BSI Recomended Regular System Maintenance

BSI recommends performing regular system maintenance on your computers running BSI products. For most systems once per week is adequate, however the exact frequency that a system will need maintenance will depend highly on the system hardware and usage.

- Run Scan Disk and Defragmenter utilities
- Clear temp folder contents
- Uninstall Programs that are not needed
- Turn off any running processes that are not needed
- Delete the audio.mdb, audio.ldb, and audio.dat files located in C:\BSI32 (All BSI software must be closed to do this)
- Run a full system back-up

If the computer has internet access

- Run a virus scan
- Run Spyware/Adware removal software
- Delete cookies
- Delete temporary internet files

On a Simian System:

- Set up a daily COMPACTHEAP macro to clear up resources
- Set up a daily COMPACTDATABASE macro to maintain the audio.mdb database
- Run the RegSave program available on the BSI website to back-up your Simian settings
