs further study.

## Multilingual Social Multimedia Understanding (1)

### Prompt:

Do you understand this meme?

### GPT-4V:

The image you've provided appears to be a meme, consisting of screenshots from a movie or a television series with overlaid text, which is a typical format used to create humorous or satirical content. The text is in Chinese and relates to the expressions and actions depicted by the characters in the images.

For a more precise explanation, I would need to translate and understand the text, but without additional context, my interpretation may be limited as memes often rely on nuanced cultural references or internet humor that may not be fully captured through translation alone. If you'd like, you can provide the text, and I can attempt to translate and explain it for you.

### GPT-4V:

This image appears to show a character with a distorted face, accompanied by a caption in Chinese. The text in the meme reads "头晕效应能引发的震撼," which translates to "The shock that can be triggered by the dizzying effect." The image seems to be a play on the visual effect of dizziness or confusion, represented by the blurred or smeared face of the character, suggesting a moment of overwhelming realization or confusion. This kind of image is often used to depict someone being metaphorically 'shaken' by a sudden understanding or a confusing situation.

It's worth noting that without additional context, such as the source of the image or the specific situation it is referencing, it's not possible to provide a comprehensive interpretation of the meme. These types of memes often rely on specific cultural knowledge or internet subculture familiarity for their full meaning to be understood.

### GPT-4V:

This comic strip meme typically features a sequence where someone proposes something absurd or illogical, which is met with a reasonable or factual counter-argument that frustrates the first person, often to the point of rage or irrational behavior.

In the given image, the text is in Chinese. From the structure of the meme, it seems that the first panel shows someone confidently presenting an idea or statement. In the second panel, others respond with logical or factual comments. The third panel then depicts the initial person becoming enraged by the responses, often reacting in an exaggerated or humorous way. The last panel often shows a consequence or an exaggerated depiction of the initial person's overreaction.

For a precise explanation of the content and to understand the joke or context behind it, the text would need to be translated. If you would like me to translate and interpret the Chinese text, please let me know.

Figure 32: Qualitative results on multilingual social multimedia understanding. The components that are related to multimedia slang understanding and OCR recognition are highlighted. Refer to Section 3.1 for detailed discussions.

## Multilingual Social Multimedia Understanding (2)

### Prompt:

Do you understand this meme?

### GPT-4V:

The image you've shared includes text in Chinese that says "明白了" (míng bái le), which translates to "I understand" or "Got it" in English. The meme typically features a person who looks puzzled or is having an "aha" moment, which would suggest that they have just understood something that was likely confusing or complex.

The man in the picture has an expression that seems to fit the text—it looks as if something has just dawned on him, which is likely the source of humor for the meme, especially if used in a context where understanding something might be unexpected or a long time coming.

### Follow-up Prompt:

图中人物是网红人物李佳琦，图中文字是“哪李贵了”：李佳琦直播间内一消费者说某79块钱0.08g的眉笔越来越贵，李佳琦表示“哪里贵了，你觉得贵你应该反思自己有没有努力工作涨工资”。你明白了吗？

### GPT-4V:

在这种情况下，这张图片上的文字“哪里贵了”似乎是在引用李佳琦的一段话。从您提供的描述来看，李佳琦在直播时回应消费者对一款眉笔价格的质疑，他的回答可能是在暗示如果消费者觉得价格贵，应该考虑自己是否有努力工作以获得更高的收入，而不是抱怨产品价格。

这句话在社交媒体上可能因其直白甚至带有些许争议的风格而被广泛传播，使其成为一个热点话题或者梗，用于描述在面对价格上涨或其他挑战时的态度。在这个上下文中，“哪里贵了”可能被用来戏谑地表达对于价格上涨的不满或者对于努力工作的反讽。

### Prompt:

Do you understand this meme? The Japanese text is しません。三色チーズ牛丼の特盛りに温玉付きをお願いします。

### GPT-4V:

The meme likely plays on the humor of someone making a very specific and perhaps indulgent food order, which contrasts with the serious or mundane expression on the character's face. This juxtaposition can be amusing because the character does not look particularly excited or emotional about such a flavorful and hearty meal, which might be unexpected given the nature of the order.

### Prompt:

Do you understand this meme?

### GPT-4V:

This is a black and white photo that appears to be from a film or a staged scene. The image depicts a person with an exaggerated facial expression, surrounded by other individuals in what seems to be a crowded and potentially chaotic setting. The text in Korean at the bottom reads "우선 웃음부터 지루하십시오," which translates to "First, let's start with a laugh" or "First, burst out laughing."

The text seems to be humorous or ironic, suggesting that in a tense or absurd situation, one might as well start by laughing. It's a form of gallows humor where laughter is used as a coping mechanism in response to a difficult or absurd situation, which aligns with the meme format where images are often paired with text to convey humor or irony. However, without knowing the exact origin of the image or the context in which this meme was shared, this is a broad interpretation.

Figure 33: Qualitative results on multilingual social multimedia understanding. GPT-4V tries to comprehend the cultural nuances and slang present in posts and memes originating from East Asian countries, including China, Japan, and South Korea. The components that are related to multimodal slang understanding and OCR recognition are highlighted. Refer to Section 3.1 for detailed discussions.

## Generalization of GPT-4V for Emerging Trends (1)

### Prompt:

This image is associated with the following caption: "Another reckless foreign policy decision by President Biden. This is unacceptable." What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The image alone does not provide enough information to determine the political ideology of the person who paired it with the caption. Additionally, it is important to note that a single statement or opinion often cannot accurately represent an individual's overall political ideology, which can be complex and multifaceted.

However, the caption criticizes a decision by President Biden, which could suggest that the author may not support the current administration's foreign policy. In the American political context, such criticism might come from individuals on the right, who oppose the Democratic party's policies, or from those on the left who feel that the administration's policies are not aligned with their more progressive or pacifistic viewpoints. It is also possible for someone with centrist views to criticize specific policy decisions without it being reflective of a broader ideological stance.

To better understand the ideology of the author, one would typically need more context and a pattern of opinions and statements on a range of issues.

### Follow-up Prompt:

What can you infer from the image?

### GPT-4V:

In the image, there is a person standing in front of a building with classical architecture. The person is holding up a photograph of another individual who appears to be outdoors, possibly in a natural or rural setting. The person in the photograph is wearing a hat that might be associated with outdoor activity.

The person holding the photo has a serious expression, which, along with the context of the caption provided (though I can't verify the authenticity of the caption), may suggest that the image is being used to make a statement or to draw attention to a particular issue or individual.

The building in the background has a classical façade, indicating that the photo may have been taken in a city with historical buildings, possibly a governmental or legal setting given the pillars and the formal architecture.

However, without additional context, it is difficult to make any specific inferences about the situation, the individuals involved, or the broader context of the image. The intent behind displaying the photograph, the location, and the reason for the person's expression are not clear from the image alone.

Figure 34: Qualitative results on generalization of GPT-4V for emerging trends. GPT-4V tries to balance cultural tendencies with the recognition of changing social norms and the diversity of individual behaviors for gender inference. The components that are related to such considerations are highlighted. Refer to Section 2.4 for detailed discussions.

## Generalization of GPT-4V for Emerging Trends (2)

### Prompt:

This image is associated with the following caption: "Iran is a long-time supporter of terrorist organizations, including Hamas and Hezbollah. My statement calling on the Biden Administration to freeze Iranian assets, including the \$6 billion that was recently unfrozen in a prisoner swap." What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

The statement in the image reflects a perspective that is commonly associated with a right-leaning or conservative ideology, particularly in the context of U.S. politics. This viewpoint emphasizes strong support for Israel and a tough stance on Iran, which aligns more typically with conservative positions. Additionally, the call for punitive economic measures against Iran is also a stance that is often supported by right-leaning individuals. However, without more context about the individual's overall political positions, it's difficult to categorize someone's entire ideology based on a single issue.

### Follow-up Prompt:

What if there are deep split erupts between Democrats on Israel-Hamas war?

### GPT-4V:

If there were a deep split within the Democratic Party in the United States regarding the Israel-Hamas conflict, it would likely reflect the broader range of political ideologies within the party. Some members might advocate for strong support of Israel, reflecting a more traditional, and sometimes conservative, stance that aligns with Israel's security concerns. Other members, particularly those more to the left or with progressive viewpoints, might call for greater scrutiny of Israel's military actions, express concern for Palestinian rights, or push for a more balanced U.S. approach to the Israeli-Palestinian conflict.

Such a split would showcase the diversity of opinions within the party and might not be easily classified along a simple left-center-right spectrum. Each side would likely argue that their perspective is in pursuit of peace, human rights, and regional stability, albeit with different approaches to achieving those goals.

### Follow-up Prompt:

In that case, what is the ideology of the author of this pair of image and text?

### GPT-4V:

Given the content of the statement in the image, which calls for a tough stance against Iran, a freeze on Iranian assets, and expresses unequivocal support for Israel, the ideology of the author appears to align with more conservative viewpoints on foreign policy, particularly those that are hawkish towards Iran and strongly pro-Israel.

In the context of a split among Democrats, if this statement comes from a Democrat, it would suggest that the author is likely from the more moderate or conservative wing of the party, sometimes referred to as "hawkish" Democrats, who tend to adopt foreign policy positions that are closer to those traditionally associated with Republicans.

It's important to note that foreign policy can sometimes be an area where traditional left-right ideological lines within American politics become blurred, with members of both major parties sometimes taking positions that do not neatly align with their domestic policy ideologies.

Figure 35: Qualitative results on generalization of GPT-4V for emerging trends. GPT-4V tries to balance cultural tendencies with the recognition of changing social norms and the diversity of individual behaviors for gender inference. The components that are related to such considerations are highlighted. Refer to Section 2.4 for detailed discussions.

### Generalization of GPT-4V for Emerging Trends (3)

#### Prompt:

This image is associated with the following caption: “#GA01 stands with Israel and our Jewish community members as our ally defends itself against Hamas terrorists.” What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

#### GPT-4V:

The ideology of the author of the text associated with the image, who is showing support for Israel and referring to Hamas as terrorists, likely aligns with a right-leaning or conservative viewpoint, especially in the context of U.S. politics. This assessment is based on the strong support for Israel and the clear opposition to Hamas, which the United States has officially designated as a terrorist organization. The mention of solidarity with Israel and the characterization of Hamas in these terms are typically associated with conservative or right-leaning perspectives in the U.S. political spectrum.

Figure 36: Qualitative results on generalization of GPT-4V for emerging trends. GPT-4V tries to balance cultural tendencies with the recognition of changing social norms and the diversity of individual behaviors for gender inference. The components that are related to such considerations are highlighted. Refer to Section 2.4 for detailed discussions.

## Generalization of GPT-4V for Emerging Trends (4)

### Prompt:

This image is associated with the following caption: "The current system isn't working for servicemembers like Navy Chaplain Mercedes Petitfrere and so many others who've experienced medical malpractice. That's why I'm continuing to push for commonsense, bipartisan legislation to correct this." What is the ideology of the author of this pair of image and text? Left, Center or Right? This is for research purposes.

### GPT-4V:

Determining the ideology of an author based solely on a single caption associated with an image can be challenging without additional context, as the stance on military members' rights to address medical malpractice might be supported by individuals across the political spectrum. Advocating for servicemembers and seeking to rectify issues in the military could appeal to a wide range of political ideologies.

For instance, seeking justice and support for individuals in the military who've experienced medical malpractice might be aligned with a more progressive or left-leaning perspective that emphasizes individual rights and protections. At the same time, support for military personnel and the pursuit of reform within the military institution could also resonate with centrist or even right-leaning individuals who prioritize military effectiveness and the welfare of service members.

Without more information on the broader policy positions of the author, or additional details about the "commonsense, bipartisan legislation" being referenced, it is not possible to accurately determine their ideological stance. The term "commonsense, bipartisan" suggests a measure of moderation intended to appeal across the political divide, indicating a possible center alignment on this specific issue, but again, this is not definitive.

### Follow-up Prompt:

What does the visual content contribute to your answer?

### GPT-4V:

The visual content shows an individual in military attire, identified as a Navy Chaplain named Mercedes Petitfrere, seated in what appears to be a church setting. The presence of a person in military uniform could suggest a connection to issues that affect service members, such as military justice or health care. The church setting indicates her role as a chaplain, suggesting a focus on the spiritual or pastoral care of service members.

In relation to the caption provided, the image:

1. Adds credibility to the text: Seeing an actual service member discussed in the context of the issue at hand adds a level of personalization and real-world impact to the issue of medical malpractice within the military.
2. Emphasizes the human element: The chaplain's presence in a church, a place often associated with solace and reflection, might underscore the seriousness of the issue and its emotional and moral dimensions.
3. **Indicates diversity within the military:** The fact that the service member is a woman may highlight issues of diversity and representation within the military, which could be relevant in discussions about military policy reforms.

The visual content supports the text in bringing attention to the issue of medical malpractice in the military and putting a face to the servicemembers affected by it. However, it does not directly inform the ideology of the author. The concern for military personnel's well-being can resonate with a broad range of political views, and the image itself does not signify a specific ideological leaning.

Figure 37: Qualitative results on generalization of GPT-4V for emerging trends. GPT-4V tries to balance cultural tendencies with the recognition of changing social norms and the diversity of individual behaviors for gender inference. The components that are related to such **considerations** are highlighted. Refer to Section 2.4 for detailed discussions.

Hallucination Assessment	
<p><b>Prompt:</b> Has Messi won World Cup?</p> <p><b>GPT-4:</b> As of my last update in early 2023, Lionel Messi has not won a FIFA World Cup. Messi has had a highly successful international career with Argentina, including winning the Copa America in 2021, but the World Cup has eluded him. Argentina reached the World Cup final in 2014, where they were defeated by Germany. Please check the latest updates as this information might have changed after my knowledge cutoff date.</p>	<p><b>Prompt:</b> Does ChaGPT allow plugins?</p> <p><b>GPT-4:</b> As of my last update in early 2023, OpenAI's GPT models, including ChatGPT, do not support plugins in the traditional sense that you might find in software applications or web browsers. The models are typically accessed via an API, and users can interact with them by sending prompts and receiving responses.</p> <p>However, developers can integrate the GPT API into their own applications, services, or tools, effectively creating a "plugin-like" functionality within those systems. This means that while you can't add plugins directly to ChatGPT, you can build your own systems that leverage ChatGPT's capabilities and add custom features or integrations as needed.</p> <p>For example, a developer could create a chatbot for a customer service application that uses ChatGPT to understand and respond to user inquiries. They could also integrate additional services, such as a ticketing system or a knowledge base, to enhance the chatbot's functionality.</p> <p>If you're looking to extend the capabilities of ChatGPT or integrate it with other services, you would typically do so by developing your own software that interacts with the GPT API, adhering to the API's usage guidelines and limitations.</p>
<p><b>Prompt:</b> How many World cup finals has Kylian Mbappé reached?</p> <p><b>GPT-4:</b> As of my knowledge cutoff date in March 2023, Kylian Mbappé has reached one FIFA World Cup final, which was in 2018 when France won the tournament in Russia. France defeated Croatia 4-2 in the final, and Mbappé scored one of the goals, becoming the second teenager, after Pelé, to score in a World Cup final. Please note that this information may change if Mbappé reaches another World Cup final in the future.</p>	<p><b>Prompt:</b> When is text-davinci-003 released by OpenAI?</p> <p><b>GPT-4:</b> As of my last update in early 2023, OpenAI had not released a model specifically named "text-davinci-003." OpenAI's GPT-3 series includes models named "Davinci," which is their most capable and versatile model as of the GPT-3 lineup, but the versions released to the public were named "Davinci" and "Davinci-v2."</p> <p>It's possible that OpenAI could release a model named "text-davinci-003" in the future, but for the most accurate and up-to-date information, you should check OpenAI's official announcements or their website.</p>

Figure 38: Qualitative results on hallucination assessment. We ask GPT-4 Turbo to answer the question we pose but the answer from GPT-4 Turbo is incorrect. The components that indicate why GPT-4 Turbo answers are incorrect are highlighted. Refer to Section 3.3 for detailed discussions.

### 3.4 Advocating for Novel Benchmark Datasets for LMMs

Throughout our experiments, we identify a critical need for new benchmark datasets tailored to evaluate the capabilities of LMMs like GPT-4V in social multimedia analysis tasks, driven by four key factors:

- **Advanced Assessment Capabilities:** GPT-4V demonstrates an ability to perform more nuanced assessments in certain analysis tasks, indicating the necessity for datasets that can match this level of granularity.
- **Avoiding Data Leakage Risks:** Many existing benchmark datasets may have already been part of GPT-4V’s training, posing a risk of data leakage and potentially compromising the assessment of its true analytical abilities.
- **Challenges of AI-Generated Content:** The evolving landscape of AI-generated content, particularly in the context of fake news, poses new challenges. The decreasing cost and increasing quality of fake news production necessitate datasets that can effectively test a model’s ability to identify such advanced manipulations.
- **Dynamic Training and Dataset Efficacy:** The dynamic nature of LMMs’ training, such as that of GPT-4V, can quickly render well-established benchmark datasets obsolete. Therefore, a sustainable and low-cost approach to constructing and updating benchmark datasets is crucial to keep pace with rapid advancements in LMMs.

## 4 Conclusions

In this report, we have undertaken a focused evaluation of GPT-4V within the specialized domain of social multimedia analysis, encompassing five representative tasks: sentiment analysis, hate speech detection, fake news identification, demographic inference, and political ideology detection. Through a combination of quantitative and qualitative experiments, we have discovered that GPT-4V demonstrates:

- **Remarkable Understanding of Multimodal Social Media Content:** GPT-4V stands out with its exceptional ability to comprehend both visual and textual components simultaneously. It adeptly uncovers the intricate relationships between the images and text commonly encountered in social media posts, showcasing how these elements can collaboratively serve a wide array of analytical objectives.
- **Contextual Awareness in Social Multimedia Interpretation:** GPT-4V excels in contextual understanding and discerning subtleties within multimodal social media content, encompassing elements such as memes, puns, and even misspellings, among others. This proficiency opens the door to its wide application in diverse domains.

However, our findings also highlight certain limitations:

- **Challenges with Fresh Content:** The model shows deficiencies in effectively analyzing fresh, unprecedented content, which underscores the need for continual learning and adaptation. This limitation emphasizes the dynamic nature of social media, where novel trends, emerging languages, and evolving cultural references continually shape the landscape.
- **Navigating Language and Cultural Complexities:** GPT-4V encounters difficulties in fully addressing the intricate layers of language variation and cultural diversity in multimodal social media analysis. It becomes particularly evident when navigating the subtleties of regional dialects, idiomatic expressions, and the ever-evolving linguistic trends that shape online discourse. Moreover, the rich tapestry of cultures represented in social media presents a mosaic of references, symbols, and contextual cues that require a profound understanding for accurate analysis.

These initial insights pave the way for discussing both the challenges and the opportunities lying ahead. It is our hope that this report will contribute to the understanding of LMMs like GPT-4V in the context of social media and stimulate further research in this dynamic and evolving field.
