COIMBRA

From the technology of the 16th century to the present day, humanity has undertaken remarkable journeys—both across the oceans and into space.

At sea, Pedro Nunes's invention of the Nonio marked a turning point in navigation; today, robotic explorers continue that legacy beneath the waves.

In the air, the adaptation of the astrolabe guided the first transatlantic flights; now, its spirit of innovation lives on in satellites orbiting the Earth.

The Portuguese legacy in Asia began with Jesuit scholars such as Tomás Pereira, who served the Emperor of China and built intricate clocks that merged science and art.

In 2026, the ATCM comes to Coimbra, continuing this tradition—seeking new journeys in mathematics, science, and technology education.
