- void **resize** (int, int, int, int) override

Resizes the [FI_Group](#) widget and all of its children.
- [FI_Tree_Item](#) * **root** ()

Returns the root item.
- void **root** ([FI_Tree_Item](#) *newitem)

Sets the root item to 'newitem'.
- void **root_label** (const char *new_label)

Set the label for the root item to 'new_label'.
- int **scrollbar_size** () const

Gets the default size of scrollbars' troughs for this widget in pixels.
- void **scrollbar_size** (int size)

Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.
- int **select** (const char *path, int docallback=1)

Select the item specified by 'path'.
- int **select** ([FI_Tree_Item](#) *item, int docallback=1)

Select the specified 'item'.
- int **select_all** ([FI_Tree_Item](#) *item=0, int docallback=1)

Select 'item' and all its children.
- int **select_only** ([FI_Tree_Item](#) *selitem, int docallback=1)

Select only the specified item, deselecting all others that might be selected.
- void **select_toggle** ([FI_Tree_Item](#) *item, int docallback=1)

Toggle the select state of the specified 'item'.
- [FI_Boxtype](#) **selectbox** () const

Sets the style of box used to draw selected items.
- void **selectbox** ([FI_Boxtype](#) val)

Gets the style of box used to draw selected items.
- [FI_Tree_Select](#) **selectmode** () const

Gets the tree's current selection mode.
- void **selectmode** ([FI_Tree_Select](#) val)

Sets the tree's selection mode.
- void **set_item_focus** ([FI_Tree_Item](#) *item)

Set the item that currently should have keyboard focus.
- void **show_item** ([FI_Tree_Item](#) *item)

Adjust the vertical scrollbar to show 'item' at the top of the display IF it is currently off-screen (for instance [show_item_top\(\)](#)).
- void **show_item** ([FI_Tree_Item](#) *item, int yoff)

Adjust the vertical scrollbar so that 'item' is visible 'yoff' pixels from the top of the [FI_Tree](#) widget's display.

- void [show_item_bottom](#) ([FI_Tree_Item](#) *item)
Adjust the vertical scrollbar so that 'item' is at the bottom of the display.
- void [show_item_middle](#) ([FI_Tree_Item](#) *item)
Adjust the vertical scrollbar so that 'item' is in the middle of the display.
- void [show_item_top](#) ([FI_Tree_Item](#) *item)
Adjust the vertical scrollbar so that 'item' is at the top of the display.
- void [show_self](#) ()
Print the tree as 'ascii art' to stdout.
- int [showcollapse](#) () const
Returns 1 if the collapse icon is enabled, 0 if not.
- void [showcollapse](#) (int val)
Set if we should show the collapse icon or not.
- int [showroot](#) () const
Returns 1 if the root item is to be shown, or 0 if not.
- void [showroot](#) (int val)
Set if the root item should be shown or not.
- [FI_Tree_Sort](#) [sortorder](#) () const
Set the default sort order used when items are added to the tree.
- void [sortorder](#) ([FI_Tree_Sort](#) val)
Gets the sort order used to add items to the tree.
- [FI_Image](#) * [usericon](#) () const
Returns the FI_Image being used as the default user icon for all newly created items.
- void [usericon](#) ([FI_Image](#) *val)
Sets the FI_Image to be used as the default user icon for all newly created items.
- int [usericonmarginleft](#) () const
Get the amount of white space (in pixels) that should appear to the left of the usericon.
- void [usericonmarginleft](#) (int val)
Set the amount of white space (in pixels) that should appear to the left of the usericon.
- int [vposition](#) () const
Returns the vertical scroll position as a pixel offset.
- void [vposition](#) (int pos)
Sets the vertical scroll offset to position 'pos'.
- int [widgetmarginleft](#) () const
Get the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).
- void [widgetmarginleft](#) (int val)
Set the amount of white space (in pixels) that should appear to the left of the child fltk widget (if any).
- ~[FI_Tree](#) ()
Destructor.

Public Member Functions inherited from [FI_Group](#)

- [FI_Widget](#) *& [_ddfdesign_kludge](#) ()
This is for forms compatibility only.
- void [add](#) ([FI_Widget](#) &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void [add](#) ([FI_Widget](#) *o)
See void FI_Group::add(FI_Widget &w)
- void [add_resizable](#) ([FI_Widget](#) &o)
Adds a widget to the group and makes it the resizable widget.
- [FI_Widget](#) *const * [array](#) () const
Returns a pointer to the internal array of children.

- `FL_Group` `const * as_group ()` `const` override
- `FL_Group * as_group ()` override

Returns an `FL_Group` pointer if this widget is an `FL_Group`.
- `void begin ()`

Sets the current group so you can build the widget tree by just constructing the widgets.
- `FL_Widget * child (int n)` `const`

*Returns the *n*'th child.*
- `int children ()` `const`

Returns how many child widgets the group has.
- `void clear ()`

Deletes all child widgets from memory recursively.
- `unsigned int clip_children ()`

Returns the current clipping mode.
- `void clip_children (int c)`

Controls whether the group widget clips the drawing of child widgets to its bounding box.
- `virtual int delete_child (int n)`

*Removes the widget at *index* from the group and deletes it.*
- `void end ()`

Exactly the same as `current(this->parent())`.
- `int find (const FL_Widget &o)` `const`

See `int FL_Group::find(const FL_Widget *w)` `const`.
- `int find (const FL_Widget *)` `const`

Searches the children for the widget and returns the index.
- `FL_Group (int, int, int, int, const char * = 0)`

Creates a new `FL_Group` widget using the given position, size, and label string.
- `void forms_end ()`

This is for forms compatibility only.
- `void init_sizes ()`

Resets the internal array of widget sizes and positions.
- `void insert (FL_Widget &, int i)`

The widget is removed from its current group (if any) and then inserted into this group.
- `void insert (FL_Widget &o, FL_Widget *before)`

This does `insert(w, find(before))`.
- `void remove (FL_Widget &)`

Removes a widget from the group but does not delete it.
- `void remove (FL_Widget *o)`

*Removes the widget *o* from the group.*
- `void remove (int index)`

*Removes the widget at *index* from the group but does not delete it.*
- `FL_Widget * resizable ()` `const`

Returns the group's resizable widget.
- `void resizable (FL_Widget &o)`

Sets the group's resizable widget.
- `void resizable (FL_Widget *o)`

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- `virtual ~FL_Group ()`

The destructor also deletes all the children.

Public Member Functions inherited from [Fl_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [Fl_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([Fl_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [Fl_Gl_Window](#) * [as_gl_window](#) ()
Returns an [Fl_Gl_Window](#) pointer if this widget is an [Fl_Gl_Window](#).
- virtual class [Fl_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [Fl_Window](#) * [as_window](#) ()
Returns an [Fl_Window](#) pointer if this widget is an [Fl_Window](#).
- virtual [Fl_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([Fl_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([Fl_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [Fl_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([Fl_Boxtype](#) new_box)
Sets the box type for the widget.
- [Fl_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([Fl_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([Fl_Callback](#) *cb, [Fl_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([Fl_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([Fl_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([Fl_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

- Marks the widget as inactive without sending events or changing focus.*

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*

 - void `clear_damage` (uchar c=0)
- Clears or sets the damage flags.*

 - void `clear_output` ()
- Sets a widget to accept input.*

 - void `clear_visible` ()
- Hides the widget.*

 - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

 - `FL_Color` `color` () const
- Gets the background color of the widget.*

 - void `color` (`FL_Color` bg)
- Sets the background color of the widget.*

 - void `color` (`FL_Color` bg, `FL_Color` sel)
- Sets the background and selection color of the widget.*

 - int `contains` (const `FL_Widget` *w) const
- Checks if w is a child of this widget.*

 - void `copy_label` (const char *new_label)
- Sets the current label.*

 - void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*

 - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

 - void `damage` (uchar c)
- Sets the damage bits for the widget.*

 - void `damage` (uchar c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int `damage_resize` (int, int, int, int)
- Internal use only.*

 - void `deactivate` ()
- Deactivates the widget.*

 - `FL_Image` * `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const `FL_Image` * `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void `deimage` (`FL_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void `deimage` (`FL_Image` *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

 - void `do_callback` (`FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with default arguments.*

 - void `do_callback` (`FL_Widget` *widget, long arg, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

 - void `do_callback` (`FL_Widget` *widget, void *arg=0, `FL_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
- Calls the widget callback function with arbitrary arguments.*

 - void `draw_label` (int, int, int, int, `FL_Align`) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [Fl_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [Fl_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([Fl_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([Fl_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [Fl_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([Fl_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [Fl_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([Fl_Color](#) c)
Sets the label color.
- [Fl_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([Fl_Font](#) f)
Sets the font to use.
- [Fl_Fontsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([Fl_Fontsize](#) pix)
Sets the font size in pixels.
- [Fl_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([Fl_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const

- Returns whether this widget needs a keyboard.*

 - void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const

Returns if a widget is used for output only.
- [Fl_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.
- void [parent](#) ([Fl_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- [Fl_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.
- void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the Tooltip Text for a Widget.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.

- `uchar type () const`
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data () const`
Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible () const`
Returns whether a widget is visible.
- `unsigned int visible_focus () const`
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r () const`
Returns whether a widget and all its parents are visible.
- `int w () const`
Gets the widget width.
- `Fl_When when () const`
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `Fl_Window * window () const`
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
Gets the widget position in its window.
- `int y () const`
Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
Destroys the widget.

Protected Member Functions

- `void do_callback_for_item (Fl_Tree_Item *item, Fl_Tree_Reason reason)`
Do the callback for the specified 'item' using 'reason', setting the `callback_item()` and `callback_reason()`.
- `void draw () override`
Standard FLTK `draw()` method, handles drawing the tree widget.
- `void item_clicked (Fl_Tree_Item *val)`
Set the item that was last clicked.

Protected Member Functions inherited from [FI_Group](#)

- [FI_Rect](#) * [bounds](#) ()
Returns the internal array of widget sizes and positions.
- void [draw_child](#) ([FI_Widget](#) &widget) const
Forces a child to redraw.
- void [draw_children](#) ()
Draws all children of the group.
- void [draw_outside_label](#) (const [FI_Widget](#) &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int [on_insert](#) ([FI_Widget](#) *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int [on_move](#) (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void [on_remove](#) (int)
Allow derived groups to act when a child widget is removed from the group.
- int * [sizes](#) ()
Returns the internal array of widget sizes and positions.
- void [update_child](#) ([FI_Widget](#) &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from [FI_Widget](#)

- void [clear_flag](#) (unsigned int c)
Clears a flag in the flags mask.
- void [draw_backdrop](#) () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void [draw_box](#) () const
Draws the widget box according to its box style.
- void [draw_box](#) ([FI_Boxtype](#) t, [FI_Color](#) c) const
Draws a box of type t, of color c at the widget's position and size.
- void [draw_box](#) ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void [draw_focus](#) () const
Draws a focus rectangle around the widget.
- void [draw_focus](#) ([FI_Boxtype](#) t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void [draw_focus](#) ([FI_Boxtype](#) t, int x, int y, int w, int h, [FI_Color](#) bg) const
Draws a focus box for the widget at the given position and size.
- void [draw_label](#) () const
Draws the widget's label at the defined label position.
- void [draw_label](#) (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- [FI_Widget](#) (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int [flags](#) () const
Gets the widget flags mask.
- void [h](#) (int v)
Internal use only.
- void [set_flag](#) (unsigned int c)
Sets a flag in the flags mask.
- void [w](#) (int v)

Internal use only.

- void [x](#) (int v)

Internal use only.

- void [y](#) (int v)

Internal use only.

Protected Attributes

- [Fl_Scrollbar](#) * [_hscroll](#)

Horizontal scrollbar.

- int [_tih](#)

Tree widget inner xywh dimension: inside borders + scrollbars.

- int [_tiw](#)

- int [_tix](#)

- int [_tiy](#)

- int [_toh](#)

Tree widget outer xywh dimension: outside scrollbars, inside widget border.

- int [_tow](#)

- int [_tox](#)

- int [_toy](#)

- int [_tree_h](#)

the calculated height of the entire tree hierarchy. See [calc_tree\(\)](#)

- int [_tree_w](#)

the calculated width of the entire tree hierarchy. See [calc_tree\(\)](#)

- [Fl_Scrollbar](#) * [_vscroll](#)

Vertical scrollbar.

Friends

- class [Fl_Tree_Item](#)

Additional Inherited Members

Static Public Member Functions inherited from [Fl_Group](#)

- static [Fl_Group](#) * [current](#) ()

Returns the currently active group.

- static void [current](#) ([Fl_Group](#) *g)

Sets the current group.

Static Public Member Functions inherited from [Fl_Widget](#)

- static void [default_callback](#) ([Fl_Widget](#) *widget, void *data)

The default callback for all widgets that don't set a callback.

- static unsigned int [label_shortcut](#) (const char *t)

Returns the Unicode value of the '&x' shortcut in a given text.

- static int [test_shortcut](#) (const char *, const bool require_alt=false)

Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [Fl_Widget](#)

```
enum {
    INACTIVE = 1<<0 , INVISIBLE = 1<<1 , OUTPUT = 1<<2 , NOBORDER = 1<<3 ,

13.147.1 Detailed Description

Tree widget.

Figure 13.62 `Fl_Tree` example program

```
Fl_Tree                                     // Top level widget
|--- Fl_Tree_Item                           // Items in the tree
|--- Fl_Tree_Prefs                         // Preferences for the tree
    |--- Fl_Tree_Connector (enum)          // Connection modes
    |--- Fl_Tree_Select (enum)            // Selection modes
    |--- Fl_Tree_Sort (enum)              // Sort behavior
```

Similar to [Fl_Browser](#), `Fl_Tree` is a browser of `Fl_Tree_Item`'s arranged in a parented hierarchy, or 'tree'. Subtrees can be expanded or closed. Items can be added, deleted, inserted, sorted and re-ordered.

The tree items may also contain other FLTK widgets, like buttons, input fields, or even "custom" widgets.

The [callback\(\)](#) is invoked depending on the value of [when\(\)](#):

- `FL_WHEN_RELEASE` – callback invoked when left mouse button is released on an item
- `FL_WHEN_CHANGED` – callback invoked when left mouse changes selection state

The simple way to define a tree:

```
#include <FL/Fl_Tree.H>
[... ]
Fl_Tree tree(X,Y,W,H);
tree.begin();
tree.add("Flintstones/Fred");
tree.add("Flintstones/Wilma");
tree.add("Flintstones/Pebbles");
tree.add("Simpsons/Homer");
tree.add("Simpsons/Marge");
```

```
tree.add("Simpsons/Bart");
tree.add("Simpsons/Lisa");
tree.end();
```

FEATURES

Items can be added with [add\(\)](#),
 removed with [remove\(\)](#),
 completely cleared with [clear\(\)](#),
 inserted with [insert\(\)](#) and [insert_above\(\)](#),
 selected/deselected with [select\(\)](#) and [deselect\(\)](#),
 open/closed with [open\(\)](#) and [close\(\)](#),
 positioned on the screen with [show_item_top\(\)](#), [show_item_middle\(\)](#) and [show_item_bottom\(\)](#),
 item children can be swapped around with [Fl_Tree_Item::swap_children\(\)](#),
 items can be moved around with [Fl_Tree_Item::move\(\)](#),
 an item's children can be walked with [Fl_Tree_Item::first\(\)](#) and [Fl_Tree_Item::next\(\)](#), an item's children can be indexed directly with [Fl_Tree_Item::child\(\)](#) and [Fl_Tree_Item::children\(\)](#),
 items can be moved from one subtree to another with [Fl_Tree_Item::deparent\(\)](#) and [Fl_Tree_Item::reparent\(\)](#),
 sorting can be controlled when items are [add\(\)](#)ed via [sortorder\(\)](#).
 You can walk the entire tree with [first\(\)](#) and [next\(\)](#).
 You can walk visible items with [first_visible_item\(\)](#) and [next_visible_item\(\)](#).
 You can walk selected items with [first_selected_item\(\)](#) and [next_selected_item\(\)](#).
 Items can be found by their pathname using [find_item\(const char*\)](#), and an item's pathname can be found with [item_pathname\(\)](#).
 The selected items' colors are controlled by [selection_color\(\)](#) (inherited from [Fl_Widget](#)).
 A hook is provided to allow you to redefine how item's labels are drawn via [Fl_Tree::item_draw_callback\(\)](#).
 Items can be interactively dragged using [FL_TREE_SELECT_SINGLE_DRAGGABLE](#).

SELECTION OF ITEMS

The tree can have different selection behaviors controlled by [selectmode\(\)](#). The background color used for selected items is the [Fl_Tree::selection_color\(\)](#). The foreground color for selected items is controlled internally with [fl_contrast\(\)](#).

CHILD WIDGETS

FLTK widgets (including custom widgets) can be assigned to tree items via [Fl_Tree_Item::widget\(\)](#).

When an [Fl_Tree_Item::widget\(\)](#) is defined, the default behavior is for the [widget\(\)](#) to be shown in place of the item's label (if it has one). Only the [widget\(\)](#)'s width will be used; the [widget\(\)](#)'s [x\(\)](#) and [y\(\)](#) position will be managed by the tree, and the [h\(\)](#) will track the item's height. This default behavior can be altered (ABI 1.3.1): Setting [Fl_Tree::item_draw_mode\(\)](#)'s [FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET](#) flag causes the label + widget to be displayed together in that order, and adding the [FL_TREE_ITEM_HEIGHT_FROM_WIDGET](#) flag causes widget's height to define the [widget\(\)](#)'s height.

ICONS

The tree's open/close icons can be redefined with [Fl_Tree::openicon\(\)](#), [Fl_Tree::closeicon\(\)](#). User icons can either be changed globally with [Fl_Tree::usericon\(\)](#), or on a per-item basis with [Fl_Tree_Item::usericon\(\)](#).

Various default preferences can be globally manipulated via [Fl_Tree_Prefs](#), including colors, margins, icons, connection lines, etc.

FONTS AND COLORS

When adding new items to the tree, the new items get the defaults for fonts and colors from:

- [Fl_Tree::item_labelfont\(\)](#) – The default item label font (default: FL_HELVETICA)
- [Fl_Tree::item_labelsize\(\)](#) – The default item label size (default: FL_NORMAL_SIZE)
- [Fl_Tree::item_labelfgcolor\(\)](#) – The default item label foreground color (default: FL_FOREGROUND_COLOR)
- [Fl_Tree::item_labelbgcolor\(\)](#) – The default item label background color (default: 0xffffffff, which tree uses as 'transparent')

Each item ([Fl_Tree_Item](#)) inherits a copy of these font/color attributes when created, and each item has its own methods to let the app change these values on a per-item basis using methods of the same name:

- [Fl_Tree_Item::labelfont\(\)](#) – The item's label font (default: FL_HELVETICA)
- [Fl_Tree_Item::labelsizesize\(\)](#) – The item's label size (default: FL_NORMAL_SIZE)
- [Fl_Tree_Item::labelfgcolor\(\)](#) – The item's label foreground color (default: FL_FOREGROUND_COLOR)
- [Fl_Tree_Item::labelbgcolor\(\)](#) – The item's label background color (default: 0xffffffff, which uses the tree's own bg color)

CALLBACKS

The tree's [callback\(\)](#) will be invoked when items change state or are open/closed. [when\(\)](#) controls when mouse/keyboard events invoke the callback. [callback_item\(\)](#) and [callback_reason\(\)](#) can be used to determine the cause of the callback. e.g.

```
void MyTreeCallback(Fl_Widget *w, void *data) {
    Fl_Tree *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = (Fl_Tree_Item*)tree->callback_item();    // get selected item
    switch ( tree->callback_reason() ) {
        case FL_TREE_REASON_SELECTED: [..]
        case FL_TREE_REASON_DESELECTED: [..]
        case FL_TREE_REASON_RESELECTED: [..]
        case FL_TREE_REASON_OPENED: [..]
        case FL_TREE_REASON_CLOSED: [..]
    }
    :
}
```

SIMPLE EXAMPLES

To find all the selected items:

```
for ( Fl_Tree_Item *i=first_selected_item(); i; i=next_selected_item(i) )
    printf("Item %s is selected\n", i->label());
```

To get an item's full menu pathname, use [Fl_Tree::item_pathname\(\)](#), e.g.

```
[..]
char pathname[256] = "???";
tree->item_pathname(pathname, sizeof(pathname), item);    // eg. "Parent/Child/Item"
[..]
```

To walk all the items of the tree from top to bottom:

```
// Walk all the items in the tree, and print their labels
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) ) {
    printf("Item: %s\n", item->label());
}
```

To recursively walk all the children of a particular item, define a function that uses recursion:

```
// Find all of the item's children and print an indented report of their labels
void my_print_all_children(Fl_Tree_Item *item, int indent=0) {
    for ( int t=0; t<item->children(); t++) {
        printf("%%s Item: %%s\\n", indent, "", item->child(t)->label());
        my_print_all_children(item->child(t), indent+4);    // recurse
    }
}
```

To change the default label font and color when creating new items:

```
tree = new Fl_Tree(..);
tree->item_labelfont(FL_COURIER);           // Use Courier font for all new items
tree->item_labelbgcolor(FL_RED);             // Use red color for labels of all new items
[..]
// Now create the items in the tree using the above defaults.
tree->add("Aaa");
tree->add("Bbb");
```

To change the font and color of all existing items in the tree:

```
// Change the font and color of all items currently in the tree
for ( FL_Tree_Item *item = tree->first(); item; item = tree->next(item) ) {
    item->labelfont(FL_COURIER);
    item->labelcolor(FL_RED);
}
```

DISPLAY DESCRIPTION

The following image shows the tree's various visual elements and the methods that control them:

Figure 13.63 Fl_Tree elements

The following shows the protected dimension variables 'tree inner' (tix..) and 'tree outer' (tox..):

Figure 13.64 FL_Tree inner/outer dimensions

KEYBOARD BINDINGS

The following table lists keyboard bindings for navigating the tree:

Keyboard	FL_TREE_SELECT↵ _MULTI	FL_TREE_SELECT↵ _SINGLE	FL_TREE_SELECT↵ _NONE
Ctrl-A (Linux/Windows)	Select all items	N/A	N/A
Command-A (Mac)	Select all items	N/A	N/A
Space	Selects item	Selects item	N/A
Ctrl-Space	Toggle item	Toggle item	N/A
Shift-Space	Extends selection	Selects item	N/A
Enter	Toggles open/close	Toggles open/close	Toggles open/close
Ctrl-Enter	Toggles open/close	Toggles open/close	Toggles open/close
Shift-Enter	Toggles open/close	Toggles open/close	Toggles open/close
Right / Left	Open/Close item	Open/Close item	Open/Close item
Up / Down	Move focus box up/down	Move focus box up/down	N/A
Shift-Up / Shift-Down	Extend selection up/down	Move focus up/down	N/A
Home / End	Move to top/bottom of tree	Move to top/bottom of tree	Move to top/bottom of tree
PageUp / PageDown	Page up/down	Page up/down	Page up/down

13.147.2 Member Function Documentation

13.147.2.1 add() [1/2]

```
Fl_Tree_Item * Fl_Tree::add (
    const char * path,
    Fl_Tree_Item * item = 0 )
```

Adds a new item, given a menu style 'path'.

Any parent nodes that don't already exist are created automatically. Adds the item based on the value of [sortorder\(\)](#). If 'item' is NULL, a new item is created.

To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
:
tree->add("/Holidays/Photos/12\\25\\2010");           // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\\\Program Files\\\\MyApp"); // Adds item "c:\Program Files\MyApp"
:
```

Parameters

in	<i>path</i>	The path to the item, e.g. "Flintstone/Fred".
in	<i>item</i>	The new item to be added. If NULL, a new item is created with a name that is the last element in 'path'.

Returns

The new item added, or 0 on error.

Version

1.3.3

13.147.2.2 add() [2/2]

```
Fl_Tree_Item * Fl_Tree::add (
    Fl_Tree_Item * parent_item,
    const char * name )
```

Add a new child item labeled 'name' to the specified 'parent_item'.

Parameters

in	<i>parent_item</i>	The parent item the new child item will be added to. Must not be NULL.
in	<i>name</i>	The label for the new item

Returns

The new item added.

Version

1.3.0 release

13.147.2.3 calc_dimensions()

```
void Fl_Tree::calc_dimensions ( )
```

Recalculate widget dimensions and scrollbar visibility, normally managed automatically.

Low overhead way to update the tree widget's outer/inner dimensions and re-determine scrollbar visibility based on these changes without recalculating the entire size of the tree data.

Assumes that either the tree's size in `_tree_w/_tree_h` are correct so that scrollbar visibility can be calculated easily, or are both zero indicating scrollbar visibility can't be calculated yet.

This method is called when the widget is [resize\(\)](#)ed or if the scrollbar's sizes are changed (affects tree widget's inner dimensions `tix/y/w/h`), and also used by [calc_tree\(\)](#).

Version

1.3.3 ABI feature

13.147.2.4 `calc_tree()`

```
void Fl_Tree::calc_tree ( )
```

Recalculates the tree's sizes and scrollbar visibility, normally managed automatically.

On return:

- `_tree_w` will be the overall pixel width of the entire viewable tree
- `_tree_h` will be the overall pixel height ""
- scrollbar visibility and pan sizes are updated
- internal `_tix/_tiy/_tiw/_tih` dimensions are updated

`_tree_w/_tree_h` include the tree's margins (e.g. `marginleft()`), whether items are open or closed, label contents and font sizes, etc.

The tree hierarchy's size is managed separately from the widget's size as an optimization; this way `resize()` on the widget doesn't involve recalculating the tree's hierarchy needlessly, as widget size has no bearing on the tree hierarchy.

The tree hierarchy's size only changes when items are added/removed, open/closed, label contents or font sizes changed, margins changed, etc.

This calculation involves walking the *entire* tree from top to bottom, potentially a slow calculation if the tree has many items (potentially hundreds of thousands), and should therefore be called sparingly.

For this reason, `recalc_tree()` is used as a way to /schedule/ calculation when changes affect the tree hierarchy's size.

Apps may want to call this method directly if the app makes changes to the tree's geometry, then immediately needs to work with the tree's new dimensions before an actual redraw (and recalc) occurs. (This use by an app should only rarely be needed)

13.147.2.5 `callback_item()` [1/2]

```
Fl_Tree_Item * Fl_Tree::callback_item ( )
```

Gets the item that caused the callback.

The `callback()` can use this value to see which item changed.

13.147.2.6 `callback_item()` [2/2]

```
void Fl_Tree::callback_item (
    Fl_Tree_Item * item )
```

Sets the item that was changed for this callback.

Used internally to pass the item that invoked the callback.

13.147.2.7 `callback_reason()` [1/2]

```
Fl_Tree_Reason Fl_Tree::callback_reason ( ) const
```

Gets the reason for this callback.

The `callback()` can use this value to see why it was called. Example:

```

:
void MyTreeCallback(Fl_Widget *w, void *userdata) {
    Fl_Tree *tree = (Fl_Tree*)w;
    Fl_Tree_Item *item = tree->callback_item();    // the item changed (can be NULL if more than one
item was changed!)
    switch ( tree->callback_reason() ) {           // reason callback was invoked
        case FL_TREE_REASON_OPENED: ..item was opened..
        case FL_TREE_REASON_CLOSED: ..item was closed..
        case FL_TREE_REASON_SELECTED: ..item was selected..
        case FL_TREE_REASON_RESELECTED: ..item was reselected (double-clicked, etc)..
        case FL_TREE_REASON_DESELECTED: ..item was deselected..
    }
}
:

```

See also

`item_reselect_mode()` – enables `FL_TREE_REASON_RESELECTED` events

13.147.2.8 callback_reason() [2/2]

```
void Fl_Tree::callback_reason (
    Fl_Tree_Reason reason )
```

Sets the reason for this callback.

Used internally to pass the reason the callback was invoked.

13.147.2.9 clear()

```
void Fl_Tree::clear (
    void )
```

Clear the entire tree's children, including the root.

The tree will be left completely empty.

13.147.2.10 clear_children()

```
void Fl_Tree::clear_children (
    Fl_Tree_Item * item )
```

Clear all the children for 'item'.

Item may not be NULL.

13.147.2.11 close() [1/2]

```
int Fl_Tree::close (
    const char * path,
    int docallback = 1 )
```

Closes the item specified by 'path'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `close("Holidays/12\25\2010")`.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>docallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - callback() is not invoked • 1 - callback() is invoked if item changed (default), callback_reason() will be <code>FL_TREE_REASON_CLOSED</code>

Returns

- 1 – OK: item closed
- 0 – OK: item was already closed, no change
- -1 – ERROR: item was not found

See also

[open\(\)](#), [close\(\)](#), [is_open\(\)](#), [is_close\(\)](#), [callback_item\(\)](#), [callback_reason\(\)](#)

13.147.2.12 close() [2/2]

```
int Fl_Tree::close (
    Fl_Tree_Item * item,
    int docallback = 1 )
```

Closes the specified 'item'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	– the item to be closed. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - callback() is not invoked • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_CLOSED

Returns

- 1 – item was closed
- 0 – item was already closed, no change

See also

[open\(\)](#), [close\(\)](#), [is_open\(\)](#), [is_close\(\)](#), [callback_item\(\)](#), [callback_reason\(\)](#)

13.147.2.13 closeicon() [1/2]

```
Fl_Image * Fl_Tree::closeicon ( ) const
```

Returns the icon to be used as the 'close' icon.

If none was set, the internal default is returned, a simple '[-]' icon.

13.147.2.14 closeicon() [2/2]

```
void Fl_Tree::closeicon (
    Fl_Image * val )
```

Sets the icon to be used as the 'close' icon.

This overrides the built in default '[-]' icon.

Parameters

in	<i>val</i>	– The new image, or zero to use the default '[-]' icon.

13.147.2.15 connectorstyle()

```
void Fl_Tree::connectorstyle (
    Fl_Tree_Connector val )
```

Sets the line drawing style for inter-connecting items.

See [Fl_Tree_Connector](#) for possible values.

13.147.2.16 deselect() [1/2]

```
int Fl_Tree::deselect (
    const char * path,
    int docallback = 1 )
```

Deselect an item specified by 'path'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `deselect("← Holidays/12\25\2010")`.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>docallback</i>	– A flag that determines if the <code>callback()</code> is invoked or not: • 0 - the <code>callback()</code> is not invoked • 1 - the <code>callback()</code> is invoked if item changed state (default), <code>callback_reason()</code> will be <code>FL_TREE_REASON_DESELECTED</code>

Returns

- 1 - OK: item's state was changed
- 0 - OK: item was already deselected, no change was made
- -1 - ERROR: item was not found

13.147.2.17 `deselect()` [2/2]

```
int Fl_Tree::deselect (
    Fl_Tree_Item * item,
    int docallback = 1 )
```

Deselect the specified `item`.

Invokes the callback depending on the value of optional parameter '`docallback`'.

Handles calling `redraw()` if anything changed.

The callback can use `callback_item()` and `callback_reason()` respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	– the item to be deselected. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the <code>callback()</code> is invoked or not: • 0 - the <code>callback()</code> is not invoked • 1 - the <code>callback()</code> is invoked if item changed state (default), <code>callback_reason()</code> will be <code>FL_TREE_REASON_DESELECTED</code>

Returns

- 0 - item was already deselected, no change was made
- 1 - item's state was changed

13.147.2.18 `deselect_all()`

```
int Fl_Tree::deselect_all (
    Fl_Tree_Item * item = 0,
    int docallback = 1 )
```

Deselect '`item`' and all its children.

If `item` is NULL, `first()` is used.

Invokes the callback depending on the value of optional parameter '`docallback`'.

Handles calling `redraw()` if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	The item that will be deselected (along with all its children). If NULL, first() is used.
in	<i>docallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - the callback() is not invoked • 1 - the callback() is invoked for each item that changed state (default), callback_reason() will be FL_TREE_REASON_DESELECTED

Returns

Count of how many items were actually changed to the deselected state.

13.147.2.19 display()

```
void Fl_Tree::display (
    Fl_Tree_Item * item )
```

Displays 'item', scrolling the tree as necessary.

Parameters

in	<i>item</i>	The item to be displayed. If NULL, first() is used.

13.147.2.20 displayed()

```
int Fl_Tree::displayed (
    Fl_Tree_Item * item )
```

See if 'item' is currently displayed on-screen (visible within the widget).

This can be used to detect if the item is scrolled off-screen. Checks to see if the item's vertical position is within the top and bottom edges of the display window. This does NOT take into account the [hide\(\)](#) / [show\(\)](#) or [open\(\)](#) / [close\(\)](#) status of the item.

Parameters

in	<i>item</i>	The item to be checked. If NULL, first() is used.

Returns

1 if displayed, 0 if scrolled off screen or no items are in tree.

13.147.2.21 draw()

```
void Fl_Tree::draw (
    void ) [override], [protected], [virtual]
```

Standard FLTK [draw\(\)](#) method, handles drawing the tree widget.

Reimplemented from [Fl_Group](#).

13.147.2.22 extend_selection()

```
int Fl_Tree::extend_selection (
    Fl_Tree_Item * from,
    Fl_Tree_Item * to,
```

```
int val = 1,
bool visible = false )
```

Extend a selection between 'from' and 'to' depending on 'visible'.

Similar to the more efficient [extend_selection_dir\(Fl_Tree_Item*,Fl_Tree_Item*,int dir,int val,bool vis\)](#) method, but direction (up or down) doesn't need to be known.

We're less efficient because we search the tree for to/from, then operate on items in between. The more efficient method avoids the "search", but necessitates a direction to be specified to find 'to'.

Used by SHIFT-click to extend a selection between two items inclusive.

Handles calling [redraw\(\)](#) if anything changed.

Parameters

in	<i>from</i>	Starting item
in	<i>to</i>	Ending item
in	<i>val</i>	Select or deselect items (0=deselect, 1=select, 2=toggle)
in	<i>visible</i>	true=affect only open() , visible items, false=affect open or closed items (default)

Returns

The number of items whose selection states were changed, if any.

Version

1.3.3 ABI feature

13.147.2.23 extend_selection_dir()

```
int Fl_Tree::extend_selection_dir (
    Fl_Tree_Item * from,
    Fl_Tree_Item * to,
    int dir,
    int val,
    bool visible )
```

Extend the selection between and including 'from' and 'to' depending on direction 'dir', 'val', and 'visible'.

Efficient: does not walk entire tree; starts with 'from' and stops at 'to' while moving in direction 'dir'. Dir must be specified though.

If dir cannot be known in advance, such as during SHIFT-click operations, the method [extend_selection\(Fl_Tree_Item*,Fl_Tree_Item*,int\)](#) should be used.

Handles calling [redraw\(\)](#) if anything changed.

Parameters

in	<i>from</i>	Starting item
in	<i>to</i>	Ending item
in	<i>dir</i>	Direction to extend selection (FL_Up or FL_Down)
in	<i>val</i>	0=deselect, 1=select, 2=toggle
in	<i>visible</i>	true=affect only open() , visible items, false=affect open or closed items (default)

Returns

The number of items whose selection states were changed, if any.

Version

1.3.3

13.147.2.24 find_clicked()

```
const Fl_Tree_Item * Fl_Tree::find_clicked (
    int yonly = 0 ) const
```

Find the item that was last clicked on.

You should use [callback_item\(\)](#) instead, which is fast, and is meant to be used within a callback to determine the item clicked.

This method walks the entire tree looking for the first item that is under the mouse. (The value of the 'yonly' flag affects whether both x and y events are checked, or just y)

Use this method /only/ if you've subclassed [Fl_Tree](#), and are receiving events before [Fl_Tree](#) has been able to process and update [callback_item\(\)](#).

Parameters

in	<i>yonly</i>	– 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.

Returns

The item clicked, or NULL if no item was under the current event.

Version

1.3.0

1.3.3 ABI feature: added yonly parameter

13.147.2.25 find_item()

```
const Fl_Tree_Item * Fl_Tree::find_item (
    const char * path ) const
```

Find the item, given a menu style path, e.g.

"/Parent/Child/item". There is both a const and non-const version of this method. Const version allows pure const methods to use this method to do lookups without causing compiler errors.

To specify items or submenus that contain slashes ('/' or '\') use an escape character to protect them, e.g.

```
:
tree->add("/Holidays/Photos/12\\25\\2010");           // Adds item "12/25/2010"
tree->add("/Pathnames/c:\\\\Program Files\\\\MyApp");    // Adds item "c:\Program Files\MyApp"
:
```

Parameters

in	<i>path</i>	– the tree item's pathname to be found (e.g. "Flintstones/Fred")

Returns

The item, or NULL if not found.

See also

[item_pathname\(\)](#)

13.147.2.26 first()

```
Fl_Tree_Item * Fl_Tree::first ( )
```

Returns the first item in the tree, or 0 if none.

Use this to walk the tree in the forward direction, e.g.

```
:
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->next(item) )
    printf("Item: %s\n", item->label());
:
```

Returns

First item in tree, or 0 if none (tree empty).

See also

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

13.147.2.27 first_selected_item()

```
Fl_Tree_Item * Fl_Tree::first_selected_item ( )
```

Returns the first selected item in the tree.

Use this to walk the tree from top to bottom looking for all the selected items, e.g.

```
:
// Walk tree forward, from top to bottom
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i) )
    printf("Selected item: %s\n", i->label());
:
```

Returns

The first selected item, or 0 if none.

See also

[first_selected_item\(\)](#), [last_selected_item\(\)](#), [next_selected_item\(\)](#)

13.147.2.28 first_visible()

```
Fl_Tree_Item * Fl_Tree::first_visible ( )
```

Returns the first [open\(\)](#), visible item in the tree, or 0 if none.

Deprecated in 1.3.3 ABI – use [first_visible_item\(\)](#) instead.

13.147.2.29 first_visible_item()

```
Fl_Tree_Item * Fl_Tree::first_visible_item ( )
```

Returns the first [open\(\)](#), visible item in the tree, or 0 if none.

Returns

First visible item in tree, or 0 if none.

See also

[first_visible_item\(\)](#), [last_visible_item\(\)](#), [next_visible_item\(\)](#)

Version

1.3.3

13.147.2.30 get_selected_items()

```
int Fl_Tree::get_selected_items (
    Fl_Tree_Item_Array & ret_items )
```

Returns the currently selected items as an array of 'ret_items'.

Example:

```
:
// Get selected items as an array
Fl_Tree_Item_Array items;
tree->get_selected_items(items);
// Manipulate the returned array
for ( int t=0; t<items.total(); t++ ) {
    Fl_Tree_Item &item = items[t];
    ..do stuff with each selected item..
}
:
```

Parameters

out	<i>ret_items</i>	The returned array of selected items.

Returns

The number of items in the returned array.

See also

[first_selected_item\(\)](#), [next_selected_item\(\)](#)

Version

1.3.3 ABI feature

13.147.2.31 handle()

```
int Fl_Tree::handle (
    int e ) [override], [virtual]
```

Standard FLTK event handler for this widget.

Todo add [Fl_Widget_Tracker](#) (see [Fl_Browser_cxx::handle\(\)](#))

Reimplemented from [Fl_Group](#).

13.147.2.32 hposition() [1/2]

```
int Fl_Tree::hposition ( ) const
```

Returns the horizontal scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the left edge of the screen.

See also

[hposition\(int\)](#), [vposition\(\)](#), [vposition\(int\)](#)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

13.147.2.33 hposition() [2/2]

```
void Fl_Tree::hposition (
    int pos )
```

Sets the horizontal scroll offset to position 'pos'.

The position is how many pixels of the tree are scrolled off the left edge of the screen.

Parameters

in	<i>pos</i>	The vertical position (in pixels) to scroll the tree to.

See also

[hposition\(\)](#), [vposition\(\)](#), [vposition\(int\)](#)

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

13.147.2.34 insert()

```
Fl_Tree_Item * Fl_Tree::insert (
    Fl_Tree_Item * item,
    const char * name,
    int pos )
```

Insert a new item 'name' into 'item's children at position 'pos'.

If pos is out of range the new item is

- prepended if pos < 0 or
- appended if pos > item->[children\(\)](#).

Note: pos == [children\(\)](#) is not considered out of range: the item is appended to the child list.

Example:

```
:
tree->add("Aaa/000");           // "000" is index 0 in Aaa's children
tree->add("Aaa/111");           // "111" is index 1 in Aaa's children
tree->add("Aaa/222");           // "222" is index 2 in Aaa's children
:
// How to use insert() to insert a new item between Aaa/111 + Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa"); // get parent item Aaa
if (item) tree->insert(item, "New item", 2); // insert as a child of Aaa at index #2
:
```

Parameters

in	<i>item</i>	The existing item to insert new child into. Must not be NULL.
in	<i>name</i>	The label for the new item
in	<i>pos</i>	The position of the new item in the child list

Returns

The new item added.

See also

[insert_above\(\)](#)

13.147.2.35 insert_above()

```
Fl_Tree_Item * Fl_Tree::insert_above (
    Fl_Tree_Item * above,
    const char * name )
```

Inserts a new item 'name' above the specified [Fl_Tree_Item](#) 'above'.

Example:

```

:
tree->add("Aaa/000");      // "000" is index 0 in Aaa's children
tree->add("Aaa/111");      // "111" is index 1 in Aaa's children
tree->add("Aaa/222");      // "222" is index 2 in Aaa's children
..
// How to use insert_above() to insert a new item above Aaa/222
Fl_Tree_Item *item = tree->find_item("Aaa/222"); // get item Aaa/222
if (item) tree->insert_above(item, "New item"); // insert new item above it
:

```

Parameters

in	<i>above</i>	– the item above which to insert the new item. Must not be NULL.
in	<i>name</i>	– the name of the new item

Returns

The new item added, or 0 if 'above' could not be found.

See also

[insert\(\)](#)

13.147.2.36 is_close() [1/2]

```

int Fl_Tree::is_close (
    const char * path ) const

```

See if item specified by 'path' is closed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_close("Holidays/12\25\2010")`.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")

Returns

- 1 - OK: item is closed
- 0 - OK: item is open
- -1 - ERROR: item was not found

13.147.2.37 is_close() [2/2]

```

int Fl_Tree::is_close (
    Fl_Tree_Item * item ) const

```

See if the specified 'item' is closed.

Parameters

in	<i>item</i>	– the item to be tested. Must not be NULL.

Returns

- 1 : item is closed
- 0 : item is open

13.147.2.38 is_hscroll_visible()

```
int Fl_Tree::is_hscroll_visible ( ) const
```

See if the horizontal scrollbar is currently visible.

Returns

1 if scrollbar visible, 0 if not.

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

13.147.2.39 is_open() [1/2]

```
int Fl_Tree::is_open (
    const char * path ) const
```

See if item specified by 'path' is open.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_open("← Holidays/12\25\2010")`.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")

Returns

- 1 - OK: item is open
- 0 - OK: item is closed
- -1 - ERROR: item was not found

See also

[Fl_Tree_Item::visible_r\(\)](#)

13.147.2.40 is_open() [2/2]

```
int Fl_Tree::is_open (
    Fl\_Tree\_Item * item ) const
```

See if 'item' is open.

Items that are 'open' are themselves not necessarily visible; one of the item's parents might be closed.

Parameters

in	<i>item</i>	– the item to be tested. Must not be NULL.

Returns

- 1 : item is open
- 0 : item is closed

13.147.2.41 is_scrollbar()

```
int Fl_Tree::is_scrollbar (
    Fl\_Widget * w )
```

See if widget 'w' is one of the [Fl_Tree](#) widget's scrollbars.

Use this to skip over the scrollbars when walking the `child()` array. Example:

```

:
for ( int i=0; i<tree->children(); i++ ) {    // walk children
    Fl_Widget *w = tree->child(i);
    if ( tree->is_scrollbar(w) ) continue;    // skip scrollbars
    ..do work here..
}
:

```

Parameters

in	<i>w</i>	Widget to test

Returns

1 if *w* is a scrollbar, 0 if not.

Todo should be const

13.147.2.42 `is_selected()` [1/2]

```

int Fl_Tree::is_selected (
    const char * path )

```

See if item specified by '*path*' is selected.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `is_selected("Holidays/12\25\2010")`.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")

Returns

- 1 : item selected
- 0 : item deselected
- -1 : item was not found

13.147.2.43 `is_selected()` [2/2]

```

int Fl_Tree::is_selected (
    Fl_Tree_Item * item ) const

```

See if the specified '*item*' is selected.

Parameters

in	<i>item</i>	– the item to be tested. Must not be NULL.

Returns

- 1 : item selected
- 0 : item deselected

13.147.2.44 `is_vscroll_visible()`

```

int Fl_Tree::is_vscroll_visible ( ) const

```

See if the vertical scrollbar is currently visible.

Returns

1 if scrollbar visible, 0 if not.

13.147.2.45 item_clicked() [1/2]

```
Fl_Tree_Item * Fl_Tree::item_clicked ( )
```

Return the item that was last clicked.

Valid only from within the [callback\(\)](#).

Returns

The item clicked, or 0 if none. 0 may also be used to indicate several items were clicked/changed.

Deprecated in 1.3.3 ABI – use [callback_item\(\)](#) instead.

13.147.2.46 item_clicked() [2/2]

```
void Fl_Tree::item_clicked (
    Fl_Tree_Item * item ) [protected]
```

Set the item that was last clicked.

Should only be used by subclasses needing to change this value. Normally [Fl_Tree](#) manages this value.

Deprecated in 1.3.3 ABI – use [callback_item\(\)](#) instead.

13.147.2.47 item_draw_mode() [1/3]

```
Fl_Tree_Item_Draw_Mode Fl_Tree::item_draw_mode ( ) const
```

Get the 'item draw mode' used for the tree.

Version

1.3.1 ABI feature

13.147.2.48 item_draw_mode() [2/3]

```
void Fl_Tree::item_draw_mode (
    Fl_Tree_Item_Draw_Mode mode )
```

Set the 'item draw mode' used for the tree to 'mode'.

This affects how items in the tree are drawn, such as when a [widget\(\)](#) is defined. See [Fl_Tree_Item_Draw_Mode](#) for possible values.

Version

1.3.1 ABI feature

13.147.2.49 item_draw_mode() [3/3]

```
void Fl_Tree::item_draw_mode (
    int mode )
```

Set the 'item draw mode' used for the tree to integer 'mode'.

This affects how items in the tree are drawn, such as when a [widget\(\)](#) is defined. See [Fl_Tree_Item_Draw_Mode](#) for possible values.

Version

1.3.1 ABI feature

13.147.2.50 item_labelbgcolor() [1/2]

```
void Fl_Tree::item_labelbgcolor (
    Fl_Color val )
```

Set the default label background color used for creating new items.

A special case is made for color 0xffffffff (default) which is treated as 'transparent'. To change the background color on a per-item basis, use [Fl_Tree_Item::labelbgcolor\(Fl_Color\)](#)

13.147.2.51 item_labelbgcolor() [2/2]

```
Fl_Color Fl_Tree::item_labelbgcolor (
    void ) const
```

Get the default label background color used for creating new items.

If the color is 0xffffffff, it is 'transparent'.

13.147.2.52 item_labelfgcolor()

```
void Fl_Tree::item_labelfgcolor (
    Fl_Color val )
```

Set the default label foreground color used for creating new items.

To change the foreground color on a per-item basis, use [Fl_Tree_Item::labelfgcolor\(Fl_Color\)](#)

13.147.2.53 item_labelfont()

```
void Fl_Tree::item_labelfont (
    Fl_Font val )
```

Set the default font face used for creating new items.

To change the font face on a per-item basis, use [Fl_Tree_Item::labelfont\(Fl_Font\)](#)

13.147.2.54 item_labelsize()

```
void Fl_Tree::item_labelsize (
    Fl_Fontsize val )
```

Set the default label font size used for creating new items.

To change the font size on a per-item basis, use [Fl_Tree_Item::labelsize\(Fl_Fontsize\)](#)

13.147.2.55 item_pathname()

```
int Fl_Tree::item_pathname (
    char * pathname,
    int pathnamelen,
    const Fl_Tree_Item * item ) const
```

Return 'pathname' of size 'pathnamelen' for the specified 'item'.

If 'item' is NULL, [root\(\)](#) is used.

The tree's root will be included in the pathname if [showroot\(\)](#) is on.

Menu items or submenus that contain slashes ('/' or '\') in their names will be escaped with a backslash. This is symmetrical with the [add\(\)](#) function which uses the same escape pattern to set names.

Parameters

out	<i>pathname</i>	The string to use to return the pathname
in	<i>pathnamelen</i>	The maximum length of the string (including NULL). Must not be zero.
in	<i>item</i>	The item whose pathname is to be returned.

Returns

- 0 : OK (*pathname* returns the item's pathname)
- -1 : item not found (*pathname*="")
- -2 : pathname not large enough (*pathname*="")

See also

[find_item\(\)](#)

13.147.2.56 item_reselect_mode() [1/2]

```
Fl_Tree_Item_Reselect_Mode Fl_Tree::item_reselect_mode ( ) const
```

Returns the current item re/selection mode.

Version

1.3.1 ABI feature

13.147.2.57 item_reselect_mode() [2/2]

```
void Fl_Tree::item_reselect_mode (
    Fl_Tree_Item_Reselect_Mode mode )
```

Sets the item re/selection mode.

See [Fl_Tree_Item_Reselect_Mode](#) for possible values.

Version

1.3.1 ABI feature

13.147.2.58 last()

```
Fl_Tree_Item * Fl_Tree::last ( )
```

Returns the last item in the tree.

This can be used to walk the tree in reverse, e.g.

```
for ( Fl_Tree_Item *item = tree->last(); item; item = tree->prev() )
    printf("Item: %s\n", item->label());
```

Returns

Last item in the tree, or 0 if none (tree empty).

See also

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

13.147.2.59 last_selected_item()

```
Fl_Tree_Item * Fl_Tree::last_selected_item ( )
```

Returns the last selected item in the tree.

Use this to walk the tree in reverse from bottom to top looking for all the selected items, e.g.

```
:
// Walk tree in reverse, from bottom to top
for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
    printf("Selected item: %s\n", i->label());
:
```

Returns

The last selected item, or 0 if none.

See also

[first_selected_item\(\)](#), [last_selected_item\(\)](#), [next_selected_item\(\)](#)

Version

1.3.3

13.147.2.60 last_visible()

```
Fl_Tree_Item * Fl_Tree::last_visible ( )
```

Returns the last [open\(\)](#), visible item in the tree.

Deprecated in 1.3.3 – use [last_visible_item\(\)](#) instead.

13.147.2.61 last_visible_item()

```
Fl_Tree_Item * Fl_Tree::last_visible_item ( )
```

Returns the last [open\(\)](#), visible item in the tree.

Returns

Last visible item in the tree, or 0 if none.

See also

[first_visible_item\(\)](#), [last_visible_item\(\)](#), [next_visible_item\(\)](#)

Version

1.3.3

13.147.2.62 load()

```
void Fl_Tree::load (
    class Fl_Preferences & prefs )
```

Load FLTK preferences.

Read a preferences database into the tree widget.

A preferences database is a hierarchical collection of data which can be directly loaded into the tree view for inspection.

Parameters

in	<i>prefs</i>	the Fl_Preferences database

13.147.2.63 next()

```
Fl_Tree_Item * Fl_Tree::next (
    Fl_Tree_Item * item = 0 )
```

Return the next item after 'item', or 0 if no more items.

Use this code to walk the entire tree:

```
:
for ( Fl_Tree_Item *i = tree->first(); i; i = tree->next(i) )
    printf("Item: %s\n", i->label());
:
```

Parameters

in	<i>item</i>	The item to use to find the next item. If NULL, returns 0.

Returns

Next item in tree, or 0 if at last item.

See also

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

13.147.2.64 next_item()

```
Fl_Tree_Item * Fl_Tree::next_item (
    Fl_Tree_Item * item,
    int dir = FL_Down,
    bool visible = false )
```

Returns next item after 'item' in direction 'dir' depending on 'visible'.

Next item will be above (if dir==FL_Up) or below (if dir==FL_Down). If 'visible' is true, only items whose parents are [open\(\)](#) will be returned. If 'visible' is false, even items whose parents are [close\(\)](#)ed will be returned.

If item is 0, the return value will be the result of this truth table:

	visible=true	visible=false
	-----	-----
dir=FL_Up:	last_visible_item()	last()
dir=FL_Down:	first_visible_item()	first()

Example use:

```
:
// Walk down the tree showing open(), visible items
for ( Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_item(i, FL_Down, true) )
    printf("Item: %s\n", i->label());

// Walk up the tree showing open(), visible items
for ( Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_item(i, FL_Up, true) )
    printf("Item: %s\n", i->label());

// Walk down the tree showing all items (open or closed)
for ( Fl_Tree_Item *i=tree->first(); i; i=tree->next_item(i, FL_Down, false) )
    printf("Item: %s\n", i->label());

// Walk up the tree showing all items (open or closed)
for ( Fl_Tree_Item *i=tree->last(); i; i=tree->next_item(i, FL_Up, false) )
    printf("Item: %s\n", i->label());
:
```

Parameters

in	<i>item</i>	The item to use to find the next item. If NULL, returns 0.
in	<i>dir</i>	Can be FL_Up or FL_Down (default=FL_Down or 'next')
in	<i>visible</i>	true=return only open() , visible items, false=return open or closed items (default)

Returns

Next item in tree in the direction and visibility specified, or 0 if no more items of specified visibility in that direction.

See also

[first\(\)](#), [last\(\)](#), [next\(\)](#),
[first_visible_item\(\)](#), [last_visible_item\(\)](#), [next_visible_item\(\)](#),
[first_selected_item\(\)](#), [last_selected_item\(\)](#), [next_selected_item\(\)](#)

Version

1.3.3

13.147.2.65 next_selected_item()

```
Fl_Tree_Item * Fl_Tree::next_selected_item (
    Fl_Tree_Item * item = 0,
    int dir = FL_Down )
```

Returns the next selected item above or below 'item', depending on 'dir'.

If 'item' is 0, search starts at either [first\(\)](#) or [last\(\)](#), depending on 'dir': [first\(\)](#) if 'dir' is FL_Down (default), [last\(\)](#) if 'dir' is FL_Up.

Use this to walk the tree looking for all the selected items, e.g.

```
:
// Walk down the tree (forwards)
for ( Fl_Tree_Item *i=tree->first_selected_item(); i; i=tree->next_selected_item(i, FL_Down) )
    printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for ( Fl_Tree_Item *i=tree->last_selected_item(); i; i=tree->next_selected_item(i, FL_Up) )
    printf("Item: %s\n", i->label());
:
```

Parameters

in	<i>item</i>	The item above or below which we'll find the next selected item. If NULL, first() is used if FL_Down, last() if FL_Up. (default=NULL)
in	<i>dir</i>	The direction to go. FL_Up for moving up the tree, FL_Down for down the tree (default)

Returns

The next selected item, or 0 if there are no more selected items.

See also

[first_selected_item\(\)](#), [last_selected_item\(\)](#), [next_selected_item\(\)](#)

Version

1.3.3

13.147.2.66 next_visible_item()

```
Fl_Tree_Item * Fl_Tree::next_visible_item (
    Fl_Tree_Item * item,
    int dir )
```

Returns next [open\(\)](#), visible item above (dir==FL_Up) or below (dir==FL_Down) the specified 'item', or 0 if no more items.

If 'item' is 0, returns [last\(\)](#) if 'dir' is FL_Up, or [first\(\)](#) if dir is FL_Down.

```
:
// Walk down the tree (forwards)
for ( Fl_Tree_Item *i=tree->first_visible_item(); i; i=tree->next_visible_item(i, FL_Down) )
    printf("Item: %s\n", i->label());

// Walk up the tree (backwards)
for ( Fl_Tree_Item *i=tree->last_visible_item(); i; i=tree->next_visible_item(i, FL_Up) )
    printf("Item: %s\n", i->label());
:
```

Parameters

in	<i>item</i>	The item above/below which we'll find the next visible item
in	<i>dir</i>	The direction to search. Can be FL_Up or FL_Down.

Returns

The item found, or 0 if there's no visible items above/below the specified `item`.

Version

1.3.3

13.147.2.67 open() [1/2]

```
int Fl_Tree::open (
    const char * path,
    int dcallback = 1 )
```

Opens the item specified by 'path'.

This causes the item's children (if any) to be shown.

Invokes the callback depending on the value of optional parameter 'dcallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `open("Holidays/12\25\2010")`.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>dcallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - callback() is not invoked • 1 - callback() is invoked if item changed (default), callback_reason() will be <code>FL_TREE_REASON_OPENED</code>

Returns

- 1 – OK: item opened
- 0 – OK: item was already open, no change
- -1 – ERROR: item was not found

See also

[open\(\)](#), [close\(\)](#), [is_open\(\)](#), [is_close\(\)](#), [callback_item\(\)](#), [callback_reason\(\)](#)

13.147.2.68 open() [2/2]

```
int Fl_Tree::open (
    Fl_Tree_Item * item,
    int dcallback = 1 )
```

Open the specified 'item'.

This causes the item's children (if any) to be shown.

Invokes the callback depending on the value of optional parameter 'dcallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	– the item to be opened. Must not be NULL.

Parameters

in	<i>docalcallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - callback() is not invoked • 1 - callback() is invoked if item changed (default), callback_reason() will be FL_TREE_REASON_OPENED

Returns

- 1 – item was opened
- 0 – item was already open, no change

See also

[open\(\)](#), [close\(\)](#), [is_open\(\)](#), [is_close\(\)](#), [callback_item\(\)](#), [callback_reason\(\)](#)

13.147.2.69 open_toggle()

```
void Fl_Tree::open_toggle (
    Fl_Tree_Item * item,
    int docalcallback = 1 )
```

Toggle the open state of 'item'.

Invokes the callback depending on the value of optional parameter 'docalcallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	– the item whose open state is to be toggled. Must not be NULL.
in	<i>docalcallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - callback() is not invoked • 1 - callback() is invoked (default), callback_reason() will be either FL_TREE_REASON_OPENED or FL_TREE_REASON_CLOSED

See also

[open\(\)](#), [close\(\)](#), [is_open\(\)](#), [is_close\(\)](#), [callback_item\(\)](#), [callback_reason\(\)](#)

13.147.2.70 openicon() [1/2]

```
Fl_Image * Fl_Tree::openicon ( ) const
```

Returns the icon to be used as the 'open' icon.

If none was set, the internal default is returned, a simple '[+]' icon.

13.147.2.71 openicon() [2/2]

```
void Fl_Tree::openicon (
    Fl_Image * val )
```

Sets the icon to be used as the 'open' icon.

This overrides the built in default '[+]' icon.

Parameters

in	val	– The new image, or zero to use the default [+] icon.

13.147.2.72 prev()

```
Fl_Tree_Item * Fl_Tree::prev (
    Fl_Tree_Item * item = 0 )
```

Return the previous item before 'item', or 0 if no more items.

This can be used to walk the tree in reverse, e.g.

```
:
for ( Fl_Tree_Item *item = tree->first(); item; item = tree->prev(item) )
    printf("Item: %s\n", item->label());
:
```

Parameters

in	item	The item to use to find the previous item. If NULL, returns 0.

Returns

Previous item in tree, or 0 if at first item.

[first\(\)](#), [next\(\)](#), [last\(\)](#), [prev\(\)](#)

13.147.2.73 recalc_tree()

```
void Fl_Tree::recalc_tree ( )
```

Schedule tree to recalc the entire tree size.

Note

Must be using FLTK ABI 1.3.3 or higher for this to be effective.

13.147.2.74 remove()

```
int Fl_Tree::remove (
    Fl_Tree_Item * item )
```

Remove the specified 'item' from the tree.

item may not be NULL. If it has children, all those are removed too. If item being removed has focus, no item will have focus.

Returns

0 if done, -1 if 'item' not found.

13.147.2.75 resize()

```
void Fl_Tree::resize (
    int X,
    int Y,
    int W,
    int H ) [override], [virtual]
```

Resizes the [Fl_Group](#) widget and all of its children.

The [Fl_Group](#) widget first resizes itself, and then it moves and resizes all its children according to the rules documented for [Fl_Group::resizable\(Fl_Widget*\)](#)

See also

[Fl_Group::resizable\(Fl_Widget*\)](#)

[Fl_Group::resizable\(\)](#)

[Fl_Widget::resize\(int,int,int,int\)](#)

Reimplemented from [Fl_Group](#).

13.147.2.76 root()

```
void Fl_Tree::root (
    Fl_Tree_Item * newitem )
```

Sets the root item to 'newitem'.

If a root item already exists, [clear\(\)](#) is called first to clear it before replacing it with newitem.

Use this to install a custom item (derived from [Fl_Tree_Item](#)) as the root of the tree. This allows the derived class to implement custom drawing by overriding [Fl_Tree_Item::draw_item_content\(\)](#).

Version

1.3.3

13.147.2.77 root_label()

```
void Fl_Tree::root_label (
    const char * new_label )
```

Set the label for the root item to 'new_label'.

Makes an internally managed copy of 'new_label'.

13.147.2.78 scrollbar_size() [1/2]

```
int Fl_Tree::scrollbar_size ( ) const
```

Gets the default size of scrollbars' troughs for this widget in pixels.

If this value is zero (default), this widget will use the global [Fl::scrollbar_size\(\)](#) value as the scrollbar's width.

Returns

Scrollbar size in pixels, or 0 if the global [Fl::scrollbar_size\(\)](#) is being used.

See also

[Fl::scrollbar_size\(int\)](#)

13.147.2.79 scrollbar_size() [2/2]

```
void Fl_Tree::scrollbar_size (
    int size )
```

Sets the pixel size of the scrollbars' troughs to 'size' for this widget, in pixels.

Normally you should not need this method, and should use the global [Fl::scrollbar_size\(int\)](#) instead to manage the size of ALL your widgets' scrollbars. This ensures your application has a consistent UI, and is the default behavior.

Normally this is what you want.

Only use this method if you really need to override just THIS instance of the widget's scrollbar size. (This need should be rare.)

Setting *size* to the special value of 0 causes the widget to track the global [Fl::scrollbar_size\(\)](#), which is the default.

Parameters

in	size	Sets the scrollbar size in pixels. If 0 (default), scrollbar size tracks the global Fl::scrollbar_size()

See also

[Fl::scrollbar_size\(\)](#)

13.147.2.80 select() [1/2]

```
int Fl_Tree::select (
    const char * path,
    int dcallback = 1 )
```

Select the item specified by 'path'.

Invokes the callback depending on the value of optional parameter 'dcallback'.

Handles calling [redraw\(\)](#) if anything changed.

Items or submenus that themselves contain slashes ('/' or '\') should be escaped, e.g. `select("← Holidays/12\25\2010")`.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>path</i>	– the tree item's pathname (e.g. "Flintstones/Fred")
in	<i>dcallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - the callback() is not invoked • 1 - the callback() is invoked if item changed state (default), callback_reason() will be FL_TREE_REASON_SELECTED

Returns

- 1 : OK: item's state was changed
- 0 : OK: item was already selected, no change was made
- -1 : ERROR: item was not found

13.147.2.81 select() [2/2]

```
int Fl_Tree::select (
    Fl_Tree_Item * item,
    int dcallback = 1 )
```

Select the specified 'item'.

Use '[deselect\(\)](#)' to deselect it.

Invokes the callback depending on the value of optional parameter `dcallback`.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	– the item to be selected. Must not be NULL.
in	<i>dcallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - the callback() is not invoked • 1 - the callback() is invoked if item changed state, callback_reason() will be FL_TREE_REASON_SELECTED

Returns

- 1 - item's state was changed
- 0 - item was already selected, no change was made

13.147.2.82 select_all()

```
int Fl_Tree::select_all (
    Fl_Tree_Item * item = 0,
    int docalldback = 1 )
```

Select 'item' and all its children.

If item is NULL, [first\(\)](#) is used.

Invokes the callback depending on the value of optional parameter 'docalldback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	The item that will be selected (along with all its children). If NULL, first() is used.
in	<i>docalldback</i>	– A flag that determines if the callback() is invoked or not: • 0 - the callback() is not invoked • 1 - the callback() is invoked for each item that changed state (default), callback_reason() will be FL_TREE_REASON_SELECTED

Returns

Count of how many items were actually changed to the selected state.

13.147.2.83 select_only()

```
int Fl_Tree::select_only (
    Fl_Tree_Item * selitem,
    int docalldback = 1 )
```

Select only the specified item, deselecting all others that might be selected.

If 'selitem' is 0, [first\(\)](#) is used.

Invokes the callback depending on the value of optional parameter 'docalldback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>selitem</i>	The item to be selected. If NULL, first() is used.
in	<i>docalldback</i>	– A flag that determines if the callback() is invoked or not: • 0 - the callback() is not invoked • 1 - the callback() is invoked for each item that changed state (default), callback_reason() will be either FL_TREE_REASON_SELECTED or FL_TREE_REASON_DESELECTED

Returns

The number of items whose selection states were changed, if any.

13.147.2.84 select_toggle()

```
void Fl_Tree::select_toggle (
    Fl_Tree_Item * item,
    int docallback = 1 )
```

Toggle the select state of the specified 'item'.

Invokes the callback depending on the value of optional parameter 'docallback'.

Handles calling [redraw\(\)](#) if anything changed.

The callback can use [callback_item\(\)](#) and [callback_reason\(\)](#) respectively to determine the item changed and the reason the callback was called.

Parameters

in	<i>item</i>	– the item to be selected. Must not be NULL.
in	<i>docallback</i>	– A flag that determines if the callback() is invoked or not: • 0 - the callback() is not invoked • 1 - the callback() is invoked (default), callback_reason() will be either <code>FL_TREE_REASON_SELECTED</code> or <code>FL_TREE_REASON_DESELECTED</code>

13.147.2.85 selectbox() [1/2]

```
Fl_Boxtype Fl_Tree::selectbox ( ) const
```

Sets the style of box used to draw selected items.

This is an fltk [Fl_Boxtype](#). The default is influenced by FLTK's current [Fl::scheme\(\)](#)

13.147.2.86 selectbox() [2/2]

```
void Fl_Tree::selectbox (
    Fl_Boxtype val )
```

Gets the style of box used to draw selected items.

This is an fltk [Fl_Boxtype](#). The default is influenced by FLTK's current [Fl::scheme\(\)](#)

13.147.2.87 selectmode() [1/2]

```
Fl_Tree_Select Fl_Tree::selectmode ( ) const
```

Gets the tree's current selection mode.

See [Fl_Tree_Select](#) for possible values.

13.147.2.88 selectmode() [2/2]

```
void Fl_Tree::selectmode (
    Fl_Tree_Select val )
```

Sets the tree's selection mode.

See [Fl_Tree_Select](#) for possible values.

13.147.2.89 set_item_focus()

```
void Fl_Tree::set_item_focus (
    Fl_Tree_Item * item )
```

Set the item that currently should have keyboard focus.

Handles calling [redraw\(\)](#) to update the focus box (if it is visible).

Parameters

in	<i>item</i>	The item that should take focus. If NULL, none will have focus.

13.147.2.90 show_item() [1/2]

```
void Fl_Tree::show_item (
    Fl_Tree_Item * item )
```

Adjust the vertical scrollbar to show '*item*' at the top of the display IF it is currently off-screen (for instance [show_item_top\(\)](#)).

If it is already on-screen, no change is made.

Parameters

in	<i>item</i>	The item to be shown. If NULL, first() is used.

See also

[show_item_top\(\)](#), [show_item_middle\(\)](#), [show_item_bottom\(\)](#)

13.147.2.91 show_item() [2/2]

```
void Fl_Tree::show_item (
    Fl_Tree_Item * item,
    int yoff )
```

Adjust the vertical scrollbar so that '*item*' is visible '*yoff*' pixels from the top of the [Fl_Tree](#) widget's display.

For instance, *yoff*=0 will position the item at the top.

If *yoff* is larger than the vertical scrollbar's limit, the value will be clipped. So if *yoff*=100, but scrollbar's max is 50, then 50 will be used.

Parameters

in	<i>item</i>	The item to be shown. If NULL, first() is used.
in	<i>yoff</i>	The pixel offset from the top for the displayed position.

See also

[show_item_top\(\)](#), [show_item_middle\(\)](#), [show_item_bottom\(\)](#)

13.147.2.92 show_item_bottom()

```
void Fl_Tree::show_item_bottom (
    Fl_Tree_Item * item )
```

Adjust the vertical scrollbar so that '*item*' is at the bottom of the display.

Parameters

in	<i>item</i>	The item to be shown. If NULL, first() is used.

13.147.2.93 show_item_middle()

```
void Fl_Tree::show_item_middle (
    Fl_Tree_Item * item )
```

Adjust the vertical scrollbar so that '*item*' is in the middle of the display.

Parameters

in	item	The item to be shown. If NULL, first() is used.

13.147.2.94 show_item_top()

```
void Fl_Tree::show_item_top (
    Fl_Tree_Item * item )
```

Adjust the vertical scrollbar so that 'item' is at the top of the display.

Parameters

in	item	The item to be shown. If NULL, first() is used.

13.147.2.95 show_self()

```
void Fl_Tree::show_self ( )
```

Print the tree as 'ascii art' to stdout.
Used mainly for debugging.

Todo should be const

Version

1.3.0

13.147.2.96 showcollapse() [1/2]

```
int Fl_Tree::showcollapse ( ) const
```

Returns 1 if the collapse icon is enabled, 0 if not.

See also

[showcollapse\(int\)](#)

13.147.2.97 showcollapse() [2/2]

```
void Fl_Tree::showcollapse (
    int val )
```

Set if we should show the collapse icon or not.

If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via [open\(\)](#) and [close\(\)](#).

Parameters

in	val	1: shows collapse icons (default), 0: hides collapse icons.

13.147.2.98 showroot()

```
void Fl_Tree::showroot (
    int val )
```

Set if the root item should be shown or not.

Parameters

in	val	1 – show the root item (default) 0 – hide the root item.

13.147.2.99 sortorder()

```
Fl_Tree_Sort Fl_Tree::sortorder ( ) const
```

Set the default sort order used when items are added to the tree.

See [Fl_Tree_Sort](#) for possible values.

13.147.2.100 usericon() [1/2]

```
Fl_Image * Fl_Tree::usericon ( ) const
```

Returns the [Fl_Image](#) being used as the default user icon for all newly created items.

Returns zero if no icon has been set, which is the default.

13.147.2.101 usericon() [2/2]

```
void Fl_Tree::usericon (
    Fl_Image * val )
```

Sets the [Fl_Image](#) to be used as the default user icon for all newly created items.

If you want to specify user icons on a per-item basis, use [Fl_Tree_Item::usericon\(\)](#) instead.

Parameters

in	val	– The new image to be used, or zero to disable user icons.

13.147.2.102 vposition() [1/2]

```
int Fl_Tree::vposition ( ) const
```

Returns the vertical scroll position as a pixel offset.

The position returned is how many pixels of the tree are scrolled off the top edge of the screen.

See also

[vposition\(int\)](#), [hposition\(\)](#), [hposition\(int\)](#)

13.147.2.103 vposition() [2/2]

```
void Fl_Tree::vposition (
    int pos )
```

Sets the vertical scroll offset to position 'pos'.

The position is how many pixels of the tree are scrolled off the top edge of the screen.

Parameters

in	pos	The vertical position (in pixels) to scroll the tree to.

See also

[vposition\(\)](#), [hposition\(\)](#), [hposition\(int\)](#)

The documentation for this class was generated from the following files:

- [Fl_Tree.H](#)
- [Fl_Tree.cxx](#)

13.148 Fl_Tree_Item Class Reference

Tree widget item.

```
#include <Fl_Tree_Item.H>
```

Public Member Functions

- void **activate** (int val=1)
Change the item's activation state to the optionally specified 'val'.
- **Fl_Tree_Item** * **add** (const **Fl_Tree_Prefs** &prefs, char **arr)
Descend into the path specified by 'arr', and add a new child there.
- **Fl_Tree_Item** * **add** (const **Fl_Tree_Prefs** &prefs, char **arr, **Fl_Tree_Item** *newitem)
Descend into path specified by 'arr' and add 'newitem' there.
- **Fl_Tree_Item** * **add** (const **Fl_Tree_Prefs** &prefs, const char *new_label)
Add a new child to this item with the name 'new_label' and defaults from 'prefs'.
- **Fl_Tree_Item** * **add** (const **Fl_Tree_Prefs** &prefs, const char *new_label, **Fl_Tree_Item** *newitem)
Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.
- **Fl_Tree_Item** * **child** (int index)
Return the child item for the given 'index'.
- const **Fl_Tree_Item** * **child** (int t) const
Return the const child item for the given 'index'.
- int **children** () const
Return the number of children this item has.
- void **clear_children** ()
Clear all the children for this item.
- void **close** ()
Close this item and all its children.
- void **deactivate** ()
Deactivate the item; the callback() won't be invoked when clicked.
- **Fl_Tree_Item** * **deparent** (int index)
Deparent child at index position 'pos'.
- int **depth** () const
Returns how many levels deep this item is in the hierarchy.
- void **deselect** ()
Disable the item's selection state.
- int **deselect_all** ()
Deselect item and all its children.
- void **draw** (int X, int &Y, int W, **Fl_Tree_Item** *itemfocus, int &tree_item_xmax, int lastchild=1, int render=1)
Draw this item and its children.
- virtual int **draw_item_content** (int render)
Draw the item content.
- int **event_on_collapse_icon** (const **Fl_Tree_Prefs** &prefs) const
Was the event on the 'collapse' button of this item?
- int **event_on_item** (const **Fl_Tree_Prefs** &prefs) const
Was event anywhere on the item?
- int **event_on_label** (const **Fl_Tree_Prefs** &prefs) const
Was event on the [label\(\)](#) of this item?
- int **event_on_user_icon** (const **Fl_Tree_Prefs** &prefs) const
Was the event on the 'user icon' of this item, if any?
- int **find_child** (const char *name)
Return the index of the immediate child of this item that has the label 'name'.
- int **find_child** (**Fl_Tree_Item** *item)

- Find the index number for the specified 'item' in the current item's list of children.*

 - [FI_Tree_Item](#) * **find_child_item** (char **arr)

*Non-const version of [FI_Tree_Item::find_child_item\(char **arr\)](#) const.*

 - const [FI_Tree_Item](#) * **find_child_item** (char **arr) const

Find child item by descending array 'arr' of names.

 - [FI_Tree_Item](#) * **find_child_item** (const char *name)

*Non-const version of [FI_Tree_Item::find_child_item\(const char *name\)](#) const.*

 - const [FI_Tree_Item](#) * **find_child_item** (const char *name) const

Return the /immediate/ child of current item that has the label 'name'.

 - [FI_Tree_Item](#) * **find_clicked** (const [FI_Tree_Prefs](#) &prefs, int yonly=0)

Non-const version of [FI_Tree_Item::find_clicked\(const FI_Tree_Prefs&,int\)](#) const.

 - const [FI_Tree_Item](#) * **find_clicked** (const [FI_Tree_Prefs](#) &prefs, int yonly=0) const

Find the item that the last event was over.

 - [FI_Tree_Item](#) * **find_item** (char **arr)

*Non-const version of [FI_Tree_Item::find_item\(char **names\)](#) const.*

 - const [FI_Tree_Item](#) * **find_item** (char **arr) const

Find item by descending array of 'names'.

 - [FI_Tree_Item](#) (const [FI_Tree_Item](#) *o)

Copy constructor.

 - [FI_Tree_Item](#) (const [FI_Tree_Prefs](#) &prefs)

Constructor.

 - [FI_Tree_Item](#) ([FI_Tree](#) *tree)

Constructor.

 - int **h** () const

The item's height.

 - int **has_children** () const

See if this item has children.

 - [FI_Tree_Item](#) * **insert** (const [FI_Tree_Prefs](#) &prefs, const char *new_label, int pos=0)

Insert a new item named 'new_label' into current item's children at a specified position 'pos'.

 - [FI_Tree_Item](#) * **insert_above** (const [FI_Tree_Prefs](#) &prefs, const char *new_label)

Insert a new item named 'new_label' above this item.

 - char **is_activated** () const

See if the item is activated.

 - char **is_active** () const

See if the item is activated. Alias for [is_activated\(\)](#).

 - int **is_close** () const

See if the item is 'closed'.

 - int **is_open** () const

See if the item is 'open'.

 - int **is_root** () const

Is this item the root of the tree?

 - char **is_selected** () const

See if the item is selected.

 - int **is_visible** () const

See if the item is visible.

 - int [is_visible_r](#) () const

See if item and all its parents are [open\(\)](#) and [visible\(\)](#).

 - const char * **label** () const

Return the label.

 - void **label** (const char *val)

Set the label to 'name'.

- `int label_h () const`
The item's label height.
- `int label_w () const`
The item's maximum label width to right edge of `Fl_Tree`'s inner width within scrollbars.
- `int label_x () const`
The item's label x position relative to the window.
- `int label_y () const`
The item's label y position relative to the window.
- `Fl_Color labelbgcolor () const`
Return item's label background text color.
- `void labelbgcolor (Fl_Color val)`
Set item's label background color.
- `Fl_Color labelcolor () const`
Return item's label text color. Alias for `labelfgcolor()` const).
- `void labelcolor (Fl_Color val)`
Set item's label text color. Alias for `labelfgcolor(Fl_Color)`.
- `Fl_Color labelfgcolor () const`
Return item's label foreground text color.
- `void labelfgcolor (Fl_Color val)`
Set item's label foreground text color.
- `Fl_Font labelfont () const`
Get item's label font face.
- `void labelfont (Fl_Font val)`
Set item's label font face.
- `Fl_Fonsize labelsize () const`
Get item's label font size.
- `void labelsize (Fl_Fonsize val)`
Set item's label font size.
- `int move (Fl_Tree_Item *item, int op=0, int pos=0)`
Move the current item above/below/into the specified 'item', where 'op' determines the type of move:
- `int move (int to, int from)`
Move an item within its parent using index numbers.
- `int move_above (Fl_Tree_Item *item)`
Move the current item above the specified 'item'.
- `int move_below (Fl_Tree_Item *item)`
Move the current item below the specified 'item'.
- `int move_into (Fl_Tree_Item *item, int pos=0)`
Parent the current item as a child of the specified 'item'.
- `Fl_Tree_Item * next ()`
Return the next item in the tree.
- `Fl_Tree_Item * next_displayed (Fl_Tree_Prefs &prefs)`
Same as `next_visible()`.
- `Fl_Tree_Item * next_sibling ()`
Return this item's next sibling.
- `Fl_Tree_Item * next_visible (Fl_Tree_Prefs &prefs)`
Return the next `open()`, `visible()` item.
- `void open ()`
Open this item and all its children.
- `void open_toggle ()`
Toggle the item's open/closed state.
- `Fl_Tree_Item * parent ()`

- Return the parent for this item. Returns NULL if we are the root.*

 - const [FI_Tree_Item](#) * **parent** () const
- Return the const parent for this item. Returns NULL if we are the root.*

 - void [parent](#) ([FI_Tree_Item](#) *val)
- Set the parent for this item.*

 - const [FI_Tree_Prefs](#) & **prefs** () const
- Return the parent tree's prefs.*

 - [FI_Tree_Item](#) * **prev** ()
- Return the previous item in the tree.*

 - [FI_Tree_Item](#) * **prev_displayed** ([FI_Tree_Prefs](#) &prefs)
- Same as [prev_visible\(\)](#).*

 - [FI_Tree_Item](#) * **prev_sibling** ()
- Return this item's previous sibling.*

 - [FI_Tree_Item](#) * **prev_visible** ([FI_Tree_Prefs](#) &prefs)
- Return the previous [open\(\)](#), [visible\(\)](#) item.*

 - int **remove_child** (const char *new_label)
- Remove immediate child (and its children) by its label 'name'.*

 - int **remove_child** ([FI_Tree_Item](#) *item)
- Remove 'item' from the current item's children.*

 - int **reparent** ([FI_Tree_Item](#) *newchild, int index)
- Reparent specified item as a child of ourself at position 'pos'.*

 - [FI_Tree_Item](#) * **replace** ([FI_Tree_Item](#) *new_item)
- Replace the current item with a new item.*

 - [FI_Tree_Item](#) * **replace_child** ([FI_Tree_Item](#) *olditem, [FI_Tree_Item](#) *newitem)
- Replace existing child 'olditem' with 'newitem'.*

 - void **select** (int val=1)
- Change the item's selection state to the optionally specified 'val'.*

 - int **select_all** ()
- Select item and all its children.*

 - void **select_toggle** ()
- Toggle the item's selection state.*

 - void **show_self** (const char *indent="") const
- Print the tree as 'ascii art' to stdout.*

 - int **swap_children** ([FI_Tree_Item](#) *a, [FI_Tree_Item](#) *b)
- Swap two of our immediate children, given item pointers.*

 - void **swap_children** (int ax, int bx)
- Swap two of our children, given two child index values 'ax' and 'bx'.*

 - [FI_Tree](#) * **tree** ()
- Return the tree for this item.*

 - const [FI_Tree](#) * **tree** () const
- Return the tree for this item.*

 - void **update_prev_next** (int index)
- Update our [_prev_sibling](#) and [_next_sibling](#) pointers to point to neighbors given [index](#) as being our current position in the parent's item array.*

 - void * **user_data** () const
- Retrieve the user-data value that has been assigned to the item.*

 - void **user_data** (void *data)
- Set a user-data value for the item.*

 - [FI_Image](#) * **userdeicon** () const
- Return the deactivated version of the user icon, if any.*

 - void **userdeicon** ([FI_Image](#) *val)

- Set the usericon to draw when the item is deactivated.*

 - `Fl_Image * usericon ()` const

Get the item's user icon as an `Fl_Image`. Returns '0' if disabled.

- `void usericon (Fl_Image *val)`

Set the item's user icon to an `Fl_Image`.

- `int visible ()` const

See if the item is visible. Alias for `is_visible()`.

- `int visible_r ()` const

See if item and all its parents are `open()` and `visible()`.

- `int w ()` const

The entire item's width to right edge of `Fl_Tree`'s inner width within scrollbars.

- `Fl_Widget * widget ()` const

Return FLTK widget assigned to this item.

- `void widget (Fl_Widget *val)`

Assign an FLTK widget to this item.

- `int x ()` const

The item's x position relative to the window.

- `int y ()` const

The item's y position relative to the window.

Protected Member Functions

- `void _Init (const Fl_Tree_Prefs &prefs, Fl_Tree *tree)`
- `int calc_item_height (const Fl_Tree_Prefs &prefs)` const

Return the item's 'visible' height.

- `virtual void draw_horizontal_connector (int x1, int x2, int y, const Fl_Tree_Prefs &prefs)`

Horizontal connector line based on preference settings.

- `virtual void draw_vertical_connector (int x, int y1, int y2, const Fl_Tree_Prefs &prefs)`

Vertical connector line based on preference settings.

- `Fl_Color drawbgcolor ()` const

Returns the recommended background color used for drawing this item.

- `Fl_Color drawfgcolor ()` const

Returns the recommended foreground color used for drawing this item.

- `void hide_widgets ()`

Internal: Hide the FLTK `widget()` for this item and all children.

- `int is_flag (unsigned short val)` const

See if flag set. Returns 0 or 1.

- `void recalc_tree ()`

Call this when our geometry is changed.

- `void set_flag (unsigned short flag, int val)`

Set a flag to an on or off value. val is 0 or 1.

- `void show_widgets ()`

Internal: Show the FLTK `widget()` for this item and all children.

13.148.1 Detailed Description

Tree widget item.

This class is a single tree item, and manages all of the item's attributes. `Fl_Tree_Item` is used by `Fl_Tree`, which is comprised of many instances of `Fl_Tree_Item`.

`Fl_Tree_Item` is hierarchical; it dynamically manages an `Fl_Tree_Item_Array` of children that are themselves instances of `Fl_Tree_Item`. Each item can have zero or more children. When an item has children, `close()` and `open()` can be used to hide or show them.

Items have their own attributes; font size, face, color. Items maintain their own hierarchy of children.

When you make changes to items, you'll need to tell the tree to `redraw()` for the changes to show up.

New 1.3.3 ABI feature: You can define custom items by either adding a custom widget to the item with `Fl_Tree_Item::widget()`, or override the `draw_item_content()` method if you want to just redefine how the label is drawn.

The following shows the `Fl_Tree_Item`'s dimensions, useful when overriding the `draw_item_content()` method:

Figure 13.65 `Fl_Tree_Item`'s internal dimensions.

13.148.2 Constructor & Destructor Documentation

13.148.2.1 `Fl_Tree_Item()` [1/2]

```
Fl_Tree_Item::Fl_Tree_Item (
    const Fl_Tree_Prefs & prefs )
```

Constructor.

Makes a new instance of `Fl_Tree_Item` using defaults from 'prefs'.

Deprecated in 1.3.3 ABI – you must use `Fl_Tree_Item(Fl_Tree*)` for proper horizontal scrollbar behavior.

13.148.2.2 `Fl_Tree_Item()` [2/2]

```
Fl_Tree_Item::Fl_Tree_Item (
    Fl_Tree * tree )
```

Constructor.

Makes a new instance of `Fl_Tree_Item` for 'tree' with an empty label (''). It's up to you to set the `label()` of the item before adding it to the tree so that it draws the item's name, and helps methods like `Fl_Tree::find_item(path)` find the item by name.

This must be used instead of the older, deprecated `Fl_Tree_Item(Fl_Tree_Prefs)` constructor for proper horizontal scrollbar calculation.

Version

1.3.3 ABI feature

13.148.3 Member Function Documentation

13.148.3.1 `activate()`

```
void Fl_Tree_Item::activate (
    int val = 1 ) [inline]
```

Change the item's activation state to the optionally specified 'val'.

When deactivated, the item will be 'grayed out'; the `callback()` won't be invoked if the user clicks on the label. If a `widget()` is associated with the item, its activation state will be changed as well.

If 'val' is not specified, the item will be activated.

13.148.3.2 add() [1/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
    const Fl_Tree_Prefs & prefs,
    char ** arr )
```

Descend into the path specified by 'arr', and add a new child there.

Should be used only by [Fl_Tree](#)'s internals. Adds the item based on the value of prefs.sortorder().

Returns

the item added.

Version

1.3.0 release

13.148.3.3 add() [2/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
    const Fl_Tree_Prefs & prefs,
    char ** arr,
    Fl_Tree_Item * newitem )
```

Descend into path specified by 'arr' and add 'newitem' there.

Should be used only by [Fl_Tree](#)'s internals. If item is NULL, a new item is created. Adds the item based on the value of prefs.sortorder().

Returns

the item added.

Version

1.3.3 ABI feature

13.148.3.4 add() [3/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
    const Fl_Tree_Prefs & prefs,
    const char * new_label )
```

Add a new child to this item with the name 'new_label' and defaults from 'prefs'.

An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

Returns

the item added

Version

1.3.0 release

13.148.3.5 add() [4/4]

```
Fl_Tree_Item * Fl_Tree_Item::add (
    const Fl_Tree_Prefs & prefs,
    const char * new_label,
    Fl_Tree_Item * item )
```

Add 'item' as immediate child with 'new_label' and defaults from 'prefs'.

If 'item' is NULL, a new item is created. An internally managed copy is made of the label string. Adds the item based on the value of prefs.sortorder().

Returns

the item added

Version

1.3.3

13.148.3.6 calc_item_height()

```
int Fl_Tree_Item::calc_item_height (
    const Fl_Tree_Prefs & prefs ) const [protected]
```

Return the item's 'visible' height.

Takes into account the item's:

- visibility (if `!is_visible()`, returns 0)
- `labelfont()` height: if `label()` != NULL
- `widget()` height: if `widget()` != NULL
- `openicon()` height (if has children)
- `usericon()` height (if not NULL) Does NOT include `Fl_Tree::linespacing()`;

Returns

maximum pixel height

13.148.3.7 child()

```
const Fl_Tree_Item * Fl_Tree_Item::child (
    int t ) const
```

Return the const child item for the given 'index'.

Return const child item for the specified 'index'.

13.148.3.8 deactivate()

```
void Fl_Tree_Item::deactivate ( ) [inline]
```

Deactivate the item; the callback() won't be invoked when clicked.

Same as `activate(0)`

13.148.3.9 deparent()

```
Fl_Tree_Item * Fl_Tree_Item::deparent (
    int pos )
```

Deparent child at index position 'pos'.

This creates an "orphaned" item that is still allocated, but has no parent or siblings. Normally the caller would want to immediately reparent the orphan elsewhere.

A successfully orphaned item will have its `parent()` and `prev_sibling()/next_sibling()` set to NULL.

Returns

- pointer to orphaned item on success
- NULL on error (could not deparent the item)

See also

[reparent\(\)](#)

13.148.3.10 depth()

```
int Fl_Tree_Item::depth ( ) const
```

Returns how many levels deep this item is in the hierarchy.

For instance; root has a depth of zero, and its immediate children would have a depth of 1, and so on. Use e.g. for determining the horizontal indent of this item during drawing.

13.148.3.11 deselect_all()

```
int Fl_Tree_Item::deselect_all ( ) [inline]
```

Deselect item and all its children.

Returns count of how many items were in the 'selected' state, ie. how many items were "changed".

13.148.3.12 draw()

```
void Fl_Tree_Item::draw (
    int X,
    int & Y,
    int W,
    Fl_Tree_Item * itemfocus,
    int & tree_item_xmax,
    int lastchild = 1,
    int render = 1 )
```

Draw this item and its children.

Parameters

in	<i>X</i>	Horizontal position for item being drawn
in, out	<i>Y</i>	Vertical position for item being drawn, returns new position for next item
in	<i>W</i>	Recommended width for item
in	<i>itemfocus</i>	The tree's current focus item (if any)
in, out	<i>tree_item_xmax</i>	The tree's running xmax (right-most edge so far). Mainly used by parent tree when render==0 to calculate tree's max width.
in	<i>lastchild</i>	Is this item the last child in a subtree?
in	<i>render</i>	Whether or not to render the item: 0: no rendering, just calculate size w/out drawing. 1: render item as well as size calc

Version

1.3.3 ABI feature: modified parameters

13.148.3.13 draw_horizontal_connector()

```
void Fl_Tree_Item::draw_horizontal_connector (
    int x1,
    int x2,
    int y,
    const Fl_Tree_Prefs & prefs ) [protected], [virtual]
```

Horizontal connector line based on preference settings.

This method can be overridden to implement custom connection line drawing.

Parameters

in	<i>x1</i>	The left hand X position of the horizontal connector
in	<i>x2</i>	The right hand X position of the horizontal connector
in	<i>y</i>	The vertical position of the horizontal connector
in	<i>prefs</i>	The Fl_Tree prefs

13.148.3.14 draw_item_content()

```
int Fl_Tree_Item::draw_item_content (
    int render ) [virtual]
```

Draw the item content.

This method can be overridden to implement custom drawing by filling the `label_[xywh]()` area with content.

A minimal example of how to override `draw_item_content()` and draw just a normal item's background and label ourselves:

```
class MyTreeItem : public Fl_Tree_Item {
public:
    MyTreeItem(Fl_Tree *tree_val) : Fl_Tree_Item(tree_val) { }
    // DRAW OUR CUSTOM CONTENT FOR THE ITEM
    int draw_item_content(int render) {
        // Our item's dimensions + text content
        int X=label_x(), Y=label_y(), W=label_w(), H=label_h();
        const char *text = label() ? label() : "";
        // Rendering? Do any drawing that's needed
        if ( render ) {
            // Draw bg -- a filled rectangle
            fl_color(drawbgcolor()); fl_rectf(X,Y,W,H);
            // Draw label
            fl_font(labelfont(), labelsize()); // use item's label font/size
            fl_color(drawfgcolor()); // use recommended fg color
            fl_draw(text, X,Y,W,H, FL_ALIGN_LEFT); // draw the item's label
        }
        // Rendered or not, we must calculate content's max X position
        int lw=0, lh=0;
        fl_measure(text, lw, lh); // get width of label text
        return X + lw; // return X + label width
    }
};
```

You can draw anything you want inside `draw_item_content()` using any of the `fl_draw.H` functions, as long as it's within the label's xywh area.

To add instances of your custom item to the tree, you can use, e.g.:

```
// Example #1: using add()
MyTreeItem *item = new MyTreeItem(tree); // class derived from Fl_Tree_Item
item->label("Bart");
tree->add("/Simpsons/.", item); // Adds custom item as "/Simpsons/Bart"

..or you can insert or replace existing items:
// Example #2: using replace()
MyTreeItem *marge = new MyTreeItem(tree); // class derived from Fl_Tree_Item
marge->label("Marge");
Fl_Tree_Item *item = tree->add("/Simpsons/Marge"); // create default item
item->replace(marge); // replace default item with custom item
```

Parameters

in	<i>render</i>	Whether we should render content (1), or just tally the geometry (0). <code>Fl_Tree</code> may want only to find the widest item in the tree for scrollbar calculations.

Returns

the right-most X coordinate, or 'xmax' of content we drew, i.e. the "scrollable" content. The tree uses the largest xmax to determine the maximum width of the tree's content (needed for e.g. computing the horizontal scrollbar's size).

Version

1.3.3 ABI feature

13.148.3.15 draw_vertical_connector()

```
void Fl_Tree_Item::draw_vertical_connector (
    int x,
    int y1,
    int y2,
    const Fl_Tree_Prefs & prefs ) [protected], [virtual]
```

Vertical connector line based on preference settings.

This method can be overridden to implement custom connection line drawing.

Parameters

in	<i>x</i>	The x position of the vertical connector
in	<i>y1</i>	The top of the vertical connector
in	<i>y2</i>	The bottom of the vertical connector
in	<i>prefs</i>	The Fl_Tree prefs

13.148.3.16 drawbgcolor()

```
Fl_Color Fl_Tree_Item::drawbgcolor ( ) const [protected]
```

Returns the recommended background color used for drawing this item.

See also

[draw_item_content\(\)](#)

Version

1.3.3 ABI

13.148.3.17 drawfgcolor()

```
Fl_Color Fl_Tree_Item::drawfgcolor ( ) const [protected]
```

Returns the recommended foreground color used for drawing this item.

See also

[draw_item_content\(\)](#)

Version

1.3.3 ABI ABI

13.148.3.18 find_child() [1/2]

```
int Fl_Tree_Item::find_child (
    const char * name )
```

Return the index of the immediate child of this item that has the label 'name'.

Returns

index of found item, or -1 if not found.

Version

1.3.0 release

13.148.3.19 find_child() [2/2]

```
int Fl_Tree_Item::find_child (
    Fl_Tree_Item * item )
```

Find the index number for the specified 'item' in the current item's list of children.

Returns

the index, or -1 if not found.

13.148.3.20 find_child_item() [1/2]

```
const Fl_Tree_Item * Fl_Tree_Item::find_child_item (
    char ** arr ) const
```

Find child item by descending array 'arr' of names.

Does not include self in search. Only [Fl_Tree](#) should need this method.

Returns

item, or 0 if not found

Version

1.3.0 release

13.148.3.21 find_child_item() [2/2]

```
const Fl_Tree_Item * Fl_Tree_Item::find_child_item (
    const char * name ) const
```

Return the /immediate/ child of current item that has the label 'name'.

Returns

const found item, or 0 if not found.

Version

1.3.3

13.148.3.22 find_clicked()

```
const Fl_Tree_Item * Fl_Tree_Item::find_clicked (
    const Fl_Tree_Prefs & prefs,
    int yonly = 0 ) const
```

Find the item that the last event was over.

If 'yonly' is 1, only check event's y value, don't care about x.

Parameters

in	<i>prefs</i>	The parent tree's Fl_Tree_Prefs
in	<i>yonly</i>	– 0: check both event's X and Y values. – 1: only check event's Y value, don't care about X.

Returns

pointer to clicked item, or NULL if none found

Version

1.3.3 ABI feature

13.148.3.23 find_item()

```
const Fl_Tree_Item * Fl_Tree_Item::find_item (
    char ** names ) const
```

Find item by descending array of 'names'.

Includes self in search. Only [Fl_Tree](#) should need this method. Use [Fl_Tree::find_item\(\)](#) instead.

Returns

const item, or 0 if not found

13.148.3.24 hide_widgets()

```
void Fl_Tree_Item::hide_widgets ( ) [protected]
```

Internal: Hide the FLTK [widget\(\)](#) for this item and all children.

Used by [close\(\)](#) to hide widgets.

13.148.3.25 insert()

```
Fl_Tree_Item * Fl_Tree_Item::insert (
    const Fl_Tree_Prefs & prefs,
    const char * new_label,
    int pos = 0 )
```

Insert a new item named 'new_label' into current item's children at a specified position 'pos'.

If pos is out of range the new item is

- prepended if pos < 0 or
- appended if pos > item->[children\(\)](#).

Returns

the new item inserted

See also

[Fl_Tree::insert\(\)](#)

13.148.3.26 insert_above()

```
Fl_Tree_Item * Fl_Tree_Item::insert_above (
    const Fl_Tree_Prefs & prefs,
    const char * new_label )
```

Insert a new item named 'new_label' above this item.

Returns

the new item inserted, or 0 if an error occurred.

13.148.3.27 is_visible_r()

```
int Fl_Tree_Item::is_visible_r ( ) const
```

See if item and all its parents are [open\(\)](#) and [visible\(\)](#).

Returns

1 – item and its parents are [open\(\)](#) and [visible\(\)](#) 0 – item or one of its parents are either not [visible\(\)](#) or [close\(\)](#)ed.

13.148.3.28 label()

```
void Fl_Tree_Item::label (
    const char * name )
```

Set the label to 'name'.

Makes and manages an internal copy of 'name'.

13.148.3.29 label_h()

```
int Fl_Tree_Item::label_h ( ) const [inline]
```

The item's label height.

Version

1.3.3

13.148.3.30 label_w()

```
int Fl_Tree_Item::label_w ( ) const [inline]
```

The item's maximum label width to right edge of [Fl_Tree](#)'s inner width within scrollbars.

Version

1.3.3

13.148.3.31 label_x()

```
int Fl_Tree_Item::label_x ( ) const [inline]
```

The item's label x position relative to the window.

Version

1.3.3

13.148.3.32 label_y()

```
int Fl_Tree_Item::label_y ( ) const [inline]
```

The item's label y position relative to the window.

Version

1.3.3

13.148.3.33 labelbgcolor() [1/2]

```
Fl_Color Fl_Tree_Item::labelbgcolor ( ) const [inline]
```

Return item's label background text color.

If the color is 0xffffffff, the default behavior is the parent tree's bg color will be used. (An overloaded [draw_item_content\(\)](#) can override this behavior.)

13.148.3.34 labelbgcolor() [2/2]

```
void Fl_Tree_Item::labelbgcolor (
    Fl_Color val ) [inline]
```

Set item's label background color.

A special case is made for color 0xffffffff which uses the parent tree's bg color.

13.148.3.35 move() [1/2]

```
int Fl_Tree_Item::move (
    Fl_Tree_Item * item,
    int op = 0,
    int pos = 0 )
```

Move the current item above/below/into the specified 'item', where 'op' determines the type of move:

- 0: move above 'item' ('pos' ignored)
- 1: move below 'item' ('pos' ignored)
- 2: move into 'item' as a child (at optional position 'pos')

..and 'pos' determines an optional index position after the move.

Returns

0 on success. a negative number on error:

- -1: one of the items has no parent
- -2: item's index could not be determined
- -3: bad 'op'
- -4: index range error
- -5: could not deparent
- -6: could not reparent at 'pos'
- (Other return values reserved for future use.)

See also

[move_above\(\)](#), [move_below\(\)](#), [move_into\(\)](#), [move\(int,int\)](#)

13.148.3.36 move() [2/2]

```
int Fl_Tree_Item::move (
    int to,
    int from )
```

Move an item within its parent using index numbers.

Item is moved 'to' its new position 'from' its old position.

Returns

- 0: Success
- -1: range error (e.g. if 'to' or 'from' out of range).
- (Other return values reserved for future use)

See also

[move_above\(\)](#), [move_below\(\)](#), [move_into\(\)](#), [move\(Fl_Tree_Item*,int,int\)](#)

13.148.3.37 move_above()

```
int Fl_Tree_Item::move_above (
    Fl_Tree_Item * item )
```

Move the current item above the specified 'item'.

This is the equivalent of calling `move(item,0,0)`.

Returns

0 on success.

On error returns a negative value; see [move\(Fl_Tree_Item*,int,int\)](#) for possible error codes.

See also

[move_below\(\)](#), [move_into\(\)](#), [move\(int,int\)](#), [move\(Fl_Tree_Item*,int,int\)](#)

13.148.3.38 move_below()

```
int Fl_Tree_Item::move_below (
    Fl_Tree_Item * item )
```

Move the current item below the specified 'item'.

This is the equivalent of calling `move(item,1,0)`.

Returns

0 on success.

On error returns a negative value; see [move\(Fl_Tree_Item*,int,int\)](#) for possible error codes.

See also

[move_above\(\)](#), [move_into\(\)](#), [move\(int,int\)](#), [move\(Fl_Tree_Item*,int,int\)](#)

13.148.3.39 move_into()

```
int Fl_Tree_Item::move_into (
    Fl_Tree_Item * item,
    int pos = 0 )
```

Parent the current item as a child of the specified 'item'.

This is the equivalent of calling [move\(item,2,pos\)](#).

Returns

0 on success.

On error returns a negative value; see [move\(Fl_Tree_Item*,int,int\)](#) for possible error codes.

See also

[move_above\(\)](#), [move_below\(\)](#), [move\(int,int\)](#), [move\(Fl_Tree_Item*,int,int\)](#)

13.148.3.40 next()

```
Fl_Tree_Item * Fl_Tree_Item::next ( )
```

Return the next item in the tree.

This method can be used to walk the tree forward. For an example of how to use this method, see [Fl_Tree::first\(\)](#).

Returns

the next item in the tree, or 0 if there's no more items.

13.148.3.41 next_displayed()

```
Fl_Tree_Item * Fl_Tree_Item::next_displayed (
    Fl_Tree_Prefs & prefs )
```

Same as [next_visible\(\)](#).

Deprecated in 1.3.3 for confusing name, use [next_visible\(\)](#) instead

13.148.3.42 next_sibling()

```
Fl_Tree_Item * Fl_Tree_Item::next_sibling ( )
```

Return this item's next sibling.

Moves to the next item below us at the same level (sibling). Use this to move down the tree without changing [depth\(\)](#). effectively skipping over this item's children/descendents.

Returns

item's next sibling, or 0 if none.

13.148.3.43 next_visible()

```
Fl_Tree_Item * Fl_Tree_Item::next_visible (
    Fl_Tree_Prefs & prefs )
```

Return the next [open\(\)](#), [visible\(\)](#) item.

(If this item has children and is closed, children are skipped)

This method can be used to walk the tree forward, skipping items that are not currently open/visible to the user.

Returns

the next [open\(\)](#) [visible\(\)](#) item below us, or 0 if there's no more items.

Version

1.3.3

13.148.3.44 parent()

```
void Fl_Tree_Item::parent (
    Fl_Tree_Item * val ) [inline]
```

Set the parent for this item.

Should only be used by [Fl_Tree](#)'s internals.

13.148.3.45 prefs()

```
const Fl_Tree_Prefs & Fl_Tree_Item::prefs ( ) const
```

Return the parent tree's prefs.

Returns

a reference to the parent tree's [Fl_Tree_Prefs](#)

Version

1.3.3 ABI feature

13.148.3.46 prev()

```
Fl_Tree_Item * Fl_Tree_Item::prev ( )
```

Return the previous item in the tree.

This method can be used to walk the tree backwards. For an example of how to use this method, see [Fl_Tree::last\(\)](#).

Returns

the previous item in the tree, or 0 if there's no item above this one (hit the root).

13.148.3.47 prev_displayed()

```
Fl_Tree_Item * Fl_Tree_Item::prev_displayed (
    Fl_Tree_Prefs & prefs )
```

Same as [prev_visible\(\)](#).

Deprecated in 1.3.3 for confusing name, use [prev_visible\(\)](#)

13.148.3.48 prev_sibling()

```
Fl_Tree_Item * Fl_Tree_Item::prev_sibling ( )
```

Return this item's previous sibling.

Moves to the previous item above us at the same level (sibling). Use this to move up the tree without changing [depth\(\)](#).

Returns

This item's previous sibling, or 0 if none.

13.148.3.49 prev_visible()

```
Fl_Tree_Item * Fl_Tree_Item::prev_visible (
    Fl_Tree_Prefs & prefs )
```

Return the previous [open\(\)](#), [visible\(\)](#) item.

(If this item above us has children and is closed, its children are skipped)

This method can be used to walk the tree backward, skipping items that are not currently open/visible to the user.

Returns

the previous [open\(\)](#) [visible\(\)](#) item above us, or 0 if there's no more items.

13.148.3.50 recalc_tree()

```
void Fl_Tree_Item::recalc_tree ( ) [protected]
```

Call this when our geometry is changed.

(Font size, label contents, etc) Schedules tree to recalculate itself, as changes to us may affect tree widget's scrollbar visibility and tab sizes.

Version

1.3.3 ABI

13.148.3.51 remove_child() [1/2]

```
int Fl_Tree_Item::remove_child (
    const char * name )
```

Remove immediate child (and its children) by its label 'name'.

If more than one item matches 'name', only the first matching item is removed.

Parameters

in	name	The label name of the immediate child to remove

Returns

0 if removed, -1 if not found.

Version

1.3.3

13.148.3.52 remove_child() [2/2]

```
int Fl_Tree_Item::remove_child (
    Fl_Tree_Item * item )
```

Remove 'item' from the current item's children.

Returns

0 if removed, -1 if item not an immediate child.

13.148.3.53 reparent()

```
int Fl_Tree_Item::reparent (
    Fl_Tree_Item * newchild,
    int pos )
```

Reparent specified item as a child of ourself at position 'pos'.

Typically 'newchild' was recently orphaned with [deparent\(\)](#).

Returns

- 0: on success
- -1: on error (e.g. if 'pos' out of range) with no changes made.

See also

[deparent\(\)](#)

13.148.3.54 replace()

```
Fl_Tree_Item * Fl_Tree_Item::replace (
    Fl_Tree_Item * newitem )
```

Replace the current item with a new item.

The current item is destroyed if successful. No checks are made to see if an item with the same name exists.

This method can be used to, for example, install 'custom' items into the tree derived from [Fl_Tree_Item](#); see [draw_item_content\(\)](#).

Parameters

in	<i>newitem</i>	The new item to replace the current item

Returns

newitem on success, NULL if could not be replaced.

See also

[Fl_Tree_Item::draw_item_content\(\)](#), [Fl_Tree::root\(Fl_Tree_Item*\)](#)

Version

1.3.3 ABI feature

13.148.3.55 replace_child()

```
Fl_Tree_Item * Fl_Tree_Item::replace_child (
    Fl_Tree_Item * olditem,
    Fl_Tree_Item * newitem )
```

Replace existing child 'olditem' with 'newitem'.

The 'olditem' is destroyed if successful. Can be used to put custom items (derived from [Fl_Tree_Item](#)) into the tree. No checks are made to see if an item with the same name exists.

Parameters

in	<i>olditem</i>	The item to be found and replaced
in	<i>newitem</i>	The new item to take the place of 'olditem'

Returns

newitem on success and 'olditem' is destroyed. NULL on error if 'olditem' was not found as an immediate child.

See also

[replace\(\)](#), [Fl_Tree_Item::draw\(\)](#)

Version

1.3.3 ABI feature

13.148.3.56 select()

```
void Fl_Tree_Item::select (
    int val = 1 ) [inline]
```

Change the item's selection state to the optionally specified 'val'.
If 'val' is not specified, the item will be selected.

13.148.3.57 select_all()

```
int Fl_Tree_Item::select_all ( ) [inline]
```

Select item and all its children.

Returns count of how many items were in the 'deselected' state, ie. how many items were "changed".

13.148.3.58 show_self()

```
void Fl_Tree_Item::show_self (
    const char * indent = "" ) const
```

Print the tree as 'ascii art' to stdout.

Used mainly for debugging.

13.148.3.59 show_widgets()

```
void Fl_Tree_Item::show_widgets ( ) [protected]
```

Internal: Show the FLTK [widget\(\)](#) for this item and all children.

Used by [open\(\)](#) to re-show widgets that were hidden by a previous [close\(\)](#)

13.148.3.60 swap_children() [1/2]

```
int Fl_Tree_Item::swap_children (
    Fl_Tree_Item * a,
    Fl_Tree_Item * b )
```

Swap two of our immediate children, given item pointers.

Use e.g. for sorting.

This method is SLOW because it involves linear lookups.

For speed, use [swap_children\(int,int\)](#) instead.

Parameters

in	<i>a,b</i>	The item ptrs of the two items to swap. Both must be immediate children of the current item.

Returns

- 0 : OK
- -1 : failed: item 'a' or 'b' is not our child.

13.148.3.61 swap_children() [2/2]

```
void Fl_Tree_Item::swap_children (
    int ax,
    int bx )
```

Swap two of our children, given two child index values 'ax' and 'bx'.

Use e.g. for sorting.

This method is FAST, and does not involve lookups.

No range checking is done on either index value.

Parameters

in	<i>ax,bx</i>	the index of the items to swap

13.148.3.62 tree() [1/2]

```
Fl_Tree * Fl_Tree_Item::tree ( ) [inline]
```

Return the tree for this item.

Version

1.3.4

13.148.3.63 tree() [2/2]

```
const Fl_Tree * Fl_Tree_Item::tree ( ) const [inline]
```

Return the tree for this item.

Version

1.3.3

13.148.3.64 update_prev_next()

```
void Fl_Tree_Item::update_prev_next (
    int index )
```

Update our `_prev_sibling` and `_next_sibling` pointers to point to neighbors given `index` as being our current position in the parent's item array.

Call this whenever items in the array are added/removed/moved/swapped/etc.

Parameters

in	<i>index</i>	Our index# in the parent. Special case if <code>index=-1</code> : become an orphan; null out all parent/sibling associations.

13.148.3.65 userdeicon() [1/2]

```
Fl_Image * Fl_Tree_Item::userdeicon ( ) const [inline]
```

Return the deactivated version of the user icon, if any.

Returns 0 if none.

13.148.3.66 userdeicon() [2/2]

```
void Fl_Tree_Item::userdeicon (
    Fl_Image * val ) [inline]
```

Set the usericon to draw when the item is deactivated.

Use '0' to disable. No internal copy is made; caller must manage icon's memory.

To create a typical 'grayed out' version of your usericon image, you can do the following:

```
// Create tree + usericon for items
Fl_Tree *tree = new Fl_Tree(..);
Fl_Image *usr_icon = new Fl_Pixmap(..); // your usericon
Fl_Image *de_icon = usr_icon->copy(); // make a copy, and..
de_icon->inactive(); // make it 'grayed out'
...
for ( .. ) { // item loop..
    item = tree->add("..."); // create new item
    item->usericon(usr_icon); // assign usericon to items
    item->userdeicon(de_icon); // assign userdeicon to items
}
..
}
```

In the above example, the app should 'delete' the two icons when they're no longer needed (e.g. after the tree is destroyed)

Version

1.3.4

13.148.3.67 usericon()

```
void Fl_Tree_Item::usericon (
    Fl_Image * val ) [inline]
```

Set the item's user icon to an [Fl_Image](#).

Use '0' to disable. No internal copy is made, caller must manage icon's memory.

Note, if you expect your items to be deactivated(), use [userdeicon\(Fl_Image*\)](#) to set up a 'grayed out' version of your icon to be used for display.

See also

[userdeicon\(Fl_Image*\)](#)

13.148.3.68 visible_r()

```
int Fl_Tree_Item::visible_r ( ) const [inline]
```

See if item and all its parents are [open\(\)](#) and [visible\(\)](#).

Alias for [is_visible_r\(\)](#).

Returns

1 – item and its parents are [open\(\)](#) and [visible\(\)](#) 0 – item (or one of its parents) are not visible or [close\(\)](#)ed.

The documentation for this class was generated from the following files:

- [Fl_Tree_Item.H](#)
- [Fl_Tree_Item.cxx](#)

13.149 Fl_Tree_Item_Array Class Reference

Manages an array of [Fl_Tree_Item](#) pointers.

```
#include <Fl_Tree_Item_Array.H>
```

Public Member Functions

- void [add \(Fl_Tree_Item *val\)](#)
Add an item to the end of the array.*
- void [clear \(\)](#)
Clear the entire array.
- int [deparent](#) (int pos)
Deparent item at 'pos' from our list of children.
- [Fl_Tree_Item_Array](#) (const [Fl_Tree_Item_Array](#) *o)
Copy constructor. Makes new copy of array, with new instances of each item.
- [Fl_Tree_Item_Array](#) (int new_chunksize=10)
Constructor; creates an empty array.
- void [insert](#) (int pos, [Fl_Tree_Item](#) *new_item)
Insert an item at index position pos.
- int [manage_item_destroy](#) () const
- void [manage_item_destroy](#) (int val)
Option to control if Fl_Tree_Item_Array's destructor will also destroy the Fl_Tree_Item's.
- int [move](#) (int to, int from)

- Move item at 'from' to new position 'to' in the array.*

 - `Fl_Tree_Item * operator[]` (int i)
Return the item and index i.
 - `const Fl_Tree_Item * operator[]` (int i) const
Const version of `operator[]`(int i)
 - `int remove` (`Fl_Tree_Item *item`)
Remove the item from the array.
 - `void remove` (int index)
Remove the item at.
 - `int reparent` (`Fl_Tree_Item *item`, `Fl_Tree_Item *newparent`, int pos)
Reparent specified item as a child of ourself.
 - `void replace` (int pos, `Fl_Tree_Item *new_item`)
Replace the item at index with newitem.
 - `void swap` (int ax, int bx)
Swap the two items at index positions ax and bx.
 - `int total` () const
Return the total items in the array, or 0 if empty.
 - `~Fl_Tree_Item_Array` ()
Destructor. Calls each item's destructor, destroys internal _items array.

13.149.1 Detailed Description

Manages an array of `Fl_Tree_Item` pointers.

Because FLTK 1.x.x. has mandated that templates and STL not be used, we use this class to dynamically manage the arrays.

None of the methods do range checking on index values; the caller must be sure that index values are within the range $0 < \text{index} < \text{total}()$ (unless otherwise noted).

13.149.2 Constructor & Destructor Documentation

13.149.2.1 Fl_Tree_Item_Array()

```
Fl_Tree_Item_Array::Fl_Tree_Item_Array (
    int new_chunksize = 10 )
```

Constructor; creates an empty array.

The optional 'chunksize' can be specified to optimize memory allocation for potentially large arrays. Default chunksize is 10.

13.149.3 Member Function Documentation

13.149.3.1 add()

```
void Fl_Tree_Item_Array::add (
    Fl_Tree_Item * val )
```

Add an item* to the end of the array.

Assumes the item was created with 'new', and will remain allocated.. `Fl_Tree_Item_Array` will handle calling the item's destructor when the array is cleared or the item `remove()`'ed.

13.149.3.2 clear()

```
void Fl_Tree_Item_Array::clear ( )
```

Clear the entire array.

Each item will be deleted (destructors will be called), and the array will be cleared. `total()` will return 0.

13.149.3.3 deparent()

```
int Fl_Tree_Item_Array::deparent (
    int pos )
```

Deparent item at 'pos' from our list of children.

Similar to a [remove\(\)](#) without the destruction of the item. This creates an orphaned item (still allocated, has no parent) which soon after is typically reparented elsewhere.

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

13.149.3.4 insert()

```
void Fl_Tree_Item_Array::insert (
    int pos,
    Fl_Tree_Item * new_item )
```

Insert an item at index position pos.

Handles enlarging array if needed, total increased by 1.

If \p pos \>= total(), the item is appended to the array.

If \p pos \< 0, the item is prepended (works like pos == 0).

13.149.3.5 manage_item_destroy()

```
void Fl_Tree_Item_Array::manage_item_destroy (
    int val ) [inline]
```

Option to control if [Fl_Tree_Item_Array](#)'s destructor will also destroy the [Fl_Tree_Item](#)'s.

If set: items and item array is destroyed. If clear: only the item array is destroyed, not items themselves.

13.149.3.6 move()

```
int Fl_Tree_Item_Array::move (
    int to,
    int from )
```

Move item at 'from' to new position 'to' in the array.

Due to how the moving an item shuffles the array around, a positional 'move' implies things that may not be obvious:

- When 'from' moved lower in tree, appears BELOW item that was at 'to'.
- When 'from' moved higher in tree, appears ABOVE item that was at 'to'.

Returns

0 on success, -1 on range error (e.g. if 'to' or 'from' out of range)

13.149.3.7 remove() [1/2]

```
int Fl_Tree_Item_Array::remove (
    Fl_Tree_Item * item )
```

Remove the item from the array.

\returns 0 if removed, or -1 if the item was not in the array.

13.149.3.8 remove() [2/2]

```
void Fl_Tree_Item_Array::remove (
    int index )
```

Remove the item at.

Parameters

in	index	from the array. The item will be delete'd (if non-NULL), so its destructor will be called.

13.149.3.9 reparent()

```
int Fl_Tree_Item_Array::reparent (
    Fl_Tree_Item * item,
    Fl_Tree_Item * newparent,
    int pos )
```

Reparent specified item as a child of ourself.

Typically 'newchild' was recently orphaned with [deparent\(\)](#).

\returns 0 on success, -1 on error (e.g. if \p 'pos' out of range)

13.149.3.10 replace()

```
void Fl_Tree_Item_Array::replace (
    int index,
    Fl_Tree_Item * newitem )
```

Replace the item at index with newitem.

Old item at index position will be destroyed, and the new item will take it's place, and stitched into the linked list.

The documentation for this class was generated from the following files:

- [Fl_Tree_Item_Array.cxx](#)

13.150 Fl_Tree_Prefs Class Reference

Tree widget's preferences.

```
#include <Fl_Tree_Prefs.H>
```

Public Member Functions

- [Fl_Image](#) * **closedeicon** () const
Return the deactivated version of the close icon, if any.
- [Fl_Image](#) * **closeicon** () const
Gets the default 'close' icon Returns the Fl_Image of the icon, or 0 if none.*
- void **closeicon** ([Fl_Image](#) *val)
Sets the icon to be used as the 'close' icon.
- int **closeicon_h** () const
- int **closeicon_w** () const
- [Fl_Color](#) **connectorcolor** () const
Get the connector color used for tree connection lines.
- void **connectorcolor** ([Fl_Color](#) val)
Set the connector color used for tree connection lines.
- [Fl_Tree_Connector](#) **connectorstyle** () const
Get the connector style.
- void **connectorstyle** ([Fl_Tree_Connector](#) val)
Set the connector style.
- void **connectorstyle** (int val)
Set the connector style [integer].

- int **connectorwidth** () const
Get the tree connection line's width.
- void **connectorwidth** (int val)
Set the tree connection line's width.
- void **do_item_draw_callback** (FI_Tree_Item *o) const
- **FI_Tree_Prefs** ()
FI_Tree_Prefs constructor.
- FI_Tree_Item_Draw_Callback * **item_draw_callback** () const
- void **item_draw_callback** (FI_Tree_Item_Draw_Callback *cb, void *data=0)
- **FI_Tree_Item_Draw_Mode** **item_draw_mode** () const
Get the 'item draw mode' used for the tree.
- void **item_draw_mode** (FI_Tree_Item_Draw_Mode val)
Set the 'item draw mode' used for the tree to val.
- void * **item_draw_user_data** () const
- **FI_Color** **item_labelbgcolor** () const
Get the default label background color.
- void **item_labelbgcolor** (FI_Color val)
Set the default label background color.
- **FI_Color** **item_labelfgcolor** () const
Get the default label foreground color.
- void **item_labelfgcolor** (FI_Color val)
Set the default label foreground color.
- **FI_Font** **item_labelfont** () const
Return the label's font.
- void **item_labelfont** (FI_Font val)
Set the label's font to val.
- **FI_Fontsize** **item_labelsize** () const
Return the label's size in pixels.
- void **item_labelsize** (FI_Fontsize val)
Set the label's size in pixels to val.
- **FI_Tree_Item_Reselect_Mode** **item_reselect_mode** () const
Returns the current item re/selection mode.
- void **item_reselect_mode** (FI_Tree_Item_Reselect_Mode mode)
Sets the item re/selection mode.
- **FI_Color** **labelbgcolor** () const
Obsolete: Get the default label background color. Please use [item_labelbgcolor\(\)](#) instead.
- void **labelbgcolor** (FI_Color val)
Obsolete: Set the default label background color. Please use [item_labelbgcolor\(FI_Color\)](#) instead.
- **FI_Color** **labelfgcolor** () const
Obsolete: Get the default label foreground color. Please use [item_labelfgcolor\(\)](#) instead.
- void **labelfgcolor** (FI_Color val)
Obsolete: Set the default label foreground color. Please use [item_labelfgcolor\(FI_Color\)](#) instead.
- **FI_Font** **labelfont** () const
Obsolete: Return the label's font. Please use [item_labelfont\(\)](#) instead.
- void **labelfont** (FI_Font val)
Obsolete: Set the label's font to val. Please use [item_labelfont\(FI_Font\)](#) instead.
- int **labelmarginleft** () const
Get the label's left margin value in pixels.
- void **labelmarginleft** (int val)
Set the label's left margin value in pixels.
- **FI_Fontsize** **labelsize** () const

- Obsolete: Return the label's size in pixels. Please use `item_labelsize()` instead.*

 - void **labelsizes** (`Fl_Fontsize` val)
- Obsolete: Set the label's size in pixels to val. Please use `item_labelsize(Fl_Fontsize)` instead.*

 - int **linespacing** () const

Get the line spacing value in pixels.

 - void **linespacing** (int val)

Set the line spacing value in pixels.
- int **marginbottom** () const

Get the bottom margin's value in pixels.

 - void **marginbottom** (int val)

Set the bottom margin's value in pixels This is the extra distance the vertical scroller lets you travel.
- int **marginleft** () const

Get the left margin's value in pixels.

 - void **marginleft** (int val)

Set the left margin's value in pixels.
- int **marginbottom** () const

Get the top margin's value in pixels.

 - void **marginbottom** (int val)

Set the top margin's value in pixels.
- int **openchild_marginbottom** () const

Get the margin below an open child in pixels.

 - void **openchild_marginbottom** (int val)

Set the margin below an open child in pixels.
- `Fl_Image` * **opendeicon** () const

Return the deactivated version of the open icon, if any.
- `Fl_Image` * **openicon** () const

Get the current default 'open' icon.

 - void **openicon** (`Fl_Image` *val)

Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.
- int **openicon_h** () const
- int **openicon_w** () const
- `Fl_Boxtype` **selectbox** () const

Get the default selection box's box drawing style as an `Fl_Boxtype`.

 - void **selectbox** (`Fl_Boxtype` val)

Set the default selection box's box drawing style to val.
- `Fl_Tree_Select` **selectmode** () const

Get the selection mode used for the tree.

 - void **selectmode** (`Fl_Tree_Select` val)

Set the selection mode used for the tree to val.
- char **showcollapse** () const

Returns 1 if the collapse icon is enabled, 0 if not.

 - void **showcollapse** (int val)

Set if we should show the collapse icon or not.
- int **showroot** () const

Returns 1 if the root item is to be shown, or 0 if not.

 - void **showroot** (int val)

Set if the root item should be shown or not.
- `Fl_Tree_Sort` **sortorder** () const

Get the default sort order value.

 - void **sortorder** (`Fl_Tree_Sort` val)

Set the default sort order value.

- `Fl_Image * userdeicon ()` const
Return the deactivated version of the user icon, if any.
- `Fl_Image * usericon ()` const
Gets the default 'user icon' (default is 0)
- `void usericon (Fl_Image *val)`
Sets the default 'user icon' Returns the Fl_Image of the icon, or 0 if none (default).*
- `int usericonmarginleft ()` const
Get the user icon's left margin value in pixels.
- `void usericonmarginleft (int val)`
Set the user icon's left margin value in pixels.
- `int widgetmarginleft ()` const
Get the widget()'s left margin value in pixels.
- `void widgetmarginleft (int val)`
Set the widget's left margin value in pixels.
- `~Fl_Tree_Prefs ()`
Fl_Tree_Prefs destructor.

13.150.1 Detailed Description

Tree widget's preferences.

[Fl_Tree](#)'s Preferences class.

This class manages the [Fl_Tree](#)'s defaults. You should probably be using the methods in [Fl_Tree](#) instead of trying to accessing tree's preferences settings directly.

13.150.2 Member Function Documentation

13.150.2.1 closedeicon()

```
Fl_Image * Fl_Tree_Prefs::closedeicon ( ) const [inline]
```

Return the deactivated version of the close icon, if any.

Returns 0 if none.

13.150.2.2 closeicon()

```
void Fl_Tree_Prefs::closeicon (
    Fl_Image * val )
```

Sets the icon to be used as the 'close' icon.

This overrides the built in default '[-]' icon.

Parameters

in	val	– The new image, or zero to use the default '[-]' icon.

13.150.2.3 item_draw_mode()

```
void Fl_Tree_Prefs::item_draw_mode (
    Fl_Tree_Item_Draw_Mode val ) [inline]
```

Set the 'item draw mode' used for the tree to val.

This affects how items in the tree are drawn, such as when a widget() is defined. See [Fl_Tree_Item_Draw_Mode](#) for possible values.

13.150.2.4 item_labelbgcolor() [1/2]

```
Fl_Color Fl_Tree_Prefs::item_labelbgcolor ( ) const [inline]
```

Get the default label background color.

This returns the [Fl_Tree::color\(\)](#) unless [item_labelbgcolor\(\)](#) has been set explicitly.

13.150.2.5 item_labelbgcolor() [2/2]

```
void Fl_Tree_Prefs::item_labelbgcolor (
    Fl_Color val ) [inline]
```

Set the default label background color.

Once set, overrides the default behavior of using [Fl_Tree::color\(\)](#).

13.150.2.6 marginbottom()

```
int Fl_Tree_Prefs::marginbottom ( ) const [inline]
```

Get the bottom margin's value in pixels.

This is the extra distance the vertical scroller lets you travel.

13.150.2.7 opendeicon()

```
Fl_Image * Fl_Tree_Prefs::opendeicon ( ) const [inline]
```

Return the deactivated version of the open icon, if any.

Returns 0 if none.

13.150.2.8 openicon() [1/2]

```
Fl_Image * Fl_Tree_Prefs::openicon ( ) const [inline]
```

Get the current default 'open' icon.

Returns the [Fl_Image*](#) of the icon, or 0 if none.

13.150.2.9 openicon() [2/2]

```
void Fl_Tree_Prefs::openicon (
    Fl_Image * val )
```

Sets the default icon to be used as the 'open' icon when items are add()ed to the tree.

This overrides the built in default '[+]' icon.

Parameters

in	val	– The new image, or zero to use the default '[+]' icon.

13.150.2.10 selectmode()

```
void Fl_Tree_Prefs::selectmode (
    Fl_Tree_Select val ) [inline]
```

Set the selection mode used for the tree to *val*.

This affects how items in the tree are selected when clicked on and dragged over by the mouse. See [Fl_Tree_Select](#) for possible values.

13.150.2.11 showcollapse()

```
void Fl_Tree_Prefs::showcollapse (
    int val ) [inline]
```

Set if we should show the collapse icon or not.

If collapse icons are disabled, the user will not be able to interactively collapse items in the tree, unless the application provides some other means via [open\(\)](#) and [close\(\)](#).

Parameters

in	val	1: shows collapse icons (default), 0: hides collapse icons.

13.150.2.12 showroot()

```
void Fl_Tree_Prefs::showroot (
    int val ) [inline]
```

Set if the root item should be shown or not.

Parameters

in	val	1 – show the root item (default) 0 – hide the root item.

13.150.2.13 sortorder()

```
void Fl_Tree_Prefs::sortorder (
    Fl_Tree_Sort val ) [inline]
```

Set the default sort order value.

Defines the order new items appear when add()ed to the tree. See `Fl_Tree_Sort` for possible values.

13.150.2.14 userdeicon()

```
Fl_Image * Fl_Tree_Prefs::userdeicon ( ) const [inline]
```

Return the deactivated version of the user icon, if any.

Returns 0 if none.

The documentation for this class was generated from the following files:

- [Fl_Tree_Prefs.H](#)
- [Fl_Tree_Prefs.cxx](#)

13.151 Fl_Valuator Class Reference

The `Fl_Valuator` class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

```
#include <Fl_Valuator.H>
```

Inheritance diagram for `Fl_Valuator`:

**Public Member Functions**

- void **bounds** (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
Clamps the passed value to the valuator range.

- virtual int **format** (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- virtual std::string **format_str** ()
C++11 API for [FI_Valuator::format\(char buffer\)](#).*
- double **increment** (double, int)
Adds n times the step value to the passed value.
- double **maximum** () const
Gets the maximum value for the valuator.
- void **maximum** (double a)
Sets the maximum value for the valuator.
- double **minimum** () const
Gets the minimum value for the valuator.
- void **minimum** (double a)
Sets the minimum value for the valuator.
- void **precision** (int digits)
Sets the step value to $1.0 / 10^{\text{digits}}$.
- void **range** (double a, double b)
Sets the minimum and maximum values for the valuator.
- double **round** (double)
Round the passed value to the nearest step increment.
- double **step** () const
Gets or sets the step value.
- void **step** (double a, int b)
See double [FI_Valuator::step\(\)](#) const
- void **step** (double s)
See double [FI_Valuator::step\(\)](#) const.
- void **step** (int a)
See double [FI_Valuator::step\(\)](#) const
- double **value** () const
Gets the floating point(double) value.
- int **value** (double)
Sets the current value.
- **~FI_Valuator** () override
Destructor is accessible despite protected constructor.

Public Member Functions inherited from [FI_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
Activates the widget.
- unsigned int **active** () const
Returns whether the widget is active.
- int **active_r** () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) **align** () const
Gets the label alignment.
- void **align** ([FI_Align](#) alignment)
Sets the label alignment.
- long **argument** () const

- Gets the current user data (long) argument that is passed to the callback function.*

 - void [argument](#) (long v)
- Sets the current user data (long) argument that is passed to the callback function.*

 - virtual class [Fl_Gl_Window](#) * [as_gl_window](#) ()
- Returns an [Fl_Gl_Window](#) pointer if this widget is an [Fl_Gl_Window](#).*

 - virtual class [Fl_Gl_Window](#) const * [as_gl_window](#) () const
- Returns an [Fl_Group](#) pointer if this widget is an [Fl_Group](#).*

 - virtual [Fl_Window](#) * [as_window](#) ()
- Returns an [Fl_Window](#) pointer if this widget is an [Fl_Window](#).*

 - virtual [Fl_Window](#) const * [as_window](#) () const
- Sets the image to use as part of the widget label when in the inactive state.*

 - void [bind_deimage](#) ([Fl_Image](#) *img)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

 - void [bind_deimage](#) (int f)
- Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*

 - void [bind_image](#) ([Fl_Image](#) *img)
- Sets the image to use as part of the widget label when in the active state.*

 - void [bind_image](#) (int f)
- Bind the image to the widget, so the widget will delete the image when it is no longer needed.*

 - [Fl_Boxtype](#) [box](#) () const
- Gets the box type of the widget.*

 - void [box](#) ([Fl_Boxtype](#) new_box)
- Sets the box type for the widget.*

 - [Fl_Callback_p](#) [callback](#) () const
- Gets the current callback function for the widget.*

 - void [callback](#) ([Fl_Callback](#) *cb)
- Sets the current callback function for the widget.*

 - void [callback](#) ([Fl_Callback](#) *cb, [Fl_Callback_User_Data](#) *p, bool auto_free)
- Sets the current callback function and managed user data for the widget.*

 - void [callback](#) ([Fl_Callback](#) *cb, void *p)
- Sets the current callback function and data for the widget.*

 - void [callback](#) ([Fl_Callback0](#) *cb)
- Sets the current callback function for the widget.*

 - void [callback](#) ([Fl_Callback1](#) *cb, long p=0)
- Sets the current callback function for the widget.*

 - unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*

 - void [clear_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*

 - void [clear_changed](#) ()
- Marks the value of the widget as unchanged.*

 - void [clear_damage](#) (uchar c=0)
- Clears or sets the damage flags.*

 - void [clear_output](#) ()
- Sets a widget to accept input.*

 - void [clear_visible](#) ()
- Hides the widget.*

 - void [clear_visible_focus](#) ()
- Disables keyboard focus navigation with this widget.*

 - [Fl_Color](#) [color](#) () const

- Gets the background color of the widget.*

 - void [color](#) ([FL_Color](#) bg)
- Sets the background color of the widget.*

 - void [color](#) ([FL_Color](#) bg, [FL_Color](#) sel)
- Sets the background and selection color of the widget.*

 - int [contains](#) (const [FL_Widget](#) *w) const
- Checks if w is a child of this widget.*

 - void [copy_label](#) (const char *new_label)
- Sets the current label.*

 - void [copy_tooltip](#) (const char *text)
- Sets the current tooltip text.*

 - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

 - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int [damage_resize](#) (int, int, int, int)
- Internal use only.*

 - void [deactivate](#) ()
- Deactivates the widget.*

 - [FL_Image](#) * [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const [FL_Image](#) * [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void [deimage](#) ([FL_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void [deimage](#) ([FL_Image](#) *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int [deimage_bound](#) () const
- Returns whether the inactive image is managed by the widget.*

 - void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with default arguments.*

 - void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

 - void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*

 - virtual void [draw](#) ()=0
- Draws the widget.*

 - void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*

 - int [h](#) () const
- Gets the widget height.*

 - virtual int [handle](#) (int event)
- Handles the specified event.*

 - virtual void [hide](#) ()
- Makes a widget invisible.*

 - int [horizontal_label_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*

 - void [horizontal_label_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*

- `FL_Image * image ()`
Gets the image that is used as part of the widget label when in the active state.
- `const FL_Image * image () const`
Gets the image that is used as part of the widget label when in the active state.
- `void image (FL_Image &img)`
Sets the image to use as part of the widget label when in the active state.
- `void image (FL_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`
Returns whether the image is managed by the widget.
- `int inside (const FL_Widget *wgt) const`
Checks if this widget is a child of wgt.
- `int is_label_copied () const`
Returns whether the current label was assigned with `copy_label()`.
- `const char * label () const`
Gets the current label text.
- `void label (const char *text)`
Sets the current label pointer.
- `void label (FL_Labeltype a, const char *b)`
Shortcut to set the label text and type in one call.
- `int label_image_spacing ()`
Return the gap size between the label and the image.
- `void label_image_spacing (int gap)`
Set the gap between the label and the image in pixels.
- `FL_Color labelcolor () const`
Gets the label color.
- `void labelcolor (FL_Color c)`
Sets the label color.
- `FL_Font labelfont () const`
Gets the font to use.
- `void labelfont (FL_Font f)`
Sets the font to use.
- `FL_Fonsize labelsize () const`
Gets the font size in pixels.
- `void labelsize (FL_Fonsize pix)`
Sets the font size in pixels.
- `FL_Labeltype labeltype () const`
Gets the label type.
- `void labeltype (FL_Labeltype a)`
Sets the label type.
- `void measure_label (int &ww, int &hh) const`
Sets width ww and height hh accordingly with the label size.
- `bool needs_keyboard () const`
Returns whether this widget needs a keyboard.
- `void needs_keyboard (bool needs)`
Sets whether this widget needs a keyboard.
- `unsigned int output () const`
Returns if a widget is used for output only.
- `FL_Group * parent () const`
Returns a pointer to the parent widget.
- `void parent (FL_Group *p)`

- Internal use only - "for hacks only".*

 - void [position](#) (int X, int Y)
Repositions the window or widget.
 - void [redraw](#) ()
Schedules the drawing of the widget.
 - void [redraw_label](#) ()
Schedules the drawing of the label.
 - virtual void [resize](#) (int x, int y, int w, int h)
Changes the size or position of the widget.
 - [Fl_Color selection_color](#) () const
Gets the selection color.
 - void [selection_color](#) ([Fl_Color](#) a)
Sets the selection color.
 - void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
 - void [set_changed](#) ()
Marks the value of the widget as changed.
 - void [set_output](#) ()
Sets a widget to output only.
 - void [set_visible](#) ()
Makes the widget visible.
 - void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
 - int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
 - void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
 - virtual void [show](#) ()
Makes a widget visible.
 - void [size](#) (int W, int H)
Changes the size of the widget.
 - int [take_focus](#) ()
Gives the widget the keyboard focus.
 - unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
 - int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
 - const char * [tooltip](#) () const
Gets the current tooltip text.
 - void [tooltip](#) (const char *text)
Sets the Tooltip Text for a Widget.
 - [Fl_Window * top_window](#) () const
Returns a pointer to the top-level window for the widget.
 - [Fl_Window * top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
 - [uchar type](#) () const
Gets the widget type.
 - void [type](#) ([uchar](#) t)
Sets the widget type.
 - int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.

- void * **user_data** () const
Gets the user data for this widget.
- void **user_data** (FL_Callback_User_Data *v, bool auto_free)
Sets the user data for this widget.
- void **user_data** (void *v)
Sets the user data for this widget.
- int **vertical_label_margin** ()
Get the spacing between the label and the vertical edge of the widget.
- void **vertical_label_margin** (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int **visible** () const
Returns whether a widget is visible.
- unsigned int **visible_focus** () const
Checks whether this widget has a visible focus.
- void **visible_focus** (int v)
Modifies keyboard focus navigation.
- int **visible_r** () const
Returns whether a widget and all its parents are visible.
- int **w** () const
Gets the widget width.
- FL_When **when** () const
Returns the conditions under which the callback is called.
- void **when** (uchar i)
Sets the flags used to decide when a callback is called.
- FL_Window * **window** () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const
Gets the widget position in its window.
- int **y** () const
Gets the widget position in its window.
- virtual ~**FL_Widget** ()
Destroys the widget.

Protected Member Functions

- FL_Valuator (int X, int Y, int W, int H, const char *L)
Creates a new FL_Valuator widget using the given position, size, and label string.
- void **handle_drag** (double newvalue)
Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void **handle_push** ()
Stores the current value in the previous value.
- void **handle_release** ()
Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal** () const
Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value** () const
Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
Sets the current floating point value.
- double **softclamp** (double)
Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void **value_damage** ()
Asks for partial redraw.

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according to its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from FI_Widget

- static void **default_callback** (FI_Widget *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [Fl_Widget](#)

```
enum {
    INACTIVE = 1<<0, INVISIBLE = 1<<1, OUTPUT = 1<<2, NOBORDER = 1<<3,
    FORCE_POSITION = 1<<4, NON_MODAL = 1<<5, SHORTCUT_LABEL = 1<<6, CHANGED = 1<<7,
    OVERRIDE = 1<<8, VISIBLE_FOCUS = 1<<9, COPIED_LABEL = 1<<10, CLIP_CHILDREN = 1<<11,
    MENU_WINDOW = 1<<12, TOOLTIP_WINDOW = 1<<13, MODAL = 1<<14, NO_OVERLAY = 1<<15,
    GROUP_RELATIVE = 1<<16, COPIED_TOOLTIP = 1<<17, FULLSCREEN = 1<<18, MAC_USE_ACCENTS_MENU = 1<<19,
    NEEDS_KEYBOARD = 1<<20, IMAGE_BOUND = 1<<21, DEIMAGE_BOUND = 1<<22,

    MAXIMIZED = 1<<24, POPUP = 1<<25, USERFLAG3 = 1<<29, USERFLAG2 = 1<<30,
    USERFLAG1 = 1<<31 }

```

flags possible values enumeration.

13.151.1 Detailed Description

The [Fl_Valuator](#) class controls a single floating-point value and provides a consistent interface to set the value, range, and step, and insures that callbacks are done the same for every object.

There are probably more of these classes in FLTK than any others:

Figure 13.66 Valuers derived from [Fl_Valuators](#)

In the above diagram each box surrounds an actual subclass. These are further differentiated by setting the [type\(\)](#) of the widget to the symbolic value labeling the widget. The ones labelled "0" are the default versions with a [type\(0\)](#). For consistency the symbol `FL_VERTICAL` is defined as zero.

13.151.2 Constructor & Destructor Documentation

13.151.2.1 [Fl_Valuator\(\)](#)

```
Fl_Valuator::Fl_Valuator (
    int X,
    int Y,
```

```
int W,
int H,
const char * L ) [protected]
```

Creates a new [Fl_Valuator](#) widget using the given position, size, and label string. The default boxtype is `FL_NO_BOX`.

13.151.3 Member Function Documentation

13.151.3.1 `format()`

```
int Fl_Valuator::format (
    char * buffer ) [virtual]
```

Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter. The actual format used depends on the current step value. If the step value has been set to zero then a `%g` format is used. If the step value is non-zero, then a `%.*f` format is used, where the precision is calculated to show sufficient digits for the current step value. An integer step value, such as 1 or 1.0, gives a precision of 0, so the formatted value will appear as an integer.

This method is used by the `Fl_Valuator_...` group of widgets to format the current value into a text string. The return value is the length of the formatted text. The formatted value is written into `buffer`. `buffer` should have space for at least 128 bytes.

You may override this function to create your own text formatting.

13.151.3.2 `format_str()`

```
std::string Fl_Valuator::format_str ( ) [virtual]
```

C++11 API for [Fl_Valuator::format\(char* buffer\)](#).

Users can override either version to change the format of the text output in the valuator.

Returns

the formatted text of the current value

See also

[Fl_Valuator::format\(char* buffer\)](#)

13.151.3.3 `increment()`

```
double Fl_Valuator::increment (
    double v,
    int n )
```

Adds `n` times the step value to the passed value.

If step was set to zero it uses `fabs(maximum() - minimum()) / 100`.

13.151.3.4 `maximum()` [1/2]

```
double Fl_Valuator::maximum ( ) const [inline]
```

Gets the maximum value for the valuator.

13.151.3.5 `maximum()` [2/2]

```
void Fl_Valuator::maximum (
    double a ) [inline]
```

Sets the maximum value for the valuator.

13.151.3.6 minimum() [1/2]

```
double Fl_Valuator::minimum ( ) const [inline]
```

Gets the minimum value for the valuator.

13.151.3.7 minimum() [2/2]

```
void Fl_Valuator::minimum (
    double a ) [inline]
```

Sets the minimum value for the valuator.

13.151.3.8 precision()

```
void Fl_Valuator::precision (
    int digits )
```

Sets the step value to $1.0 / 10^{\text{digits}}$.

Precision `digits` is limited to 0...9 to avoid internal overflow errors. Values outside this range are clamped.

Note

For negative values of `digits` the step value is set to $A = 1.0$ and $B = 1$, i.e. $1.0/1 = 1$.

13.151.3.9 range()

```
void Fl_Valuator::range (
    double a,
    double b ) [inline]
```

Sets the minimum and maximum values for the valuator.

When the user manipulates the widget, the value is limited to this range. This clamping is done *after* rounding to the step value (this makes a difference if the range is not a multiple of the step).

The minimum may be greater than the maximum. This has the effect of "reversing" the object so the larger values are in the opposite direction. This also switches which end of the filled sliders is filled.

Some widgets consider this a "soft" range. This means they will stop at the range, but if the user releases and grabs the control again and tries to move it further, it is allowed.

The range may affect the display. You must [redraw\(\)](#) the widget after changing the range.

13.151.3.10 round()

```
double Fl_Valuator::round (
    double v )
```

Round the passed value to the nearest step increment.

Does nothing if step is zero.

13.151.3.11 step()

```
double Fl_Valuator::step ( ) const [inline]
```

Gets or sets the step value.

As the user moves the mouse the value is rounded to the nearest multiple of the step value. This is done *before* clamping it to the range. For most widgets the default step is zero.

For precision the step is stored as the ratio of a double A and an integer $B = A/B$. You can set these values directly. Currently setting a floating point value sets the nearest $A/1$ or $1/B$ value possible.

13.151.3.12 value() [1/2]

```
double Fl_Valuator::value ( ) const [inline]
```

Gets the floating point(double) value.

See int [value\(double\)](#)

13.151.3.13 value() [2/2]

```
int Fl_Valuator::value (
    double v )
```

Sets the current value.

The new value is *not* clamped or otherwise changed before storing it. Use [clamp\(\)](#) or [round\(\)](#) to modify the value before calling [value\(\)](#). The widget is redrawn if the new value is different than the current one. The initial value is zero.

[changed\(\)](#) will return true if the user has moved the slider, but it will be turned off by [value\(x\)](#) and just before doing a callback (the callback can turn it back on if desired).

13.151.3.14 value_damage()

```
void Fl_Valuator::value_damage ( ) [protected], [virtual]
```

Asks for partial redraw.

Reimplemented in [Fl_Adjuster](#).

The documentation for this class was generated from the following files:

- [Fl_Valuator.H](#)
- [Fl_Valuator.cxx](#)

13.152 Fl_Value_Input Class Reference

The [Fl_Value_Input](#) widget displays a numeric value.

```
#include <Fl_Value_Input.H>
```

Inheritance diagram for [Fl_Value_Input](#):

**Public Member Functions**

- [Fl_Color](#) [cursor_color](#) () const
Gets the color of the text cursor.
- void [cursor_color](#) ([Fl_Color](#) n)
Sets the color of the text cursor.
- [Fl_Value_Input](#) (int x, int y, int w, int h, const char *l=0)
Creates a new [Fl_Value_Input](#) widget using the given position, size, and label string.
- int [handle](#) (int) override
Handles the specified event.
- void [resize](#) (int, int, int, int) override
Changes the size or position of the widget.
- int [shortcut](#) () const
Returns the current shortcut key for the Input.
- void [shortcut](#) (int s)
Sets the shortcut key to s.
- char [soft](#) () const
If "soft" is turned on, the user is allowed to drag the value outside the range.
- void **soft** (char s)
See void [Fl_Value_Input::soft\(char s\)](#)

- [FL_Color](#) `textcolor` () const
Gets the color of the text in the value box.
- void **textcolor** ([FL_Color](#) n)
Sets the color of the text in the value box.
- [FL_Font](#) `textfont` () const
Gets the typeface of the text in the value box.
- void `textfont` ([FL_Font](#) s)
Sets the typeface of the text in the value box.
- [FL_Fontsize](#) `textsize` () const
Gets the size of the text in the value box.
- void `textsize` ([FL_Fontsize](#) s)
Sets the size of the text in the value box.

Public Member Functions inherited from [FL_Valuator](#)

- void **bounds** (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- double **clamp** (double)
Clamps the passed value to the valuator range.
- virtual int `format` (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- virtual std::string `format_str` ()
C++11 API for [FL_Valuator::format\(char buffer\)](#).*
- double `increment` (double, int)
Adds n times the step value to the passed value.
- double `maximum` () const
Gets the maximum value for the valuator.
- void `maximum` (double a)
Sets the maximum value for the valuator.
- double `minimum` () const
Gets the minimum value for the valuator.
- void `minimum` (double a)
Sets the minimum value for the valuator.
- void `precision` (int digits)
Sets the step value to $1.0 / 10^{\text{digits}}$.
- void `range` (double a, double b)
Sets the minimum and maximum values for the valuator.
- double `round` (double)
Round the passed value to the nearest step increment.
- double `step` () const
Gets or sets the step value.
- void **step** (double a, int b)
See double [FL_Valuator::step\(\)](#) const
- void **step** (double s)
See double [FL_Valuator::step\(\)](#) const.
- void **step** (int a)
See double [FL_Valuator::step\(\)](#) const
- double `value` () const
Gets the floating point(double) value.

- int [value](#) (double)
Sets the current value.
- [~FI_Valuator](#) () override
Destructor is accessible despite protected constructor.

Public Member Functions inherited from [FI_Widget](#)

- void [_clear_fullscreen](#) ()
- void [_set_fullscreen](#) ()
- void [activate](#) ()
Activates the widget.
- unsigned int [active](#) () const
Returns whether the widget is active.
- int [active_r](#) () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) [align](#) () const
Gets the label alignment.
- void [align](#) ([FI_Align](#) alignment)
Sets the label alignment.
- long [argument](#) () const
Gets the current user data (long) argument that is passed to the callback function.
- void [argument](#) (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_Gl_Window](#) * [as_gl_window](#) ()
Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).
- virtual class [FI_Gl_Window](#) const * [as_gl_window](#) () const
- virtual [FI_Group](#) * [as_group](#) ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * [as_group](#) () const
- virtual [FI_Window](#) * [as_window](#) ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * [as_window](#) () const
- void [bind_deimage](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)

- Sets the current callback function and data for the widget.*

 - void `callback` (`FI_Callback0` *cb)
- Sets the current callback function for the widget.*

 - void `callback` (`FI_Callback1` *cb, long p=0)
- Sets the current callback function for the widget.*

 - unsigned int `changed` () const
- Checks if the widget value changed since the last callback.*

 - void `clear_active` ()
- Marks the widget as inactive without sending events or changing focus.*

 - void `clear_changed` ()
- Marks the value of the widget as unchanged.*

 - void `clear_damage` (`uchar` c=0)
- Clears or sets the damage flags.*

 - void `clear_output` ()
- Sets a widget to accept input.*

 - void `clear_visible` ()
- Hides the widget.*

 - void `clear_visible_focus` ()
- Disables keyboard focus navigation with this widget.*

 - `FI_Color` `color` () const
- Gets the background color of the widget.*

 - void `color` (`FI_Color` bg)
- Sets the background color of the widget.*

 - void `color` (`FI_Color` bg, `FI_Color` sel)
- Sets the background and selection color of the widget.*

 - int `contains` (const `FI_Widget` *w) const
- Checks if w is a child of this widget.*

 - void `copy_label` (const char *new_label)
- Sets the current label.*

 - void `copy_tooltip` (const char *text)
- Sets the current tooltip text.*

 - `uchar` `damage` () const
- Returns non-zero if `draw()` needs to be called.*

 - void `damage` (`uchar` c)
- Sets the damage bits for the widget.*

 - void `damage` (`uchar` c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int `damage_resize` (int, int, int, int)
- Internal use only.*

 - void `deactivate` ()
- Deactivates the widget.*

 - `FI_Image` * `deimage` ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const `FI_Image` * `deimage` () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void `deimage` (`FI_Image` &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void `deimage` (`FI_Image` *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int `deimage_bound` () const
- Returns whether the inactive image is managed by the widget.*

- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with default arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
Calls the widget callback function with arbitrary arguments.
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int [h](#) () const
Gets the widget height.
- virtual void [hide](#) ()
Makes a widget invisible.
- int [horizontal_label_margin](#) ()
Get the spacing between the label and the horizontal edge of the widget.
- void [horizontal_label_margin](#) (int px)
Set the spacing between the label and the horizontal edge of the widget.
- [FL_Image](#) * [image](#) ()
Gets the image that is used as part of the widget label when in the active state.
- const [FL_Image](#) * [image](#) () const
Gets the image that is used as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) &img)
Sets the image to use as part of the widget label when in the active state.
- void [image](#) ([FL_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- int [image_bound](#) () const
Returns whether the image is managed by the widget.
- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FL_Font](#) f)
Sets the font to use.
- [FL_Fonsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([FL_Fonsize](#) pix)

- Sets the font size in pixels.*

 - [Fl_Labeltype](#) [labeltype](#) () const

Gets the label type.

 - void [labeltype](#) ([Fl_Labeltype](#) a)

Sets the label type.

 - void [measure_label](#) (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.

 - bool [needs_keyboard](#) () const

Returns whether this widget needs a keyboard.

 - void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.

 - unsigned int [output](#) () const

Returns if a widget is used for output only.

 - [Fl_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.

 - void [parent](#) ([Fl_Group](#) *p)

Internal use only - "for hacks only".

 - void [position](#) (int X, int Y)

Repositions the window or widget.

 - void [redraw](#) ()

Schedules the drawing of the widget.

 - void [redraw_label](#) ()

Schedules the drawing of the label.

 - [Fl_Color](#) [selection_color](#) () const

Gets the selection color.

 - void [selection_color](#) ([Fl_Color](#) a)

Sets the selection color.

 - void [set_active](#) ()

Marks the widget as active without sending events or changing focus.

 - void [set_changed](#) ()

Marks the value of the widget as changed.

 - void [set_output](#) ()

Sets a widget to output only.

 - void [set_visible](#) ()

Makes the widget visible.

 - void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.

 - int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.

 - void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.

 - virtual void [show](#) ()

Makes a widget visible.

 - void [size](#) (int W, int H)

Changes the size of the widget.

 - int [take_focus](#) ()

Gives the widget the keyboard focus.

 - unsigned int [takeevents](#) () const

Returns if the widget is able to take events.

 - int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.

- `const char * tooltip () const`
Gets the current tooltip text.
- `void tooltip (const char *text)`
Sets the Tooltip Text for a Widget.
- `Fl_Window * top_window () const`
Returns a pointer to the top-level window for the widget.
- `Fl_Window * top_window_offset (int &xoff, int &yoff) const`
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type () const`
Gets the widget type.
- `void type (uchar t)`
Sets the widget type.
- `int use_accents_menu ()`
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data () const`
Gets the user data for this widget.
- `void user_data (Fl_Callback_User_Data *v, bool auto_free)`
Sets the user data for this widget.
- `void user_data (void *v)`
Sets the user data for this widget.
- `int vertical_label_margin ()`
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin (int px)`
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible () const`
Returns whether a widget is visible.
- `unsigned int visible_focus () const`
Checks whether this widget has a visible focus.
- `void visible_focus (int v)`
Modifies keyboard focus navigation.
- `int visible_r () const`
Returns whether a widget and all its parents are visible.
- `int w () const`
Gets the widget width.
- `Fl_When when () const`
Returns the conditions under which the callback is called.
- `void when (uchar i)`
Sets the flags used to decide when a callback is called.
- `Fl_Window * window () const`
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x () const`
Gets the widget position in its window.
- `int y () const`
Gets the widget position in its window.
- `virtual ~Fl_Widget ()`
Destroys the widget.

Public Attributes

- `Fl_Input input`

Protected Member Functions

- void **draw** () override
Draws the widget.

Protected Member Functions inherited from **FL_Valuator**

- **FL_Valuator** (int X, int Y, int W, int H, const char *L)
*Creates a new **FL_Valuator** widget using the given position, size, and label string.*
- void **handle_drag** (double newvalue)
Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void **handle_push** ()
Stores the current value in the previous value.
- void **handle_release** ()
Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal** () const
Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value** () const
Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
Sets the current floating point value.
- double **softclamp** (double)
Clamps the value, but accepts v if the previous value is not already out of range.

Protected Member Functions inherited from **FL_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according to its box style.
- void **draw_box** (FL_Boxtype t, FL_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **FL_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.

- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Static Public Member Functions inherited from FI_Widget

- static void **default_callback** (FI_Widget *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int **label_shortcut** (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int **test_shortcut** (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from FI_Widget

- enum {

USERFLAG1 = 1<<31 }
flags possible values enumeration.

13.152.1 Detailed Description

The **FI_Value_Input** widget displays a numeric value.

The user can click in the text field and edit it - there is in fact a hidden **FI_Input** widget with type(FL_FLOAT_INPUT) or type(FL_INT_INPUT) in there - and when they hit return or tab the value updates to what they typed and the callback is done.

If **step()** is non-zero and integral, then the range of numbers is limited to integers instead of floating point numbers. As well as displaying the value as an integer, typed input is also limited to integer values, even if the hidden **FI_Input** widget is of type(FL_FLOAT_INPUT).

If **step()** is non-zero, the user can also drag the mouse across the object and thus slide the value. The left button moves one **step()** per pixel, the middle by 10 **step()**, and the right button by 100 * **step()**. It is therefore impossible to select text by dragging across it, although clicking can still move the insertion cursor.

If **step()** is non-zero and integral, then the range of numbers are limited to integers instead of floating point values.

13.152.2 Constructor & Destructor Documentation

13.152.2.1 Fl_Value_Input()

```
Fl_Value_Input::Fl_Value_Input (
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0 )
```

Creates a new [Fl_Value_Input](#) widget using the given position, size, and label string. The default boxtype is FL_DOWN_BOX.

13.152.3 Member Function Documentation

13.152.3.1 cursor_color() [1/2]

```
Fl_Color Fl_Value_Input::cursor_color ( ) const [inline]
```

Gets the color of the text cursor.

The text cursor is black by default.

13.152.3.2 cursor_color() [2/2]

```
void Fl_Value_Input::cursor_color (
    Fl_Color n ) [inline]
```

Sets the color of the text cursor.

The text cursor is black by default.

13.152.3.3 draw()

```
void Fl_Value_Input::draw ( ) [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

13.152.3.4 handle()

```
int Fl_Value_Input::handle (
    int event ) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented from [Fl_Widget](#).

13.152.3.5 `resize()`

```
void Fl_Value_Input::resize (
    int x,
    int y,
    int w,
    int h ) [override], [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for `resize(X, Y, w(), h())`, and `size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented from [Fl_Widget](#).

13.152.3.6 `shortcut()` [1/2]

```
int Fl_Value_Input::shortcut ( ) const [inline]
```

Returns the current shortcut key for the Input.

See also

[Fl_Value_Input::shortcut\(int\)](#)

13.152.3.7 `shortcut()` [2/2]

```
void Fl_Value_Input::shortcut (
    int s ) [inline]
```

Sets the shortcut key to *s*.

Setting this overrides the use of '&' in the [label\(\)](#). The value is a bitwise OR of a key and a set of shift flags, for example `FL_ALT | 'a'`, `FL_ALT | (FL_F + 10)`, or just `'a'`. A value of 0 disables the shortcut.

The key can be any value returned by [Fl::event_key\(\)](#), but will usually be an ASCII letter. Use a lower-case letter unless you require the shift key to be held down.

The shift flags can be any set of values accepted by [Fl::event_state\(\)](#). If the bit is on that shift key must be pushed. Meta, Alt, Ctrl, and Shift must be off if they are not in the shift flags (zero for the other bits indicates a "don't care" setting).

13.152.3.8 `soft()`

```
char Fl_Value_Input::soft ( ) const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. The default is true.

13.152.3.9 `textcolor()`

```
Fl_Color Fl_Value_Input::textcolor ( ) const [inline]
```

Gets the color of the text in the value box.

13.152.3.10 `textfont()` [1/2]

```
Fl_Font Fl_Value_Input::textfont ( ) const [inline]
```

Gets the typeface of the text in the value box.

13.152.3.11 `textfont()` [2/2]

```
void Fl_Value_Input::textfont (
    Fl_Font s ) [inline]
```

Sets the typeface of the text in the value box.

13.152.3.12 `textsize()` [1/2]

```
Fl_Fontsize Fl_Value_Input::textsize ( ) const [inline]
```

Gets the size of the text in the value box.

13.152.3.13 `textsize()` [2/2]

```
void Fl_Value_Input::textsize (
    Fl_Fontsize s ) [inline]
```

Sets the size of the text in the value box.

The documentation for this class was generated from the following files:

- `Fl_Value_Input.H`
- `Fl_Value_Input.cxx`

13.153 `Fl_Value_Output` Class Reference

The `Fl_Value_Output` widget displays a floating point value.

```
#include <Fl_Value_Output.H>
```

Inheritance diagram for `Fl_Value_Output`:

Public Member Functions

- **Fl_Value_Output** (int *x*, int *y*, int *w*, int *h*, const char **l*=0)
Creates a new *Fl_Value_Output* widget using the given position, size, and label string.
- int **handle** (int) override
Handles the specified event.
- **uchar soft** () const
If "soft" is turned on, the user is allowed to drag the value outside the range.
- void **soft** (uchar *s*)
If "soft" is turned on, the user is allowed to drag the value outside the range.
- **Fl_Color textcolor** () const
Sets the color of the text in the value box.
- void **textcolor** (Fl_Color *s*)
Gets the color of the text in the value box.
- **Fl_Font textfont** () const
Gets the typeface of the text in the value box.
- void **textfont** (Fl_Font *s*)
Sets the typeface of the text in the value box.
- **Fl_Fonsize textsize** () const
Gets the size of the text in the value box.
- void **textsize** (Fl_Fonsize *s*)

Public Member Functions inherited from Fl_Valuator

- void **bounds** (double *a*, double *b*)
Sets the minimum (*a*) and maximum (*b*) values for the valuator widget.
- double **clamp** (double)
Clamps the passed value to the valuator range.
- virtual int **format** (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- virtual std::string **format_str** ()
C++11 API for *Fl_Valuator::format(char* buffer)*.
- double **increment** (double, int)
Adds *n* times the step value to the passed value.
- double **maximum** () const
Gets the maximum value for the valuator.
- void **maximum** (double *a*)
Sets the maximum value for the valuator.
- double **minimum** () const
Gets the minimum value for the valuator.
- void **minimum** (double *a*)
Sets the minimum value for the valuator.
- void **precision** (int *digits*)
Sets the step value to $1.0 / 10^{\text{digits}}$.

- void **range** (double a, double b)
Sets the minimum and maximum values for the valuator.
- double **round** (double)
Round the passed value to the nearest step increment.
- double **step** () const
Gets or sets the step value.
- void **step** (double a, int b)
See double [FI_Valuator::step\(\)](#) const
- void **step** (double s)
See double [FI_Valuator::step\(\)](#) const.
- void **step** (int a)
See double [FI_Valuator::step\(\)](#) const
- double **value** () const
Gets the floating point(double) value.
- int **value** (double)
Sets the current value.
- **~FI_Valuator** () override
Destructor is accessible despite protected constructor.

Public Member Functions inherited from [FI_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
Activates the widget.
- unsigned int **active** () const
Returns whether the widget is active.
- int **active_r** () const
Returns whether the widget and all of its parents are active.
- [FI_Align](#) **align** () const
Gets the label alignment.
- void **align** ([FI_Align](#) alignment)
Sets the label alignment.
- long **argument** () const
Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class [FI_GI_Window](#) * **as_gi_window** ()
Returns an [FI_GI_Window](#) pointer if this widget is an [FI_GI_Window](#).
- virtual class [FI_GI_Window](#) const * **as_gi_window** () const
- virtual [FI_Group](#) * **as_group** ()
Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).
- virtual [FI_Group](#) const * **as_group** () const
- virtual [FI_Window](#) * **as_window** ()
Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).
- virtual [FI_Window](#) const * **as_window** () const
- void **bind_deimage** ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

- void [bind_image](#) ([FI_Image](#) *img)
Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const
Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()
Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()
Marks the value of the widget as unchanged.
- void [clear_damage](#) ([uchar](#) c=0)
Clears or sets the damage flags.
- void [clear_output](#) ()
Sets a widget to accept input.
- void [clear_visible](#) ()
Hides the widget.
- void [clear_visible_focus](#) ()
Disables keyboard focus navigation with this widget.
- [FI_Color](#) [color](#) () const
Gets the background color of the widget.
- void [color](#) ([FI_Color](#) bg)
Sets the background color of the widget.
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)
Sets the background and selection color of the widget.
- int [contains](#) (const [FI_Widget](#) *w) const
Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)
Sets the current label.
- void [copy_tooltip](#) (const char *text)
Sets the current tooltip text.
- [uchar](#) [damage](#) () const
Returns non-zero if [draw\(\)](#) needs to be called.
- void [damage](#) ([uchar](#) c)
Sets the damage bits for the widget.
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)

- Sets the damage bits for an area inside the widget.*

 - int **damage_resize** (int, int, int, int)

Internal use only.
- void **deactivate** ()

Deactivates the widget.
- **Fl_Image * deimage** ()

Gets the image that is used as part of the widget label when in the inactive state.
- const **Fl_Image * deimage** () const

Gets the image that is used as part of the widget label when in the inactive state.
- void **deimage** (**Fl_Image** &img)

Sets the image to use as part of the widget label when in the inactive state.
- void **deimage** (**Fl_Image** *img)

Sets the image to use as part of the widget label when in the inactive state.
- int **deimage_bound** () const

Returns whether the inactive image is managed by the widget.
- void **do_callback** (**Fl_Callback_Reason** reason=**FL_REASON_UNKNOWN**)

Calls the widget callback function with default arguments.
- void **do_callback** (**Fl_Widget** *widget, long arg, **Fl_Callback_Reason** reason=**FL_REASON_UNKNOWN**)

Calls the widget callback function with arbitrary arguments.
- void **do_callback** (**Fl_Widget** *widget, void *arg=0, **Fl_Callback_Reason** reason=**FL_REASON_UNKNOWN**)

Calls the widget callback function with arbitrary arguments.
- void **draw_label** (int, int, int, int, **Fl_Align**) const

Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int **h** () const

Gets the widget height.
- virtual void **hide** ()

Makes a widget invisible.
- int **horizontal_label_margin** ()

Get the spacing between the label and the horizontal edge of the widget.
- void **horizontal_label_margin** (int px)

Set the spacing between the label and the horizontal edge of the widget.
- **Fl_Image * image** ()

Gets the image that is used as part of the widget label when in the active state.
- const **Fl_Image * image** () const

Gets the image that is used as part of the widget label when in the active state.
- void **image** (**Fl_Image** &img)

Sets the image to use as part of the widget label when in the active state.
- void **image** (**Fl_Image** *img)

Sets the image to use as part of the widget label when in the active state.
- int **image_bound** () const

Returns whether the image is managed by the widget.
- int **inside** (const **Fl_Widget** *wgt) const

Checks if this widget is a child of wgt.
- int **is_label_copied** () const

Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * **label** () const

Gets the current label text.
- void **label** (const char *text)

Sets the current label pointer.
- void **label** (**Fl_Labeltype** a, const char *b)

Shortcut to set the label text and type in one call.

- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [Fl_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([Fl_Color](#) c)
Sets the label color.
- [Fl_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([Fl_Font](#) f)
Sets the font to use.
- [Fl_Fontsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([Fl_Fontsize](#) pix)
Sets the font size in pixels.
- [Fl_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([Fl_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [Fl_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([Fl_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)
Changes the size or position of the widget.
- [Fl_Color](#) [selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()

- Makes the widget visible.*

 - void [set_visible_focus](#) ()

Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

Makes a widget visible.
- void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the Tooltip Text for a Widget.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.
- int [use_accents_menu](#) ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)

Sets the user data for this widget.
- void [user_data](#) (void *v)

Sets the user data for this widget.
- int [vertical_label_margin](#) ()

Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)

Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const

Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const

Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)

Modifies keyboard focus navigation.
- int [visible_r](#) () const

Returns whether a widget and all its parents are visible.
- int [w](#) () const

Gets the widget width.

- **FL_When** **when** () const
Returns the conditions under which the callback is called.
- void **when** (uchar i)
Sets the flags used to decide when a callback is called.
- **FL_Window** * **window** () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int **x** () const
Gets the widget position in its window.
- int **y** () const
Gets the widget position in its window.
- virtual ~**FL_Widget** ()
Destroys the widget.

Protected Member Functions

- void **draw** () override
Draws the widget.

Protected Member Functions inherited from FL_Valuator

- **FL_Valuator** (int X, int Y, int W, int H, const char *L)
Creates a new FL_Valuator widget using the given position, size, and label string.
- void **handle_drag** (double newvalue)
Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.
- void **handle_push** ()
Stores the current value in the previous value.
- void **handle_release** ()
Called after an FL_WHEN_RELEASE event is received and before the callback.
- int **horizontal** () const
Tells if the valuator is an FL_HORIZONTAL one.
- double **previous_value** () const
Gets the previous floating point value before an event changed it.
- void **set_value** (double v)
Sets the current floating point value.
- double **softclamp** (double)
Clamps the value, but accepts v if the previous value is not already out of range.
- virtual void **value_damage** ()
Asks for partial redraw.

Protected Member Functions inherited from FL_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according to its box style.
- void **draw_box** (FL_Boxtype t, FL_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const

- Draws a focus rectangle around the widget.*
- void **draw_focus** (**FI_Boxtype** t, int X, int Y, int W, int H) const
- Draws a focus rectangle around the widget.*
- void **draw_focus** (**FI_Boxtype** t, int x, int y, int w, int h, **FI_Color** bg) const
- Draws a focus box for the widget at the given position and size.*
- void **draw_label** () const
- Draws the widget's label at the defined label position.*
- void **draw_label** (int, int, int, int) const
- Draws the label in an arbitrary bounding box.*
- **FI_Widget** (int x, int y, int w, int h, const char *label=0L)
- Creates a widget at the given position and size.*
- unsigned int **flags** () const
- Gets the widget flags mask.*
- void **h** (int v)
- Internal use only.*
- void **set_flag** (unsigned int c)
- Sets a flag in the flags mask.*
- void **w** (int v)
- Internal use only.*
- void **x** (int v)
- Internal use only.*
- void **y** (int v)
- Internal use only.*

Additional Inherited Members

Static Public Member Functions inherited from **FI_Widget**

- static void **default_callback** (**FI_Widget** *widget, void *data)
- The default callback for all widgets that don't set a callback.*
- static unsigned int **label_shortcut** (const char *t)
- Returns the Unicode value of the '&x' shortcut in a given text.*
- static int **test_shortcut** (const char *, const bool require_alt=false)
- Returns true if the given text t contains the entered '&x' shortcut.*

Protected Types inherited from **FI_Widget**

- enum {
INACTIVE = 1<<0 , **INVISIBLE** = 1<<1 , **OUTPUT** = 1<<2 , **NOBORDER** = 1<<3 ,
FORCE_POSITION = 1<<4 , **NON_MODAL** = 1<<5 , **SHORTCUT_LABEL** = 1<<6 , **CHANGED** = 1<<7

MAXIMIZED = 1<<24 , **POPUP** = 1<<25 , **USERFLAG3** = 1<<29 , **USERFLAG2** = 1<<30 ,
USERFLAG1 = 1<<31 }
flags possible values enumeration.

13.153.1 Detailed Description

The [Fl_Value_Output](#) widget displays a floating point value.

If [step\(\)](#) is not zero, the user can adjust the value by dragging the mouse left and right. The left button moves one [step\(\)](#) per pixel, the middle by $10 * \text{step}()$, and the right button by $100 * \text{step}()$.

This is much lighter-weight than [Fl_Value_Input](#) because it contains no text editing code or character buffer.

Figure 13.68 Fl_Value_Output

13.153.2 Constructor & Destructor Documentation

13.153.2.1 Fl_Value_Output()

```
Fl_Value_Output::Fl_Value_Output (
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0 )
```

Creates a new [Fl_Value_Output](#) widget using the given position, size, and label string.

The default boxtype is FL_NO_BOX.

Inherited destructor destroys the Valuator.

13.153.3 Member Function Documentation

13.153.3.1 draw()

```
void Fl_Value_Output::draw ( ) [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implements [Fl_Widget](#).

13.153.3.2 handle()

```
int Fl_Value_Output::handle (
    int event ) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

<code>in</code>	<code>event</code>	the kind of event received

Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented from [Fl_Widget](#).

13.153.3.3 soft() [1/2]

```
uchar Fl_Value_Output::soft ( ) const [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

13.153.3.4 soft() [2/2]

```
void Fl_Value_Output::soft (
    uchar s ) [inline]
```

If "soft" is turned on, the user is allowed to drag the value outside the range.

If they drag the value to one of the ends, let go, then grab again and continue to drag, they can get to any value. Default is one.

13.153.3.5 textcolor() [1/2]

```
Fl_Color Fl_Value_Output::textcolor ( ) const [inline]
```

Sets the color of the text in the value box.

13.153.3.6 textcolor() [2/2]

```
void Fl_Value_Output::textcolor (
    Fl_Color s ) [inline]
```

Gets the color of the text in the value box.

13.153.3.7 textfont() [1/2]

```
Fl_Font Fl_Value_Output::textfont ( ) const [inline]
```

Gets the typeface of the text in the value box.

13.153.3.8 textfont() [2/2]

```
void Fl_Value_Output::textfont (
    Fl_Font s ) [inline]
```

Sets the typeface of the text in the value box.

13.153.3.9 `textsize()`

```
Fl_Fontsize Fl_Value_Output::textsize ( ) const [inline]
```

Gets the size of the text in the value box.

The documentation for this class was generated from the following files:

- Fl_Value_Output.H
- Fl_Value_Output.cxx

13.154 Fl_Value_Slider Class Reference

The [Fl_Value_Slider](#) widget is a [Fl_Slider](#) widget with a box displaying the current value.

```
#include <Fl_Value_Slider.H>
```

Inheritance diagram for Fl_Value_Slider:

Public Member Functions

- [Fl_Value_Slider](#) (int `x`, int `y`, int `w`, int `h`, const char *`l`=0)
Creates a new [Fl_Value_Slider](#) widget using the given position, size, and label string.
- int [handle](#) (int) override
Handles the specified event.
- [Fl_Color](#) [textcolor](#) () const
Gets the color of the text in the value box.
- void [textcolor](#) ([Fl_Color](#) `s`)
Sets the color of the text in the value box.
- [Fl_Font](#) [textfont](#) () const
Gets the typeface of the text in the value box.
- void [textfont](#) ([Fl_Font](#) `s`)
Sets the typeface of the text in the value box.
- [Fl_Fontsize](#) [textsize](#) () const
Gets the size of the text in the value box.
- void [textsize](#) ([Fl_Fontsize](#) `s`)
Sets the size of the text in the value box.
- int [value_height](#) () const
Gets the height of the value box in pixels (vertical mode only).
- void [value_height](#) (int `s`)
Sets the height of the value box in pixels (vertical mode only).
- int [value_width](#) () const
Gets the width of the value box in pixels (horizontal mode only).
- void [value_width](#) (int `s`)
Sets the width of the value box in pixels (horizontal mode only).

Public Member Functions inherited from [FI_Slider](#)

- void [bounds](#) (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- [FI_Slider](#) (int X, int Y, int W, int H, const char *L=0)
Creates a new [FI_Slider](#) widget using the given position, size, and label string.
- [FI_Slider](#) (uchar t, int X, int Y, int W, int H, const char *L)
Creates a new [FI_Slider](#) widget using the given type, position, size, and label string.
- [uchar num_ticks](#) () const
Gets the number of tick marks.
- [Scale_Type scale](#) () const
Gets the scale type.
- void [scale](#) ([Scale_Type](#) s)
Sets the scale type.
- int [scrollvalue](#) (int pos, int [size](#), int first, int total)
Sets the size and position of the sliding knob in the box.
- [FI_Boxtype slider](#) () const
Gets the slider box type.
- void [slider](#) ([FI_Boxtype](#) c)
Sets the slider box type.
- float [slider_size](#) () const
Get the dimensions of the moving piece of slider.
- void [slider_size](#) (double v)
Set the dimensions of the moving piece of slider.
- [uchar ticks](#) () const
Gets the tick mark position.
- void [ticks](#) (uchar t, [uchar num_ticks](#)=11)
Sets the tick mark position for [FI_Nice_Slider](#).

Public Member Functions inherited from [FI_Valuator](#)

- void [bounds](#) (double a, double b)
Sets the minimum (a) and maximum (b) values for the valuator widget.
- double [clamp](#) (double)
Clamps the passed value to the valuator range.
- virtual int [format](#) (char *)
Uses internal rules to format the fields numerical value into the character array pointed to by the passed parameter.
- virtual std::string [format_str](#) ()
C++11 API for [FI_Valuator::format\(char buffer\)](#).*
- double [increment](#) (double, int)
Adds n times the step value to the passed value.
- double [maximum](#) () const
Gets the maximum value for the valuator.
- void [maximum](#) (double a)
Sets the maximum value for the valuator.
- double [minimum](#) () const
Gets the minimum value for the valuator.
- void [minimum](#) (double a)
Sets the minimum value for the valuator.
- void [precision](#) (int digits)
Sets the step value to $1.0 / 10^{\text{digits}}$.
- void [range](#) (double a, double b)

- Sets the minimum and maximum values for the valuator.*
- double **round** (double)
 - Round the passed value to the nearest step increment.*
- double **step** () const
 - Gets or sets the step value.*
- void **step** (double a, int b)
 - See double [FI_Valuator::step\(\)](#) const*
- void **step** (double s)
 - See double [FI_Valuator::step\(\)](#) const.*
- void **step** (int a)
 - See double [FI_Valuator::step\(\)](#) const*
- double **value** () const
 - Gets the floating point(double) value.*
- int **value** (double)
 - Sets the current value.*
- ~**FI_Valuator** () override
 - Destructor is accessible despite protected constructor.*

Public Member Functions inherited from [FI_Widget](#)

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
 - Activates the widget.*
- unsigned int **active** () const
 - Returns whether the widget is active.*
- int **active_r** () const
 - Returns whether the widget and all of its parents are active.*
- [FI_Align](#) **align** () const
 - Gets the label alignment.*
- void **align** ([FI_Align](#) alignment)
 - Sets the label alignment.*
- long **argument** () const
 - Gets the current user data (long) argument that is passed to the callback function.*
- void **argument** (long v)
 - Sets the current user data (long) argument that is passed to the callback function.*
- virtual class [FI_Gl_Window](#) * **as_gl_window** ()
 - Returns an [FI_Gl_Window](#) pointer if this widget is an [FI_Gl_Window](#).*
- virtual class [FI_Gl_Window](#) const * **as_gl_window** () const
- virtual [FI_Group](#) * **as_group** ()
 - Returns an [FI_Group](#) pointer if this widget is an [FI_Group](#).*
- virtual [FI_Group](#) const * **as_group** () const
- virtual [FI_Window](#) * **as_window** ()
 - Returns an [FI_Window](#) pointer if this widget is an [FI_Window](#).*
- virtual [FI_Window](#) const * **as_window** () const
- void **bind_deimage** ([FI_Image](#) *img)
 - Sets the image to use as part of the widget label when in the inactive state.*
- void **bind_deimage** (int f)
 - Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.*
- void **bind_image** ([FI_Image](#) *img)

- Sets the image to use as part of the widget label when in the active state.*

 - void [bind_image](#) (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FI_Boxtype](#) [box](#) () const

Gets the box type of the widget.
- void [box](#) ([FI_Boxtype](#) new_box)

Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const

Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)

Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)

Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)

Sets the current callback function for the widget.
- unsigned int [changed](#) () const

Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()

Marks the value of the widget as unchanged.
- void [clear_damage](#) (uchar c=0)

Clears or sets the damage flags.
- void [clear_output](#) ()

Sets a widget to accept input.
- void [clear_visible](#) ()

Hides the widget.
- void [clear_visible_focus](#) ()

Disables keyboard focus navigation with this widget.
- [FI_Color](#) [color](#) () const

Gets the background color of the widget.
- void [color](#) ([FI_Color](#) bg)

Sets the background color of the widget.
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)

Sets the background and selection color of the widget.
- int [contains](#) (const [FI_Widget](#) *w) const

Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)

Sets the current label.
- void [copy_tooltip](#) (const char *text)

Sets the current tooltip text.
- uchar [damage](#) () const

Returns non-zero if [draw\(\)](#) needs to be called.
- void [damage](#) (uchar c)

Sets the damage bits for the widget.
- void [damage](#) (uchar c, int x, int y, int w, int h)

Sets the damage bits for an area inside the widget.

- int **damage_resize** (int, int, int, int)
Internal use only.
- void **deactivate** ()
Deactivates the widget.
- **FL_Image** * **deimage** ()
Gets the image that is used as part of the widget label when in the inactive state.
- const **FL_Image** * **deimage** () const
Gets the image that is used as part of the widget label when in the inactive state.
- void **deimage** (**FL_Image** &img)
Sets the image to use as part of the widget label when in the inactive state.
- void **deimage** (**FL_Image** *img)
Sets the image to use as part of the widget label when in the inactive state.
- int **deimage_bound** () const
Returns whether the inactive image is managed by the widget.
- void **do_callback** (**FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
Calls the widget callback function with default arguments.
- void **do_callback** (**FL_Widget** *widget, long arg, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
Calls the widget callback function with arbitrary arguments.
- void **do_callback** (**FL_Widget** *widget, void *arg=0, **FL_Callback_Reason** reason=**FL_REASON_UNKNOWN**)
Calls the widget callback function with arbitrary arguments.
- void **draw_label** (int, int, int, int, **FL_Align**) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int **h** () const
Gets the widget height.
- virtual void **hide** ()
Makes a widget invisible.
- int **horizontal_label_margin** ()
Get the spacing between the label and the horizontal edge of the widget.
- void **horizontal_label_margin** (int px)
Set the spacing between the label and the horizontal edge of the widget.
- **FL_Image** * **image** ()
Gets the image that is used as part of the widget label when in the active state.
- const **FL_Image** * **image** () const
Gets the image that is used as part of the widget label when in the active state.
- void **image** (**FL_Image** &img)
Sets the image to use as part of the widget label when in the active state.
- void **image** (**FL_Image** *img)
Sets the image to use as part of the widget label when in the active state.
- int **image_bound** () const
Returns whether the image is managed by the widget.
- int **inside** (const **FL_Widget** *wgt) const
Checks if this widget is a child of wgt.
- int **is_label_copied** () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * **label** () const
Gets the current label text.
- void **label** (const char *text)
Sets the current label pointer.
- void **label** (**FL_Labeltype** a, const char *b)
Shortcut to set the label text and type in one call.
- int **label_image_spacing** ()

- Return the gap size between the label and the image.*

 - void [label_image_spacing](#) (int gap)

Set the gap between the label and the image in pixels.
- [FI_Color](#) [labelcolor](#) () const

Gets the label color.
- void [labelcolor](#) ([FI_Color](#) c)

Sets the label color.
- [FI_Font](#) [labelfont](#) () const

Gets the font to use.
- void [labelfont](#) ([FI_Font](#) f)

Sets the font to use.
- [FI_Fontsize](#) [labelsize](#) () const

Gets the font size in pixels.
- void [labelsize](#) ([FI_Fontsize](#) pix)

Sets the font size in pixels.
- [FI_Labeltype](#) [labeltype](#) () const

Gets the label type.
- void [labeltype](#) ([FI_Labeltype](#) a)

Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const

Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const

Returns if a widget is used for output only.
- [FI_Group](#) * [parent](#) () const

Returns a pointer to the parent widget.
- void [parent](#) ([FI_Group](#) *p)

Internal use only - "for hacks only".
- void [position](#) (int X, int Y)

Repositions the window or widget.
- void [redraw](#) ()

Schedules the drawing of the widget.
- void [redraw_label](#) ()

Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)

Changes the size or position of the widget.
- [FI_Color](#) [selection_color](#) () const

Gets the selection color.
- void [selection_color](#) ([FI_Color](#) a)

Sets the selection color.
- void [set_active](#) ()

Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()

Marks the value of the widget as changed.
- void [set_output](#) ()

Sets a widget to output only.
- void [set_visible](#) ()

Makes the widget visible.

- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()
Makes a widget visible.
- void [size](#) (int W, int H)
Changes the size of the widget.
- int [take_focus](#) ()
Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const
Returns if the widget is able to take events.
- int [test_shortcut](#) ()
Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const
Gets the current tooltip text.
- void [tooltip](#) (const char *text)
Sets the Tooltip Text for a Widget.
- [Fl_Window](#) * [top_window](#) () const
Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const
Gets the widget type.
- void [type](#) ([uchar](#) t)
Sets the widget type.
- int [use_accents_menu](#) ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const
Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)
Sets the user data for this widget.
- void [user_data](#) (void *v)
Sets the user data for this widget.
- int [vertical_label_margin](#) ()
Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)
Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const
Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const
Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)
Modifies keyboard focus navigation.
- int [visible_r](#) () const
Returns whether a widget and all its parents are visible.
- int [w](#) () const
Gets the widget width.
- [Fl_When](#) [when](#) () const

- Returns the conditions under which the callback is called.*
- void **when** (uchar i)
 - Sets the flags used to decide when a callback is called.*
- **FL_Window** * **window** () const
 - Returns a pointer to the nearest parent window up the widget hierarchy.*
- int **x** () const
 - Gets the widget position in its window.*
- int **y** () const
 - Gets the widget position in its window.*
- virtual ~**FL_Widget** ()
 - Destroys the widget.*

Protected Member Functions

- void **draw** () override
 - Draws the widget.*

Protected Member Functions inherited from **FL_Slider**

- void **draw** (int, int, int, int)
- void **draw_ticks** (const **FL_Rect** &r, int S)
 - Draw tick marks.*
- int **handle** (int, int, int, int, int)
- double **increment_lin_log** (double v, int n, int range)
 - Adds a sensible step value to the passed value.*
- double **position_to_value** (double pos) const
 - Converts a normalized position (0.0 to 1.0) to a value based on the current scale type.*
- double **value_to_position** (double val) const
 - Converts a value to a normalized position (0.0 to 1.0) based on the current scale type.*

Protected Member Functions inherited from **FL_Valuator**

- **FL_Valuator** (int X, int Y, int W, int H, const char *L)
 - Creates a new **FL_Valuator** widget using the given position, size, and label string.*
- void **handle_drag** (double newvalue)
 - Called during a drag operation, after an FL_WHEN_CHANGED event is received and before the callback.*
- void **handle_push** ()
 - Stores the current value in the previous value.*
- void **handle_release** ()
 - Called after an FL_WHEN_RELEASE event is received and before the callback.*
- int **horizontal** () const
 - Tells if the valuator is an FL_HORIZONTAL one.*
- double **previous_value** () const
 - Gets the previous floating point value before an event changed it.*
- void **set_value** (double v)
 - Sets the current floating point value.*
- double **softclamp** (double)
 - Clamps the value, but accepts v if the previous value is not already out of range.*
- virtual void **value_damage** ()
 - Asks for partial redraw.*

Protected Member Functions inherited from FI_Widget

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according to its box style.
- void **draw_box** (FI_Boxtype t, FI_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FI_Boxtype t, int x, int y, int w, int h, FI_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FI_Boxtype t, int x, int y, int w, int h, FI_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- FI_Widget (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Additional Inherited Members

Public Types inherited from FI_Slider

- enum **Scale_Type** : uchar { **LINEAR_SCALE** = 0 , **LOG_SCALE** }
Bitset for tick mark positions for FI_Nice_Slider.
- enum **Tick_Position** : uchar {
TICKS_NONE = 0x00 , **TICKS_BELOW** = 0x01 , **TICKS_ABOVE** = 0x02 , **TICKS_LEFT** = 0x01 ,
TICKS_RIGHT = 0x02 }
Bitset for tick mark positions for FI_Nice_Slider.

Static Public Member Functions inherited from [Fl_Widget](#)

- static void [default_callback](#) ([Fl_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types inherited from [Fl_Widget](#)

- enum {
[INACTIVE](#) = 1<<0 , [INVISIBLE](#) = 1<<1 , [OUTPUT](#) = 1<<2 , [NOBORDER](#) = 1<<3 ,
[FORCE_POSITION](#) = 1<<4 , [NON_MODAL](#) = 1<<5 , [SHORTCUT_LABEL](#) = 1<<6 , [CHANGED](#) = 1<<7
, [OVERRIDE](#) = 1<<8 , [VISIBLE_FOCUS](#) = 1<<9 , [COPIED_LABEL](#) = 1<<10 , [CLIP_CHILDREN](#) = 1<<11
, [MENU_WINDOW](#) = 1<<12 , [TOOLTIP_WINDOW](#) = 1<<13 , [MODAL](#) = 1<<14 , [NO_OVERLAY](#) = 1<<15
, [GROUP_RELATIVE](#) = 1<<16 , [COPIED_TOOLTIP](#) = 1<<17 , [FULLSCREEN](#) = 1<<18 , [MAC_USE_ACCENTS_MENU](#)
= 1<<19 ,
[NEEDS_KEYBOARD](#) = 1<<20 , [IMAGE_BOUND](#) = 1<<21 , [DEIMAGE_BOUND](#) = 1<<22 ,
[AUTO_DELETE_USER_DATA](#) = 1<<23 ,
[MAXIMIZED](#) = 1<<24 , [POPUP](#) = 1<<25 , [USERFLAG3](#) = 1<<29 , [USERFLAG2](#) = 1<<30 ,
[USERFLAG1](#) = 1<<31 }
flags possible values enumeration.

13.154.1 Detailed Description

The [Fl_Value_Slider](#) widget is a [Fl_Slider](#) widget with a box displaying the current value.

Figure 13.69 [Fl_Value_Slider](#)

13.154.2 Constructor & Destructor Documentation

13.154.2.1 [Fl_Value_Slider\(\)](#)

```
Fl_Value_Slider::Fl_Value_Slider (
    int X,
    int Y,
    int W,
    int H,
    const char * l = 0 )
```

Creates a new [Fl_Value_Slider](#) widget using the given position, size, and label string. The default boxtype is `FL_DOWN_BOX`.

13.154.3 Member Function Documentation

13.154.3.1 [draw\(\)](#)

```
void Fl_Value_Slider::draw ( ) [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl_Slider](#).

13.154.3.2 [handle\(\)](#)

```
int Fl_Value_Slider::handle (
    int event ) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

<code>in</code>	<code>event</code>	the kind of event received

Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented from [Fl_Slider](#).

13.154.3.3 [value_height\(\)](#) [1/2]

```
int Fl_Value_Slider::value_height ( ) const [inline]
```

Gets the height of the value box in pixels (vertical mode only).

Since

1.4.0

13.154.3.4 [value_height\(\)](#) [2/2]

```
void Fl_Value_Slider::value_height (
    int s ) [inline]
```

Sets the height of the value box in pixels (vertical mode only).

Limited range checking is applied but drawing errors may occur if the size `s` is set too high or too low, particularly if the widget is resized (later).

The programmer is responsible for setting sensible values and widget sizes.

The default value set by the constructor is 25.

Parameters

in	s	new height of the value box

Since

1.4.0

13.154.3.5 value_width() [1/2]

```
int Fl_Value_Slider::value_width ( ) const [inline]
```

Gets the width of the value box in pixels (horizontal mode only).

Since

1.4.0

13.154.3.6 value_width() [2/2]

```
void Fl_Value_Slider::value_width (
    int s ) [inline]
```

Sets the width of the value box in pixels (horizontal mode only).

Limited range checking is applied but drawing errors may occur if the size *s* is set too high or too low, particularly if the widget is resized (later).

The programmer is responsible for setting sensible values and widget sizes.

The default value set by the constructor is 35.

Parameters

in	s	new width of the value box

Since

1.4.0

The documentation for this class was generated from the following files:

- Fl_Value_Slider.H
- Fl_Value_Slider.cxx

13.155 Fl_Widget Class Reference

[Fl_Widget](#) is the base class for all widgets in FLTK.

```
#include <Fl_Widget.H>
```

Inheritance diagram for Fl_Widget:

Public Member Functions

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()
Activates the widget.
- unsigned int **active** () const
Returns whether the widget is active.
- int **active_r** () const
Returns whether the widget and all of its parents are active.
- **FL_Align align** () const
Gets the label alignment.
- void **align** (**FL_Align** alignment)
Sets the label alignment.
- long **argument** () const
Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)
Sets the current user data (long) argument that is passed to the callback function.
- virtual class **FL_Gl_Window** * **as_gl_window** ()
*Returns an **FL_Gl_Window** pointer if this widget is an **FL_Gl_Window**.*
- virtual class **FL_Gl_Window** const * **as_gl_window** () const
- virtual **FL_Group** * **as_group** ()
*Returns an **FL_Group** pointer if this widget is an **FL_Group**.*
- virtual **FL_Group** const * **as_group** () const
- virtual **FL_Window** * **as_window** ()

- Returns an [FL_Window](#) pointer if this widget is an [FL_Window](#).*

 - virtual [FL_Window](#) const * **as_window** () const
- void [bind_deimage](#) ([FL_Image](#) *img)

Sets the image to use as part of the widget label when in the inactive state.
- void [bind_deimage](#) (int f)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void [bind_image](#) ([FL_Image](#) *img)

Sets the image to use as part of the widget label when in the active state.
- void [bind_image](#) (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- [FL_Boxtype](#) **box** () const

Gets the box type of the widget.
- void [box](#) ([FL_Boxtype](#) new_box)

Sets the box type for the widget.
- [FL_Callback_p](#) **callback** () const

Gets the current callback function for the widget.
- void [callback](#) ([FL_Callback](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FL_Callback](#) *cb, [FL_Callback_User_Data](#) *p, bool auto_free)

Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FL_Callback](#) *cb, void *p)

Sets the current callback function and data for the widget.
- void [callback](#) ([FL_Callback0](#) *cb)

Sets the current callback function for the widget.
- void [callback](#) ([FL_Callback1](#) *cb, long p=0)

Sets the current callback function for the widget.
- unsigned int [changed](#) () const

Checks if the widget value changed since the last callback.
- void [clear_active](#) ()

Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()

Marks the value of the widget as unchanged.
- void [clear_damage](#) (uchar c=0)

Clears or sets the damage flags.
- void [clear_output](#) ()

Sets a widget to accept input.
- void [clear_visible](#) ()

Hides the widget.
- void [clear_visible_focus](#) ()

Disables keyboard focus navigation with this widget.
- [FL_Color](#) **color** () const

Gets the background color of the widget.
- void [color](#) ([FL_Color](#) bg)

Sets the background color of the widget.
- void [color](#) ([FL_Color](#) bg, [FL_Color](#) sel)

Sets the background and selection color of the widget.
- int [contains](#) (const [FL_Widget](#) *w) const

Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)

Sets the current label.
- void [copy_tooltip](#) (const char *text)

- Sets the current tooltip text.*

 - `uchar damage () const`

Returns non-zero if `draw()` needs to be called.
- `void damage (uchar c)`

Sets the damage bits for the widget.
- `void damage (uchar c, int x, int y, int w, int h)`

Sets the damage bits for an area inside the widget.
- `int damage_resize (int, int, int, int)`

Internal use only.
- `void deactivate ()`

Deactivates the widget.
- `FL_Image * deimage ()`

Gets the image that is used as part of the widget label when in the inactive state.
- `const FL_Image * deimage () const`

Gets the image that is used as part of the widget label when in the inactive state.
- `void deimage (FL_Image &img)`

Sets the image to use as part of the widget label when in the inactive state.
- `void deimage (FL_Image *img)`

Sets the image to use as part of the widget label when in the inactive state.
- `int deimage_bound () const`

Returns whether the inactive image is managed by the widget.
- `void do_callback (FL_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with default arguments.
- `void do_callback (FL_Widget *widget, long arg, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with arbitrary arguments.
- `void do_callback (FL_Widget *widget, void *arg=0, FL_Callback_Reason reason=FL_REASON_UNKNOWN)`

Calls the widget callback function with arbitrary arguments.
- `virtual void draw ()=0`

Draws the widget.
- `void draw_label (int, int, int, int, FL_Align) const`

Draws the label in an arbitrary bounding box with an arbitrary alignment.
- `int h () const`

Gets the widget height.
- `virtual int handle (int event)`

Handles the specified event.
- `virtual void hide ()`

Makes a widget invisible.
- `int horizontal_label_margin ()`

Get the spacing between the label and the horizontal edge of the widget.
- `void horizontal_label_margin (int px)`

Set the spacing between the label and the horizontal edge of the widget.
- `FL_Image * image ()`

Gets the image that is used as part of the widget label when in the active state.
- `const FL_Image * image () const`

Gets the image that is used as part of the widget label when in the active state.
- `void image (FL_Image &img)`

Sets the image to use as part of the widget label when in the active state.
- `void image (FL_Image *img)`

Sets the image to use as part of the widget label when in the active state.
- `int image_bound () const`

Returns whether the image is managed by the widget.

- int [inside](#) (const [FL_Widget](#) *wgt) const
Checks if this widget is a child of wgt.
- int [is_label_copied](#) () const
Returns whether the current label was assigned with [copy_label\(\)](#).
- const char * [label](#) () const
Gets the current label text.
- void [label](#) (const char *text)
Sets the current label pointer.
- void [label](#) ([FL_Labeltype](#) a, const char *b)
Shortcut to set the label text and type in one call.
- int [label_image_spacing](#) ()
Return the gap size between the label and the image.
- void [label_image_spacing](#) (int gap)
Set the gap between the label and the image in pixels.
- [FL_Color](#) [labelcolor](#) () const
Gets the label color.
- void [labelcolor](#) ([FL_Color](#) c)
Sets the label color.
- [FL_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([FL_Font](#) f)
Sets the font to use.
- [FL_Fonsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([FL_Fonsize](#) pix)
Sets the font size in pixels.
- [FL_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([FL_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [FL_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([FL_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- virtual void [resize](#) (int x, int y, int w, int h)
Changes the size or position of the widget.
- [FL_Color](#) [selection_color](#) () const

- Gets the selection color.*

 - void `selection_color` (`Fl_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.
- void `set_visible` ()

Makes the widget visible.
- void `set_visible_focus` ()

Enables keyboard focus navigation with this widget.
- int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void `show` ()

Makes a widget visible.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the Tooltip Text for a Widget.
- `Fl_Window` * `top_window` () const

Returns a pointer to the top-level window for the widget.
- `Fl_Window` * `top_window_offset` (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- `uchar` `type` () const

Gets the widget type.
- void `type` (`uchar` t)

Sets the widget type.
- int `use_accents_menu` ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * `user_data` () const

Gets the user data for this widget.
- void `user_data` (`Fl_Callback_User_Data` *v, bool auto_free)

Sets the user data for this widget.
- void `user_data` (void *v)

Sets the user data for this widget.
- int `vertical_label_margin` ()

Get the spacing between the label and the vertical edge of the widget.
- void `vertical_label_margin` (int px)

Set the spacing between the label and the vertical edge of the widget.

- unsigned int `visible` () const
Returns whether a widget is visible.
- unsigned int `visible_focus` () const
Checks whether this widget has a visible focus.
- void `visible_focus` (int v)
Modifies keyboard focus navigation.
- int `visible_r` () const
Returns whether a widget and all its parents are visible.
- int `w` () const
Gets the widget width.
- `Fl_When` `when` () const
Returns the conditions under which the callback is called.
- void `when` (uchar i)
Sets the flags used to decide when a callback is called.
- `Fl_Window` * `window` () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- int `x` () const
Gets the widget position in its window.
- int `y` () const
Gets the widget position in its window.
- virtual `~Fl_Widget` ()
Destroys the widget.

Static Public Member Functions

- static void `default_callback` (`Fl_Widget` *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int `label_shortcut` (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int `test_shortcut` (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Types

- enum {
`INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,
`FORCE_POSITION` = 1<<4 , `NON_MODAL` = 1<<5 , `SHORTCUT_LABEL` = 1<<6 , `CHANGED` = 1<<7
, `OVERRIDE` = 1<<8 , `VISIBLE_FOCUS` = 1<<9 , `COPIED_LABEL` = 1<<10 , `CLIP_CHILDREN` = 1<<11
, `MENU_WINDOW` = 1<<12 , `TOOLTIP_WINDOW` = 1<<13 , `MODAL` = 1<<14 , `NO_OVERLAY` = 1<<15
, `GROUP_RELATIVE` = 1<<16 , `COPIED_TOOLTIP` = 1<<17 , `FULLSCREEN` = 1<<18 , `MAC_USE_ACCENTS_MENU`
= 1<<19 ,
`NEEDS_KEYBOARD` = 1<<20 , `IMAGE_BOUND` = 1<<21 , `DEIMAGE_BOUND` = 1<<22 ,
`AUTO_DELETE_USER_DATA` = 1<<23 ,
`MAXIMIZED` = 1<<24 , `POPUP` = 1<<25 , `USERFLAG3` = 1<<29 , `USERFLAG2` = 1<<30 ,
`USERFLAG1` = 1<<31 }
flags possible values enumeration.

Protected Member Functions

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according to its box style.
- void **draw_box** (FL_Boxtype t, FL_Color c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (FL_Boxtype t, int x, int y, int w, int h, FL_Color c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (FL_Boxtype t, int x, int y, int w, int h, FL_Color bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const
Draws the label in an arbitrary bounding box.
- **FL_Widget** (int x, int y, int w, int h, const char *label=0L)
Creates a widget at the given position and size.
- unsigned int **flags** () const
Gets the widget flags mask.
- void **h** (int v)
Internal use only.
- void **set_flag** (unsigned int c)
Sets a flag in the flags mask.
- void **w** (int v)
Internal use only.
- void **x** (int v)
Internal use only.
- void **y** (int v)
Internal use only.

Friends

- class **FL_Group**

13.155.1 Detailed Description

FL_Widget is the base class for all widgets in FLTK.

You can't create one of these because the constructor is not public. However you can subclass it.

All "property" accessing methods, such as **color()**, **parent()**, or **argument()** are implemented as trivial inline functions and thus are as fast and small as accessing fields in a structure. Unless otherwise noted, the property setting methods such as **color(n)** or **label(s)** are also trivial inline functions, even if they change the widget's appearance. It is up to the user code to call **redraw()** after these.

13.155.2 Member Enumeration Documentation

13.155.2.1 anonymous enum

anonymous enum [protected]

flags possible values enumeration.

See [activate\(\)](#), [output\(\)](#), [visible\(\)](#), [changed\(\)](#), [set_visible_focus\(\)](#)

Enumerator

INACTIVE	the widget can't receive focus, and is disabled but potentially visible
INVISIBLE	the widget is not drawn, but can receive a few special events
OUTPUT	for output only
NOBORDER	don't draw a decoration (Fl_Window)
FORCE_POSITION	don't let the window manager position the window (Fl_Window)
NON_MODAL	this is a hovering toolbar window (Fl_Window)
SHORTCUT_LABEL	the label contains a shortcut we need to draw
CHANGED	the widget value changed
OVERRIDE	position window on top (Fl_Window)
VISIBLE_FOCUS	accepts keyboard focus navigation if the widget can have the focus
COPIED_LABEL	the widget label is internally copied, its destruction is handled by the widget
CLIP_CHILDREN	all drawing within this widget will be clipped (Fl_Group)
MENU_WINDOW	a temporary popup window, dismissed by clicking outside (Fl_Window)
TOOLTIP_WINDOW	a temporary popup, transparent to events, and dismissed easily (Fl_Window)
MODAL	a window blocking input to all other windows (Fl_Window)
NO_OVERLAY	window not using a hardware overlay plane (Fl_Menu_Window)
GROUP_RELATIVE	Reserved, not implemented. DO NOT USE.
COPIED_TOOLTIP	the widget tooltip is internally copied, its destruction is handled by the widget
FULLSCREEN	a fullscreen window (Fl_Window)
MAC_USE_ACCENTS_MENU	On the macOS platform, pressing and holding a key on the keyboard opens an accented-character menu window (Fl_Input , Fl_Text_Editor)
NEEDS_KEYBOARD	set on touch screen devices if a widget needs a keyboard when it gets the focus. Reserved, not yet used in 1.4.0. See also Fl_Widget::needs_keyboard()
IMAGE_BOUND	binding the image to the widget will transfer ownership, so that the widget will delete the image when it is no longer needed
DEIMAGE_BOUND	bind the inactive image to the widget, so the widget deletes the image when it is no longer needed
AUTO_DELETE_USER_DATA	automatically call <code>delete</code> on the <code>user_data</code> pointer when destroying this widget; if set, <code>user_data</code> must point to a class derived from the class Fl_Callback_User_Data
MAXIMIZED	a maximized Fl_Window
POPUP	popup window (i.e., positioned relatively to another mapped window)
USERFLAG3	reserved for 3rd party extensions
USERFLAG2	reserved for 3rd party extensions
USERFLAG1	reserved for 3rd party extensions

13.155.3 Constructor & Destructor Documentation

13.155.3.1 Fl_Widget()

```
Fl_Widget::Fl_Widget (
    int x,
    int y,
    int w,
    int h,
    const char * label = 0L ) [protected]
```

Creates a widget at the given position and size.

The `Fl_Widget` is a protected constructor, but all derived widgets have a matching public constructor. It takes a value for `x()`, `y()`, `w()`, `h()`, and an optional value for `label()`.

Parameters

in	<i>x,y</i>	the position of the widget relative to the enclosing window
in	<i>w,h</i>	size of the widget in pixels
in	<i>label</i>	optional text for the widget label

13.155.3.2 ~Fl_Widget()

```
Fl_Widget::~~Fl_Widget ( ) [virtual]
```

Destroys the widget.

Destroys the widget, taking care of throwing focus before if any.

Destroying single widgets is not very common. You almost always want to destroy the parent group instead, which will destroy all of the child widgets and groups in that group.

Since

FLTK 1.3, the widget's destructor removes the widget from its parent group, if it is member of a group.

Destruction removes the widget from any parent group! And groups when destroyed destroy all their children. This is convenient and fast.

13.155.4 Member Function Documentation

13.155.4.1 activate()

```
void Fl_Widget::activate ( )
```

Activates the widget.

Changing this value will send `FL_ACTIVATE` to the widget if `active_r()` is true.

See also

[active\(\)](#), [active_r\(\)](#), [deactivate\(\)](#)

13.155.4.2 active()

```
unsigned int Fl_Widget::active ( ) const [inline]
```

Returns whether the widget is active.

Return values

0	if the widget is inactive

See also

[active_r\(\)](#), [activate\(\)](#), [deactivate\(\)](#)

13.155.4.3 active_r()

```
int Fl_Widget::active_r ( ) const
```

Returns whether the widget and all of its parents are active.

Return values

0	if this or any of the parent widgets are inactive

See also

[active\(\)](#), [activate\(\)](#), [deactivate\(\)](#)

13.155.4.4 align() [1/2]

```
Fl_Align Fl_Widget::align ( ) const [inline]
```

Gets the label alignment.

Returns

label alignment

See also

[label\(\)](#), [align\(Fl_Align\)](#), [Fl_Align](#)

13.155.4.5 align() [2/2]

```
void Fl_Widget::align (
    Fl_Align alignment ) [inline]
```

Sets the label alignment.

This controls how the label is displayed next to or inside the widget. The default value is FL_ALIGN_CENTER, which centers the label inside the widget.

Parameters

in	<i>alignment</i>	new label alignment

See also

[align\(\)](#), [Fl_Align](#)

13.155.4.6 argument() [1/2]

```
long Fl_Widget::argument ( ) const [inline]
```

Gets the current user data (long) argument that is passed to the callback function.

Note

On platforms with `sizeof(long) < sizeof(void*)`, particularly on Windows 64-bit platforms, this method can truncate stored addresses (`void*`) to the size of a `long` value. Use with care and only if you are sure that the stored `user_data` value fits in a `long` value because it was stored with [argument\(long\)](#) or another method using only `long` values. You may want to use [user_data\(\)](#) instead.

See also

[user_data\(\)](#)

13.155.4.7 argument() [2/2]

```
void Fl_Widget::argument (
    long v ) [inline]
```

Sets the current user data (long) argument that is passed to the callback function.

See also

[argument\(\)](#)

13.155.4.8 as_gl_window()

```
virtual class Fl_Gl_Window * Fl_Widget::as_gl_window ( ) [inline], [virtual]
```

Returns an [Fl_Gl_Window](#) pointer if this widget is an [Fl_Gl_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl_Gl_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl_Gl_Window](#).

Return values

NULL	if this widget is not derived from Fl_Gl_Window .

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl_Widget::as_group\(\)](#), [Fl_Widget::as_window\(\)](#)

Reimplemented in [Fl_Gl_Window](#).

13.155.4.9 as_group()

```
virtual Fl_Group * Fl_Widget::as_group ( ) [inline], [virtual]
```

Returns an [Fl_Group](#) pointer if this widget is an [Fl_Group](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl_Group](#). If it returns non-NULL, then the widget in question is derived from [Fl_Group](#), and you can use the returned pointer to access its children or other [Fl_Group](#)-specific methods.

Example:

```
void my_callback (Fl_Widget *w, void *) {
    Fl_Group *g = w->as_group();
    if (g)
        printf ("This group has %d children\n", g->children());
    else
        printf ("This widget is not a group!\n");
}
```

Return values

NULL	if this widget is not derived from Fl_Group .

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl_Widget::as_window\(\)](#), [Fl_Widget::as_gl_window\(\)](#)

Reimplemented in [Fl_Group](#).

13.155.4.10 as_window()

```
virtual Fl_Window * Fl_Widget::as_window ( ) [inline], [virtual]
```

Returns an [Fl_Window](#) pointer if this widget is an [Fl_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl_Window](#), and you can use the returned pointer to access its children or other [Fl_Window](#)-specific methods.

Return values

NULL	if this widget is not derived from Fl_Window .

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl_Widget::as_group\(\)](#), [Fl_Widget::as_gl_window\(\)](#)

Reimplemented in [Fl_Window](#).

13.155.4.11 bind_deimage() [1/2]

```
void Fl_Widget::bind_deimage (
    Fl_Image * img )
```

Sets the image to use as part of the widget label when in the inactive state.

Parameters

<i>in</i>	<i>img</i>	the new image for the deactivated widget

Note

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

See also

void [deimage\(Fl_Image* img\)](#)

13.155.4.12 bind_deimage() [2/2]

```
void Fl_Widget::bind_deimage (
    int f ) [inline]
```

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.

Parameters

<i>f</i>	1: mark the image as bound, 0: mark the image as managed by the user

See also

[deimage_bound\(\)](#), [bind_image\(\)](#)

13.155.4.13 bind_image() [1/2]

```
void Fl_Widget::bind_image (
    Fl_Image * img )
```

Sets the image to use as part of the widget label when in the active state.

The image will be bound to the widget. When the widget is deleted, the image will be deleted as well.

Calling [bind_image\(\)](#) with a new image will delete the old image if it was bound, and then set the new image, and bind that. If old and new image are the same, nothing happens.

Calling [bind_image\(\)](#) with NULL will delete the old image if it was bound and not set a new image.

Parameters

<i>in</i>	<i>img</i>	the new image for the label

See also

[void image\(Fl_Image* img\)](#)

13.155.4.14 bind_image() [2/2]

```
void Fl_Widget::bind_image (
    int f ) [inline]
```

Bind the image to the widget, so the widget will delete the image when it is no longer needed.

Parameters

<i>f</i>	1: mark the image as bound, 0: mark the image as managed by the user

See also

[image_bound\(\)](#), [bind_deimage\(\)](#)

13.155.4.15 box() [1/2]

```
Fl_Boxtype Fl_Widget::box (
    void ) const [inline]
```

Gets the box type of the widget.

Returns

the current box type

See also

[box\(Fl_Boxtype\)](#), [Fl_Boxtype](#)

13.155.4.16 box() [2/2]

```
void Fl_Widget::box (
    Fl_Boxtype new_box ) [inline]
```

Sets the box type for the widget.

This identifies a routine that draws the background of the widget. See [Fl_Boxtype](#) for the available types. The default depends on the widget, but is usually [FL_NO_BOX](#) or [FL_UP_BOX](#).

Parameters

<i>in</i>	<i>new_box</i>	the new box type

See also

[box\(\)](#), [Fl_Boxtype](#)

13.155.4.17 callback() [1/6]

```
Fl_Callback_p Fl_Widget::callback ( ) const [inline]
```

Gets the current callback function for the widget.

Each widget has a single callback.

Returns

current callback

13.155.4.18 callback() [2/6]

```
void Fl_Widget::callback (
    Fl_Callback * cb ) [inline]
```

Sets the current callback function for the widget.
Each widget has a single callback.

Parameters

in	<i>cb</i>	new callback

13.155.4.19 callback() [3/6]

```
void Fl_Widget::callback (
    Fl_Callback * cb,
    Fl_Callback_User_Data * p,
    bool auto_free ) [inline]
```

Sets the current callback function and managed user data for the widget.
Setting `auto_free` will transfer ownership of the callback user data to the widget. Deleting the widget will then also delete the user data.

Parameters

in	<i>cb</i>	new callback
in	<i>p</i>	user data
in	<i>auto_free</i>	if set, the widget will free user data when destroyed

13.155.4.20 callback() [4/6]

```
void Fl_Widget::callback (
    Fl_Callback * cb,
    void * p ) [inline]
```

Sets the current callback function and data for the widget.
Each widget has a single callback.

Parameters

in	<i>cb</i>	new callback
in	<i>p</i>	user data

13.155.4.21 callback() [5/6]

```
void Fl_Widget::callback (
    Fl_Callback0 * cb ) [inline]
```

Sets the current callback function for the widget.
Each widget has a single callback.

Parameters

in	<i>cb</i>	new callback

13.155.4.22 callback() [6/6]

```
void Fl_Widget::callback (
```

```
Fl_Callback1 * cb,
long p = 0 ) [inline]
```

Sets the current callback function for the widget.
Each widget has a single callback.

Parameters

in	<i>cb</i>	new callback
in	<i>p</i>	user data

13.155.4.23 changed()

```
unsigned int Fl_Widget::changed ( ) const [inline]
```

Checks if the widget value changed since the last callback.

"Changed" is a flag that is turned on when the user changes the value stored in the widget. This is only used by subclasses of [Fl_Widget](#) that store values, but is in the base class so it is easier to scan all the widgets in a panel and [do_callback\(\)](#) on the changed ones in response to an "OK" button.

Most widgets turn this flag off when they do the callback, and when the program sets the stored value.

Note

[do_callback\(\)](#) turns this flag off after the callback.

Return values

0	if the value did not change

See also

[set_changed\(\)](#), [clear_changed\(\)](#)

[do_callback\(Fl_Widget *widget, void *data\)](#)

13.155.4.24 clear_active()

```
void Fl_Widget::clear_active ( ) [inline]
```

Marks the widget as inactive without sending events or changing focus.

This is mainly for specialized use, for normal cases you want [deactivate\(\)](#).

See also

[deactivate\(\)](#)

13.155.4.25 clear_changed()

```
void Fl_Widget::clear_changed ( ) [inline]
```

Marks the value of the widget as unchanged.

See also

[changed\(\)](#), [set_changed\(\)](#)

13.155.4.26 clear_damage()

```
void Fl_Widget::clear_damage (
    uchar c = 0 ) [inline]
```

Clears or sets the damage flags.

Damage flags are cleared when parts of the widget drawing is repaired.

The optional argument *c* specifies the bits that **are set** after the call (default: 0) and **not** the bits that are cleared!

Note

Therefore it is possible to set damage bits with this method, but this should be avoided. Use [damage\(uchar\)](#) instead.

Parameters

<code>in</code>	<code>c</code>	new bitmask of damage flags (default: 0)

See also

[damage\(uchar\)](#), [damage\(\)](#)

13.155.4.27 clear_output()

```
void Fl_Widget::clear_output ( ) [inline]
```

Sets a widget to accept input.

See also

[set_output\(\)](#), [output\(\)](#)

13.155.4.28 clear_visible()

```
void Fl_Widget::clear_visible ( ) [inline]
```

Hides the widget.

You must still redraw the parent to see a change in the window. Normally you want to use the [hide\(\)](#) method instead.

13.155.4.29 clear_visible_focus()

```
void Fl_Widget::clear_visible_focus ( ) [inline]
```

Disables keyboard focus navigation with this widget.

Normally, all widgets participate in keyboard focus navigation.

See also

[set_visible_focus\(\)](#), [visible_focus\(\)](#), [visible_focus\(int\)](#)

13.155.4.30 color() [1/3]

```
Fl_Color Fl_Widget::color (
    void ) const [inline]
```

Gets the background color of the widget.

Returns

current background color

See also

[color\(Fl_Color\)](#), [color\(Fl_Color, Fl_Color\)](#)

13.155.4.31 color() [2/3]

```
void Fl_Widget::color (
    Fl_Color bg ) [inline]
```

Sets the background color of the widget.

The color is passed to the box routine. The color is either an index into an internal table of RGB colors or an RGB color value generated using [fl_rgb_color\(\)](#).

The default for most widgets is FL_BACKGROUND_COLOR. Use [Fl::set_color\(\)](#) to redefine colors in the color map.

Parameters

<i>in</i>	<i>bg</i>	background color

See also

[color\(\)](#), [color\(Fl_Color, Fl_Color\)](#), [selection_color\(Fl_Color\)](#)

13.155.4.32 color() [3/3]

```
void Fl_Widget::color (
    Fl_Color bg,
    Fl_Color sel ) [inline]
```

Sets the background and selection color of the widget.
The two color form sets both the background and selection colors.

Parameters

<i>in</i>	<i>bg</i>	background color
<i>in</i>	<i>sel</i>	selection color

See also

[color\(unsigned\)](#), [selection_color\(unsigned\)](#)

13.155.4.33 contains()

```
int Fl_Widget::contains (
    const Fl_Widget * w ) const
```

Checks if *w* is a child of this widget.

Parameters

<i>in</i>	<i>w</i>	potential child widget

Returns

Returns 1 if *w* is a child of this widget, or is equal to this widget. Returns 0 if *w* is NULL.

13.155.4.34 copy_label()

```
void Fl_Widget::copy_label (
    const char * new_label )
```

Sets the current label.

Unlike [label\(\)](#), this method allocates a copy of the label string instead of using the original string pointer.
The internal copy will automatically be freed whenever you assign a new label or when the widget is destroyed.

Parameters

<i>in</i>	<i>new_label</i>	the new label text

See also

[label\(\)](#)

13.155.4.35 copy_tooltip()

```
void Fl_Widget::copy_tooltip (
    const char * text )
```

Sets the current tooltip text.

Unlike [tooltip\(\)](#), this method allocates a copy of the tooltip string instead of using the original string pointer.

The internal copy will automatically be freed whenever you assign a new tooltip or when the widget is destroyed.

If no tooltip is set, the tooltip of the parent is inherited. Setting a tooltip for a group and setting no tooltip for a child will show the group's tooltip instead. To avoid this behavior, you can set the child's tooltip to an empty string ("").

Parameters

in	<i>text</i>	New tooltip text (an internal copy is made and managed)

See also

[tooltip\(const char*\)](#), [tooltip\(\)](#)

13.155.4.36 damage() [1/3]

```
uchar Fl_Widget::damage ( ) const [inline]
```

Returns non-zero if [draw\(\)](#) needs to be called.

The damage value is actually a bit field that the widget subclass can use to figure out what parts to draw.

Returns

a bitmap of flags describing the kind of damage to the widget

See also

[damage\(uchar\)](#), [clear_damage\(uchar\)](#)

13.155.4.37 damage() [2/3]

```
void Fl_Widget::damage (
    uchar c )
```

Sets the damage bits for the widget.

Setting damage bits will schedule the widget for the next redraw.

Parameters

in	<i>c</i>	bitmask of flags to set

See also

[damage\(\)](#), [clear_damage\(uchar\)](#)

13.155.4.38 damage() [3/3]

```
void Fl_Widget::damage (
    uchar c,
    int x,
    int y,
    int w,
    int h )
```

Sets the damage bits for an area inside the widget.

Setting damage bits will schedule the widget for the next redraw.

Parameters

in	<i>c</i>	bitmask of flags to set
in	<i>x,y,w,h</i>	size of damaged area

See also

[damage\(\)](#), [clear_damage\(uchar\)](#)

13.155.4.39 deactivate()

```
void Fl_Widget::deactivate ( )
```

Deactivates the widget.

Inactive widgets will be drawn "grayed out", e.g. with less contrast than the active widget. Inactive widgets will not receive any keyboard or mouse button events. Other events (including FL_ENTER, FL_MOVE, FL_LEAVE, FL_SHORTCUT, and others) will still be sent. A widget is only active if [active\(\)](#) is true on it *and all of its parents*. Changing this value will send FL_DEACTIVATE to the widget if [active_r\(\)](#) is true.

Currently you cannot deactivate [Fl_Window](#) widgets.

[activate\(\)](#), [active\(\)](#), [active_r\(\)](#)

13.155.4.40 default_callback()

```
void Fl_Widget::default_callback (
    Fl_Widget * widget,
    void * data ) [static]
```

The default callback for all widgets that don't set a callback.

This callback function puts a pointer to the widget on the queue returned by [Fl::readqueue\(\)](#). This is the default for all widgets if you don't set a callback.

You can avoid the overhead of this default handling if you set the callback to `NULL` explicitly.

Relying on the default callback and reading the callback queue with [Fl::readqueue\(\)](#) is not recommended. If you need a callback, you should set one with [Fl_Widget::callback\(Fl_Callback *cb, void *data\)](#) or one of its variants.

Parameters

in	<i>widget</i>	the Fl_Widget given to the callback
in	<i>data</i>	user data associated with that callback

See also

[callback\(\)](#), [Fl::readqueue\(\)](#)
[do_callback\(Fl_Widget *widget, void *data\)](#)

13.155.4.41 deimage() [1/4]

```
Fl_Image * Fl_Widget::deimage ( ) [inline]
```

Gets the image that is used as part of the widget label when in the inactive state.

Returns

the current image for the deactivated widget

13.155.4.42 deimage() [2/4]

```
const Fl_Image * Fl_Widget::deimage ( ) const [inline]
```

Gets the image that is used as part of the widget label when in the inactive state.

Returns

the current image for the deactivated widget

13.155.4.43 deimage() [3/4]

```
void Fl_Widget::deimage (
    Fl\_Image & img )
```

Sets the image to use as part of the widget label when in the inactive state.

Parameters

<i>in</i>	<i>img</i>	the new image for the deactivated widget

See also

void [deimage\(Fl_Image* img\)](#)

13.155.4.44 deimage() [4/4]

```
void Fl_Widget::deimage (
    Fl\_Image * img )
```

Sets the image to use as part of the widget label when in the inactive state.

Parameters

<i>in</i>	<i>img</i>	the new image for the deactivated widget

Note

The caller is responsible for making sure *img* is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.

See also

void [bind_deimage\(Fl_Image* img\)](#)

13.155.4.45 deimage_bound()

```
int Fl_Widget::deimage_bound ( ) const [inline]
```

Returns whether the inactive image is managed by the widget.

Return values

<i>0</i>	if the image is not bound to the widget
<i>1</i>	if the image will be deleted when the widget is deleted

See also

[image_bound\(\)](#), [bind_deimage\(\)](#)

13.155.4.46 do_callback() [1/3]

```
void Fl_Widget::do_callback (
    Fl\_Callback\_Reason reason = FL\_REASON\_UNKNOWN ) [inline]
```

Calls the widget callback function with default arguments.

This is the same as calling

```
do_callback(this, user_data(), reason);
```

Parameters

in	<i>reason</i>	give a reason to why this callback was called, defaults to FL_REASON_UNKNOWN

See also

[callback\(\)](#)

[do_callback\(Fl_Widget *widget, void *data, Fl_Callback_Reason reason\), Fl_Callback_Reason](#)

13.155.4.47 do_callback() [2/3]

```
void Fl_Widget::do_callback (
    Fl_Widget * widget,
    long arg,
    Fl_Callback_Reason reason = FL_REASON_UNKNOWN ) [inline]
```

Calls the widget callback function with arbitrary arguments.

Parameters

in	<i>widget</i>	call the callback with <i>widget</i> as the first argument
in	<i>arg</i>	call the callback with <i>arg</i> as the user data (second) argument
in	<i>reason</i>	give a reason to why this callback was called, defaults to FL_REASON_UNKNOWN

See also

[callback\(\)](#)

[do_callback\(Fl_Widget *widget, void *data\), Fl_Callback_Reason](#)

13.155.4.48 do_callback() [3/3]

```
void Fl_Widget::do_callback (
    Fl_Widget * widget,
    void * arg = 0,
    Fl_Callback_Reason reason = FL_REASON_UNKNOWN )
```

Calls the widget callback function with arbitrary arguments.

All overloads of [do_callback\(\)](#) call this method. It does nothing if the widget's [callback\(\)](#) is NULL. It clears the widget's *changed* flag **after** the callback was called unless the callback is the default callback. Hence it is not necessary to call [clear_changed\(\)](#) after calling [do_callback\(\)](#) in your own widget's [handle\(\)](#) method.

A *reason* must be set for widgets if different actions can trigger the same callback.

Note

It is legal to delete the widget in the callback (i.e. in user code), but you must not access the widget in the [handle\(\)](#) method after calling [do_callback\(\)](#) if the widget was deleted in the callback. We recommend to use [Fl_Widget_Tracker](#) to check whether the widget was deleted in the callback.

Parameters

in	<i>widget</i>	call the callback with <i>widget</i> as the first argument
in	<i>arg</i>	use <i>arg</i> as the user data (second) argument
in	<i>reason</i>	give a reason to why this callback was called, defaults to FL_REASON_UNKNOWN

See also

[default_callback\(\)](#)
[callback\(\)](#)
class [Fl_Widget_Tracker](#)
[Fl::callback_reason\(\)](#)

13.155.4.49 draw()

```
virtual void Fl_Widget::draw ( ) [pure virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Implemented in [Fl_Adjuster](#), [Fl_Box](#), [Fl_Browser](#), [Fl_Button](#), [Fl_Cairo_Window](#), [Fl_Chart](#), [Fl_Choice](#), [Fl_Clock_Output](#), [Fl_Counter](#), [Fl_Dial](#), [Fl_File_Input](#), [Fl_Flex](#), [Fl_FormsBitmap](#), [Fl_FormsPixmap](#), [Fl_Free](#), [Fl_Gl_Window](#), [Fl_Grid](#), [Fl_Group](#), [Fl_Help_View](#), [Fl_Input](#), [Fl_Input_Choice](#), [Fl_Light_Button](#), [Fl_Menu_Bar](#), [Fl_Menu_Button](#), [Fl_Pack](#), [Fl_Positioner](#), [Fl_Progress](#), [Fl_Return_Button](#), [Fl_Roller](#), [Fl_Scroll](#), [Fl_Scrollbar](#), [Fl_Shortcut_Button](#), [Fl_Slider](#), [Fl_Spinner](#), [Fl_Sys_Menu_Bar](#), [Fl_Table](#), [Fl_Tabs](#), [Fl_Text_Display](#), [Fl_Timer](#), [Fl_Tree](#), [Fl_Value_Input](#), [Fl_Value_Output](#), [Fl_Value_Slider](#), [Fl_Window](#), [Fl_Wizard](#), [Fl_FormsText](#), [Fl_Glut_Window](#), and [Fl_Terminal](#).

13.155.4.50 draw_focus() [1/3]

```
void Fl_Widget::draw_focus ( ) const [inline], [protected]
```

Draws a focus rectangle around the widget.

This method uses the widget's boxtype and coordinates and its background color [color\(\)](#).

See also

[Fl_Widget::draw_focus\(Fl_Boxtype, int, int, int, int, Fl_Color\) const](#)

13.155.4.51 draw_focus() [2/3]

```
void Fl_Widget::draw_focus (
    Fl_Boxtype t,
    int X,
    int Y,
    int W,
    int H ) const [inline], [protected]
```

Draws a focus rectangle around the widget.

This method uses the given boxtype and coordinates and the widget's background color [color\(\)](#).

See also

[Fl_Widget::draw_focus\(Fl_Boxtype, int, int, int, int, Fl_Color\) const](#)

13.155.4.52 draw_focus() [3/3]

```
void Fl_Widget::draw_focus (
    Fl_Boxtype bt,
    int X,
    int Y,
    int W,
```

```
int H,
    Fl_Color bg ) const [protected]
```

Draws a focus box for the widget at the given position and size.

This method does nothing if

- the global option [Fl::visible_focus\(\)](#) or
- the per-widget option [visible_focus\(\)](#) is false (off).

This means that [Fl_Widget::draw_focus\(\)](#) or one of the more specialized methods can be called without checking these visible focus options.

Note

This method must only be called if the widget has the focus. This is not tested internally.

The boxtype `bt` is used to calculate the inset so the focus box is drawn inside the box borders.

The default focus box drawing color is black. The background color `bg` is used to determine a better visible color if necessary by using [fl_contrast\(\)](#) with the given background color.

Parameters

in	<i>bt</i>	Boxtype that needs to be considered (frame width)
in	<i>X,Y,W,H</i>	Bounding box
in	<i>bg</i>	Background color

See also

[Fl_Widget::draw_focus\(\)](#)

[Fl_Widget::draw_focus\(Fl_Boxtype, int, int, int, int\) const](#)

13.155.4.53 draw_label() [1/3]

```
void Fl_Widget::draw_label ( ) const [protected]
```

Draws the widget's label at the defined label position.

This is the normal call for a widget's [draw\(\)](#) method.

13.155.4.54 draw_label() [2/3]

```
void Fl_Widget::draw_label (
    int X,
    int Y,
    int W,
    int H ) const [protected]
```

Draws the label in an arbitrary bounding box.

[draw\(\)](#) can use this instead of [draw_label\(void\)](#) to change the bounding box

13.155.4.55 draw_label() [3/3]

```
void Fl_Widget::draw_label (
    int X,
    int Y,
    int W,
    int H,
    Fl_Align a ) const
```

Draws the label in an arbitrary bounding box with an arbitrary alignment.

Anybody can call this to force the label to draw anywhere.

13.155.4.56 h() [1/2]

```
int Fl_Widget::h ( ) const [inline]
```

Gets the widget height.

Returns

the height of the widget in pixels.

13.155.4.57 h() [2/2]

```
void Fl_Widget::h (
    int v ) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

13.155.4.58 handle()

```
int Fl_Widget::handle (
    int event ) [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

<code>in</code>	<code>event</code>	the kind of event received

Return values

<code>0</code>	if the event was not used or understood
<code>1</code>	if the event was used and can be deleted

See also

[Fl_Event](#)

Reimplemented in [Fl_Color_Chooser](#), [Fl_Free](#), [Fl_Table](#), [Fl_Terminal](#), [Fl_Text_Display](#), [Fl_Text_Editor](#), [Fl_Tree](#), [Fl_Browser_](#), [Fl_File_Input](#), [Fl_Scheme_Choice](#), [Fl_Spinner::Fl_Spinner_Input](#), [Fl_Spinner](#), [Fl_Table_Row](#), [Fl_Tile](#), [Fl_Adjuster](#), [Fl_Box](#), [Fl_Button](#), [Fl_Check_Browser](#), [Fl_Choice](#), [Fl_Clock](#), [Fl_Counter](#), [Fl_Dial](#), [Fl_Gl_Window](#), [Fl_Group](#), [Fl_Help_View](#), [Fl_Input](#), [Fl_Light_Button](#), [Fl_Menu_Bar](#), [Fl_Menu_Button](#), [Fl_Positioner](#), [Fl_Repeat_Button](#), [Fl_Return_Button](#), [Fl_Roller](#), [Fl_Scroll](#), [Fl_Scrollbar](#), [Fl_Secret_Input](#), [Fl_Shortcut_Button](#), [Fl_Slider](#), [Fl_Tabs](#), [Fl_Timer](#), [Fl_Value_Input](#), [Fl_Value_Output](#), [Fl_Value_Slider](#), [Fl_Window](#), and [Fl_Glut_Window](#).

13.155.4.59 hide()

```
void Fl_Widget::hide ( ) [virtual]
```

Makes a widget invisible.

See also

[show\(\)](#), [visible\(\)](#), [visible_r\(\)](#)

Reimplemented in [Fl_Browser](#), [Fl_Double_Window](#), [Fl_Gl_Window](#), [Fl_Overlay_Window](#), and [Fl_Window](#).

13.155.4.60 horizontal_label_margin() [1/2]

```
int Fl_Widget::horizontal_label_margin ( ) [inline]
```

Get the spacing between the label and the horizontal edge of the widget.

Returns

px gap in pixels

13.155.4.61 horizontal_label_margin() [2/2]

```
void Fl_Widget::horizontal_label_margin (
    int px ) [inline]
```

Set the spacing between the label and the horizontal edge of the widget.

Parameters

in	<i>px</i>	gap in pixels

13.155.4.62 image() [1/4]

```
Fl_Image * Fl_Widget::image ( ) [inline]
```

Gets the image that is used as part of the widget label when in the active state.

Returns

the current image

13.155.4.63 image() [2/4]

```
const Fl_Image * Fl_Widget::image ( ) const [inline]
```

Gets the image that is used as part of the widget label when in the active state.

Returns

the current image

13.155.4.64 image() [3/4]

```
void Fl_Widget::image (
    Fl_Image & img )
```

Sets the image to use as part of the widget label when in the active state.

Parameters

in	<i>img</i>	the new image for the label

See also

[void image\(Fl_Image* img\)](#)

13.155.4.65 image() [4/4]

```
void Fl_Widget::image (
    Fl_Image * img )
```

Sets the image to use as part of the widget label when in the active state.

The caller is responsible for making sure `img` is not deleted while it's used by the widget, and, if appropriate, for deleting it after the widget's deletion.

Calling [image\(\)](#) with a new image will delete the old image if it was bound, and set the new image without binding it. If old and new are the same, the image will not be deleted, but it will be unbound.

Calling [image\(\)](#) with NULL will delete the old image if it was bound and not set a new image.

Parameters

in	<i>img</i>	the new image for the label

See also

[bind_image\(Fl_Image* img\)](#)

13.155.4.66 image_bound()

```
int Fl_Widget::image_bound ( ) const [inline]
```

Returns whether the image is managed by the widget.

Return values

0	if the image is not bound to the widget
1	if the image will be deleted when the widget is deleted

See also

[deimage_bound\(\)](#), [bind_image\(\)](#)

13.155.4.67 inside()

```
int Fl_Widget::inside (
    const Fl_Widget * wgt ) const [inline]
```

Checks if this widget is a child of `wgt`.

Returns 1 if this widget is a child of `wgt`, or is equal to `wgt`. Returns 0 if `wgt` is NULL.

Parameters

in	<i>wgt</i>	the possible parent widget.

See also

[contains\(\)](#)

13.155.4.68 is_label_copied()

```
int Fl_Widget::is_label_copied ( ) const [inline]
```

Returns whether the current label was assigned with [copy_label\(\)](#).
This can be useful for temporarily overwriting the widget's label and restoring it later.

Return values

0	current label was assigned with label() .
1	current label was assigned with copy_label() .

13.155.4.69 [label\(\)](#) [1/3]

```
const char * Fl_Widget::label ( ) const [inline]
```

Gets the current label text.

Returns

a pointer to the current label text

See also

[label\(const char *\)](#), [copy_label\(const char *\)](#)

13.155.4.70 [label\(\)](#) [2/3]

```
void Fl_Widget::label (
    const char * text )
```

Sets the current label pointer.

The label is shown somewhere on or next to the widget. See [Labels and Label Types](#) for details about what can be put in a label. The passed pointer is stored unchanged in the widget (the string is *not* copied), so if you need to set the label to a formatted value, make sure the buffer is static, global, or allocated. The [copy_label\(\)](#) method can be used to make a copy of the label string automatically.

Parameters

in	<i>text</i>	pointer to new label text

See also

[copy_label\(\)](#)

13.155.4.71 [label\(\)](#) [3/3]

```
void Fl_Widget::label (
    Fl_Labeltype a,
    const char * b ) [inline]
```

Shortcut to set the label text and type in one call.

See also

[label\(const char *\)](#), [labeltype\(Fl_Labeltype\)](#)

13.155.4.72 [label_image_spacing\(\)](#) [1/2]

```
int Fl_Widget::label_image_spacing ( ) [inline]
```

Return the gap size between the label and the image.

Returns

spacing in pixels

13.155.4.73 label_image_spacing() [2/2]

```
void Fl_Widget::label_image_spacing (
    int gap ) [inline]
```

Set the gap between the label and the image in pixels.
This value is limited to 0..255.

Parameters

in	<i>gap</i>	spacing in pixels

13.155.4.74 label_shortcut()

```
unsigned int Fl_Widget::label_shortcut (
    const char * t ) [static]
```

Returns the Unicode value of the '&x' shortcut in a given text.

The given text *t* (usually a widget's label or a menu text) is searched for a '&x' shortcut label, and if found, the Unicode value (code point) of the '&x' shortcut is returned.

Parameters

<i>t</i>	text or label to search for '&x' shortcut.

Returns

Unicode (UCS-4) value of shortcut in *t* or 0.

Note

Internal use only.

13.155.4.75 labelcolor() [1/2]

```
Fl_Color Fl_Widget::labelcolor ( ) const [inline]
```

Gets the label color.

The default color is FL_FOREGROUND_COLOR.

Returns

the current label color

13.155.4.76 labelcolor() [2/2]

```
void Fl_Widget::labelcolor (
    Fl_Color c ) [inline]
```

Sets the label color.

The default color is FL_FOREGROUND_COLOR.

Parameters

in	<i>c</i>	the new label color

13.155.4.77 labelfont() [1/2]

```
Fl_Font Fl_Widget::labelfont ( ) const [inline]
```

Gets the font to use.

Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function [Fl::set_font\(\)](#) can define new typefaces.

Returns

current font used by the label

See also

[Fl_Font](#)

13.155.4.78 labelfont() [2/2]

```
void Fl_Widget::labelfont (
    Fl\_Font f ) [inline]
```

Sets the font to use.

Fonts are identified by indexes into a table. The default value uses a Helvetica typeface (Arial for Microsoft® Windows®). The function [Fl::set_font\(\)](#) can define new typefaces.

Parameters

<code>in</code>	<code>f</code>	the new font for the label

See also

[Fl_Font](#)

13.155.4.79 labelsize() [1/2]

```
Fl\_Fontsize Fl_Widget::labelsize ( ) const [inline]
```

Gets the font size in pixels.

The default size is 14 pixels.

Returns

the current font size

13.155.4.80 labelsize() [2/2]

```
void Fl_Widget::labelsize (
    Fl\_Fontsize pix ) [inline]
```

Sets the font size in pixels.

Parameters

<code>in</code>	<code>pix</code>	the new font size

See also

[Fl_Fontsize labelsize\(\)](#)

13.155.4.81 labeltype() [1/2]

```
Fl\_Labeltype Fl_Widget::labeltype ( ) const [inline]
```

Gets the label type.

Returns

the current label type.

See also

[Fl_Labeltype](#)

13.155.4.82 labeltype() [2/2]

```
void Fl_Widget::labeltype (
    Fl_Labeltype a ) [inline]
```

Sets the label type.

The label type identifies the function that draws the label of the widget. This is generally used for special effects such as embossing or for using the [label\(\)](#) pointer as another form of data such as an icon. The value `FL_NORMAL_LABEL` prints the label as plain text.

Parameters

<code>in</code>	<code>a</code>	new label type

See also

[Fl_Labeltype](#)

13.155.4.83 measure_label()

```
void Fl_Widget::measure_label (
    int & ww,
    int & hh ) const [inline]
```

Sets width `ww` and height `hh` accordingly with the label size.

Labels with images will return `w()` and `h()` of the image.

This calls [fl_measure\(\)](#) internally. For more information about the arguments `ww` and `hh` and word wrapping

See also

[fl_measure\(const char*, int&, int&, int\)](#)

13.155.4.84 needs_keyboard() [1/2]

```
bool Fl_Widget::needs_keyboard ( ) const [inline]
```

Returns whether this widget needs a keyboard.

Returns

true or false

See also

[needs_keyboard\(bool\)](#)

13.155.4.85 needs_keyboard() [2/2]

```
void Fl_Widget::needs_keyboard (
    bool needs ) [inline]
```

Sets whether this widget needs a keyboard.

Set this on touch screen devices if a widget needs a keyboard when it gets the focus.

Note

This flag can be set but is not yet **used** in FLTK 1.4.0. It is intended to be used in the future on real touch devices.

Parameters

in	needs	Set this to true or false

13.155.4.86 output()

```
unsigned int Fl_Widget::output ( ) const [inline]
```

Returns if a widget is used for output only.

[output\(\)](#) means the same as [lactive\(\)](#) except it does not change how the widget is drawn. The widget will not receive any events. This is useful for making scrollbars or buttons that work as displays rather than input devices.

Return values

0	if the widget is used for input and output

See also

[set_output\(\)](#), [clear_output\(\)](#)

13.155.4.87 parent() [1/2]

```
Fl_Group * Fl_Widget::parent ( ) const [inline]
```

Returns a pointer to the parent widget.

Usually this is a [Fl_Group](#) or [Fl_Window](#).

Return values

NULL	if the widget has no parent

See also

[Fl_Group::add\(Fl_Widget*\)](#)

13.155.4.88 parent() [2/2]

```
void Fl_Widget::parent (
    Fl_Group * p ) [inline]
```

Internal use only - "for hacks only".

It is ***STRONGLY recommended*** not to use this method, because it short-circuits [Fl_Group](#)'s normal widget adding and removing methods, if the widget is already a child widget of another [Fl_Group](#).

Use [Fl_Group::add\(Fl_Widget*\)](#) and/or [Fl_Group::remove\(Fl_Widget*\)](#) instead.

13.155.4.89 position()

```
void Fl_Widget::position (
    int X,
    int Y ) [inline]
```

Repositions the window or widget.

[position\(X, Y\)](#) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#).

Parameters

in	X,Y	new position relative to the parent window

See also

[resize\(int,int,int,int\)](#), [size\(int,int\)](#)

13.155.4.90 redraw()

```
void Fl_Widget::redraw ( )
```

Schedules the drawing of the widget.

Marks the widget as needing its [draw\(\)](#) routine called.

13.155.4.91 redraw_label()

```
void Fl_Widget::redraw_label ( )
```

Schedules the drawing of the label.

Marks the widget or the parent as needing a redraw for the label area of a widget.

13.155.4.92 resize()

```
void Fl_Widget::resize (
    int x,
    int y,
    int w,
    int h ) [virtual]
```

Changes the size or position of the widget.

This is a virtual function so that the widget may implement its own handling of resizing. The default version does *not* call the [redraw\(\)](#) method, but instead relies on the parent widget to do so because the parent may know a faster way to update the display, such as scrolling from the old position.

Some window managers under X11 call [resize\(\)](#) a lot more often than needed. Please verify that the position or size of a widget did actually change before doing any extensive calculations.

position(X, Y) is a shortcut for [resize\(X, Y, w\(\), h\(\)\)](#), and [size\(W, H\)](#) is a shortcut for [resize\(x\(\), y\(\), W, H\)](#).

Parameters

in	<i>x,y</i>	new position relative to the parent window
in	<i>w,h</i>	new size

See also

[position\(int,int\)](#), [size\(int,int\)](#)

Reimplemented in [Fl_Browser_](#), [Fl_Flex](#), [Fl_Grid](#), [Fl_Input_Choice](#), [Fl_Pack](#), [Fl_Scroll](#), [Fl_Spinner](#), [Fl_Table](#), [Fl_Terminal](#), [Fl_Text_Display](#), [Fl_Tile](#), [Fl_Window](#), [Fl_Double_Window](#), [Fl_Gl_Window](#), [Fl_Group](#), [Fl_Help_View](#), [Fl_Input_](#), [Fl_Overlay_Window](#), [Fl_Tabs](#), [Fl_Tree](#), and [Fl_Value_Input](#).

13.155.4.93 selection_color() [1/2]

```
Fl_Color Fl_Widget::selection_color ( ) const [inline]
```

Gets the selection color.

Returns

the current selection color

See also

[selection_color\(Fl_Color\)](#), [color\(Fl_Color, Fl_Color\)](#)

13.155.4.94 selection_color() [2/2]

```
void Fl_Widget::selection_color (
    Fl_Color a ) [inline]
```

Sets the selection color.

The selection color is defined for Forms compatibility and is usually used to color the widget when it is selected, although some widgets use this color for other purposes. You can set both colors at once with [color\(Fl_Color bg, Fl_Color sel\)](#).

Parameters

in	a	the new selection color

See also

[selection_color\(\)](#), [color\(Fl_Color, Fl_Color\)](#)

13.155.4.95 set_active()

```
void Fl_Widget::set_active ( ) [inline]
```

Marks the widget as active without sending events or changing focus.

This is mainly for specialized use, for normal cases you want [activate\(\)](#).

See also

[activate\(\)](#)

13.155.4.96 set_changed()

```
void Fl_Widget::set_changed ( ) [inline]
```

Marks the value of the widget as changed.

See also

[changed\(\)](#), [clear_changed\(\)](#)

13.155.4.97 set_output()

```
void Fl_Widget::set_output ( ) [inline]
```

Sets a widget to output only.

See also

[output\(\)](#), [clear_output\(\)](#)

13.155.4.98 set_visible()

```
void Fl_Widget::set_visible ( ) [inline]
```

Makes the widget visible.

You must still redraw the parent widget to see a change in the window. Normally you want to use the [show\(\)](#) method instead.

13.155.4.99 set_visible_focus()

```
void Fl_Widget::set_visible_focus ( ) [inline]
```

Enables keyboard focus navigation with this widget.

Note, however, that this will not necessarily mean that the widget will accept focus, but for widgets that can accept focus, this method enables it if it has been disabled.

See also

[visible_focus\(\)](#), [clear_visible_focus\(\)](#), [visible_focus\(int\)](#)

13.155.4.100 shortcut_label() [1/2]

```
int Fl_Widget::shortcut_label ( ) const [inline]
```

Returns whether the widget's label uses '&' to indicate shortcuts.

See also

[void shortcut_label\(int value\)](#)

13.155.4.101 shortcut_label() [2/2]

```
void Fl_Widget::shortcut_label (
    int value ) [inline]
```

Sets whether the widget's label uses '&' to indicate shortcuts.

By default, all objects of classes [Fl_Menu_](#) (and derivatives), [Fl_Button](#) (and derivatives), [Fl_Text_Display](#), [Fl_Value_Input](#), and [Fl_Input_](#) (and derivatives) use character '&' in their label, unless '&' is repeated, to indicate shortcuts: '&' does not appear in the drawn label, the next character after '&' in the label is drawn underlined, and typing this character triggers the corresponding menu window, button, or other widget. If the label contains 2 consecutive '&', only one is drawn and the next character is not underlined and not used as a shortcut. If `value` is set to 0, all these labels don't process character '&' as indicating a shortcut: '&' is drawn in the label, the next character is not underlined and does not define a shortcut.

13.155.4.102 show()

```
void Fl_Widget::show ( ) [virtual]
```

Makes a widget visible.

An invisible widget never gets redrawn and does not get keyboard or mouse events, but can receive a few other events like `FL_SHOW`.

The [visible\(\)](#) method returns true if the widget is set to be visible. The [visible_r\(\)](#) method returns true if the widget and all of its parents are visible. A widget is only visible if [visible\(\)](#) is true on it *and all of its parents*.

Changing it will send `FL_SHOW` or `FL_HIDE` events to the widget. *Do not change it if the parent is not visible, as this will send false `FL_SHOW` or `FL_HIDE` events to the widget.* [redraw\(\)](#) is called if necessary on this or the parent.

See also

[hide\(\)](#), [visible\(\)](#), [visible_r\(\)](#)

Reimplemented in [Fl_Browser](#), [Fl_Double_Window](#), [Fl_Gl_Window](#), [Fl_Overlay_Window](#), [Fl_Single_Window](#), [Fl_Tabs](#), and [Fl_Window](#).

13.155.4.103 size()

```
void Fl_Widget::size (
    int W,
    int H ) [inline]
```

Changes the size of the widget.

`size(W, H)` is a shortcut for `resize(x(), y(), W, H)`.

Parameters

in	<i>W,H</i>	new size

See also

[position\(int,int\)](#), [resize\(int,int,int,int\)](#)

13.155.4.104 take_focus()

```
int Fl_Widget::take_focus ( )
```

Gives the widget the keyboard focus.

Tries to make this widget be the [Fl::focus\(\)](#) widget, by first sending it an FL_FOCUS event, and if it returns non-zero, setting [Fl::focus\(\)](#) to this widget. You should use this method to assign the focus to a widget.

Returns

true if the widget accepted the focus.

13.155.4.105 takeevents()

```
unsigned int Fl_Widget::takeevents ( ) const [inline]
```

Returns if the widget is able to take events.

This is the same as ([active\(\)](#) && ![output\(\)](#) && [visible\(\)](#)) but is faster.

Return values

0	if the widget takes no events

13.155.4.106 test_shortcut() [1/2]

```
int Fl_Widget::test_shortcut ( )
```

Returns true if the widget's label contains the entered '&x' shortcut.

This method must only be called in [handle\(\)](#) methods or callbacks after a keypress event (usually FL_KEYDOWN or FL_SHORTCUT). The widget's label is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

[Fl::event_text\(\)](#) is used to get the entered key value.

Returns

true, if the entered text matches the widget's '&x' shortcut, false (0) otherwise.

Note

Useful when a widget's [handle\(int\)](#) method needs dedicated processing of FL_SHORTCUT.

13.155.4.107 test_shortcut() [2/2]

```
int Fl_Widget::test_shortcut (
    const char * t,
    const bool require_alt = false ) [static]
```

Returns true if the given text *t* contains the entered '&x' shortcut.

This method must only be called in [handle\(\)](#) methods or callbacks after a keypress event (usually FL_KEYDOWN or FL_SHORTCUT). The given text *t* (usually a widget's label or menu text) is searched for a '&x' shortcut, and if found, this is compared with the entered key value.

[Fl::event_text\(\)](#) is used to get the entered key value. [Fl::event_state\(\)](#) is used to get the Alt modifier, if *require_alt* is true.

Parameters

<i>t</i>	text or label to search for '&x' shortcut.
<i>require_alt</i>	if true: match only if Alt key is pressed.

Returns

true, if the entered text matches the '&x' shortcut in *t* false (0) otherwise.

Note

Useful when a widget's [handle\(int\)](#) method needs dedicated processing of FL_SHORTCUT.

13.155.4.108 tooltip() [1/2]

```
const char * Fl_Widget::tooltip ( ) const [inline]
```

Gets the current tooltip text.

Returns

a pointer to the tooltip text or NULL

See also

[tooltip\(const char*\)](#), [copy_tooltip\(const char*\)](#)

13.155.4.109 tooltip() [2/2]

```
void Fl_Widget::tooltip (
    const char * text )
```

Sets the Tooltip Text for a Widget.

Assigns a tooltip string that appears in a popup when the user hovers over the widget. The provided string is not copied. The caller must ensure it remains valid by storing it in a static, global, or dynamically allocated buffer. If you need the tooltip string to be copied and managed automatically, use [copy_tooltip\(\)](#).

By default, a widget inherits the tooltip of its parent if none is explicitly set. If you assign a tooltip to a group but not to its child widgets, the child widgets will display the group's tooltip. To prevent inheritance, set the child's tooltip to an empty string ("").

Tooltips can be updated dynamically before they are displayed. When a tooltip is about to be shown, FLTK sends an `FL_BEFORE_TOOLTIP` event to the widget's [handle\(\)](#) method. Developers can override the tooltip text temporarily using [Fl_Tooltip::override_text\(const char* new_text\)](#) and returning 1 from [handle\(\)](#) to apply the change.

Parameters

<code>in</code>	<code>text</code>	New tooltip text (no copy is made)

See also

[copy_tooltip\(const char*\)](#), [tooltip\(\)](#)

13.155.4.110 top_window()

```
Fl_Window * Fl_Widget::top_window ( ) const
```

Returns a pointer to the top-level window for the widget.

In other words, the 'window manager window' that contains this widget. This method differs from [window\(\)](#) in that it won't return sub-windows (if there are any).

Returns

the top-level window, or NULL if no top-level window is associated with this widget.

See also

[window\(\)](#)

13.155.4.111 top_window_offset()

```
Fl_Window * Fl_Widget::top_window_offset (
    int & xoff,
    int & yoff ) const
```

Finds the x/y offset of the current widget relative to the top-level window.

Parameters

out	xoff,yoff	Returns the x/y offset

Returns

the top-level window (or NULL for a widget that's not in any window)

13.155.4.112 type() [1/2]

```
uchar Fl_Widget::type ( ) const [inline]
```

Gets the widget type.

Returns the widget type value, which gives some information about the derived widget class to which the object belongs. Noticeably, the condition `type() >= FL_WINDOW` indicates a widget is an [Fl_Window](#) or derived object.

Note

Known values for `type_` are listed at the top of `src/Fl_Widget.cxx` .

13.155.4.113 type() [2/2]

```
void Fl_Widget::type (
    uchar t ) [inline]
```

Sets the widget type.

See also

[type\(\)](#)

13.155.4.114 user_data()

```
void * Fl_Widget::user_data ( ) const [inline]
```

Gets the user data for this widget.

Gets the current user data (void *) argument that is passed to the callback function.

Returns

user data as a pointer

13.155.4.115 vertical_label_margin() [1/2]

```
int Fl_Widget::vertical_label_margin ( ) [inline]
```

Get the spacing between the label and the vertical edge of the widget.

Returns

px gap in pixels

13.155.4.116 vertical_label_margin() [2/2]

```
void Fl_Widget::vertical_label_margin (
    int px ) [inline]
```

Set the spacing between the label and the vertical edge of the widget.

Parameters

in	px	gap in pixels

13.155.4.117 visible()

```
unsigned int Fl_Widget::visible ( ) const [inline]
```

Returns whether a widget is visible.

Return values

0	if the widget is not drawn and hence invisible.

See also

[show\(\)](#), [hide\(\)](#), [visible_r\(\)](#)

13.155.4.118 visible_focus() [1/2]

```
unsigned int Fl_Widget::visible_focus ( ) const [inline]
```

Checks whether this widget has a visible focus.

Return values

0	if this widget has no visible focus.

See also

[visible_focus\(int\)](#), [set_visible_focus\(\)](#), [clear_visible_focus\(\)](#)

13.155.4.119 visible_focus() [2/2]

```
void Fl_Widget::visible_focus (
    int v ) [inline]
```

Modifies keyboard focus navigation.

Parameters

in	v	set or clear visible focus

See also

[set_visible_focus\(\)](#), [clear_visible_focus\(\)](#), [visible_focus\(\)](#)

13.155.4.120 visible_r()

```
int Fl_Widget::visible_r ( ) const
```

Returns whether a widget and all its parents are visible.

Return values

0	if the widget or any of its parents are invisible.

See also

[show\(\)](#), [hide\(\)](#), [visible\(\)](#)

13.155.4.121 w() [1/2]

```
int Fl_Widget::w ( ) const [inline]
```

Gets the widget width.

Returns

the width of the widget in pixels.

13.155.4.122 w() [2/2]

```
void Fl_Widget::w (
    int v ) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

13.155.4.123 when() [1/2]

```
Fl_When Fl_Widget::when ( ) const [inline]
```

Returns the conditions under which the callback is called.

You can set the flags with [when\(uchar\)](#), the default value is FL_WHEN_RELEASE.

Returns

set of flags

See also

[when\(uchar\)](#), [Fl_When](#), [do_callback\(\)](#), [Fl::callback_reason\(\)](#)

13.155.4.124 when() [2/2]

```
void Fl_Widget::when (
    uchar i ) [inline]
```

Sets the flags used to decide when a callback is called.

This controls when callbacks are done. The following values are useful, the default value is FL_WHEN_RELEASE:

- 0: The callback is not done, but [changed\(\)](#) is turned on.
- FL_WHEN_CHANGED: The callback is done each time the text is changed by the user.
- FL_WHEN_RELEASE: The callback will be done when this widget loses the focus, including when the window is unmapped. This is a useful value for text fields in a panel where doing the callback on every change is wasteful. However the callback will also happen if the mouse is moved out of the window, which means it should not do anything visible (like pop up an error message). You might do better setting this to zero, and scanning all the items for [changed\(\)](#) when the OK button on a panel is pressed.
- FL_WHEN_ENTER_KEY: If the user types the Enter key, the entire text is selected, and the callback is done if the text has changed. Normally the Enter key will navigate to the next field (or insert a newline for a [Fl_Multiline_Input](#)) - this changes the behavior.
- FL_WHEN_ENTER_KEY|FL_WHEN_NOT_CHANGED: The Enter key will do the callback even if the text has not changed. Useful for command fields.
- [FL_WHEN_CLOSED](#) : If the user requests that the widget is closed, the callback is called with [FL_REASON_CLOSED](#). The [Fl_Tabs](#) widget checks this flag on its children to determine whether to display a close button on the tab of that widget.

[Fl_Widget::when\(\)](#) is a set of bitflags used by subclasses of [Fl_Widget](#) to decide when to do the callback.

If the value is zero then the callback is never done. Other values are described in the individual widgets. This field is in the base class so that you can scan a panel and [do_callback\(\)](#) on all the ones that don't do their own callbacks in response to an "OK" button.

Parameters

in	i	set of flags

See also

[Fl_When](#), [do_callback\(\)](#), [Fl::callback_reason\(\)](#)

13.155.4.125 window()

```
Fl_Window * Fl_Widget::window ( ) const
```

Returns a pointer to the nearest parent window up the widget hierarchy.

This will return sub-windows if there are any, or the parent window if there's no sub-windows. If this widget IS the top-level window, NULL is returned.

Return values

NULL	if no window is associated with this widget.

Note

for an [Fl_Window](#) widget, this returns its *parent* window (if any), not *this* window.

See also

[top_window\(\)](#)

13.155.4.126 x() [1/2]

```
int Fl_Widget::x ( ) const [inline]
```

Gets the widget position in its window.

Returns

the x position relative to the window

13.155.4.127 x() [2/2]

```
void Fl_Widget::x (
    int v ) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

13.155.4.128 y() [1/2]

```
int Fl_Widget::y ( ) const [inline]
```

Gets the widget position in its window.

Returns

the y position relative to the window

13.155.4.129 y() [2/2]

```
void Fl_Widget::y (
    int v ) [inline], [protected]
```

Internal use only.

Use [position\(int,int\)](#), [size\(int,int\)](#) or [resize\(int,int,int,int\)](#) instead.

The documentation for this class was generated from the following files:

- [Fl_Widget.H](#)
- [Fl.cxx](#)
- [fl_boxtype.cxx](#)

13.156 Fl_Widget_Surface Class Reference

A surface on which any FLTK widget can be drawn.

```
#include <Fl_Widget_Surface.H>
```

Inheritance diagram for Fl_Widget_Surface:

Public Member Functions

- void [draw](#) ([Fl_Widget](#) *widget, int delta_x=0, int delta_y=0)
Draws the widget on the drawing surface.
- void [draw_decorated_window](#) ([Fl_Window](#) *win, int x_offset=0, int y_offset=0)
Draws a window with its title bar and frame if any.
- virtual void [origin](#) (int *x, int *y)
Computes the coordinates of the current origin of graphics functions.
- virtual void [origin](#) (int x, int y)
Sets the position of the origin of graphics in the drawable part of the drawing surface.
- void [print_window_part](#) ([Fl_Window](#) *win, int x, int y, int w, int h, int delta_x=0, int delta_y=0)
Draws a rectangular part of an on-screen window.
- virtual int [printable_rect](#) (int *w, int *h)
Computes the width and height of the drawable area of the drawing surface.
- virtual void [translate](#) (int x, int y)
Translates the current graphics origin accounting for the current rotation.
- virtual void [untranslate](#) ()
Undoes the effect of a previous [translate\(\)](#) call.

Public Member Functions inherited from [Fl_Surface_Device](#)

- [Fl_Graphics_Driver](#) * [driver](#) ()
Returns the graphics driver of this drawing surface.
- virtual bool [is_current](#) ()
Is this surface the current drawing surface?
- virtual void [set_current](#) (void)
Make this surface the current drawing surface.
- virtual ~[Fl_Surface_Device](#) ()
The destructor.

Protected Member Functions

- [Fl_Widget_Surface](#) (Fl_Graphics_Driver *d)

The constructor.

Protected Member Functions inherited from [Fl_Surface_Device](#)

- void **driver** (Fl_Graphics_Driver *graphics_driver)
Sets the graphics driver of this drawing surface.
- virtual void [end_current](#) ()
FLTK calls this each time a surface ceases to be the current drawing surface.
- **Fl_Surface_Device** (Fl_Graphics_Driver *graphics_driver)
Constructor that sets the graphics driver to use for the created surface.

Protected Attributes

- int **x_offset**
horizontal offset to the origin of graphics coordinates
- int **y_offset**
vertical offset to the origin of graphics coordinates

Additional Inherited Members

Static Public Member Functions inherited from [Fl_Surface_Device](#)

- static [Fl_Surface_Device](#) * [pop_current](#) ()
Removes the top element from the current drawing surface stack, and makes the new top element current.
- static void [push_current](#) ([Fl_Surface_Device](#) *new_current)
Pushes new_current on top of the stack of current drawing surfaces, and makes it current.
- static [Fl_Surface_Device](#) * [surface](#) ()
The current drawing surface.

13.156.1 Detailed Description

A surface on which any FLTK widget can be drawn.

13.156.2 Constructor & Destructor Documentation

13.156.2.1 Fl_Widget_Surface()

```
Fl_Widget_Surface::Fl_Widget_Surface (
    Fl_Graphics_Driver * d ) [protected]
```

The constructor.

Parameters

<i>d</i>	can be nul.

13.156.3 Member Function Documentation

13.156.3.1 draw()

```
void Fl_Widget_Surface::draw (
    Fl_Widget * widget,
    int delta_x = 0,
    int delta_y = 0 )
```

Draws the widget on the drawing surface.

The widget's position on the surface is determined by the last call to [origin\(\)](#) and by the optional `delta_x` and `delta_y` arguments. Its dimensions are in points unless there was a previous call to [scale\(\)](#).

Parameters

in	<i>widget</i>	Any FLTK widget (e.g., standard, custom, window).
in	<i>delta_x, delta_y</i>	Optional horizontal and vertical offsets for positioning the widget top left relatively to the current origin of graphics.

13.156.3.2 [draw_decorated_window\(\)](#)

```
void Fl_Widget_Surface::draw_decorated_window (
    Fl_Window * win,
    int win_offset_x = 0,
    int win_offset_y = 0 )
```

Draws a window with its title bar and frame if any.

`win_offset_x` and `win_offset_y` are optional coordinates of where to position the window top left. Equivalent to [draw\(\)](#) if `win` is a subwindow or has no border. Use [Fl_Window::decorated_w\(\)](#) and [Fl_Window::decorated_h\(\)](#) to get the size of the framed window.

13.156.3.3 [origin\(\)](#) [1/2]

```
void Fl_Widget_Surface::origin (
    int * x,
    int * y ) [virtual]
```

Computes the coordinates of the current origin of graphics functions.

Parameters

out	<i>x,y</i>	If non-null, <code>*x</code> and <code>*y</code> are set to the horizontal and vertical coordinates of the graphics origin.

Reimplemented in [Fl_EPS_File_Surface](#), [Fl_Copy_Surface](#), [Fl_Image_Surface](#), [Fl_PDF_File_Surface](#), [Fl_PostScript_File_Device](#), [Fl_Printer](#), and [Fl_SVG_File_Surface](#).

13.156.3.4 [origin\(\)](#) [2/2]

```
void Fl_Widget_Surface::origin (
    int x,
    int y ) [virtual]
```

Sets the position of the origin of graphics in the drawable part of the drawing surface.

Arguments should be expressed relatively to the result of a previous [printable_rect\(\)](#) call. That is, `printable_rect(&w, &h); origin(w/2, 0);` sets the graphics origin at the top center of the drawable area. Successive [origin\(\)](#) calls don't combine their effects. [Origin\(\)](#) calls are not affected by [rotate\(\)](#) calls (for classes derived from [Fl_Paged_Device](#)).

Parameters

in	<i>x,y</i>	Horizontal and vertical positions in the drawing surface of the desired origin of graphics.

Reimplemented in [Fl_Copy_Surface](#), [Fl_Image_Surface](#), [Fl_PDF_File_Surface](#), [Fl_PostScript_File_Device](#), [Fl_EPS_File_Surface](#), [Fl_Printer](#), and [Fl_SVG_File_Surface](#).

13.156.3.5 [print_window_part\(\)](#)

```
void Fl_Widget_Surface::print_window_part (
    Fl_Window * win,
```

```

    int x,
    int y,
    int w,
    int h,
    int delta_x = 0,
    int delta_y = 0 )

```

Draws a rectangular part of an on-screen window.

Parameters

<i>win</i>	The window from where to capture. Can be an Fl_Gl_Window . Sub-windows that intersect the rectangle are also captured.
<i>x</i>	The rectangle left
<i>y</i>	The rectangle top
<i>w</i>	The rectangle width
<i>h</i>	The rectangle height
<i>delta_x, delta_y</i>	Optional horizontal and vertical offsets from current graphics origin where to draw the top left of the captured rectangle.

13.156.3.6 printable_rect()

```

int Fl_Widget_Surface::printable_rect (
    int * w,
    int * h ) [virtual]

```

Computes the width and height of the drawable area of the drawing surface.

Values are in the same unit as that used by FLTK drawing functions and are unchanged by calls to [origin\(\)](#). If the object is derived from class [Fl_Paged_Device](#), values account for the user-selected paper type and print orientation and are changed by [scale\(\)](#) calls.

Returns

0 if OK, non-zero if any error

Reimplemented in [Fl_Copy_Surface](#), [Fl_Image_Surface](#), [Fl_PDF_File_Surface](#), [Fl_PostScript_File_Device](#), [Fl_EPS_File_Surface](#), [Fl_Printer](#), and [Fl_SVG_File_Surface](#).

13.156.3.7 translate()

```

void Fl_Widget_Surface::translate (
    int x,
    int y ) [virtual]

```

Translates the current graphics origin accounting for the current rotation.

Each [translate\(\)](#) call must be matched by an [untranslate\(\)](#) call. Successive [translate\(\)](#) calls add up their effects.

Reimplemented in [Fl_Copy_Surface](#), [Fl_Image_Surface](#), [Fl_PDF_File_Surface](#), [Fl_PostScript_File_Device](#), [Fl_EPS_File_Surface](#), [Fl_Printer](#), and [Fl_SVG_File_Surface](#).

13.156.3.8 untranslate()

```

void Fl_Widget_Surface::untranslate (
    void ) [virtual]

```

Undoes the effect of a previous [translate\(\)](#) call.

Reimplemented in [Fl_Copy_Surface](#), [Fl_Image_Surface](#), [Fl_PDF_File_Surface](#), [Fl_EPS_File_Surface](#), [Fl_SVG_File_Surface](#), [Fl_PostScript_File_Device](#), and [Fl_Printer](#).

The documentation for this class was generated from the following files:

- [Fl_Widget_Surface.H](#)
- [Fl_Widget_Surface.cxx](#)

13.157 FI_Widget_Tracker Class Reference

This class should be used to control safe widget deletion.

```
#include <Fl_Widget_Tracker.H>
```

Public Member Functions

- void **clear** ()
Clear the widget pointer.
- int **deleted** ()
Check if the widget was deleted since the tracker was created.
- int **exists** ()
Check if the widget exists and was not deleted since the tracker was created.
- **FI_Widget_Tracker** (const **FI_Widget_Tracker** &)=delete
- **FI_Widget_Tracker** (**FI_Widget** *wi)
The constructor adds a widget to the watch list.
- **FI_Widget_Tracker** (**FI_Widget_Tracker** &&)=delete
- **FI_Widget_Tracker** & **operator=** (const **FI_Widget_Tracker** &)=delete
- **FI_Widget_Tracker** & **operator=** (**FI_Widget_Tracker** &&)=delete
- **FI_Widget** * **widget** ()
Returns a pointer to the watched widget.
- ~**FI_Widget_Tracker** ()
The destructor removes a widget from the watch list.

13.157.1 Detailed Description

This class should be used to control safe widget deletion.

You can use an **FI_Widget_Tracker** object to watch another widget, if you need to know whether this widget has been deleted during a callback.

This simplifies the use of the "safe widget deletion" methods **Fl::watch_widget_pointer()** and **Fl::release_widget_pointer()** and makes their use more reliable, because the destructor automatically releases the widget pointer from the widget watch list.

FI_Widget_Tracker is intended to be used as an automatic (local/stack) variable, such that its destructor is called when the object's scope is left. This ensures that no stale widget pointers are left in the widget watch list (see example below).

You can also create **FI_Widget_Tracker** objects with **new**, but then it is your responsibility to delete the object (and thus remove the widget pointer from the watch list) when it is no longer needed.

Example:

```
int MyClass::handle (int event) {

    if (...) {
        FI_Widget_Tracker wp(this);           // watch myself
        do_callback();                         // call the callback

        if (wp.deleted()) return 1;           // exit, if deleted

        // Now we are sure that the widget has not been deleted,
        // and it is safe to access the widget:

        box(FL_FLAT_BOX);
        color(FL_WHITE);
        redraw();
    }
}
```

13.157.2 Member Function Documentation

13.157.2.1 deleted()

```
int FI_Widget_Tracker::deleted ( ) [inline]
```

Check if the widget was deleted since the tracker was created.

Returns

1 if the watched widget has been deleted, otherwise 0

13.157.2.2 exists()

```
int Fl_Widget_Tracker::exists ( ) [inline]
```

Check if the widget exists and was not deleted since the tracker was created.

Returns

1 if the watched widget exists, otherwise 0

13.157.2.3 widget()

```
Fl_Widget * Fl_Widget_Tracker::widget ( ) [inline]
```

Returns a pointer to the watched widget.

Returns

nullptr if the widget was deleted.

The documentation for this class was generated from the following files:

- [Fl_Widget_Tracker.H](#)
- [Fl.cxx](#)

13.158 Fl_Window Class Reference

This widget produces an actual window.

```
#include <Fl_Window.H>
```

Inheritance diagram for Fl_Window:

**Public Types**

- typedef struct HICON__ * **HICON**

Public Member Functions

- void [allow_expand_outside_parent](#) ()
Allow this subwindow to expand outside the area of its parent window.
- virtual class [Fl_Double_Window](#) * [as_double_window](#) ()
Return non-null if this is an [Fl_Double_Window](#) object.
- virtual class [Fl_Overlay_Window](#) * [as_overlay_window](#) ()
Return non-null if this is an [Fl_Overlay_Window](#) object.

- [Fl_Window](#) const * [as_window](#) () const [override](#)
- [Fl_Window](#) * [as_window](#) () [override](#)
Returns an [Fl_Window](#) pointer if this widget is an [Fl_Window](#).
- unsigned int **border** () const
Returns whether the window possesses a border.
- void [border](#) (int b)
Sets whether or not the window manager border is around the window.
- void [clear_border](#) ()
Fast inline function to turn the window manager border off.
- void [clear_modal_states](#) ()
Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.
- void **copy_label** (const char *a)
Sets the window titlebar label to a copy of a character string.
- void [cursor](#) (const [Fl_RGB_Image](#) *, int, int)
Changes the cursor for this window using the provided image as cursor's shape.
- void [cursor](#) ([Fl_Cursor](#) c, [Fl_Color](#), [Fl_Color](#)=FL_WHITE)
For back compatibility only.
- void [cursor](#) ([Fl_Cursor](#))
Changes the cursor for this window.
- int [decorated_h](#) () const
Returns the window height including any window title bar and any frame added by the window manager.
- int [decorated_w](#) () const
Returns the window width including any frame added by the window manager.
- void [default_cursor](#) ([Fl_Cursor](#) c, [Fl_Color](#), [Fl_Color](#)=FL_WHITE)
For back compatibility only.
- void [default_cursor](#) ([Fl_Cursor](#))
Sets the default window cursor.
- void **draw_backdrop** ()
Draw the background image if one is set and is aligned inside.
- [Fl_Window](#) (int w, int h, const char *title=0)
Creates a window from the given width w, height h, and title.
- [Fl_Window](#) (int x, int y, int w, int h, const char *title=0)
Creates a window from the given position (x, y), size (w, h) and title.
- virtual void [flush](#) ()
Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).
- void [free_position](#) ()
Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.
- void [fullscreen](#) ()
Makes the window completely fill one or more screens, without any window manager border visible.
- unsigned int **fullscreen_active** () const
Returns non zero if FULLSCREEN flag is set, 0 otherwise.
- void **fullscreen_off** ()
Turns off any side effects of [fullscreen\(\)](#)
- void **fullscreen_off** (int X, int Y, int W, int H)
Turns off any side effects of [fullscreen\(\)](#) and does [resize\(x,y,w,h\)](#).
- void [fullscreen_screens](#) (int top, int bottom, int left, int right)
Sets which screens should be used when this window is in fullscreen mode.
- [uchar](#) [get_size_range](#) (int *minw, int *minh, int *maxw=NULL, int *maxh=NULL, int *dw=NULL, int *dh=NULL, int *aspect=NULL) const
Gets the allowable range to which the user can resize this window.

- int **handle** (int) **override**
Handles the specified event.
- void **hide** () **override**
Removes the window from the screen.
- void **hotspot** (const **FL_Widget** &p, int offscreen=0)
*See void **FL_Window::hotspot**(int x, int y, int offscreen = 0)*
- void **hotspot** (const **FL_Widget** *, int offscreen=0)
*See void **FL_Window::hotspot**(int x, int y, int offscreen = 0)*
- void **hotspot** (int x, int y, int offscreen=0)
Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.
- const void * **icon** () const
Gets the current icon window target dependent data.
- void **icon** (const **FL_RGB_Image** *)
Sets or resets a single window icon.
- void **icon** (const void *ic)
Platform-specific method to set the window icon usable on Windows and X11 only.
- void **iconize** ()
Iconifies the window.
- const char * **iconlabel** () const
*See void **FL_Window::iconlabel**(const char*)*
- void **iconlabel** (const char *)
Sets the icon label.
- void **icons** (const **FL_RGB_Image** *[], int)
Sets the window icons.
- void **icons** (HICON big_icon, HICON small_icon)
Sets the window icons using HICON handles (Windows platform only).
- const char * **label** () const
*See void **FL_Window::label**(const char*)*
- void **label** (const char *)
Sets the window title bar label.
- void **label** (const char *label, const char ***iconlabel**)
Sets the icon label.
- void **make_current** ()
*Sets things up so that the drawing functions in <**FL/fl_draw.H**> will go into this window.*
- void **maximize** ()
Maximizes a top-level window to its current screen.
- unsigned int **maximize_active** () const
Returns whether the window is currently maximized.
- unsigned int **menu_window** () const
Returns true if this window is a menu window.
- unsigned int **modal** () const
Returns true if this window is modal.
- unsigned int **non_modal** () const
Returns true if this window is modal or non-modal.
- **fl_uintptr_t** **os_id** () const
Returns a platform-specific identification of a shown window, or 0 if not shown.
- unsigned int **override** () const
*Returns non zero if **OVERRIDE** flag is set, 0 otherwise.*

- void [resize](#) (int X, int Y, int W, int H) [override](#)
Changes the size and position of the window.
- int [screen_num](#) () const
The number of the screen containing the mapped window.
- void [screen_num](#) (int screen_num)
Set the number of the screen where to map the window.
- void [set_menu_window](#) ()
Marks the window as a menu window.
- void [set_modal](#) ()
A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).
- void [set_non_modal](#) ()
A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.
- void [set_override](#) ()
Activates the flags NOBORDER|OVERRIDE.
- void [set_tooltip_window](#) ()
Marks the window as a tooltip window.
- const [FI_Image](#) * [shape](#) () const
Returns the image controlling the window shape or NULL.
- void [shape](#) (const [FI_Image](#) &b)
Set the window's shape with an [FI_Image](#).
- void [shape](#) (const [FI_Image](#) *img)
Assigns a non-rectangular shape to the window.
- void [show](#) () [override](#)
Puts the window on the screen.
- void [show](#) (int argc, char **argv)
Puts the window on the screen with [show\(\)](#) and parses command-line arguments.
- int [shown](#) () const
Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#)).
- void [size_range](#) (int minw, int minh, int maxw=0, int maxh=0, int dw=0, int dh=0, int aspect=0)
Sets the allowable range to which the user can resize this window.
- unsigned int [tooltip_window](#) () const
Returns true if this window is a tooltip window.
- void [un_maximize](#) ()
Returns a previously maximized top-level window to its previous size.
- void [wait_for_expose](#) ()
Waits for the window to be displayed after calling [show\(\)](#).
- int [x_root](#) () const
Gets the x position of the window on the screen.
- const char * [xclass](#) () const
Returns the xclass for this window, or a default.
- void [xclass](#) (const char *c)
Sets the xclass for this window.
- int [y_root](#) () const
Gets the y position of the window on the screen.
- virtual [~FI_Window](#) ()
The destructor also deletes all the children.

Public Member Functions inherited from FL_Group

- [FL_Widget](#) *[_ddfdesign_kludge](#) ()
This is for forms compatibility only.
- void **add** ([FL_Widget](#) &)
The widget is removed from its current group (if any) and then added to the end of this group.
- void **add** ([FL_Widget](#) *o)
See void [FL_Group::add\(FL_Widget &w\)](#)
- void **add_resizable** ([FL_Widget](#) &o)
Adds a widget to the group and makes it the resizable widget.
- [FL_Widget](#) *const * **array** () const
Returns a pointer to the internal array of children.
- [FL_Group](#) const * **as_group** () const override
- [FL_Group](#) * **as_group** () override
Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).
- void **begin** ()
Sets the current group so you can build the widget tree by just constructing the widgets.
- [FL_Widget](#) * **child** (int n) const
Returns the n'th child.
- int **children** () const
Returns how many child widgets the group has.
- void **clear** ()
Deletes all child widgets from memory recursively.
- unsigned int **clip_children** ()
Returns the current clipping mode.
- void **clip_children** (int c)
Controls whether the group widget clips the drawing of child widgets to its bounding box.
- virtual int **delete_child** (int n)
*Removes the widget at *index* from the group and deletes it.*
- void **end** ()
*Exactly the same as *current(this->parent())*.*
- int **find** (const [FL_Widget](#) &o) const
*See int [FL_Group::find\(const FL_Widget *w\)](#) const.*
- int **find** (const [FL_Widget](#) *) const
Searches the children for the widget and returns the index.
- [FL_Group](#) (int, int, int, int, const char * = 0)
Creates a new [FL_Group](#) widget using the given position, size, and label string.
- void **forms_end** ()
This is for forms compatibility only.
- void **init_sizes** ()
Resets the internal array of widget sizes and positions.
- void **insert** ([FL_Widget](#) &, int i)
The widget is removed from its current group (if any) and then inserted into this group.
- void **insert** ([FL_Widget](#) &o, [FL_Widget](#) *before)
*This does *insert(w, find(before))*.*
- void **remove** ([FL_Widget](#) &)
Removes a widget from the group but does not delete it.
- void **remove** ([FL_Widget](#) *o)
Removes the widget o from the group.
- void **remove** (int index)
*Removes the widget at *index* from the group but does not delete it.*

- `FI_Widget * resizable () const`
Returns the group's resizable widget.
- `void resizable (FI_Widget &o)`
Sets the group's resizable widget.
- `void resizable (FI_Widget *o)`
The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- `virtual ~FI_Group ()`
The destructor also deletes all the children.

Public Member Functions inherited from `FI_Widget`

- `void _clear_fullscreen ()`
- `void _set_fullscreen ()`
- `void activate ()`
Activates the widget.
- `unsigned int active () const`
Returns whether the widget is active.
- `int active_r () const`
Returns whether the widget and all of its parents are active.
- `FI_Align align () const`
Gets the label alignment.
- `void align (FI_Align alignment)`
Sets the label alignment.
- `long argument () const`
Gets the current user data (long) argument that is passed to the callback function.
- `void argument (long v)`
Sets the current user data (long) argument that is passed to the callback function.
- `virtual class FI_GL_Window * as_gl_window ()`
Returns an `FI_GL_Window` pointer if this widget is an `FI_GL_Window`.
- `virtual class FI_GL_Window const * as_gl_window () const`
- `void bind_deimage (FI_Image *img)`
Sets the image to use as part of the widget label when in the inactive state.
- `void bind_deimage (int f)`
Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- `void bind_image (FI_Image *img)`
Sets the image to use as part of the widget label when in the active state.
- `void bind_image (int f)`
Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- `FI_Boxtype box () const`
Gets the box type of the widget.
- `void box (FI_Boxtype new_box)`
Sets the box type for the widget.
- `FI_Callback_p callback () const`
Gets the current callback function for the widget.
- `void callback (FI_Callback *cb)`
Sets the current callback function for the widget.
- `void callback (FI_Callback *cb, FI_Callback_User_Data *p, bool auto_free)`
Sets the current callback function and managed user data for the widget.
- `void callback (FI_Callback *cb, void *p)`
Sets the current callback function and data for the widget.
- `void callback (FI_Callback0 *cb)`

- Sets the current callback function for the widget.*

 - void [callback](#) ([FL_Callback1](#) *cb, long p=0)
- Sets the current callback function for the widget.*

 - unsigned int [changed](#) () const
- Checks if the widget value changed since the last callback.*

 - void [clear_active](#) ()
- Marks the widget as inactive without sending events or changing focus.*

 - void [clear_changed](#) ()
- Marks the value of the widget as unchanged.*

 - void [clear_damage](#) ([uchar](#) c=0)
- Clears or sets the damage flags.*

 - void [clear_output](#) ()
- Sets a widget to accept input.*

 - void [clear_visible](#) ()
- Hides the widget.*

 - void [clear_visible_focus](#) ()
- Disables keyboard focus navigation with this widget.*

 - [FL_Color](#) [color](#) () const
- Gets the background color of the widget.*

 - void [color](#) ([FL_Color](#) bg)
- Sets the background color of the widget.*

 - void [color](#) ([FL_Color](#) bg, [FL_Color](#) sel)
- Sets the background and selection color of the widget.*

 - int [contains](#) (const [FL_Widget](#) *w) const
- Checks if w is a child of this widget.*

 - void [copy_label](#) (const char *new_label)
- Sets the current label.*

 - void [copy_tooltip](#) (const char *text)
- Sets the current tooltip text.*

 - [uchar](#) [damage](#) () const
- Returns non-zero if [draw\(\)](#) needs to be called.*

 - void [damage](#) ([uchar](#) c)
- Sets the damage bits for the widget.*

 - void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
- Sets the damage bits for an area inside the widget.*

 - int [damage_resize](#) (int, int, int, int)
- Internal use only.*

 - void [deactivate](#) ()
- Deactivates the widget.*

 - [FL_Image](#) * [deimage](#) ()
- Gets the image that is used as part of the widget label when in the inactive state.*

 - const [FL_Image](#) * [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*

 - void [deimage](#) ([FL_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - void [deimage](#) ([FL_Image](#) *img)
- Sets the image to use as part of the widget label when in the inactive state.*

 - int [deimage_bound](#) () const
- Returns whether the inactive image is managed by the widget.*

 - void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with default arguments.*

- void `do_callback` (`FI_Widget` *widget, long arg, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `do_callback` (`FI_Widget` *widget, void *arg=0, `FI_Callback_Reason` reason=`FL_REASON_UNKNOWN`)
Calls the widget callback function with arbitrary arguments.
- void `draw_label` (int, int, int, int, `FI_Align`) const
Draws the label in an arbitrary bounding box with an arbitrary alignment.
- int `h` () const
Gets the widget height.
- int `horizontal_label_margin` ()
Get the spacing between the label and the horizontal edge of the widget.
- void `horizontal_label_margin` (int px)
Set the spacing between the label and the horizontal edge of the widget.
- `FI_Image` * `image` ()
Gets the image that is used as part of the widget label when in the active state.
- const `FI_Image` * `image` () const
Gets the image that is used as part of the widget label when in the active state.
- void `image` (`FI_Image` &img)
Sets the image to use as part of the widget label when in the active state.
- void `image` (`FI_Image` *img)
Sets the image to use as part of the widget label when in the active state.
- int `image_bound` () const
Returns whether the image is managed by the widget.
- int `inside` (const `FI_Widget` *wgt) const
Checks if this widget is a child of wgt.
- int `is_label_copied` () const
Returns whether the current label was assigned with `copy_label()`.
- const char * `label` () const
Gets the current label text.
- void `label` (const char *text)
Sets the current label pointer.
- void `label` (`FI_Labeltype` a, const char *b)
Shortcut to set the label text and type in one call.
- int `label_image_spacing` ()
Return the gap size between the label and the image.
- void `label_image_spacing` (int gap)
Set the gap between the label and the image in pixels.
- `FI_Color` `labelcolor` () const
Gets the label color.
- void `labelcolor` (`FI_Color` c)
Sets the label color.
- `FI_Font` `labelfont` () const
Gets the font to use.
- void `labelfont` (`FI_Font` f)
Sets the font to use.
- `FI_Fonsize` `labelsize` () const
Gets the font size in pixels.
- void `labelsize` (`FI_Fonsize` pix)
Sets the font size in pixels.
- `FI_Labeltype` `labeltype` () const
Gets the label type.
- void `labeltype` (`FI_Labeltype` a)

- Sets the label type.*

 - void `measure_label` (int &ww, int &hh) const

Sets width ww and height hh accordingly with the label size.
- bool `needs_keyboard` () const

Returns whether this widget needs a keyboard.
- void `needs_keyboard` (bool needs)

Sets whether this widget needs a keyboard.
- unsigned int `output` () const

Returns if a widget is used for output only.
- `Fl_Group` * `parent` () const

Returns a pointer to the parent widget.
- void `parent` (`Fl_Group` *p)

Internal use only - "for hacks only".
- void `position` (int X, int Y)

Repositions the window or widget.
- void `redraw` ()

Schedules the drawing of the widget.
- void `redraw_label` ()

Schedules the drawing of the label.
- `Fl_Color` `selection_color` () const

Gets the selection color.
- void `selection_color` (`Fl_Color` a)

Sets the selection color.
- void `set_active` ()

Marks the widget as active without sending events or changing focus.
- void `set_changed` ()

Marks the value of the widget as changed.
- void `set_output` ()

Sets a widget to output only.
- void `set_visible` ()

Makes the widget visible.
- void `set_visible_focus` ()

Enables keyboard focus navigation with this widget.
- int `shortcut_label` () const

Returns whether the widget's label uses '&' to indicate shortcuts.
- void `shortcut_label` (int value)

Sets whether the widget's label uses '&' to indicate shortcuts.
- void `size` (int W, int H)

Changes the size of the widget.
- int `take_focus` ()

Gives the widget the keyboard focus.
- unsigned int `takeevents` () const

Returns if the widget is able to take events.
- int `test_shortcut` ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * `tooltip` () const

Gets the current tooltip text.
- void `tooltip` (const char *text)

Sets the Tooltip Text for a Widget.
- `Fl_Window` * `top_window` () const

Returns a pointer to the top-level window for the widget.

- `FL_Window * top_window_offset` (int &xoff, int &yoff) const
Finds the x/y offset of the current widget relative to the top-level window.
- `uchar type` () const
Gets the widget type.
- `void type` (uchar t)
Sets the widget type.
- `int use_accents_menu` ()
Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- `void * user_data` () const
Gets the user data for this widget.
- `void user_data` (FL_Callback_User_Data *v, bool auto_free)
Sets the user data for this widget.
- `void user_data` (void *v)
Sets the user data for this widget.
- `int vertical_label_margin` ()
Get the spacing between the label and the vertical edge of the widget.
- `void vertical_label_margin` (int px)
Set the spacing between the label and the vertical edge of the widget.
- `unsigned int visible` () const
Returns whether a widget is visible.
- `unsigned int visible_focus` () const
Checks whether this widget has a visible focus.
- `void visible_focus` (int v)
Modifies keyboard focus navigation.
- `int visible_r` () const
Returns whether a widget and all its parents are visible.
- `int w` () const
Gets the widget width.
- `FL_When when` () const
Returns the conditions under which the callback is called.
- `void when` (uchar i)
Sets the flags used to decide when a callback is called.
- `FL_Window * window` () const
Returns a pointer to the nearest parent window up the widget hierarchy.
- `int x` () const
Gets the widget position in its window.
- `int y` () const
Gets the widget position in its window.
- `virtual ~FL_Widget` ()
Destroys the widget.

Static Public Member Functions

- `static FL_Window * current` ()
Returns the last window that was made current.
- `static void default_callback` (FL_Window *, void *v)
Back compatibility: Sets the default callback v for win to call on close event.
- `static void default_icon` (const FL_RGB_Image *)
Sets a single default window icon.
- `static void default_icons` (const FL_RGB_Image *[], int)
Sets the default window icons.

- static void [default_icons](#) (HICON big_icon, HICON small_icon)
Sets the default window icons (Windows platform only).
- static const char * [default_xclass](#) ()
Returns the default xclass.
- static void [default_xclass](#) (const char *)
Sets the default window xclass.
- static bool [is_a_rescale](#) ()
Returns true when a window is being rescaled.
- static char [show_next_window_iconic](#) ()
Returns the static flag whether the next window should be opened iconified.
- static void [show_next_window_iconic](#) (char stat)
Sets a static flag whether the next window should be opened iconified.

Static Public Member Functions inherited from [Fl_Group](#)

- static [Fl_Group](#) * [current](#) ()
Returns the currently active group.
- static void [current](#) ([Fl_Group](#) *g)
Sets the current group.

Static Public Member Functions inherited from [Fl_Widget](#)

- static void [default_callback](#) ([Fl_Widget](#) *widget, void *data)
The default callback for all widgets that don't set a callback.
- static unsigned int [label_shortcut](#) (const char *t)
Returns the Unicode value of the '&x' shortcut in a given text.
- static int [test_shortcut](#) (const char *, const bool require_alt=false)
Returns true if the given text t contains the entered '&x' shortcut.

Protected Member Functions

- void [default_size_range](#) ()
Protected method to calculate the default size range of a window.
- void [draw](#) () [override](#)
Draws the widget.
- int [force_position](#) () const
Returns the internal state of the window's `FORCE_POSITION` flag.
- void [force_position](#) (int force)
Sets an internal flag that tells FLTK and the window manager to honor position requests.
- void [free_icons](#) ()
Deletes all icons previously attached to the window.
- int [is_resizable](#) ()
Protected method to determine whether a window is resizable.

Protected Member Functions inherited from [Fl_Group](#)

- [Fl_Rect](#) * [bounds](#) ()
Returns the internal array of widget sizes and positions.
- void [draw_child](#) ([Fl_Widget](#) &widget) const
Forces a child to redraw.
- void [draw_children](#) ()
Draws all children of the group.
- void [draw_outside_label](#) (const [Fl_Widget](#) &widget) const

- Parents normally call this to draw outside labels of child widgets.*
- virtual int **on_insert** (**FL_Widget** *, int)
 - Allow derived groups to act when a widget is added as a child.*
- virtual int **on_move** (int, int)
 - Allow derived groups to act when a widget is moved within the group.*

13.158.1 Detailed Description

This widget produces an actual window.

This can either be a main window, with a border and title and all the window management controls, or a "subwindow" inside a window. This is controlled by whether or not the window has a [parent\(\)](#).

Once you create a window, you usually add children [Fl_Widget](#)'s to it by using `window->add(child)` for each new widget. See [Fl_Group](#) for more information on how to add and remove children.

There are several subclasses of [Fl_Window](#) that provide double-buffering, overlay, menu, and OpenGL support.

The window's callback is done if the user tries to close a window using the window manager and [Fl::modal\(\)](#) is zero or equal to the window. [Fl_Window](#) has a default callback that calls [Fl_Window::hide\(\)](#). Callback reasons can be [FL_REASON_CANCELLED](#) if the Escape key was pressed, or [FL_REASON_CLOSED](#) when the close button is clicked. [FL_WHEN_...](#) flags are ignored.

13.158.2 Constructor & Destructor Documentation**13.158.2.1 [Fl_Window\(\)](#) [1/2]**

```
Fl_Window::Fl_Window (
    int w,
    int h,
    const char * title = 0 )
```

Creates a window from the given width `w`, height `h`, and `title`.

If [Fl_Group::current\(\)](#) is not NULL, the window is created as a subwindow of the parent window.

The (w, h) form of the constructor creates a top-level window and asks the window manager to position the window.

The (x, y, w, h) form of the constructor either creates a subwindow or a top-level window at the specified location (x, y), subject to window manager configuration. If you do not specify the position of the window, the window manager will pick a place to show the window or allow the user to pick a location. Use [position\(x, y\)](#) or [hotspot\(\)](#) before calling [show\(\)](#) to request a position on the screen. See [Fl_Window::resize\(\)](#) for some more details on positioning windows. Top-level windows initially have [visible\(\)](#) set to 0 and [parent\(\)](#) set to NULL. Subwindows initially have [visible\(\)](#) set to 1 and [parent\(\)](#) set to the parent window pointer.

[Fl_Widget::box\(\)](#) defaults to [FL_FLAT_BOX](#). If you plan to completely fill the window with children widgets you should change this to [FL_NO_BOX](#). If you turn the window border off you may want to change this to [FL_UP_BOX](#).

See also

[Fl_Window\(int x, int y, int w, int h, const char *title\)](#)

13.158.2.2 Fl_Window() [2/2]

```
Fl_Window::Fl_Window (
    int x,
    int y,
    int w,
    int h,
    const char * title = 0 )
```

Creates a window from the given position (x, y), size (w, h) and title.

On a multi-screen system, the values computed by [Fl::screen_xywh\(int &X, int &Y, int &W, int &H, int n\)](#) can be used to discover the coordinates of the area of screen #n. When these screens have various scale factor values, an (x, y) pair may not be enough to specify the targeted screen for the window, because the same (x,y) pair can belong to several screens. In that situation, a call to [Fl_Window::screen_num\(int\)](#) is to be used to identify unambiguously the targeted screen.

See also

[Fl_Window\(int w, int h, const char *title\)](#)

[Fl::screen_xywh\(int &X, int &Y, int &W, int &H, int n\)](#)

Note

Under Wayland, it's generally not possible for the client app to control the position of a window in the system. It's possible to specify on what screen should the compositor place a fullscreen window. It's also possible to make an [Fl_Window](#) the child of another window or group and control with `x` and `y` its screen position relatively to the enclosing window. Apply member function [Fl_Window::allow_expand_outside_parent\(\)](#) to the child window to allow it to expand partially or totally outside its parent.

13.158.2.3 ~Fl_Window()

```
Fl_Window::~~Fl_Window ( ) [virtual]
```

The destructor *also deletes all the children*.

This allows a whole tree to be deleted at once, without having to keep a pointer to all the children in the user code. A kludge has been done so the [Fl_Window](#) and all of its children can be automatic (local) variables, but you must declare the [Fl_Window](#) *first* so that it is destroyed last.

13.158.3 Member Function Documentation

13.158.3.1 allow_expand_outside_parent()

```
void Fl_Window::allow_expand_outside_parent ( )
```

Allow this subwindow to expand outside the area of its parent window.

This is presently implemented only for the Wayland platform to help support window docking.

Since

1.4.0

13.158.3.2 as_double_window()

```
virtual class Fl_Double_Window * Fl_Window::as_double_window ( ) [inline], [virtual]
```

Return non-null if this is an [Fl_Double_Window](#) object.

Reimplemented in [Fl_Double_Window](#).

13.158.3.3 as_overlay_window()

```
virtual class Fl_Overlay_Window * Fl_Window::as_overlay_window ( ) [inline], [virtual]
```

Return non-null if this is an [Fl_Overlay_Window](#) object.

Reimplemented in [Fl_Overlay_Window](#).

13.158.3.4 as_window() [1/2]

```
Fl_Window const * Fl_Window::as_window ( ) const [inline], [override], [virtual]
```

Reimplemented from [Fl_Widget](#).

13.158.3.5 as_window() [2/2]

```
Fl_Window * Fl_Window::as_window ( ) [inline], [override], [virtual]
```

Returns an [Fl_Window](#) pointer if this widget is an [Fl_Window](#).

Use this method if you have a widget (pointer) and need to know whether this widget is derived from [Fl_Window](#). If it returns non-NULL, then the widget in question is derived from [Fl_Window](#), and you can use the returned pointer to access its children or other [Fl_Window](#)-specific methods.

Return values

<code>NULL</code>	if this widget is not derived from Fl_Window .

Note

This method is provided to avoid `dynamic_cast`.

See also

[Fl_Widget::as_group\(\)](#), [Fl_Widget::as_gl_window\(\)](#)

Reimplemented from [Fl_Widget](#).

13.158.3.6 border()

```
void Fl_Window::border (
    int b )
```

Sets whether or not the window manager border is around the window.

The default value is true. The macOS platform ignores requests to change the border state of a fullscreen or maximized window. *With some X window managers, this does not work after [show\(\)](#) has been called.*

13.158.3.7 clear_border()

```
void Fl_Window::clear_border ( ) [inline]
```

Fast inline function to turn the window manager border off.

It only works before [show\(\)](#) is called.

13.158.3.8 clear_modal_states()

```
void Fl_Window::clear_modal_states ( ) [inline]
```

Clears the "modal" flags and converts a "modal" or "non-modal" window back into a "normal" window.

Note that there are *three* states for a window: modal, non-modal, and normal.

You can not change the "modality" of a window whilst it is shown, so it is necessary to first [hide\(\)](#) the window, change its "modality" as required, then re-show the window for the new state to take effect.

This method can also be used to change a "modal" window into a "non-modal" one. On several supported platforms, the "modal" state over-rides the "non-modal" state, so the "modal" state must be cleared before the window can be set into the "non-modal" state. In general, the following sequence should work:

```
win->hide();
win->clear_modal_states();
// Set win to new state as desired, or leave "normal", e.g...
win->set_non_modal();
win->show();
```

Note

Under some window managers, the sequence of hiding the window and changing its modality will often cause it to be re-displayed at a different position when it is subsequently shown. This is an irritating feature but appears to be unavoidable at present. As a result we would advise to use this method only when absolutely necessary.

See also

void [set_modal\(\)](#), void [set_non_modal\(\)](#)

13.158.3.9 current()

```
Fl_Window * Fl_Window::current ( ) [static]
```

Returns the last window that was made current.

See also

[Fl_Window::make_current\(\)](#)

13.158.3.10 cursor() [1/3]

```
void Fl_Window::cursor (
    const Fl_RGB_Image * image,
    int hotx,
    int hoty )
```

Changes the cursor for this window using the provided image as cursor's shape.

The window must be [show\(\)](#)'n for this function to have any effect. This always calls the system. If you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The default cursor will be used if the provided image cannot be used as a cursor.

Parameters

<i>image</i>	Sets the cursor size and shape
<i>hotx,hoty</i>	Sets the cursor's active location relatively to top-left of <i>image</i> when clicking

See also

[cursor\(Fl_Cursor\)](#), [default_cursor\(\)](#)

13.158.3.11 cursor() [2/3]

```
void Fl_Window::cursor (
    Fl_Cursor c,
    Fl_Color ,
    Fl_Color = FL_WHITE )
```

For back compatibility only.

Same as [Fl_Window::cursor\(Fl_Cursor\)](#)

13.158.3.12 cursor() [3/3]

```
void Fl_Window::cursor (
    Fl_Cursor c )
```

Changes the cursor for this window.

The window must be [show\(\)](#)'n for this function to have any effect. This always calls the system. If you are changing the cursor a lot you may want to keep track of how you set it in a static variable and call this only if the new cursor is different.

The type `Fl_Cursor` is an enumeration defined in [<FL/Enumerations.H>](#).

See also

[cursor\(const Fl_RGB_Image*, int, int\), default_cursor\(\)](#)

13.158.3.13 decorated_h()

```
int Fl_Window::decorated_h ( ) const
```

Returns the window height including any window title bar and any frame added by the window manager. Same as [h\(\)](#) if applied to a subwindow, or if window is not yet mapped.

Note

Under X11, FLTK is able to compute the size of window titlebars and borders only if these decoration elements are strictly X11-based. When that's not the case, [decorated_h\(\)](#) returns the same value as [h\(\)](#) and [decorated_w\(\)](#) as [w\(\)](#), and FLTK cannot access window decorations.

Under X11 again, the values returned by [decorated_h\(\)](#) and [decorated_w\(\)](#) may not be reliable **during a resize operation**. The size of decoration elements of a window is best computed when the window is first mapped.

13.158.3.14 decorated_w()

```
int Fl_Window::decorated_w ( ) const
```

Returns the window width including any frame added by the window manager. Same as [w\(\)](#) if applied to a subwindow, or if window is not yet mapped.

See also

[decorated_h\(\)](#).

13.158.3.15 default_cursor() [1/2]

```
void Fl_Window::default_cursor (
    Fl_Cursor c,
    Fl_Color ,
    Fl_Color = FL_WHITE )
```

For back compatibility only.

same as [Fl_Window::default_cursor\(Fl_Cursor\)](#)

13.158.3.16 default_cursor() [2/2]

```
void Fl_Window::default_cursor (
    Fl_Cursor c )
```

Sets the default window cursor.

This is the cursor that will be used after the mouse pointer leaves a widget with a custom cursor set.

See also

[cursor\(const Fl_RGB_Image*, int, int\), default_cursor\(\)](#)

13.158.3.17 default_icon()

```
void Fl_Window::default_icon (
    const Fl_RGB_Image * icon ) [static]
```

Sets a single default window icon.

If `icon` is NULL the current default icons are removed.

Parameters

<code>in</code>	<code>icon</code>	default icon for all windows subsequently created or NULL

See also

[Fl_Window::default_icons\(const Fl_RGB_Image *\[\], int\)](#)
[Fl_Window::icon\(const Fl_RGB_Image *\)](#)
[Fl_Window::icons\(const Fl_RGB_Image *\[\], int\)](#)

Note

See [Window icons](#) for the Wayland platform.

13.158.3.18 default_icons() [1/2]

```
void Fl_Window::default_icons (
    const Fl_RGB_Image * icons[],
    int count ) [static]
```

Sets the default window icons.

The default icons are used for all windows that don't have their own icons set before [show\(\)](#) is called. You can change the default icons whenever you want, but this only affects windows that are created (and shown) after this call.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call.

Parameters

in	<i>icons</i>	default icons for all windows subsequently created
in	<i>count</i>	number of images in <i>icons</i> . Set to 0 to remove the current default icons

See also

[Fl_Window::default_icon\(const Fl_RGB_Image *\)](#)
[Fl_Window::icon\(const Fl_RGB_Image *\)](#)
[Fl_Window::icons\(const Fl_RGB_Image *\[\], int\)](#)

Note

See [Window icons](#) for the Wayland platform.

13.158.3.19 default_icons() [2/2]

```
static void Fl_Window::default_icons (
    HICON big_icon,
    HICON small_icon ) [static]
```

Sets the default window icons (Windows platform only).

Convenience function to set the default icons using Windows' native HICON icon handles.

The given icons are copied. You can free the icons immediately after this call.

Parameters

in	<i>big_icon</i>	default large icon for all windows subsequently created
in	<i>small_icon</i>	default small icon for all windows subsequently created

See also

[Fl_Window::default_icon\(const Fl_RGB_Image *\)](#)
[Fl_Window::default_icons\(const Fl_RGB_Image *\[\], int\)](#)
[Fl_Window::icon\(const Fl_RGB_Image *\)](#)

```
Fl_Window::icons(const Fl_RGB_Image *[], int)
Fl_Window::icons(HICON, HICON)
```

13.158.3.20 default_size_range()

```
void Fl_Window::default_size_range ( ) [protected]
```

Protected method to calculate the default size range of a window.

This method is called internally prior to showing a window to ensure that the window's size range values are calculated if a [resizable\(\)](#) widget has been set but [size_range\(\)](#) has not been called explicitly.

This method does nothing if [size_range\(\)](#) has been called before.

Otherwise FLTK tries to figure out the window's size range from the setting of the window's [resizable\(\)](#) widget as follows and roughly in the given order.

1. If [resizable\(\)](#) is NULL (this is the default) then the window cannot be resized and the resize border and max-size control will not be displayed for the window.
2. If either dimension of [resizable\(\)](#) is zero, then the window cannot resize in that direction.
3. The [resizable\(\)](#) widget is clipped to the window area.
4. The non-resizable portion of the window is calculated as the difference of the window's size and the clipped [resizable\(\)](#) widget's size.
5. If either dimension of the clipped [resizable\(\)](#) widget is greater than 100, then 100 is considered its minimum width/height. This allows the resizable widget to shrink below its original size.
6. Finally the minimum width/height of the window is set to the non-resizable portion plus the width/height of the [resizable\(\)](#) widget as calculated above.

In simple words:

- It is assumed that the [resizable\(\)](#) widget can be indefinitely enlarged and/or shrunk to a minimum width/height of 100 unless it is smaller than that, which is then considered the minimum.
- The window's [size_range\(\)](#) minimum values are set to the sum of the non-resizable portion of the window and the previously calculated minimum size of the [resizable\(\)](#) widget.

Examples:

```
Fl_Window win(400, 400);
win.resizable(win);
// win.size_range(100, 100, 0, 0);
```

The minimum size of the resizable is 100, hence the minimum size of the total window is also 100 in both directions.

```
Fl_Window win(400, 400);
Fl_Box box(20, 20, 360, 360);
win.resizable(box);
// win.size_range(140, 140, 0, 0);
```

The calculated minimum width and height would be 20 + 100 + 20 in both dimensions.

```
Fl_Window win(400, 400);
Fl_Box box(200, 0, 500, 300); // note: width 500 too large: clipped
win.resizable(box);
// win.size_range(300, 200, 0, 0);
```

The width of the resizable is clipped to 200, hence the minimum size of the total window is also 200 (fix) + 100 (min. resizable) in x direction. The minimum value in y direction is 100 (resizable) + 100 (fixed part).

The calculation is based on clipping the resizable widget to the window area to prevent programming errors and the assumption that the resizable widget can be shrunk to 100x100 or its original size, whichever is smaller.

If this is not what you want, please use [Fl_Window::size_range\(\)](#) explicitly so you can set any appropriate range.

Since

1.4.0

13.158.3.21 default_xclass() [1/2]

```
const char * Fl_Window::default_xclass ( ) [static]
```

Returns the default xclass.

See also

[Fl_Window::default_xclass\(const char *\)](#)

13.158.3.22 default_xclass() [2/2]

```
void Fl_Window::default_xclass (
    const char * xc ) [static]
```

Sets the default window xclass.

The default xclass is used for all windows that don't have their own xclass set before [show\(\)](#) is called. You can change the default xclass whenever you want, but this only affects windows that are created (and shown) after this call.

The given string `xc` is copied. You can use a local variable or free the string immediately after this call.

If you don't call this, the default xclass for all windows will be "FLTK". You can reset the default xclass by specifying NULL for `xc`.

If you call [Fl_Window::xclass\(const char *\)](#) for any window, then this also sets the default xclass, unless it has been set before.

Parameters

in	xc	default xclass for all windows subsequently created

See also

[Fl_Window::xclass\(const char *\)](#)

13.158.3.23 draw()

```
void Fl_Window::draw ( ) [override], [protected], [virtual]
```

Draws the widget.

Never call this function directly. FLTK will schedule redrawing whenever needed. If your widget must be redrawn as soon as possible, call [redraw\(\)](#) instead.

Override this function to draw your own widgets.

If you ever need to call another widget's draw method *from within your own [draw\(\)](#) method*, e.g. for an embedded scrollbar, you can do it (because [draw\(\)](#) is virtual) like this:

```
Fl_Widget *s = &scrollbar; // scrollbar is an embedded Fl_Scrollbar
s->draw();                 // calls Fl_Scrollbar::draw()
```

Reimplemented from [Fl_Group](#).

13.158.3.24 flush()

```
void Fl_Window::flush ( ) [virtual]
```

Forces the window to be drawn, this window is also made current and calls [draw\(\)](#).

Reimplemented in [Fl_Double_Window](#), [Fl_Gl_Window](#), [Fl_Overlay_Window](#), and [Fl_Single_Window](#).

13.158.3.25 force_position() [1/2]

```
int Fl_Window::force_position ( ) const [inline], [protected]
```

Returns the internal state of the window's FORCE_POSITION flag.

Return values

1	if flag is set
0	otherwise

See also

[force_position\(int\)](#)

13.158.3.26 force_position() [2/2]

```
void Fl_Window::force_position (
    int force ) [inline], [protected]
```

Sets an internal flag that tells FLTK and the window manager to honor position requests. This is used internally and should not be needed by user code.

Parameters

in	<i>force</i>	1 to set the FORCE_POSITION flag, 0 to clear it

13.158.3.27 free_icons()

```
void Fl_Window::free_icons ( ) [protected]
```

Deletes all icons previously attached to the window.

See also

[Fl_Window::icons\(const Fl_RGB_Image *icons\[\], int count\)](#)

13.158.3.28 free_position()

```
void Fl_Window::free_position ( ) [inline]
```

Undoes the effect of a previous [resize\(\)](#) or [show\(\)](#) so that the next time [show\(\)](#) is called the window manager is free to position the window.

This is the same as the *protected* method `Fl_Window::force_position(0)`.

13.158.3.29 fullscreen()

```
void Fl_Window::fullscreen ( )
```

Makes the window completely fill one or more screens, without any window manager border visible.

You must use [fullscreen_off\(\)](#) to undo this.

Note

On some platforms, this can result in the keyboard being grabbed. The window may also be recreated, meaning [hide\(\)](#) and [show\(\)](#) will be called.

See also

`void Fl\_Window::fullscreen\_screens\(\)`

13.158.3.30 fullscreen_screens()

```
void Fl_Window::fullscreen_screens (
    int top,
    int bottom,
    int left,
    int right )
```

Sets which screens should be used when this window is in fullscreen mode.

The window will be resized to the top of the screen with index `top`, the bottom of the screen with index `bottom`, etc.

If this method is never called, or if any argument is < 0 , then the window will be resized to fill the screen it is currently on.

See also

void [Fl_Window::fullscreen\(\)](#)

13.158.3.31 `get_size_range()`

```
uchar Fl_Window::get_size_range (
    int * minWidth,
    int * minHeight,
    int * maxWidth = NULL,
    int * maxHeight = NULL,
    int * deltaX = NULL,
    int * deltaY = NULL,
    int * aspectRatio = NULL ) const
```

Gets the allowable range to which the user can resize this window.

Parameters

out	<i>minWidth,minHeight,maxWidth,maxHeight,deltaX,deltaY,aspectRatio</i>	are all pointers to integers that will receive the current respective value during the call. Every pointer can be NULL if that value is not needed.

Return values

0	if size range not set
1	if the size range was explicitly set by a call to Fl_Window::size_range() or has been calculated

See also

[Fl_Window::size_range\(int minWidth, int minHeight, int maxWidth, int maxHeight, int deltaX, int deltaY, int aspectRatio\)](#)

Since

1.4.0

13.158.3.32 `handle()`

```
int Fl_Window::handle (
    int event ) [override], [virtual]
```

Handles the specified event.

You normally don't call this method directly, but instead let FLTK do it when the user interacts with the widget.

When implemented in a widget, this function must return 0 if the widget does not use the event or 1 otherwise.

Most of the time, you want to call the inherited [handle\(\)](#) method in your overridden method so that you don't short-circuit events that you don't handle. In this last case you should return the callee retval.

One exception to the rule in the previous paragraph is if you really want to *override* the behavior of the base class. This requires knowledge of the details of the inherited class.

In rare cases you may want to return 1 from your [handle\(\)](#) method although you don't really handle the event. The effect would be to *filter* event processing, for instance if you want to dismiss non-numeric characters (keypresses) in a numeric input widget. You may "ring the bell" or show another visual indication or drop the event silently. In such a case you must not call the [handle\(\)](#) method of the base class and tell FLTK that you *consumed* the event by returning 1 even if you didn't *do* anything with it.

Parameters

in	<i>event</i>	the kind of event received

Return values

0	if the event was not used or understood
1	if the event was used and can be deleted

See also

[Fl_Event](#)Reimplemented from [Fl_Group](#).**13.158.3.33 hide()**

```
void Fl_Window::hide ( ) [override], [virtual]
```

Removes the window from the screen.

If the window is already hidden or has not been shown then this does nothing and is harmless.

Reimplemented from [Fl_Widget](#).**13.158.3.34 hotspot()**

```
void Fl_Window::hotspot (
    int x,
    int y,
    int offscreen = 0 )
```

Positions the window so that the mouse is pointing at the given position, or at the center of the given widget, which may be the window itself.

If the optional offscreen parameter is non-zero, then the window is allowed to extend off the screen (this does not work with some X window managers).

See also

[position\(\)](#)**13.158.3.35 icon() [1/3]**

```
const void * Fl_Window::icon ( ) const
```

Gets the current icon window target dependent data.

Deprecated in 1.3.3**13.158.3.36 icon() [2/3]**

```
void Fl_Window::icon (
    const Fl\_RGB\_Image * icon )
```

Sets or resets a single window icon.

A window icon *can* be changed while the window is shown, but this *may* be platform and/or window manager dependent. To be sure that the window displays the correct window icon you should always set the icon before the window is shown.

If a window icon has not been set for a particular window, then the default window icon (see links below) or the system default icon will be used.

This method makes an internal copy of the `icon` pixel buffer, so once set, the [Fl_RGB_Image](#) instance can be freed by the caller.

Parameters

in	<i>icon</i>	icon for this window, NULL to reset window icon.

See also

[Fl_Window::default_icon\(const Fl_RGB_Image *\)](#)
[Fl_Window::default_icons\(const Fl_RGB_Image *\[\], int\)](#)
[Fl_Window::icons\(const Fl_RGB_Image *\[\], int\)](#)

Note

See [Window icons](#) for the Wayland platform.

13.158.3.37 icon() [3/3]

```
void Fl_Window::icon (
    const void * ic )
```

Platform-specific method to set the window icon usable on Windows and X11 only.

See [Setting the Icon of a Window](#) for its use under X11, and [Setting the Icon of a Window](#) under Windows.

Deprecated in 1.3.3 in favor of platform-independent methods [Fl_Window::icon\(const Fl_RGB_Image *icon\)](#) and [Fl_Window::icons\(const Fl_RGB_Image *icons\[\], int count\)](#).

13.158.3.38 iconize()

```
void Fl_Window::iconize ( )
```

Iconifies the window.

If you call this when [shown\(\)](#) is false it will [show\(\)](#) it as an icon. If the window is already iconified this does nothing. Call [show\(\)](#) to restore the window.

When a window is iconified/restored (either by these calls or by the user) the [handle\(\)](#) method is called with FL_HIDE and FL_SHOW events and [visible\(\)](#) is turned on and off.

There is no way to control what is drawn in the icon except with the string passed to [Fl_Window::xclass\(\)](#). You should not rely on window managers displaying the icons.

13.158.3.39 icons() [1/2]

```
void Fl_Window::icons (
    const Fl_RGB_Image * icons[],
    int count )
```

Sets the window icons.

You may set multiple window icons with different sizes. Dependent on the platform and system settings the best (or the first) icon will be chosen.

The given images in `icons` are copied. You can use a local variable or free the images immediately after this call. If `count` is zero, current icons are removed. If `count` is greater than zero (must not be negative), then `icons[]` must contain at least `count` valid image pointers (not NULL). Otherwise the behavior is undefined.

Parameters

in	<i>icons</i>	icons for this window
in	<i>count</i>	number of images in <i>icons</i> . Set to 0 to remove the current icons

See also

[Fl_Window::default_icon\(const Fl_RGB_Image *\)](#)
[Fl_Window::default_icons\(const Fl_RGB_Image *\[\], int\)](#)
[Fl_Window::icon\(const Fl_RGB_Image *\)](#)

Note

See [Window icons](#) for the Wayland platform.

13.158.3.40 icons() [2/2]

```
void Fl_Window::icons (
    HICON big_icon,
    HICON small_icon )
```

Sets the window icons using HICON handles (Windows platform only).
The given icons are copied. You can free the icons immediately after this call.

Parameters

in	<i>big_icon</i>	large window icon
in	<i>small_icon</i>	small window icon

13.158.3.41 is_a_rescale()

```
bool Fl_Window::is_a_rescale ( ) [static]
```

Returns true when a window is being rescaled.

Since

1.4.0

13.158.3.42 is_resizable()

```
int Fl_Window::is_resizable ( ) [protected]
```

Protected method to determine whether a window is resizable.

If [size_range\(\)](#) has not yet been called this method calculates the default size range values by calling [default_size_range\(\)](#).

This method is for internal use only. The returned value is a bit mask and non-zero if the window is resizable in at least one direction.

Returns

non-zero if the window is resizable

Return values

0	the window is not resizable
1	the window is resizable in horizontal direction (w)
2	the window is resizable in vertical direction (h)
3	the window is resizable in both directions (w and h)

See also

[default_size_range\(\)](#)

Since

1.4.0

13.158.3.43 make_current()

```
void Fl_Window::make_current ( )
```

Sets things up so that the drawing functions in [<FL/fl_draw.H>](#) will go into this window.

This is useful for incremental update of windows, such as in an idle callback, which will make your program behave much better if it draws a slow graphic. **Danger: incremental update is very hard to debug and maintain!**

This method only works for the [Fl_Window](#) and [Fl_Gl_Window](#) derived classes.

13.158.3.44 maximize()

```
void Fl_Window::maximize ( )
```

Maximizes a top-level window to its current screen.

This function is effective only with a [show\(\)](#)'n, resizable, top-level window. Bordered and borderless windows can be used. Fullscreen windows can't be used.

See also

[Fl_Window::un_maximize\(\)](#), [Fl_Window::maximize_active\(\)](#)

Since

1.4.0

13.158.3.45 modal()

```
unsigned int Fl_Window::modal ( ) const [inline]
```

Returns true if this window is modal.

13.158.3.46 os_id()

```
fl_uintptr_t Fl_Window::os_id ( ) const
```

Returns a platform-specific identification of a shown window, or 0 if not shown.

Note

This identification may differ from the platform-specific reference of an [Fl_Window](#) object used by functions [fl_x11_xid\(\)](#), [fl_mac_xid\(\)](#), [fl_x11_find\(\)](#), and [fl_mac_find\(\)](#).

- X11 platform: the window's XID.
- macOS platform: The window number of the window's window device.
- other platforms: 0.

Since

1.4.0

13.158.3.47 resize()

```
void Fl_Window::resize (
    int X,
    int Y,
    int W,
    int H ) [override], [virtual]
```

Changes the size and position of the window.

If [shown\(\)](#) is true, these changes are communicated to the window server (which may refuse that size and cause a further resize). If [shown\(\)](#) is false, the size and position are used when [show\(\)](#) is called. See [Fl_Group](#) for the effect of resizing on the child widgets.

You can also call the [Fl_Widget](#) methods [position\(x, y\)](#) and [size\(w, h\)](#) which are inline wrappers for this virtual function.

A top-level window can not force, but merely suggest a position and size to the operating system. The window manager may not be willing or able to display a window at the desired position or with the given dimensions. It is up to the application developer to verify window parameters after the resize request.

Reimplemented from [Fl_Group](#).

13.158.3.48 screen_num() [1/2]

```
int Fl_Window::screen_num ( ) const
```

The number of the screen containing the mapped window.

This method returns the screen number (0 .. n) of the window if it is shown, otherwise the result value is undefined.

Note

The return value is undefined before the window is shown and if the window has been hidden after it was previously shown.

To position a window on a particular screen, use [Fl_Window::screen_num\(int\)](#) **before** you [show\(\)](#) it.

Returns

screen number of the window if it is shown

See also

[Fl_Window::screen_num\(int\)](#)

Since

1.4.0

13.158.3.49 screen_num() [2/2]

```
void Fl_Window::screen_num (
    int screen_num )
```

Set the number of the screen where to map the window.

Call this and set also the window's desired x/y position before [show\(\)](#)'ing the window. This can be necessary if a system has several screens with distinct scaling factors because the window's [x\(\)](#) and [y\(\)](#) may not suffice to uniquely identify one screen.

Consider a system with two screens where the left screen is A pixels wide and has a scaling factor of 1 whereas the right screen has a scaling factor of 2. For the sake of simplicity, consider only the X coordinate of the window. FLTK coordinates translate directly to pixel coordinates on the left screen, whereas FLTK coordinates multiplied by 2 correspond to pixel coordinates on the right screen. Consequently, FLTK coordinates between $A/2 + 1$ and $A-1$ can map to both screens. Therefore both the window coordinates and the screen number are necessary to uniquely identify where a window is to be mapped.

The valid range of `screen_num` is 0 .. [Fl::screen_count\(\)](#) - 1.

This method does nothing if

- the window is already [shown\(\)](#) or
- the given screen number is out of range.

Parameters

<code>in</code>	<code>screen_num</code>	screen number where the window is to be mapped

See also

[Fl_Window::screen_num\(\)](#)

[Fl::screen_count\(\)](#)

Since

1.4.0

13.158.3.50 set_menu_window()

```
void Fl_Window::set_menu_window ( ) [inline]
```

Marks the window as a menu window.

This is intended for internal use, but it can also be used if you write your own menu handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

13.158.3.51 set_modal()

```
void Fl_Window::set_modal ( ) [inline]
```

A "modal" window, when [shown\(\)](#), will prevent any events from being delivered to other windows in the same program, and will also remain on top of the other windows (if the X window manager supports the "transient for" property).

Several modal windows may be shown at once, in which case only the last one shown gets events. You can see which window (if any) is modal by calling [Fl::modal\(\)](#).

13.158.3.52 set_non_modal()

```
void Fl_Window::set_non_modal ( ) [inline]
```

A "non-modal" window (terminology borrowed from Microsoft Windows) acts like a [modal\(\)](#) one in that it remains on top, but it has no effect on event delivery.

There are *three* states for a window: modal, non-modal, and normal.

13.158.3.53 set_tooltip_window()

```
void Fl_Window::set_tooltip_window ( ) [inline]
```

Marks the window as a tooltip window.

This is intended for internal use, but it can also be used if you write your own tooltip handling. However, this is not recommended.

This flag is used for correct "parenting" of windows in communication with the windowing system. Modern X window managers can use different flags to distinguish menu and tooltip windows from normal windows.

This must be called before the window is shown and cannot be changed later.

Note

Since [Fl_Tooltip_Window](#) is derived from [Fl_Menu_Window](#), this also **clears** the [menu_window\(\)](#) state.

13.158.3.54 shape() [1/3]

```
const Fl_Image * Fl_Window::shape ( ) const
```

Returns the image controlling the window shape or NULL.

Since

1.4.0

13.158.3.55 shape() [2/3]

```
void Fl_Window::shape (
    const Fl_Image & img )
```

Set the window's shape with an [Fl_Image](#).

See also

void [shape\(const Fl_Image* img\)](#)

13.158.3.56 shape() [3/3]

```
void Fl_Window::shape (
    const Fl_Image * img )
```

Assigns a non-rectangular shape to the window.

This function gives an arbitrary shape (not just a rectangular region) to an [Fl_Window](#). An [Fl_Image](#) of any dimension can be used as mask; it is rescaled to the window's dimension as needed.

The layout and widgets inside are unaware of the mask shape, and most will act as though the window's rectangular bounding box is available to them. It is up to you to make sure they adhere to the bounds of their masking shape.

The `img` argument can be an [Fl_Bitmap](#), [Fl_Pixmap](#), [Fl_RGB_Image](#) or [Fl_Shared_Image](#):

- With [Fl_Bitmap](#) or [Fl_Pixmap](#), the shaped window covers the image part where bitmap bits equal one, or where the pixmap is not fully transparent.
- With an [Fl_RGB_Image](#) with an alpha channel (depths 2 or 4), the shaped window covers the image part that is not fully transparent.
- With an [Fl_RGB_Image](#) of depth 1 (gray-scale) or 3 (RGB), the shaped window covers the non-black image part.
- With an [Fl_Shared_Image](#), the shape is determined by rules above applied to the underlying image. The shared image should not have been scaled through [Fl_Image::scale\(\)](#).

Platform details:

- On the unix/linux platform, the SHAPE extension of the X server is required. This function does control the shape of [Fl_Gl_Window](#) instances.
- On the Windows platform, this function does nothing with class [Fl_Gl_Window](#).
- On the Mac platform, OS version 10.4 or above is required. An 8-bit shape-mask is used when `img` is an [Fl_RGB_Image](#): with depths 2 or 4, the image alpha channel becomes the shape mask such that areas with alpha = 0 are out of the shaped window; with depths 1 or 3, white and black are in and out of the shaped window, respectively, and other colors give intermediate masking scores. This function does nothing with class [Fl_Gl_Window](#).

The window borders and caption created by the window system are turned off by default. They can be re-enabled by calling `Fl_Window::border(1)`.

A usage example is found at `example/shapedwindow.cxx`.

Version

1.3.3

13.158.3.57 show() [1/2]

```
void Fl_Window::show ( ) [override], [virtual]
```

Puts the window on the screen.

This has the side effect of opening the display, if not done before.

If the window is already shown then it is restored and raised to the top. This is really convenient because your program can call [show\(\)](#) at any time, even if the window is already up. It also means that [show\(\)](#) serves the purpose of [raise\(\)](#) in other toolkits.

[Fl_Window::show\(int argc, char **argv\)](#) is used for top-level windows and allows standard arguments to be parsed from the command-line.

Note

For some obscure reasons [Fl_Window::show\(\)](#) resets the current group by calling `Fl_Group::current(0)`. The comments in the code say "get rid of very common user bug: forgot end()". Although this is true it may have unwanted side effects if you [show\(\)](#) an unrelated window (maybe for an error message or warning) while building a window or any other group widget.

Todo Check if we can remove resetting the current group in a later FLTK version (after 1.3.x). This may break "already broken" programs though if they rely on this "feature".

See also

[Fl_Window::show\(int argc, char **argv\)](#)

Reimplemented from [Fl_Widget](#).

13.158.3.58 show() [2/2]

```
void Fl_Window::show (
    int argc,
    char ** argv )
```

Puts the window on the screen with [show\(\)](#) and parses command-line arguments.

This call should be used for top-level windows, at least for the first (main) window. It allows standard arguments to be parsed, as done by [Fl::args\(int, char **\)](#), from the command-line. You can use `argc` and `argv` from `main(int argc, char **argv)` for this call.

This call also sets up some system-specific internal variables, that is, it sets `FL_SELECTION_COLOR` and calls [Fl::background\(\)](#), [Fl::background2\(\)](#), [Fl::foreground\(\)](#) with default or X resources-given values, and calls [Fl::scheme\(const char *\)](#) for the current scheme. On X11, it also calls [Fl::dnd_text_ops\(int\)](#), [Fl_Tooltip::enable\(int\)](#), [Fl::visible_focus\(int\)](#) with X resources-given values.

Parameters

<i>argc</i>	command-line argument count, usually from <code>main()</code>
<i>argv</i>	command-line argument vector, usually from <code>main()</code>

See also

virtual void [Fl_Window::show\(\)](#)

[Fl::args\(int, char **\)](#)

13.158.3.59 show_next_window_iconic() [1/2]

```
static char Fl_Window::show_next_window_iconic ( ) [inline], [static]
```

Returns the static flag whether the next window should be opened iconified.

Note

This is an **internal function**, you should not use this in user code.

Please use [Fl_Window::iconize\(\)](#) to iconify a window.

13.158.3.60 show_next_window_iconic() [2/2]

```
static void Fl_Window::show_next_window_iconic (
    char stat ) [inline], [static]
```

Sets a static flag whether the next window should be opened iconified.

Note

This is an **internal function**, you should not use this in user code.

Please use [Fl_Window::iconize\(\)](#) instead.

13.158.3.61 shown()

```
int Fl_Window::shown ( ) const [inline]
```

Returns non-zero if [show\(\)](#) has been called (but not [hide\(\)](#)).

You can tell if a window is iconified with `(w->shown()) && !w->visible()`.

13.158.3.62 size_range()

```
void Fl_Window::size_range (
    int minWidth,
    int minHeight,
    int maxWidth = 0,
    int maxHeight = 0,
    int deltaX = 0,
    int deltaY = 0,
    int aspectRatio = 0 )
```

Sets the allowable range to which the user can resize this window.

We recommend to call [size_range\(\)](#) if you have a [resizable\(\)](#) widget in a main window, and to call it after setting the [resizable\(\)](#) and before [show\(\)](#)'ing the window for best cross platform compatibility.

If this function is **not** called, FLTK tries to figure out the range when the window is shown. Please see the protected method [default_size_range\(\)](#) for details.

It is undefined what happens if the current window size does not fit in the constraints passed to [size_range\(\)](#).

Note

This only works for top-level windows and the exact behavior can be platform specific. To work correctly across all platforms [size_range\(\)](#) must be called after setting the [resizable\(\)](#) widget of the window and before the window is [show\(\)](#)'n.

Calling [size_range\(\)](#) after the window has been shown may work on some but not all platforms. If you need to change the [size_range\(\)](#) after the window has been shown, then you should consider to [hide\(\)](#) and [show\(\)](#) the window again, i.e. call [hide\(\)](#), [size_range\(\)](#), and [show\(\)](#) in this order.

Typical usage: call

```
size\_range(minWidth, minHeight);
```

after setting the resizable widget and before calling [show\(\)](#). This ensures that the window cannot be resized smaller than the given values by user interaction.

`maxWidth` and `maxHeight` might be useful in some special cases but less frequently used.

The other optional parameters `deltaX`, `deltaY`, and `aspectRatio` are not recommended because they may not work on all platforms and may even under X11 not be supported by all Window Managers.

Parameters

in	<i>minWidth,minHeight</i>	The smallest the window can be. Either value must be greater than 0.
in	<i>maxWidth,maxHeight</i>	The largest the window can be. If either is equal to the minimum then you cannot resize in that direction. If either is zero then FLTK picks a maximum size in that direction such that the window will fill the screen.
in	<i>deltaX,deltaY</i>	These are size increments. The window will be constrained to widths of <code>minWidth + N * deltaX</code> , where N is any non-negative integer. If these are less or equal to 1 they are ignored (this is always ignored on Windows).
in	<i>aspectRatio</i>	A flag that indicates that the window should preserve its aspect ratio. This only works if both the maximum and minimum have the same aspect ratio (ignored on Windows and by many X window managers).

13.158.3.63 un_maximize()

```
void Fl_Window::un_maximize ( )
```

Returns a previously maximized top-level window to its previous size.

See also

[Fl_Window::maximize\(\)](#)

Since

1.4.0

13.158.3.64 wait_for_expose()

```
void Fl_Window::wait_for_expose ( )
```

Waits for the window to be displayed after calling [show\(\)](#).

[Fl_Window::show\(\)](#) is not guaranteed to show and draw the window on all platforms immediately. Instead this is done in the background; particularly on X11 it will take a few messages (client server roundtrips) to display the window. Usually this small delay doesn't matter, but in some cases you may want to have the window instantiated and displayed synchronously.

Currently (as of FLTK 1.3.4) this method has an effect on X11 and Mac OS. On Windows, [show\(\)](#) is always synchronous. The effect of [show\(\)](#) varies with versions of Mac OS X: early versions have the window appear on the screen when [show\(\)](#) returns, later versions don't. If you want to write portable code and need this synchronous [show\(\)](#) feature, add `win->wait_for_expose()` on all platforms, and FLTK will just do the right thing.

This method can be used for displaying splash screens before calling [Fl::run\(\)](#) or for having exact control over which window has the focus after calling [show\(\)](#).

If the window is not [shown\(\)](#), this method does nothing.

Note

Depending on the platform and window manager [wait_for_expose\(\)](#) may not guarantee that the window is fully drawn when it is called. Under X11 it may only make sure that the window is **mapped**, i.e. the internal (OS dependent) window object was created (and maybe shown on the desktop as an empty frame or something like that). You may need to call [Fl::flush\(\)](#) after [wait_for_expose\(\)](#) to make sure the window and all its widgets are drawn and thus visible.

FLTK does the best it can do to make sure that all widgets get drawn if you call [wait_for_expose\(\)](#) and [Fl::flush\(\)](#). However, dependent on the window manager it can not be guaranteed that this does always happen synchronously. The only guaranteed behavior that all widgets are eventually drawn is if the FLTK event loop is run continuously, for instance with [Fl::run\(\)](#).

See also

virtual void [Fl_Window::show\(\)](#)

Example code for displaying a window before calling [Fl::run\(\)](#)

```
Fl_Double_Window win = new Fl_Double_Window(...);

// do more window initialization here ...

win->show();           // show window
win->wait_for_expose(); // wait, until displayed
Fl::flush();           // make sure everything gets drawn

// do more initialization work that needs some time here ...

Fl::run();             // start FLTK event loop
```

Note that the window will not be responsive until the event loop is started with [Fl::run\(\)](#).

13.158.3.65 xclass() [1/2]

```
const char * Fl_Window::xclass ( ) const
```

Returns the xclass for this window, or a default.

See also

[Fl_Window::default_xclass\(const char *\)](#)

[Fl_Window::xclass\(const char *\)](#)

13.158.3.66 xclass() [2/2]

```
void Fl_Window::xclass (
    const char * xc )
```

Sets the xclass for this window.

A string used to tell the system what type of window this is. Mostly this identifies the picture to draw in the icon. This only works if called *before* calling [show\(\)](#).

Under X, this is turned into a XA_WM_CLASS pair by truncating at the first non-alphanumeric character and capitalizing the first character, and the second one if the first is 'x'. Thus "foo" turns into "foo, Foo", and "xprog.1" turns into "xprog, XProg".

Under Microsoft Windows, this string is used as the name of the WNDCLASS structure, though it is not clear if this can have any visible effect.

Since

FLTK 1.3 the passed string is copied. You can use a local variable or free the string immediately after this call. Note that FLTK 1.1 stores the *pointer* without copying the string.

If the default xclass has not yet been set, this also sets the default xclass for all windows created subsequently.

See also

[Fl_Window::default_xclass\(const char *\)](#)

13.158.4 Member Data Documentation

13.158.4.1 current_

```
Fl_Window * Fl_Window::current_ [static], [protected]
```

Stores the last window that was made current.

See [current\(\)](#) `const`

The documentation for this class was generated from the following files:

- [Fl_Window.H](#)
- [Fl_arg.cxx](#)

- [Fl_Window_iconize.cxx](#)

13.159 Fl_Wizard Class Reference

This widget is based off the [Fl_Tabs](#) widget, but instead of displaying tabs it only changes "tabs" under program control.

```
#include <Fl_Wizard.H>
```

Inheritance diagram for Fl_Wizard:

Public Member Functions

- [Fl_Wizard](#) (int, int, int, int, const char *=0)
The constructor creates the [Fl_Wizard](#) widget at the specified position and size.
- void [next](#) ()
This method shows the next child of the wizard.
- void [prev](#) ()
Shows the previous child.
- [Fl_Widget](#) * [value](#) ()

Gets the current visible child widget.

- void **value** ([FL_Widget](#) *)

Sets the child widget that is visible.

Public Member Functions inherited from [FL_Group](#)

- [FL_Widget](#) *& **_ddfdesign_kludge** ()

This is for forms compatibility only.

- void **add** ([FL_Widget](#) &)

The widget is removed from its current group (if any) and then added to the end of this group.

- void **add** ([FL_Widget](#) *o)

See void [FL_Group::add\(FL_Widget &w\)](#)

- void **add_resizable** ([FL_Widget](#) &o)

Adds a widget to the group and makes it the resizable widget.

- [FL_Widget](#) *const * **array** () const

Returns a pointer to the internal array of children.

- [FL_Group](#) const * **as_group** () const override

- [FL_Group](#) * **as_group** () override

Returns an [FL_Group](#) pointer if this widget is an [FL_Group](#).

- void **begin** ()

Sets the current group so you can build the widget tree by just constructing the widgets.

- [FL_Widget](#) * **child** (int n) const

Returns the n'th child.

- int **children** () const

Returns how many child widgets the group has.

- void **clear** ()

Deletes all child widgets from memory recursively.

- unsigned int **clip_children** ()

Returns the current clipping mode.

- void **clip_children** (int c)

Controls whether the group widget clips the drawing of child widgets to its bounding box.

- virtual int **delete_child** (int n)

*Removes the widget at *index* from the group and deletes it.*

- void **end** ()

*Exactly the same as *current(this->parent())*.*

- int **find** (const [FL_Widget](#) &o) const

*See int [FL_Group::find\(const FL_Widget *w\)](#) const.*

- int **find** (const [FL_Widget](#) *) const

Searches the children for the widget and returns the index.

- [FL_Group](#) (int, int, int, int, const char * = 0)

Creates a new [FL_Group](#) widget using the given position, size, and label string.

- void **forms_end** ()

This is for forms compatibility only.

- int **handle** (int) override

Handles the specified event.

- void **init_sizes** ()

Resets the internal array of widget sizes and positions.

- void **insert** ([FL_Widget](#) &, int i)

The widget is removed from its current group (if any) and then inserted into this group.

- void **insert** ([FL_Widget](#) &o, [FL_Widget](#) *before)

*This does *insert(w, find(before))*.*

- void **remove** (FL_Widget &)

Removes a widget from the group but does not delete it.
- void **remove** (FL_Widget *o)

Removes the widget o from the group.
- void **remove** (int index)

Removes the widget at index from the group but does not delete it.
- FL_Widget * **resizable** () const

Returns the group's resizable widget.
- void **resizable** (FL_Widget &o)

Sets the group's resizable widget.
- void **resizable** (FL_Widget *o)

The resizable widget defines both the resizing box and the resizing behavior of the group and its children.
- void **resize** (int, int, int, int) override

Resizes the FL_Group widget and all of its children.
- virtual ~FL_Group ()

The destructor also deletes all the children.

Public Member Functions inherited from FL_Widget

- void **_clear_fullscreen** ()
- void **_set_fullscreen** ()
- void **activate** ()

Activates the widget.
- unsigned int **active** () const

Returns whether the widget is active.
- int **active_r** () const

Returns whether the widget and all of its parents are active.
- FL_Align **align** () const

Gets the label alignment.
- void **align** (FL_Align alignment)

Sets the label alignment.
- long **argument** () const

Gets the current user data (long) argument that is passed to the callback function.
- void **argument** (long v)

Sets the current user data (long) argument that is passed to the callback function.
- virtual class FL_GL_Window * **as_gl_window** ()

Returns an FL_GL_Window pointer if this widget is an FL_GL_Window.
- virtual class FL_GL_Window const * **as_gl_window** () const
- virtual FL_Window * **as_window** ()

Returns an FL_Window pointer if this widget is an FL_Window.
- virtual FL_Window const * **as_window** () const
- void **bind_deimage** (FL_Image *img)

Sets the image to use as part of the widget label when in the inactive state.
- void **bind_deimage** (int f)

Bind the inactive image to the widget, so the widget will delete the image when it is no longer needed.
- void **bind_image** (FL_Image *img)

Sets the image to use as part of the widget label when in the active state.
- void **bind_image** (int f)

Bind the image to the widget, so the widget will delete the image when it is no longer needed.
- FL_Boxtype **box** () const

Gets the box type of the widget.

- void [box](#) ([FI_Boxtype](#) new_box)
Sets the box type for the widget.
- [FI_Callback_p](#) [callback](#) () const
Gets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback](#) *cb, [FI_Callback_User_Data](#) *p, bool auto_free)
Sets the current callback function and managed user data for the widget.
- void [callback](#) ([FI_Callback](#) *cb, void *p)
Sets the current callback function and data for the widget.
- void [callback](#) ([FI_Callback0](#) *cb)
Sets the current callback function for the widget.
- void [callback](#) ([FI_Callback1](#) *cb, long p=0)
Sets the current callback function for the widget.
- unsigned int [changed](#) () const
Checks if the widget value changed since the last callback.
- void [clear_active](#) ()
Marks the widget as inactive without sending events or changing focus.
- void [clear_changed](#) ()
Marks the value of the widget as unchanged.
- void [clear_damage](#) ([uchar](#) c=0)
Clears or sets the damage flags.
- void [clear_output](#) ()
Sets a widget to accept input.
- void [clear_visible](#) ()
Hides the widget.
- void [clear_visible_focus](#) ()
Disables keyboard focus navigation with this widget.
- [FI_Color](#) [color](#) () const
Gets the background color of the widget.
- void [color](#) ([FI_Color](#) bg)
Sets the background color of the widget.
- void [color](#) ([FI_Color](#) bg, [FI_Color](#) sel)
Sets the background and selection color of the widget.
- int [contains](#) (const [FI_Widget](#) *w) const
Checks if w is a child of this widget.
- void [copy_label](#) (const char *new_label)
Sets the current label.
- void [copy_tooltip](#) (const char *text)
Sets the current tooltip text.
- [uchar](#) [damage](#) () const
Returns non-zero if [draw\(\)](#) needs to be called.
- void [damage](#) ([uchar](#) c)
Sets the damage bits for the widget.
- void [damage](#) ([uchar](#) c, int x, int y, int w, int h)
Sets the damage bits for an area inside the widget.
- int [damage_resize](#) (int, int, int, int)
Internal use only.
- void [deactivate](#) ()
Deactivates the widget.
- [FI_Image](#) * [deimage](#) ()

- Gets the image that is used as part of the widget label when in the inactive state.*
- const [FL_Image](#) * [deimage](#) () const
- Gets the image that is used as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL_Image](#) &img)
- Sets the image to use as part of the widget label when in the inactive state.*
- void [deimage](#) ([FL_Image](#) *img)
- Sets the image to use as part of the widget label when in the inactive state.*
- int [deimage_bound](#) () const
- Returns whether the inactive image is managed by the widget.*
- void [do_callback](#) ([FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with default arguments.*
- void [do_callback](#) ([FL_Widget](#) *widget, long arg, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [do_callback](#) ([FL_Widget](#) *widget, void *arg=0, [FL_Callback_Reason](#) reason=[FL_REASON_UNKNOWN](#))
- Calls the widget callback function with arbitrary arguments.*
- void [draw_label](#) (int, int, int, int, [FL_Align](#)) const
- Draws the label in an arbitrary bounding box with an arbitrary alignment.*
- int [h](#) () const
- Gets the widget height.*
- virtual void [hide](#) ()
- Makes a widget invisible.*
- int [horizontal_label_margin](#) ()
- Get the spacing between the label and the horizontal edge of the widget.*
- void [horizontal_label_margin](#) (int px)
- Set the spacing between the label and the horizontal edge of the widget.*
- [FL_Image](#) * [image](#) ()
- Gets the image that is used as part of the widget label when in the active state.*
- const [FL_Image](#) * [image](#) () const
- Gets the image that is used as part of the widget label when in the active state.*
- void [image](#) ([FL_Image](#) &img)
- Sets the image to use as part of the widget label when in the active state.*
- void [image](#) ([FL_Image](#) *img)
- Sets the image to use as part of the widget label when in the active state.*
- int [image_bound](#) () const
- Returns whether the image is managed by the widget.*
- int [inside](#) (const [FL_Widget](#) *wgt) const
- Checks if this widget is a child of wgt.*
- int [is_label_copied](#) () const
- Returns whether the current label was assigned with [copy_label\(\)](#).*
- const char * [label](#) () const
- Gets the current label text.*
- void [label](#) (const char *text)
- Sets the current label pointer.*
- void [label](#) ([FL_Labeltype](#) a, const char *b)
- Shortcut to set the label text and type in one call.*
- int [label_image_spacing](#) ()
- Return the gap size between the label and the image.*
- void [label_image_spacing](#) (int gap)
- Set the gap between the label and the image in pixels.*
- [FL_Color](#) [labelcolor](#) () const
- Gets the label color.*

- void [labelcolor](#) ([Fl_Color](#) c)
Sets the label color.
- [Fl_Font](#) [labelfont](#) () const
Gets the font to use.
- void [labelfont](#) ([Fl_Font](#) f)
Sets the font to use.
- [Fl_Fontsize](#) [labelsize](#) () const
Gets the font size in pixels.
- void [labelsize](#) ([Fl_Fontsize](#) pix)
Sets the font size in pixels.
- [Fl_Labeltype](#) [labeltype](#) () const
Gets the label type.
- void [labeltype](#) ([Fl_Labeltype](#) a)
Sets the label type.
- void [measure_label](#) (int &ww, int &hh) const
Sets width ww and height hh accordingly with the label size.
- bool [needs_keyboard](#) () const
Returns whether this widget needs a keyboard.
- void [needs_keyboard](#) (bool needs)
Sets whether this widget needs a keyboard.
- unsigned int [output](#) () const
Returns if a widget is used for output only.
- [Fl_Group](#) * [parent](#) () const
Returns a pointer to the parent widget.
- void [parent](#) ([Fl_Group](#) *p)
Internal use only - "for hacks only".
- void [position](#) (int X, int Y)
Repositions the window or widget.
- void [redraw](#) ()
Schedules the drawing of the widget.
- void [redraw_label](#) ()
Schedules the drawing of the label.
- [Fl_Color](#) [selection_color](#) () const
Gets the selection color.
- void [selection_color](#) ([Fl_Color](#) a)
Sets the selection color.
- void [set_active](#) ()
Marks the widget as active without sending events or changing focus.
- void [set_changed](#) ()
Marks the value of the widget as changed.
- void [set_output](#) ()
Sets a widget to output only.
- void [set_visible](#) ()
Makes the widget visible.
- void [set_visible_focus](#) ()
Enables keyboard focus navigation with this widget.
- int [shortcut_label](#) () const
Returns whether the widget's label uses '&' to indicate shortcuts.
- void [shortcut_label](#) (int value)
Sets whether the widget's label uses '&' to indicate shortcuts.
- virtual void [show](#) ()

- Makes a widget visible.*

 - void [size](#) (int W, int H)

Changes the size of the widget.
- int [take_focus](#) ()

Gives the widget the keyboard focus.
- unsigned int [takeevents](#) () const

Returns if the widget is able to take events.
- int [test_shortcut](#) ()

Returns true if the widget's label contains the entered '&x' shortcut.
- const char * [tooltip](#) () const

Gets the current tooltip text.
- void [tooltip](#) (const char *text)

Sets the Tooltip Text for a Widget.
- [Fl_Window](#) * [top_window](#) () const

Returns a pointer to the top-level window for the widget.
- [Fl_Window](#) * [top_window_offset](#) (int &xoff, int &yoff) const

Finds the x/y offset of the current widget relative to the top-level window.
- [uchar](#) [type](#) () const

Gets the widget type.
- void [type](#) ([uchar](#) t)

Sets the widget type.
- int [use_accents_menu](#) ()

Returns non zero if MAC_USE_ACCENTS_MENU flag is set, 0 otherwise.
- void * [user_data](#) () const

Gets the user data for this widget.
- void [user_data](#) ([Fl_Callback_User_Data](#) *v, bool auto_free)

Sets the user data for this widget.
- void [user_data](#) (void *v)

Sets the user data for this widget.
- int [vertical_label_margin](#) ()

Get the spacing between the label and the vertical edge of the widget.
- void [vertical_label_margin](#) (int px)

Set the spacing between the label and the vertical edge of the widget.
- unsigned int [visible](#) () const

Returns whether a widget is visible.
- unsigned int [visible_focus](#) () const

Checks whether this widget has a visible focus.
- void [visible_focus](#) (int v)

Modifies keyboard focus navigation.
- int [visible_r](#) () const

Returns whether a widget and all its parents are visible.
- int [w](#) () const

Gets the widget width.
- [Fl_When](#) [when](#) () const

Returns the conditions under which the callback is called.
- void [when](#) ([uchar](#) i)

Sets the flags used to decide when a callback is called.
- [Fl_Window](#) * [window](#) () const

Returns a pointer to the nearest parent window up the widget hierarchy.
- int [x](#) () const

Gets the widget position in its window.

- int **y** () const
Gets the widget position in its window.
- virtual **~FI_Widget** ()
Destroys the widget.

Protected Member Functions

- void **draw** () override
Draws the wizard border and visible child.

Protected Member Functions inherited from **FI_Group**

- **FI_Rect** * **bounds** ()
Returns the internal array of widget sizes and positions.
- void **draw_child** (**FI_Widget** &widget) const
Forces a child to redraw.
- void **draw_children** ()
Draws all children of the group.
- void **draw_outside_label** (const **FI_Widget** &widget) const
Parents normally call this to draw outside labels of child widgets.
- virtual int **on_insert** (**FI_Widget** *, int)
Allow derived groups to act when a widget is added as a child.
- virtual int **on_move** (int, int)
Allow derived groups to act when a widget is moved within the group.
- virtual void **on_remove** (int)
Allow derived groups to act when a child widget is removed from the group.
- int * **sizes** ()
Returns the internal array of widget sizes and positions.
- void **update_child** (**FI_Widget** &widget) const
Draws a child only if it needs it.

Protected Member Functions inherited from **FI_Widget**

- void **clear_flag** (unsigned int c)
Clears a flag in the flags mask.
- void **draw_backdrop** () const
If FL_ALIGN_IMAGE_BACKDROP is set, the image or deimage will be drawn.
- void **draw_box** () const
Draws the widget box according to its box style.
- void **draw_box** (**FI_Boxtype** t, **FI_Color** c) const
Draws a box of type t, of color c at the widget's position and size.
- void **draw_box** (**FI_Boxtype** t, int x, int y, int w, int h, **FI_Color** c) const
Draws a box of type t, of color c at the position X,Y and size W,H.
- void **draw_focus** () const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FI_Boxtype** t, int X, int Y, int W, int H) const
Draws a focus rectangle around the widget.
- void **draw_focus** (**FI_Boxtype** t, int x, int y, int w, int h, **FI_Color** bg) const
Draws a focus box for the widget at the given position and size.
- void **draw_label** () const
Draws the widget's label at the defined label position.
- void **draw_label** (int, int, int, int) const

- Draws the label in an arbitrary bounding box.*
- `FI_Widget` (int `x`, int `y`, int `w`, int `h`, const char *`label`=0L)
 - Creates a widget at the given position and size.*
- unsigned int `flags` () const
 - Gets the widget flags mask.*
- void `h` (int `v`)
 - Internal use only.*
- void `set_flag` (unsigned int `c`)
 - Sets a flag in the flags mask.*
- void `w` (int `v`)
 - Internal use only.*
- void `x` (int `v`)
 - Internal use only.*
- void `y` (int `v`)
 - Internal use only.*

Additional Inherited Members

Static Public Member Functions inherited from `FI_Group`

- static `FI_Group` * `current` ()
 - Returns the currently active group.*
- static void `current` (`FI_Group` *`g`)
 - Sets the current group.*

Static Public Member Functions inherited from `FI_Widget`

- static void `default_callback` (`FI_Widget` *`widget`, void *`data`)
 - The default callback for all widgets that don't set a callback.*
- static unsigned int `label_shortcut` (const char *`t`)
 - Returns the Unicode value of the '&x' shortcut in a given text.*
- static int `test_shortcut` (const char *`t`, const bool `require_alt`=false)
 - Returns true if the given text `t` contains the entered '&x' shortcut.*

Protected Types inherited from `FI_Widget`

- enum {
 - `INACTIVE` = 1<<0 , `INVISIBLE` = 1<<1 , `OUTPUT` = 1<<2 , `NOBORDER` = 1<<3 ,

 - `USERFLAG1` = 1<<31 }
 - flags possible values enumeration.*

13.159.1 Detailed Description

This widget is based off the [Fl_Tabs](#) widget, but instead of displaying tabs it only changes "tabs" under program control.

Its primary purpose is to support "wizards" that step a user through configuration or troubleshooting tasks.

As with [Fl_Tabs](#), wizard panes are composed of child (usually [Fl_Group](#)) widgets. Navigation buttons must be added separately.

13.159.2 Constructor & Destructor Documentation

13.159.2.1 Fl_Wizard()

```
Fl_Wizard::Fl_Wizard (
    int xx,
    int yy,
    int ww,
    int hh,
    const char * l = 0 )
```

The constructor creates the [Fl_Wizard](#) widget at the specified position and size.

The inherited destructor destroys the widget and its children.

13.159.3 Member Function Documentation

13.159.3.1 draw()

```
void Fl_Wizard::draw (
    void ) [override], [protected], [virtual]
```

Draws the wizard border and visible child.

Reimplemented from [Fl_Group](#).

13.159.3.2 next()

```
void Fl_Wizard::next ( )
```

This method shows the next child of the wizard.

If the last child is already visible, this function does nothing.

The documentation for this class was generated from the following files:

- [Fl_Wizard.H](#)
- [Fl_Wizard.cxx](#)

13.160 Fl_XBM_Image Class Reference

The [Fl_XBM_Image](#) class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

```
#include <Fl_XBM_Image.H>
```

Inheritance diagram for [Fl_XBM_Image](#):

Public Member Functions

- [Fl_XBM_Image](#) (const char *filename)

The constructor loads the named XBM file from the given name filename.

Public Member Functions inherited from FI_Bitmap

- int **cache_h** ()
- int **cache_w** ()
- FI_Image * **copy** () const
- FI_Image * **copy** (int W, int H) const override
Creates a resized copy of the image.
- void **draw** (int X, int Y)
- void **draw** (int X, int Y, int W, int H, int cx=0, int cy=0) override
Draws the image to the current drawing surface with a bounding box.
- FI_Bitmap (const char *bits, int bits_length, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- FI_Bitmap (const char *bits, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- FI_Bitmap (const uchar *bits, int bits_length, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- FI_Bitmap (const uchar *bits, int W, int H)
The constructors create a new bitmap from the specified bitmap data.
- void **label** (FI_Menu_Item *m) override
This method is an obsolete way to set the image attribute of a menu item.
- void **label** (FI_Widget *w) override
This method is an obsolete way to set the image attribute of a widget or menu item.
- void **uncache** () override
If the image has been cached for display, delete the cache data.
- virtual ~FI_Bitmap ()
The destructor frees all memory and server resources that are used by the bitmap.

Public Member Functions inherited from FI_Image

- virtual class FI_Shared_Image * **as_shared_image** ()
Returns whether an image is an FI_Shared_Image or not.
- virtual void **color_average** (FI_Color c, float i)
The color_average() method averages the colors in the image with the provided FLTK color value.
- FI_Image * **copy** () const
Creates a copy of the image in the same size.
- int **count** () const
Returns the number of data values associated with the image.
- int **d** () const
Returns the image depth.
- const char *const * **data** () const
Returns a pointer to the current image data array.
- int **data_h** () const
Returns the height of the image data.
- int **data_w** () const
Returns the width of the image data.
- virtual void **desaturate** ()
The desaturate() method converts an image to grayscale.
- void **draw** (int X, int Y)
Draws the image to the current drawing surface.
- int **fail** () const
Returns a value that is not 0 if there is currently no image available.
- FI_Image (int W, int H, int D)

- The constructor creates an empty image with the specified width, height, and depth.*

 - int **h** () const

Returns the current image drawing height in FLTK units.
- void **inactive** ()

*The **inactive()** method calls **color_average(FL_BACKGROUND_COLOR, 0.33f)** to produce an image that appears grayed out.*
- int **ld** () const

Returns the current line data size in bytes.
- virtual void **release** ()

*Releases an **FI_Image** - the same as 'delete this'.*
- virtual void **scale** (int width, int height, int proportional=1, int can_expand=0)

Sets the drawing size of the image.
- int **w** () const

Returns the current image drawing width in FLTK units.
- virtual ~**FI_Image** ()

The destructor is a virtual method that frees all memory used by the image.

Additional Inherited Members

Static Public Member Functions inherited from **FI_Image**

- static **FI_Labeltype** **define_FL_IMAGE_LABEL** ()
- static **FI_RGB_Scaling** **RGB_scaling** ()

Returns the currently used RGB image scaling method.
- static void **RGB_scaling** (**FI_RGB_Scaling**)

Sets the RGB image scaling method used for copy(int, int).
- static **FI_RGB_Scaling** **scaling_algorithm** ()

Gets what algorithm is used when resizing a source image to draw it.
- static void **scaling_algorithm** (**FI_RGB_Scaling** algorithm)

Sets what algorithm is used when resizing a source image to draw it.

Public Attributes inherited from **FI_Bitmap**

- int **alloc_array**
- Non-zero if array points to bitmap data allocated internally.*
- const **uchar** * **array**
- pointer to raw bitmap data*

Static Public Attributes inherited from **FI_Image**

- static const int **ERR_FILE_ACCESS** = -2
 - static const int **ERR_FORMAT** = -3
 - static const int **ERR_MEMORY_ACCESS** = -4
 - static const int **ERR_NO_IMAGE** = -1
 - static bool **register_images_done** = false
- True after **fl_register_images()** was called, false before.*

Protected Member Functions inherited from Fl_Image

- void **d** (int D)
Sets the current image depth.
- void **data** (const char *const *p, int c)
Sets the current data pointer and count of pointers in the array.
- void **draw_empty** (int X, int Y)
The protected method `draw_empty()` draws a box with an X in it.
- int **draw_scaled** (int X, int Y, int W, int H)
Draw the image to the current drawing surface rescaled to a given width and height.
- void **h** (int H)
Sets the height of the image data.
- void **ld** (int LD)
Sets the current line data size in bytes.
- void **w** (int W)
Sets the width of the image data.

Static Protected Member Functions inherited from Fl_Image

- static void **labeltype** (const Fl_Label *lo, int lx, int ly, int lw, int lh, Fl_Align la)
- static void **measure** (const Fl_Label *lo, int &lw, int &lh)

13.160.1 Detailed Description

The [Fl_XBM_Image](#) class supports loading, caching, and drawing of X Bitmap (XBM) bitmap files.

13.160.2 Constructor & Destructor Documentation

13.160.2.1 Fl_XBM_Image()

```
Fl_XBM_Image::Fl_XBM_Image (
    const char * name )
```

The constructor loads the named XBM file from the given name filename.

The destructor frees all memory and server resources that are used by the image.

The documentation for this class was generated from the following files:

- Fl_XBM_Image.H
- Fl_XBM_Image.cxx

13.161 Fl_XPM_Image Class Reference

The [Fl_XPM_Image](#) class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

```
#include <Fl_XPM_Image.H>
```

Inheritance diagram for Fl_XPM_Image:

Public Member Functions

- [FI_XPM_Image](#) (const char *filename)
The constructor loads the XPM image from the name filename.

Public Member Functions inherited from [FI_Pixmap](#)

- int **cache_h** ()
- int **cache_w** ()
- void [color_average](#) ([FI_Color](#) c, float i) override
The [color_average\(\)](#) method averages the colors in the image with the provided FLTK color value.
- [FI_Image](#) * **copy** () const
- [FI_Image](#) * **copy** (int W, int H) const override
Creates a resized copy of the image.
- void [desaturate](#) () override
The [desaturate\(\)](#) method converts an image to grayscale.
- void **draw** (int X, int Y)
- void [draw](#) (int X, int Y, int W, int H, int cx=0, int cy=0) override
Draws the image to the current drawing surface with a bounding box.
- [FI_Pixmap](#) (char *const *D)
The constructors create a new pixmap from the specified XPM data.
- [FI_Pixmap](#) (const char *const *D)
The constructors create a new pixmap from the specified XPM data.
- [FI_Pixmap](#) (const [uchar](#) *const *D)
The constructors create a new pixmap from the specified XPM data.
- [FI_Pixmap](#) ([uchar](#) *const *D)
The constructors create a new pixmap from the specified XPM data.
- void [label](#) ([FI_Menu_Item](#) *m) override
This method is an obsolete way to set the image attribute of a menu item.
- void [label](#) ([FI_Widget](#) *w) override
This method is an obsolete way to set the image attribute of a widget or menu item.
- void [uncache](#) () override
If the image has been cached for display, delete the cache data.
- virtual ~[FI_Pixmap](#) ()
The destructor frees all memory and server resources that are used by the pixmap.

Public Member Functions inherited from [FI_Image](#)

- virtual class [FI_Shared_Image](#) * **as_shared_image** ()
Returns whether an image is an [FI_Shared_Image](#) or not.
- [FI_Image](#) * **copy** () const
Creates a copy of the image in the same size.
- int [count](#) () const
Returns the number of data values associated with the image.
- int **d** () const
Returns the image depth.
- const char *const * **data** () const
Returns a pointer to the current image data array.
- int **data_h** () const
Returns the height of the image data.
- int **data_w** () const
Returns the width of the image data.

- void **draw** (int X, int Y)
Draws the image to the current drawing surface.
- int **fail** () const
Returns a value that is not 0 if there is currently no image available.
- **FL_Image** (int W, int H, int D)
The constructor creates an empty image with the specified width, height, and depth.
- int **h** () const
Returns the current image drawing height in FLTK units.
- void **inactive** ()
*The **inactive()** method calls **color_average(FL_BACKGROUND_COLOR, 0.33f)** to produce an image that appears grayed out.*
- int **ld** () const
Returns the current line data size in bytes.
- virtual void **release** ()
*Releases an **FL_Image** - the same as 'delete this'.*
- virtual void **scale** (int width, int height, int proportional=1, int can_expand=0)
Sets the drawing size of the image.
- int **w** () const
Returns the current image drawing width in FLTK units.
- virtual ~**FL_Image** ()
The destructor is a virtual method that frees all memory used by the image.

Additional Inherited Members

Static Public Member Functions inherited from **FL_Image**

- static **FL_Labeltype** **define_FL_IMAGE_LABEL** ()
- static **FL_RGB_Scaling** **RGB_scaling** ()
Returns the currently used RGB image scaling method.
- static void **RGB_scaling** (**FL_RGB_Scaling**)
Sets the RGB image scaling method used for copy(int, int).
- static **FL_RGB_Scaling** **scaling_algorithm** ()
Gets what algorithm is used when resizing a source image to draw it.
- static void **scaling_algorithm** (**FL_RGB_Scaling** algorithm)
Sets what algorithm is used when resizing a source image to draw it.

Public Attributes inherited from **FL_Pixmap**

- int **alloc_data**

Static Public Attributes inherited from **FL_Image**

- static const int **ERR_FILE_ACCESS** = -2
- static const int **ERR_FORMAT** = -3
- static const int **ERR_MEMORY_ACCESS** = -4
- static const int **ERR_NO_IMAGE** = -1
- static bool **register_images_done** = false
*True after **fl_register_images()** was called, false before.*

Protected Member Functions inherited from **FL_Pixmap**

- void **measure** ()

Protected Member Functions inherited from [FI_Image](#)

- void **d** (int D)
Sets the current image depth.
- void **data** (const char *const *p, int c)
Sets the current data pointer and count of pointers in the array.
- void **draw_empty** (int X, int Y)
The protected method [draw_empty\(\)](#) draws a box with an X in it.
- int **draw_scaled** (int X, int Y, int W, int H)
Draw the image to the current drawing surface rescaled to a given width and height.
- void **h** (int H)
Sets the height of the image data.
- void **ld** (int LD)
Sets the current line data size in bytes.
- void **w** (int W)
Sets the width of the image data.

Static Protected Member Functions inherited from [FI_Image](#)

- static void **labeltype** (const [FI_Label](#) *lo, int lx, int ly, int lw, int lh, [FI_Align](#) la)
- static void **measure** (const [FI_Label](#) *lo, int &lw, int &lh)

13.161.1 Detailed Description

The [FI_XPM_Image](#) class supports loading, caching, and drawing of X Pixmap (XPM) images, including transparency.

13.161.2 Constructor & Destructor Documentation

13.161.2.1 [FI_XPM_Image\(\)](#)

```
FI_XPM_Image::FI_XPM_Image (
    const char * name )
```

The constructor loads the XPM image from the name filename.

The destructor frees all memory and server resources that are used by the image.

The documentation for this class was generated from the following files:

- [FI_XPM_Image.H](#)
- [FI_XPM_Image.cxx](#)

13.162 [FI_GIF_Image::GIF_FRAME](#) Struct Reference

Classes

- struct [CPAL](#)

Public Member Functions

- void **colors** (int nclrs, int bg, int tp)
- void **disposal** (int mode, int time)
- **GIF_FRAME** (int frame, int W, int H, int fx, int fy, int fw, int fh, [uchar](#) *data)
- **GIF_FRAME** (int frame, [uchar](#) *data)

Public Attributes

13.163 FI_ICO_Image::IconDirEntry Struct Reference

Windows ICONDIRENTRY structure

```
#include <FI_ICO_Image.H>
```

Public Attributes

- int **bColorCount**
Number of colors (0 if 8bpp)
- int **bHeight**
Image height.
- int **bReserved**
Reserved.
- int **bWidth**
Image width.
- int **dwBytesInRes**
Resource size in bytes.
- int **dwImageOffset**
Offset to the image.
- int **wBitCount**
Bits per pixel.
- int **wPlanes**
Color Planes.

13.163.1 Detailed Description

Windows ICONDIRENTRY structure

The documentation for this struct was generated from the following file:

- FI_ICO_Image.H

13.164 `Fl_Text_Editor::Key_Binding` Struct Reference

Simple linked list item associating a key/state to a function.

```
#include <Fl_Text_Editor.H>
```

Public Attributes

- [Key_Func](#) function
associated function
- int **key**
the key pressed
- [Key_Binding](#) * **next**
next key binding in the list
- int **state**
the state of key modifiers

13.164.1 Detailed Description

Simple linked list item associating a key/state to a function.

The documentation for this struct was generated from the following file:

- [Fl_Text_Editor.H](#)

13.165 `Fl_Terminal::Margin` Class Reference

Public Member Functions

- void **bottom** (int val)
- int **bottom** (void) const
- void **left** (int val)
- int **left** (void) const
- void **right** (int val)
- int **right** (void) const
- void **top** (int val)
- int **top** (void) const

The documentation for this class was generated from the following file:

- [Fl_Terminal.H](#)

13.166 `Fl_Preferences::Name` Class Reference

'[Name](#)' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

```
#include <Fl_Preferences.H>
```

Public Member Functions

- [Name](#) (const char *format,...)
Creates a group name or entry name on the fly.
- [Name](#) (unsigned int n)
Creates a group name or entry name on the fly.
- **operator const char *** ()
Return the [Name](#) as a "C" string.

13.166.1 Detailed Description

'Name' provides a simple method to create numerical or more complex procedural names for entries and groups on the fly.

Example: `prefs.set(Fl_Preferences::Name("File%d",i),file[i]);`

See `test/preferences.cxx` as a sample for writing arrays into preferences.

'Name' is actually implemented as a class inside [Fl_Preferences](#). It casts into `const char*` and gets automatically destroyed after the enclosing call ends.

13.166.2 Constructor & Destructor Documentation

13.166.2.1 Name() [1/2]

```
Fl_Preferences::Name::Name (
    unsigned int n )
```

Creates a group name or entry name on the fly.

This version creates a simple unsigned integer as an entry name.

```
int n, i;
Fl_Preferences prev( appPrefs, "PreviousFiles" );
prev.get( "n", 0 );
for ( i=0; i<n; i++ )
    prev.get( Fl_Preferences::Name(i), prevFile[i], "" );
```

13.166.2.2 Name() [2/2]

```
Fl_Preferences::Name::Name (
    const char * format,
    ... )
```

Creates a group name or entry name on the fly.

This version creates entry names as in 'printf'.

```
int n, i;
Fl_Preferences prefs( USER, "matthiasm.com", "test" );
prev.get( "nFiles", 0 );
for ( i=0; i<n; i++ )
    prev.get( Fl_Preferences::Name( "File%d", i ), prevFile[i], "" );
```

The documentation for this class was generated from the following files:

- `Fl_Preferences.H`
- `Fl_Preferences.cxx`

13.167 Fl_Preferences::Node Class Reference

Public Member Functions

- void **add** (const char *line)
- [Node](#) * **addChild** (const char *path)
- const char * **child** (int ix)
- [Node](#) * **childNodes** (int ix)
- void **clearDirtyFlags** ()

The documentation for this class was generated from the following files:

- [Fl_Preferences.H](#)
- [Fl_Preferences.cxx](#)

13.168 [Fl_Paged_Device::page_format](#) Struct Reference

width, height and name of a page format

```
#include <Fl_Paged_Device.H>
```

Public Attributes

- int **height**
height in points
- const char * **name**
format name
- int **width**
width in points

13.168.1 Detailed Description

width, height and name of a page format

The documentation for this struct was generated from the following file:

- [Fl_Paged_Device.H](#)

13.169 [Fl_Terminal::PartialUtf8Buf](#) Class Reference

Public Member Functions

- int **write** ()

The documentation for this class was generated from the following files:

- FI_Preferences.H
- FI_Preferences.cxx

13.172 FI_Scroll::ScrollInfo Struct Reference

Structure to manage scrollbar and widget interior sizes.

```
#include <FI_Scroll.H>
```

Public Attributes

- [FI_Region_LRTB](#) **child**
child bounding box: left/right/top/bottom
- int **hneeded**
horizontal scrollbar visibility
- [FI_Scrollbar_Data](#) **hscroll**
horizontal scrollbar region + values
- [FI_Region_XYWH](#) **innerbox**
widget's inner box, excluding scrollbars
- [FI_Region_XYWH](#) **innerchild**
widget's inner box, including scrollbars
- int **scrollsize**
the effective scrollbar thickness (local or global)
- int **vneeded**
vertical scrollbar visibility
- [FI_Scrollbar_Data](#) **vscroll**
vertical scrollbar region + values

13.172.1 Detailed Description

Structure to manage scrollbar and widget interior sizes.

This is filled out by [recalc_scrollbars\(\)](#) for use in calculations that need to know the visible scroll area size, etc.

Version

1.3.3

The documentation for this struct was generated from the following file:

- FI_Scroll.H

13.173 Fl_Terminal::Selection Class Reference

Public Member Functions

- bool **clear** (void)
- bool **dragged_off** (int row, int col, bool char_right)
- int **ecol** (void) const
- void **end** (void)
- int **erow** (void) const
- bool **extend** (int row, int col, bool char_right)
- bool **get_selection** (int &srow, int &scol, int &erow, int &ecol) const
Return selection start/end.
- bool **is_selection** (void) const
- void **push_clear** ()
- void **push_rowcol** (int row, int col, bool char_right)
- int **scol** (void) const
- void **scroll** (int nrows)
- void **select** (int srow, int scol, int erow, int ecol)
- **Selection** (Fl_Terminal *terminal)
- void **selectionbgcolor** (Fl_Color val)
- Fl_Color **selectionbgcolor** (void) const
- void **selectionfgcolor** (Fl_Color val)
- Fl_Color **selectionfgcolor** (void) const
- int **srow** (void) const
- bool **start** (int row, int col, bool char_right)
- void **start_push** ()
- int **state** (void) const

13.173.1 Member Function Documentation

13.173.1.1 get_selection()

```
bool Fl_Terminal::Selection::get_selection (
    int & srow,
    int & scol,
    int & erow,
    int & ecol ) const
```

Return selection start/end.

Ensures (start < end) to allow walking 'forward' thru selection, left-to-right, top-to-bottom.

Returns:

- true – valid selection values returned
- false – no selection was made, returned values undefined

The documentation for this class was generated from the following files:

- [Fl_Terminal.H](#)
- [Fl_Terminal.cxx](#)

13.174 Fl_Tile::Size_Range Struct Reference

Public Attributes

- int **maxh**
- int **maxw**
- int **minh**
- int **minw**

The documentation for this struct was generated from the following file:

- [Fl_Tile.H](#)

13.175 FI_Text_Display::Style_Table_Entry Struct Reference

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

```
#include <FI_Text_Display.H>
```

Public Attributes

- unsigned **attr**
further attributes for the text style (see ATTR_BGCOLOR, etc.)
- [FI_Color](#) **bgcolor**
text background color if ATTR_BGCOLOR or ATTR_BGCOLOR_EXT is set
- [FI_Color](#) **color**
text color
- [FI_Font](#) **font**
text font
- [FI_Fonsize](#) **size**
text font size

13.175.1 Detailed Description

This structure associates the color, font, and font size of a string to draw with an attribute mask matching attr.

There must be one entry for each style that can be used in an [FI_Text_Display](#) for displaying text. The style table is an array of struct [Style_Table_Entry](#).

The style table is associated with an [FI_Text_Display](#) by using [FI_Text_Display::highlight_data\(\)](#).

See also

[FI_Text_Display::highlight_data\(\)](#)

#include <FL/core/function_types.H>

```

Namespaces

- namespace [Fl](#)
Fl is the FLTK global namespace containing state information and global methods for the current application.

Functions

- void [Fl::add_handler](#) ([Fl_Event_Handler](#) ha)
Install a function to parse unrecognized events.
- void [Fl::add_handler](#) ([Fl_Event_Handler](#) ha, [Fl_Event_Handler](#) before)
Install a function to parse unrecognized events with less priority than another function.
- void [Fl::add_system_handler](#) ([Fl_System_Handler](#) h, void *data)
Install a function to intercept system events.
- [Fl_Widget *](#) [Fl::belowmouse](#) ()
Gets the widget that is below the mouse.
- void [Fl::belowmouse](#) ([Fl_Widget *](#))
Sets the widget that is below the mouse.
- [Fl_Callback_Reason](#) [Fl::callback_reason](#) ()
Give the reason for calling a callback.
- int [Fl::compose](#) (int &del)

- Any text editing widget should call this for each FL_KEYBOARD event.*

 - void [Fl::compose_reset](#) ()

If the user moves the cursor, be sure to call [Fl::compose_reset\(\)](#).
- void [Fl::disable_im](#) ()

Disables the system input methods facilities.
- void [Fl::enable_im](#) ()

Enables the system input methods facilities.
- int [Fl::event](#) ()

Returns the last event that was processed.
- int [Fl::event_alt](#) ()

Returns non-zero if the Alt key is pressed.
- int [Fl::event_button](#) ()

Gets which particular mouse button caused the current event.
- int [Fl::event_button1](#) ()

Returns non-zero if mouse button 1 is currently held down.
- int [Fl::event_button2](#) ()

Returns non-zero if mouse button 2 is currently held down.
- int [Fl::event_button3](#) ()

Returns non-zero if mouse button 3 is currently held down.
- int [Fl::event_button4](#) ()

Returns non-zero if mouse button 4 is currently held down.
- int [Fl::event_button5](#) ()

Returns non-zero if mouse button 5 is currently held down.
- int [Fl::event_buttons](#) ()

Returns the mouse buttons state bits; if non-zero, then at least one button is pressed now.
- int [Fl::event_clicks](#) ()

Returns non zero if we had a double click event.
- void [Fl::event_clicks](#) (int i)

Manually sets the number returned by [Fl::event_clicks\(\)](#).
- void * [Fl::event_clipboard](#) ()

During an FL_PASTE event of non-textual data, returns a pointer to the pasted data.
- const char * [Fl::event_clipboard_type](#) ()

Returns the type of the pasted data during an FL_PASTE event.
- int [Fl::event_command](#) ()

Returns non-zero if the FL_COMMAND key is pressed, either FL_CTRL or on OSX FL_META.
- int [Fl::event_ctrl](#) ()

Returns non-zero if the Control key is pressed.
- [Fl_Event_Dispatch](#) [Fl::event_dispatch](#) ()

Return the current event dispatch function.
- void [Fl::event_dispatch](#) ([Fl_Event_Dispatch](#) d)

Set a new event dispatch function.
- int [Fl::event_dx](#) ()

Returns the current horizontal mouse scrolling associated with the FL_MOUSEWHEEL event.
- int [Fl::event_dy](#) ()

Returns the current vertical mouse scrolling associated with the FL_MOUSEWHEEL event.
- int [Fl::event_inside](#) (const [Fl_Widget](#) *)

Returns whether or not the mouse event is inside a given child widget.
- int [Fl::event_inside](#) (int, int, int, int)

Returns whether or not the mouse event is inside the given rectangle.
- int [Fl::event_is_click](#) ()

- Returns non-zero if the mouse has not moved far enough and not enough time has passed since the last `FL_PUSH` or `FL_KEYBOARD` event for it to be considered a "drag" rather than a "click".
- void `Fl::event_is_click` (int i)
Clears the value returned by `Fl::event_is_click()`.
 - int `Fl::event_key` ()
Gets which key on the keyboard was last pushed.
 - int `Fl::event_key` (int key)
Returns true if the given `key` was held down (or pressed) during the last event.
 - int `Fl::event_length` ()
Returns the length of the text in `Fl::event_text()`.
 - int `Fl::event_original_key` ()
Returns the keycode of the last key event, regardless of the NumLock state.
 - int `Fl::event_shift` ()
Returns non-zero if the Shift key is pressed.
 - int `Fl::event_state` ()
Returns the keyboard and mouse button states of the last event.
 - int `Fl::event_state` (int mask)
Returns non-zero if any of the passed event state bits are turned on.
 - const char * `Fl::event_text` ()
Returns the text associated with the current event, including `FL_PASTE` or `FL_DND_RELEASE` events.
 - int `Fl::event_x` ()
Returns the mouse position of the event relative to the `Fl_Window` it was passed to.
 - int `Fl::event_x_root` ()
Returns the mouse position on the screen of the event.
 - int `Fl::event_y` ()
Returns the mouse position of the event relative to the `Fl_Window` it was passed to.
 - int `Fl::event_y_root` ()
Returns the mouse position on the screen of the event.
 - `Fl_Widget` * `Fl::focus` ()
Gets the current `Fl::focus()` widget.
 - void `Fl::focus` (`Fl_Widget` *)
Sets the widget that will receive `FL_KEYBOARD` events.
 - int `Fl::get_key` (int key)
Returns true if the given `key` is held down now.
 - void `Fl::get_mouse` (int &, int &)
Return where the mouse is on the screen by doing a round-trip query to the server.
 - int `Fl::handle` (int, `Fl_Window` *)
Handle events from the window system.
 - int `Fl::handle_` (int, `Fl_Window` *)
Handle events from the window system.
 - `Fl_Event_Handler` `Fl::last_handler` ()
Returns the last function installed by a call to `Fl::add_handler()`.
 - `Fl_Widget` * `Fl::pushed` ()
Gets the widget that is being pushed.
 - void `Fl::pushed` (`Fl_Widget` *)
Sets the widget that is being pushed.
 - void `Fl::remove_handler` (`Fl_Event_Handler` h)
Removes a previously added event handler.
 - void `Fl::remove_system_handler` (`Fl_System_Handler` h)
Removes a previously added system event handler.
 - int `Fl::test_shortcut` (`Fl_Shortcut`)
Tests the current event, which must be an `FL_KEYBOARD` or `FL_SHORTCUT`, against a shortcut value (described in `Fl_Button`).

Variables

- char const *const **Fl::clipboard_image** = "image"
Denotes image data.
- char const *const **Fl::clipboard_plain_text** = "text/plain"
Denotes plain textual data.

14.2.1 Detailed Description

Global event handling variables and functions.

14.3 events.H

14.4 function_types.H File Reference

FLTK typedefs for service and widget callbacks.

```
#include <FL/fl_config.h>
#include <FL/Fl_Export.H>
#include <FL/platform_types.h>
#include <FL/Enumerations.H>
```

Typedefs

- typedef void(* **FI_Abort_Handler**) (const char *format,...)
Signature of set_abort functions passed as parameters.
- typedef int(* **FI_Args_Handler**) (int argc, char **argv, int &i)
Signature of args functions passed as parameters.
- typedef void(* **FI_Atclose_Handler**) (**FI_Window** *window, void *data)
Signature of set_atclose functions passed as parameters.
- typedef void(* **FI_Awake_Handler**) (void *data)
Signature of some wakeup callback functions passed as parameters.
- typedef void() **FI_Box_Draw_F**(int x, int y, int w, int h, **FI_Color** color)
Signature of some box drawing functions passed as parameters.
- typedef void() **FI_Box_Draw_Focus_F**(**FI_Boxtype** bt, int x, int y, int w, int h, **FI_Color** fg, **FI_Color** bg)
Signature of box focus frame drawing functions.
- typedef void(* **FI_Clipboard_Notify_Handler**) (int source, void *data)
Signature of add_clipboard_notify functions passed as parameters.
- typedef int(* **FI_Event_Dispatch**) (int event, **FI_Window** *w)
Signature of event_dispatch functions passed as parameters.
- typedef int(* **FI_Event_Handler**) (int event)
Signature of add_handler functions passed as parameters.
- typedef void(* **FI_FD_Handler**) (**FL_SOCKET** fd, void *data)
Signature of add_fd functions passed as parameters.
- typedef void(* **FI_Idle_Handler**) (void *data)
Signature of add_idle callback function passed as parameter.
- typedef void() **FI_Label_Draw_F**(const **FI_Label** *label, int x, int y, int w, int h, **FI_Align** align)
Signature of some label drawing functions passed as parameters.
- typedef void() **FI_Label_Measure_F**(const **FI_Label** *label, int &width, int &height)
Signature of some label measurement functions passed as parameters.
- typedef void(* **FI_Old_Idle_Handler**) ()
Signature of add_idle callback function passed as parameter.
- typedef int(* **FI_System_Handler**) (void *event, void *data)
Signature of add_system_handler functions passed as parameters.
- typedef void(* **FI_Timeout_Handler**) (void *data)
Signature of timeout callback functions passed as parameters.

14.4.1 Detailed Description

FLTK typedefs for service and widget callbacks.

14.6 options.H File Reference

Application and system wide options management.

```
#include <FL/fl_config.h>
#include <FL/Fl_Export.H>
```

Namespaces

- namespace [Fl](#)

[Fl](#) is the FLTK global namespace containing state information and global methods for the current application.

Enumerations

- enum [Fl::Fl_Option](#) {
[Fl::OPTION_ARROW_FOCUS](#) = 0 , [Fl::OPTION_VISIBLE_FOCUS](#) , [Fl::OPTION_DND_TEXT](#) ,
[Fl::OPTION_SHOW_TOOLTIPS](#) ,
[Fl::OPTION_FNFC_USES_GTK](#) , [Fl::OPTION_FNFC_USES_ZENITY](#) , [Fl::OPTION_FNFC_USES_KDIALOG](#)
, [Fl::OPTION_PRINTER_USES_GTK](#) ,
[Fl::OPTION_SHOW_SCALING](#) , [Fl::OPTION_SIMPLE_ZOOM_SHORTCUT](#) , [Fl::OPTION_LAST](#) }

Enumerator for global FLTK options.

Functions

- int [Fl::dnd_text_ops](#) ()
Gets whether drag and drop text operations are supported.
- void [Fl::dnd_text_ops](#) (int v)
Sets whether drag and drop text operations are supported.
- bool [Fl::option](#) ([Fl_Option](#) opt)
FLTK library options management.
- void [Fl::option](#) ([Fl_Option](#) opt, bool val)
Override an option while the application is running.
- int [Fl::visible_focus](#) ()
Gets or sets the visible keyboard focus on buttons and other non-text widgets.
- void [Fl::visible_focus](#) (int v)
Gets or sets the visible keyboard focus on buttons and other non-text widgets.

14.6.1 Detailed Description

Application and system wide options management.

14.7 options.H

```

14.8 pen_events.H File Reference

Pen event handling variables and functions.

```

#include <FL/fl_config.h>
#include <FL/Fl_Export.H>
#include <FL/core/function_types.H>
#include <cstdint>

```

Namespaces

- namespace `Fl`
Fl is the FLTK global namespace containing state information and global methods for the current application.
- namespace `Fl::Pen`
FLTK Pen/Stylus/Tablet input driver API.

Enumerations

- enum `Fl::Pen::Event` {
`Fl::Pen::DETECTED` = 0x1000 , `Fl::Pen::CHANGED` , `Fl::Pen::IN_RANGE` , `Fl::Pen::OUT_OF_RANGE` ,
`Fl::Pen::ENTER` , `Fl::Pen::LEAVE` , `Fl::Pen::TOUCH` , `Fl::Pen::LIFT` ,
`Fl::Pen::HOVER` , `Fl::Pen::DRAW` , `Fl::Pen::BUTTON_PUSH` , `Fl::Pen::BUTTON_RELEASE` }
List of pen events.
- enum class `Fl::Pen::State` : `uint32_t` {
`Fl::Pen::State::NONE` = 0x0000 , `Fl::Pen::State::TIP_HOVERS` = 0x0001 , `Fl::Pen::State::TIP_DOWN` =
0x0002 , `Fl::Pen::State::ERASER_HOVERS` = 0x0004 ,
`Fl::Pen::State::ERASER_DOWN` = 0x0008 , `Fl::Pen::State::BUTTON0` = 0x0100 , `Fl::Pen::State::BUTTON1`
= 0x0200 , `Fl::Pen::State::BUTTON2` = 0x0400 ,
`Fl::Pen::State::BUTTON3` = 0x0800 , `Fl::Pen::State::ANY_DOWN` = `BUTTON0` | `BUTTON1` | `BUTTON2` |
`BUTTON3` | `TIP_DOWN` | `ERASER_DOWN` }
Bitfield of pen state flags.
- enum class `Fl::Pen::Trait` : `uint32_t` {
`Fl::Pen::Trait::NONE` = 0x0000 , `Fl::Pen::Trait::DRIVER_AVAILABLE` = 0x0001 , `Fl::Pen::Trait::DETECTED` =
0x0002 , `Fl::Pen::Trait::DISPLAY` = 0x0004 ,
`Fl::Pen::Trait::PEN_ID` = 0x0008 , `Fl::Pen::Trait::ERASER` = 0x0010 , `Fl::Pen::Trait::PRESSURE` = 0x0020 ,
`Fl::Pen::Trait::BARREL_PRESSURE` = 0x0040 ,
`Fl::Pen::Trait::TILT_X` = 0x0080 , `Fl::Pen::Trait::TILT_Y` = 0x0100 , `Fl::Pen::Trait::TWIST` = 0x0200 ,
`Fl::Pen::Trait::PROXIMITY` = 0x0400 }
Bitfield of traits.

Functions

- `Trait Fl::Pen::driver_traits ()`
Query the traits supported by the pen/tablet driver.
- `bool Fl::Pen::driver_traits (Trait bits)`
Return true if the corresponding bit is set in the driver traits.
- `constexpr State Fl::Pen::operator& (State lhs, State rhs)`
Bitwise AND operator for State enum.
- `constexpr Trait Fl::Pen::operator& (Trait lhs, Trait rhs)`
Bitwise AND operator for Trait enum.
- `constexpr State Fl::Pen::operator| (State lhs, State rhs)`
Bitwise OR operator for State enum.
- `constexpr Trait Fl::Pen::operator| (Trait lhs, Trait rhs)`
Bitwise OR operator for Trait enum.
- `State & Fl::Pen::operator|= (State &lhs, State rhs)`
Bitwise OR assignment operator for State enum.
- `Trait & Fl::Pen::operator|= (Trait &lhs, Trait rhs)`
Bitwise OR assignment operator for Trait enum.
- `Trait Fl::Pen::pen_traits (int pen_id=0)`
Query traits of the current pen or stylus.
- `bool Fl::Pen::pen_traits (Trait bits, int pen_id=0)`
Return true if the corresponding bit is set in the pen traits.
- `void Fl::Pen::release ()`

Clear the "pushed" state and forward pen events as mouse events.

- void [Fl::Pen::subscribe](#) ([Fl_Widget](#) *widget)

Receives a [Pen::ENTER](#) event when the pen enters this widget.

- void [Fl::Pen::unsubscribe](#) ([Fl_Widget](#) *widget)

Stop receiving [Pen::ENTER](#) for this widget.

Query values during event handling

- double [Fl::Pen::event_barrel_pressure](#) ()
Returns barrel pressure or tangential pressure.
- int [Fl::Pen::event_pen_id](#) ()
Returns the ID of the pen used in the last event.
- double [Fl::Pen::event_pressure](#) ()
Returns the pressure between the tip or eraser and the surface.
- double [Fl::Pen::event_proximity](#) ()
Returns the proximity of the pen to the surface between 0 and 1.
- [State](#) [Fl::Pen::event_state](#) ()
Returns the state of the various buttons and tips.
- bool [Fl::Pen::event_state](#) ([State](#) bits)
Return true if any of the bits are set in the event state.
- double [Fl::Pen::event_tilt_x](#) ()
Returns the tilt of the pen in the x and y directions between -1 and 1.
- double [Fl::Pen::event_tilt_y](#) ()
Returns pen Y-axis tilt, see [event_tilt_x\(\)](#)
- [State](#) [Fl::Pen::event_trigger](#) ()
Returns the state change that triggered the event.
- double [Fl::Pen::event_twist](#) ()
Returns the pen's axial rotation in degrees.
- double [Fl::Pen::event_x](#) ()
Returns the pen x and y position inside the handling widget as doubles.
- double [Fl::Pen::event_x_root](#) ()
Returns the pen x and y position in global coordinates as doubles.
- double [Fl::Pen::event_y](#) ()
Returns pen Y coordinate in widget space, see [event_x\(\)](#).
- double [Fl::Pen::event_y_root](#) ()
Returns pen Y coordinate in screen space, see [event_x_root\(\)](#).

14.8.1 Detailed Description

Pen event handling variables and functions.

14.10 Enumerations.H File Reference

This file contains type definitions and general enumerations.

```
#include <FL/fl_config.h>
#include "FL_Export.H"
#include "fl_types.h"
#include <FL/platform_types.h>
```

Macros

- `#define FL_API_VERSION (FL_MAJOR_VERSION*10000 + FL_MINOR_VERSION*100 + FL_PATCH_VERSION)`
The FLTK API version number as an int.
- `#define FL_IMAGE_WITH_ALPHA 0x40000000`
- `#define FL_VERSION`
The FLTK version number as a double.

Names of Non-ASCII keys and mouse buttons

The following constants define the names of non-ASCII keys on the keyboard and of mouse buttons for `FL_KEYBOARD` and `FL_SHORTCUT` events.

See also

[`Fl::event\_key\(\)`](#) and [`Fl::get\_key\(int\)`](#) (use ASCII letters for all other keys):

- `#define FL_Alt_Gr 0xfe03`
The AltGr key on some international keyboards.
- `#define FL_Alt_L 0xffe9`
The left alt key.
- `#define FL_Alt_R 0xffea`
The right alt key.
- `#define FL_Back 0xEF26`
Like back on a browser.
- `#define FL_BackSpace 0xff08`
The backspace key.
- `#define FL_Button 0xfee8`
A mouse button; use `FL_Button + n` for mouse button `n`.
- `#define FL_Caps_Lock 0xffe5`
The caps lock key.
- `#define FL_Control_L 0xffe3`
The lefthand control key.
- `#define FL_Control_R 0xffe4`
The righthand control key.
- `#define FL_Delete 0xffff`
The delete key.
- `#define FL_Down 0xff54`
The down arrow key.
- `#define FL_Eisu 0xff2f`
The Eisu key of JIS keyboards.
- `#define FL_End 0xff57`
The end key.
- `#define FL_Enter 0xff0d`
The enter key.
- `#define FL_Escape 0xff1b`
The escape key.
- `#define FL_F 0xffbd`

- One of the function keys; use FL_F + n for function key n.*

 - #define **FL_F_Last** 0xffe0

The last function key; use to range-check function keys.
- #define **FL_Favorites** 0xEF30

Show favorite locations.
- #define **FL_Forward** 0xEF27

Like forward on a browser.
- #define **FL_Help** 0xff68

The 'help' key on Mac keyboards.
- #define **FL_Home** 0xff50

The home key.
- #define **FL_Home_Page** 0xEF18

Display user's home page.
- #define **FL_Insert** 0xff63

The insert key.
- #define **FL_Iso_Key** 0xff0c

The additional key of ISO keyboards.
- #define **FL_JIS_Underscore** 0xff31

The underscore key of JIS keyboards.
- #define **FL_Kana** 0xff2e

The Kana key of JIS keyboards.
- #define **FL_KP** 0xff80

One of the keypad numbers; use FL_KP + 'n' for digit n.
- #define **FL_KP_Enter** 0xff8d

The enter key on the keypad, same as FL_KP+'r'.
- #define **FL_KP_Last** 0xffbd

The last keypad key; use to range-check keypad.
- #define **FL_Left** 0xff51

The left arrow key.
- #define **FL_Mail** 0xEF19

Invoke user's mail program.
- #define **FL_Media_Next** 0xEF17

Next track.
- #define **FL_Media_Play** 0xEF14

Start playing of audio.
- #define **FL_Media_Prev** 0xEF16

Previous track.
- #define **FL_Media_Stop** 0xEF15

Stop playing audio.
- #define **FL_Menu** 0xff67

The menu key.
- #define **FL_Meta_L** 0xffe7

The left meta/Windows key.
- #define **FL_Meta_R** 0xffe8

The right meta/Windows key.
- #define **FL_Num_Lock** 0xff7f

The num lock key.
- #define **FL_Page_Down** 0xff56

The page-down key.
- #define **FL_Page_Up** 0xff55

The page-up key.
- #define **FL_Pause** 0xff13

The pause key.
- #define **FL_Print** 0xff61

The print (or print-screen) key.
- #define **FL_Refresh** 0xEF29

Refresh the page.
- #define **FL_Right** 0xff53

The right arrow key.

- **#define FL_Scroll_Lock** 0xff14
The scroll lock key.
- **#define FL_Search** 0xEF1B
Search.
- **#define FL_Shift_L** 0xffe1
The lefthand shift key.
- **#define FL_Shift_R** 0xffe2
The righthand shift key.
- **#define FL_Sleep** 0xEF2F
Put system to sleep.
- **#define FL_Stop** 0xEF28
Stop current operation.
- **#define FL_Tab** 0xff09
The tab key.
- **#define FL_Up** 0xff52
The up arrow key.
- **#define FL_Volume_Down** 0xEF11
Volume control down.
- **#define FL_Volume_Mute** 0xEF12
Mute sound from the system.
- **#define FL_Volume_Up** 0xEF13
Volume control up.
- **#define FL_Yen** 0xff30
The Yen key of JIS keyboards.

Mouse Buttons

These constants define the button numbers for `FL_PUSH` and `FL_RELEASE` events.

See also

[`Fl::event\_button\(\)`](#)

- **#define FL_BACK_MOUSE** 4
The back mouse button (side button 1)
- **#define FL_FORWARD_MOUSE** 5
The forward mouse button (side button 2)
- **#define FL_LEFT_MOUSE** 1
The left mouse button.
- **#define FL_MIDDLE_MOUSE** 2
The middle mouse button.
- **#define FL_RIGHT_MOUSE** 3
The right mouse button.

Event States

The following constants define bits in the `Fl::event_state()` value.

- **#define FL_ALT** 0x00080000
One of the alt keys is down.
- **#define FL_BUTTON(n)** (0x00800000<<(n))
Mouse button n (n = 1..5) is pushed, undefined if n outside 1..5.
- **#define FL_BUTTON1** 0x01000000
Mouse button 1 is pushed (L)
- **#define FL_BUTTON2** 0x02000000
Mouse button 2 is pushed (M)
- **#define FL_BUTTON3** 0x04000000
Mouse button 3 is pushed (R)
- **#define FL_BUTTON4** 0x08000000
Mouse button 4 is pushed (BACK)
- **#define FL_BUTTON5** 0x10000000
Mouse button 5 is pushed (FORWARD)

- `#define FL_BUTTONS 0x1f000000`
Bitmask: any mouse button (1-5) is pushed.
- `#define FL_CAPS_LOCK 0x00020000`
The caps lock is on.
- `#define FL_CTRL 0x00040000`
One of the ctrl keys is down.
- `#define FL_KEY_MASK 0x0000ffff`
All keys are 16 bit for now.
- `#define FL_META 0x00400000`
One of the meta/Windows keys is down.
- `#define FL_NUM_LOCK 0x00100000`
The num lock is on.
- `#define FL_SCROLL_LOCK 0x00800000`
The scroll lock is on.
- `#define FL_SHIFT 0x00010000`
One of the shift keys is down.

Typedefs

- typedef int [FL_Fontsize](#)
Size of a font in pixels.

Enumerations

- enum { [FL_READ](#) = 1 , [FL_WRITE](#) = 4 , [FL_EXCEPT](#) = 8 }
FD "when" conditions.
- enum [FL_Arrow_Type](#) { [FL_ARROW_SINGLE](#) = 0x01 , [FL_ARROW_DOUBLE](#) = 0x02 , [FL_ARROW_CHOICE](#) = 0x03 , [FL_ARROW_RETURN](#) = 0x04 }
Arrow types define the type of arrow drawing function.
- enum [FL_Damage](#) {
[FL_DAMAGE_CHILD](#) = 0x01 , [FL_DAMAGE_EXPOSE](#) = 0x02 , [FL_DAMAGE_SCROLL](#) = 0x04 ,
[FL_DAMAGE_OVERLAY](#) = 0x08 ,
[FL_DAMAGE_USER1](#) = 0x10 , [FL_DAMAGE_USER2](#) = 0x20 , [FL_DAMAGE_ALL](#) = 0x80 }
Damage masks.
- enum [FL_Event](#) {
[FL_NO_EVENT](#) = 0 , [FL_PUSH](#) = 1 , [FL_RELEASE](#) = 2 , [FL_ENTER](#) = 3 ,
[FL_LEAVE](#) = 4 , [FL_DRAG](#) = 5 , [FL_FOCUS](#) = 6 , [FL_UNFOCUS](#) = 7 ,
[FL_KEYDOWN](#) = 8 , [FL_KEYBOARD](#) = 8 , [FL_KEYUP](#) = 9 , [FL_CLOSE](#) = 10 ,
[FL_MOVE](#) = 11 , [FL_SHORTCUT](#) = 12 , [FL_DEACTIVATE](#) = 13 , [FL_ACTIVATE](#) = 14 ,
[FL_HIDE](#) = 15 , [FL_SHOW](#) = 16 , [FL_PASTE](#) = 17 , [FL_SELECTIONCLEAR](#) = 18 ,
[FL_MOUSEWHEEL](#) = 19 , [FL_DND_ENTER](#) = 20 , [FL_DND_DRAG](#) = 21 , [FL_DND_LEAVE](#) = 22 ,
[FL_DND_RELEASE](#) = 23 , [FL_SCREEN_CONFIGURATION_CHANGED](#) = 24 , [FL_FULLSCREEN](#) = 25 ,
[FL_ZOOM_GESTURE](#) = 26 ,
[FL_ZOOM_EVENT](#) = 27 , [FL_BEFORE_TOOLTIP](#) = 28 , [FL_BEFORE_MENU](#) = 29 , [FL_APP_ACTIVATE](#) = 30 ,
[FL_APP_DEACTIVATE](#) = 31 }
Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.
- enum [FL_Labeltype](#) {
[FL_NORMAL_LABEL](#) = 0 , [FL_NO_LABEL](#) , [_FL_SHADOW_LABEL](#) , [_FL_ENGRAVED_LABEL](#) ,
[_FL_EMBOSSSED_LABEL](#) , [_FL_MULTI_LABEL](#) , [_FL_ICON_LABEL](#) , [_FL_IMAGE_LABEL](#) ,
[FL_FREE_LABELTYPE](#) }
The `labeltype()` method sets the type of the label.
- enum [FL_Mode](#) {
[FL_RGB](#) = 0 , [FL_INDEX](#) = 1 , [FL_SINGLE](#) = 0 , [FL_DOUBLE](#) = 2 ,
[FL_ACCUM](#) = 4 , [FL_ALPHA](#) = 8 , [FL_DEPTH](#) = 16 , [FL_STENCIL](#) = 32 ,
[FL_RGB8](#) = 64 , [FL_MULTISAMPLE](#) = 128 , [FL_STEREO](#) = 256 , [FL_FAKE_SINGLE](#) = 512 ,
[FL_OPENGL3](#) = 1024 , [FL_DEPTH32](#) = 2048 }

visual types and `Fl_Gl_Window::mode()` (values match `Glut`)

- enum `Fl_Orientation` {
`FL_ORIENT_NONE` = 0x00 , `FL_ORIENT_RIGHT` = 0x00 , `FL_ORIENT_NE` = 0x01 , `FL_ORIENT_UP` = 0x02 ,
`FL_ORIENT_NW` = 0x03 , `FL_ORIENT_LEFT` = 0x04 , `FL_ORIENT_SW` = 0x05 , `FL_ORIENT_DOWN` = 0x06 ,
`FL_ORIENT_SE` = 0x07 }

Fl_Orientation describes the orientation of a GUI element.

When Conditions

- enum `Fl_When` {
`FL_WHEN_NEVER` = 0 , `FL_WHEN_CHANGED` = 1 , `FL_WHEN_NOT_CHANGED` = 2 , `FL_WHEN_RELEASE` = 4 ,
`FL_WHEN_RELEASE_ALWAYS` = 6 , `FL_WHEN_ENTER_KEY` = 8 , `FL_WHEN_ENTER_KEY_ALWAYS` = 10 , `FL_WHEN_ENTER_KEY_CHANGED` = 11 ,
`FL_WHEN_CLOSED` = 16 }

These constants determine when a callback is performed.

Callback Reasons

- enum `Fl_Callback_Reason` {
`FL_REASON_UNKNOWN` = 0 , `FL_REASON_SELECTED` , `FL_REASON_DESELECTED` , `FL_REASON_RESELECTED` ,
`FL_REASON_OPENED` , `FL_REASON_CLOSED` , `FL_REASON_DRAGGED` , `FL_REASON_CANCELLED` ,
`FL_REASON_CHANGED` , `FL_REASON_GOT_FOCUS` , `FL_REASON_LOST_FOCUS` , `FL_REASON_RELEASED` ,
`FL_REASON_ENTER_KEY` , `FL_REASON_USER` = 32 }

These constants describe why a callback is performed.

Cursors

- enum `Fl_Cursor` {
`FL_CURSOR_DEFAULT` = 0 , `FL_CURSOR_ARROW` = 35 , `FL_CURSOR_CROSS` = 66 ,
`FL_CURSOR_WAIT` = 76 ,
`FL_CURSOR_INSERT` = 77 , `FL_CURSOR_HAND` = 31 , `FL_CURSOR_HELP` = 47 , `FL_CURSOR_MOVE` = 27 ,
`FL_CURSOR_NS` = 78 , `FL_CURSOR_WE` = 79 , `FL_CURSOR_NWSE` = 80 , `FL_CURSOR_NESW` = 81 ,
`FL_CURSOR_N` = 70 , `FL_CURSOR_NE` = 69 , `FL_CURSOR_E` = 49 , `FL_CURSOR_SE` = 8 ,
`FL_CURSOR_S` = 9 , `FL_CURSOR_SW` = 7 , `FL_CURSOR_W` = 36 , `FL_CURSOR_NW` = 68 ,
`FL_CURSOR_NONE` = 255 }

The following constants define the mouse cursors that are available in FLTK.

Variables

- `Fl_Fontsize FL_NORMAL_SIZE`

normal font size

Box Types

FLTK standard box types

This enum defines the standard box types included with FLTK.

Note

For backward compatibility, the `FL_Boxtype` enum includes some additional symbols that start with underscores. These underscore-prefixed symbols have identical values to their regular counterparts.

`FL_NO_BOX` means nothing is drawn at all, so whatever is already on the screen remains. The `FL_..._FRAME` types only draw their edges, leaving the interior unchanged. The blue color in the image below is the area that is not drawn by the frame types.

Figure 14.1 FLTK Standard Box Types

Note

Not all box types are depicted in the figure above. See enum [FL_Boxtype](#) below for the complete list of box types.

See also

[Fl::get_system_colors\(\)](#)

- [FL_Boxtype fl_box](#) ([FL_Boxtype](#) b)

Get the filled version of a frame.

- enum [FL_Boxtype](#) {
[FL_NO_BOX](#) = 0, [FL_FLAT_BOX](#), [FL_UP_BOX](#), [FL_DOWN_BOX](#),
[FL_UP_FRAME](#), [FL_DOWN_FRAME](#), [FL_THIN_UP_BOX](#), [FL_THIN_DOWN_BOX](#),

FL_GLEAM_ROUND_DOWN_BOX ,
FL_OXY_UP_BOX , FL_OXY_DOWN_BOX , FL_OXY_UP_FRAME , FL_OXY_DOWN_FRAME ,
FL_OXY_THIN_UP_BOX , FL_OXY_THIN_DOWN_BOX , FL_OXY_THIN_UP_FRAME , FL_OXY_THIN_DOWN_FRAME
,
FL_OXY_ROUND_UP_BOX , FL_OXY_ROUND_DOWN_BOX , FL_OXY_BUTTON_UP_BOX , FL_OXY_BUTTON_DOWN_BOX
,
FL_FREE_BOXTYPE , FL_MAX_BOXTYPE = 255 }
```

FLTK standard box types.

- **#define FL_CIRCLE_BOX FL_ROUND_DOWN_BOX**
- **#define FL_DIAMOND_BOX FL_DIAMOND_DOWN_BOX**
- **Fl_Boxtype fl_down (Fl_Boxtype b)**
Get the "pressed" or "down" version of a box.
- **Fl_Boxtype fl_frame (Fl_Boxtype b)**
Get the unfilled, frame only version of a box.
- **#define FL_FRAME FL_ENGRAVED_FRAME**
- **#define FL_FRAME_BOX FL_ENGRAVED_BOX**
- **Fl_Labeltype fl_define_FL_EMBOSSED_LABEL ()**
Initializes the internal table entry for FL_EMBOSSED_LABEL and returns its internal value.
- **Fl_Labeltype fl_define_FL_ENGRAVED_LABEL ()**
Initializes the internal table entry for FL_ENGRAVED_LABEL and returns its internal value.
- **Fl_Labeltype fl_define_FL_ICON_LABEL ()**
Initializes the internal table entry for FL_ICON_LABEL and returns its internal value.
- **Fl_Labeltype fl_define_FL_IMAGE_LABEL ()**
Initializes the internal table entry for FL_IMAGE_LABEL and returns its internal value.
- **Fl_Labeltype fl_define_FL_MULTI_LABEL ()**
Initializes the internal table entry for FL_MULTI_LABEL and returns its internal value.
- **Fl_Labeltype fl_define_FL_SHADOW_LABEL ()**
Initializes the internal table entry for FL_SHADOW_LABEL and returns its internal value.
- **#define FL_EMBOSSED_LABEL fl_define_FL_EMBOSSED_LABEL()**
Draws a label with embossed text.
- **#define FL_ENGRAVED_LABEL fl_define_FL_ENGRAVED_LABEL()**
Draws a label with engraved text.
- **#define FL_ICON_LABEL fl_define_FL_ICON_LABEL()**
Draws an icon as the label.
- **#define FL_IMAGE_LABEL fl_define_FL_IMAGE_LABEL()**
Draws an image (Fl_Image) as the label.
- **#define FL_MULTI_LABEL fl_define_FL_MULTI_LABEL()**
Draws a label that can comprise several parts like text and images.
- **#define FL_SHADOW_LABEL fl_define_FL_SHADOW_LABEL()**
Draws a label with shadows behind the text.
- **#define FL_SYMBOL_LABEL FL_NORMAL_LABEL**
Sets the current label type and returns its corresponding Fl_Labeltype value.

Colors

The `Fl_Color` type holds an FLTK color value.

Colors are either 8-bit indexes into a [virtual colormap](#) or 24-bit RGB color values. (See [Colors](#) for the default FLTK colormap)

Color indices occupy the lower 8 bits of the value, while RGB colors occupy the upper 24 bits, for a byte organization of RGBI.

```
Fl_Color => 0xrrgbbii
           | | | |
           | | | +--- index between 0 and 255
           | | +----- blue color component (8 bit)
           | +----- green component (8 bit)
           +----- red component (8 bit)
```

A color can have either an index or an rgb value. Colors with rgb set and an index >0 are reserved for special use.

- const [Fl_Color](#) **FL_BACKGROUND2_COLOR** = 7
the default background color for text, list, and valuator widgets
- const [Fl_Color](#) **FL_BACKGROUND_COLOR** = 49
Default background color.
- const [Fl_Color](#) **FL_BLACK** = 56
- const [Fl_Color](#) **FL_BLUE** = 216
- typedef unsigned int **Fl_Color**
An FLTK color value; see also [Colors](#)
- [Fl_Color](#) **fl_color_average** ([Fl_Color](#) c1, [Fl_Color](#) c2, float weight)
Returns the weighted average color between the two given colors.
- #define **FL_COLOR_CUBE** ([Fl_Color](#))56
- [Fl_Color](#) **fl_color_cube** (int r, int g, int b)
Returns a color out of the color cube.
- [Fl_Color](#) **fl_contrast** ([Fl_Color](#) fg, [Fl_Color](#) bg, int context=0, int size=0)
Returns a color that contrasts with the background color.
- typedef [Fl_Color](#)() **Fl_Contrast_Function**([Fl_Color](#), [Fl_Color](#), int, int)
Type of a custom [fl_contrast\(\)](#) function.
- void **fl_contrast_function** ([Fl_Contrast_Function](#) *f)
Register a custom contrast function.
- int **fl_contrast_level** ()
Get the contrast level (sensitivity) of the [fl_contrast\(\)](#) method.
- void **fl_contrast_level** (int level)
Set the contrast level (sensitivity) of the [fl_contrast\(\)](#) method.
- enum **Fl_Contrast_Mode** {
 FL_CONTRAST_NONE = 0, **FL_CONTRAST_LEGACY**, **FL_CONTRAST_CIELAB**, **FL_CONTRAST_CUSTOM**,
 FL_CONTRAST_LAST }
Define the possible modes to calculate [fl_contrast\(\)](#).
- int **fl_contrast_mode** ()
Return the current contrast algorithm (mode).
- void **fl_contrast_mode** (int mode)
Set the contrast algorithm (mode).
- const [Fl_Color](#) **FL_CYAN** = 223
- const [Fl_Color](#) **FL_DARK1** = 47
- const [Fl_Color](#) **FL_DARK2** = 45
- const [Fl_Color](#) **FL_DARK3** = 39
- const [Fl_Color](#) **FL_DARK_BLUE** = 136

- `const FI_Color FL_DARK_CYAN = 140`
- `const FI_Color FL_DARK_GREEN = 60`
- `const FI_Color FL_DARK_MAGENTA = 152`
- `const FI_Color FL_DARK_RED = 72`
- `const FI_Color FL_DARK_YELLOW = 76`
- `FI_Color fl_darker (FI_Color c)`
Returns a darker version of the specified color.
- `const FI_Color FL_FOREGROUND_COLOR = 0`
the default foreground color (0) used for labels and text
- `#define FL_FREE_COLOR (FI_Color)16`
Colors numbered between FL_FREE_COLOR and FL_FREE_COLOR + FL_NUM_FREE_COLOR - 1 are free for the user to be given any value using FI::set_color().
- `#define FL_GRAY FL_BACKGROUND_COLOR`
- `const FI_Color FL_GRAY0 = 32`
- `#define FL_GRAY_RAMP (FI_Color)32`
- `FI_Color fl_gray_ramp (int i)`
Returns a gray color value from black (i == 0) to white (i == FL_NUM_GRAY - 1).
- `const FI_Color FL_GREEN = 63`
- `FI_Color fl_inactive (FI_Color c)`
Returns the inactive, dimmed version of the given color.
- `const FI_Color FL_INACTIVE_COLOR = 8`
the inactive foreground color
- `const FI_Color FL_LIGHT1 = 50`
- `const FI_Color FL_LIGHT2 = 52`
- `const FI_Color FL_LIGHT3 = 54`
- `FI_Color fl_lighter (FI_Color c)`
Returns a lighter version of the specified color.
- `double fl_lightness (FI_Color color)`
Return the perceived lightness of a color.
- `double fl_luminance (FI_Color color)`
Return the raw / physical luminance of a color.
- `const FI_Color FL_MAGENTA = 248`
- `#define FL_NUM_BLUE 5`
- `#define FL_NUM_FREE_COLOR 16`
- `#define FL_NUM_GRAY 24`
- `#define FL_NUM_GREEN 8`
- `#define FL_NUM_RED 5`
- `const FI_Color FL_RED = 88`
- `FI_Color fl_rgb_color (uchar g)`
Returns the 24-bit color value closest to g (grayscale).
- `FI_Color fl_rgb_color (uchar r, uchar g, uchar b)`
Returns the 24-bit color value closest to r, g, b.
- `const FI_Color FL_SELECTION_COLOR = 15`
the default selection/highlight color
- `const FI_Color FL_WHITE = 255`
- `const FI_Color FL_YELLOW = 95`

Alignment Flags

Flags to control the label alignment.

This controls how the label is displayed next to or inside the widget. The default value is `FL_ALIGN_CENTER` (0) for most widgets, which centers the label inside the widget.

All alignment flags use the common prefix `"FL_ALIGN_"`. In the following descriptions this prefix is sometimes omitted for brevity.

Flags can be or'd to achieve a combination of alignments, but there are some *"magic values"* (e.g. combinations of TOP and BOTTOM and of LEFT and RIGHT) that have special meanings (see below). For instance:

`FL_ALIGN_TOP_LEFT == (FL_ALIGN_TOP | FL_ALIGN_LEFT) != FL_ALIGN_LEFT_TOP.`

Outside alignments (`FL_ALIGN_INSIDE` is not set):

```

      TOP_LEFT      TOP      TOP_RIGHT
+-----+
LEFT_TOP |          | RIGHT_TOP
|        |          |
LEFT    |  CENTER  | RIGHT
|        |          |
LEFT_BOTTOM |      | RIGHT_BOTTOM
+-----+
      BOTTOM_LEFT  BOTTOM  BOTTOM_RIGHT

```

Inside alignments (`FL_ALIGN_INSIDE` is set):

```

+-----+
|TOP_LEFT  TOP    TOP_RIGHT|
|          |          |
|LEFT      CENTER  RIGHT|
|          |          |
|BOTTOM_LEFT BOTTOM BOTTOM_RIGHT|
+-----+

```

See also

[Fl_Align](#), [FL_ALIGN_CENTER](#), etc.

Note

1. Bit positions not defined in the following constants of type `Fl_Align` are reserved for future extensions. Do not use.
2. The *"magic values"* (`FL_ALIGN_`)`LEFT_TOP`, `RIGHT_TOP`, `LEFT_BOTTOM`, and `RIGHT_BOTTOM` must not be used together with `FL_ALIGN_INSIDE`. Use `TOP_LEFT`, `TOP_RIGHT`, `BOTTOM_LEFT`, or `BOTTOM_RIGHT` instead.
3. Although bits can be or'd together there are some unused/illegal combinations, for instance:
 - setting both `FL_ALIGN_TOP` and `FL_ALIGN_BOTTOM` in combinations other than those given in the `Fl_Align` constants below (magic values)
 - setting both `FL_ALIGN_LEFT` and `FL_ALIGN_RIGHT` in combinations other than those given in the `Fl_Align` constants below (magic values)
 - using one of the "magic values" (2) together with `FL_ALIGN_INSIDE`

Using illegal bit combinations or undefined bits may yield unexpected behavior, and this behavior may be changed without notice in future FLTK versions.

- typedef unsigned **Fl_Align**

FLTK type for alignment control.

- const [Fl_Align](#) **FL_ALIGN_BOTTOM** = 0x0002

Align the label at the bottom of the widget.

- const [Fl_Align](#) **FL_ALIGN_BOTTOM_LEFT** = [FL_ALIGN_BOTTOM](#) | [FL_ALIGN_LEFT](#)
- const [Fl_Align](#) **FL_ALIGN_BOTTOM_RIGHT** = [FL_ALIGN_BOTTOM](#) | [FL_ALIGN_RIGHT](#)
- const [Fl_Align](#) **FL_ALIGN_CENTER** = 0x0000

Align the label horizontally in the middle.

- const [Fl_Align](#) **FL_ALIGN_CLIP** = 0x0040

All parts of the label that are larger than the widget will not be drawn.

- const [Fl_Align](#) **FL_ALIGN_IMAGE_BACKDROP** = 0x0200

If the label contains an image, draw the image or deimage in the background.

- const [Fl_Align](#) **FL_ALIGN_IMAGE_MASK** = 0x0320
Mask value to test for image alignment flags.
- const [Fl_Align](#) **FL_ALIGN_IMAGE_NEXT_TO_TEXT** = 0x0100
If the label contains an image, draw the text to the right of the image.
- const [Fl_Align](#) **FL_ALIGN_IMAGE_OVER_TEXT** = 0x0000
If the label contains an image, draw the text below the image.
- const [Fl_Align](#) **FL_ALIGN_INSIDE** = 0x0010
Draw the label inside of the widget.
- const [Fl_Align](#) **FL_ALIGN_LEFT** = 0x0004
Align the label at the left of the widget.
- const [Fl_Align](#) **FL_ALIGN_LEFT_BOTTOM** = 0x000d
Outside only, left of widget, bottom position, magic value: TOP | LEFT | RIGHT.
- const [Fl_Align](#) **FL_ALIGN_LEFT_TOP** = 0x0007
Outside only, left of widget, top position, magic value: TOP | BOTTOM | LEFT.
- const [Fl_Align](#) **FL_ALIGN_NOWRAP** = 0x0000
Nothing, same as FL_ALIGN_CENTER, for back compatibility.
- const [Fl_Align](#) **FL_ALIGN_POSITION_MASK** = 0x000f
Mask value to test for TOP, BOTTOM, LEFT, and RIGHT flags.
- const [Fl_Align](#) **FL_ALIGN_RIGHT** = 0x0008
Align the label to the right of the widget.
- const [Fl_Align](#) **FL_ALIGN_RIGHT_BOTTOM** = 0x000e
Outside only, right of widget, bottom position, magic value: BOTTOM | LEFT | RIGHT.
- const [Fl_Align](#) **FL_ALIGN_RIGHT_TOP** = 0x000b
Outside only, right of widget, top position, magic value: TOP | BOTTOM | RIGHT.
- const [Fl_Align](#) **FL_ALIGN_TEXT_NEXT_TO_IMAGE** = 0x0120
If the label contains an image, draw the text to the left of the image.
- const [Fl_Align](#) **FL_ALIGN_TEXT_OVER_IMAGE** = 0x0020
If the label contains an image, draw the text on top of the image.
- const [Fl_Align](#) **FL_ALIGN_TOP** = 0x0001
Align the label at the top of the widget.
- const [Fl_Align](#) **FL_ALIGN_TOP_LEFT** = [FL_ALIGN_TOP](#) | [FL_ALIGN_LEFT](#)
- const [Fl_Align](#) **FL_ALIGN_TOP_RIGHT** = [FL_ALIGN_TOP](#) | [FL_ALIGN_RIGHT](#)
- const [Fl_Align](#) **FL_ALIGN_WRAP** = 0x0080
Wrap text that does not fit the width of the widget.

Font Numbers

The following constants define the standard FLTK fonts:

- const [Fl_Font](#) **FL_BOLD** = 1
add this to Helvetica, Courier, or Times
- const [Fl_Font](#) **FL_BOLD_ITALIC** = 3
add this to Helvetica, Courier, or Times
- const [Fl_Font](#) **FL_COURIER** = 4
Courier normal.
- const [Fl_Font](#) **FL_COURIER_BOLD** = 5
Courier bold.
- const [Fl_Font](#) **FL_COURIER_BOLD_ITALIC** = 7
Courier bold-italic.
- const [Fl_Font](#) **FL_COURIER_ITALIC** = 6
Courier italic.
- typedef int **Fl_Font**

- A font number is an index into the internal font table.*
- const [Fl_Font](#) **FL_FREE_FONT** = 16
first one to allocate
 - const [Fl_Font](#) **FL_HELVETICA** = 0
Helvetica (or Arial) normal (0)
 - const [Fl_Font](#) **FL_HELVETICA_BOLD** = 1
Helvetica (or Arial) bold.
 - const [Fl_Font](#) **FL_HELVETICA_BOLD_ITALIC** = 3
Helvetica (or Arial) bold-oblique.
 - const [Fl_Font](#) **FL_HELVETICA_ITALIC** = 2
Helvetica (or Arial) oblique.
 - const [Fl_Font](#) **FL_ITALIC** = 2
add this to Helvetica, Courier, or Times
 - const [Fl_Font](#) **FL_SCREEN** = 13
Default monospaced screen font.
 - const [Fl_Font](#) **FL_SCREEN_BOLD** = 14
Default monospaced bold screen font.
 - const [Fl_Font](#) **FL_SYMBOL** = 12
Standard symbol font.
 - const [Fl_Font](#) **FL_TIMES** = 8
Times roman.
 - const [Fl_Font](#) **FL_TIMES_BOLD** = 9
Times roman bold.
 - const [Fl_Font](#) **FL_TIMES_BOLD_ITALIC** = 11
Times roman bold-italic.
 - const [Fl_Font](#) **FL_TIMES_ITALIC** = 10
Times roman italic.
 - const [Fl_Font](#) **FL_ZAPF_DINGBATS** = 15
Zapf-dingbats font.

14.10.1 Detailed Description

This file contains type definitions and general enumerations.

14.10.2 Macro Definition Documentation

14.10.2.1 FL_IMAGE_LABEL

```
#define FL_IMAGE_LABEL fl_define_FL_IMAGE_LABEL()
```

Draws an image ([Fl_Image](#)) as the label.

This is useful for one particular part of an [Fl_Multi_Label](#). Use [Fl_Widget::image\(\)](#) and/or [Fl_Widget::deimage\(\)](#) for normal widgets with images as labels.

14.10.2.2 FL_MULTI_LABEL

```
#define FL_MULTI_LABEL fl_define_FL_MULTI_LABEL()
```

Draws a label that can comprise several parts like text and images.

See also

[Fl_Multi_Label](#)

14.10.2.3 FL_SYMBOL_LABEL

```
#define FL_SYMBOL_LABEL FL_NORMAL_LABEL
```

Sets the current label type and returns its corresponding FL_Labeltype value.

FL_SYMBOL_LABEL is an alias for FL_NORMAL_LABEL.

'@' symbols can be drawn with normal labels as well.

This definition is for historical reasons only (forms compatibility). You should use FL_NORMAL_LABEL instead.

14.10.3 Typedef Documentation

14.10.3.1 FI_Contrast_Function

```
typedef FL_Color() FI_Contrast_Function(FL_Color, FL_Color, int, int)
```

Type of a custom [fl_contrast\(\)](#) function.

Use this signature to define your own custom [fl_contrast\(\)](#) function together with [fl_contrast_mode\(FL_↵ CONTRAST_CUSTOM\)](#). Example:

```
FL_Color my_contrast(FL_Color fg, FL_Color bg, int context, int size) {
    // calculate contrast and ...
    return color;
}
// call this early in your main() program:
fl_contrast_function(my_contrast);
fl_contrast_mode(FL_CONTRAST_CUSTOM);
fl_contrast_level(50); // optional, must be called after fl_contrast_mode()
```

For parameters and types see [fl_contrast\(FL_Color, FL_Color, int, int\)](#).

See also

[fl_contrast\(FL_Color, FL_Color, int, int\)](#)

[fl_contrast_mode\(int\)](#)

14.10.3.2 FI_Fontsize

```
typedef int FI_Fontsize
```

Size of a font in pixels.

This is the approximate height of a font in pixels.

14.10.4 Enumeration Type Documentation

14.10.4.1 anonymous enum

```
anonymous enum
```

FD "when" conditions.

Enumerator

FL_READ	Call the callback when there is data to be read.
FL_WRITE	Call the callback when data can be written without blocking.
FL_EXCEPT	Call the callback if an exception occurs on the file.

14.10.4.2 FI_Arrow_Type

```
enum FL_Arrow_Type
```

Arrow types define the type of arrow drawing function.

FLTK schemes can draw several graphical elements in their particular way. One of these elements is an arrow type that can be in different GUI elements like scrollbars, choice buttons, and FLTK's [FL_Return_Button](#).

Note

This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

Since

1.4.0

Enumerator

FL_ARROW_SINGLE	Single arrow, e.g. in Fl_Scrollbar .
FL_ARROW_DOUBLE	Double arrow, e.g. in Fl_Counter .
FL_ARROW_CHOICE	Dropdown box, e.g. in Fl_Choice .
FL_ARROW_RETURN	Return arrow, e.g. in Fl_Return_Button .

14.10.4.3 Fl_Boxtype

enum [Fl_Boxtype](#)

FLTK standard box types.

This enum defines the standard box types included with FLTK.

Enumerator

FL_NO_BOX	nothing is drawn at all, this box is invisible
FL_FLAT_BOX	a flat box
FL_UP_BOX	see figure Standard Box Types
FL_DOWN_BOX	see figure Standard Box Types
FL_UP_FRAME	see figure Standard Box Types
FL_DOWN_FRAME	see figure Standard Box Types
FL_THIN_UP_BOX	see figure Standard Box Types
FL_THIN_DOWN_BOX	see figure Standard Box Types
FL_THIN_UP_FRAME	see figure Standard Box Types
FL_THIN_DOWN_FRAME	see figure Standard Box Types
FL_ENGRAVED_BOX	see figure Standard Box Types
FL_EMBOSSSED_BOX	see figure Standard Box Types
FL_ENGRAVED_FRAME	see figure Standard Box Types
FL_EMBOSSSED_FRAME	see figure Standard Box Types
FL_BORDER_BOX	see figure Standard Box Types
FL_SHADOW_BOX	see figure Standard Box Types
FL_BORDER_FRAME	see figure Standard Box Types
FL_SHADOW_FRAME	see figure Standard Box Types
FL_ROUNDED_BOX	see figure Standard Box Types
FL_RSHADOW_BOX	see figure Standard Box Types
FL_ROUNDED_FRAME	see figure Standard Box Types
FL_RFLAT_BOX	see figure Standard Box Types
FL_ROUND_UP_BOX	see figure Standard Box Types
FL_ROUND_DOWN_BOX	see figure Standard Box Types
FL_DIAMOND_UP_BOX	see figure Standard Box Types
FL_DIAMOND_DOWN_BOX	see figure Standard Box Types
FL_OVAL_BOX	see figure Standard Box Types
FL_OSHADOW_BOX	see figure Standard Box Types
FL_OVAL_FRAME	see figure Standard Box Types
FL_OFLAT_BOX	see figure Standard Box Types
FL_PLASTIC_UP_BOX	plastic version of FL_UP_BOX

Enumerator

FL_PLASTIC_DOWN_BOX	plastic version of FL_DOWN_BOX
FL_PLASTIC_UP_FRAME	plastic version of FL_UP_FRAME
FL_PLASTIC_DOWN_FRAME	plastic version of FL_DOWN_FRAME
FL_PLASTIC_THIN_UP_BOX	plastic version of FL_THIN_UP_BOX
FL_PLASTIC_THIN_DOWN_BOX	plastic version of FL_THIN_DOWN_BOX
FL_PLASTIC_ROUND_UP_BOX	plastic version of FL_ROUND_UP_BOX
FL_PLASTIC_ROUND_DOWN_BOX	plastic version of FL_ROUND_DOWN_BOX
FL_GTK_UP_BOX	gtk+ version of FL_UP_BOX
FL_GTK_DOWN_BOX	gtk+ version of FL_DOWN_BOX
FL_GTK_UP_FRAME	gtk+ version of FL_UP_FRAME
FL_GTK_DOWN_FRAME	gtk+ version of FL_DOWN_FRAME
FL_GTK_THIN_UP_BOX	gtk+ version of FL_THIN_UP_BOX
FL_GTK_THIN_DOWN_BOX	gtk+ version of FL_THIN_DOWN_BOX
FL_GTK_THIN_UP_FRAME	gtk+ version of FL_THIN_UP_FRAME
FL_GTK_THIN_DOWN_FRAME	gtk+ version of FL_THIN_DOWN_FRAME
FL_GTK_ROUND_UP_BOX	gtk+ version of FL_ROUND_UP_BOX
FL_GTK_ROUND_DOWN_BOX	gtk+ version of FL_ROUND_DOWN_BOX
FL_GLEAM_UP_BOX	gleam version of FL_UP_BOX
FL_GLEAM_DOWN_BOX	gleam version of FL_DOWN_BOX
FL_GLEAM_UP_FRAME	gleam version of FL_UP_FRAME
FL_GLEAM_DOWN_FRAME	gleam version of FL_DOWN_FRAME
FL_GLEAM_THIN_UP_BOX	gleam version of FL_THIN_UP_BOX
FL_GLEAM_THIN_DOWN_BOX	gleam version of FL_THIN_DOWN_BOX
FL_GLEAM_ROUND_UP_BOX	gleam version of FL_ROUND_UP_BOX
FL_GLEAM_ROUND_DOWN_BOX	gleam version of FL_ROUND_DOWN_BOX
FL_OXY_UP_BOX	oxy version of FL_UP_BOX
FL_OXY_DOWN_BOX	oxy version of FL_DOWN_BOX
FL_OXY_UP_FRAME	oxy version of FL_UP_FRAME
FL_OXY_DOWN_FRAME	oxy version of FL_DOWN_FRAME
FL_OXY_THIN_UP_BOX	oxy version of FL_THIN_UP_BOX
FL_OXY_THIN_DOWN_BOX	oxy version of FL_THIN_DOWN_BOX
FL_OXY_THIN_UP_FRAME	oxy version of FL_THIN_UP_FRAME
FL_OXY_THIN_DOWN_FRAME	oxy version of FL_THIN_DOWN_FRAME
FL_OXY_ROUND_UP_BOX	oxy version of FL_ROUND_UP_BOX
FL_OXY_ROUND_DOWN_BOX	oxy version of FL_ROUND_DOWN_BOX
FL_OXY_BUTTON_UP_BOX	FL_OXY_BUTTON_UP_BOX.
FL_OXY_BUTTON_DOWN_BOX	FL_OXY_BUTTON_DOWN_BOX.
FL_FREE_BOXTYPE	the first free box type for creation of new box types
FL_MAX_BOXTYPE	highest legal index for a box type

14.10.4.4 FI_Callback_Reason

enum [Fl_Callback_Reason](#)

These constants describe why a callback is performed.

See also

[Fl::callback_reason\(\)](#), [Fl_Widget::when\(\)](#), [Fl_When](#)

Enumerator

FL_REASON_UNKNOWN	unknown or unset reason
FL_REASON_SELECTED	an item was selected
FL_REASON_DESELECTED	an item was de-selected
FL_REASON_RESELECTED	an item was re-selected (double-clicked).
FL_REASON_OPENED	an item was opened
FL_REASON_CLOSED	an item was closed
FL_REASON_DRAGGED	an item was dragged into a new place
FL_REASON_CANCELLED	a dialog was cancelled
FL_REASON_CHANGED	the value of the widget was modified
FL_REASON_GOT_FOCUS	a widget received focus
FL_REASON_LOST_FOCUS	a widget lost focus
FL_REASON_RELEASED	the mouse button was released
FL_REASON_ENTER_KEY	user finished input pressing Enter
FL_REASON_USER	user defined callback reasons

14.10.4.5 Fl_Contrast_Mode

enum [Fl_Contrast_Mode](#)

Define the possible modes to calculate [fl_contrast\(\)](#).

Enumerator

FL_CONTRAST_NONE	always return foreground color
FL_CONTRAST_LEGACY	legacy (FLTK 1.3.x) contrast function
FL_CONTRAST_CIELAB	new (FLTK 1.4.0) default function
FL_CONTRAST_CUSTOM	optional custom contrast function
FL_CONTRAST_LAST	internal use only (invalid contrast mode)

14.10.4.6 Fl_Cursor

enum [Fl_Cursor](#)

The following constants define the mouse cursors that are available in FLTK.

Cursors are provided by the system when available, or bitmaps built into FLTK as a fallback.

Enumerator

FL_CURSOR_DEFAULT	the default cursor, usually an arrow:
FL_CURSOR_ARROW	an arrow pointer:
FL_CURSOR_CROSS	crosshair:
FL_CURSOR_WAIT	busy indicator (for instance hourglass): ,
FL_CURSOR_INSERT	I-beam:
FL_CURSOR_HAND	pointing hand:
FL_CURSOR_HELP	question mark pointer: ?
FL_CURSOR_MOVE	4-pointed arrow or hand: ,
FL_CURSOR_NS	up/down resize:

Enumerator

FL_CURSOR_WE	left/right resize:
FL_CURSOR_NWSE	diagonal resize:
FL_CURSOR_NESW	diagonal resize:
FL_CURSOR_N	upwards resize:
FL_CURSOR_NE	upwards, right resize:
FL_CURSOR_E	rightwards resize:
FL_CURSOR_SE	downwards, right resize:
FL_CURSOR_S	downwards resize:
FL_CURSOR_SW	downwards, left resize:
FL_CURSOR_W	leftwards resize:
FL_CURSOR_NW	upwards, left resize:
FL_CURSOR_NONE	invisible.

14.10.4.7 **Fl_Damage**

enum [Fl_Damage](#)

Damage masks.

Enumerator

FL_DAMAGE_CHILD	A child needs to be redrawn.
FL_DAMAGE_EXPOSE	The window was exposed.
FL_DAMAGE_SCROLL	The Fl_Scroll widget was scrolled. Used by other widgets for other widget specific damages.
FL_DAMAGE_OVERLAY	The overlay planes need to be redrawn.
FL_DAMAGE_USER1	First user-defined damage bit.
FL_DAMAGE_USER2	Second user-defined damage bit.
FL_DAMAGE_ALL	Everything needs to be redrawn.

14.10.4.8 **Fl_Event**

enum [Fl_Event](#)

Every time a user moves the mouse pointer, clicks a button, or presses a key, an event is generated and sent to your application.

Events can also come from other programs like the window manager.

Events are identified by the integer argument passed to the [Fl_Widget::handle\(\)](#) virtual method. Other information about the most recent event is stored in static locations and acquired by calling the `Fl::event_*`() methods. This static information remains valid until the next event is read from the window system, so it is ok to look at it outside of the `handle()` method.

Event numbers can be converted to their actual names using the `fl_eventnames[]` array (`std::map` since FLTK 1.5) defined in `#include <FL/names.h>`

See also

[Fl::event_text\(\)](#), [Fl::event_key\(\)](#), class `Fl::`

Enumerator

FL_NO_EVENT	No event.

Enumerator

FL_PUSH	A mouse button has gone down with the mouse pointing at this widget. You can find out what button by calling Fl::event_button(). You find out the mouse position by calling Fl::event_x() and Fl::event_y(). A widget indicates that it "wants" the mouse click by returning non-zero from its Fl_Widget::handle() method. It will then become the Fl::pushed() widget and will get FL_DRAG and the matching FL_RELEASE events. If Fl_Widget::handle() returns zero then FLTK will try sending the FL_PUSH to another widget.
FL_RELEASE	A mouse button has been released. You can find out what button by calling Fl::event_button(). In order to receive the FL_RELEASE event, the widget must return non-zero when handling FL_PUSH.
FL_ENTER	The mouse has been moved to point at this widget. This can be used for highlighting feedback. If a widget wants to highlight or otherwise track the mouse, it indicates this by returning non-zero from its handle() method. It then becomes the Fl::belowmouse() widget and will receive FL_MOVE and FL_LEAVE events.
FL_LEAVE	The mouse has moved out of the widget. In order to receive the FL_LEAVE event, the widget must return non-zero when handling FL_ENTER.
FL_DRAG	The mouse has moved with a button held down. The current button state is in Fl::event_state(). The mouse position is in Fl::event_x() and Fl::event_y(). In order to receive FL_DRAG events, the widget must return non-zero when handling FL_PUSH.
FL_FOCUS	This indicates an <i>attempt</i> to give a widget the keyboard focus. If a widget wants the focus, it should change itself to display the fact that it has the focus, and return non-zero from its handle() method. It then becomes the Fl::focus() widget and gets FL_KEYDOWN, FL_KEYUP, and FL_UNFOCUS events. The focus will change either because the window manager changed which window gets the focus, or because the user tried to navigate using tab, arrows, or other keys. You can check Fl::event_key() to figure out why it moved. For navigation it will be the key pressed and for interaction with the window manager it will be zero.
FL_UNFOCUS	This event is sent to the previous Fl::focus() widget when another widget gets the focus or the window loses focus.

Enumerator

FL_KEYDOWN	A key was pressed (FL_KEYDOWN) or released (FL_KEYUP). FL_KEYBOARD is a synonym for FL_KEYDOWN. The key can be found in Fl::event_key(). The text that the key should insert can be found with Fl::event_text() and its length is in Fl::event_length(). If you use the key handle() should return 1. If you return zero then FLTK assumes you ignored the key and will then attempt to send it to a parent widget. If none of them want it, it will change the event into a FL_SHORTCUT event. To receive FL_KEYBOARD events you must also respond to the FL_FOCUS and FL_UNFOCUS events. If you are writing a text-editing widget you may also want to call the Fl::compose() function to translate individual keystrokes into non-ASCII characters. FL_KEYUP events are sent to the widget that currently has focus. This is not necessarily the same widget that received the corresponding FL_KEYDOWN event because focus may have changed between events.
FL_KEYBOARD	Equivalent to FL_KEYDOWN. See also FL_KEYDOWN
FL_KEYUP	Key release event. See also FL_KEYDOWN
FL_CLOSE	The user clicked the close button of a window. This event is used internally only to trigger the callback of Fl_Window derived classed. The default callback closes the window calling Fl_Window::hide().
FL_MOVE	The mouse has moved without any mouse buttons held down. This event is sent to the Fl::belowmouse() widget. In order to receive FL_MOVE events, the widget must return non-zero when handling FL_ENTER.
FL_SHORTCUT	If the Fl::focus() widget is zero or ignores an FL_KEYBOARD event then FLTK tries sending this event to every widget it can, until one of them returns non-zero. FL_SHORTCUT is first sent to the Fl::belowmouse() widget, then its parents and siblings, and eventually to every widget in the window, trying to find an object that returns non-zero. FLTK tries really hard to not to ignore any keystrokes! You can also make "global" shortcuts by using Fl::add_handler(). A global shortcut will work no matter what windows are displayed or which one has the focus.
FL_DEACTIVATE	This widget is no longer active, due to Fl_Widget::deactivate() being called on it or one of its parents. Fl_Widget::active() may still be true after this, the widget is only active if Fl_Widget::active() is true on it and all its parents (use Fl_Widget::active_r() to check this).
FL_ACTIVATE	This widget is now active, due to Fl_Widget::activate() being called on it or one of its parents.

Enumerator

FL_HIDE	This widget is no longer visible, due to Fl_Widget::hide() being called on it or one of its parents, or due to a parent window being minimized (old Wayland versions may not send the FL_HIDE event to minimized toplevel windows). Fl_Widget::visible() may still be true after this, but the widget is visible only if visible() is true for it and all its parents (use Fl_Widget::visible_r() to check this).
FL_SHOW	This widget is visible again, due to Fl_Widget::show() being called on it or one of its parents, or due to a parent window being restored. Child Fl_Windows respond to this by actually creating the window if not done already, so if you subclass a window, be sure to pass FL_SHOW to the base class Fl_Widget::handle() method!
FL_PASTE	You should get this event some time after you call Fl::paste() . The contents of Fl::event_text() is the text to insert and the number of characters is in Fl::event_length() .
FL_SELECTIONCLEAR	The Fl::selection_owner() will get this event before the selection is moved to another widget. This indicates that some other widget or program has claimed the selection. Motif programs used this to clear the selection indication. Most modern programs ignore this.
FL_MOUSEWHEEL	The user has moved the mouse wheel. The Fl::event_dx() and Fl::event_dy() methods can be used to find the amount to scroll horizontally and vertically.
FL_DND_ENTER	The mouse has been moved to point at this widget. A widget that is interested in receiving drag'n'drop data must return 1 to receive FL_DND_DRAG, FL_DND_LEAVE and FL_DND_RELEASE events.
FL_DND_DRAG	The mouse has been moved inside a widget while dragging data. A widget that is interested in receiving drag'n'drop data should indicate the possible drop position.
FL_DND_LEAVE	The mouse has moved out of the widget.
FL_DND_RELEASE	The user has released the mouse button dropping data into the widget. If the widget returns 1, it will receive the data in the immediately following FL_PASTE event.
FL_SCREEN_CONFIGURATION_CHANGED	The screen configuration (number, positions) was changed. Use Fl::add_handler() to be notified of this event.
FL_FULLSCREEN	The fullscreen state of the window has changed. This event is sent to the window's handle method.
FL_ZOOM_GESTURE	The user has made a zoom/pinch/magnification gesture (Mac OS platform only). The Fl::event_dy() method can be used to find magnification amount, Fl::event_x() and Fl::event_y() are set as well. This event is sent to the window's handle method.
FL_ZOOM_EVENT	A zoom event (ctrl/+/-/0/ or cmd/+/-/0/) was processed. Use Fl::add_handler() to be notified of this event.
FL_BEFORE_TOOLTIP	A tooltip is about to pop up for this widget. The mouse coordinates are available in Fl::event_x() and Fl::event_y() . Change the widget tooltip as needed.
FL_BEFORE_MENU	Triggered just before a menu is displayed. Widgets derived from Fl_Menu_ receive this event right before the menu appears, providing an opportunity to update menu item states and activation.

Enumerator

FL_APP_ACTIVATE	Sent when the application is activated and becomes topmost and focused. Not supported on X11. See also Fl::add_handler()
FL_APP_DEACTIVATE	Sent when the application is sent to the background and deactivated. Not supported on X11. See also Fl::add_handler()

14.10.4.9 Fl_Labeltype

enum [Fl_Labeltype](#)

The `labeltype()` method sets the type of the label.

Note

The documented enum `Fl_Labeltype` contains some values (names) with leading underscores, e.g. `↔` **`_FL_IMAGE_LABEL`**. This is due to technical reasons - please use the same values (names) without the leading underscore in your code! Enum values with leading underscores are reserved for internal use and subject to change without notice!

The following standard label types are included:

Enumerator

FL_NORMAL_LABEL	draws the text (0)
FL_NO_LABEL	does nothing
_FL_SHADOW_LABEL	draws a drop shadow under the text
_FL_ENGRAVED_LABEL	draws edges as though the text is engraved
_FL_EMBOSSED_LABEL	draws edges as though the text is raised
_FL_MULTI_LABEL	draws a composite label See also Fl_Multi_Label
_FL_ICON_LABEL	draws the icon associated with the text
_FL_IMAGE_LABEL	the label displays an "icon" based on a Fl_Image
FL_FREE_LABELTYPE	first free labeltype to use for creating own labeltypes

14.10.4.10 Fl_Orientation

enum [Fl_Orientation](#)

`Fl_Orientation` describes the orientation of a GUI element.

FLTK schemes can draw several graphical elements, for instance arrows, pointing at different directions. This enum defines the direction to use for drawing a particular GUI element.

The definition of this enum was chosen such that the enum value can be multiplied by 45 to get a rotation angle in degrees starting at the horizontal axis (0 = right, 1 = NE, 2 = up, ...) that can be used with [fl_rotate\(\)](#). Note: angle is counter-clockwise in degrees.

The 'unspecified' value **`FL_ORIENT_NONE`** shall be used for elements that would usually not be rotated, like the return arrow of the [Fl_Return_Button](#). It can still be used as an angle though since it is the same value as `FL_↔`

ORIENT_RIGHT (0 degrees).

Note

This enum is not yet stable (as of FLTK 1.4.0) and may be changed without notice as necessary.

Since

1.4.0

Enumerator

FL_ORIENT_NONE	GUI element direction is unspecified.
FL_ORIENT_RIGHT	GUI element pointing right (0°)
FL_ORIENT_NE	GUI element pointing NE (45°)
FL_ORIENT_UP	GUI element pointing up (90°)
FL_ORIENT_NW	GUI element pointing NW (135°)
FL_ORIENT_LEFT	GUI element pointing left (180°)
FL_ORIENT_SW	GUI element pointing SW (225°)
FL_ORIENT_DOWN	GUI element pointing down (270°)
FL_ORIENT_SE	GUI element pointing SE (315°)

14.10.4.11 Fl_When

enum [Fl_When](#)

These constants determine when a callback is performed.

Fl_When is a bit field. Some values are merely shortcuts for common bit combinations. New flags may be added in the future, so it's important to mask the required bit when reading via `when()`.

Note

Some widgets may not fully support FL_WHEN_... flags.

See also

[Fl_Widget::when\(\)](#), [Fl::callback_reason\(\)](#), [Fl_Callback_Reason](#), [Fl_Widget::do_callback\(\)](#)

Enumerator

FL_WHEN_NEVER	Never call the callback.
FL_WHEN_CHANGED	Do the callback only when the widget value changes.
FL_WHEN_NOT_CHANGED	Do the callback whenever the user interacts with the widget.
FL_WHEN_RELEASE	Do the callback when the button or key is released and the value changes.
FL_WHEN_RELEASE_ALWAYS	Do the callback when the button or key is released, even if the value doesn't change.
FL_WHEN_ENTER_KEY	Do the callback when the user presses the ENTER key and the value changes.
FL_WHEN_ENTER_KEY_ALWAYS	Do the callback when the user presses the ENTER key, even if the value doesn't change.
FL_WHEN_ENTER_KEY_CHANGED	Do callbacks whether the value changed or not, and when the ENTER key is pressed.
FL_WHEN_CLOSED	Do the callback when a child of Fl_Tabs is closed.

14.10.5 Function Documentation

14.10.5.1 fl_box()

```
Fl_Boxtype fl_box (
    Fl_Boxtype b ) [inline]
```

Get the filled version of a frame.

If no filled version of a given frame exists, the behavior of this function is undefined and some random box or frame is returned.

14.10.5.2 fl_color_cube()

```
Fl_Color fl_color_cube (
    int r,
    int g,
    int b ) [inline]
```

Returns a color out of the color cube.

r must be in the range 0 to FL_NUM_RED (5) minus 1, *g* must be in the range 0 to FL_NUM_GREEN (8) minus 1, *b* must be in the range 0 to FL_NUM_BLUE (5) minus 1.

To get the closest color to a 8-bit set of R,G,B values use:

```
fl_color_cube(R * (FL_NUM_RED - 1) / 255,
    G * (FL_NUM_GREEN - 1) / 255,
    B * (FL_NUM_BLUE - 1) / 255);
```

14.10.5.3 fl_define_FL_EMBOSSED_LABEL()

```
Fl_Labeltype fl_define_FL_EMBOSSED_LABEL ( ) [extern]
```

Initializes the internal table entry for FL_EMBOSSED_LABEL and returns its internal value.

Internal use only.

14.10.5.4 fl_define_FL_ENGRAVED_LABEL()

```
Fl_Labeltype fl_define_FL_ENGRAVED_LABEL ( ) [extern]
```

Initializes the internal table entry for FL_ENGRAVED_LABEL and returns its internal value.

Internal use only.

14.10.5.5 fl_define_FL_ICON_LABEL()

```
Fl_Labeltype fl_define_FL_ICON_LABEL ( ) [extern]
```

Initializes the internal table entry for FL_ICON_LABEL and returns its internal value.

Internal use only.

14.10.5.6 fl_define_FL_IMAGE_LABEL()

```
Fl_Labeltype fl_define_FL_IMAGE_LABEL ( ) [extern]
```

Initializes the internal table entry for FL_IMAGE_LABEL and returns its internal value.

Internal use only.

14.10.5.7 fl_define_FL_MULTI_LABEL()

```
Fl_Labeltype fl_define_FL_MULTI_LABEL ( ) [extern]
```

Initializes the internal table entry for FL_MULTI_LABEL and returns its internal value.

Internal use only.

14.10.5.8 fl_define_FL_SHADOW_LABEL()

```
Fl_Labeltype fl_define_FL_SHADOW_LABEL ( ) [extern]
```

Initializes the internal table entry for FL_SHADOW_LABEL and returns its internal value.

Internal use only.

14.10.5.9 fl_down()

```
Fl_Boxtype fl_down (
    Fl_Boxtype b ) [inline]
```

Get the "pressed" or "down" version of a box.

If no "down" version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

14.10.5.10 fl_frame()

```
Fl_Boxtype fl_frame (
    Fl_Boxtype b ) [inline]
```

Get the unfilled, frame only version of a box.

If no frame version of a given box exists, the behavior of this function is undefined and some random box or frame is returned.

14.10.5.11 fl_gray_ramp()

```
Fl_Color fl_gray_ramp (
    int i ) [inline]
```

Returns a gray color value from black (i == 0) to white (i == FL_NUM_GRAY - 1).

FL_NUM_GRAY is defined to be 24 in the current FLTK release. To get the closest FLTK gray value to an 8-bit grayscale color 'I' use:

```
fl_gray_ramp(I * (FL_NUM_GRAY - 1) / 255)
```

14.10.6 Variable Documentation

14.10.6.1 FL_ALIGN_LEFT

```
const Fl_Align FL_ALIGN_LEFT = 0x0004
```

Align the label at the left of the widget.

Inside labels appear left-justified starting at the left side of the widget, outside labels are right-justified and drawn to the left of the widget.

14.10.6.2 FL_ALIGN_TOP

```
const Fl_Align FL_ALIGN_TOP = 0x0001
```

Align the label at the top of the widget.

Inside labels appear below the top, outside labels are drawn on top of the widget.

14.10.6.3 FL_NORMAL_SIZE

```
Fl_Fontsize FL_NORMAL_SIZE [extern]
```

normal font size

normal font size

14.12 filename.H File Reference

File names and URI utility functions.

```

#include "Fl_Export.H"
#include <FL/platform_types.h>
#include <string>

```

Macros

- `#define FL_PATH_MAX 2048`
all path buffers should use this length

Typedefs

- typedef int() `Fl_File_Sort_F`(struct dirent **, struct dirent **)
File sorting function.

Functions

- void `fl_decode_uri` (char *uri)
Decodes a URL-encoded string.
- int `fl_filename_absolute` (char *to, int tolen, const char *from)
Makes a filename absolute from a relative filename to the current working directory.
- int `fl_filename_absolute` (char *to, int tolen, const char *from, const char *cwd)
*Concatenate the absolute path *base* with *from* to form the new absolute path in *to*.*
- std::string `fl_filename_absolute_str` (const std::string &from)
Makes a filename absolute from a filename relative to the current working directory.
- std::string `fl_filename_absolute_str` (const std::string &from, const std::string &base)
*Append the relative filename *from* to the absolute filename *base* to form the new absolute path.*
- int `fl_filename_expand` (char *to, int tolen, const char *from)
Expands a filename containing shell variables and tilde (~).
- std::string `fl_filename_expand_str` (const std::string &from)
Expands a filename containing shell variables and tilde (~).
- const char * `fl_filename_ext` (const char *buf)
Gets the extension of a filename.
- std::string `fl_filename_ext_str` (const std::string &filename)
Return a new string that contains the filename extension.
- void `fl_filename_free_list` (struct dirent **l, int n)
Free the list of filenames that is generated by `fl_filename_list()`.
- int `fl_filename_isdir` (const char *name)
Determines if a file exists and is a directory from its filename.
- int `fl_filename_list` (const char *d, struct dirent **l, `Fl_File_Sort_F` *s=`fl_numeric_sort`)
Portable and const-correct wrapper for the `scandir()` function.
- int `fl_filename_match` (const char *name, const char *pattern)
*Checks if a string *s* matches a pattern *p*.*
- const char * `fl_filename_name` (const char *filename)
Gets the file name from a path.
- std::string `fl_filename_name_str` (const std::string &filename)
Return a new string that contains the name part of the filename.
- std::string `fl_filename_path_str` (const std::string &filename)
Return a new string that contains the path part of the filename.
- int `fl_filename_relative` (char *to, int tolen, const char *from)
Makes a filename relative to the current working directory.
- int `fl_filename_relative` (char *to, int tolen, const char *from, const char *cwd)
Makes a filename relative to any other directory.
- std::string `fl_filename_relative_str` (const std::string &from)
Makes a filename relative to the current working directory.
- std::string `fl_filename_relative_str` (const std::string &from, const std::string &base)
Makes a filename relative to any directory.
- char * `fl_filename_setext` (char *to, int tolen, const char *ext)
*Replaces the extension in *buf* of *max*.*
- std::string `fl_filename_setext_str` (const std::string &filename, const std::string &new_extension)
Return a copy of the old filename with the new extension.
- std::string `fl_getcwd_str` ()
Cross-platform function to get the current working directory as a UTF-8 encoded value in an std::string.
- int `fl_open_uri` (const char *uri, char *msg, int msglen)
Opens the specified Uniform Resource Identifier (URI).

14.12.1 Detailed Description

File names and URI utility functions.

```

Classes

- struct [Fl::TimeoutData](#)

Namespaces

- namespace `Fl`

Fl is the FLTK global namespace containing state information and global methods for the current application.

Macros

- `#define FL_Object Fl_Widget`

for back compatibility - use Fl_Widget!

Functions

- `int Fl::abi_check (const int val=99999)`
Returns whether the runtime library ABI version is correct.
- `int Fl::abi_version ()`
Returns the compiled-in value of the FL_ABI_VERSION constant.
- `void Fl::add_check (Fl_Timeout_Handler, void *=0)`
FLTK will call this callback just before it flushes the display and waits for events.
- `void Fl::add_clipboard_notify (Fl_Clipboard_Notify_Handler h, void *data=0)`
FLTK will call the registered callback whenever there is a change to the selection buffer or the clipboard.
- `void Fl::add_fd (int fd, Fl_FD_Handler cb, void *=0)`
Adds file descriptor fd to listen to.
- `void Fl::add_fd (int fd, int when, Fl_FD_Handler cb, void *=0)`
Adds file descriptor fd to listen to.
- `void Fl::add_idle (Fl_Idle_Handler cb, void *data=0)`
Adds a callback function that is called every time by Fl::wait() and also makes it act as though the timeout is zero (this makes Fl::wait() return immediately, so if it is in a loop it is called repeatedly, and thus the idle function is called repeatedly).
- `void Fl::add_idle (Fl_Old_Idle_Handler cb)`
- `void Fl::add_timeout (double t, Fl_Timeout_Handler cb, void *data=0)`
Adds a one-shot timeout callback.
- `int Fl::api_version ()`
Returns the compiled-in value of the FL_API_VERSION constant.
- `int Fl::arg (int argc, char **argv, int &i)`
Parse a single switch from argv, starting at word i.
- `void Fl::args (int argc, char **argv)`
Parse all command line switches matching standard FLTK options only.
- `int Fl::args (int argc, char **argv, int &i, Fl_Args_Handler cb=0)`
Parse command line switches using the cb argument handler.
- `int Fl::args_to_utf8 (int argc, char **&argv)`
Convert Windows commandline arguments to UTF-8.
- `void Fl::awake ()`
Notifies the main GUI thread from a worker thread.
- `int Fl::awake (Fl_Awake_Handler handler, void *user_data=nullptr)`
Schedules a callback to be executed by the main thread, then wakes up the main thread.
- `void Fl::awake (void *message)`
Awake the main GUI thread and leave a message pointer.
- `int Fl::awake_once (Fl_Awake_Handler handler, void *user_data=nullptr)`
Schedules a callback to be executed once by the main thread, then wakes up the main thread.
- `void Fl::background (uchar, uchar, uchar)`
Changes fl_color(FL_BACKGROUND_COLOR) to the given color, and changes the gray ramp from 32 to 56 to black to white.
- `void Fl::background2 (uchar, uchar, uchar)`

- Changes the alternative background color.*

 - `bool Fl::box_bg (Fl_Boxtype)`
Returns whether the given boxtype draws its background.
 - `int Fl::box_border_radius_max ()`
Get the maximum border radius of all "rounded" boxtypes in pixels.
 - `void Fl::box_border_radius_max (int R)`
Set the maximum border radius of all "rounded" boxtypes in pixels.
 - `Fl_Color Fl::box_color (Fl_Color)`
Gets the drawing color to be used for the background of a box.
 - `int Fl::box_dh (Fl_Boxtype)`
Returns the height offset for the given boxtype.
 - `int Fl::box_dw (Fl_Boxtype)`
Returns the width offset for the given boxtype.
 - `int Fl::box_dx (Fl_Boxtype)`
Returns the X offset for the given boxtype.
 - `int Fl::box_dy (Fl_Boxtype)`
Returns the Y offset for the given boxtype.
 - `int Fl::box_shadow_width ()`
Get the box shadow width of all "shadow" boxtypes in pixels.
 - `void Fl::box_shadow_width (int W)`
Set the box shadow width of all "shadow" boxtypes in pixels.
 - `bool Fl::cairo_autolink_context ()`
Gets the current autolink mode for Cairo support.
 - `void Fl::cairo_autolink_context (bool alink)`
When FLTK_HAVE_CAIRO is defined and `cairo_autolink_context()` is true, any current window dc is linked to a current Cairo context.
 - `cairo_t * Fl::cairo_cc ()`
Gets the current Cairo context linked with a fltk window.
 - `void Fl::cairo_cc (cairo_t *c, bool own=false)`
Sets the current Cairo context to c.
 - `void Fl::cairo_flush (cairo_t *c)`
Flush Cairo drawings on Cairo context c.
 - `cairo_t * Fl::cairo_make_current (Fl_Window *w)`
Provides a Cairo context for window wi.
 - `int Fl::check ()`
Same as `Fl::wait(0)`.
 - `int Fl::clipboard_contains (const char *type)`
Returns non 0 if the clipboard contains data matching type.
 - `void Fl::copy (const char *stuff, int len, int destination=0, const char *type=Fl::clipboard_plain_text)`
Copies data to the selection buffer, the clipboard, or both.
 - `int Fl::damage ()`
If true then `flush()` will do something.
 - `void Fl::damage (int d)`
If true then `flush()` will do something.
 - `void Fl::default_atclose (Fl_Window *, void *)`
Default callback for window widgets.
 - `void Fl::display (const char *)`
Sets the X or Wayland display to use for all windows.
 - `int Fl::dnd ()`
Initiate a Drag And Drop operation.
 - `int Fl::draw_box_active ()`

- Determines if the currently drawn box is active or inactive.*
- `int FL::draw_GL_text_with_textures ()`
returns whether whether OpenGL uses textures to draw all text.
- `void FL::draw_GL_text_with_textures (int val)`
sets whether OpenGL uses textures to draw all text.
- `FL_Window * FL::first_window ()`
Returns the first top-level window in the list of shown() windows.
- `void FL::first_window (FL_Window *)`
Sets the window that is returned by first_window().
- `void FL::flush ()`
Causes all the windows that need it to be redrawn and graphics forced out through the pipes.
- `void FL::foreground (uchar, uchar, uchar)`
Changes fl_color(FL_FOREGROUND_COLOR).
- `void FL::free_color (FL_Color i, int overlay=0)`
Frees the specified color from the colormap, if applicable.
- `FL_Box_Draw_F * FL::get_boxtype (FL_Boxtype)`
Gets the current box drawing function for the specified box type.
- `unsigned FL::get_color (FL_Color i)`
Returns the RGB value(s) for the given FLTK color index.
- `void FL::get_color (FL_Color i, uchar &red, uchar &green, uchar &blue)`
Returns the RGB value(s) for the given FLTK color index.
- `void FL::get_color (FL_Color i, uchar &red, uchar &green, uchar &blue, uchar &alpha)`
Returns the RGBA value(s) for the given FLTK color index.
- `const char * FL::get_font (FL_Font)`
Gets the string for this face.
- `const char * FL::get_font_name (FL_Font, int *attributes=0)`
Get a human-readable string describing the family of this face.
- `int FL::get_font_sizes (FL_Font, int *&sizep)`
Return an array of sizes in sizep.
- `void FL::get_system_colors ()`
Read the user preference colors from the system and use them to call FL::foreground(), FL::background(), and FL::background2().
- `int FL::gl_visual (int, int *alist=0)`
This does the same thing as FL::visual(int) but also requires OpenGL drawing to work.
- `FL_Window * FL::grab ()`
Returns the window that currently receives all events.
- `void FL::grab (FL_Window &win)`
See grab(FL_Window)*
- `void FL::grab (FL_Window *)`
Selects the window to grab.
- `int FL::h ()`
Returns the height in pixels of the main screen work area.
- `int FL::has_check (FL_Timeout_Handler, void *=0)`
Returns 1 if the check exists and has not been called yet, 0 otherwise.
- `int FL::has_idle (FL_Idle_Handler cb, void *data=0)`
Returns true if the specified idle callback is currently installed.
- `int FL::has_timeout (FL_Timeout_Handler cb, void *data=0)`
Returns true if the timeout exists and has not been called yet.
- `void FL::hide_all_windows ()`
Hide all visible windows to make FLTK leave FL::run().
- `bool FL::idle ()`

- Returns whether at least one idle callback is currently set.*

 - int [Fl::is_scheme](#) (const char *name)

Returns whether the current scheme is the given name.
- void [Fl::keyboard_screen_scaling](#) (int value)

Controls the possibility to scale all windows by ctrl+/-/0/ or cmd+/-/0/.
- int [Fl::lock](#) ()

Acquire the global UI lock for FLTK.
- int [Fl::menu_linespacing](#) ()

Gets the default line spacing used by menus.
- void [Fl::menu_linespacing](#) (int H)

Sets the default line spacing used by menus.
- [Fl_Window](#) * [Fl::modal](#) ()

Returns the top-most [modal\(\)](#) window currently shown.
- [Fl_Window](#) * [Fl::next_window](#) (const [Fl_Window](#) *)

Returns the next top-level window in the list of shown() windows.
- [Fl_Timestamp](#) [Fl::now](#) (double offset=0)

Set a time stamp at this point in time with optional signed offset in seconds.
- void [Fl::own_colormap](#) ()

Makes FLTK use its [own colormap](#).
- void [Fl::paste](#) ([Fl_Widget](#) &receiver)

Backward compatibility only.
- void [Fl::paste](#) ([Fl_Widget](#) &receiver, int source, const char *type=[Fl::clipboard_plain_text](#))

*Pastes the data from the selection buffer (*source* is 0) or the clipboard (*source* is 1) into receiver.*
- int [Fl::program_should_quit](#) ()

Returns non-zero when a request for program termination was received and accepted.
- void [Fl::program_should_quit](#) (int should_i)

Indicate to the FLTK library whether a program termination request was received and accepted.
- [Fl_Widget](#) * [Fl::readqueue](#) ()

Reads the default callback queue and returns the first widget.
- int [Fl::ready](#) ()

This is similar to [Fl::check\(\)](#) except this does not call [Fl::flush\(\)](#) or any callbacks, which is useful if your program is in a state where such callbacks are illegal.
- void [Fl::redraw](#) ()

Redraws all widgets.
- int [Fl::reload_scheme](#) ()

Called internally when setting a new scheme according to scheme name.
- void [Fl::remove_check](#) ([Fl_Timeout_Handler](#), void *=0)

Removes a check callback.
- void [Fl::remove_clipboard_notify](#) ([Fl_Clipboard_Notify_Handler](#) h)

Stop calling the specified callback when there are changes to the selection buffer or the clipboard.
- void [Fl::remove_fd](#) (int)

Removes a file descriptor handler.
- void [Fl::remove_fd](#) (int, int when)

Removes a file descriptor handler.
- void [Fl::remove_idle](#) ([Fl_Idle_Handler](#) cb, void *data=0)

Removes the specified idle callback, if it is installed.
- int [Fl::remove_next_timeout](#) ([Fl_Timeout_Handler](#) cb, void *data=0, void **data_return=0)

*Remove the next matching timeout callback and return its *data* pointer.*
- void [Fl::remove_timeout](#) ([Fl_Timeout_Handler](#) cb, void *data=0)

Remove one or more matching timeout callbacks from the timer queue.
- void [Fl::repeat_timeout](#) (double t, [Fl_Timeout_Handler](#) cb, void *data=0)

- Repeats a timeout callback from the expiration of the previous timeout, allowing for more accurate timing.*

 - int [Fl::run](#) ()

Calls [Fl::wait\(\)](#) repeatedly as long as any windows are displayed.
- const char * [Fl::scheme](#) ()

*See void [scheme\(const char *name\)](#)*
- int [Fl::scheme](#) (const char *name)

Sets the current widget scheme.
- int [Fl::screen_count](#) ()

Gets the total count of available screens.
- void [Fl::screen_dpi](#) (float &h, float &v, int n=0)

Gets the screen resolution in dots-per-inch for the given screen.
- Fl_Screen_Driver * [Fl::screen_driver](#) ()

Returns a pointer to the unique Fl_Screen_Driver object of the platform.
- int [Fl::screen_num](#) (int x, int y)

Gets the screen number of a screen that contains the specified screen position x, y.
- int [Fl::screen_num](#) (int x, int y, int w, int h)

Gets the screen number of the screen which intersects the most with the rectangle defined by x, y, w, h.
- float [Fl::screen_scale](#) (int n)

Gets the GUI scaling factor of screen number n.
- void [Fl::screen_scale](#) (int n, float factor)

Sets the GUI scaling factor of screen number n.
- int [Fl::screen_scaling_supported](#) ()

Returns whether scaling factors are supported by this platform.
- void [Fl::screen_work_area](#) (int &X, int &Y, int &W, int &H)

Gets the bounding box of the work area of the screen that contains the mouse pointer.
- void [Fl::screen_work_area](#) (int &X, int &Y, int &W, int &H, int mx, int my)

Gets the bounding box of the work area of a screen that contains the specified screen position mx, my.
- void [Fl::screen_work_area](#) (int &X, int &Y, int &W, int &H, int n)

Gets the bounding box of the work area of the given screen.
- void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H)

Gets the bounding box of a screen that contains the mouse pointer.
- void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H, int mx, int my)

Gets the bounding box of a screen that contains the specified screen position mx, my.
- void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H, int mx, int my, int mw, int mh)

Gets the screen bounding rect for the screen which intersects the most with the rectangle defined by mx, my, mw, mh.
- void [Fl::screen_xywh](#) (int &X, int &Y, int &W, int &H, int n)

Gets the screen bounding rect for the given screen.
- int [Fl::scrollbar_size](#) ()

Gets the default scrollbar size used by [Fl_Browser_](#), [Fl_Help_View](#), [Fl_Scroll](#), and [Fl_Text_Display](#) widgets.
- void [Fl::scrollbar_size](#) (int W)

Sets the default scrollbar size that is used by the [Fl_Browser_](#), [Fl_Help_View](#), [Fl_Scroll](#), and [Fl_Text_Display](#) widgets.
- double [Fl::seconds_between](#) (Fl_Timestamp &back, Fl_Timestamp &further_back)

Return the time in seconds between two time stamps.
- double [Fl::seconds_since](#) (Fl_Timestamp &then)

Return the time in seconds between now and a previously taken time stamp.
- void [Fl::selection](#) (Fl_Widget &owner, const char *, int len)

Changes the current selection.
- Fl_Widget * [Fl::selection_owner](#) ()

back-compatibility only: Gets the widget owning the current selection
- void [Fl::selection_owner](#) (Fl_Widget *)

Back-compatibility only: The single-argument call can be used to move the selection to another widget or to set the owner to NULL, without changing the actual text of the selection.

- `int FL::selection_to_clipboard ()`
Returns the current selection_to_clipboard mode.
- `void FL::selection_to_clipboard (int mode)`
Copies selections on X11 directly to the clipboard if enabled.
- `void FL::set_abort (FL_Abort_Handler f)`
For back compatibility, sets the void FL::fatal handler callback.
- `void FL::set_atclose (FL_Atclose_Handler f)`
For back compatibility, sets the FL::atclose handler callback.
- `void FL::set_box_color (FL_Color)`
Sets the drawing color for the box that is currently drawn.
- `void FL::set_boxtype (FL_Boxtype, FL_Box_Draw_F *, uchar, uchar, uchar, uchar, FL_Box_Draw_Focus_F *=NULL)`
Sets the function to call to draw a specific box type.
- `void FL::set_boxtype (FL_Boxtype, FL_Boxtype from)`
Copies the from boxtype.
- `void FL::set_color (FL_Color i, unsigned c)`
Sets an entry in the fl_color index table.
- `void FL::set_color (FL_Color, uchar, uchar, uchar)`
Sets an entry in the fl_color index table.
- `void FL::set_color (FL_Color, uchar, uchar, uchar, uchar)`
Sets an entry in the fl_color index table.
- `void FL::set_font (FL_Font, const char *)`
Changes a face.
- `void FL::set_font (FL_Font, FL_Font)`
Copies one face to another.
- `FL_Font FL::set_fonts (const char * = 0)`
FLTK will open the display, and add every fonts on the server to the face table.
- `void FL::set_labeltype (FL_Labeltype, FL_Label_Draw_F *, FL_Label_Measure_F *)`
Sets the functions to call to draw and measure a specific labeltype.
- `void FL::set_labeltype (FL_Labeltype, FL_Labeltype from)`
Sets the functions to call to draw and measure a specific labeltype.
- `int FL::system (const char *command)`
Run a command line on the computer.
- `FL_System_Driver * FL::system_driver ()`
Returns a pointer to the unique FL_System_Driver object of the platform.
- `void * FL::thread_message ()`
Returns the last message sent by a child thread.
- `long FL::ticks_between (FL_Timestamp &back, FL_Timestamp &further_back)`
Return the time in ticks (60Hz) between two time stamps.
- `long FL::ticks_since (FL_Timestamp &then)`
Return the time in ticks (60Hz) between now and a previously taken time stamp.
- `std::vector< TimeoutData > FL::timeout_list ()`
Return a list of all currently running timeouts.
- `void FL::unlock ()`
Release the global UI lock set by FL::lock().
- `int FL::use_high_res_GL ()`
returns whether GL windows should be drawn at high resolution on Apple computers with retina displays.
- `void FL::use_high_res_GL (int val)`
sets whether GL windows should be drawn at high resolution on Apple computers with retina displays

- double `Fl::version` ()
Returns the compiled-in value of the `FL_VERSION` constant.
- int `Fl::visual` (int)
Selects a visual so that your graphics are drawn correctly.
- int `Fl::w` ()
Returns the width in pixels of the main screen work area.
- int `Fl::wait` ()
Waits until "something happens" and then returns.
- double `Fl::wait` (double time)
Waits a maximum of `time_to_wait` seconds or until "something happens".
- int `Fl::x` ()
Returns the leftmost x coordinate of the main screen work area.
- int `Fl::y` ()
Returns the topmost y coordinate of the main screen work area.

Variables

- void(* `Fl::atclose`)(FL_Window *, void *) = `Fl::default_atclose`
Back compatibility: default window callback handler.
- void(* `Fl::error`)(const char *,...) = `Fl_System_Driver::error`
FLTK calls `Fl::error()` to output a normal error message.
- void(* `Fl::fatal`)(const char *,...) = `Fl_System_Driver::fatal`
FLTK calls `Fl::fatal()` to output a fatal error message.
- const char * `fl_local_alt`
string pointer used in shortcuts, you can change it to another language
- const char * `fl_local_ctrl`
string pointer used in shortcuts, you can change it to another language
- const char * `fl_local_meta`
string pointer used in shortcuts, you can change it to another language
- const char * `fl_local_shift`
string pointer used in shortcuts, you can change it to another language
- const char *const `Fl::help` = `helpmsg+13`
Usage string displayed if `Fl::args()` detects an invalid argument.
- void(* `Fl::warning`)(const char *,...) = `Fl_System_Driver::warning`
FLTK calls `Fl::warning()` to output a warning message.

14.14.1 Detailed Description

`Fl` namespace.

14.15 FL.H

14.18.1 Detailed Description

API for common dialogs.

14.18.2 Enumeration Type Documentation

14.18.2.1 FL_Beep

enum [FL_Beep](#)

Defines the different system beeps available.

Some systems may play different sounds or use different sound volume depending on the [FL_Beep](#) value. The implementation is platform dependent.

See also

[fl_beep\(int\)](#)

Enumerator

FL_BEEP_DEFAULT	Default beep.
FL_BEEP_MESSAGE	Message beep.
FL_BEEP_ERROR	Error beep.

Enumerator

FL_BEEP_QUESTION	Question beep.
FL_BEEP_PASSWORD	Password beep.
FL_BEEP_NOTIFICATION	Notification beep.

14.18.3 Function Documentation

14.18.3.1 fl_message_position()

```
void fl_message_position (
    Fl_Widget & widget ) [inline]
```

14.20 fl_attr.h File Reference

This file defines compiler-specific macros.

Macros

- `#define __fl_attr(x)`
This section lists macros for Doxygen documentation only.
- `#define FL_DEPRECATED(msg, func)`
Enclosing a function or method in FL_DEPRECATED marks it as no longer recommended.
- `#define FL_OVERRIDE override`
This macro makes it safe to use the C++11 keyword `override` with older compilers.

14.20.1 Detailed Description

This file defines compiler-specific macros.

14.20.2 Macro Definition Documentation

14.20.2.1 __fl_attr

```
#define __fl_attr(
    x )
```

This section lists macros for Doxygen documentation only.

The next section will define the actual macros based on the compiler used and based on the capabilities of the version of that compiler. To be used in prototypes with a variable list of arguments. This macro helps detection of mismatches between format string and argument list at compilation time.

Usage example: [FL/fl_ask.H](#)

14.20.2.2 FL_DEPRECATED

```
#define FL_DEPRECATED(
    msg,
    func )
```

Value:

```
/*##### \deprecated msg *##/ \
func
```

Enclosing a function or method in FL_DEPRECATED marks it as no longer recommended.

This macro syntax can not be used if the return type contains a comma, which is not the case in FLTK.

```
FL_DEPRECATED("Outdated, don't use", int position()) { return position; }
```

14.20.2.3 FL_OVERRIDE

```
#define FL_OVERRIDE override
```

This macro makes it safe to use the C++11 keyword `override` with older compilers.

Since FLTK 1.5.0 a C++11 capable compiler is required, hence we can safely define FL_OVERRIDE unconditionally as 'override'.

This macro is kept for backwards compatibility with old (1.4.x) user code that uses the FL_OVERRIDE macro.

We recommend to use 'override' explicitly if C++11 or higher is available.

14.21 fl_attr.h

14.29 FL_Cairo.H File Reference

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).

```
#include <FL/Fl.H>
```

```
#include <cairo.h>
```

Classes

- class [FL_Cairo_State](#)

Contains all the necessary info on the current cairo context.

14.29.1 Detailed Description

Cairo is currently supported for the following platforms: Windows, macOS, Unix/Linux (X11 + Wayland).

Note

In FLTK 1.3.x this header file ([FL_Cairo.H](#)) included the platform specific Cairo headers. This is no longer true since 1.4.0.

This header file is platform agnostic. If you need platform specific Cairo headers you need to `#include` them in your source file.

To use FLTK's builtin Cairo support you need to `#include <FL/Fl.H>` **before** you include any other FLTK header which is officially required anyway. Since FLTK 1.4.0 the preprocessor constants `FLTK_HAVE_CAIRO` and/or `FLTK_HAVE_CAIROEXT` are defined in `<FL/Fl.H>` by including `<FL/fl_config.h>`.

14.33 fl_callback_macros.H File Reference

This file provides macros for easy function and method callbacks with multiple type safe arguments.

#include <stdlib.h>

Macros

- `#define FL_FUNCTION_CALLBACK_3(WIDGET, FUNC, TYPE0, VALUE0, TYPE1, VALUE1, TYPE2, VALUE2)`
Declare a C function callback with custom parameters.
- `#define FL_INLINE_CALLBACK_2(WIDGET, TYPE0, NAME0, VALUE0, TYPE1, NAME1, VALUE1, LAMBDA)`
Creates code to declare a callback function in line with instantiating a widget.
- `#define FL_METHOD_CALLBACK_1(WIDGET, CLASS, SELF, METH, TYPE0, VALUE0)`
Declare a non-static class method callback with custom parameters.

14.33.1 Detailed Description

This file provides macros for easy function and method callbacks with multiple type safe arguments.

14.33.2 Macro Definition Documentation

14.33.2.1 FL_FUNCTION_CALLBACK_3

```
#define FL_FUNCTION_CALLBACK_3(
    WIDGET,
    FUNC,
    TYPE0,
    VALUE0,
    TYPE1,
    VALUE1,
    TYPE2,
    VALUE2 )
```

Declare a C function callback with custom parameters.

You can declare a plain C function callback or a static method callback with custom parameters using this macro. It simplifies the process of calling arbitrary functions with up to five custom parameters. The macro generates code that ensures type safety and expands FLTK's standard callbacks, which are limited to a single `void*` or `long` argument.

To use the macro, you provide the widget that will handle the callback as the first argument. The second argument can be either a regular function or a static method in any class.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5)

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>
...
Fl_Button *btn1 = new Fl_Button(10, 10, 100, 20, "Beep");
FL_FUNCTION_CALLBACK_0(btn1, fl_beep);
...
Fl_Button *btn2 = new Fl_Button(10, 40, 100, 20, "Hello");
FL_FUNCTION_CALLBACK_5(btn2,
    fl_message,
    const char *, "Hello\n%d %d %d %d",
    int, 1, int, 2, int, 3, int, 4
);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>FUNC</i>	a C/C++ function or a static class method
<i>TYPE0,VALUE0,TYPE1,VALUE1,TYPE2,VALUE2</i>	a list of zero to five type/value pairs, all separated by commas

See also

[FL_METHOD_CALLBACK_1](#), [FL_INLINE_CALLBACK_2](#)

14.33.2.2 FL_INLINE_CALLBACK_2

```
#define FL_INLINE_CALLBACK_2(  
    WIDGET,  
    TYPE0,  
    NAME0,  
    VALUE0,  
    TYPE1,  
    NAME1,  
    VALUE1,  
    LAMBDA )
```

Creates code to declare a callback function in line with instantiating a widget.

You can use this macro to create a function as a callback, allowing you to define the callback function right where the widget and callback are declared, similar to a Lambda function.

The first argument of the macro specifies the widget that will handle the callback. Next, you can include up to five triplets, where each triplet consists of a type, a parameter name, and a value. For example, `int, x, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two triplets, such as `int, x, 3, int, y, 4`. The last digit of the macro name must be the same as the number of triplets (0..5).

The last argument is the actual function body itself.

The function body is limited to a syntax that the macro preprocessor can handle. It should include the leading '{' and trailing '}' and may contain local variable declarations, use global variables and functions, and use also the variables listed and initialized in the argument triples of the macro. Very large function bodies should be avoided because they may exceed the admissible size of a macro argument.

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```
#include <FL/fl_callback_macros.H>  
...  
Fl_Button *btn = new Fl_Button(10, 10, 100, 20, "Test");  
FL_INLINE_CALLBACK_1(btn,  
    const char *, name, btn->label(),  
    {  
        fl_message("Greetings from the %s button", name);  
    }  
);
```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>TYPE0</i>	the type of the first parameter in the function call
<i>NAME0</i>	an arbitrary variable name that can be used as a parameter in the function body
<i>VALUE0</i>	a constant value or a variable; the value of the variable is copied when the callback is created
<i>TYPE1,NAME1,VALUE1</i>	as above; there are six macros that support 0 to 5 parameters
<i>LAMBDA</i>	the function body within the limits of the C macro preprocessor

See also

[FL_METHOD_CALLBACK_1](#), [FL_FUNCTION_CALLBACK_3](#)

14.33.2.3 FL_METHOD_CALLBACK_1

```
#define FL_METHOD_CALLBACK_1(  
    WIDGET,  
    CLASS,
```

```

    SELF,
    METH,
    TYPE0,
    VALUE0 )

```

Declare a non-static class method callback with custom parameters.

You can declare a callback for a non-static class method with custom parameters using this macro. It provides a convenient way to call arbitrary methods in any class, overcoming FLTK's limitation of passing only a single `void*` or `long` argument. Furthermore, it ensures type safety.

The first argument of the macro specifies the widget that will handle the callback. The second argument indicates the class type to be called. The third argument must be a pointer to an instance of that class. The fourth argument is the name of the method within the class. That method must be public and should not be static.

Following these arguments, you can include up to five pairs, where each pair consists of a type and a value. For example, `int, 3` specifies an integer parameter with a value of 3. If you need to pass two arguments, you can use two pairs, like this: `int, 3, int, 4`. The last digit of the macro name must be the same as the number of pairs (0..5)

Whenever the code generated by the macro is called, the custom parameters are duplicated and marked for automatic deallocation using `delete` when the callback widget is destroyed.

```

#include <FL/fl_callback_macros.H>
...
Fl_Button *btn = new Fl_Button(10, 10, 100, 20, "Test");
FL_METHOD_CALLBACK_1(btn, Fl_Button, btn, color, Fl_Color, FL_GREEN);

```

You can find a small demonstration program showcasing the usage of `FL*_CALLBACK_*` in the `examples/callbacks.cxx` file.

Parameters

<i>WIDGET</i>	the widget that will call the callback
<i>CLASS</i>	the class type
<i>SELF</i>	a pointer to an instance of the class
<i>METH</i>	a C++ class method that must be public and not static
<i>TYPE0,VALUE0</i>	a list of zero to five type/value pairs, all separated by commas

00453 } while(0)
00454
00455 /*
00456 These macros create boilerplate code for callback functions inlined into
00457 the widget creation code (similar to lambda functions in C++11 and up)
00458 with up to five arguments.
00459
00460 This macro invocation for example
00461 ```
00462 FL_INLINE_CALLBACK_2(           // callback has two parameters
00463     btn,                        // attach callback to this button
00464     const char *, text, "FLTK", // first parameter (type, name, value)
00465     int, number, 2,             // second parameter
00466     {                           // function body
00467         fl_message("We received the message %s with %d!", text, number);
00468     }
00469 );
00470 ```
00471 will generate the following code:
00472 ```
00473 do {
00474     class Fl_Callback_User_Data_133 : public Fl_Callback_User_Data {
00475     public:
00476         const char * p0_;           // store first parameter here
00477         int p1_;                   // store second parameter here
00478         // lambda style function
00479         static void fn(const char * text, int number ) {
00480             fl_message("We received the message %s with %d!", text, number);
00481         }
00482         // FLTK style callback
00483         static void cb(Fl_Widget *w, void *user_data) {
00484             Fl_Callback_User_Data_133 *d = (Fl_Callback_User_Data_133*)user_data;
00485             fn(d->p0_, d->p1_);
00486         }
00487         // class constructor
00488         Fl_Callback_User_Data_133(const char * p0, int p1)
00489         : p0_(p0),                 // copy parameter 0
00490           p1_(p1)                 // copy parameter 1
00491         { }                       // constructor body
00492     };
00493     // connect our class to the widget callback
00494     btn->callback(Fl_Callback_User_Data_133::cb,
00495                 new Fl_Callback_User_Data_133("FLTK", 2),
00496                 true);
00497 } while(0);                       // user code adds semicolon
00498 ```
00499
00500 Clicking the Fl_Button `btn` will call
00501 `fl_message("We received the message %s with %d!", "FLTK", 2);`.
00502 Deleting the button will also delete the data that was created in our
00503 boilerplate code.

14.36 Fl_Chart.H File Reference

[Fl_Chart](#) widget.

```
#include "Fl_Widget.H"
```

Classes

- class [Fl_Chart](#)
Fl_Chart displays simple charts.
- struct [FL_CHART_ENTRY](#)
For internal use only.

Macros

- #define [FL_BAR_CHART](#) 0
type() for Bar Chart variant
- #define [FL_CHART_LABEL_MAX](#) 18

- max label length for entry*
- **#define FL_CHART_MAX** 128
- max entries per chart*
- **#define FL_FILL_CHART** 3
- type() for Fill Line Chart variant*
- **#define FL_FILLED_CHART** [FL_FILL_CHART](#)
- for compatibility*
- **#define FL_HORBAR_CHART** 1
- type() for Horizontal Bar Chart variant*
- **#define FL_LINE_CHART** 2
- type() for Line Chart variant*
- **#define FL_PIE_CHART** 5
- type() for Pie Chart variant*
- **#define FL_SPECIALPIE_CHART** 6
- type() for Special Pie Chart variant*
- **#define FL_SPIKE_CHART** 4
- type() for Spike Chart variant*

14.36.1 Detailed Description

[Fl_Chart](#) widget.

declaration of classes [Fl_Surface_Device](#), [Fl_Display_Device](#), [Fl_Device_Plugin](#).

```

#include <FL/Fl_Plugin.H>
#include <FL/platform_types.h>

```

Classes

- class [Fl_Device_Plugin](#)
This plugin socket allows the integration of new device drivers for special window or screen types.
- class [Fl_Display_Device](#)
The computer's display.
- class [Fl_Surface_Device](#)
A drawing surface that's susceptible to receive graphical output.

14.46.1 Detailed Description

declaration of classes [Fl_Surface_Device](#), [Fl_Display_Device](#), [Fl_Device_Plugin](#).

14.50 fl_draw.H File Reference

utility header to pull drawing functions together

```

#include <FL/Enumerations.H>
#include <FL/Fl_Graphics_Driver.H>
#include <FL/Fl_Rect.H>

```

Enumerations

- enum {

FL_SOLID = 0 , FL_DASH = 1 , FL_DOT = 2 , FL_DASHDOT = 3 ,

FL_DASHDOTDOT = 4 , FL_CAP_FLAT = 0x100 , FL_CAP_ROUND = 0x200 , FL_CAP_SQUARE = 0x300 ,

```
FL_JOIN_MITER = 0x1000 , FL_JOIN_ROUND = 0x2000 , FL_JOIN_BEVEL = 0x3000 , FL_UNIFORM_WIDTH
= 0x10000 }
```

Functions

- `int fl_add_symbol (const char *name, void(*drawit)(FL_Color), int scalable)`
Adds a symbol to the system.
- `int fl_antialias ()`
Return whether line drawings are currently antialiased.
- `void fl_antialias (int state)`
Turn antialiased line drawings ON or OFF, if supported by platform.
- `void fl_arc (double x, double y, double r, double start, double end)`
Add a series of points to the current path on the arc of a circle.
- `void fl_arc (int x, int y, int w, int h, double a1, double a2)`
Draw ellipse sections using integer coordinates.
- `void fl_begin_complex_polygon ()`
Start drawing a complex filled polygon.
- `void fl_begin_line ()`
Start drawing a list of lines.
- `void fl_begin_loop ()`
Start drawing a closed sequence of lines.
- `void fl_begin_offscreen (FL_Offscreen ctx)`
Send all subsequent drawing commands to this offscreen buffer.
- `void fl_begin_points ()`
Start drawing a list of points.
- `void fl_begin_polygon ()`
Start drawing a convex filled polygon.
- `char fl_can_do_alpha_blending ()`
Check whether platform supports true alpha blending for RGBA images.
- `FL_RGB_Image * fl_capture_window (FL_Window *win, int x, int y, int w, int h)`
Captures the content of a rectangular zone of a mapped window.
- `void fl_chord (int x, int y, int w, int h, double a1, double a2)`
fl_chord declaration is a place holder - the function does not yet exist
- `void fl_circle (double x, double y, double r)`
fl_circle(x,y,r) is equivalent to fl_arc(x,y,r,0,360), but may be faster.
- `int fl_clip_box (int x, int y, int w, int h, int &X, int &Y, int &W, int &H)`
Intersect a rectangle with the current clip region and return the bounding box of the result.
- `FL_Region fl_clip_region ()`
Return the current clipping region.
- `void fl_clip_region (FL_Region r)`
Replace the top of the clipping stack with a clipping region of any shape.
- `FL_Color fl_color ()`
Return the last fl_color() that was set.
- `void fl_color (FL_Color c)`
Set the color for all subsequent drawing operations.
- `void fl_color (int c)`
for back compatibility - use fl_color(FL_Color c) instead
- `void fl_color (uchar r, uchar g, uchar b)`
Set the color for all subsequent drawing operations.
- `void fl_copy_offscreen (int x, int y, int w, int h, FL_Offscreen pixmap, int srcx, int srcy)`

- Copy a rectangular area of the given offscreen buffer into the current drawing destination.*
- [FL_Offscreen fl_create_offscreen](#) (int w, int h)
 - Creation of an offscreen graphics buffer.*
- void [fl_cursor](#) ([FL_Cursor](#))
 - Sets the cursor for the current window to the specified shape and colors.*
- void [fl_cursor](#) ([FL_Cursor](#), [FL_Color](#) fg, [FL_Color](#) bg=FL_WHITE)
- void [fl_curve](#) (double X0, double Y0, double X1, double Y1, double X2, double Y2, double X3, double Y3)
 - Add a series of points on a Bézier curve to the path.*
- void [fl_delete_offscreen](#) ([FL_Offscreen](#) ctx)
 - Deletion of an offscreen graphics buffer.*
- int [fl_descent](#) ()
 - Return the recommended distance above the bottom of a [fl_height\(\)](#) tall box to draw the text at so it looks centered vertically in that box.*
- void [fl_draw](#) (const char *str, int n, int x, int y)
 - Draws starting at the given x, y location a UTF-8 string of length n bytes.*
- void [fl_draw](#) (const char *str, int x, int y)
 - Draw a nul-terminated UTF-8 string starting at the given x, y location.*
- void [fl_draw](#) (const char *str, int x, int y, int w, int h, [FL_Align](#) align, [FL_Image](#) *img=0, int draw_symbols=1, int spacing=0)
 - Fancy string drawing function which is used to draw all the labels.*
- void [fl_draw](#) (const char *str, int x, int y, int w, int h, [FL_Align](#) align, void(*callthis)(const char *, int, int, int), [FL_Image](#) *img=0, int draw_symbols=1, int spacing=0)
 - The same as [fl_draw\(const char*,int,int,int,int,FL_Align,FL_Image*,int\)](#) with the addition of the *callthis* parameter, which is a pointer to a text drawing function such as [fl_draw\(const char*, int, int, int\)](#) to do the real work.*
- void [fl_draw](#) (int angle, const char *str, int n, int x, int y)
 - Draw at the given x, y location a UTF-8 string of length n bytes rotating *angle* degrees counter-clockwise.*
- void [fl_draw](#) (int angle, const char *str, int x, int y)
 - Draw a nul-terminated UTF-8 string starting at the given x, y location and rotating *angle* degrees counter-clockwise.*
- void [fl_draw_arrow](#) ([FL_Rect](#) bb, [FL_Arrow_Type](#) t, [FL_Orientation](#) o, [FL_Color](#) color)
 - Draw an "arrow like" GUI element for the selected scheme.*
- void [fl_draw_box](#) ([FL_Boxtype](#), int x, int y, int w, int h, [FL_Color](#))
 - Draws a box using given type, position, size and color.*
- void [fl_draw_box_focus](#) ([FL_Boxtype](#), int x, int y, int w, int h, [FL_Color](#), [FL_Color](#))
 - Draws the focus rectangle inside a box using given type, position, size and color.*
- void [fl_draw_check](#) ([FL_Rect](#) bb, [FL_Color](#) col)
 - Draw a check mark inside the given bounding box.*
- void [fl_draw_circle](#) (int x, int y, int d, [FL_Color](#) color)
 - Draw a potentially small, filled circle using a given color.*
- void [fl_draw_image](#) (const [uchar](#) *buf, int X, int Y, int W, int H, int D=3, int L=0)
 - Draw an 8-bit per color RGB or luminance image.*
- void [fl_draw_image](#) ([FL_Draw_Image_Cb](#) cb, void *data, int X, int Y, int W, int H, int D=3)
 - Draw an image using a callback function to generate image data.*
- void [fl_draw_image_mono](#) (const [uchar](#) *buf, int X, int Y, int W, int H, int D=1, int L=0)
 - Draw a gray-scale (1 channel) image.*
- void [fl_draw_image_mono](#) ([FL_Draw_Image_Cb](#) cb, void *data, int X, int Y, int W, int H, int D=1)
 - Draw a gray-scale image using a callback function to generate image data.*
- int [fl_draw_pixmap](#) (char *const *data, int x, int y, [FL_Color](#) bg=FL_GRAY)
 - Draw XPM image data, with the top-left corner at the given position.*
- int [fl_draw_pixmap](#) (const char *const *cdata, int x, int y, [FL_Color](#) bg=FL_GRAY)
 - Draw XPM image data, with the top-left corner at the given position.*
- void [fl_draw_radio](#) (int x, int y, int d, [FL_Color](#) color)

- Draw a round check mark (circle) of a radio button.*

 - `int fl_draw_symbol` (const char *label, int x, int y, int w, int h, `FL_Color`)

Draw the named symbol in the given rectangle using the given color.
- `void fl_end_complex_polygon` ()

End complex filled polygon, and draw.
- `void fl_end_line` ()

End list of lines, and draw.
- `void fl_end_loop` ()

End closed sequence of lines, and draw.
- `void fl_end_offscreen` ()

Quit sending drawing commands to the current offscreen buffer.
- `void fl_end_points` ()

End list of points, and draw.
- `void fl_end_polygon` ()

End convex filled polygon, and draw.
- `const char * fl_expand_text` (const char *from, char *buf, int maxbuf, double maxw, int &n, double &width, int wrap, int draw_symbols=0)

Copy from to buf, replacing control characters with ^X.
- `void fl_focus_rect` (int x, int y, int w, int h)

Draw a dotted rectangle, used to indicate keyboard focus on a widget.
- `FL_Font fl_font` ()

Return the face set by the most recent call to fl_font().
- `void fl_font` (`FL_Font` face, `FL_Fontsize` fsize)

Sets the current font, which is then used in various drawing routines.
- `void fl_frame` (const char *s, int x, int y, int w, int h)

Draws a series of line segments around the given box.
- `void fl_frame2` (const char *s, int x, int y, int w, int h)

Draws a series of line segments around the given box.
- `void fl_gap` ()

Separate loops of the path.
- `int fl_height` ()

Return the recommended minimum line spacing for the current font.
- `int fl_height` (int font, int size)

This function returns the actual height of the specified font and size.
- `const char * fl_latin1_to_local` (const char *t, int n=-1)

Convert text from Windows/X11 latin1 character set to local encoding.
- `void fl_line` (int x, int y, int x1, int y1)

Draw a line from (x,y) to (x1,y1)
- `void fl_line` (int x, int y, int x1, int y1, int x2, int y2)

Draw a line from (x,y) to (x1,y1) and another from (x1,y1) to (x2,y2)
- `void fl_line_style` (int style, int width=0, char *dashes=0)

Set how to draw lines (the "pen").
- `void fl_load_identity` ()

Set the transformation matrix to identity.
- `void fl_load_matrix` (double a, double b, double c, double d, double x, double y)

Set the current transformation matrix.
- `const char * fl_local_to_latin1` (const char *t, int n=-1)

Convert text from local encoding to Windows/X11 latin1 character set.
- `const char * fl_local_to_mac_roman` (const char *t, int n=-1)

Convert text from local encoding to Mac Roman character set.
- `void fl_loop` (int x, int y, int x1, int y1, int x2, int y2)

- Outline a 3-sided polygon with lines.*

 - void **fl_loop** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)
- Outline a 4-sided polygon with lines.*

 - const char * **fl_mac_roman_to_local** (const char *t, int n=-1)

Convert text from Mac Roman character set to local encoding.

 - void **fl_measure** (const char *str, int &x, int &y, int draw_symbols=1)

Measure how wide and tall the string will be when printed by the fl_draw() function with align parameter.

 - int **fl_measure_pixmap** (char *const *data, int &w, int &h)

Get the dimensions of a pixmap.

 - int **fl_measure_pixmap** (const char *const *cdata, int &w, int &h)

Get the dimensions of a pixmap.

 - void **fl_mult_matrix** (double a, double b, double c, double d, double x, double y)

Concatenate another transformation onto the current one.

 - int **fl_not_clipped** (int x, int y, int w, int h)

Does the rectangle intersect the current clip region?

 - unsigned int **fl_old_shortcut** (const char *s)

Emulation of XForms named shortcuts.

 - void **fl_overlay_clear** ()

Erase a selection rectangle without drawing a new one.

 - void **fl_overlay_rect** (int x, int y, int w, int h)

Draw a transient dotted selection rectangle.

 - float **fl_override_scale** ()

Removes any GUI scaling factor in subsequent drawing operations.

 - void **fl_pie** (int x, int y, int w, int h, double a1, double a2)

Draw filled ellipse sections using integer coordinates.

 - void **fl_point** (int x, int y)

Draw a single pixel at the given coordinates.

 - void **fl_polygon** (int x, int y, int x1, int y1, int x2, int y2)

Fill a 3-sided polygon.

 - void **fl_polygon** (int x, int y, int x1, int y1, int x2, int y2, int x3, int y3)

Fill a 4-sided polygon.

 - void **fl_pop_clip** ()

Restore the previous clip region.

 - void **fl_pop_matrix** ()

Restore the current transformation matrix from the stack.

 - void **fl_push_clip** (int x, int y, int w, int h)

Intersect the current clip region with a rectangle and push this new region onto the stack.

 - void **fl_push_matrix** ()

Save the current transformation matrix on the stack.

 - void **fl_push_no_clip** ()

Push an empty clip region onto the stack so nothing will be clipped.

 - uchar * **fl_read_image** (uchar *p, int X, int Y, int W, int H, int alpha=0)

Reads an RGB(A) image from the current window or off-screen buffer.

 - void **fl_rect** (Fl_Rect r)

Draw a border inside the given bounding box.

 - void **fl_rect** (int x, int y, int w, int h)

Draw a border inside the given bounding box.

 - void **fl_rect** (int x, int y, int w, int h, Fl_Color c)

Draw with passed color a border inside the given bounding box.

 - void **fl_rectf** (Fl_Rect bb, uchar r, uchar g, uchar b)

Color a rectangle with "exactly" the passed r, g, b color.

- void **fl_rectf** ([Fl_Rect](#) r)
Color with current color a rectangle that exactly fills the given bounding box.
- void **fl_rectf** ([Fl_Rect](#) r, [Fl_Color](#) c)
Color with passed color a rectangle that exactly fills the given bounding box.
- void **fl_rectf** (int x, int y, int w, int h)
Color with current color a rectangle that exactly fills the given bounding box.
- void **fl_rectf** (int x, int y, int w, int h, [Fl_Color](#) c)
Color with passed color a rectangle that exactly fills the given bounding box.
- void **fl_rectf** (int x, int y, int w, int h, [uchar](#) r, [uchar](#) g, [uchar](#) b)
*Color a rectangle with "exactly" the passed *r*, *g*, *b* color.*
- void **fl_rescale_offscreen** ([Fl_Offscreen](#) &ctx)
Adapts an offscreen buffer to a changed value of the scale factor.
- void **fl_reset_spot** (void)
Resets marked text.
- void **fl_restore_clip** ()
Undo any clobbering of the clip region done by your program.
- void **fl_restore_scale** (float s)
Restores the GUI scaling factor in subsequent drawing operations.
- void **fl_rotate** (double d)
Concatenate rotation transformation onto the current one.
- void **fl_rounded_rect** (int x, int y, int w, int h, int r)
Draw a rounded border inside the given bounding box.
- void **fl_rounded_rectf** (int x, int y, int w, int h, int r)
Color with current color a rounded rectangle that exactly fills the given bounding box.
- void **fl_rtl_draw** (const char *str, int n, int x, int y)
*Draw a UTF-8 string of length *n* bytes right to left starting at the given *x*, *y* location.*
- void **fl_scale** (double x)
Concatenate scaling transformation onto the current one.
- void **fl_scale** (double x, double y)
Concatenate scaling transformation onto the current one.
- void **fl_scroll** (int X, int Y, int W, int H, int dx, int dy, void(*draw_area)(void *, int, int, int, int), void *data)
Scroll a rectangle and draw the newly exposed portions.
- void **fl_set_spot** (int font, int size, int X, int Y, int W, int H, [Fl_Window](#) *win=0)
Inform text input methods about the current text insertion cursor.
- void **fl_set_status** (int X, int Y, int W, int H)
Related to text input methods under X11.
- const char * **fl_shortcut_label** (unsigned int shortcut)
Get a human-readable string from a shortcut value.
- const char * **fl_shortcut_label** (unsigned int shortcut, const char **eom)
Get a human-readable string from a shortcut value.
- [Fl_Fontsize](#) **fl_size** ()
*Return the *size* set by the most recent call to [fl_font\(\)](#).*
- void **fl_text_extents** (const char *t, int &dx, int &dy, int &w, int &h)
Determine the minimum pixel dimensions of a nul-terminated string using the current [fl_font\(\)](#).
- void **fl_text_extents** (const char *t, int n, int &dx, int &dy, int &w, int &h)
*Determine the minimum pixel dimensions of a sequence of *n* bytes of text using the current font face and size.*
- double **fl_transform_dx** (double x, double y)
Transform distance using current transformation matrix.
- double **fl_transform_dy** (double x, double y)
Transform distance using current transformation matrix.
- double **fl_transform_x** (double x, double y)

- Transform coordinate using the current transformation matrix.*
- double **fl_transform_y** (double x, double y)
- Transform coordinate using the current transformation matrix.*
- void **fl_transformed_vertex** (double xf, double yf)
- Add coordinate pair to the vertex list without further transformations.*
- void **fl_translate** (double x, double y)
- Concatenate translation transformation onto the current one.*
- void **fl_vertex** (double x, double y)
- Add a single vertex to the current path.*
- double **fl_width** (const char *txt)
- Return the typographical width of a nul-terminated string using the current font face and size.*
- double **fl_width** (const char *txt, int n)
- Return the typographical width of a sequence of n bytes of text in UTF-8 encoding, using the current font face and size.*
- double **fl_width** (unsigned int c)
- Return the typographical width of a single character using the current font face and size.*
- void **fl_xylene** (int x, int y, int x1)
- Draw a horizontal line from (x,y) to (x1,y).*
- void **fl_xylene** (int x, int y, int x1, int y2)
- Draw a horizontal line from (x,y) to (x1,y), then vertical from (x1,y) to (x1,y2).*
- void **fl_xylene** (int x, int y, int x1, int y2, int x3)
- Draw a horizontal line from (x,y) to (x1,y), then a vertical from (x1,y) to (x1,y2) and then another horizontal from (x1,y2) to (x3,y2).*
- void **fl_yxline** (int x, int y, int y1)
- Draw a vertical line from (x,y) to (x,y1)*
- void **fl_yxline** (int x, int y, int y1, int x2)
- Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1).*
- void **fl_yxline** (int x, int y, int y1, int x2, int y3)
- Draw a vertical line from (x,y) to (x,y1), then a horizontal from (x,y1) to (x2,y1), then another vertical from (x2,y1) to (x2,y3).*

Variables

- char **fl_draw_shortcut**

14.50.1 Detailed Description

utility header to pull drawing functions together

14.51 fl_draw.H

[Go to the documentation of this file.](#)

00068     friend FL_EXPORT void gl_start();
00069     /* ===== Implementation note about image drawing =====
00070     A graphics driver can implement up to 6 virtual member functions to draw images:
00071     virtual void draw_pixmap(Fl_Pixmap *pixmap,int XP, int YP, int WP, int HP, int cx, int cy)
00072     virtual void draw_bitmap(Fl_Bitmap *bm,int XP, int YP, int WP, int HP, int cx, int cy)
00073     virtual void draw_rgb(Fl_RGB_Image *rgb,int XP, int YP, int WP, int HP, int cx, int cy)
00074     and
00075     virtual void draw_fixed(Fl_Pixmap *pixmap,int XP, int YP, int WP, int HP, int cx, int cy)
00076     virtual void draw_fixed(Fl_Bitmap *bm,int XP, int YP, int WP, int HP, int cx, int cy)
00077     virtual void draw_fixed(Fl_RGB_Image *rgb,int XP, int YP, int WP, int HP, int cx, int cy)
00078     - The 1st group of functions is used when the driver can directly map the image data,
00079     sized at data_w() x data_h(), to the image drawing area, sized at w()*scale x h()*scale
00080     where scale is the current GUI scale factor.
00081     - If the driver does not support such scale-and-draw operation for a given image type,
00082     it should implement the draw_fixed() function which is called by the library after the
00083     image has been internally resized to the drawing size and cached.
00084     - The platform-independent Fl_Graphics_Driver class implements the 1st group of functions.
00085     Each resizes the image, caches it, and calls the platform-specific implementation of
00086     draw_fixed(image-class *,...) with the cached image.
00087     - Consider an image object, say from class Fl_RGB_Image. Fl_RGB_Image::draw()
00088     calls the virtual member function draw_rgb(Fl_RGB_Image *,...). If Fl_XXX_Graphics_Driver
00089     re-implements this function, this code runs and is expected to draw the image
00090     adequately scaled to its drawing size. If Fl_XXX_Graphics_Driver does not re-implement
00091     this function, Fl_Graphics_Driver::draw_rgb(Fl_RGB_Image *,...) runs. It internally
00092     resizes the image, caches it, and calls Fl_XXX_Graphics_Driver::draw_fixed(Fl_RGB_Image *,...)
00093     that draws the image from its cached form which already has the adequate size.
00094     - Some drivers implement, for a given image class, only the function of the 1st group or
00095     only draw_fixed() as in these examples:
00096     - Fl_Quartz_Graphics_Driver implements only draw_rgb(Fl_RGB_Image *,...) because it
00097     can perform the scale-and-draw operation whatever the RGB image and the required scaling.
00098     - Fl_Xlib_Graphics_Driver implements only draw_fixed(Fl_Pixmap *,...). The library
00099     takes care of resizing and caching the Pixmap to the adequate drawing size.
00100     - Some drivers implement, for a given image class, the function of both groups, e.g. :
00101     Fl_GDI_Graphics_Driver implements both draw_rgb(Fl_RGB_Image *,...) and
00102     draw_fixed(Fl_RGB_Image *,...) because scale-and-draw may require function Alphablend()
00103     from MSIMG32.DLL. In the absence of that, the draw_rgb() implementation calls
00104     Fl_Graphics_Driver::draw_rgb() which runs Fl_GDI_Graphics_Driver::draw_fixed(Fl_RGB_Image*,...).
00105
00106     Graphics drivers also implement cache(Fl_Pixmap*), cache(Fl_Bitmap*) and cache(Fl_RGB_Image*)
00107     to compute the cached form of all image types, and uncache(Fl_RGB_Image *,...),
00108     uncache_pixmap(fl_uintptr_t) and delete_bitmap(fl_uintptr_t) to destroy cached image forms.
00109     Graphics drivers that use the mask_ variable of class Fl_Pixmap to cache an Fl_Pixmap
00110     object also reimplement the uchar **Fl_Graphics_Driver::mask_bitmap() member function.
00111     */

14.67 FL_Grid.H File Reference

[FL_Grid](#) container widget.

```
#include <FL/Fl_Group.H>
```

```
#include <FL/Fl_Rect.H>
```

Classes

- class [FL_Grid::Cell](#)
- class [FL_Grid](#)

[FL_Grid](#) is a container (layout) widget with multiple columns and rows.

Typedefs

- typedef unsigned short **FL_Grid_Align**
[FL_Grid](#) type for child widget alignment control.

Variables

- const [FL_Grid_Align](#) **FL_GRID_BOTTOM** = 0x0002
Align the widget at the bottom of the cell.
- const [FL_Grid_Align](#) **FL_GRID_BOTTOM_LEFT** = [FL_GRID_BOTTOM](#) | [FL_GRID_LEFT](#)
- const [FL_Grid_Align](#) **FL_GRID_BOTTOM_RIGHT** = [FL_GRID_BOTTOM](#) | [FL_GRID_RIGHT](#)
- const [FL_Grid_Align](#) **FL_GRID_CENTER** = 0x0000
Align the widget in the middle of the cell (default).
- const [FL_Grid_Align](#) **FL_GRID_FILL** = 0x0030
Stretch the widget in both directions to fill the cell.
- const [FL_Grid_Align](#) **FL_GRID_HORIZONTAL** = 0x0010
Stretch the widget horizontally to fill the cell.

- const `Fl_Grid_Align` `FL_GRID_LEFT` = 0x0004
Align the widget at the left side of the cell.
- const `Fl_Grid_Align` `FL_GRID_PROPORTIONAL` = 0x0040
Stretch the widget proportionally.
- const `Fl_Grid_Align` `FL_GRID_RIGHT` = 0x0008
Align the widget at the right side of the cell.
- const `Fl_Grid_Align` `FL_GRID_TOP` = 0x0001
Align the widget at the top of the cell.
- const `Fl_Grid_Align` `FL_GRID_TOP_LEFT` = `FL_GRID_TOP` | `FL_GRID_LEFT`
- const `Fl_Grid_Align` `FL_GRID_TOP_RIGHT` = `FL_GRID_TOP` | `FL_GRID_RIGHT`
- const `Fl_Grid_Align` `FL_GRID_VERTICAL` = 0x0020
Stretch the widget vertically to fill the cell.

14.67.1 Detailed Description

`Fl_Grid` container widget.

14.68 Fl_Grid.H

14.69 Fl_Group.H File Reference

[Fl_Group](#) and [Fl_End](#) classes.

```

#include "Fl_Widget.H"
#include <vector>

```

Classes

- class [Fl_End](#)

This is a dummy class that allows you to end a [Fl_Group](#) in a constructor list of a class:

- class [Fl_Group](#)

The [Fl_Group](#) class is the main FLTK container widget.

14.69.1 Detailed Description

[Fl_Group](#) and [Fl_End](#) classes.

14.70 Fl_Group.H

[Go to the documentation of this file.](#)

14.79 Fl_Image.H File Reference

[Fl_Image](#), [Fl_RGB_Image](#) classes.

```
#include "Enumerations.H"
```

```
#include "Fl_Widget.H"
```

Classes

- class [Fl_Image](#)
Base class for image caching, scaling and drawing.
- class [Fl_RGB_Image](#)
The [Fl_RGB_Image](#) class supports caching and drawing of full-color images with 1 to 4 channels of color information.

Enumerations

- enum [Fl_RGB_Scaling](#) { [FL_RGB_SCALING_NEAREST](#) = 0 , [FL_RGB_SCALING_BILINEAR](#) }
The scaling algorithm to use for RGB images.

14.79.1 Detailed Description

[Fl_Image](#), [Fl_RGB_Image](#) classes.

14.79.2 Enumeration Type Documentation

14.79.2.1 Fl_RGB_Scaling

```
enum Fl\_RGB\_Scaling
```

The scaling algorithm to use for RGB images.

Enumerator

FL_RGB_SCALING_NEAREST	default RGB image scaling algorithm
FL_RGB_SCALING_BILINEAR	more accurate, but slower RGB image scaling algorithm

14.80 Fl_Image.H

Classes

- struct [Fl_Menu_Item](#)

The [Fl_Menu_Item](#) structure defines a single menu item that is used by the [Fl_Menu_](#) class.

Typedefs

- typedef [Fl_Menu_Item](#) **Fl_Menu**

Enumerations

- enum {
[FL_MENU_INACTIVE](#) = 1 , [FL_MENU_TOGGLE](#) = 2 , [FL_MENU_VALUE](#) = 4 , [FL_MENU_RADIO](#) = 8 ,
[FL_MENU_INVISIBLE](#) = 0x10 , [FL_SUBMENU_POINTER](#) = 0x20 , [FL_SUBMENU](#) = 0x40 , [FL_MENU_DIVIDER](#)
= 0x80 ,
[FL_MENU_HORIZONTAL](#) = 0x100 , [FL_MENU_CHATTY](#) = 0x200 , [FL_MENU_HEADLINE](#) = 0x400 }
- enum {
FL_PUP_NONE = 0 , **FL_PUP_GREY** = [FL_MENU_INACTIVE](#) , **FL_PUP_GRAY** = [FL_MENU_INACTIVE](#) ,
FL_MENU_BOX = [FL_MENU_TOGGLE](#) ,
FL_PUP_BOX = [FL_MENU_TOGGLE](#) , **FL_MENU_CHECK** = [FL_MENU_VALUE](#) , **FL_PUP_CHECK** = [FL_MENU_VALUE](#) , **FL_PUP_RADIO** = [FL_MENU_RADIO](#) ,
FL_PUP_INVISIBLE = [FL_MENU_INVISIBLE](#) , **FL_PUP_SUBMENU** = [FL_SUBMENU_POINTER](#) }

14.93.1 Enumeration Type Documentation

14.93.1.1 anonymous enum

anonymous enum

Enumerator

FL_MENU_INACTIVE	Deactivate menu item (gray out)
FL_MENU_TOGGLE	Item is a checkbox toggle (shows checkbox for on/off state)
FL_MENU_VALUE	The on/off state for checkbox/radio buttons (if set, state is 'on')
FL_MENU_RADIO	Item is a radio button (one checkbox of many can be on)
FL_MENU_INVISIBLE	Item will not show up (shortcut will work)
FL_SUBMENU_POINTER	Indicates <code>user_data()</code> is a pointer to another menu array.
FL_SUBMENU	Item is a submenu to other items.
FL_MENU_DIVIDER	Creates divider line below this item. Also ends a group of radio buttons.
FL_MENU_HORIZONTAL	reserved, do not use
FL_MENU_CHATTY	Menu Item receives additional callbacks.
FL_MENU_HEADLINE	Mark menu item as a headline. Note: All other bits in <code>flags</code> are reserved: do not use them for your own purposes!

00021 /* Implementation note:
00022
00023 class Fl_Native_File_Chooser <== public API used by applications
00024
00025 class Fl_Native_File_Chooser_Driver <== virtual API that a platform may implement
00026                                this API has a do-nothing default implementation
00027
00028 class Fl_Native_File_Chooser_FLTK_Driver <== this API implementation is the default FLTK
file chooser
00029 class Fl_GTK_Native_File_Chooser_Driver <== this API implementation runs a GTK file
chooser
00030 class Fl_Kdialog_Native_File_Chooser_Driver <== this API implementation runs a KDE
file chooser
00031                                it is determined at run-time if the GTK dynamic libraries are
available
00032                                and the KDE file chooser runs under the KDE desktop
00033
00034 class Fl_Quartz_Native_File_Chooser_Driver <== this API implementation runs a Mac OS X file
chooser
00035
00036 class Fl_WinAPI_Native_File_Chooser_Driver <== this API implementation runs a Windows file
chooser
00037
00038
00039 Each platform must implement the constructor of the Fl_Native_File_Chooser class.
00040 This particular implementation:
00041
00042 Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
00043     platform_fnfc = new Fl_Native_File_Chooser_FLTK_Driver(val);
00044 }
00045
00046 can be used by any platform.
00047 No more code is required. The cross-platform Fl_Native_File_Chooser_FLTK.cxx file must be compiled in
libfltk,
and the default FLTK file chooser will be used.
00049
00050 This other implementation:
00051 Fl_Native_File_Chooser::Fl_Native_File_Chooser(int val) {
00052     platform_fnfc = 0;
00053 }
00054 can be used by a platform that needs no file chooser.
00055 */

14.108 Fl_Paged_Device.H File Reference

declaration of class [Fl_Paged_Device](#).

```
#include <FL/Fl_Widget_Surface.H>
```

Classes

- class [Fl_Paged_Device](#)
Represents page-structured drawing surfaces.
- struct [Fl_Paged_Device::page_format](#)
width, height and name of a page format

Macros

- #define **NO_PAGE_FORMATS** 30 /* MSVC6 compilation fix */
Number of elements in enum Page_Format.

14.108.1 Detailed Description

declaration of class [Fl_Paged_Device](#).

14.109 Fl_Paged_Device.H

14.116 Fl_PostScript.H File Reference

declaration of classes [Fl_PostScript_File_Device](#) and [Fl_EPS_File_Surface](#).

```

#include <FL/Fl_Paged_Device.H>
#include <FL/fl_draw.H>
#include <stdarg.h>

```

Classes

- class [Fl_EPS_File_Surface](#)
Encapsulated PostScript drawing surface.
- class [Fl_PostScript_File_Device](#)
To send graphical output to a PostScript file.

Typedefs

- typedef int(* [Fl_PostScript_Close_Command](#)) (FILE *)
Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.

14.116.1 Detailed Description

declaration of classes [Fl_PostScript_File_Device](#) and [Fl_EPS_File_Surface](#).

14.116.2 Typedef Documentation

14.116.2.1 Fl_PostScript_Close_Command

typedef int (* Fl_PostScript_Close_Command) (FILE *)

Signature of functions FLTK may use to close FILE variables after PostScript/EPS output.

A non-null return value indicates output error.

See also

[Fl_PostScript_File_Device::close_command\(\)](#) and [Fl_EPS_File_Surface::Fl_EPS_File_Surface\(\)](#).

14.138 Fl_Shared_Image.H File Reference

[Fl_Shared_Image](#) class.

```
#include "Fl_Image.H"
```

Classes

- class [Fl_Shared_Image](#)

This class supports caching, loading, and drawing of image files.

Typedefs

- typedef [Fl_Image](#) *(* [Fl_Shared_Handler](#)) (const char *name, [uchar](#) *header, int headerlen)

Test function (typedef) for adding new shared image formats.

Functions

- void [fl_register_images](#) ()

Register the known image formats.

14.138.1 Detailed Description

[Fl_Shared_Image](#) class.

14.138.2 Typedef Documentation

14.138.2.1 Fl_Shared_Handler

```
typedef Fl\_Image *(* Fl\_Shared\_Handler) (const char *name, uchar *header, int headerlen)
```

Test function (typedef) for adding new shared image formats.

This defines the function type you can use to add a handler for unknown image formats that can be opened and loaded as an [Fl_Shared_Image](#).

[fl_register_images](#)() adds all image formats known to FLTK. Call [Fl_Shared_Image::add_handler\(\)](#) to add your own check function to the list of known image formats.

Your function will be passed the filename (*name*), some *header* bytes already read from the image file and the size *headerlen* of the data read. The max value of size is implementation dependent. If your handler function needs to check more bytes you must open the image file yourself.

The provided buffer *header* must not be overwritten.

If your handler function can identify the file type you must open the file and return a valid [Fl_Image](#) or derived type, otherwise you must return NULL. Example:

```

static Fl\_Image *check_my_image(const char *name,
                               uchar *header,
                               int headerlen) {
    // (test image type using header and headerlen)
    if (known) {
        // (load image data from file \p name)
        return new Fl\_RGB\_Image(data, ...);
    } else
        return 0;
}
// add your handler:
Fl\_Shared\_Image::add\_handler(check_my_image);

```

Parameters

in	<i>name</i>	filename to be checked and opened if applicable
in	<i>header</i>	portion of the file that has already been read
in	<i>headerlen</i>	length of provided header data

Returns

valid [Fl_Image](#) or NULL.

See also

[Fl_Shared_Image::add_handler\(\)](#)

14.138.3 Function Documentation

14.138.3.1 fl_register_images()

```
void fl_register_images ( ) [extern]
```

Register the known image formats.

This function is provided in the `fltk_images` library and registers all of the "extra" image file formats known to FLTK that are not part of the core FLTK library.

You may add your own image formats with [Fl_Shared_Image::add_handler\(\)](#).

14.141 fl_show_colormap.H File Reference

The `fl_show_colormap()` function hides the implementation classes used to provide the popup window and color selection mechanism.

Functions

- `Fl_Color fl_show_colormap (Fl_Color oldcol)`
Pops up a window to let the user pick a colormap entry.

14.141.1 Detailed Description

The `fl_show_colormap()` function hides the implementation classes used to provide the popup window and color selection mechanism.

00040
00041 /*
00042 "character size" is the size of a UTF-8 character in bytes
00043 "character width" is the width of a Unicode character in pixels
00044 "column" was originally defined as a character offset from the left margin.
00045 It was identical to the byte offset. In UTF-8, we have neither a byte offset
00046 nor truly fixed width fonts (*). Column could be a pixel value multiplied with
00047 an average character width (which is a bearable approximation).
00048
00049 * in Unicode, there are no fixed width fonts! Even if the ASCII characters may
00050 happen to be all the same width in pixels, Chinese characters surely are not.
00051 There are plenty of exceptions, like ligatures, that make special handling of
00052 "fixed" character widths a nightmare. I decided to remove all references to
00053 fixed fonts and see "columns" as a multiple of the average width of a
00054 character in the main font.

Classes

- class [FL_Tree](#)

Tree widget.

Enumerations

- enum [FL_Tree_Reason](#) {
[FL_TREE_REASON_NONE](#) = FL_REASON_UNKNOWN , [FL_TREE_REASON_SELECTED](#) = FL_↔
REASON_SELECTED , [FL_TREE_REASON_DESELECTED](#) = FL_REASON_DESELECTED , [FL_TREE_REASON_RESELE](#)
= FL_REASON_RESELECTED ,
[FL_TREE_REASON_OPENED](#) = FL_REASON_OPENED , [FL_TREE_REASON_CLOSED](#) = FL_↔
REASON_CLOSED , [FL_TREE_REASON_DRAGGED](#) = FL_REASON_DRAGGED }
The reason the callback was invoked.

14.169.1 Detailed Description

This file contains the definitions of the [FL_Tree](#) class.

14.169.2 Enumeration Type Documentation

14.169.2.1 FL_Tree_Reason

enum [FL_Tree_Reason](#)

The reason the callback was invoked.

Enumerator

FL_TREE_REASON_NONE	unknown reason
FL_TREE_REASON_SELECTED	an item was selected
FL_TREE_REASON_DESELECTED	an item was de-selected
FL_TREE_REASON_RESELECTED	an item was re-selected (double-clicked). See FL_Tree_Item_Reselect_Mode to enable this.
FL_TREE_REASON_OPENED	an item was opened
FL_TREE_REASON_CLOSED	an item was closed
FL_TREE_REASON_DRAGGED	an item was dragged into a new place

14.175 Fl_Tree_Prefs.H File Reference

This file contains the definitions for [Fl_Tree](#)'s preferences.

```
#include <FL/Fl.H>
```

Classes

- class [Fl_Tree_Prefs](#)
Tree widget's preferences.

Typedefs

- typedef void() [Fl_Tree_Item_Draw_Callback](#)([Fl_Tree_Item](#) *, void *)

Enumerations

- enum [Fl_Tree_Connector](#) { [FL_TREE_CONNECTOR_NONE](#) =0 , [FL_TREE_CONNECTOR_DOTTED](#) =1 , [FL_TREE_CONNECTOR_SOLID](#) =2 }
Defines the style of connection lines between items.
- enum [Fl_Tree_Item_Draw_Mode](#) { [FL_TREE_ITEM_DRAW_DEFAULT](#) =0 , [FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET](#) =1 , [FL_TREE_ITEM_HEIGHT_FROM_WIDGET](#) =2 }
Bit flags that control how item's labels and widget(s) are drawn in the tree via `item_draw_mode()`.
- enum [Fl_Tree_Item_Reselect_Mode](#) { [FL_TREE_SELECTABLE_ONCE](#) =0 , [FL_TREE_SELECTABLE_ALWAYS](#) }
- Defines the ways an item can be (re) selected via `item_reselect_mode()`.*
- enum [Fl_Tree_Select](#) { [FL_TREE_SELECT_NONE](#) =0 , [FL_TREE_SELECT_SINGLE](#) =1 , [FL_TREE_SELECT_MULTI](#) =2 , [FL_TREE_SELECT_SINGLE_DRAGGABLE](#) =3 }
- Tree selection style.*
- enum [Fl_Tree_Sort](#) { [FL_TREE_SORT_NONE](#) =0 , [FL_TREE_SORT_ASCENDING](#) =1 , [FL_TREE_SORT_DESCENDING](#) =2 }
- Sort order options for items added to the tree.*

14.175.1 Detailed Description

This file contains the definitions for [Fl_Tree](#)'s preferences.

```
Fl_Tree_Prefs
:
:.....:
:      :
Fl_Tree  :
|_____ Fl_Tree_Item
```

14.175.2 Enumeration Type Documentation

14.175.2.1 Fl_Tree_Connector

```
enum Fl_Tree_Connector
```

Defines the style of connection lines between items.

Enumerator

FL_TREE_CONNECTOR_NONE	Use no lines connecting items.
FL_TREE_CONNECTOR_DOTTED	Use dotted lines connecting items (default)
FL_TREE_CONNECTOR_SOLID	Use solid lines connecting items.

14.175.2.2 Fl_Tree_Item_Draw_Mode

enum [Fl_Tree_Item_Draw_Mode](#)

Bit flags that control how item's labels and widget(s) are drawn in the tree via `item_draw_mode()`.

Enumerator

FL_TREE_ITEM_DRAW_DEFAULT	If widget() defined, draw in place of label, and widget() tracks item height (default)
FL_TREE_ITEM_DRAW_LABEL_AND_WIDGET	If widget() defined, include label to the left of the widget.
FL_TREE_ITEM_HEIGHT_FROM_WIDGET	If widget() defined, widget()'s height controls item's height.

14.175.2.3 Fl_Tree_Item_Reselect_Mode

enum [Fl_Tree_Item_Reselect_Mode](#)

Defines the ways an item can be (re) selected via `item_reselect_mode()`.

Enumerator

FL_TREE_SELECTABLE_ONCE	Item can only be selected once (default)
FL_TREE_SELECTABLE_ALWAYS	Enables FL_TREE_REASON_RESELECTED events for callbacks.

14.175.2.4 Fl_Tree_Select

enum [Fl_Tree_Select](#)

Tree selection style.

Enumerator

FL_TREE_SELECT_NONE	Nothing selected when items are clicked.
FL_TREE_SELECT_SINGLE	Single item selected when item is clicked (default)
FL_TREE_SELECT_MULTI	Multiple items can be selected by clicking with SHIFT, CTRL or mouse drags.
FL_TREE_SELECT_SINGLE_DRAGGABLE	Single items may be selected, and they may be reordered by mouse drag.

14.175.2.5 Fl_Tree_Sort

enum [Fl_Tree_Sort](#)

Sort order options for items added to the tree.

Enumerator

FL_TREE_SORT_NONE	No sorting; items are added in the order defined (default).
FL_TREE_SORT_ASCENDING	Add items in ascending sort order.
FL_TREE_SORT_DESCENDING	Add items in descending sort order.

Typedefs

Miscellaneous

- typedef unsigned int [Fl_Shortcut](#)
16-bit Unicode character + 8-bit indicator for keyboard flags.
- typedef unsigned char **uchar**
unsigned char
- typedef unsigned long **ulong**
unsigned long

14.177.1 Detailed Description

This file contains simple "C"-style type definitions.

14.177.2 Typedef Documentation

14.177.2.1 Fl_Shortcut

```
typedef unsigned int Fl\_Shortcut
```

16-bit Unicode character + 8-bit indicator for keyboard flags.

Note

This **should** be 24-bit Unicode character + 8-bit indicator for keyboard flags. The upper 8 bits are currently unused but reserved.

Due to compatibility issues this type and all FLTK **shortcuts** can only be used with 16-bit Unicode characters (U+0000 .. U+FFFF) and not with the full range of unicode characters (U+0000 .. U+10FFFF).

This is caused by the bit flags `FL_SHIFT`, `FL_CTRL`, `FL_ALT`, and `FL_META` being all in the range 0x010000 .. 0x400000.

Todo Discuss and decide whether we can "shift" these special keyboard flags to the upper byte to enable full 21-bit Unicode characters (U+0000 .. U+10FFFF) plus the keyboard indicator bits as this was originally intended. This would be possible if we could rely on **all** programs being coded with symbolic names and not hard coded bit values.

#include <stdio.h>
#include <sys/stat.h>

```

Functions

- [int fl_access](#) (const char *f, int mode)
Cross-platform function to test a files access() with a UTF-8 encoded name or value.
- [int fl_chdir](#) (const char *path)
Cross-platform function to change the current working directory, given as a UTF-8 encoded string.
- [int fl_chmod](#) (const char *f, int mode)
Cross-platform function to set a files mode() with a UTF-8 encoded name or value.
- [int fl_close_fd](#) (int fd)
Cross-platform function to close a file descriptor.
- [int fl_execvp](#) (const char *file, char *const *argv)
Calls execvp on all platforms.
- [FILE * fl_fopen](#) (const char *f, const char *mode)
Cross-platform function to open files with a UTF-8 encoded name.
- [char * fl_getcwd](#) (char *buf, int len)
Cross-platform function to get the current working directory as a UTF-8 encoded value.
- [char * fl_getenv](#) (const char *v)
Cross-platform function to get environment variables with a UTF-8 encoded name or value.
- [char fl_make_path](#) (const char *path)
Cross-platform function to recursively create a path in the file system.
- [void fl_make_path_for_file](#) (const char *path)
Cross-platform function to create a path for the file in the file system.

- `int fl_mkdir (const char *f, int mode)`
Cross-platform function to create a directory with a UTF-8 encoded name.
- `unsigned int fl_nonspacing (unsigned int ucs)`
Returns true if the Unicode character `ucs` is non-spacing.
- `int fl_open (const char *fname, int oflags,...)`
Cross-platform function to open files with a UTF-8 encoded name.
- `int fl_open_ext (const char *fname, int binary, int oflags,...)`
Cross-platform function to open files with a UTF-8 encoded name.
- `int fl_putenv (const char *var)`
Cross-platform function to write environment variables with a UTF-8 encoded name or value.
- `int fl_rename (const char *f, const char *n)`
Cross-platform function to rename a filesystem object using UTF-8 encoded names.
- `int fl_rmdir (const char *f)`
Cross-platform function to remove a directory with a UTF-8 encoded name.
- `int fl_stat (const char *f, struct stat *b)`
Cross-platform function to `stat()` a file using a UTF-8 encoded name or value.
- `int fl_system (const char *cmd)`
Cross-platform function to run a system command with a UTF-8 encoded string.
- `int fl_tolower (unsigned int ucs)`
Returns the Unicode lower case value of `ucs`.
- `int fl_toupper (unsigned int ucs)`
Returns the Unicode upper case value of `ucs`.
- `unsigned fl_ucs_to_Utf16 (const unsigned ucs, unsigned short *dst, const unsigned dstlen)`
Convert a single 32-bit Unicode codepoint into an array of 16-bit characters.
- `int fl_unlink (const char *fname)`
Cross-platform function to `unlink()` (that is, delete) a file using a UTF-8 encoded filename.
- `char * fl_utf2mbcs (const char *s)`
Converts UTF-8 string `s` to a local multi-byte character string.
- `const char * fl_utf8_next_composed_char (const char *from, const char *end)`
Returns pointer to beginning of character after given location in UTF8 string accounting for emoji sequences.
- `const char * fl_utf8_previous_composed_char (const char *from, const char *begin)`
Returns pointer to beginning of character before given location in UTF8 string accounting for emoji sequences.
- `const char * fl_utf8back (const char *p, const char *start, const char *end)`
Move `p` backward until it points to the start of a UTF-8 character.
- `int fl_utf8bytes (unsigned ucs)`
Returns number of bytes that `utf8encode()` will use to encode the character `ucs`.
- `unsigned fl_utf8decode (const char *p, const char *end, int *len)`
Decode a single UTF-8 encoded character starting at `p`.
- `int fl_utf8encode (unsigned ucs, char *buf)`
Write the UTF-8 encoding of `ucs` into `buf` and return the number of bytes written.
- `unsigned fl_utf8from_mb (char *dst, unsigned dstlen, const char *src, unsigned srclen)`
Convert a filename from the locale-specific multibyte encoding used by Windows to UTF-8 as used by FLTK.
- `unsigned fl_utf8froma (char *dst, unsigned dstlen, const char *src, unsigned srclen)`
Convert an ISO-8859-1 (ie normal c-string) byte stream to UTF-8.
- `unsigned fl_utf8fromwbc (char *dst, unsigned dstlen, const wchar_t *src, unsigned srclen)`
Turn "wide characters" as returned by some system calls (especially on Windows) into UTF-8.
- `const char * fl_utf8fwd (const char *p, const char *start, const char *end)`
Move `p` forward until it points to the start of a UTF-8 character.
- `int fl_utf8len (char c)`
Returns the byte length of the UTF-8 sequence, or -1.
- `int fl_utf8len1 (char c)`

- Returns the byte length of the UTF-8 sequence with first byte `c`, or 1 if `c` is not valid.*
- `int fl_utf8locale ()`
Return true if the "locale" seems to indicate that UTF-8 encoding is used.
- `int fl_utf8strlen (const char *text, int len)`
Return the length in bytes of a UTF-8 string.
- `int fl_utf8test (const char *src, unsigned srclen)`
Examines the first `srclen` bytes in `src` and returns a verdict on whether it is UTF-8 or not.
- `unsigned fl_utf8to_mb (const char *src, unsigned srclen, char *dst, unsigned dstlen)`
Convert the UTF-8 used by FLTK to the locale-specific encoding used for filenames (and sometimes used for data in files).
- `unsigned fl_utf8toa (const char *src, unsigned srclen, char *dst, unsigned dstlen)`
Convert a UTF-8 sequence into an array of 1-byte characters.
- `unsigned fl_utf8toUtf16 (const char *src, unsigned srclen, unsigned short *dst, unsigned dstlen)`
Convert a UTF-8 sequence into an array of 16-bit characters.
- `unsigned fl_utf8towc (const char *src, unsigned srclen, wchar_t *dst, unsigned dstlen)`
Converts a UTF-8 string into a wide character string.
- `int fl_utf_nb_char (const unsigned char *buf, int len)`
Returns the number of Unicode chars in the UTF-8 string.
- `int fl_utf_strcasecmp (const char *s1, const char *s2)`
UTF-8 aware strcasecmp - converts to Unicode and tests.
- `int fl_utf_strncasecmp (const char *s1, const char *s2, int n)`
UTF-8 aware strncasecmp - converts to lower case Unicode and tests.
- `int fl_utf_tolower (const unsigned char *str, int len, char *buf)`
Converts the string `str` to its lower case equivalent into `buf`.
- `int fl_utf_toupper (const unsigned char *str, int len, char *buf)`
Converts the string `str` to its upper case equivalent into `buf`.
- `int fl_wcwidth (const char *src)`
extended wrapper around `fl_wcwidth_(unsigned int ucs)` function.
- `int fl_wcwidth_ (unsigned int ucs)`
Wrapper to adapt Markus Kuhn's implementation of `wcwidth()` for FLTK.

14.185 Fl_Widget.H File Reference

[Fl_Widget](#) and [Fl_Label](#) classes.

```
#include "Fl.H"
```

Classes

- class [Fl_Callback_User_Data](#)
A class prototype that allows for additional data in callbacks.
- struct [Fl_Label](#)
This struct stores all information for a text or mixed graphics label.
- class [Fl_Widget](#)
Fl_Widget is the base class for all widgets in FLTK.

Macros

- #define [FL_RESERVED_TYPE](#) 100
Reserved type numbers (necessary for my cheapo RTTI) start here.

Typedefs

- typedef void() [Fl_Callback](#)([Fl_Widget](#) *, void *)
Default callback type definition for all fltk widgets (by far the most used)
- typedef void() [Fl_Callback0](#)([Fl_Widget](#) *)
One parameter callback type definition passing only the widget.
- typedef void() [Fl_Callback1](#)([Fl_Widget](#) *, long)
Callback type definition passing the widget and a long data value.
- typedef [Fl_Callback](#) * [Fl_Callback_p](#)
Default callback type pointer definition for all fltk widgets.

14.185.1 Detailed Description

[Fl_Widget](#) and [Fl_Label](#) classes.

14.185.2 Macro Definition Documentation

14.185.2.1 FL_RESERVED_TYPE

```
#define FL_RESERVED_TYPE 100
```

Reserved type numbers (necessary for my cheapo RTTI) start here.

Grep the header files for "RESERVED_TYPE" to find the next available number.

14.186 Fl_Widget.H

14.188 Fl_Widget_Tracker.H File Reference

Track widget deletion.

```

#include <FL/fl_config.h>
#include <FL/Fl_Export.H>

```

Classes

- class [Fl_Widget_Tracker](#)
This class should be used to control safe widget deletion.

Namespaces

- namespace [Fl](#)

Fl is the FLTK global namespace containing state information and global methods for the current application.

Functions

- void `Fl::clear_widget_pointer` (`Fl_Widget` const *w)
Clears a widget pointer in the watch list.
- void `Fl::delete_widget` (`Fl_Widget` *w)
Schedules a widget for deletion at the next call to the event loop.
- void `Fl::do_widget_deletion` ()
Deletes widgets previously scheduled for deletion.
- void `Fl::release_widget_pointer` (`Fl_Widget` *&w)
Releases a widget pointer from the watch list.
- void `Fl::watch_widget_pointer` (`Fl_Widget` *&w)
Adds a widget pointer to the widget watch list.

14.188.1 Detailed Description

Track widget deletion.

14.196 gl.h File Reference

This file defines wrapper functions for OpenGL in FLTK.

```
#include "Enumerations.H"
```

```
#include <GL/gl.h>
```

Functions

- void [gl_color](#) (Fl_Color i)
Sets the current OpenGL color to an FLTK color.
- void [gl_color](#) (int c)
back compatibility
- int [gl_descent](#) ()
Returns the current font's descent.
- void [gl_draw](#) (const char *)
Draws a nul-terminated string in the current font at the current position.
- void [gl_draw](#) (const char *, float x, float y)
Draws a nul-terminated string in the current font at the given position.
- void [gl_draw](#) (const char *, int n)
Draws an array of n characters of the string in the current font at the current position.
- void [gl_draw](#) (const char *, int n, float x, float y)
Draws n characters of the string in the current font at the given position.
- void [gl_draw](#) (const char *, int n, int x, int y)
Draws n characters of the string in the current font at the given position.

- void **gl_draw** (const char *, int x, int y)
Draws a nul-terminated string in the current font at the given position.
- void **gl_draw** (const char *, int x, int y, int w, int h, **Fl_Align**)
Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to ^X.
- void **gl_draw_image** (const **uchar** *, int x, int y, int w, int h, int d=3, int ld=0)
- void **gl_finish** ()
Releases an OpenGL context.
- void **gl_font** (int fontid, int size)
*Sets the current OpenGL font to the same font as calling **fl_font()**.*
- int **gl_height** ()
Returns the current font's height.
- void **gl_measure** (const char *, int &x, int &y)
*Measure how wide and tall the string will be when drawn by the **gl_draw()** function.*
- void **gl_rect** (int x, int y, int w, int h)
Outlines the given rectangle with the current color.
- void **gl_rectf** (int x, int y, int w, int h)
Fills the given rectangle with the current color.
- void **gl_start** ()
Creates an OpenGL context.
- int **gl_texture_pile_height** ()
Returns the current maximum height of the pile of pre-computed string textures.
- void **gl_texture_pile_height** (int max)
Changes the maximum height of the pile of pre-computed string textures.
- void **gl_texture_reset** ()
*To call after GL operations that may invalidate textures used to draw text in GL scenes (e.g., switch between **FL_↔DOUBLE** / **FL_SINGLE** modes).*
- double **gl_width** (const char *)
Returns the width of the string in the current font.
- double **gl_width** (const char *, int n)
Returns the width of n characters of the string in the current font.
- double **gl_width** (**uchar**)
Returns the width of the character in the current font.

14.196.1 Detailed Description

This file defines wrapper functions for OpenGL in FLTK.

To use OpenGL from within an FLTK application you MUST use **gl_visual()** to select the default visual before doing **show()** on any windows. Mesa will crash if you try to use a visual not returned by **glxChooseVisual**.

Historically, this did not always work well with **FL_Double_Window**'s! It can try to draw into the front buffer. Depending on the system this might either crash or do nothing (when pixmaps are being used as back buffer and GL is being done by hardware), work correctly (when GL is done with software, such as Mesa), or draw into the front buffer and be erased when the buffers are swapped (when double buffer hardware is being used)

14.196.2 Function Documentation

14.196.2.1 **gl_color()**

```
void gl_color (
    Fl_Color i )
```

Sets the current OpenGL color to an FLTK color.

For color-index modes it will use **fl_xpixel(c)**, which is only right if the window uses the default colormap!

14.196.2.2 gl_draw() [1/7]

```
void gl_draw (
    const char * str )
```

Draws a nul-terminated string in the current font at the current position.

See also

gl_texture_pile_height(int)

14.196.2.3 gl_draw() [2/7]

```
void gl_draw (
    const char * str,
    float x,
    float y )
```

Draws a nul-terminated string in the current font at the given position.

See also

gl_texture_pile_height(int)

14.196.2.4 gl_draw() [3/7]

```
void gl_draw (
    const char * str,
    int n )
```

Draws an array of n characters of the string in the current font at the current position.

See also

gl_texture_pile_height(int)

14.196.2.5 gl_draw() [4/7]

```
void gl_draw (
    const char * str,
    int n,
    float x,
    float y )
```

Draws n characters of the string in the current font at the given position.

See also

gl_texture_pile_height(int)

14.196.2.6 gl_draw() [5/7]

```
void gl_draw (
    const char * str,
    int n,
    int x,
    int y )
```

Draws n characters of the string in the current font at the given position.

See also

gl_texture_pile_height(int)

14.196.2.7 gl_draw() [6/7]

```
void gl_draw (
    const char * str,
    int x,
    int y )
```

Draws a nul-terminated string in the current font at the given position.

See also

[gl_texture_pile_height\(int\)](#)

14.196.2.8 gl_draw() [7/7]

```
void gl_draw (
    const char * str,
    int x,
    int y,
    int w,
    int h,
    Fl\_Align align )
```

Draws a string formatted into a box, with newlines and tabs expanded, other control characters changed to ^X. and aligned with the edges or center. Exactly the same output as [fl_draw\(\)](#).

14.196.2.9 gl_font()

```
void gl_font (
    int fontid,
    int size )
```

Sets the current OpenGL font to the same font as calling [fl_font\(\)](#).

See also

[Fl::draw_GL_text_with_textures\(int val\)](#)

14.196.2.10 gl_rect()

```
void gl_rect (
    int x,
    int y,
    int w,
    int h )
```

Outlines the given rectangle with the current color.

If [Fl_Gl_Window::ortho\(\)](#) has been called, then the rectangle will exactly fill the given pixel rectangle.

14.196.2.11 gl_rectf()

```
void gl_rectf (
    int x,
    int y,
    int w,
    int h )
```

Fills the given rectangle with the current color.

See also

[gl_rect\(int x, int y, int w, int h\)](#)

14.196.2.12 gl_texture_pile_height() [1/2]

```
int gl_texture_pile_height (
    void )
```

Returns the current maximum height of the pile of pre-computed string textures.
The default value is 100

See also

[FL::draw_GL_text_with_textures\(int\)](#)

14.196.2.13 gl_texture_pile_height() [2/2]

```
void gl_texture_pile_height (
    int max )
```

Changes the maximum height of the pile of pre-computed string textures.
Strings that are often re-displayed can be processed much faster if this pile is set high enough to hold all of them.

Parameters

<i>max</i>	Maximum height of the texture pile

14.202 mac.H File Reference

Mac OS X-specific symbols.

Classes

- class [FL_Mac_App_Menu](#)

Functions

- [FL_Window](#) * [fl_mac_find](#) (FLWindow *)
Returns the [FL_Window](#) corresponding to the given macOS-specific window reference.
- CGContextRef [fl_mac_gc](#) ()
Returns the macOS-specific graphics context for the current window.
- void [fl_mac_set_about](#) ([FL_Callback](#) *cb, void *user_data, int shortcut=0)
Attaches a callback to the "About myprog" item of the system application menu.
- FLWindow * [fl_mac_xid](#) (const [FL_Window](#) *win)
Returns the macOS-specific window reference corresponding to the given [FL_Window](#) object.

Variables

- int [fl_mac_os_version](#)
The version number of the running Mac OS X (e.g., 100604 for 10.6.4, 101300 for 10.13, 140102 for 14.1.2).

14.202.1 Detailed Description

14.205 names.h File Reference

This file defines arrays of human readable names for FLTK symbolic constants.

```

#include <FL/Fl.H>
#include <string>
#include <map>

```

Functions

- `std::string fl_callback_reason_str` (int reason)
Return the C++ symbol of an Fl_Callback_Reason as a string.
- `std::string fl_eventname_str` (int event)
Return the C++ symbol of an Fl_Event as a string.
- `std::string fl_fontname_str` (int font)
Return the C++ symbol of an Fl_Font as a string.

Variables

- `const char *const fl_callback_reason_names` []
This is an array of callback reason names you can use to convert callback reasons into names.
- `const char *const fl_fontnames` []
This is an array of font names you can use to convert font numbers into names.

14.205.1 Detailed Description

This file defines arrays of human readable names for FLTK symbolic constants.

14.208 platform_types.h File Reference

Definitions of platform-dependent types.

Macros

- **#define FL_COMMAND** opaque
An alias for FL_CTRL on Windows and X11, or FL_META on MacOS X.
- **#define FL_CONTROL** opaque
An alias for FL_META on Windows and X11, or FL_CTRL on MacOS X.

Typedefs

- typedef opaque [fl_intptr_t](#)
An integral type large enough to store a pointer or a long value.
- typedef opaque [Fl_Offscreen](#)
Platform-specific value representing an offscreen drawing buffer.
- typedef struct opaque * [Fl_Region](#)
Pointer to a platform-specific structure representing a collection of rectangles.
- typedef opaque **FL_SOCKET**
socket or file descriptor
- typedef opaque [Fl_Timestamp](#)
Platform-specific point in time, used for delta time calculation.
- typedef opaque [fl_uintptr_t](#)
An unsigned integral type large enough to store a pointer or an unsigned long value.
- typedef struct opaque * [GLContext](#)
Pointer to a platform-specific structure representing the window's OpenGL rendering context.

14.208.1 Detailed Description

Definitions of platform-dependent types.

The exact nature of these types varies with the platform. Therefore, portable FLTK applications should not assume these types have a specific size, or that they are pointers.

14.208.2 Typedef Documentation

14.208.2.1 fl_intptr_t

```
typedef opaque fl_intptr_t
```

An integral type large enough to store a pointer or a long value.

A pointer value can be safely cast to fl_intptr_t, and later cast back to its initial pointer type without change to the pointer value. A variable of type fl_intptr_t can also store a long int value.

14.208.2.2 Fl_Offscreen

```
typedef opaque Fl_Offscreen
```

Platform-specific value representing an offscreen drawing buffer.

Note

This value can be safely cast to these types on each platform:

- X11: Pixmap
- Wayland: cairo_t *
- Windows: HBITMAP
- macOS: CGContextRef

14.208.2.3 Fl_Region

```
typedef struct opaque* Fl_Region
```

Pointer to a platform-specific structure representing a collection of rectangles.

Note

This pointer can be safely cast to these types on each platform:

- X11: Region as defined by X11
- Wayland: cairo_region_t *
- Windows: HRGN
- macOS: struct flCocoaRegion *

14.208.2.4 Fl_Timestamp

```
typedef opaque Fl_Timestamp
```

Platform-specific point in time, used for delta time calculation.

Note

This type may be a struct. sizeof(Fl_Timestamp) may be different on different platforms. Fl_Timestamp may change with future ABI changes.

14.208.2.5 fl_uintptr_t

```
typedef opaque fl_uintptr_t
```

An unsigned integral type large enough to store a pointer or an unsigned long value.

A pointer value can be safely cast to fl_uintptr_t, and later cast back to its initial pointer type without change to the pointer value. A variable of type fl_uintptr_t can also store an unsigned long int value.

14.208.2.6 GLContext

`typedef struct opaque* GLContext`

Pointer to a platform-specific structure representing the window's OpenGL rendering context.

Note

This pointer can be safely cast to these types on each platform:

- X11: GLXContext
- Wayland: EGLContext
- Windows: HGLRC
- macOS: NSOpenGLContext *

14.210 wayland.H File Reference

Definitions of functions specific to the Wayland platform.

Typedefs

- typedef struct _cairo **cairo_t**
- typedef void * **EGLContext**

Functions

- int **fl_wl_buffer_scale** ([Fl_Window](#) *window)
Returns the current buffer scaling factor for window.
- struct wl_compositor * **fl_wl_compositor** ()
Returns the wl_compositor of the current Wayland session.
- struct wl_display * **fl_wl_display** ()
Returns the Wayland display in use.
- [Fl_Window](#) * **fl_wl_find** (struct wld_window *)
Returns the [Fl_Window](#) corresponding to a given the platform-specific window reference.
- cairo_t * **fl_wl_gc** ()
Returns the cairo context associated to the current window or [Fl_Image_Surface](#).
- EGLContext **fl_wl_glcontext** ([GLContext](#) rc)
Returns the EGLContext corresponding to the given GLContext.
- struct wl_surface * **fl_wl_surface** (struct wld_window *xid)

Returns the wl_surface associated to a shown window.

- struct wld_window * **fl_wl_xid** (const [Fl_Window](#) *win)

Returns a platform-specific reference associated to a shown window.

14.210.1 Detailed Description

Definitions of functions specific to the Wayland platform.

14.210.2 Function Documentation

14.210.2.1 fl_wl_compositor()

```
struct wl_compositor * fl_wl_compositor ( ) [extern]
```

Returns the wl_compositor of the current Wayland session.

This allows, for example, to create a wl_surface with

```
struct wl_surface *my_wl_surface = wl_compositor_create_surface(fl_wl_compositor());
```

14.210.2.2 fl_wl_gc()

```
cairo_t * fl_wl_gc ( ) [extern]
```

Returns the cairo context associated to the current window or [Fl_Image_Surface](#).

Usable both when the Wayland/X11 hybrid FLTK library runs as a Wayland client and when it runs as an X11 client.

14.212 win32.H File Reference

Definitions of functions specific to the Windows platform.

Functions

- `HINSTANCE fl_win32_display ()`
Returns the Windows-specific display in use
- `Fl_Window * fl_win32_find (HWND)`
Returns the [Fl_Window](#) corresponding to the given Windows-specific window reference.
- `HDC fl_win32_gc ()`
Returns the Windows-specific graphics context for the current window
- `HGLRC fl_win32_glcontext (GLContext rc)`
Returns the Windows-specific GL rendering context corresponding to the given GLContext
- `HWND fl_win32_xid (const Fl_Window *win)`
Returns the Windows-specific window reference corresponding to the given [Fl_Window](#) object.

14.215 x11.H File Reference

Definitions of functions specific to the X11 platform.

Functions

- `cairo_t * fl_cairo_gc ()`

Returns the Cairo-specific currently active graphics context (FLTK_GRAPHICS_CAIRO=On)

- Display * **fl_x11_display** ()
Returns the X11 Display in use.
- **Fl_Window** * **fl_x11_find** (Window xid)
*Returns the **Fl_Window** corresponding to the given Window reference.*
- GC **fl_x11_gc** ()
Returns the X11-specific currently active graphics context.
- void **fl_x11_use_display** (Display *d)
Have FLTK use a pre-established X11 connection.
- Window **fl_x11_xid** (const **Fl_Window** *win)
*Returns the Window reference for the given **Fl_Window**, or zero if not shown().*

14.215.1 Detailed Description

Definitions of functions specific to the X11 platform.

14.215.2 Function Documentation

14.215.2.1 fl_x11_find()

```
Fl_Window * fl_x11_find (
    Window xid ) [extern]
```

Returns the **Fl_Window** corresponding to the given Window reference.

14.215.2.2 fl_x11_gc()

```
GC fl_x11_gc ( ) [extern]
```

Returns the X11-specific currently active graphics context.

14.215.2.3 fl_x11_use_display()

```
void fl_x11_use_display (
    Display * d ) [extern]
```

Have FLTK use a pre-established X11 connection.

This function must be called before FLTK attempts to open its own X11 connection, that is, as long as **fl_x11_display()** returns NULL.

Parameters

<i>d</i>	the X11 Display* value representing a valid, pre-established X11 connection

14.215.2.4 fl_x11_xid()

```
Window fl_x11_xid (
    const Fl_Window * win ) [extern]
```

Returns the Window reference for the given **Fl_Window**, or zero if not shown().

#include <FL/fl_draw.H>
#include <ctype.h>

```

```
#include <stdlib.h>
#include "flstring.h"
```

Macros

- `#define FOREVER 1e20`

Functions

- `bool fl_clipboard_notify_empty (void)`
- `void fl_close_display ()`
Closes the connection to the windowing system when that's possible.
- `const char * fl_filename_name (const char *name)`
Gets the file name from a path.
- `FL_Window * fl_find (Window xid)`
Returns the [FL_Window](#) that corresponds to the given window reference, or `NULL` if not found.
- `void fl_fix_focus ()`
- `void fl_open_callback (void(*cb)(const char *))`
Register a function called for each file dropped onto an application icon.
- `void fl_open_display ()`
Opens the display.
- `int fl_send_system_handlers (void *e)`
- `void fl_throw_focus (FL_Widget *o)`
- `void fl_trigger_clipboard_notify (int source)`
- `Window fl_xid_ (const FL\_Window *w)`

Variables

- `bool fl_disable_wayland = true`
Prevent the FLTK library from using its Wayland backend and force it to use its X11 backend.
- `const char * fl_local_alt = Fl::system\_driver\(\)->alt_name()`
string pointer used in shortcuts, you can change it to another language
- `const char * fl_local_ctrl = Fl::system\_driver\(\)->control_name()`
string pointer used in shortcuts, you can change it to another language
- `int(* fl_local_grab )(int)`
- `const char * fl_local_meta = Fl::system\_driver\(\)->meta_name()`
string pointer used in shortcuts, you can change it to another language
- `const char * fl_local_shift = Fl::system\_driver\(\)->shift_name()`
string pointer used in shortcuts, you can change it to another language
- `FL\_Widget * fl_oldfocus`
- `FL\_Widget * fl_selection_requestor`

14.219.1 Detailed Description

Implementation of the member functions of class [Fl](#).

14.219.2 Function Documentation

14.219.2.1 fl_close_display()

```
void fl_close_display ( )
```

Closes the connection to the windowing system when that's possible.

You do *not* need to call this to exit, and in fact it is faster to not do so. It may be useful to call this if you want your program to continue without a GUI. You cannot open the display again, and cannot call any FLTK functions.

Note

Requires `#include <FL/platform.H>`

14.219.2.2 fl_find()

```
Fl_Window * fl_find (
    Window xid )
```

Returns the `Fl_Window` that corresponds to the given window reference, or `NULL` if not found.

Deprecated Kept in the X11, Windows, and macOS platforms for compatibility with FLTK versions before 1.4. Please use `fl_x11_find(Window)`, `fl_wl_find(struct wld_window*)`, `fl_win32_find(HWND)` or `fl_mac_find(FLWindow*)` with FLTK 1.4.0 and above.

14.219.2.3 fl_open_display()

```
void fl_open_display ( )
```

Opens the display.

Automatically called by the library when the first window is `show()`'n. Does nothing if the display is already open.

Note

Requires `#include <FL/platform.H>`

14.219.3 Variable Documentation**14.219.3.1 fl_disable_wayland**

```
bool fl_disable_wayland = true
```

Prevent the FLTK library from using its Wayland backend and force it to use its X11 backend.

Put this declaration somewhere in your source code outside the body of any function:

```
FL_EXPORT bool fl_disable_wayland = true;
```

This declaration makes sure that source code developed for FLTK 1.3, including X11-specific code, will build and run with FLTK 1.4 and its Wayland platform with a single line source code level change. This declaration has no effect on non-Wayland platforms. Don't add this declaration if you want the Wayland backend to be used when it's available.

Note

Please see also chapter 2.1 of README.Wayland.txt for further information on how to build your application to ensure that this declaration is effective.

Since

1.4.0

14.220 fl_arc.cxx File Reference

Utility functions for drawing arcs and circles.

```
#include <FL/fl_draw.H>
```

```
#include <FL/math.h>
```

14.220.1 Detailed Description

Utility functions for drawing arcs and circles.

14.221 fl_ask.cxx File Reference

Utility functions for common dialogs.

```
#include <FL/Fl.H>
#include <FL/Fl_Box.H>
#include <FL/Fl_Input_.H>
#include "flstring.h"
#include "Fl_Screen_Driver.H"
#include <FL/fl_ask.H>
#include "Fl_Message.h"
#include <stdio.h>
#include <stdarg.h>
```

Functions

- void [fl_alert](#) (const char *fmt,...)
Shows an alert message dialog box.
- void [fl_beep](#) (int type)
Emits a system beep.
- int [fl_choice](#) (const char *fmt, const char *b0, const char *b1, const char *b2,...)
*Shows a dialog displaying the printf style *fmt* message.*
- int [fl_choice_n](#) (const char *fmt, const char *b0, const char *b1, const char *b2,...)
*Shows a dialog displaying the printf style *fmt* message.*
- const char * [fl_input](#) (const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- const char * [fl_input](#) (int maxchar, const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- std::string [fl_input_str](#) (int &ret, int maxchar, const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- std::string [fl_input_str](#) (int maxchar, const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- void [fl_message](#) (const char *fmt,...)
Shows an information message dialog box.
- int [fl_message_hotspot](#) ()
Gets whether or not to move the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#) to follow the mouse pointer.
- void [fl_message_hotspot](#) (int enable)
Sets whether or not to move the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#) to follow the mouse pointer.
- FL_Widget * [fl_message_icon](#) ()
Gets the [FL_Box](#) icon container of the current default dialog used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).
- void [fl_message_icon_label](#) (const char *str)
Sets the icon label of the dialog window used in many common dialogs.
- void [fl_message_position](#) (const int x, const int y, const int center)
Sets the preferred position for the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).
- void [fl_message_position](#) (FL_Widget *widget)
Sets the preferred position for the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).
- int [fl_message_position](#) (int *x, int *y)
Gets the preferred position for the message box used in many common dialogs like [fl_message\(\)](#), [fl_alert\(\)](#), [fl_ask\(\)](#), [fl_choice\(\)](#), [fl_input\(\)](#), [fl_password\(\)](#).

- void [fl_message_title](#) (const char *title)
Sets the title of the dialog window used in many common dialogs.
- void [fl_message_title_default](#) (const char *title)
Sets the default title of the dialog window used in many common dialogs.
- const char * [fl_password](#) (const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- const char * [fl_password](#) (int maxchar, const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- std::string [fl_password_str](#) (int &ret, int maxchar, const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*
- std::string [fl_password_str](#) (int maxchar, const char *fmt, const char *defstr,...)
*Shows an input dialog displaying the *fmt* message with variable arguments.*

Variables

- const char * [fl_cancel](#) = "Cancel"
string pointer used in common dialogs, you can change it to another language
- const char * [fl_close](#) = "Close"
string pointer used in common dialogs, you can change it to another language
- [FL_Font](#) [fl_message_font](#) = [FL_HELVETICA](#)
- [FL_Fontsize](#) [fl_message_size](#) = -1
- const char * [fl_no](#) = "No"
string pointer used in common dialogs, you can change it to another language
- const char * [fl_ok](#) = "OK"
string pointer used in common dialogs, you can change it to another language
- const char * [fl_yes](#) = "Yes"
string pointer used in common dialogs, you can change it to another language

14.221.1 Detailed Description

Utility functions for common dialogs.

This file defines the functions

- [fl_alert\(\)](#)
- [fl_beep\(\)](#)
- [fl_message\(\)](#)
- [fl_ask\(\)](#) // deprecated since 1.1.7 (2006), see comment in [FL/fl_ask.H](#)
- [fl_choice\(\)](#)
- [fl_input\(\)](#)
- [fl_input_str\(\)](#)
- [fl_password\(\)](#)
- [fl_password_str\(\)](#)

and some more functions to change their behavior (positioning, window title, and more).
Since FLTK 1.4.0 a big part of these functions is implemented in class [Fl_Message](#).

14.222 fl_boxtype.cxx File Reference

Drawing code for common box types.

```
#include "src/Fl_Private.H"
#include <FL/Fl_Widget.H>
#include <FL/fl_draw.H>
#include <config.h>
```

Macros

- `#define D1 BORDER_WIDTH`
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)`
- `#define fl_border_box fl_rectbound`

allow consistent naming

Typedefs

- `typedef struct BOXTABLE boxtable_t`

Functions

- `void fl_border_frame` (int x, int y, int w, int h, [Fl_Color](#) c)
Draws a frame of type FL_BORDER_FRAME.
- `void fl_diamond_down_box` (int x, int y, int w, int h, [Fl_Color](#) bgcolor)
- `void fl_diamond_focus` ([Fl_Boxtype](#), int, int, int, int, [Fl_Color](#), [Fl_Color](#))
- `void fl_diamond_up_box` (int x, int y, int w, int h, [Fl_Color](#) bgcolor)
- `void fl_down_box` (int x, int y, int w, int h, [Fl_Color](#) c)
Draws a box of type FL_DOWN_BOX.
- `void fl_down_frame` (int x, int y, int w, int h, [Fl_Color](#))
Draws a frame of type FL_DOWN_FRAME.
- `void fl_draw_box` ([Fl_Boxtype](#) t, int x, int y, int w, int h, [Fl_Color](#) c)
Draws a box using given type, position, size and color.
- `void fl_draw_box_focus` ([Fl_Boxtype](#) bt, int x, int y, int w, int h, [Fl_Color](#) fg, [Fl_Color](#) bg)
Draws the focus rectangle inside a box using given type, position, size and color.
- `void fl_embossed_box` (int x, int y, int w, int h, [Fl_Color](#) c)
Draws a box of type FL_EMBOSSED_BOX.
- `void fl_embossed_frame` (int x, int y, int w, int h, [Fl_Color](#))
Draws a frame of type FL_EMBOSSED_FRAME.
- `void fl_engraved_box` (int x, int y, int w, int h, [Fl_Color](#) c)
Draws a box of type FL_ENGRAVED_BOX.
- `void fl_engraved_frame` (int x, int y, int w, int h, [Fl_Color](#))
Draws a frame of type FL_ENGRAVED_FRAME.
- `void fl_flat_box` (int x, int y, int w, int h, [Fl_Color](#) c)
Draws a box of type FL_FLAT_BOX.
- `void fl_frame` (const char *s, int x, int y, int w, int h)
Draws a series of line segments around the given box.
- `void fl_frame2` (const char *s, int x, int y, int w, int h)
Draws a series of line segments around the given box.
- `void fl_gleam_down_box` (int x, int y, int w, int h, [Fl_Color](#) c)
- `void fl_gleam_down_frame` (int x, int y, int w, int h, [Fl_Color](#) c)
- `void fl_gleam_thin_down_box` (int x, int y, int w, int h, [Fl_Color](#) c)
- `void fl_gleam_thin_up_box` (int x, int y, int w, int h, [Fl_Color](#) c)
- `void fl_gleam_up_box` (int x, int y, int w, int h, [Fl_Color](#) c)

- void **fl_gleam_up_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- const [uchar](#) * **fl_gray_ramp** ()
- void **fl_gtk_down_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_down_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_round_down_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_round_up_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_thin_down_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_thin_down_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_thin_up_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_thin_up_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_up_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_gtk_up_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_no_box** (int, int, int, int, [FL_Color](#))

Draws a box of type FL_NO_BOX.

- void **fl_oval_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_oval_flat_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_oval_focus** ([FL_Boxtype](#) bt, int x, int y, int w, int h, [FL_Color](#) fg, [FL_Color](#) bg)
- void **fl_oval_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_oval_shadow_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_oxy_button_down_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_button_up_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_down_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_down_frame** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_round_down_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_round_up_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_thin_down_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_thin_down_frame** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_thin_up_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_thin_up_frame** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_up_box** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_oxy_up_frame** (int x, int y, int w, int h, [FL_Color](#) col)
- void **fl_plastic_down_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_plastic_down_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_plastic_down_round** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_plastic_thin_up_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_plastic_up_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_plastic_up_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_plastic_up_round** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_rectbound** (int x, int y, int w, int h, [FL_Color](#) bgcolor)

Draws a bounded rectangle with a given position, size and color.

- void **fl_rflat_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_round_down_box** (int x, int y, int w, int h, [FL_Color](#) bgcolor)
- void **fl_round_focus** ([FL_Boxtype](#), int, int, int, int, [FL_Color](#), [FL_Color](#))
- void **fl_round_up_box** (int x, int y, int w, int h, [FL_Color](#) bgcolor)
- void **fl_rounded_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_rounded_focus** ([FL_Boxtype](#) bt, int x, int y, int w, int h, [FL_Color](#) fg, [FL_Color](#) bg)
- void **fl_rounded_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_rshadow_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_shadow_box** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_shadow_frame** (int x, int y, int w, int h, [FL_Color](#) c)
- void **fl_thin_down_box** (int x, int y, int w, int h, [FL_Color](#) c)

Draws a box of type FL_THIN_DOWN_BOX.

- void **fl_thin_down_frame** (int x, int y, int w, int h, [FL_Color](#))

Draws a frame of type FL_THIN_DOWN_FRAME.

- void **fl_thin_up_box** (int x, int y, int w, int h, [Fl_Color](#) c)
Draws a box of type FL_THIN_UP_BOX.
- void **fl_thin_up_frame** (int x, int y, int w, int h, [Fl_Color](#))
Draws a frame of type FL_THIN_UP_FRAME.
- void **fl_up_box** (int x, int y, int w, int h, [Fl_Color](#) c)
Draws a box of type FL_UP_BOX.
- void **fl_up_frame** (int x, int y, int w, int h, [Fl_Color](#))
Draws a frame of type FL_UP_FRAME.

14.222.1 Detailed Description

Drawing code for common box types.

14.222.2 Function Documentation

14.222.2.1 fl_rectbound()

```
void fl_rectbound (
    int x,
    int y,
    int w,
    int h,
    Fl\_Color bgcolor )
```

Draws a bounded rectangle with a given position, size and color.
Equivalent to drawing a box of type FL_BORDER_BOX.

14.223 fl_cmap.h

```

```

14.224 fl_color.cxx File Reference

Color handling.

```

#include <FL/Fl.H>
#include <FL/Fl_Device.H>
#include <FL/Fl_Graphics_Driver.H>
#include "fl_cmap.h"

```

Functions

- [Fl_Color fl_color_average](#) ([Fl_Color](#) color1, [Fl_Color](#) color2, float weight)

Returns the weighted average color between the two given colors.

- [Fl_Color fl_inactive](#) ([Fl_Color](#) c)

Returns the inactive, dimmed version of the given color.

Variables

- unsigned [fl_cmap](#) [256]

14.224.1 Detailed Description

Color handling.

14.224.2 Variable Documentation

14.224.2.1 fl_cmap

```
unsigned fl_cmap[256]
```

Initial value:

```
= {  
}  
}
```

14.225 FI_compose.cxx File Reference

Utility functions to support text input.

```
#include <FL/Fl.H>  
#include "Fl_Screen_Driver.H"
```

14.225.1 Detailed Description

Utility functions to support text input.

14.226 fl_contrast.cxx File Reference

Color contrast handling.

```
#include <FL/Fl.H>  
#include <math.h>
```

Macros

- `#define DEBUG_CONTRAST_LEGACY 0`

Functions

- [FI_Color fl_contrast](#) ([FI_Color](#) fg, [FI_Color](#) bg, int context, int size)
Returns a color that contrasts with the background color.
- void [fl_contrast_function](#) ([FI_Contrast_Function](#) *f)
Register a custom contrast function.
- int [fl_contrast_level](#) ()
Get the contrast level (sensitivity) of the [fl_contrast\(\)](#) method.
- void [fl_contrast_level](#) (int level)
Set the contrast level (sensitivity) of the [fl_contrast\(\)](#) method.
- int [fl_contrast_mode](#) ()
Return the current contrast algorithm (mode).
- void [fl_contrast_mode](#) (int mode)
Set the contrast algorithm (mode).
- double [fl_lightness](#) ([FI_Color](#) color)
Return the perceived lightness of a color.
- double [fl_luminance](#) ([FI_Color](#) color)

Return the raw / physical luminance of a color.

- unsigned **get_color** ([Fl_Color](#) i)

Variables

- unsigned **fl_cmap** [256]

14.226.1 Detailed Description

Color contrast handling.

Implementation of [fl_contrast\(\)](#) and its variants.

14.227 fl_curve.cxx File Reference

Utility for drawing Bézier curves, adding the points to the current fl_begin/fl_vertex/fl_end path.

```
#include <FL/fl_draw.H>
```

```
#include <math.h>
```

14.227.1 Detailed Description

Utility for drawing Bézier curves, adding the points to the current fl_begin/fl_vertex/fl_end path.

Incremental math implementation: I very much doubt this is optimal! From Foley/vanDam page 511. If anybody has a better algorithm, please send it!

14.228 Fl_Double_Window.cxx File Reference

[Fl_Double_Window](#) implementation.

```

```

```
#include "tile.xpm"
```

Macros

- `#define D1 BORDER_WIDTH`
- `#define D2 (BORDER_WIDTH+BORDER_WIDTH)`

Functions

- void **fl_down_box** (int, int, int, int, [FL_Color](#))
Draws a box of type FL_DOWN_BOX.
- void **fl_down_frame** (int, int, int, int, [FL_Color](#))
Draws a frame of type FL_DOWN_FRAME.
- int **fl_parse_color** (const char *p, [uchar](#) &r, [uchar](#) &g, [uchar](#) &b)
Parse a string containing a description of a color and write r, g, and b.
- void **fl_round_down_box** (int, int, int, int, [FL_Color](#))
- void **fl_round_focus** ([FL_Boxtype](#), int, int, int, int, [FL_Color](#), [FL_Color](#))
- void **fl_round_up_box** (int, int, int, int, [FL_Color](#))
- void **fl_thin_down_box** (int, int, int, int, [FL_Color](#))
Draws a box of type FL_THIN_DOWN_BOX.
- void **fl_thin_down_frame** (int, int, int, int, [FL_Color](#))
Draws a frame of type FL_THIN_DOWN_FRAME.
- void **fl_thin_up_box** (int, int, int, int, [FL_Color](#))
Draws a box of type FL_THIN_UP_BOX.
- void **fl_thin_up_frame** (int, int, int, int, [FL_Color](#))
Draws a frame of type FL_THIN_UP_FRAME.
- void **fl_up_box** (int, int, int, int, [FL_Color](#))
Draws a box of type FL_UP_BOX.
- void **fl_up_frame** (int, int, int, int, [FL_Color](#))
Draws a frame of type FL_UP_FRAME.

Variables

- const char * **fl_bg** = NULL
- const char * **fl_bg2** = NULL
- const char * **fl_fg** = NULL

14.229.1 Detailed Description

System color support.

14.229.2 Function Documentation

14.229.2.1 fl_parse_color()

```
int fl_parse_color (
    const char * p,
    uchar & r,
    uchar & g,
    uchar & b )
```

Parse a string containing a description of a color and write r, g, and b.

This call is used by the Pixmap file format interpreter and by the command line arguments parser to set UI colors. RGB color triplets usually start with a '#' character, but it can be omitted if it does not conflict with the later rules. Color components are defined in hexadecimal notation with 1, 2, 3, or four hex digits per component, making color triplets 3, 6, 9, or 12 characters long. The interpreter is case insensitive. Valid code examples include "FF0000" for red, "#0F0" for green, and "000000004444" for a dark blue.

On the X11 platform, color values can also be given a color name like "red". The list of accepted color names is provided by the X11 server.

If none of the color interpretations work, [fl_parse_color](#) returns 0. The Pixmap reader interprets those as transparent, and are usually written as "None", "#transparent", or "bg".

Parameters

in	p	a C-string describing the color
out	r,g,b	the color components in the 0...255 range

Returns

0 if the color cannot be interpreted, 1 otherwise

14.230 Fl_Gl_Choice.H

```

14.240.1 Detailed Description

Implementation of the 'plastic' scheme.

14.241 Fl_Private.H File Reference

Fl::Private namespace.

```

#include <FL/fl_config.h>
#include <FL/Fl.H>

```

Namespaces

- namespace [Fl](#)

[Fl](#) is the FLTK global namespace containing state information and global methods for the current application.

Functions

- `cairo_t * Fl::Private::cairo\_make\_current (void *gc, int W, int H)`
Creates a Cairo context from a `gc` and the given size.
- `void Fl::Private::run\_checks ()`
- `void Fl::Private::run\_idle ()`
- `void Fl::Private::set\_idle\_ (Fl\_Old\_Idle\_Handler cb)`
Sets an idle callback (internal use only).

Variables

- `int Fl::Private::box\_border\_radius\_max = 15`
- `int Fl::Private::box\_shadow\_width = 3`
- `Fl\_Cairo\_State Fl::Private::cairo\_state`
current Cairo context information
- `int Fl::Private::draw\_GL\_text\_with\_textures = 1`
- `void(* Fl::Private::idle\_ )()`
The currently executing idle callback function: DO NOT USE THIS DIRECTLY!
- `unsigned char Fl::Private::options [OPTION\_LAST]`
- `unsigned char Fl::Private::options\_read`
- `int Fl::Private::program\_should\_quit = 0`
- `int Fl::Private::selection\_to\_clipboard`
- `int Fl::Private::use\_high\_res\_GL = 0`

14.241.1 Detailed Description

`Fl::Private` namespace.

14.241.2 Function Documentation

14.241.2.1 `cairo_make_current()`

```
cairo_t * Fl::Private::cairo\_make\_current (
    void * gc,
    int W,
    int H ) [extern]
```

Creates a Cairo context from a `gc` and the given size.

Note

Only available if CMake `FLTK_OPTION_CAIRO_WINDOW` is enabled.

14.241.2.2 `set_idle_()`

```
void Fl::Private::set\_idle\_ (
    Fl\_Old\_Idle\_Handler cb ) [inline]
```

Sets an idle callback (internal use only).

This method is now private and is used to store the idle callback. The old, public `set_idle()` method was deprecated since 1.3.x and is no longer available in FLTK 1.5.

See documentation: use [Fl::add_idle\(\)](#) instead.

14.241.3 Variable Documentation

14.241.3.1 idle_

```
void(* Fl::Private::idle_ ) ( ) [extern]
```

The currently executing idle callback function: DO NOT USE THIS DIRECTLY!

This is now used as part of a higher level system allowing multiple idle callback functions to be called.

See also

add_idle(), remove_idle()

00026 /* Class Fl_Scalable_Graphics_Driver is platform-independent.
00027 It supports the scaling of all graphics coordinates by a
00028 float factor helpful to support HiDPI displays.
00029 This class does :
00030 - compute scaled coordinates
00031 - scale the cached offscreen of image objects
00032 - scale the pixel arrays used when performing direct image draws
00033 - call the member functions of a platform-specific,
00034 Fl_Scalable_Graphics_Driver-derived class that do the drawings with adequately
00035 scaled coordinates. These member functions are named with the _unscaled suffix.
00036 - scale and unscale the clipping region.
00037
00038 This class is presently used by the X11 and Windows platforms.

00176  /* Member function read_win_rectangle() supports public functions
00177  fl_read_image() and fl_capture_window() which capture pixel data from
00178  a window (or also from an offscreen buffer with fl_read_image).
00179
00180  If 'may_capture_subwins' is true, an implementation may or may not capture
00181  also the content of subwindows embedded in 'win'. If subwindows were captured,
00182  *'did_capture_subwins' is returned set to true. If read_win_rectangle()
00183  is called with 'may_capture_subwins' set to true, 'did_capture_subwins' should
00184  be set before the call to the address of a boolean set to false.
00185  The implementation of this virtual function for the macOS platform has the
00186  capability of capturing subwindows when asked for.
00187
00188  A platform may also use its read_win_rectangle() implementation to capture

```

Classes

- class [Fl_Timeout](#)

The internal class [Fl_Timeout](#) handles all timeout related functions.

Macros

- `#define FL_TIMEOUT_DEBUG 0`

14.250.1 Detailed Description

[Fl_Timeout](#) handling.

This file contains implementations of:

- [Fl::add_timeout\(\)](#)
- [Fl::repeat_timeout\(\)](#)
- [Fl::has_timeout\(\)](#)
- [Fl::remove_timeout\(\)](#)
- [Fl::remove_next_timeout\(\)](#)

and related methods of class [Fl_Timeout](#).

14.251 Fl_Timeout.h

```

Functions

- `int fl_write_png (const char *filename, const char *pixels, int w, int h, int d, int ld)`
Write raw image data to a PNG image file.
- `int fl_write_png (const char *filename, const unsigned char *pixels, int w, int h, int d, int ld)`
Write raw image data to a PNG image file.
- `int fl_write_png (const char *filename, Fl_RGB_Image *img)`
Write an RGB(A) image to a PNG image file.

14.254.1 Detailed Description

PNG image support functions.

14.254.2 Function Documentation

14.254.2.1 fl_write_png() [1/3]

```

int fl_write_png (
    const char * filename,
    const char * pixels,
    int w,
    int h,
    int d,
    int ld )

```

Write raw image data to a PNG image file.

This is a very basic and restricted function to create a PNG image file from raw image data, e.g. a screenshot.

The image data must be aligned w/o gaps after each row ($ld = 0$ or $ld = w * d$) or ld must be the total length of each row, i.e. $w * d + \text{gapsizes}$. If $ld == 0$ then $ld = w * d$ is assumed.

The total data size must be $(w * d + \text{gapsizes}) * h = ld' * h$ where $ld' = w * d$ if $ld == 0$.

For further restrictions and return values please see `fl_write_png(const char *filename, Fl_RGB_Image *img)`.

Parameters

in	<i>filename</i>	Output filename, extension should be '.png'
in	<i>pixels</i>	Image data
in	<i>w</i>	Image data width

Parameters

in	<i>h</i>	Image data height
in	<i>d</i>	Image depth: 1 = GRAY, 2 = GRAY + alpha, 3 = RGB, 4 = RGBA
in	<i>ld</i>	Line delta: default (0) = w * d

Returns

success (0) or error code, see ...

See also

[fl_write_png\(const char *filename, FI_RGB_Image *img\)](#)

14.254.2.2 fl_write_png() [2/3]

```
int fl_write_png (
    const char * filename,
    const unsigned char * pixels,
    int w,
    int h,
    int d,
    int ld )
```

Write raw image data to a PNG image file.

See also

[fl_write_png\(const char *filename, const char *pixels, int w, int h, int d, int ld\)](#)

14.254.2.3 fl_write_png() [3/3]

```
int fl_write_png (
    const char * filename,
    FI_RGB_Image * img )
```

Write an RGB(A) image to a PNG image file.

This is a very basic and restricted function to create a PNG image file from an RGB image ([FI_RGB_Image](#)).

The image data must be aligned w/o gaps, i.e. `ld()` **MUST** be zero or equal to `data_w()` * `data_h()`.

The image file is always written with the original image size `data_w()` and `data_h()`, even if the image has been scaled.

Image depth 1 (gray), 2 (gray + alpha channel), 3 (RGB) and 4 (RGBA) are supported.

Note

Currently there is no error handling except for errors when opening the file. This may be changed in the future.

Parameters

in	<i>filename</i>	Output filename, extension should be '.png'
in	<i>img</i>	RGB image to be written

Returns

success (0) or error code: negative values are errors

Return values

0	success, file has been written
-1	png or zlib library not available
-2	file open error

```

Functions

- `int fl_casenumERICsort` (struct dirent **A, struct dirent **B)
Compares directory entries alphanumerically (case-insensitive).
- `int fl_numericSort` (struct dirent **A, struct dirent **B)
Compares directory entries alphanumerically (case-sensitive).

14.259.1 Function Documentation

14.259.1.1 fl_casenumERICsort()

```
int fl_casenumERICsort (
    struct dirent ** A,
    struct dirent ** B )
```

Compares directory entries alphanumerically (case-insensitive).

Note

This comparison is UTF-8 aware.

See also

[fl_numericSort\(\)](#)

14.259.1.2 fl_numericSort()

```
int fl_numericSort (
    struct dirent ** A,
    struct dirent ** B )
```

Compares directory entries alphanumerically (case-sensitive).

Numbers are compared without sign, i.e. "-" is not taken as a sign of following numerical values. The following list of files would be in ascending order (examples are ASCII and numbers only for simplicity):

1. 1zzz.txt
2. 2xxx.txt
3. 19uuu.txt
4. 100aaa.txt
5. file1z.txt
6. file5a.txt
7. file5z.txt
8. file30z.txt
9. file200a.txt
10. temp+5.txt ('+' is lexically lower than '-')
11. temp-5.txt ('-' is not a sign)
12. temp-100.txt (100 is bigger than 5, no sign)

Parameters

in	<i>A</i>	first directory entry
in	<i>B</i>	second directory entry

Returns

comparison result (-1, 0, or +1)

Return values

-1	$A < B$

Return values

0	A == B
+1	A > B

Note

This comparison is UTF-8 aware.

14.264 vsnprintf.c File Reference

Portable vsnprintf() implementation.

```
#include <stdio.h>
#include "flstring.h"
```

Functions

- `int fl_snprintf (char *str, size_t size, const char *fmt,...)`
- `int fl_vsnprintf (char *buffer, size_t bufsz, const char *format, va_list ap)`

FLTK's platform independent wrapper for the vsnprintf() C library function.

14.264.1 Detailed Description

Portable vsnprintf() implementation.

14.264.2 Function Documentation

14.264.2.1 fl_vsnprintf()

```
int fl_vsnprintf (
    char * buffer,
    size_t bufsz,
    const char * format,
    va_list ap )
```

FLTK's platform independent wrapper for the vsnprintf() C library function.

This function guarantees:

- access to vsnprintf(), even on systems that don't have it (FLTK's own built-in code is used)
- Guarantees NUL termination. Even if string expands larger than the buffer, a terminating NUL is included, unlike some implementations of vsnprintf(), notably Microsoft Visual Studio (pre-2015), which can leave the string unterminated when truncated.

If the build environment for FLTK has vsnprintf(), `fl_vsnprintf()` is just a wrapper around the compiler's provided function. Otherwise, if the function is NOT available, FLTK's own built-in version is provided.

The FLTK built in provides these style options:

- `%[ -+#]`
- `*` – padding width
- `.*` – precision width
- Data types: h, l, ll, L
- Floating point formats: E, G, e, f, g
- Integer formats: B, X, b, d, i, o, u, x
- Pointer format: p
- String/char: c, s, n
