

USER GUIDE

Essential Studio for File Formats

Version - v18.1.0.36 | Release Date - March 19, 2020

Welcome to Syncfusion Essential File Formats Platform.....	30
How to best read this user guide	30
Additional help resources	30
Create a support incident	30
List of File Format libraries:	30
Quick Start links:	31
System Requirements	31
Operating Systems	31
Hardware Environment.....	31
Development Environment.....	31
Download Installer	31
Download the Trial Version	31
Free Trial Page.....	31
Start Trial Page	32
Download the License Version.....	33
Installation and Upgrade.....	33
Installation using Web Installer	33
Overview	33
Installation	34
Uninstallation.....	44
Installation and Uninstallation	49
Installation using Offline Installer	58
Installing with UI	58
Installing in silent mode	65
Installation FAQ.....	67
Upgrade from one version to another version.	67
Upgrade from major version to service pack version	67
Upgrade from trial version to license version.....	67
NuGet Packages	67
Installing NuGet Packages.....	67
Using NuGet Package Manager	67
Using Package Manager Console	69
DocIO.....	69
Creating a new Word document with few lines of code	69
Creating a new Word document from scratch with basic elements	71

Modifying an existing Word document	84
Performing Mail merge	87
Converting Word document to PDF.....	99
Document Object Model representation	102
Loading & saving document.....	104
Opening an existing document	104
Opening an existing document from Stream.....	105
Opening an Encrypted Word document	107
Opening the read only Word document.....	109
Saving a Word document to file system	110
Saving a Word document to Stream	112
Sending to a client browser	114
Closing a document.....	115
Working with Word document	117
Iterating through document elements	117
Cloning a Word document	134
Merging Word documents.....	138
Printing a Word document	146
Working with Styles	150
Working with Word document properties	157
Setting the Background for a Word document.....	162
Working with Sections	167
Specifying Page Properties.....	172
Creating Multi-column document.....	174
Creating document with different page settings.....	178
Working with Headers and Footers	181
Adding Page Numbers.....	197
Removing a Section.....	207
Working with Paragraph	208
Applying paragraph formatting.....	213
Working with text	226
Working with Images	234
Working with lists	249
Working with hyperlinks	277
Working with symbols.....	291

Appending breaks	296
Appending OLE objects	299
Working with Text Box.....	302
Working with Tables	308
Nested Table	321
Align text within a table	325
Apply formatting to Table, Row and Cell	326
Merging cells vertically and horizontally	347
Specifying table header row to repeat on each page	356
Keeping rows from breaking across pages	359
Iterating through table elements.....	360
Working with Bookmarks.....	363
Adding a bookmark	363
Obtaining a bookmark instance	366
Removing a Bookmark from Word document.....	368
Retrieving contents within a bookmark.....	370
Inserting content into a bookmark	375
Deleting content from a bookmark	387
Replacing content in a bookmark	389
Working with document Fields	397
Adding fields.....	397
Formatting fields	399
Updating fields	402
IF field.....	404
Document variables	407
Cross reference	410
Unlink fields.....	413
Working with Shapes	415
Adding shapes	415
Grouping shapes	425
Ungrouping shapes	451
Working with Mail merge	453
Mail merge process.....	454
Simple Mail merge	459
Performing Mail merge for a group	459

Performing Nested Mail merge for group	459
Performing Mail merge with dynamic objects.....	459
Performing Mail merge with business objects	459
Performing Nested Mail merge with relational data objects	459
Event support for mail merge	459
Mail merge options	460
Find and Replace.....	460
Finding contents in a Word document	460
Replacing the Search results	468
Working with Table Of Contents.....	476
Adding a TOC field.....	476
Updating table of contents	478
Creating table of contents with user-defined styles.....	479
Applying Watermark	482
Text Watermark	482
Picture Watermark.....	485
Working with Comments	486
Adding a Comment	486
Modifying a Comment	488
Removing Comments.....	490
Working with Form Fields	493
Check Box.....	493
Drop-Down.....	499
Text Form field	504
Working with Charts	511
Creating a simple Chart from scratch	511
Creating a Chart from Excel file	517
Creating Custom Charts	520
Refreshing the Chart	525
Modifying the Chart data.....	527
Customizing the Chart & its elements	529
Applying 3D Formats.....	549
Removing Chart.....	551
Supported Chart Types	553
Security	555

Encrypting with password.....	555
Opening the encrypted Word document.....	556
Remove encryption.....	558
Protecting Word document from editing	559
Footnotes and endnotes.....	561
Adding a Footnotes	561
Adding a Endnotes	564
Footnote and Endnote separators	568
Working with Macros.....	575
Working with Content Controls	579
What is Content Control?	579
Common properties of Content Control.....	584
Why Content Control?	589
Types of Content Controls	633
Working with Mathematical Equation.....	652
Types of equation	652
Modify existing equation	718
Accepting or Rejecting Track Changes	724
Conversion	728
Working with Document Conversions	728
Converting Word document to PDF.....	729
Rendering / Converting Word document to Image	729
RTF conversion.....	729
HTML conversion	729
Text file.....	730
Word to EPUB	730
Supported and Unsupported Features	730
Word document features.....	730
Blazor supported features	737
FAQ/How to	739
How to modify an existing style?	739
How to open a document from stream using DocIO?	740
How to set OpenType Font Features?	742
How to attach a Template to a Word document?	747
How to insert a DataTable in a Word document?	747

How to insert a table from HTML string in Word document?	750
How to set table cell width?	750
How to position a table in a Word document?.....	751
How to set the text direction to a table in Word document?	752
How to extract the images in the document?	753
How to remove headers and footers from the document?	754
Which units does Essential DocIO uses for measurement properties such as size, margins, etc, in a Word document?	756
Could not find Syncfusion.OfficeChartToImageConverter assembly in .NET 3.5 Framework, does it mean there is no support for chart conversion in this Framework?	756
Can the chart data be refreshed?	756
Is it possible to convert 3D charts to PDF or image?	756
Is it possible to specify PDF conformance level in Word to PDF conversion?	756
Migration from Microsoft Office Automation to Essential DocIO	757
How to copy necessary fonts to Linux containers	780
PDF	780
Creating a PDF document with simple text	781
Creating a PDF document with image	783
Creating a PDF document with table	785
Creating a simple PDF document with basic elements.....	789
Filling forms.....	802
Converting HTML contents to PDF.....	807
Merge PDF Documents	811
Open and Save PDF file in C# and VB.NET	813
Opening an existing PDF document.....	813
Opening an existing PDF document from Stream.....	814
Opening an existing PDF document from byte array.....	814
Opening an Encrypted PDF document.....	815
Opening a corrupted PDF document	816
Saving a PDF document to file system	818
Saving a PDF document to stream	820
Saving a PDF document into the same file or stream.....	821
Closing a document.....	823
Working with Document.....	824
Adding the document settings.....	824

Creating sections in a PDF	834
Printing PDF document	837
Working with document properties	838
Performing incremental update for PDF document	843
Choosing the viewer preferences	845
Adding document action.....	850
Working in Multi-Threading Environment.....	850
Uniform Resource Naming in PDF document	852
Memory Optimization.....	856
Find corrupted PDF document.....	858
Working with Pages	861
Adding a new page to the document.....	861
Inserting pages in a document.....	863
Adding margin to the PDF pages.....	865
Adding sections with different page settings	867
Get number of pages from a PDF document	874
Importing pages from an existing document.....	875
Importing pages from an existing document without bookmarks.	877
Rearranging pages in an existing document	880
Changing the page numbers in a PDF document.....	881
Removing pages from a document	884
Rotating a PDF page	886
Rotating an existing PDF page.....	888
Splitting a PDF file to individual pages.....	890
Working with Text.....	893
Drawing text in a new document.....	893
Drawing text in an existing document	895
Drawing text using different fonts	897
Measuring a string	905
Embedding fonts and working with Unicode text	908
Drawing Right-To-Left text.....	909
Adding a HTML Styled Text	913
Creating a multicolumn PDF document.....	915
Inserting Rich Text Format contents.....	922
Adding an Ordered List	923

Adding an Unordered List	927
Replace Fonts in an existing document	931
Search and get the bounds of a text in a document.....	932
Drawing complex script language text.....	932
Drawing text using OpenType font	938
Working with Images	941
Inserting an image in a new document.....	941
Inserting an image in an existing document	943
Inserting a vector image	949
Working with image masking.....	950
Replacing Images in an existing PDF document.....	952
Image Pagination	952
Applying transparency and rotation to the image.....	955
Converting multi page TIFF to PDF.....	958
Working with Brushes	960
Solid Brush	960
Linear gradient brush.....	963
Radial Gradient Brush	965
Tiling Brush.....	967
Working with Tables	969
Creating a simple table	969
Support for cell customization	991
Support for rows and columns customization	1005
Support for table customization	1021
Built-in table styles.....	1029
Pagination	1041
Adjust table width automatically	1048
Adding multiple tables	1052
String formatting.....	1057
Row and Column spanning	1079
Table cell styles	1086
Table row style	1092
Difference between PdfLightTable and PdfGrid	1098
Working with flow layout.....	1098
Working with Text.....	1099

Working with text and images	1103
Working with table.....	1109
Flow model using PdfLayoutResult	1115
Working with Forms.....	1122
Creating a new PDF form	1122
Set appearance to the PDF form fields	1164
Modifying the existing form field in PDF document	1166
Retrieving/Modifying the fore and back color of an existing form fields	1169
Filling form fields in an existing PDF Document	1172
Fill the XFA form fields along with Acroform in a same API	1194
Removing editing capability of form fields	1196
Removing the form fields from existing PDF document.....	1206
Importing FDF file to PDF	1208
Export PDF file to FDF	1209
Complex script support for form fields	1209
Auto naming of form fields	1218
Adding actions to form fields.....	1222
Auto resizing text box field text	1222
Troubleshooting.....	1224
Working with XFA	1229
Creating a new XFA form	1229
Creating dynamic XFA forms.....	1240
Creating static XFA forms.....	1243
Creating XFA form fields	1246
Working with XFA form flow directions.....	1316
Rotating XFA form fields	1322
Validating the date time field	1325
Customizing the numeric field value.....	1328
Adding nested sub forms	1331
Formatting XFA form fields	1335
Filling form fields in an existing XFA document.....	1349
Flattening XFA Form fields	1376
Removing the dynamic form fields from an existing XFA document.....	1376
Modifying the existing fields in XFA document	1379
Clear XFA date time field value	1381

Supported fields for XFA form	1383
Merge Documents	1384
Merging multiple documents from disk and stream	1384
Importing pages from multiple documents	1389
Best practices	1395
Optimizing PDF resources when merging PDF documents.....	1398
Working with Text Extraction	1401
Working with basic text extraction	1401
Working with layout based text extraction	1404
Text Extraction with Bounds	1405
Working with Image Extraction	1409
Image informations	1410
Converting HTML to PDF.....	1411
Steps to download the HTML converter installer	1411
Getting Started.....	1412
Supported and Unsupported Features by Rendering Engines.....	1415
Working with Document Conversions	1417
Converting Word documents to PDF	1417
Converting Excel documents to PDF	1422
Converting RTF documents to PDF	1427
Converting TIFF to PDF.....	1431
Converting XPS document to PDF.....	1435
Converting PDF to Image	1438
MHTML to PDF	1439
HTML to MHTML.....	1440
HTML to Raster Image.....	1441
HTML string to Raster Image	1442
Partial webpage to Raster Image	1444
HTML to SVG	1445
Partial webpage to SVG.....	1446
Working with Optical Character Recognition (OCR)	1448
Prerequisites and setting up the Tesseract Engine.....	1448
Performing OCR for an entire document.....	1448
Performing OCR with tesseract version 3.05	1449
Performing OCR for a region of the document.....	1450

Performing OCR on image.....	1451
Performing OCR for large PDF documents.....	1452
Performing OCR on rotated page of PDF document.....	1452
Layout result from OCR.....	1453
Native call.....	1454
Customizing temp folder.....	1456
Best Practices	1457
Troubleshooting	1458
Working with Hyperlinks.....	1458
Working with Web navigation	1458
Working with internal document navigation.....	1464
Working with external document navigation	1470
Working with PDF Templates.....	1473
Creating a new PDF template	1473
Creating templates from existing PDF document.....	1478
Working with PdfPageTemplateElement.....	1481
Creating Document Overlays	1485
Working with Headers and Footers	1489
Adding an automatic field in header and footer.....	1489
Working with Shapes	1493
Adding Shapes to a PDF document.....	1493
Working with shape pagination	1535
Working with Bookmarks.....	1537
Adding Bookmarks in a PDF	1537
Adding Bookmarks in an existing PDF document	1539
Adding a Child to the Bookmarks.....	1542
Inserting Bookmarks in an existing PDF.....	1545
Removing Bookmarks from an existing PDF	1547
Modifying the Bookmarks.....	1549
Working with Named Destination	1551
Adding Named Destination to a PDF document.....	1552
Adding Named Destination to an existing PDF document.....	1554
Removing/Modifying the named destination.....	1557
Adding named destination to the bookmarks	1559
Working with Annotations.....	1562

Adding annotations to a PDF document	1562
Flatten annotation	1567
Supported annotation types	1575
Measurement Annotations	1608
Modifying the annotations	1618
Removing annotations from an existing PDF	1621
Importing annotations from FDF file	1623
Importing annotations from XFDF file	1625
Exporting annotations to FDF file	1627
Exporting annotations to XFDF file	1629
Adding comments and review status to the PDF annotation	1630
Removing comments and review status from PDF annotation	1644
Modifying comments and review status	1649
Retrieve review status and comments from PDF annotation	1655
Printing Annotations	1659
Add Custom Stamp using Rubber Stamp Annotation	1662
Working with Attachments	1668
Adding attachment to a PDF document	1668
Removing attachment from an existing PDF	1673
Extracting and saving an attachment to the disk	1675
Working with Security	1676
Working with RC4 Encryption	1677
Working with AES Encryption	1682
Encryption Options	1688
Opening an encrypt-only-attachment document	1697
Set user password using event when accessing the attachment	1699
Protect attachments in existing PDF document	1701
Protect an existing document	1703
Changing the password of the PDF document	1705
Change the permission of the PDF document	1707
Remove password from the user password PDF document	1709
How to determine whether the PDF document is password protected or not?	1711
How to determine whether the PDF document is protected by user or owner password	1712
Working with PDF Redaction	1713
Removing sensitive content from the PDF document	1713

Display text on the redacted area.....	1714
Drawing image on the redacted area	1715
Drawing pattern on the redacted area	1716
Fill color on the redacted area	1718
Redaction without fill color and appearance.....	1719
Working with Digital Signature	1720
Adding a digital signature	1720
Adding a digital signature using stream.....	1724
Adding a digital signature using X509Certificate2	1730
Signing an existing document	1733
Sign an existing document using stream	1735
Externally sing a PDF document.....	1738
Create Long Term Validation (LTV) when signing PDF documents externally.....	1741
Adding a signature validation appearance based on the signature	1744
Adding a timestamp in digital signature	1748
Adding a timestamp to PDF document.....	1751
Adding a timestamp to existing PDF document.....	1753
Retrieve certificate details from an existing signed PDF document.....	1755
Enable Long Term Validation (LTV) PDF signature.....	1758
Adding a digital signature with customization.....	1762
Digital signature validation	1769
Working with Barcode	1776
Adding a one dimensional barcode to the PDF document	1776
Adding a two dimensional barcode to a PDF document	1778
Set location and size to the barcode.....	1780
Export Barcode as Image	1783
Customizing the barcode appearance	1785
Supported barcode types.....	1785
Working with Actions.....	1786
Adding an action to the PDF	1786
Supported action types.....	1787
Adding an action to the form field.....	1803
Adding an action to the bookmarks.....	1806
Working with Watermarks.....	1808
Adding text watermark in PDF document.....	1808

Adding image watermark in PDF document	1814
Working with Portfolio.....	1820
Creating a PDF portfolio.....	1820
Extracting file from PDF Portfolio	1823
Removing files from PDF Portfolio.....	1824
Working with Layers	1826
Adding Layers in a PDF document	1826
Adding annotation to layer	1832
Nested Layers.....	1837
Removing layers from an existing PDF document	1840
Flattening the layers in an existing PDF document.....	1842
Toggling the visibility of layers.....	1844
Tagged PDF.....	1849
Introduction	1849
Adding tag to text element	1849
Adding tag to image	1853
Adding tag to shapes.....	1856
Adding tag to Form Fields	1859
Adding tag to Annotation.....	1862
Adding tag to Hyperlink	1865
Adding tag to Template	1869
Adding tag to Table	1872
Adding tag to List Element	1877
Marking PDF content as an artifact	1882
Tag Reading Order	1887
Auto Tagging a new document	1892
How to pass accessibility full check	1895
Tagged PDF support for converting HTML to PDF	1896
Converting Word document to Tagged PDF	1896
Validating tagged PDF in Acrobat	1898
Working with Compression.....	1899
Compressing existing PDF document.....	1899
Compressing images with image quality	1900
Optimizing embedded font.....	1900
Optimizing page contents	1901

Remove metadata information.....	1902
Compressing the PDF content.....	1902
Compressing images	1904
Working with PDF Conformance.....	1906
PDF/A-1b conformance.....	1906
PDF/A-2b conformance.....	1908
PDF/A-3b conformance.....	1911
PDF/A-1a conformance.....	1914
PDF/A-2a conformance.....	1917
PDF/A-3a conformance.....	1919
PDF/A-2u conformance.....	1923
PDF/A-3u conformance.....	1925
PDF/X-1a conformance	1929
PDF to PDF/A-1b conversion.....	1930
Working with ZUGFeRD invoice	1930
Generating ZUGFeRD invoice.....	1930
Adding ZUGFeRD structured data as attachment.....	1932
Complete code	1933
Extract ZUGFeRD invoice from PDF	1936
Validating ZUGFeRD invoices using Adobe Acrobat	1938
Working with Metadata (XMP)	1942
Working with the XMP metadata	1942
Adding XMP metadata in a PDF document.....	1942
Adding XMP metadata in an existing PDF document	1945
Supported Schema types	1947
Basic Schema.....	1947
Adding Custom Schema to the PDF document.....	1963
Adding Custom Metadata to the PDF document.....	1965
Removing Custom Metadata from an existing PDF document.....	1966
Working with image metadata	1968
Adding XMP metadata along with an image in a PDF document	1968
Extracting XMP metadata from PDF image	1970
Working with Color Spaces	1971
Working with color space in document	1971
Device Color Space.....	1971

CIE-based Color Spaces	1971
ICC-based Color Spaces	1977
Pantone colors	1985
Working with color space in graphics	1991
Working with JavaScript.....	1998
Document level JavaScript action	1998
JavaScript action to the form fields	2000
JavaScript in 3D Annotation	2003
Supported and Unsupported Features	2005
Presentation.....	2012
Overview of PowerPoint Presentation	2012
Key features	2012
Compatible Microsoft PowerPoint Versions.....	2013
Assemblies Required.....	2013
Converting PowerPoint Presentation to PDF.....	2013
NuGet Packages Required.....	2014
Converting PowerPoint Presentation into PDF.....	2015
Converting PowerPoint Presentation to image	2015
Converting charts in Presentation	2016
NuGet package installation and uninstallation.....	2016
Getting Started.....	2019
Creating a simple PowerPoint Presentation with basic elements from scratch.....	2019
Converting PowerPoint Presentation to PDF.....	2027
Document Object Model representation	2030
Load and save the Presentation.....	2031
Opening an existing Presentation from file system	2031
Opening an existing Presentation from stream	2031
Opening an encrypted Presentation	2032
Saving a PowerPoint Presentation to file system	2033
Saving a PowerPoint Presentation to stream	2035
Sending to a client browser	2036
Closing a PowerPoint Presentation.....	2037
Working with PowerPoint presentation	2038
Cloning a PowerPoint presentation	2038
Printing a PowerPoint presentation	2041

Working with PowerPoint presentation properties	2044
Custom Document properties.....	2046
Marking a PowerPoint presentation as final	2050
Working with Slides in PowerPoint.....	2052
Adding slide to the PowerPoint presentation.....	2052
Create a slide with predefined LayoutSlide	2053
Adding Custom layout slide	2059
Cloning slide	2064
Merging slide.....	2067
Removing slide	2069
Converting to image.....	2071
Changing Slide background	2073
Create and edit Master and Layout slides	2075
Access the MasterSlide	2076
Create a custom LayoutSlide.....	2076
Working with Paragraph	2077
Adding Paragraph to slide.....	2077
Applying Paragraph formatting.....	2080
Working with text	2082
Modifying text.....	2087
Enabling shrink text on overflow option.....	2089
Removing the paragraph	2090
Working with lists	2092
Creating a simple list.....	2092
Creating a Multilevel List	2109
Working with Shapes	2116
Adding shapes to a slide	2116
Iterating through shapes.....	2118
Specifying shape properties.....	2120
Removing the shapes.....	2124
Working with GroupShape.....	2126
Working with images	2133
Adding Images.....	2133
Replacing Images	2135
Removing Images	2138

Working with PowerPoint Tables	2140
Create a table by adding rows	2140
Create a table by adding columns.....	2143
Append a new row at the end of table	2146
Copy an existing row to the end of table	2148
Insert a row in table	2150
Append a new column at the end table.....	2152
Copy an existing column to the end of table	2154
Insert a column to a table	2156
Get the actual height of the table.....	2158
Applying table formatting	2159
Applying table styles	2164
Modifying the table.....	2168
Merging the cells.....	2171
Removing the table	2174
Working with Charts	2176
Creating a Chart from scratch	2176
Creating charts from excel sheet	2181
Creating Custom Charts	2183
Refreshing the chart.....	2189
Editing the Chart Data.....	2191
Customizing the chart	2194
Applying 3D Formats.....	2211
Chart to Image conversion.....	2214
Removing the chart from slide.....	2215
Creating a Scatter chart	2217
PowerPoint 2016 Charts	2220
Supported Chart Types	2250
Working with Animations	2252
Adding animation effect to shapes	2252
Adding interactive animation	2254
Adding animation to text	2257
Adding exit animation effect.....	2259
Edit existing animation effect	2262
Modifying animation effect sub type.....	2264

Modifying timing of animation effect	2266
Reordering the animation effects	2269
Creating custom path animation effect	2271
Removing animation effect	2275
Supported animation effects type	2278
Add and edit transitions in PowerPoint slides	2285
Set a transition effect to a PowerPoint slide	2285
Modify a transition effect applied to a PowerPoint slide	2287
Set the transition duration	2289
Set the transition delay	2292
Set the trigger mode for the transition	2294
Set the speed for transition effect	2296
Supported transition effect types:	2298
Adding connectors in PowerPoint slides	2303
Adding a single point connector	2306
Editing a connector in PowerPoint slide	2308
Updating the positions of the connector in PowerPoint slide	2312
Removing a connector from PowerPoint shapes	2314
Working with Headers and Footers	2316
Add Headers and Footers in PowerPoint	2316
Modify Headers and Footers in PowerPoint	2335
Remove Headers and Footers from Title Slides	2343
Working with Notes	2346
Adding Notes to a Slide	2346
Adding Text into the Notes	2348
Adding a numbered list to Notes	2351
Removing Notes from a Slide	2357
Working with SmartArt	2358
Adding SmartArt to a Slide	2358
Adding a node to the SmartArt	2360
Modifying SmartArt appearance	2365
Iterating through child nodes of an existing SmartArt	2367
Removing node from an existing SmartArt	2370
Assistant nodes in SmartArt	2372
Limitations	2375

Supported SmartArt layout types	2375
Working with Comments	2378
Adding a comment	2378
Replying to a comment	2379
Modifying the comment	2382
Deleting the comment	2386
Working with Sections	2389
Creating a section	2390
Moving the sections within a PowerPoint presentation	2395
Moving a slide within sections	2397

Welcome to Syncfusion Essential File Formats Platform

Essential File Formats is a collection of .NET class libraries to create, edit, write, and convert PDF, Excel, Word, and PowerPoint file formats in .NET Framework [C#, VB.NET], .NET Core, UWP, and Xamarin applications without Microsoft Office or Adobe dependencies.

How to best read this user guide

- The best way to get started would be to read the “Getting Started” section for the component you would like to start first. The “Getting Started” and “Assemblies required” sections gives enough information, so it is recommended to read these sections end-to-end before starting to write a code. All other information can be referred as needed.
- After learning the basics about the component, integrate the component into your application. A good starting point is to refer to the code examples in the sample browser and in this user guide. It is very likely that you can find a code example that resembles your intended usage scenario.
- Another valuable resource is available in the [API reference](#) that provides detailed information on the object hierarchy as well as the settings available on every object.

Additional help resources

The [Knowledge Base](#) section contains responses for common questions asked by the customers. This would be a good place to search for the topics that are not covered in the User Guide.

Similar to the Knowledge Base, the [Forum](#) section also contains responses to the questions that are asked by other customers.

Create a support incident

If you are unable to find the information you are looking for in the self-help resources mentioned above, please contact us by creating a [support ticket](#).

List of File Format libraries:

File Format library	Description
Essential PDF	.NET Class library used to create, read, and write PDF files in .NET Framework [Windows Forms, WPF, ASP.NET MVC, ASP.NET], .NET Core, UWP and Xamarin applications.
Essential XlsIO	.NET Class library used to create, read, edit, write, and convert Microsoft Excel files in .NET Framework [Windows Forms, WPF, ASP.NET MVC, ASP.NET], .NET Core, UWP, and Xamarin applications.
Essential DocIO	.NET Class library used to create, read, edit, and convert Microsoft Word files in .NET Framework [Windows Forms, WPF, ASP.NET MVC, ASP.NET], .NET Core, UWP, and Xamarin applications.
Essential Presentation	.NET Class library used to create, read, edit, and convert Microsoft PowerPoint (PPTX) files in .NET Framework [Windows Forms, WPF, ASP.NET MVC, ASP.NET], .NET Core, UWP, and Xamarin applications.

Quick Start links:

[Create Word file in C# without Microsoft Office](#)

[Create PowerPoint file in C# without Microsoft Office](#)

System Requirements

The following topic describes the system requirements needed by Syncfusion File Formats platform.

Operating Systems

Syncfusion File Formats platform can be installed on any of the following operating systems:

- Windows 10
- Windows 8, 8.1
- Windows 7
- Windows Vista
- Windows Server 2008 and later

Hardware Environment

- Processor: x86 or x64
- RAM : 512 MB (minimum), 1 GB (recommended)
- Hard disk: up to 8.5 GB of available space may be required. However, 750 MB free space is required in boot drive even if you are installing in other drive.

Development Environment

In order to develop applications with Syncfusion File Formats platform, you need to have installed anyone of the Visual Studio version.

- Microsoft Visual Studio 2005
- Microsoft Visual Studio 2008
- Microsoft Visual Studio 2010
- Microsoft Visual Studio 2012
- Microsoft Visual Studio 2013
- Microsoft Visual Studio 2015
- Microsoft Visual Studio 2017

Download Installer

You can download the installer from Syncfusion.com website.

Download the Trial Version

There are two ways to download our 30-day trial.

Free Trial Page

1. You can evaluate our 30-day free trial from [Free Trial](#) page.

2. Once you fill the required form or made the login using the your Syncfusion registered account you can download the trial installer in the confirmation page.
3. You can download the latest version trial installer.
4. You can unlock the installer using the unlock key, also you can unlock the installer using the Syncfusion registered login credential.
5. You can download the trial installer using the [Trials & Downloads](#) page under your registered account at any time before the trial expire. (Refer the below screenshot).

Trial Downloads and Unlock Keys

Start Trial Page

1. You can evaluate our 30-day free trial from [Start Trial](#) page.
2. You should login using your Syncfusion account to access this page.
3. You can start your trail by clicking on the required product.

Note: If you already using the trail products and it's not expired, you couldn't start the trial again for same product.

4. After you started the trial, you can download the latest version trial installer using the [Trials & Downloads](#) page.
5. In [Trials & Downloads](#) page, you can find your current active trial products. Trials, which you done in both Free Trial Page and Start trial pages are listed here.
6. Use the Download (element 1 in below screenshot) button to download the installer of respective product.
7. Online installer can be downloaded from this page.
8. No need of unlock key to unlock the online installer.
9. You can unlock the installer using the Syncfusion registered login credential.

License Downloads and Unlock Keys

Note: You can generate the license key for your active trial products from [Trials & Downloads](#) page. This license key will be mandatory to use our trial products in your application. To know more about License key, refer this [help topic](#).

Download the License Version

1. You can find your available licensed products which under your registered Syncfusion account in [License & Downloads](#) page.
2. You can find all the licenses (both active licenses and expired licenses) which are under your account.
3. You can find the licenses listed based on SKU names.
4. Use the Download (element 1 in below screenshot) button to download the installer of respective product.
5. Latest version installer will be downloaded from this page.
6. You can navigate to [Downloads Older Versions](#) (element 2 in below screenshot) to download older version installers.
7. From 16.2 version online installer will be downloaded by default, and earlier versions offline installer will be downloaded.

Note: Online Installer have been introduced from the release version 16.2.

8. You can navigate to More Downloads Options (element 3 in below screenshot) to download other installers.
9. EXE and Zip format available to download for Windows OS. Both are Offline Installer.
10. No need of unlock key to unlock the online installer.
11. You can unlock the installer using the unlock key for versions earlier to 16.2, also you can unlock the installer using the Syncfusion registered login credential.

License Downloads and Unlock Keys

Note: You can generate the license key for your licensed products from [License & Downloads](#) page. This license key will be required only from release version 16.2. To know more about License key, refer this [help topic](#).

Installation and Upgrade

Installation using Web Installer

Overview

Starting with version 16.2 (2018 Vol 2), Syncfusion provides Web Installer for Essential Studio platforms. This installer reduces the burden of downloading the installer of larger size. You can just download and launch the online installer which will be of smaller size and it will download and install the Essential Studio products you have selected. The Essential Studio Web Installer includes the following platforms. You can download the latest version Essential Studio Web Installer [here](#).

Starting with the version 17.3 (2019 Vol 3), Syncfusion provides updated version of Web Installer which allows both installation and uninstallation of the platforms for that specific version.

Web (Essential JS 2)

- ASP.NET MVC
- ASP.NET Core
- JavaScript

Mobile

- Xamarin
- Flutter

Desktop

- Windows Forms
- WPF
- Universal Windows Platform

FileFormats

- Read and Write Excel, Word, PDF and PowerPoint files

Web (Essential JS 1)

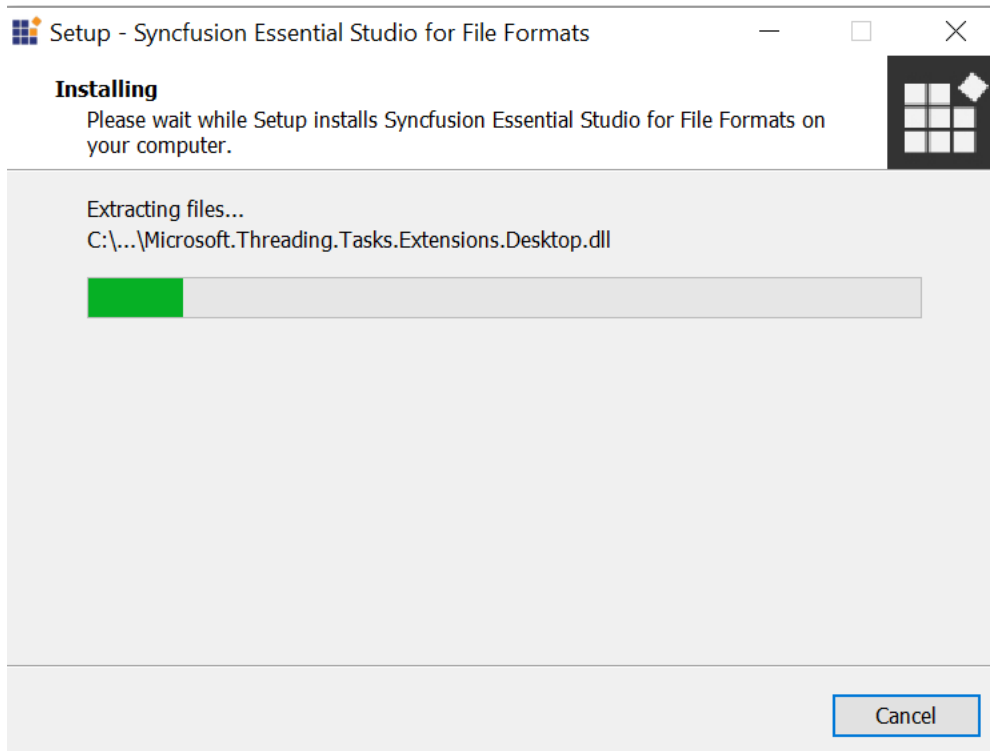

- ASP.NET Web Forms
- ASP.NET MVC
- ASP.NET Core
- JavaScript
- PHP
- JSP

Note: Universal Windows Platform will be installed in Windows 8.1 and later.

[Installation](#)

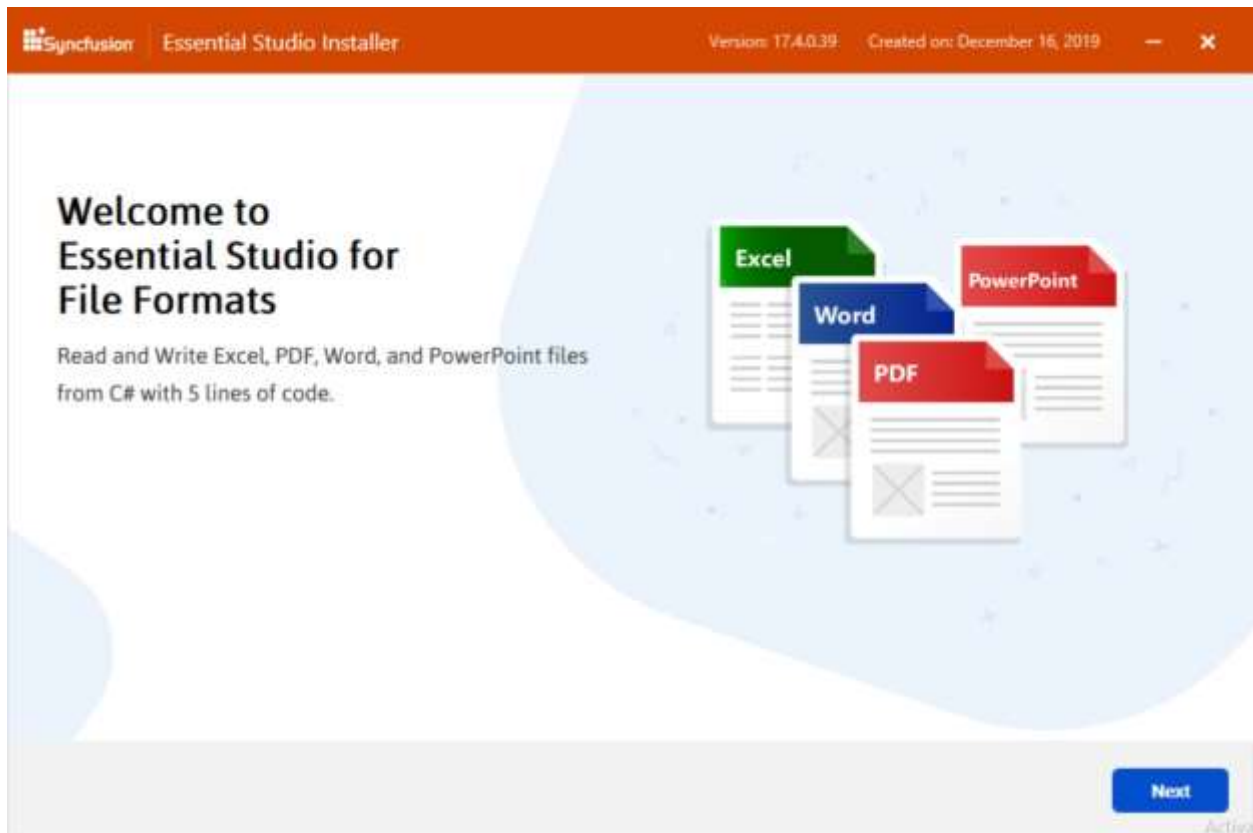

The following procedure illustrates how to install Essential Studio Platform Online Installer.

1. Double-click the Syncfusion Essential Studio Platform Online Installer file. The installer Wizard opens and extracts the package automatically.

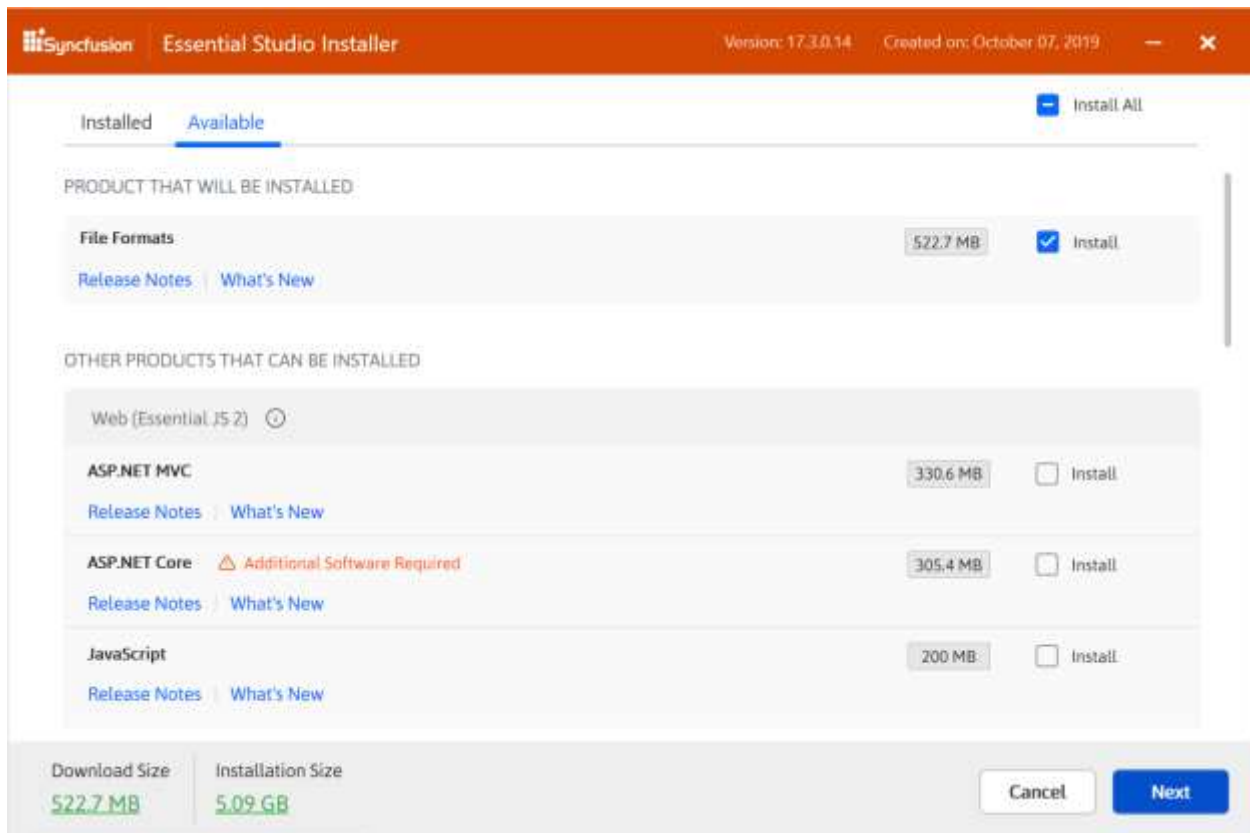

Note: The installer wizard extracts the `syncfusionfileformatswebinstaller_{version}.exe` dialog, displaying the unzip operation of the package.

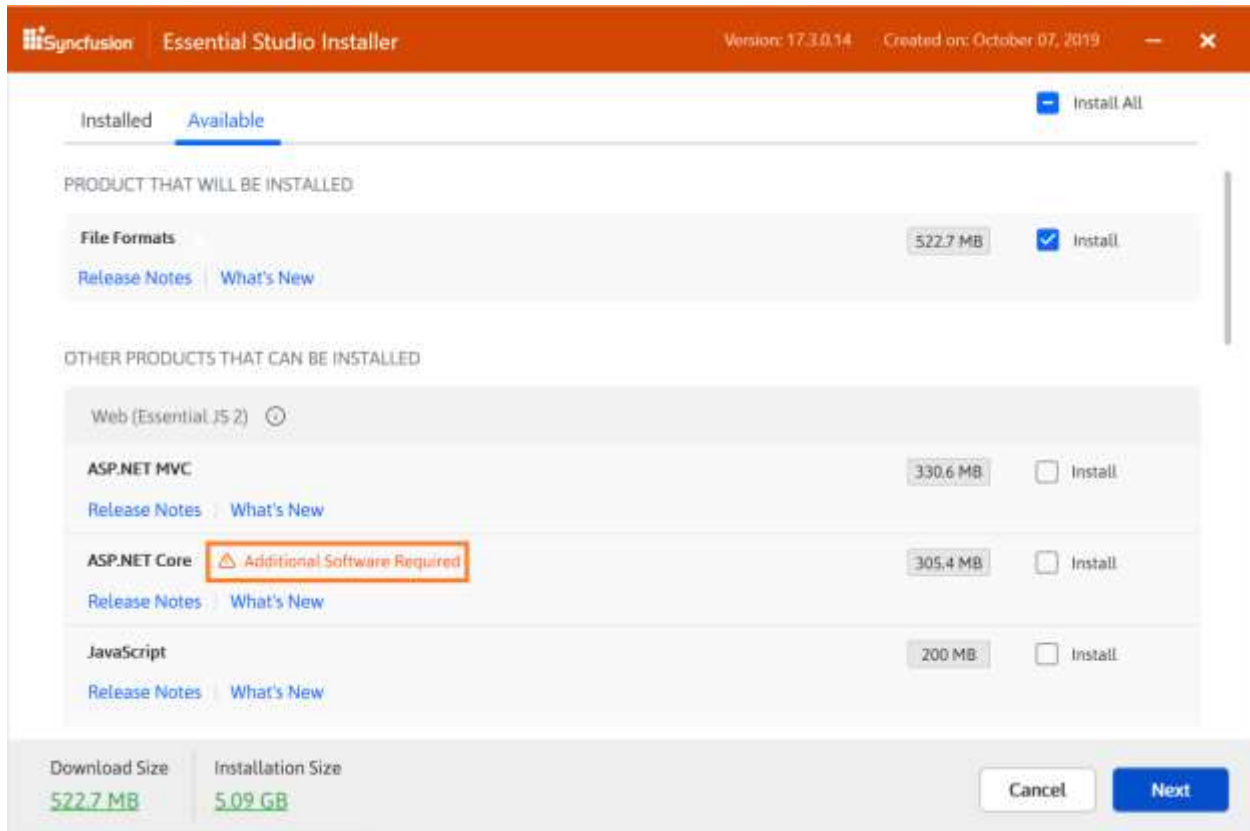

2. Welcome wizard of the Syncfusion Online Installer will be displayed. Click Next.

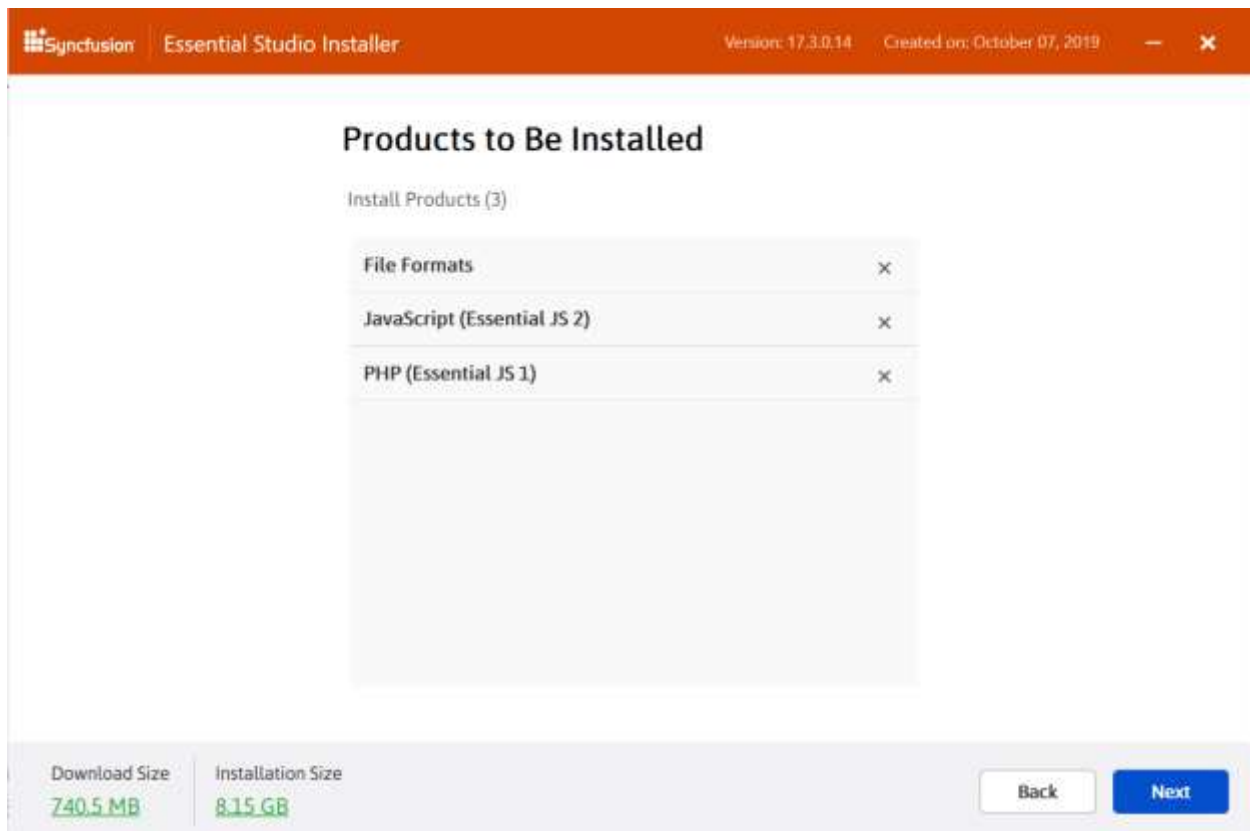

3. Platform Selection wizard will be displayed. Select the platforms to be installed from the **Available** tab. Select **Install All** checkbox to select all the platforms. Click Next.

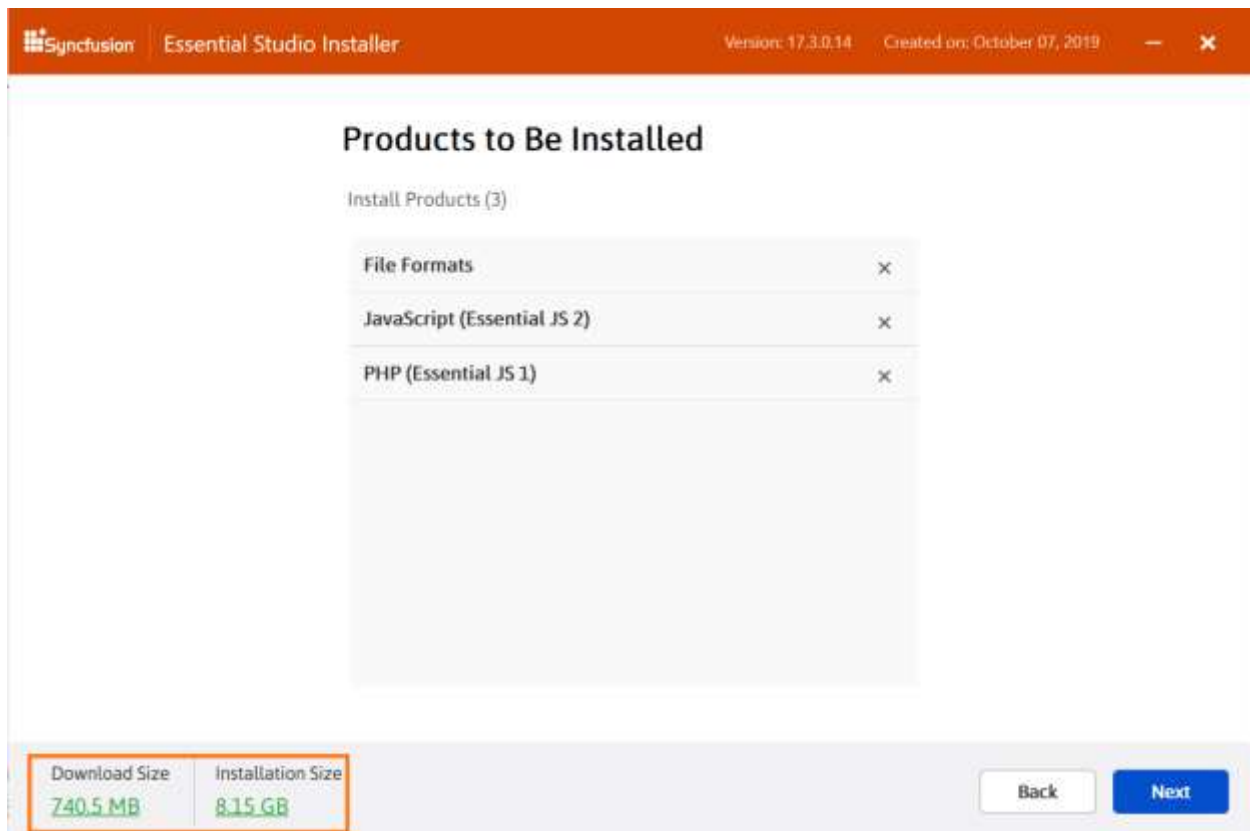

Information: If the required software of the selected platform was not already installed, **Additional Software Required** alert will be displayed. However, you can continue the installation and install the required software later.

4. Confirmation wizard will be displayed. Here you can view and modify the list of platforms that will be installed.

Note: You can check the Estimated size of the Download and Installation by clicking the **Download Size** and **Installation Size** link.

5. Configuration wizard will be displayed. Here you can change the Download, Install and samples location. Also, you can change the Additional settings by platform basis. To install using the default configuration, click Next.

Information: From version 17.3 (2019 Vol 3), Syncfusion provides option to provide custom download location.

Note: From the 2018 Volume 2 release, Syncfusion has changed the install and samples location

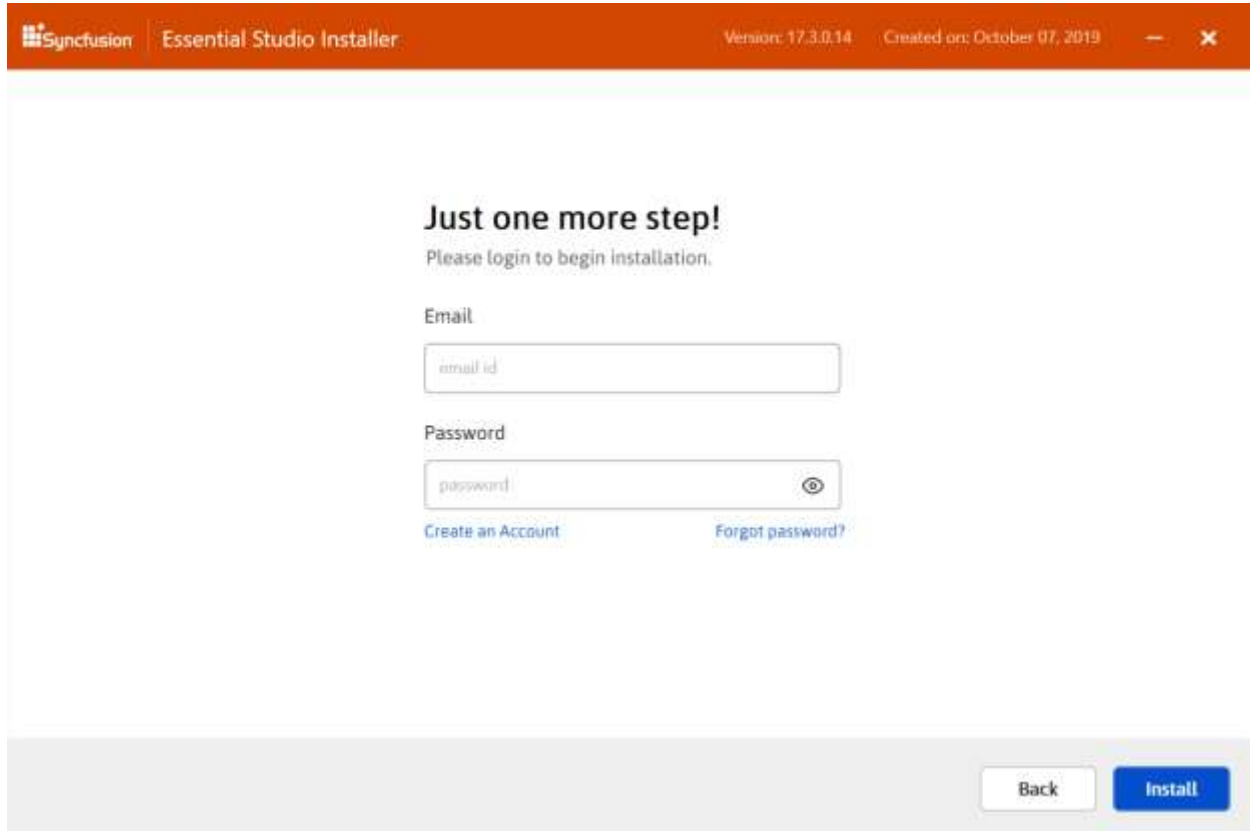

Default Install location: {ProgramFilesFolder}\Syncfusion\{Platform}\{version}

Default Samples location: C:\Users\Public\Documents\Syncfusion\{platform}\{version}

However, you can change the locations by clicking browse button.

- Select the **Install Demos** check box to install Syncfusion samples, or leave the check box clear, when you do not want to install Syncfusion samples.
- Select the **Register Syncfusion Assemblies in GAC** check box to install the latest Syncfusion assemblies in GAC, or clear this check box when you do not want to install the latest assemblies in GAC.
- Select the **Configure Syncfusion controls in Visual Studio** check box to configure the Syncfusion controls in the Visual Studio toolbox, or clear this check box when you do not want to configure the Syncfusion controls in the Visual Studio toolbox during installation. Note that you must also select the Register Syncfusion assemblies in GAC check box when you select this check box.
- Select the **Configure Syncfusion Extensions controls in Visual Studio** checkbox to configure the Syncfusion Extensions in Visual Studio or clear this check box when you do not want to configure the Syncfusion Extensions in Visual Studio.
- Select the **Create Desktop Shortcut** checkbox to create the desktop shortcut for Syncfusion Control Panel.

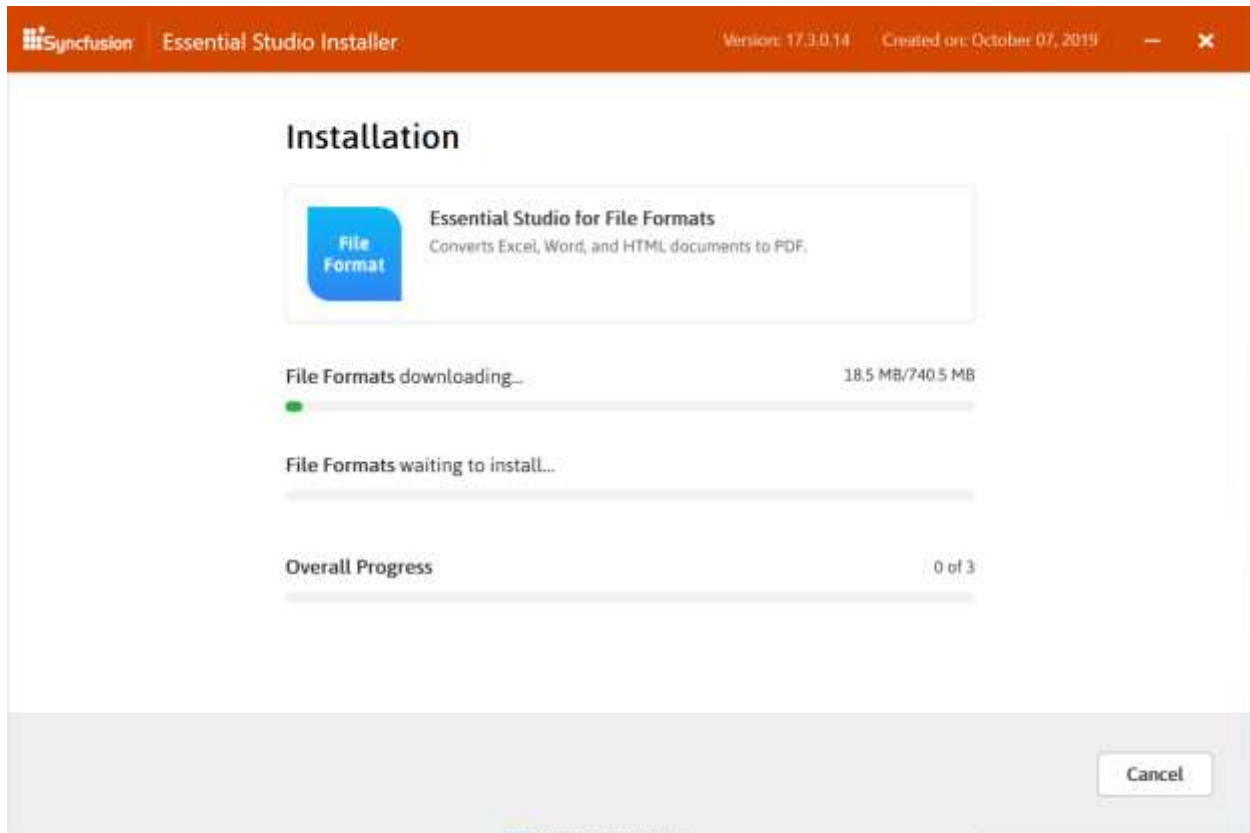

6. After reading the License Terms and Conditions, check the **I agree to the License Terms and Privacy Policy** check box. Click Next.
7. Login wizard will be displayed. You should enter your Syncfusion Direct-Trac login credentials. If you don't have Syncfusion Direct-Trac login credentials, then you can click on **Create an Account**. Else if you forgot your password, click on **Forgot Password** to create new password. Click Install.

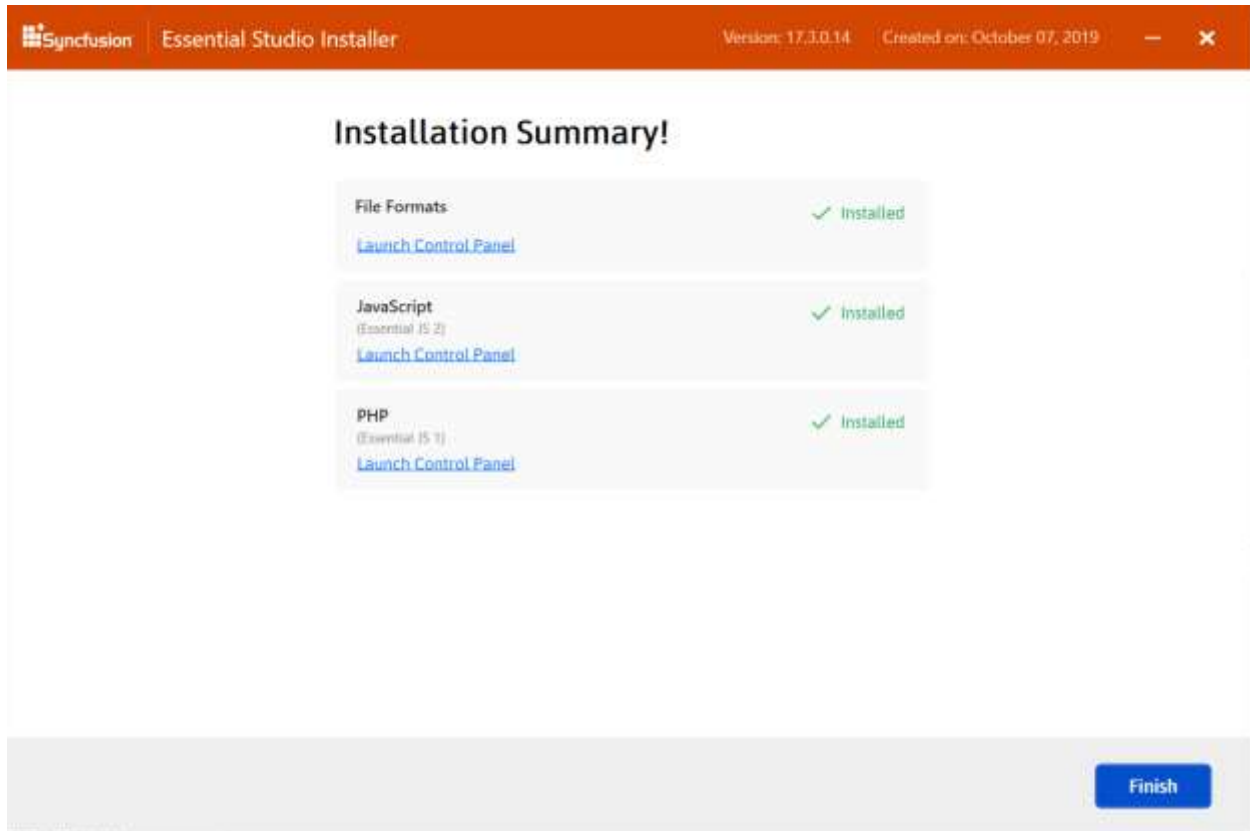

The screenshot shows the 'Essential Studio Installer' window. The title bar is orange and contains the Syncfusion logo, the text 'Essential Studio Installer', and version/creation information: 'Version: 17.3.0.14' and 'Created on: October 07, 2019'. The main content area has a light gray background and features the heading 'Just one more step!' followed by the instruction 'Please login to begin installation.' Below this are two input fields: 'Email' with a placeholder 'email id' and 'Password' with a placeholder 'password' and a toggle icon. At the bottom of the input fields are two links: 'Create an Account' and 'Forgot password?'. At the bottom right of the window are two buttons: 'Back' and 'Install'.

Information: The selected platforms will be installed based on your Syncfusion License (Trial or Licensed).

8. Download and Installation progress will be displayed.

9. Once the Installation is complete, **Summary** wizard will be displayed. Here you can check the list of platforms which are installed successfully and failed. Click Finish to exit the Summary wizard.

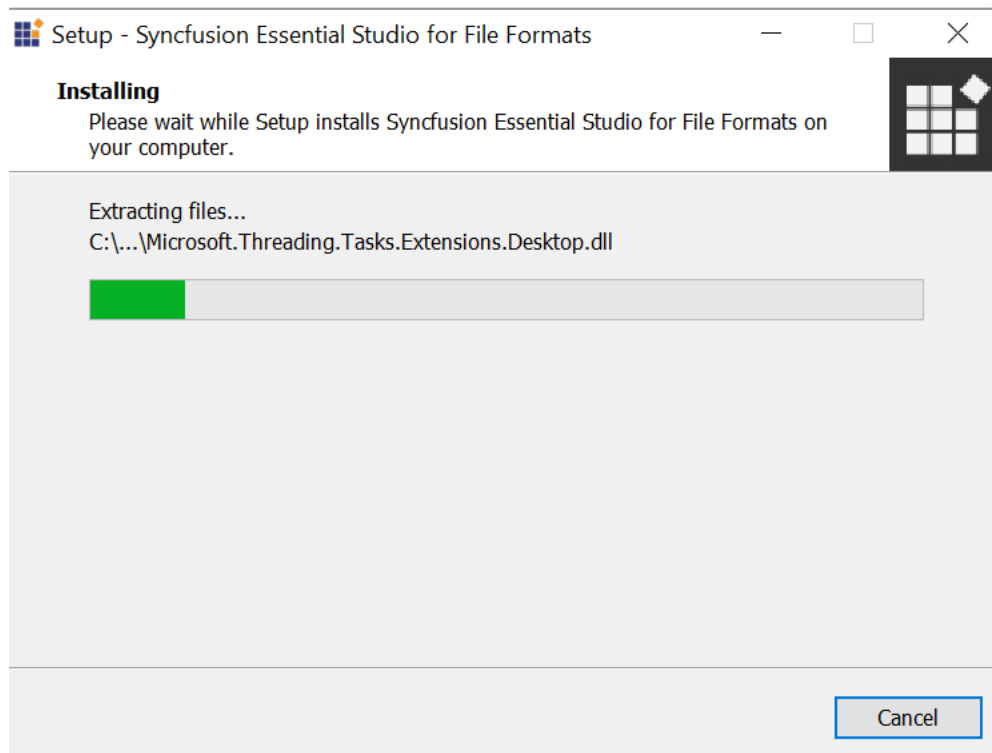

- Click **Launch Control Panel** to open the Syncfusion Control Panel.

Uninstallation

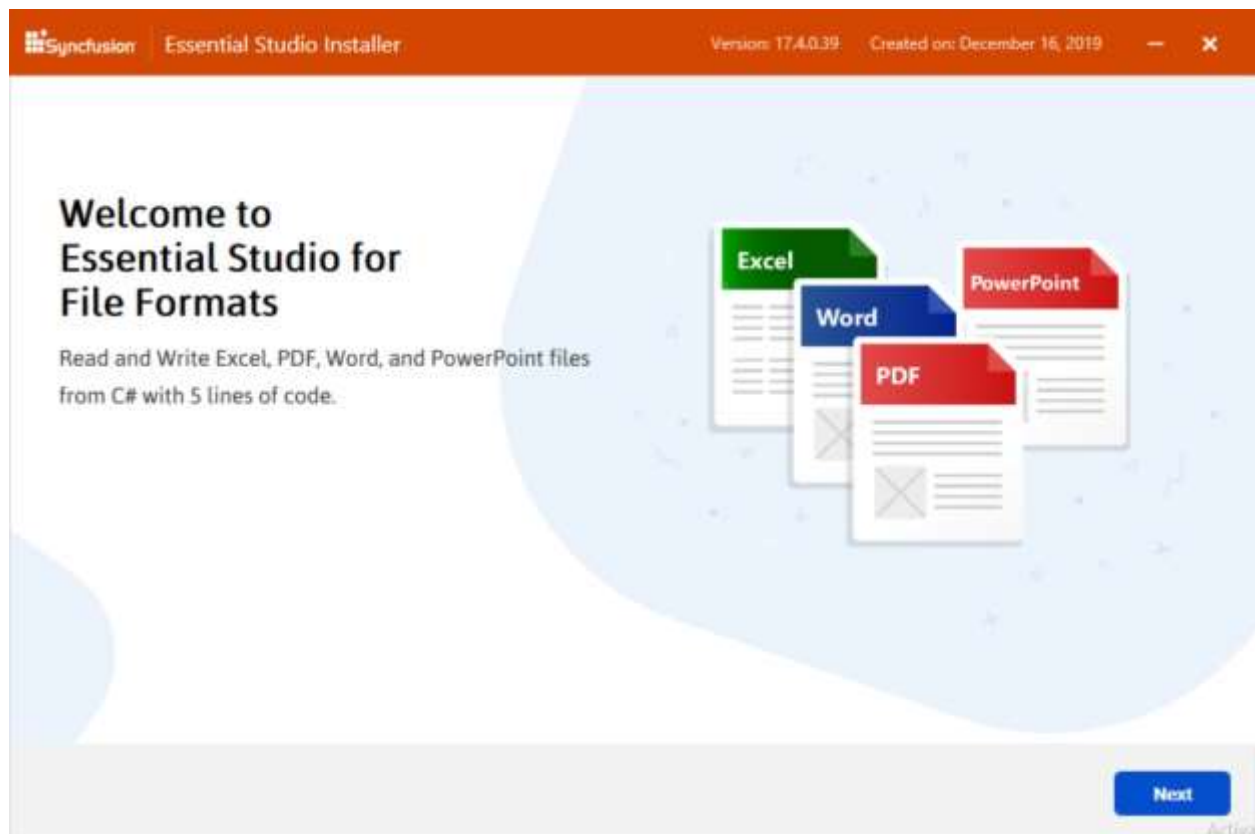

Till version 17.2, Syncfusion Web Installer had option for installation alone. Starting with the version 17.3 (2019 Vol 3), Syncfusion provides option for uninstalling the platforms of the same version from the Web Installer application itself. Select the list of the platforms to be uninstalled and Web Installer will uninstall those platforms one by one.

The following procedure illustrates how to uninstall Essential Studio Platform from Web Installer.

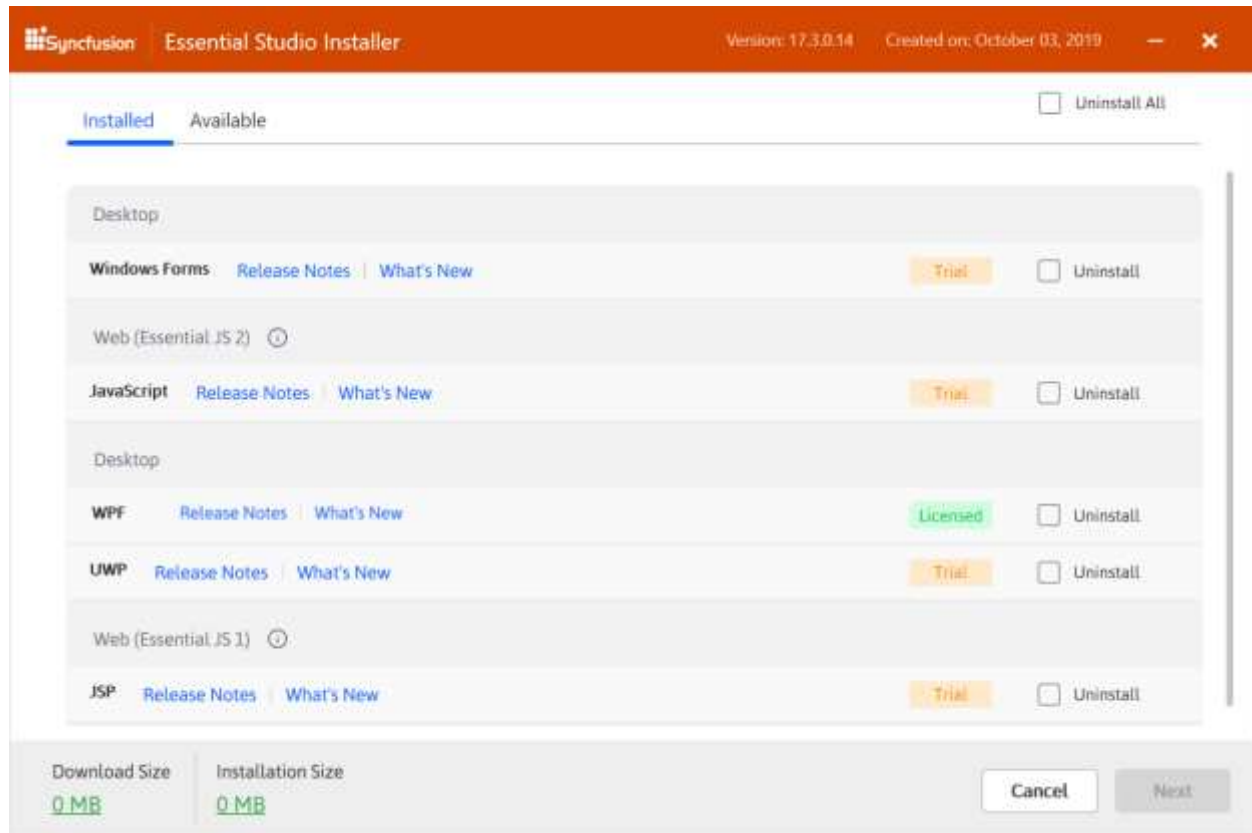

1. Double-click the Syncfusion Essential Studio Platform Online Installer file. The installer Wizard opens and extracts the package automatically.

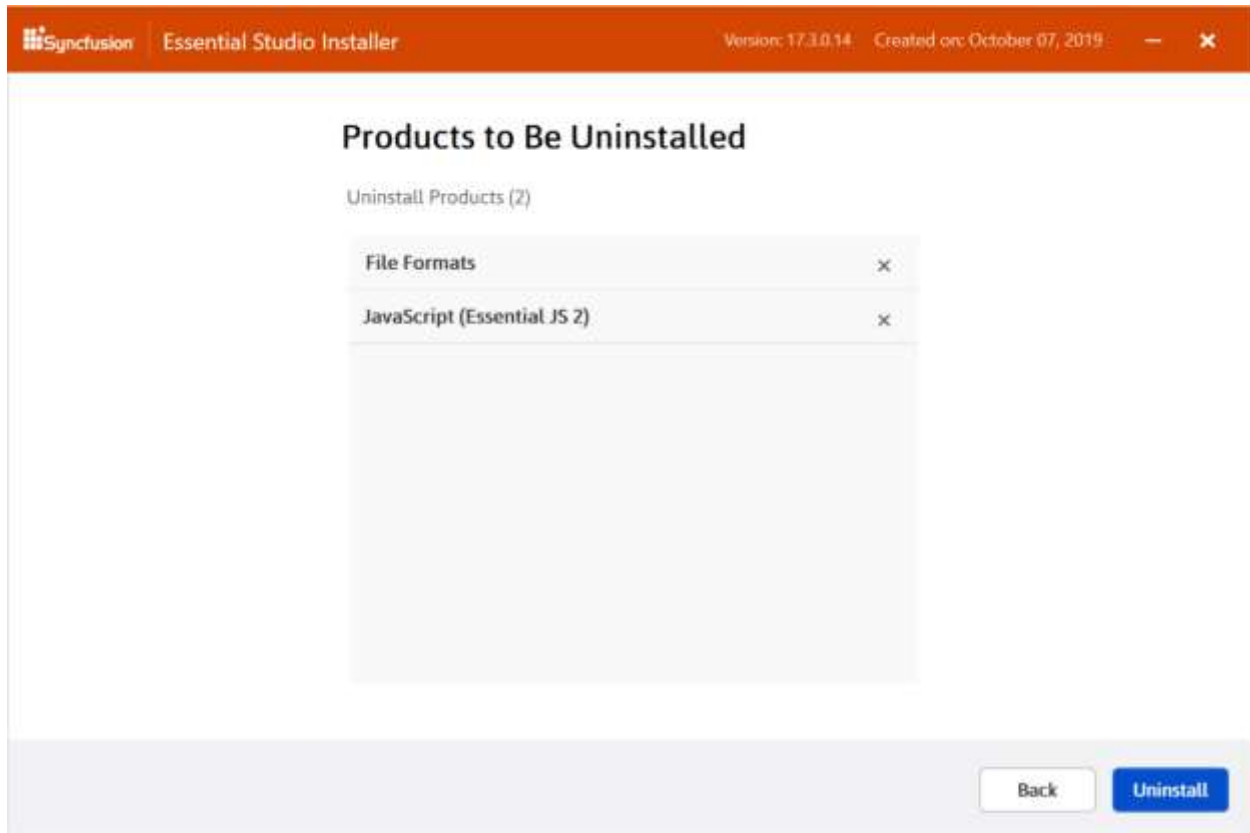

2. Welcome wizard of the Syncfusion Online Installer will be displayed. Click Next.

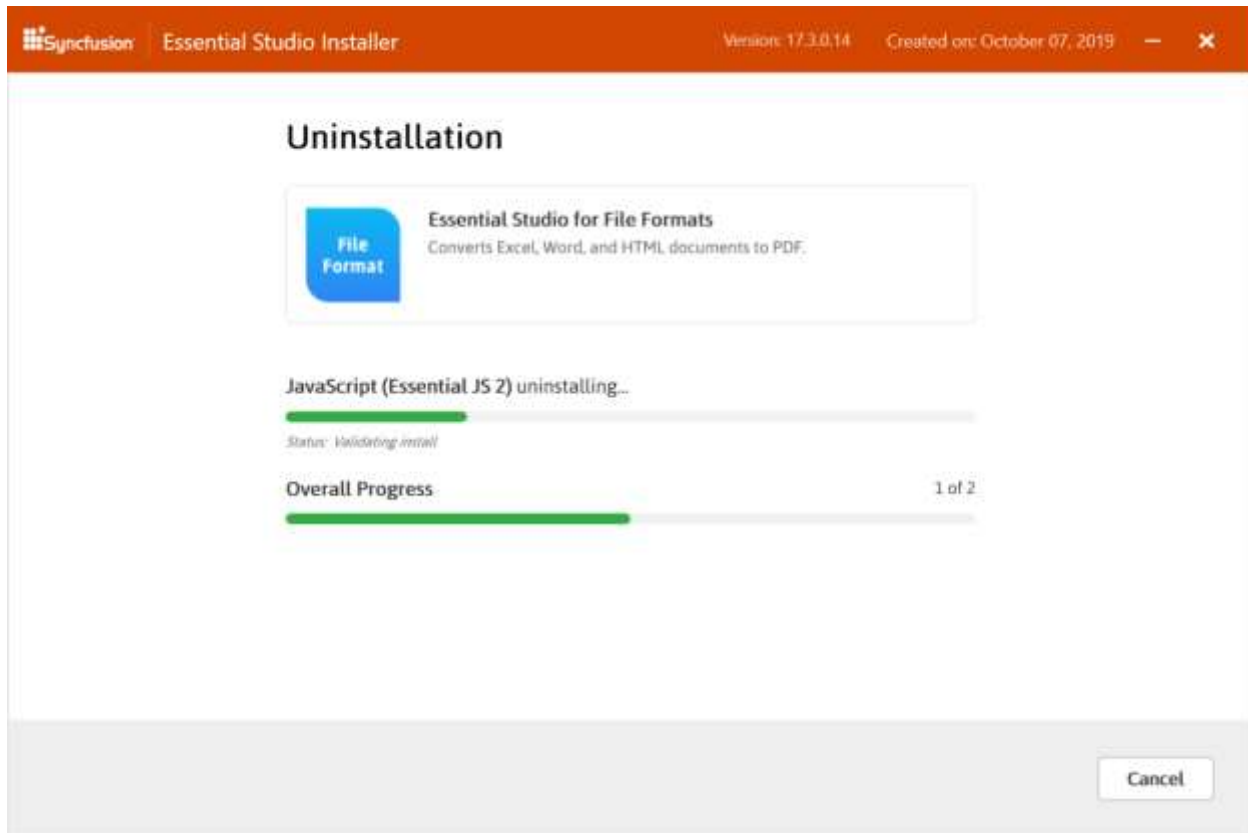

- Platform Selection wizard will be displayed. Select the platforms to be uninstalled from the **Installed** tab. Select **Uninstall All** checkbox to select all the platforms. Click Next.

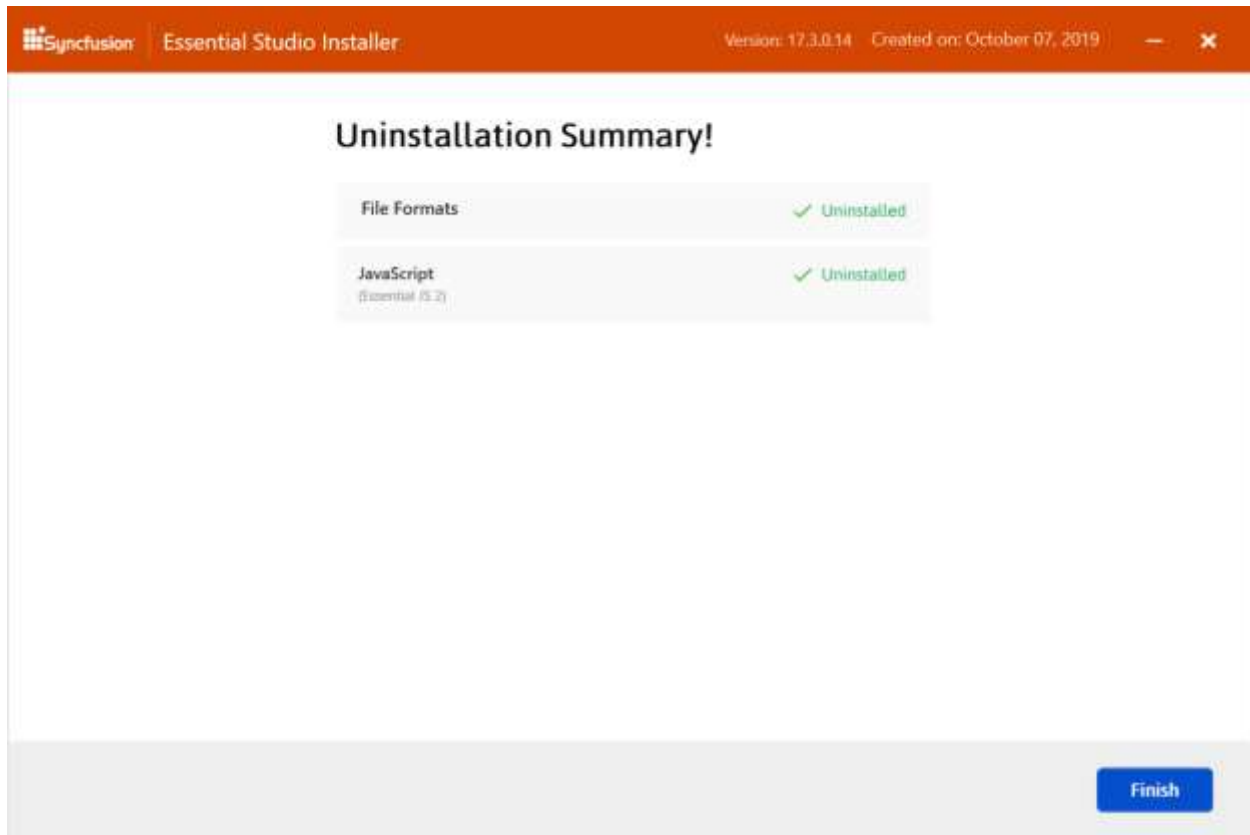

- Confirmation wizard will be displayed. Here you can view and modify the list of platforms that will be uninstalled. Click Uninstall.

5. Uninstallation progress will be displayed.

6. Once the Uninstallation is complete, **Summary** wizard will be displayed. Here you can check the list of platforms which are uninstalled successfully and failed. Click Finish to exit the Summary wizard.

Installation and Uninstallation

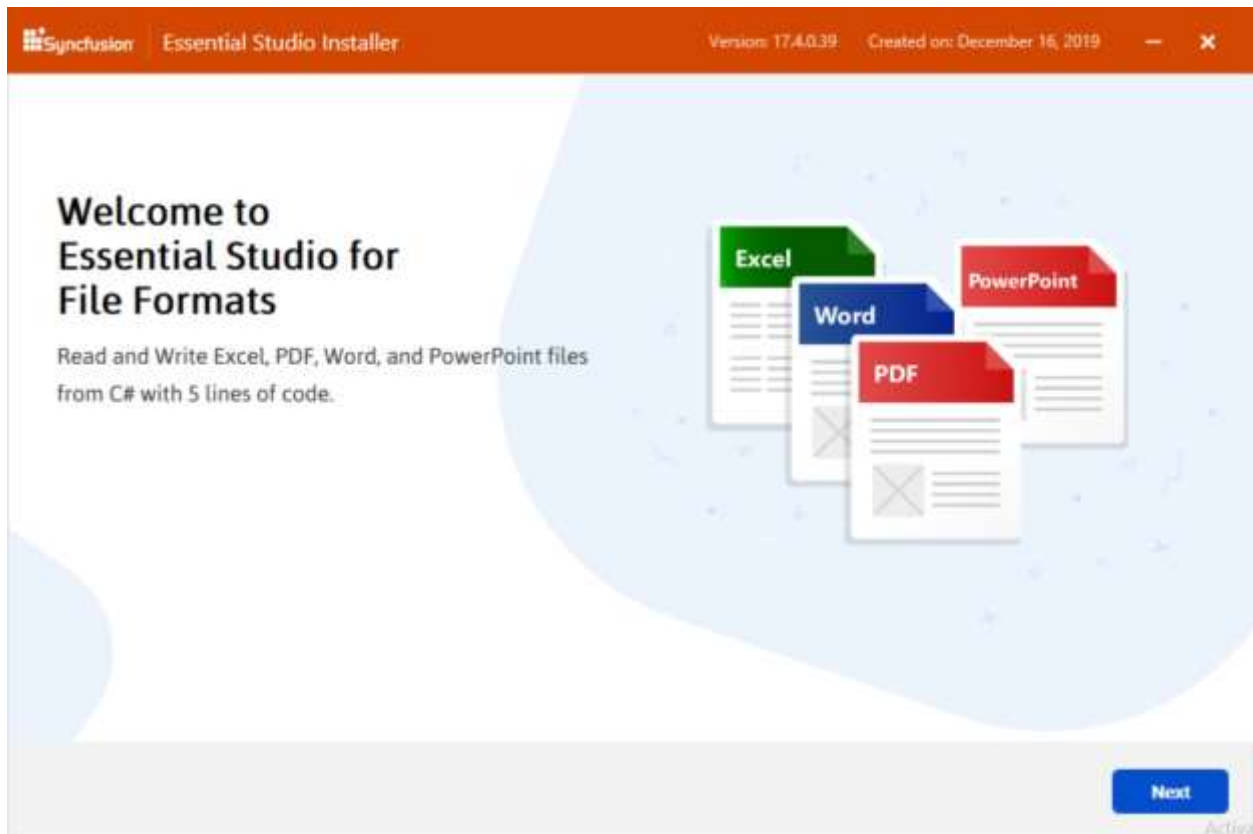

Till version 17.2, Syncfusion Web Installer had option for installation alone. Starting with the version 17.3 (2019 Vol 3), Syncfusion provides option for both install and uninstall the platforms of the same version from the Web Installer application itself.

The following procedure illustrates how to install/uninstall Essential Studio Platform from Web Installer.

1. Double-click the Syncfusion Essential Studio Platform Online Installer file. The installer Wizard opens and extracts the package automatically.

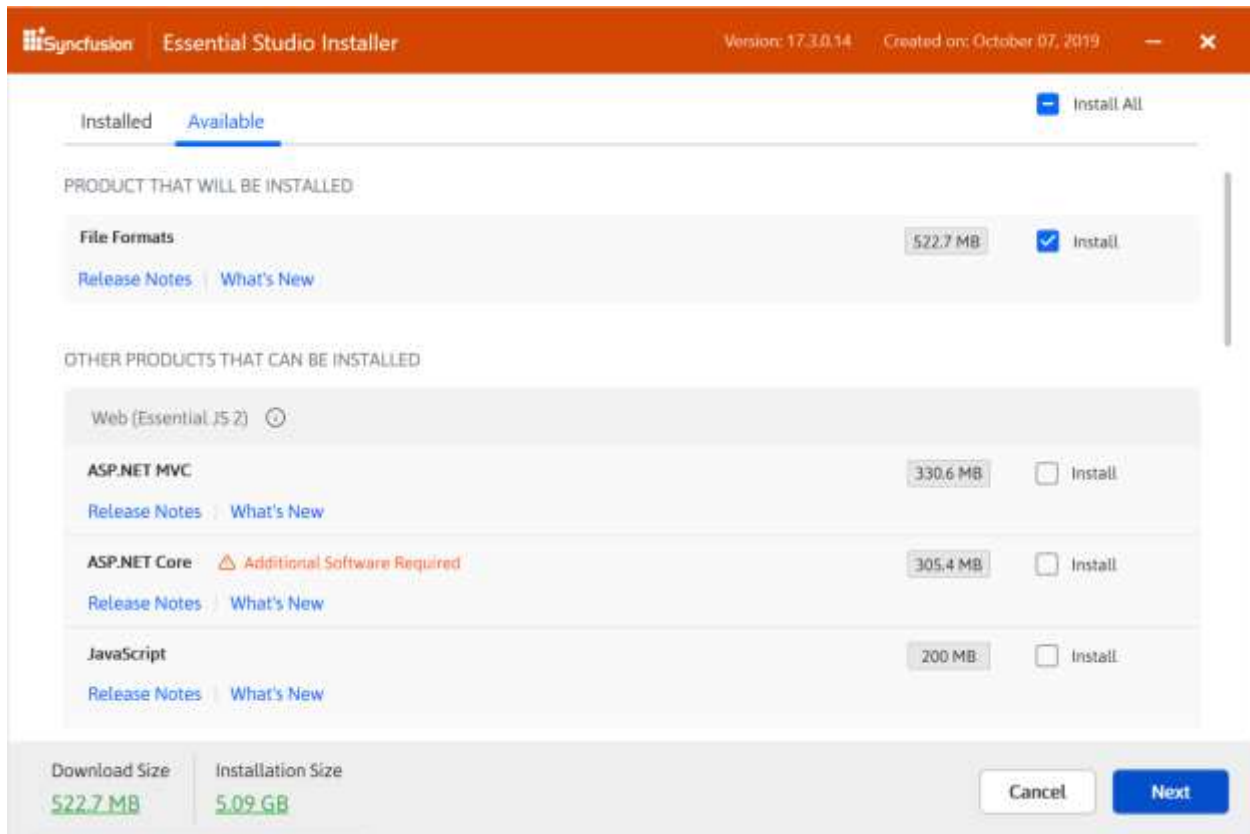

2. Welcome wizard of the Syncfusion Online Installer will be displayed. Click Next.

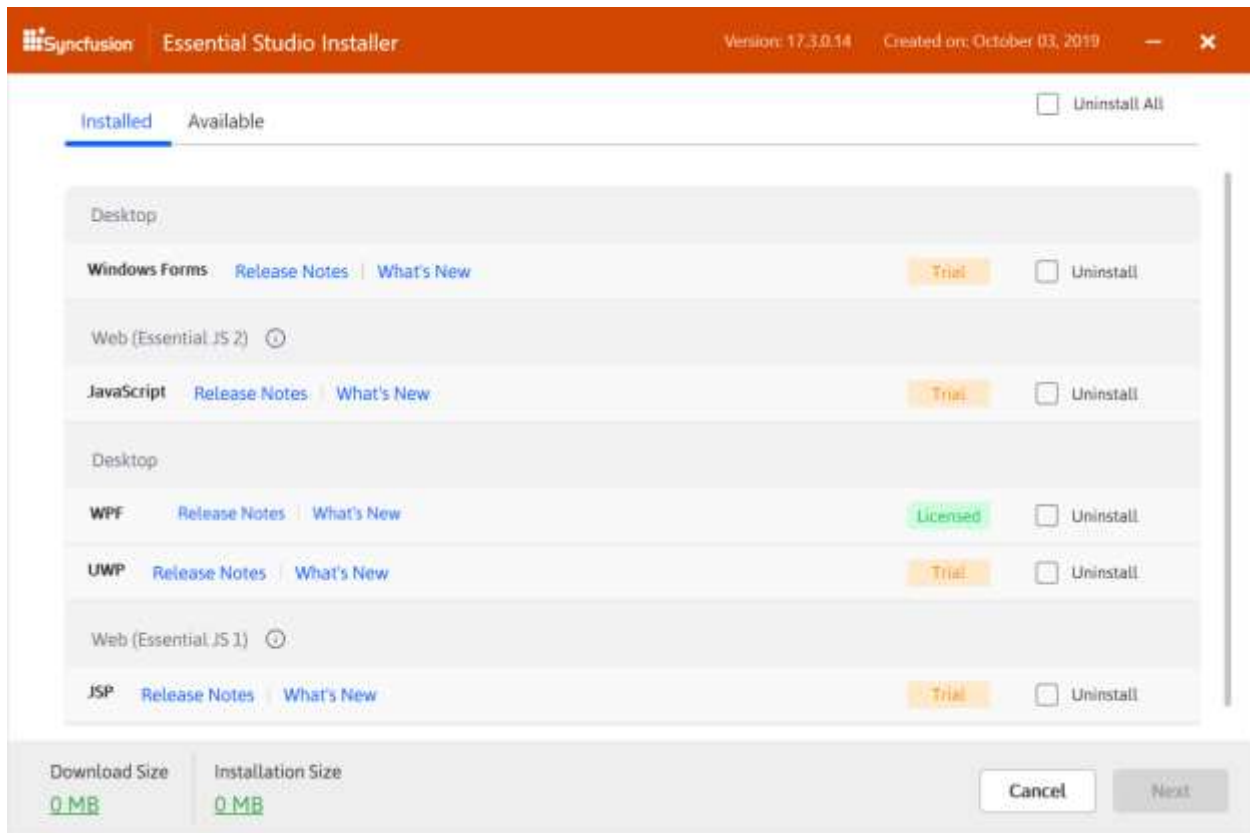

- Platform Selection wizard will be displayed. Select the platforms to be installed from the **Available** tab and platforms to be uninstalled from the **Installed** tab. Click Next.

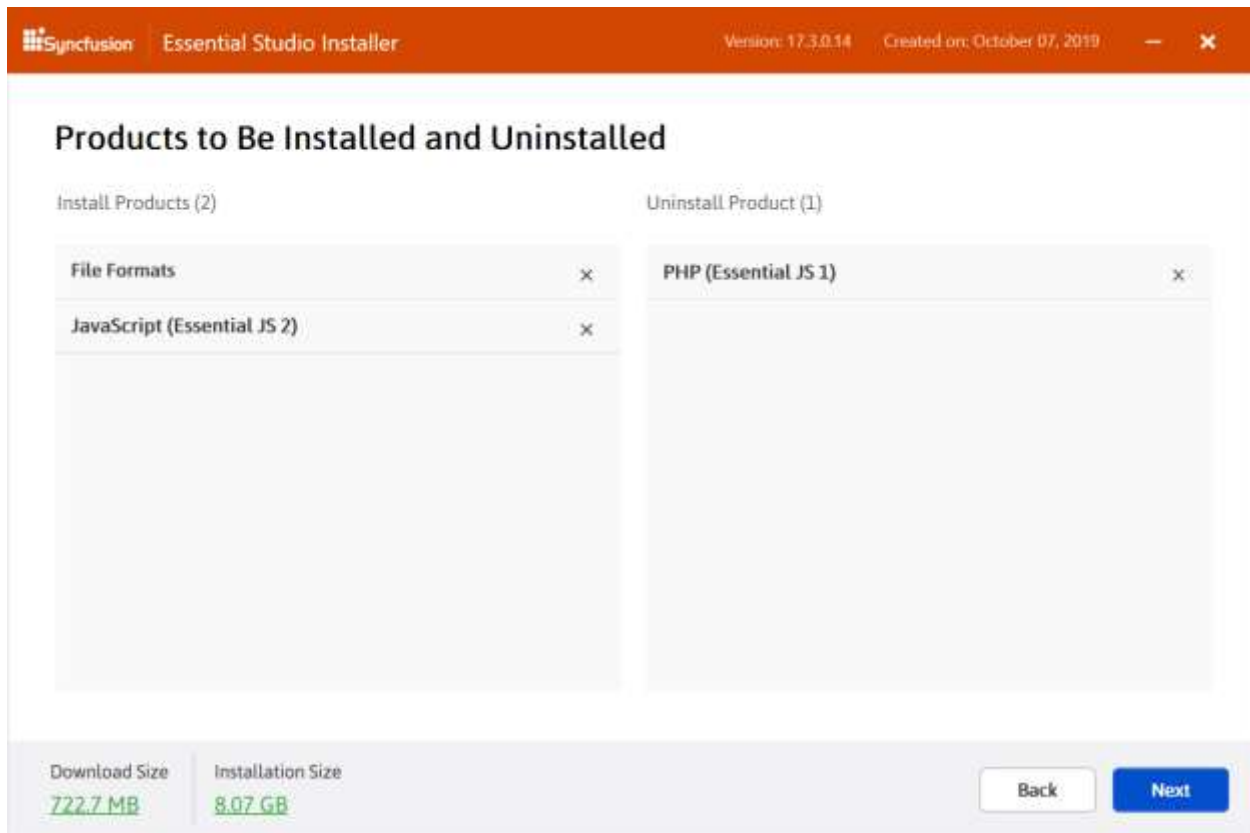

Available

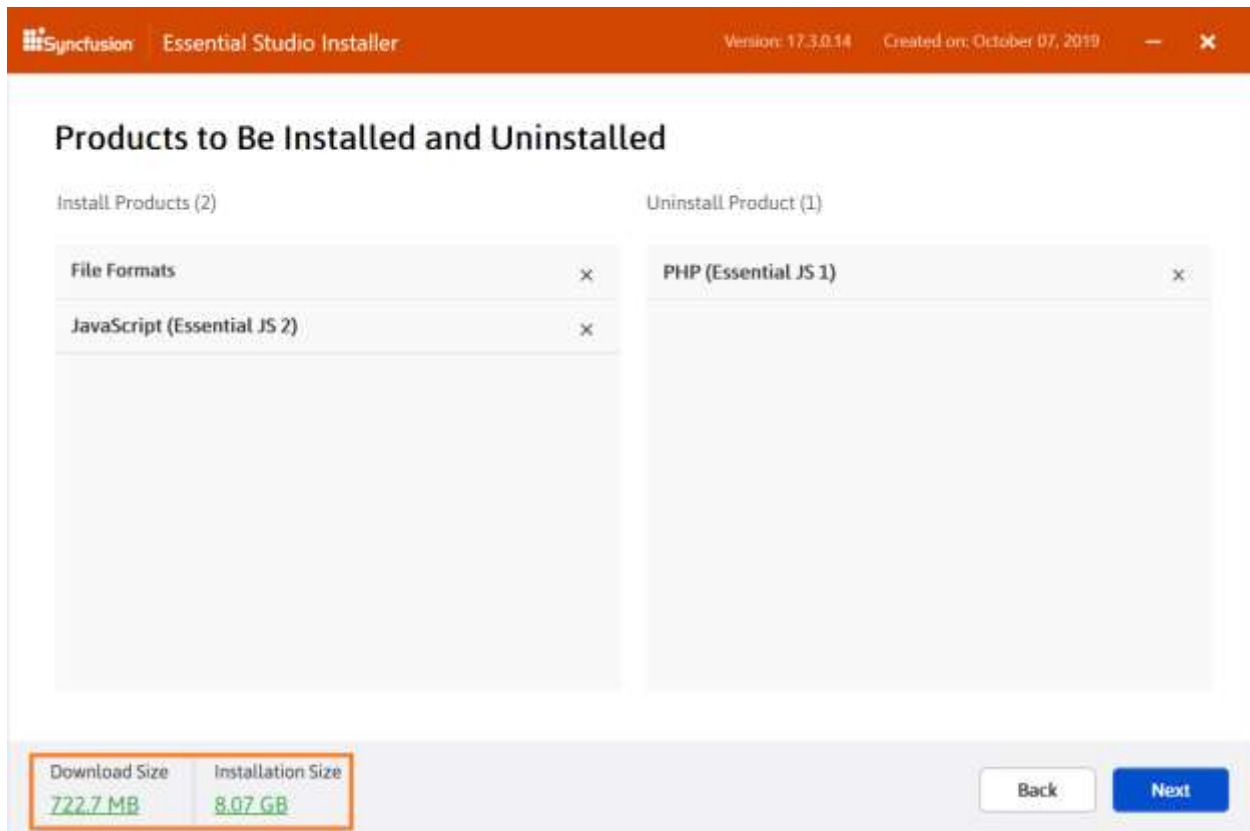

Installed

4. Confirmation wizard will be displayed. Here you can view and modify the list of platforms that will be installed/uninstalled.

Note: You can check the Estimated size of the Download and Installation by clicking the **Download Size and Installation Size** link.

5. Configuration wizard will be displayed. Here you can change the Download, Install and samples location. Also, you can change the Additional settings by platform basis. To install using the default configuration, click Next.

The main content area is white and features the heading 'Just one more step!' followed by the instruction 'Please login to begin installation.' Below this are two input fields: 'Email' with a placeholder 'email id' and 'Password' with a placeholder 'password' and a toggle icon. At the bottom of the login section are two links: 'Create an Account' and 'Forgot password?'. At the very bottom of the window are two buttons: 'Back' and 'Install'.

Information: The selected platforms will be installed based on your Syncfusion License (Trial or Licensed).

8. Download, Installation and Uninstallation progress will be displayed.

9. Once the Installation is complete, **Summary** wizard will be displayed. Here you can check the list of platforms which are **installed/uninstalled** successfully and failed. Click Finish to exit the Summary wizard.

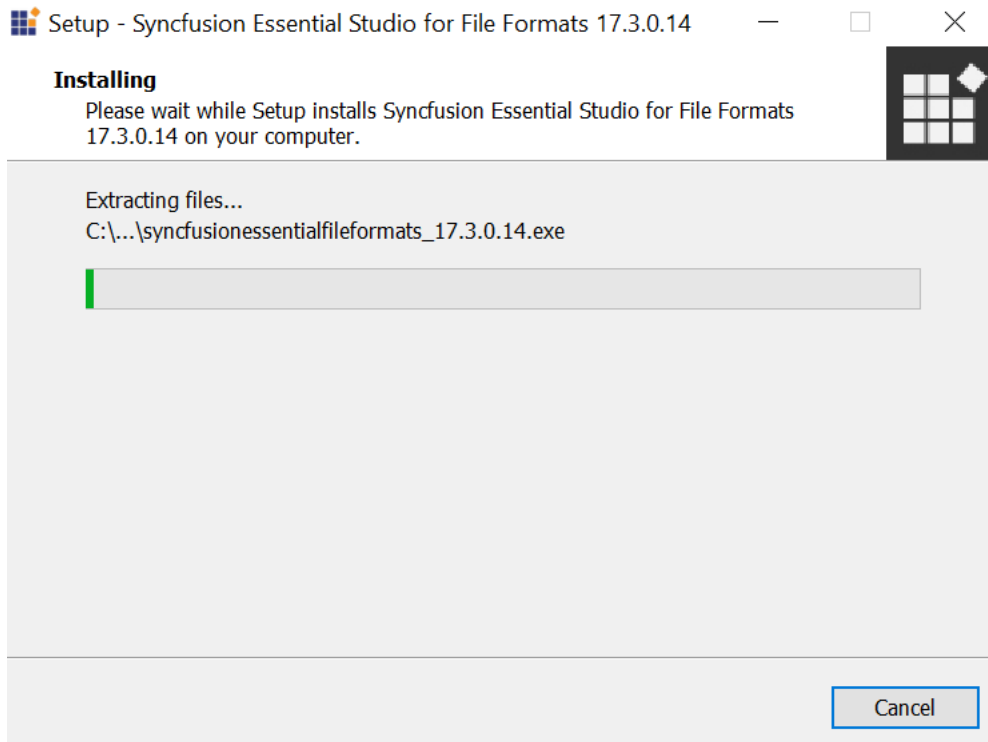

- Click **Launch Control Panel** to open the Syncfusion Control Panel.

Installation using Offline Installer

Installing with UI

The following procedure illustrates how to install Essential Studio File Formats platform.

1. Close all the running Visual Studio instances.
2. Double-click the Syncfusion File Formats platform installer file. The installer Wizard opens and extracts the package automatically.

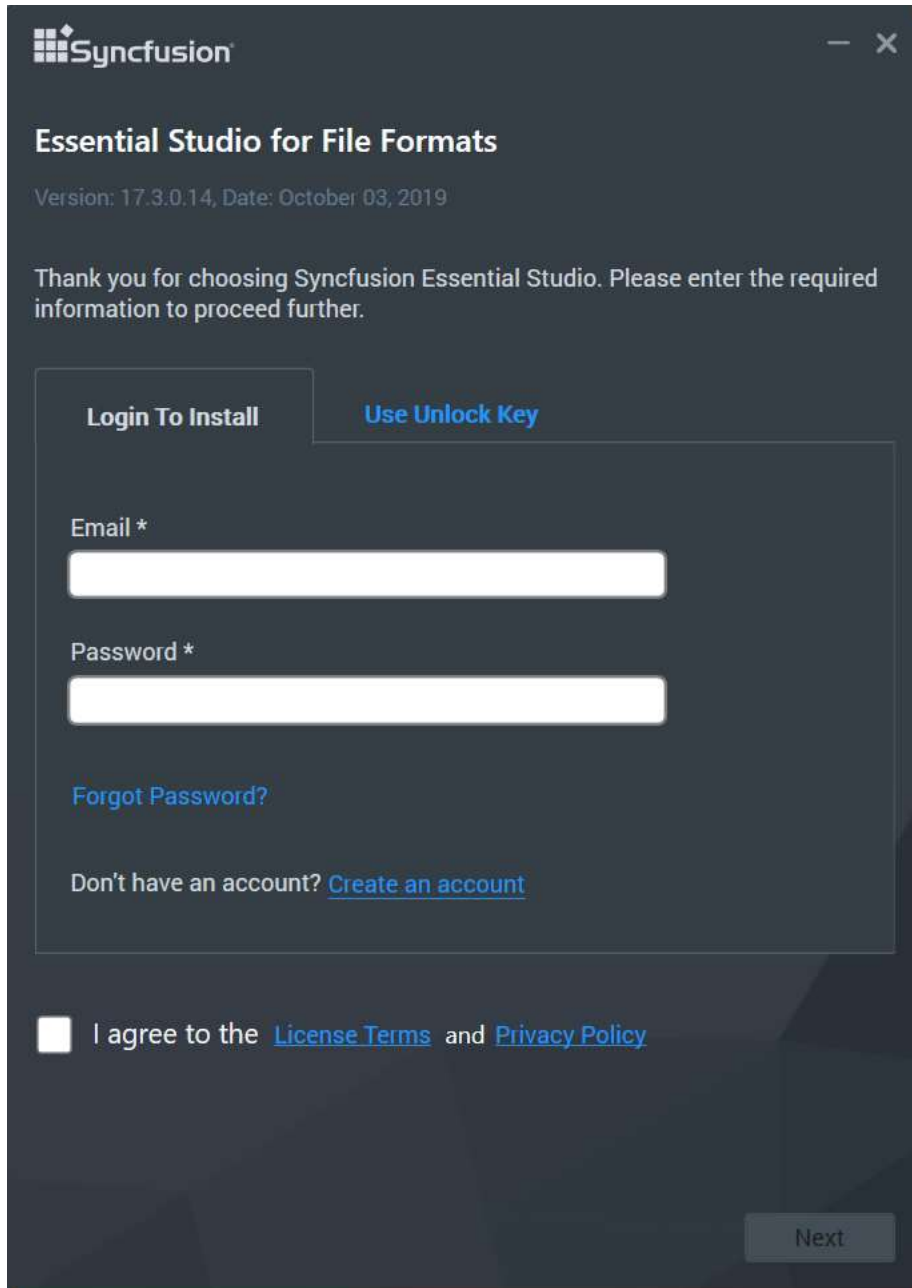

Note: The installer wizard extracts the syncfusionessentialfileformats_(version).exe dialog, displaying the unzip operation of the package.

3. You have two options to unlock the Syncfusion installer:

- *Login To Install*
- *Use Unlock Key*

Login To Install

You should enter your Syncfusion Direct-Trac login credentials. If you don't have Syncfusion Direct-Trac login credentials, then you can click on Sign Up to create a new account. Else if you forgot your password, click on Reset Password to create a new password. Here Email address and Password is validated and the Platform Selection window opens.

Syncfusion

Essential Studio for File Formats

Version: 17.3.0.14, Date: October 03, 2019

Thank you for choosing Syncfusion Essential Studio. Please enter the required information to proceed further.

Login To Install **Use Unlock Key**

☐ I agree to the [License Terms](#) and [Privacy Policy](#)

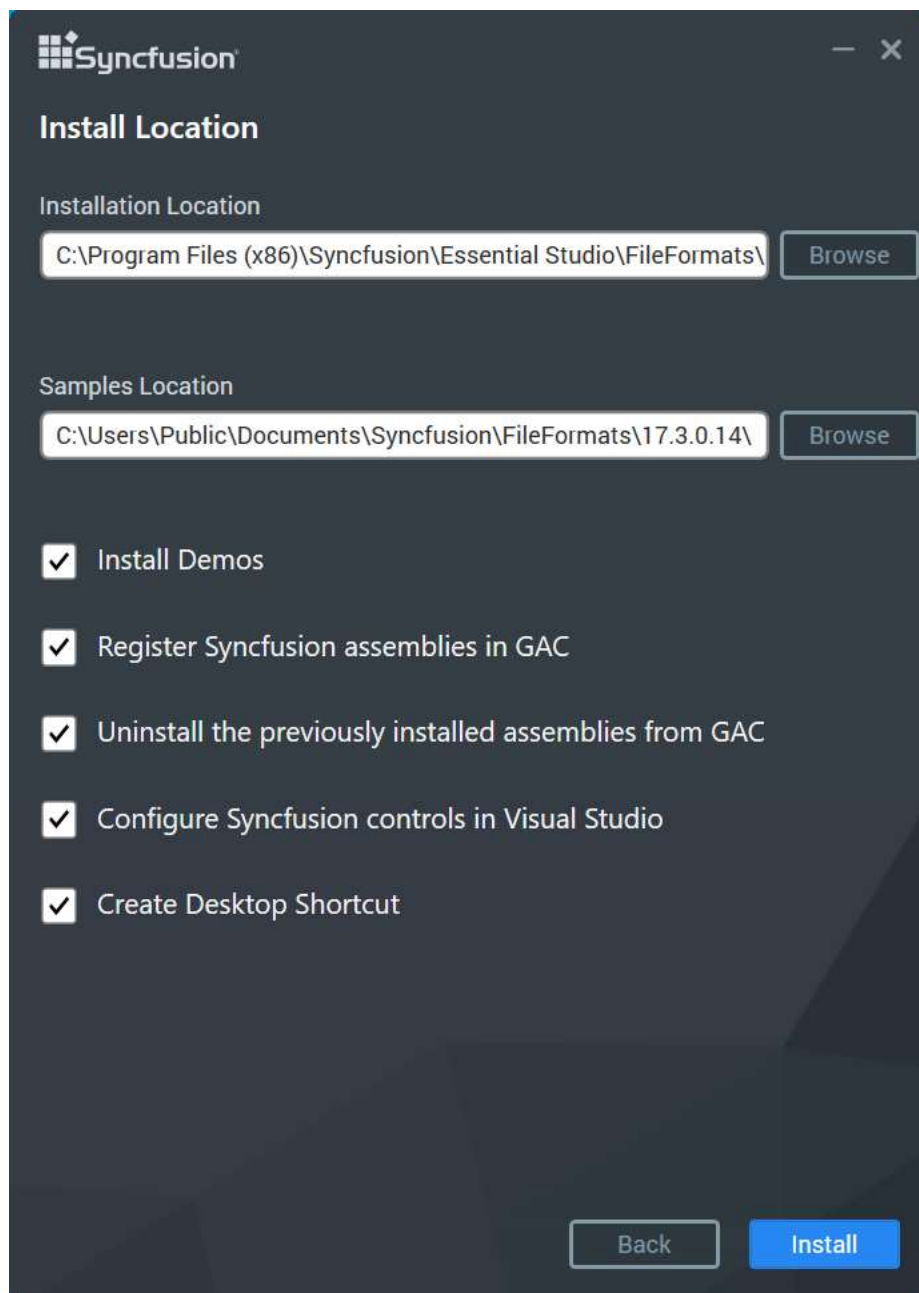

Next

Use Unlock Key

You should use the Syncfusion License/Trial key. Trial key is valid for 30 days and the installer won't accept the expired trial key. Licensed customer can generate key from [here](#).

4. After reading the License Terms and Conditions, check the **I agree to the License Terms and Conditions** check box.
5. Click Next. Select the Installation, Samples Folder and Advanced Options screen opens. To install in the displayed default location, click Install

Note: From the 2018 Volume 2 release, Syncfusion has changed the install and samples location

Default Install location: {ProgramFilesFolder}\Syncfusion\{Platform}\{version}

Default Samples location: C:\Users\Public\Documents\Syncfusion\{platform}\{version}

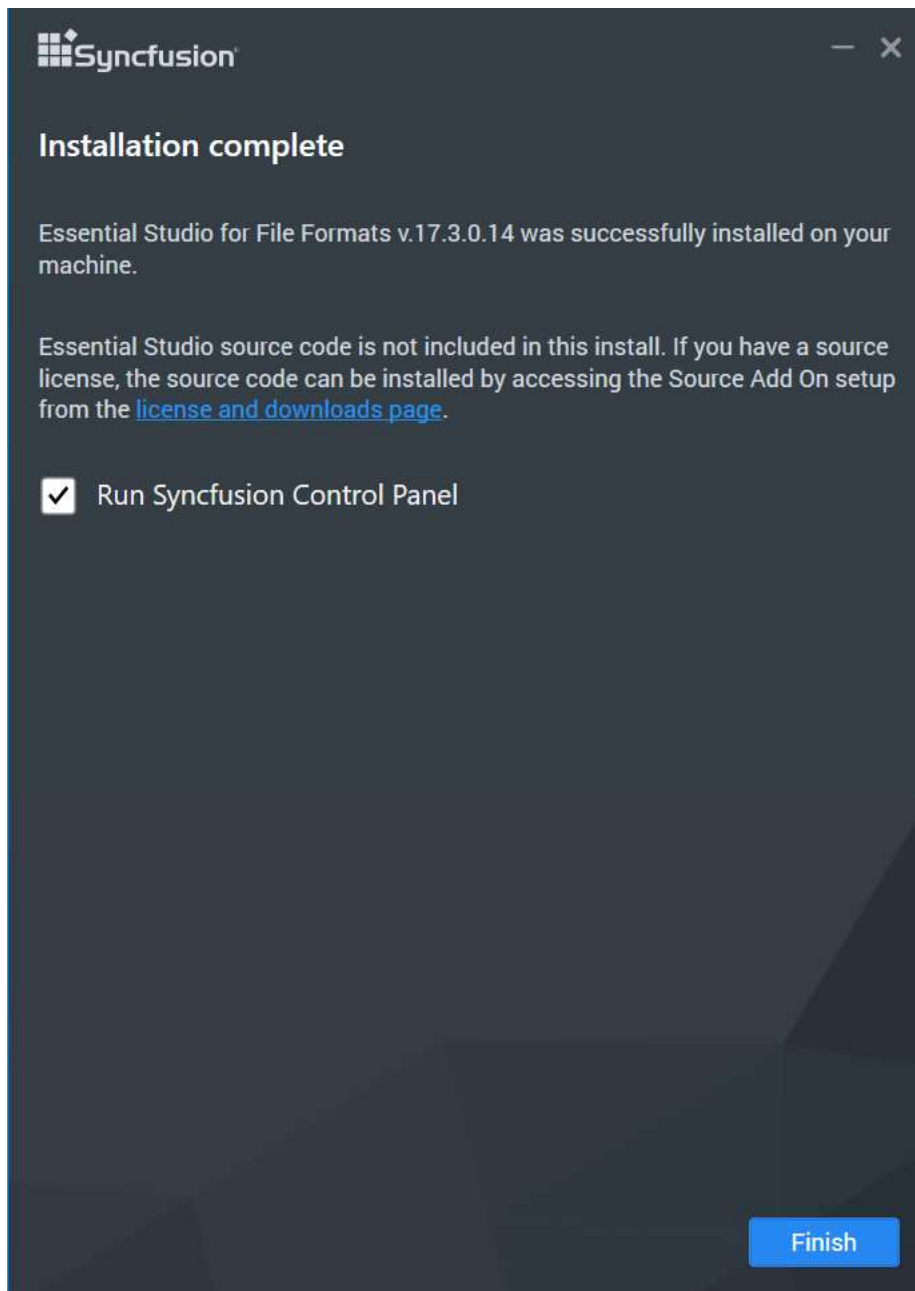

However, you can change the locations by clicking browse button.

- Select the **Install Syncfusion Samples** check box to install Syncfusion samples, or leave the check box clear, when you do not want to install Syncfusion samples.
- Select the **Register Syncfusion Assemblies in GAC** check box to install the latest Syncfusion assemblies in GAC, or clear this check box when you do not want to install the latest assemblies in GAC.

- Select the **Uninstall the previously installed Syncfusion assemblies from GAC** check box to uninstall the previously installed Syncfusion assemblies from GAC, or clear this check box to maintain the previously installed assemblies.
 - Select the **Configure Syncfusion controls in Visual Studio Toolbox** check box to configure the Syncfusion controls in the Visual Studio toolbox, or clear this check box when you do not want to configure the Syncfusion controls in the Visual Studio toolbox during installation. Note that you must also select the Register Syncfusion assemblies in GAC check box when you select this check box.
 - Select the **Install Syncfusion Extensions** checkbox to configure the Syncfusion Extensions in Visual Studio or clear this check box when you do not want to configure the Syncfusion Extensions in Visual Studio.
6. Click Install.

7. The Completed screen is displayed once the File Formats platform is installed.

8. Select the **Run Syncfusion Control Panel** check box to launch the Syncfusion Control Panel after installing.
9. Click Finish. Syncfusion File Formats platform is installed in your system and the Syncfusion Essential Studio [Syncfusion Control Panel](#) is launched automatically.

Installing in silent mode

The Syncfusion Essential Studio Platform Installer supports installing/uninstalling through Command Line. The following sections illustrate this ability.

Command Line Installation

Follow the steps below to install through Command Line in Silent mode.

1. Double-click the Syncfusion Essential Studio platform installer file. The installer Wizard opens and extracts the package automatically.
2. The syncfusionessentialfileformats_(version).exe file is extracted into the Temp folder.
3. Run %temp%. The Temp folder will open. The syncfusionessentialfileformats_(version).exe file is available in one of the folders.
4. Copy the extracted syncfusionessentialfileformats_(version).exe file in local drive.
5. Cancel the Wizard.
6. Open the Command Prompt in administrator mode and pass the following arguments.

Arguments: "Installer file path\SyncfusionEssentialStudio(platform)_(version).exe" /Install silent /PIDKEY:"(product unlock key)" [/log "{Log file path}"] [/InstallPath:{Location to install}] [/InstallSamples:{true/false}] [/InstallAssemblies:{true/false}] [/UninstallExistAssemblies:{true/false}] [/InstallToolbox:{true/false}]

Note: [...] – Arguments inside the square brackets are optional.

Example: "D:\Temp\syncfusionessentialfileformatsx.x.x.x.exe" /Install silent /PIDKEY:"product unlock key" /log "C:\Temp\EssentialStudioPlatform.log" /InstallPath:C:\Syncfusion\x.x.x.x /InstallSamples:true /InstallAssemblies:true /UninstallExistAssemblies:true /InstallToolbox:true

7. Essential Studio for File Formats is installed.

Note: x.x.x.x needs to be replaced with the Essential Studio version and the Product Unlock Key needs to be replaced with the Unlock Key for that version.

Command Line Uninstallation

Syncfusion Essential Studio supports uninstalling through Command Line in Silent mode. The following steps illustrate this.

1. When you do not have the extracted installer (syncfusionessentialfileformats_(version).exe) then follow the steps from 2 to 7.
2. Double-click the Syncfusion Essential Studio platform installer file. The installer Wizard opens and extracts the package automatically.
3. The syncfusionessentialfileformats_(version).exe file is extracted into the Temp folder.
4. Run %temp%. The Temp folder will open. The syncfusionessentialfileformats_(version).exe file is available in one of the folders.
5. Copy the syncfusionessentialfileformats_(version).exe file in local drive.
6. Cancel the Wizard.
7. Open the Command Prompt in administrator mode and pass the following arguments.

Arguments: "Copied installer file path\syncfusionessentialfileformats_(version).exe" /uninstall silent

Example: "D:\Temp\syncfusionessentialfileformats_x.x.x.x.exe" /uninstall silent

8. Essential Studio for File Formats is uninstalled.

Note: x.x.x.x needs to be replaced with the Essential Studio version installed in your machine.

Installation FAQ

Refer [this](#) topic for more information regarding the issues related to installation.

Upgrade from one version to another version.

You can upgrade to the latest version by downloading and installing the platforms you require from [this](#) link.

Upgrade from major version to service pack version

Syncfusion provides a new Volume release once in every three months which has exciting new features. For that Volume release, there may be one or two Service Pack releases. The issues in the Volume release will be addressed in the Service Pack releases. You can download and install the latest Service Pack installer [here](#).

It is not required to install the Volume release before installing the Service Pack release. As Volume and Service Packs releases works independently, you can directly install the latest Service Pack contains major issue fixes.

Upgrade from trial version to license version

To upgrade from trial version, there are two possible solutions.

- Uninstall the trial version and install the fully licensed build from the [License & Downloads](#) section of our website.
- Replace the currently used trial license key with a paid license key that can be generated from the License & Downloads section of our website.

NuGet Packages

[NuGet](#) can be used to automatically add files and references to your Visual Studio projects. You can use the Syncfusion NuGet packages without installing the Essential Studio or platform installation to development with the Syncfusion controls. From v16.2.0.46 (2018 Volume 2 Service Pack 1) onwards, all the Syncfusion components are available as NuGet packages at [nuget.org](#).

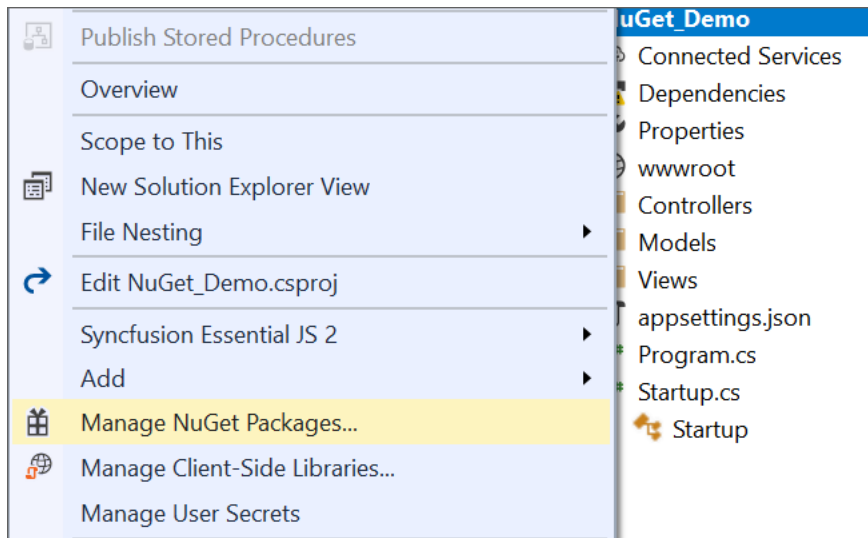

Note: The Syncfusion Xamarin NuGet packages are published in [NuGet.org](#) from v15.4.0.17. Starting from v17.1.0.32 (2018 Volume 1), Syncfusion will no longer publish NuGet packages at [nuget.syncfusion.com](#).

Installing NuGet Packages

Using NuGet Package Manager

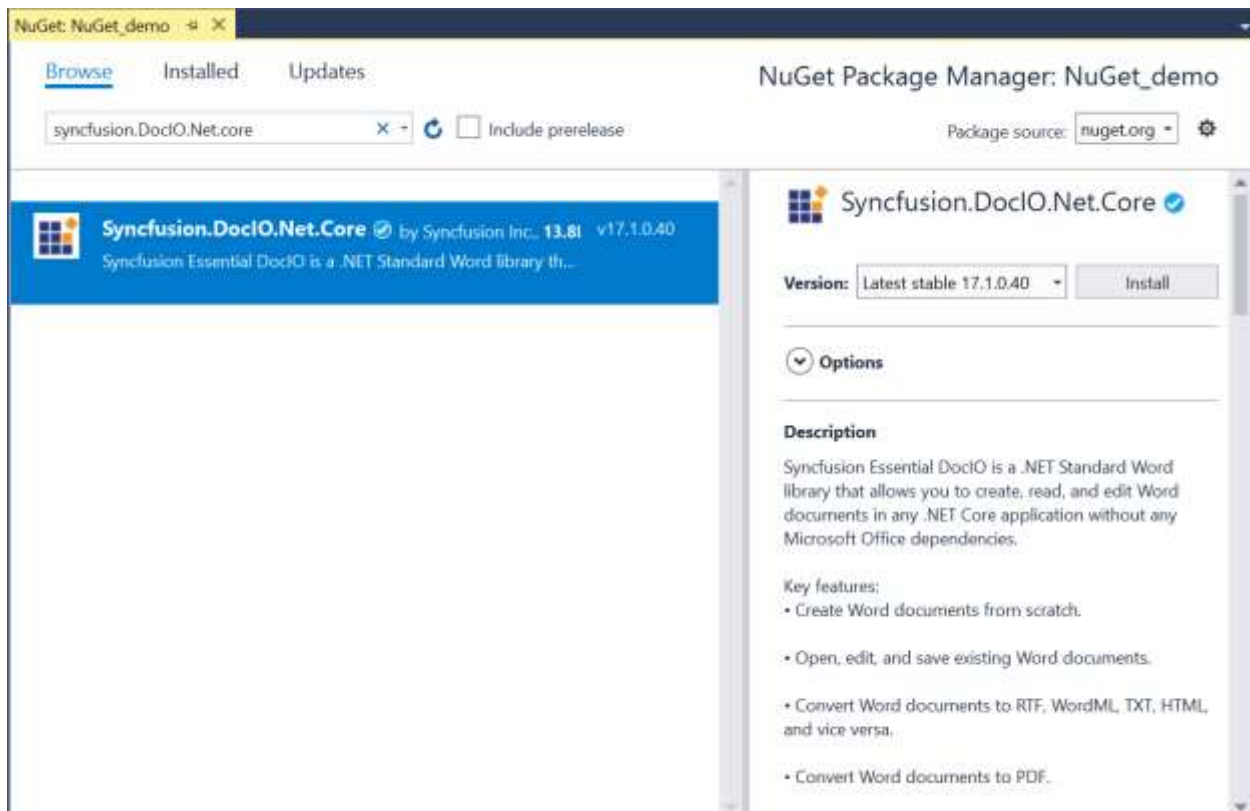

The NuGet Package Manager can be used to search and install NuGet packages in the Visual Studio solution or project:

1. Right-click the project or solution in the Solution Explorer tab, and choose **Manage NuGet Packages...**

Alternatively, click **Tools** menu, **NuGet Package Manager | Manage NuGet Packages for Solution...**

2. By default, the NuGet.org package is selected in the **Package source** drop-down. If NuGet.org is not configured in your Visual Studio, refer to the [Microsoft docs](#) to configure NuGet.org feed URL in your Visual Studio.

3. The SynCFusion NuGet Packages are listed the available package in the source feed URL. Search and install the required packages in your application, by clicking **Install** button.

Note: The Syncfusion NuGet packages are published in public [NuGet.org](https://www.nuget.org/packages/Syncfusion.DocIO) from v16.2.0.46. So, If you need to Install earlier version of 16.2.0.46 Syncfusion NuGet packages, [configure Syncfusion private feed URL](#).

Using Package Manager Console

To reference the Syncfusion component using the Package Manager Console as NuGet packages, follow the below steps.

1. On the **Tools** menu, select **NuGet Package Manager**, and then **Package Manager Console**. 2. Run the following NuGet installation commands.

DocIO

C#

```
using Syncfusion.DocIO;  
using Syncfusion.DocIO.DLS;
```

VB.NET

```
Imports Syncfusion.DocIO  
Imports Syncfusion.DocIO.DLS
```

UWP

```
using Syncfusion.DocIO;  
using Syncfusion.DocIO.DLS;
```

ASP.NET CORE

```
using Syncfusion.DocIO;  
using Syncfusion.DocIO.DLS;
```

XAMARIN

```
using Syncfusion.DocIO;  
using Syncfusion.DocIO.DLS;
```

Creating a new Word document with few lines of code

The following code example explains how to create a new Word document with few lines of code

C#

```
//Creates an instance of WordDocument Instance (Empty Word Document)  
WordDocument document = new WordDocument();  
//Add a section & a paragraph in the empty document  
document.EnsureMinimal();  
//Append text to the last paragraph of the document  
document.LastParagraph.AppendText("Hello World");  
//Save and close the Word document  
document.Save("Result.docx");  
document.Close();
```

VB.NET

```
'Creates an instance of WordDocument Instance (Empty Word Document)
Dim document As New WordDocument()
'Add a section & a paragraph in the empty document
document.EnsureMinimal()
'Append text to the last paragraph of the document
document.LastParagraph.AppendText("Hello World")
'Save and close the Word document
document.Save("Result.docx")
document.Close()
```

UWP

```
//Creates an instance of WordDocument Instance (Empty Word Document)
WordDocument document = new WordDocument();
//Add a section & a paragraph in the empty document
document.EnsureMinimal();
//Append text to the last paragraph of the document
document.LastParagraph.AppendText("Hello World");
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new instance of WordDocument (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a section and a paragraph to the document
document.EnsureMinimal();
//Appends text to the last paragraph of the document
document.LastParagraph.AppendText("Hello World");
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
stream.Position = 0;
document.Close();
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Creates an instance of WordDocument Instance (Empty Word Document)
WordDocument document = new WordDocument();
//Add a section & a paragraph in the empty document
document.EnsureMinimal();
//Append text to the last paragraph of the document
document.LastParagraph.AppendText("Hello World");
//Saves the Word document to MemoryStream
```

```

MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Creating a new Word document from scratch with basic elements

An entire Word document is represented by an instance of `WordDocument` and it is root element of DocIO's DOM. Word document contains a collection of sections. A Word document must contain at least one section.

A section represents group of paragraphs, tables etc., that have a specific set of properties used to define the pages, number of columns, headers and footers and so on that decides how the text appears. A section should contain at least one paragraph in this body.

The following code example explains how to add a section into a `WordDocument` instance.

C#

```

//Creates an instance of WordDocument Instance (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a new section into the Word document
IWSection section = document.AddSection();
//Specifies the page margins
section.PageSetup.Margins.All = 50f;

```

VB.NET

```

'Creates an instance of WordDocument Instance (Empty Word Document)
Dim document As New WordDocument()
'Adds a new section into the Word document
Dim section As IWSection = document.AddSection()
'Specifies the page margins
section.PageSetup.Margins.All = 50.0F

```

UWP

```

//Creates an instance of WordDocument Instance (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a new section into the Word document
IWSection section = document.AddSection();
//Specifies the page margins
section.PageSetup.Margins.All = 50f;

```

ASP.NET CORE

```

//Creates an instance of WordDocument Instance (Empty Word Document)
WordDocument document = new WordDocument();

```

```
//Adds a new section into the Word document
IWSection section = document.AddSection();
//Specifies the page margins
section.PageSetup.Margins.All = 50f;
```

XAMARIN

```
//Creates an instance of WordDocument Instance (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a new section into the Word document
IWSection section = document.AddSection();
//Specifies the page margins
section.PageSetup.Margins.All = 50f;
```

All the textual contents in a Word document is represented by Paragraphs. Within the paragraph, textual contents are grouped into one or more child elements such as TextRange, field etc. Each TextRange represents a region of text with a common set of rich text formatting.

The following code example explains how to add a Paragraph into a Word document

C#

```
//Adds a new simple paragraph into the section
IWParagraph firstParagraph = section.AddParagraph();
//Sets the paragraph's horizontal alignment as justify
firstParagraph.ParagraphFormat.HorizontalAlignment =
HorizontalAlignment.Justify;
//Adds a text range into the paragraph
IWTextRange firstTextRange = firstParagraph.AppendText("AdventureWorks
Cycles,");
//sets the font formatting of the text range
firstTextRange.CharacterFormat.Bold = true;
firstTextRange.CharacterFormat.FontName = "Calibri";
firstTextRange.CharacterFormat.FontSize = 14;
//Adds another text range into the paragraph
IWTextRange secondTextRange = firstParagraph.AppendText(" the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
//sets the font formatting of the text range
secondTextRange.CharacterFormat.FontName = "Calibri";
secondTextRange.CharacterFormat.FontSize = 11;
```

VB.NET

```
'Adds a new simple paragraph into the section
Dim firstParagraph As IWParagraph = section.AddParagraph()
'Sets the paragraph's horizontal alignment as justify
firstParagraph.ParagraphFormat.HorizontalAlignment =
HorizontalAlignment.Justify
'Adds a text range into the paragraph
Dim firstTextRange As IWTextRange =
firstParagraph.AppendText("AdventureWorks Cycles, ")
'sets the font formatting of the text range
firstTextRange.CharacterFormat.Bold = True
firstTextRange.CharacterFormat.FontName = "Calibri"
```

```

firstTextRange.CharacterFormat.FontSize = 14
'Adds another text range into the paragraph
Dim secondTextRange As IWTextRange = firstParagraph.AppendText("the
fictitious company on which the AdventureWorks sample databases are based,
is a large, multinational manufacturing company.")
'sets the font formatting of the text range
secondTextRange.CharacterFormat.FontName = "Calibri"
secondTextRange.CharacterFormat.FontSize = 11

```

UWP

```

//Adds a new simple paragraph into the section
IWParagraph firstParagraph = section.AddParagraph();
//Sets the paragraph's horizontal alignment as justify
firstParagraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Justify;
//Adds a text range into the paragraph
IWTextRange firstTextRange = firstParagraph.AppendText("AdventureWorks
Cycles,");
//sets the font formatting of the text range
firstTextRange.CharacterFormat.Bold = true;
firstTextRange.CharacterFormat.FontName = "Calibri";
firstTextRange.CharacterFormat.FontSize = 14;
//Adds another text range into the paragraph
IWTextRange secondTextRange = firstParagraph.AppendText(" the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
//sets the font formatting of the text range
secondTextRange.CharacterFormat.FontName = "Calibri";
secondTextRange.CharacterFormat.FontSize = 11;

```

ASP.NET CORE

```

//Adds a new simple paragraph into the section
IWParagraph firstParagraph = section.AddParagraph();
//Sets the paragraph's horizontal alignment as justify
firstParagraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Justify;
//Adds a text range into the paragraph
IWTextRange firstTextRange = firstParagraph.AppendText("AdventureWorks
Cycles,");
//sets the font formatting of the text range
firstTextRange.CharacterFormat.Bold = true;
firstTextRange.CharacterFormat.FontName = "Calibri";
firstTextRange.CharacterFormat.FontSize = 14;
//Adds another text range into the paragraph
IWTextRange secondTextRange = firstParagraph.AppendText(" the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
//sets the font formatting of the text range
secondTextRange.CharacterFormat.FontName = "Calibri";
secondTextRange.CharacterFormat.FontSize = 11;

```

XAMARIN

```
//Adds a new simple paragraph into the section
IWParagraph firstParagraph = section.AddParagraph();
//Sets the paragraph's horizontal alignment as justify
firstParagraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Justify;
//Adds a text range into the paragraph
IWTextRange firstTextRange = firstParagraph.AppendText("AdventureWorks
Cycles,");
//sets the font formatting of the text range
firstTextRange.CharacterFormat.Bold = true;
firstTextRange.CharacterFormat.FontName = "Calibri";
firstTextRange.CharacterFormat.FontSize = 14;
//Adds another text range into the paragraph
IWTextRange secondTextRange = firstParagraph.AppendText(" the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
//sets the font formatting of the text range
secondTextRange.CharacterFormat.FontName = "Calibri";
secondTextRange.CharacterFormat.FontSize = 11;
```

The following code example shows how to add an image into the Word document.

C#

```
//Adds another paragraph and aligns it as center
IWParagraph paragraph = section.AddParagraph();
paragraph.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Center;
//Adds a picture into the paragraph
IWPicture picture =
paragraph.AppendPicture(Image.FromFile("DummyProfilePicture.jpg"));
//Specify the size of the picture
picture.Height = 100;
picture.Width = 100;
```

VB.NET

```
'Adds another paragraph and aligns it as center
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Center
'Adds a picture into the paragraph
Dim picture As IWPicture =
paragraph.AppendPicture(Image.FromFile("DummyProfilePicture.jpg"))
'Specifies the size of the picture
picture.Height = 100
picture.Width = 100
```

UWP

```
//Adds another paragraph and aligns it as center
IWParagraph paragraph = section.AddParagraph();
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center;
//Adds a picture into the paragraph
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
```

```
Stream imageStream1 =
assembly.GetManifestResourceStream("CreateWordSample.Assets.DummyProfilePicture.jpg");
IWPicture picture = paragraph.AppendPicture(imageStream1);
//Specify the size of the picture
picture.Height = 100;
picture.Width = 100;
```

ASP.NET CORE

```
//Adds another paragraph and aligns it as center
IWParagraph paragraph = section.AddParagraph();
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center;
//Adds a picture into the paragraph
FileStream image1 = new FileStream("DummyProfilePicture.jpg", FileMode.Open,
FileAccess.Read);
IWPicture picture = paragraph.AppendPicture(image1);
//Specify the size of the picture
picture.Height = 100;
picture.Width = 100;
```

XAMARIN

```
//Adds another paragraph and aligns it as center
IWParagraph paragraph = section.AddParagraph();
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center;
//Adds a picture into the paragraph
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream imageStream1 =
assembly.GetManifestResourceStream("CreateWordSample.Assets.DummyProfilePicture.jpg");
IWPicture picture = paragraph.AppendPicture(imageStream1);
//Specify the size of the picture
picture.Height = 100;
picture.Width = 100;
```

Table is another important element in Word that contains a set of paragraphs arranged in rows and columns. You can create simple as well as complex table by using Essential DocIO's API. The following code example creates a simple table and adds contents into it. Each table cell must contain at least one paragraph.

C#

```
//Adds a table into the Word document
IWTable table = section.AddTable();
//Creates the specified number of rows and columns
table.ResetCells(2, 2);
//Accesses the instance of the cell (first row, first cell)
WTableCell firstCell = table.Rows[0].Cells[0];
//Specifies the width of the cell
firstCell.Width = 150;
//Adds a paragraph into the cell; a cell must have atleast 1 paragraph
```

```

paragraph = firstCell.AddParagraph();
IWTextRange textRange = paragraph.AppendText("Profile picture");
textRange.CharacterFormat.Bold = true;
//Accesses the instance of cell (first row, second cell)
WTableCell secondCell = table.Rows[0].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("Description");
textRange.CharacterFormat.Bold = true;
firstCell = table.Rows[1].Cells[0];
firstCell.Width = 150;
paragraph = firstCell.AddParagraph();
IWPicture profilePicture =
paragraph.AppendPicture(Image.FromFile(DummyProfile-Picture.jpg));
profilePicture.Height = 100;
profilePicture.Width = 100;
secondCell = table.Rows[1].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");

```

VB.NET

```

'Adds a table into the Word document
Dim table As ITable = section.AddTable()
'Creates the specified number of rows and columns
table.ResetCells(2, 2)
'Accesses the instance of the cell (first row, first cell)
Dim firstCell As WTableCell = table.Rows(0).Cells(0)
'Specifies the width of the cell
firstCell.Width = 150
'Adds a paragraph into the cell; a cell must have atleast 1 paragraph
paragraph = firstCell.AddParagraph()
Dim textRange As IWTextRange = paragraph.AppendText("Profile picture")
textRange.CharacterFormat.Bold = True
'Accesses the instance of cell (first row, second cell)
Dim secondCell As WTableCell = table.Rows(0).Cells(1)
secondCell.Width = 330
paragraph = secondCell.AddParagraph()
textRange = paragraph.AppendText("Description")
textRange.CharacterFormat.Bold = True
firstCell = table.Rows(1).Cells(0)
firstCell.Width = 150
paragraph = firstCell.AddParagraph()
Dim profilePicture As IWPicture =
paragraph.AppendPicture(Image.FromFile("DummyProfile-Picture.jpg"))
profilePicture.Height = 100
profilePicture.Width = 100
secondCell = table.Rows(1).Cells(1)
secondCell.Width = 330
paragraph = secondCell.AddParagraph()
textRange = paragraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.")

```

UWP

```
//Adds a table into the Word document
IWTable table = section.AddTable();
//Creates the specified number of rows and columns
table.ResetCells(2, 2);
//Accesses the instance of the cell (first row, first cell)
WTableCell firstCell = table.Rows[0].Cells[0];
//Specifies the width of the cell
firstCell.Width = 150;
//Adds a paragraph into the cell; a cell must have atleast 1 paragraph
paragraph = firstCell.AddParagraph();
IWTextRange textRange = paragraph.AppendText("Profile picture");
textRange.CharacterFormat.Bold = true;
//Accesses the instance of cell (first row, second cell)
WTableCell secondCell = table.Rows[0].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("Description");
textRange.CharacterFormat.Bold = true;
firstCell = table.Rows[1].Cells[0];
firstCell.Width = 150;
paragraph = firstCell.AddParagraph();
Stream imageStream2 =
assembly.GetManifestResourceStream("CreateWordSample.Assets.DummyProfile-
Picture.jpg");
IWPicture profilePicture = paragraph.AppendPicture(imageStream2);
profilePicture.Height = 100;
profilePicture.Width = 100;
secondCell = table.Rows[1].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
```

ASP.NET CORE

```
//Adds a table into the Word document
IWTable table = section.AddTable();
//Creates the specified number of rows and columns
table.ResetCells(2, 2);
//Accesses the instance of the cell (first row, first cell)
WTableCell firstCell = table.Rows[0].Cells[0];
//Specifies the width of the cell
firstCell.Width = 150;
//Adds a paragraph into the cell; a cell must have atleast 1 paragraph
paragraph = firstCell.AddParagraph();
IWTextRange textRange = paragraph.AppendText("Profile picture");
textRange.CharacterFormat.Bold = true;
//Accesses the instance of cell (first row, second cell)
WTableCell secondCell = table.Rows[0].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("Description");
```

```

textRange.CharacterFormat.Bold = true;
firstCell = table.Rows[1].Cells[0];
firstCell.Width = 150;
paragraph = firstCell.AddParagraph();
FileStream image2 = new FileStream("DummyProfile-Picture.jpg",
    FileMode.Open, FileAccess.Read);
IWPicture profilePicture = paragraph.AppendPicture(image2);
profilePicture.Height = 100;
profilePicture.Width = 100;
secondCell = table.Rows[1].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");

```

XAMARIN

```

//Adds a table into the Word document
IWTable table = section.AddTable();
//Creates the specified number of rows and columns
table.ResetCells(2, 2);
//Accesses the instance of the cell (first row, first cell)
WTableCell firstCell = table.Rows[0].Cells[0];
//Specifies the width of the cell
firstCell.Width = 150;
//Adds a paragraph into the cell; a cell must have atleast 1 paragraph
paragraph = firstCell.AddParagraph();
IWTextRange textRange = paragraph.AppendText("Profile picture");
textRange.CharacterFormat.Bold = true;
//Accesses the instance of cell (first row, second cell)
WTableCell secondCell = table.Rows[0].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("Description");
textRange.CharacterFormat.Bold = true;
firstCell = table.Rows[1].Cells[0];
firstCell.Width = 150;
paragraph = firstCell.AddParagraph();
Stream imageStream2 =
assembly.GetManifestResourceStream("CreateWordSample.Assets.DummyProfile-
Picture.jpg");
IWPicture profilePicture = paragraph.AppendPicture(imageStream2);
profilePicture.Height = 100;
profilePicture.Width = 100;
secondCell = table.Rows[1].Cells[1];
secondCell.Width = 330;
paragraph = secondCell.AddParagraph();
textRange = paragraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");

```

Essential DocIO allow you to create simple and multi-level lists. The following code snippet explains about how to create a numbered and bulleted list.

C#

```

//Writes default numbered list.
paragraph = section.AddParagraph();
paragraph.AppendText("Level 0");
//Applies the default numbered list formats
paragraph.ListFormat.ApplyDefNumberedStyle();
paragraph = section.AddParagraph();
paragraph.AppendText("Level 1");
//Specifies the list format to continue from last list
paragraph.ListFormat.ContinueListNumbering();
//Increments the list level
paragraph.ListFormat.IncreaseIndentLevel();
paragraph = section.AddParagraph();
paragraph.AppendText("Level 0");
paragraph.ListFormat.ContinueListNumbering();
//Decrements the list level
paragraph.ListFormat.DecreaseIndentLevel();

//Decrements the list level
paragraph.ListFormat.DecreaseIndentLevel();
section.AddParagraph();
```

Finally, save the document in file system and close its instance.

C#

```
//Saves the document in the given name and format
document.Save(outputFileName, FormatType.Docx);
//Releases the resources occupied by WordDocument instance
document.Close();
```

VB.NET

```
'Saves the document in the given name and format
document.Save(outputFileName, FormatType.Docx)
'Releases the resources occupied by WordDocument instance
document.Close()
```

UWP

```
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word document file in local machine
Save(stream, outputFileName);
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
```

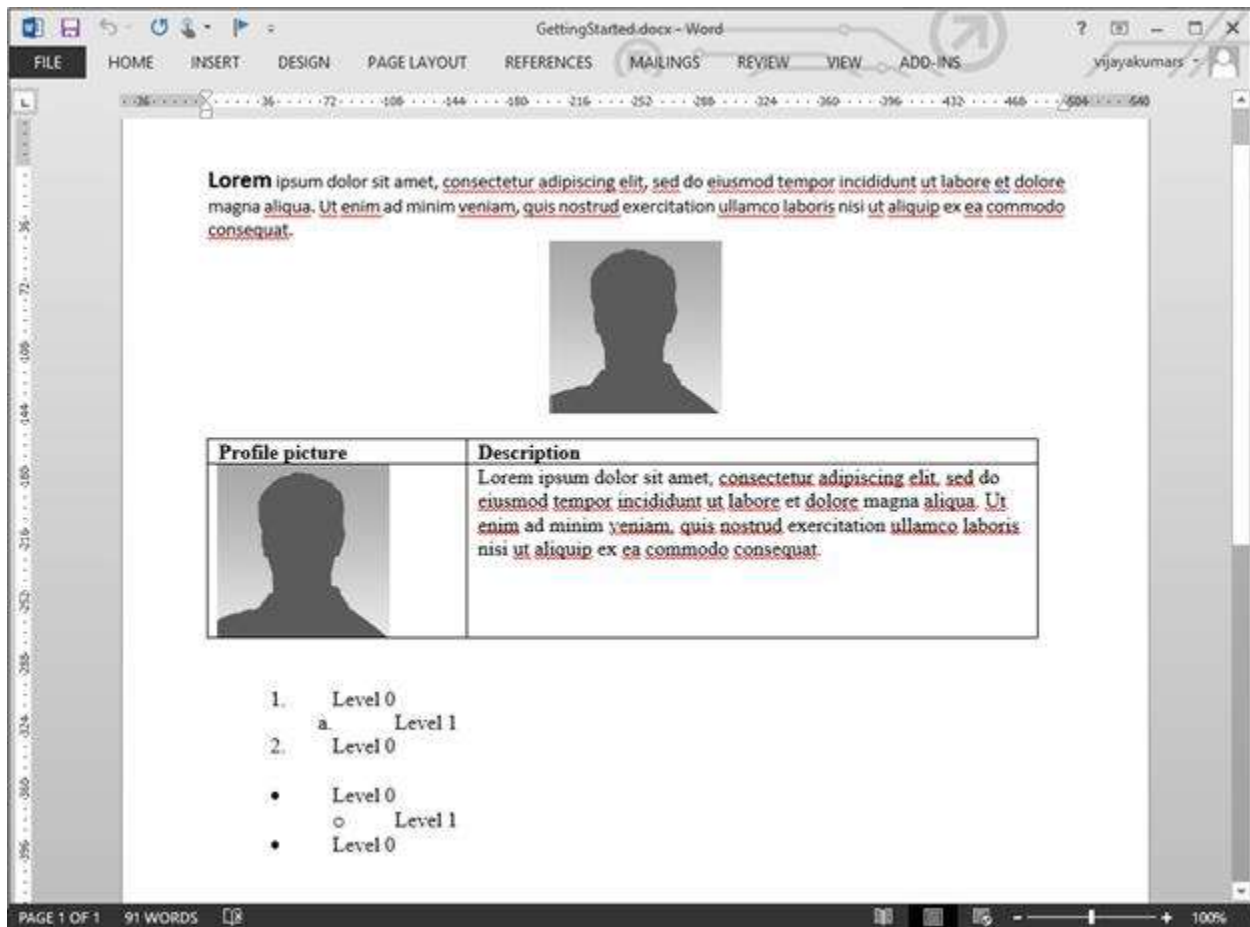

```
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", outputFileName);
```

XAMARIN

```
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(outputFileName,
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

The resultant Word document looks as follows.

Modifying an existing Word document

Essential DocIO allows you to manipulate an existing Word document, RTF, WordML, HTML and Plain text files. You can modify the documents either by manipulating DocIO's DOM or by using DocIO's built-in functionalities such as Find and Replace, replacing bookmark contents etc.

Here, you can see how an existing Word document is loaded into DocIO's DOM, replaces an existing content with another and finally saves the Word document.

You can open an existing Word document either by using constructor of `WordDocument` class or by using `Open` method of `WordDocument` class that reads the document and populates DocIO's DOM. The following code example shows how to load an existing document.

C#

```
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument("Giant Panda.docx");
//Replaces the word "bear" as "panda"
document.Replace("bear", "panda", false, true);
//Saves the Word document
document.Save("Result.docx");
//Closes the document
document.Close();
```

VB.NET

```
'Loads an existing Word document into DocIO instance
Dim document As New WordDocument("Giant Panda.docx")
'Replaces the word "bear" as "panda"
document.Replace("bear", "panda", False, True)
'Saves the Word document
document.Save("Result.docx")
'Closes the document
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream FileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Giant
Panda.docx");
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(FileStream);
//Replaces the word "bear" as "panda"
document.Replace("bear", "panda", false, true);
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word document file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```

FileStream fileStream = new FileStream(@"Giant
Panda.docx", FileMode.Open, FileAccess.ReadWrite);
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(fileStream, FormatType.Automatic);
//Replaces the word "bear" as "panda"
document.Replace("bear", "panda", false, true);
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
stream.Position = 0;
document.Close();
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream FileStream =
assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.Giant
Panda.docx");
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(FileStream, FormatType.Automatic);
//Replaces the word "bear" as "panda"
document.Replace("bear", "panda", false, true);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

The following code example explains how to search a particular text and highlight it.

C#

```

//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(@"..\..\Data\Giant Panda.docx");
//Finds the occurrence of the Word "panda" in the document
TextSelection[] textSelection = document.FindAll("panda", false, true);
//Iterates through each occurrence and highlights it
foreach (TextSelection selection in textSelection)
{
    IWTextRange textRange = selection.GetAsOneRange();
    textRange.CharacterFormat.HighlightColor = Color.Yellow;
}
//Saves and closes the document
document.Save("Result.docx");
document.Close();

```

VB.NET

```

'Loads an existing Word document into DocIO instance
Dim document As New WordDocument("../Data/Giant Panda.docx")
'Finds the occurrence of the word "panda" in the document
Dim textSelection As TextSelection() = document.FindAll("panda", False,
True)
'Iterates through each occurrence and highlights it.
For Each selection As TextSelection In textSelection
Dim textRange As ITextRange = selection.GetAsOneRange()
textRange.CharacterFormat.HighlightColor = Color.Yellow
Next
document.Save("Result.docx")
document.Close()

```

UWP

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream FileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Test.docx");
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(FileStream);
//Finds the occurrence of the Word "panda" in the document
TextSelection[] textSelection = document.FindAll("panda", false, true);
//Iterates through each occurrence and highlights it
foreach (TextSelection selection in textSelection)
{
ITextRange textRange = selection.GetAsOneRange();
textRange.CharacterFormat.HighlightColor = Color.Yellow;
}
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word document file in local machine
Save(stream, "Sample.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

FileStream fileStream = new
FileStream(@"Test.docx", FileMode.Open, FileAccess.ReadWrite);
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(fileStream, FormatTypeAutomatic);
//Finds the occurrence of the Word "panda" in the document
TextSelection[] textSelection = document.FindAll("panda", false, true);
//Iterates through each occurrence and highlights it
foreach (TextSelection selection in textSelection)
{

```

Performing Mail merge

Essential DocIO allows to generate documents by filling data in template document from data source. Mail merge operation automatically maps the column name in the data source and names of the merge fields in the template Word document and fills the data.

The following data sources are supported by Essential DocIO for performing Mail merge.

- String Arrays
- ADO.NET objects
- Business Objects
- Dynamic objects

Also, you can perform more than one Mail merge operations over the same template to generate document as per your requirement.

Follow the given steps to perform simple Mail merge in a Word document.

Let's consider that you have a template Word document with merge fields as shown.

The **MailMerge** class provides various overloads for **Execute** method to perform Mail merge from various data source. The Mail merge operation replaces the matching merge fields with the respective data.

The following code example shows how to perform simple Mail merge by using string array.

C#

```
//Loads the template document with required merge fields
WordDocument document = new
WordDocument(@"..\..\data\SimpleMailMergeTemplate.docx");
//Initializes the string array with field names
string[] fieldNames = new string[] { "FirstName", "LastName", "Email",
"Country" };
//Initializes the string array with field values
string[] fieldValues = new string[] { "John", "Smith",
"john_smith@domain.com", "USA" };
//Executes the mail merge operation that replaces the matching field names
with field values respectively.
document.MailMerge.Execute(fieldNames, fieldValues);
//Saves and closes the WordDocument instance
document.Save("result.docx");
document.Close();
```

VB.NET

```
'Loads the template document with required merge fields
Dim document As New WordDocument(@"..\..\data\SimpleMailMergeTemplate.docx")
'Initializes the string array with field names
Dim fieldNames As String() = New String() { "FirstName", "LastName", "Email",
"Country" }
'Initializes the string array with field values
Dim fieldValues As String() = New String() { "John", "Smith",
"john_smith@domain.com", "USA" }
'Executes the mail merge operation that replaces the matching field names
with field values respectively.
document.MailMerge.Execute(fieldNames, fieldValues)
'Saves and closes the WordDocument instance
document.Save("result.docx")
document.Close()
```

UWP

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream FileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.SimpleMailMergeT
emplate.docx");
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(FileStream);
//Initializes the string array with field names
string[] fieldNames = new string[] { "FirstName", "LastName", "Email",
"Country" };
//Initializes the string array with field values
string[] fieldValues = new string[] { "John", "Smith",
"john_smith@domain.com", "USA" };
//Executes the mail merge operation that replaces the matching field names
with field values respectively.
document.MailMerge.Execute(fieldNames, fieldValues);
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word document file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

FileStream fileStream = new FileStream(@"SimpleMailMergeTemplate.docx",
FileMode.Open, FileAccess.ReadWrite);
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(fileStream, FormatType.Automatic);
//Initializes the string array with field names
string[] fieldNames = new string[] { "FirstName", "LastName", "Email",
"Country" };
//Initializes the string array with field values
string[] fieldValues = new string[] { "John", "Smith",
"john_smith@domain.com", "USA" };
//Executes the mail merge operation that replaces the matching field names
with field values respectively.
document.MailMerge.Execute(fieldNames, fieldValues);
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
stream.Position = 0;
document.Close();
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

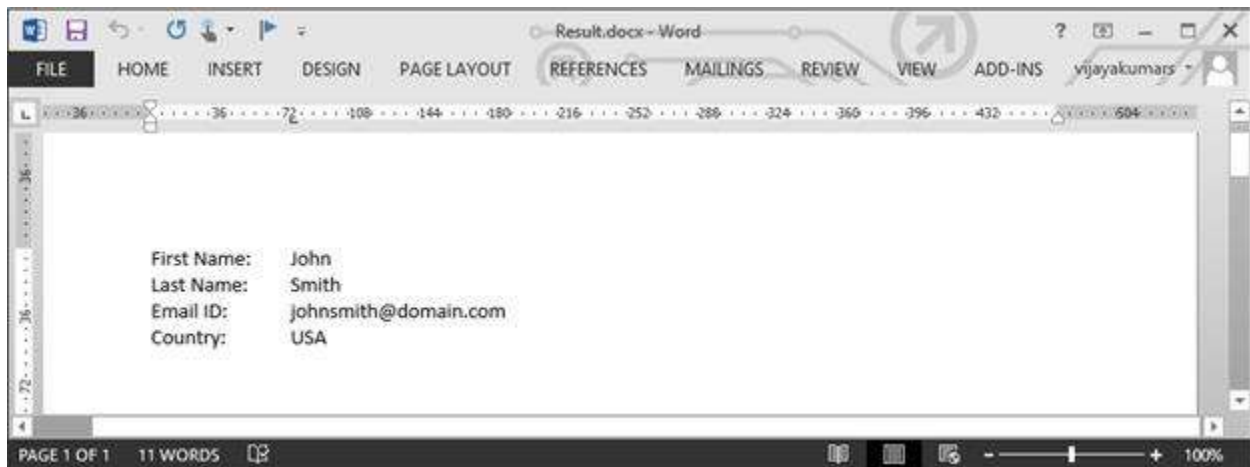

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream FileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.SimpleMailMergeT
emplate.docx");
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(FileStream, FormatType.Automatic);

```

```
//Initializes the string array with field names
string[] fieldNames = new string[] { "FirstName", "LastName", "Email",
"Country" };
//Initializes the string array with field values
string[] fieldValues = new string[] { "John", "Smith",
"john_smith@domain.com", "USA" };
//Executes the mail merge operation that replaces the matching field names
with field values respectively.
document.MailMerge.Execute(fieldNames, fieldValues);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("GettingStartedSample.docx", "application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin
```

The resultant Word document look as follows.

Simple Mail merge with Group

You can perform Mail merge with group to append multiple records from data source into a single document. Group is a part of the document enclosed by two special merge fields named «TableStart:TableName» and «TableEnd:TableName»

- «TableStart:TableName» - denotes the start of the group
- «TableEnd:TableName» - denotes the end of the group

The region between these two merge fields get repeated for every record from the data source.

For example – let's consider that you have a template document as shown.

Here, in this template, Employees is the group name and exact same name should be used while performing Mail merge through code. There are two special merge fields “TableStart:Employees” and “TableEnd:Employees”, to denote the start and end of the Mail merge group.

To merge an image in the replace of a merge field, you need to add a prefix (“Image:”)the merge field name.

For example: the merge field name should be like “<<Image:Photo>>”(<<Image:MergeFieldName>>)

The following code example shows how to perform Mail merge with objects.

C#

```
//Loads the template document
WordDocument document = new
WordDocument(@"..\..\Data\EmployeesTemplate.doc");
//Gets the employee details as IEnumerable collection
List<Employee> employeeList = GetEmployees();
//Creates an instance of MailMergeDataTable by specifying MailMerge group
name and IEnumerable collection
MailMergeDataTable dataSource = new MailMergeDataTable("Employees",
employeeList);
//Performs Mail merge
document.MailMerge.ExecuteGroup(dataSource);
//Saves and closes the document
document.Save("Result.docx");
document.Close();
```

VB.NET

```
//Loads the template document
Dim document As New WordDocument(@"..\..\Data\EmployeesTemplate.doc")
'Gets the employee details as IEnumerable collection
Dim employeeList As List(Of Employee) = GetEmployees()
'Creates an instance of MailMergeDataTable by specifying MailMerge group
name and IEnumerable collection
Dim dataSource As New MailMergeDataTable("Employees", employeeList)
```

```
'Performs Mail merge
document.MailMerge.ExecuteGroup(dataSource)
'Saves and closes the document
document.Save("Result.docx")
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream FileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.EmployeesTemplate.docx");
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(FileStream);
//Gets the employee details as IEnumerable collection
List<Employee> employeeList = GetEmployees();
//Creates an instance of MailMergeDataTable by specifying MailMerge group name and IEnumerable collection
MailMergeDataTable dataSource = new MailMergeDataTable("Employees", employeeList);
//Performs Mail merge
document.MailMerge.ExecuteGroup(dataSource);
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word document file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
FileStream fileStream = new FileStream(@"EmployeesTemplate.docx",
 FileMode.Open, FileAccess.ReadWrite);
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument(fileStream, FormatType.Automatic);
//Gets the employee details as IEnumerable collection
List<Employee> employeeList = GetEmployees();
//Creates an instance of MailMergeDataTable by specifying MailMerge group name and IEnumerable collection
MailMergeDataTable dataSource = new MailMergeDataTable("Employees", employeeList);
//Performs Mail merge
document.MailMerge.ExecuteGroup(dataSource);
MemoryStream stream = new MemoryStream();

        Stream stream =
        typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("CreateWordSamp
le.Assets." + photoFilePath);
        Photo = Syncfusion.Drawing.Image.FromStream(stream);
    }
}
```

The resultant document looks as follows.

Converting Word document to PDF

Essential DocIO allows you to convert a Word document into PDF document in a few lines of code.

For converting a Word document to PDF, the following assemblies are required to be referenced in your application

- Syncfusion.DocIO.Base
- Syncfusion.OfficeChart.Base
- Syncfusion.Compression.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocToPdfConverter.Base
- Syncfusion.OfficeChartToImageConverter.WPF
- Syncfusion.SfChart.WPF

For converting a word document to PDF in Xamarin, UWP and ASP.NET Core platform, the following assemblies are required.

- Syncfusion.DocIO.Portable
- Syncfusion.OfficeChart.Portable
- Syncfusion.Compression.Portable

- Syncfusion.Pdf.Portable
- Syncfusion.DocIORenderer.Portable

DocToPDFConverter class is responsible for converting a Word document into PDF.

In portable projects, **DocIORenderer** is responsible for converting a Word document into PDF.

The following code example illustrates how to convert a Word document into PDF document.

C#

```
//Loads the template document
WordDocument wordDocument = new WordDocument(inputWordDocument,
FormatTypeAutomatic );
//Initializes chart to image converter for converting charts during Word to
pdf conversion
wordDocument.ChartToImageConverter = new ChartToImageConverter();
wordDocument.ChartToImageConverter.ScalingMode = ScalingMode.Normal;
//Creates an instance of DocToPDFConverter - responsible for Word to PDF
conversion
DocToPDFConverter converter = new DocToPDFConverter();
//Converts Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(wordDocument);
//Saves the PDF file to file system
pdfDocument.Save("Sample.pdf");
//closes the instance of document objects
pdfDocument.Close();
wordDocument.Close();
```

VB.NET

```
'Loads the template document
Dim wordDocument As New WordDocument(inputWordDocument,
FormatTypeAutomatic)
'Initializes chart to image converter for converting charts during Word to
pdf conversion
wordDocument.ChartToImageConverter = New ChartToImageConverter()
wordDocument.ChartToImageConverter.ScalingMode = ScalingMode.Normal
'Creates an instance of DocToPDFConverter - responsible for Word to PDF
conversion
Dim converter As New DocToPDFConverter()
'Converts Word document into PDF document
Dim pdfDocument As PdfDocument = converter.ConvertToPDF(wordDocument)
'Saves the PDF file to file system
pdfDocument.Save("Sample.pdf")
'closes the instance of document objects
pdfDocument.Close()
wordDocument.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputWordDocument =
assembly.GetManifestResourceStream("CreateWordSample.Assets.WordToPDF.docx");
;
//Loads the template document
```

```

WordDocument wordDocument = new WordDocument(inputWordDocument,
FormatType.Automatic);
//Creates an instance of DocToPDFConverter - responsible for Word to PDF
conversion
DocIORenderer converter = new DocIORenderer();
//Converts Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(wordDocument);
//Save the document into stream.
MemoryStream outputStream = new MemoryStream();
pdfDocument.Save(outputStream);
//Closes the instance of PDF document object
pdfDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(outputStream, "Output.pdf");
//Saves the Word document
async void Save(MemoryStream streams, string filename)
{
streams.Position = 0;
StorageFile stFile;
if
(! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.U
I.Input.HardwareButtons")))
{
FileSavePicker savePicker = new FileSavePicker();
savePicker.DefaultFileExtension = ".pdf";
savePicker.SuggestedFileName = filename;
savePicker.FileTypeChoices.Add("PDF Documents", new List<string>() { ".pdf"
});
stFile = await savePicker.PickSaveFileAsync();
}
else
{
StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
stFile = await local.CreateFileAsync(filename,
CreationCollisionOption.ReplaceExisting);
}
if (stFile != null)
{
using (IRandomAccessStream zipStream = await
stFile.OpenAsync(FileAccessMode.ReadWrite))
{
//Write compressed data from memory to file
using (Stream outstream = zipStream.AsStreamForWrite())
{
byte[] buffer = streams.ToArray();
outstream.Write(buffer, 0, buffer.Length);
outstream.Flush();
}
}
}
//Launch the saved Word file
await Windows.System.Launcher.LaunchFileAsync(stFile);
}

```

ASP.NET CORE

```

FileStream fileStream = new FileStream(@"EmployeesTemplate.docx",
    FileMode.Open, FileAccess.ReadWrite);
//Loads an existing Word document into DocIO instance
WordDocument wordDocument = new WordDocument(fileStream,
    FormatType.Automatic);
//Creates an instance of DocToPDFConverter - responsible for Word to PDF
conversion
DocIORenderer converter = new DocIORenderer();
//Converts Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(wordDocument);
//Save the document into stream.
MemoryStream outputStream = new MemoryStream();
pdfDocument.Save(outputStream);
//Closes the instance of PDF document object
pdfDocument.Close();
wordDocument.Close();
outputStream.Position = 0;
//Download Word document in the browser
return File(outputStream, "application/pdf", "Result.pdf");

```

XAMARIN

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputWordDocument =
assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.EmployeesTemplat
e.docx");
//Loads an existing Word document into DocIO instance
WordDocument wordDocument = new WordDocument(inputWordDocument,
    FormatType.Automatic);
//document.Save(stream, FormatType.Docx);
DocIORenderer docIORenderer = new DocIORenderer();
PdfDocument pdfDocument = docIORenderer.ConvertToPDF(wordDocument);
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
pdfDocument.Close();
wordDocument.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.pdf",
    "application/pdf", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

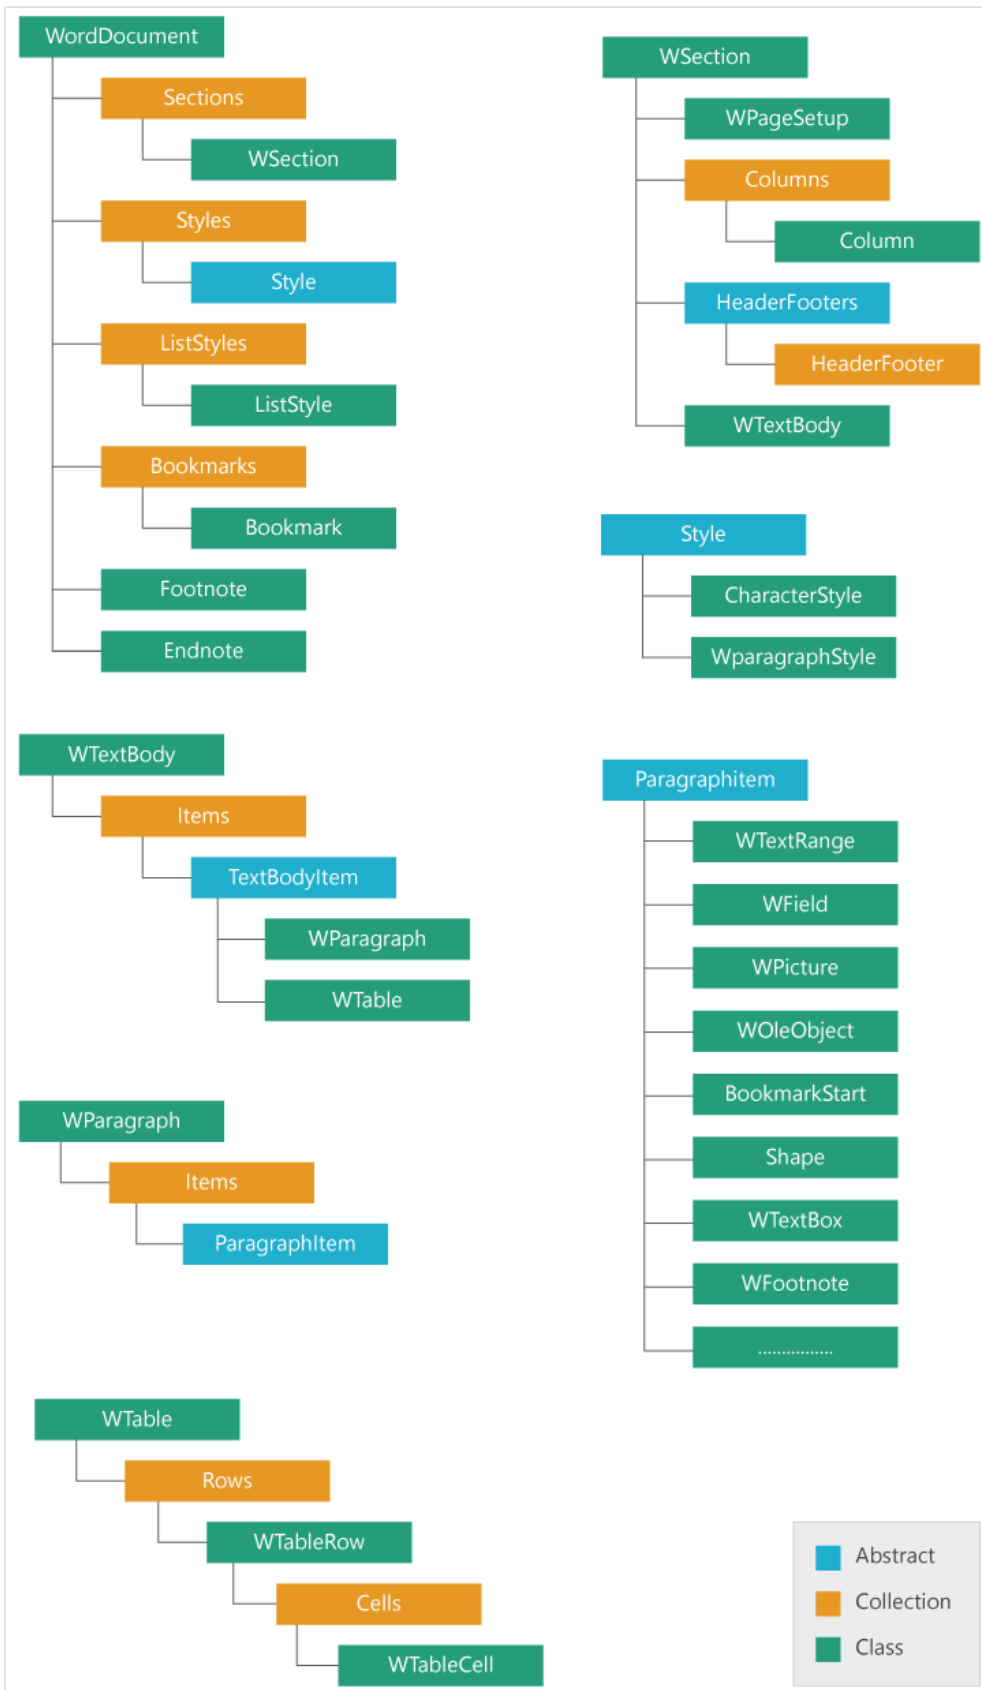

Note:

When the ChartToImageConverter object is not initialized, then the charts in Word document gets skipped during Word to PDF conversion.

ChartToImageConverter is supported from .NET Framework 4.0 onwards

Document Object Model representation

When an existing document is opened or a new document is created, the DocIO library creates a **Document Object Model (DOM)** of the document in main memory. This object model can be used to manipulate the document as needed.

Loading & saving document

Opening an existing document

You can open an existing Word document by using either the **Open** method or the constructor of **WordDocument** class

C#

```
//Opens an existing document from file system through constructor of WordDocument class
WordDocument document = new WordDocument(fileName);
```

VB.NET

```
'Opens an existing document from file system through constructor of WordDocument class
Dim document As New WordDocument(fileName)
```

UWP

```
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document through constructor of `WordDocument` class
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx);
```

ASP.NET CORE

```
//Opens an existing document from stream through constructor of
`WordDocument` class
FileStream fileStreamPath = new FileStream(@"Data/Hello World.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath,
FormatType.Automatic);
```

XAMARIN

```
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document through constructor of `WordDocument` class
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.Tes
t.docx"), FormatType.Automatic);
```

C#

```
//Creates an empty Word document instance
WordDocument document = new WordDocument();
//Loads or opens an existing word document through Open method of WordDocument class
document.Open(fileName);
```

VB.NET

```
'Creates an empty Word document instance
Dim document As New WordDocument()
'Loads or opens an existing word document through Open method of
WordDocument class
document.Open(fileName)
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".docx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
WordDocument document = new WordDocument();
await document.OpenAsync(inputStorageFile);
```

ASP.NET CORE

```
//Opens an existing document from stream through constructor of
WordDocument` class
FileStream fileStreamPath = new FileStream(@"Data/Hello World.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Creates an empty Word document instance
WordDocument document = new WordDocument();
//Loads or opens an existing word document through Open method of
WordDocument class
document.Open(fileStreamPath, FormatTypeAutomatic);
```

XAMARIN

```
/"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates an empty Word document instance
WordDocument document = new WordDocument();
//Loads or opens an existing word document through Open method of
WordDocument class
document.Open(assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Test.docx"), FormatTypeAutomatic);
```

Opening an existing document from Stream

You can open an existing document from stream by using either the overloads of **Open** methods or the constructor of **WordDocument** class

C#

```
//Opens an existing document from stream through constructor of WordDocument
class
WordDocument document = new WordDocument(wordDocumentStream,
FormatTypeAutomatic);
```

VB.NET

```
'Opens an existing document from stream through constructor of WordDocument
class
Dim document As New WordDocument(wordDocumentStream, FormatTypeAutomatic)
```

UWP

```
///"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
///Loads or opens an existing Word document from stream
Stream inputStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Test.docx");
///Opens an existing document through constructor of `WordDocument` class
WordDocument document = new WordDocument(inputStream, FormatType.Docx);
```

ASP.NET CORE

```
//Opens an existing document from stream through constructor of
`WordDocument` class
FileStream fileStreamPath = new FileStream(@"Data/Hello World.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Opens an existing document from stream through constructor of WordDocument
class
WordDocument document = new WordDocument(fileStreamPath,
FormatTypeAutomatic);
```

XAMARIN

```
///"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
///Loads or opens an existing Word document from stream
Stream inputStream =
assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello
World.docx");
///Opens an existing document through constructor of `WordDocument` class
WordDocument document = new WordDocument(inputStream, FormatTypeAutomatic);
```

C#

```
///Creates an empty WordDocument instance
WordDocument document = new WordDocument();
///Loads or opens an existing Word document through Open method of
WordDocument class
document.Open(wordDocumentStream, FormatTypeAutomatic);
```

VB.NET

```
'Creates an empty WordDocument instance
Dim document As New WordDocument()
'Loads or opens an existing word document through Open method of
WordDocument class
document.Open(wordDocumentStream, FormatTypeAutomatic)
```

UWP

```
// "App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
// Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    // Loads or opens an existing Word document from stream
    Stream inputStream =
        assembly.GetManifestResourceStream("CreateWordSample.Assets.Test.docx");
    // Loads or opens an existing Word document through Open method of
    WordDocument class
    document.Open(inputStream, FormatType.Docx);
}
```

ASP.NET CORE

```
// Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    // Loads or opens an existing Word document from stream
    FileStream fileStreamPath = new FileStream(@"Data/Hello World.docx",
        FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
    // Loads or opens an existing Word document through Open method of
    WordDocument class
    document.Open(fileStreamPath, FormatTypeAutomatic);
}
```

XAMARIN

```
// "App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
// Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    // Loads or opens an existing Word document from stream
    Stream inputStream =
        assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello
        World.docx");
    // Loads or opens an existing Word document through Open method of
    WordDocument class
    document.Open(inputStream, FormatTypeAutomatic);
}
```

Opening an Encrypted Word document

You can open an existing encrypted Word document from either the file system or the stream by using the following overloads as shown.

C#

```
// Opens an existing encrypted document through constructor of WordDocument
class
WordDocument document = new WordDocument(fileName, FormatTypeAutomatic,
    "password");
```

VB.NET

```
'Opens an existing encrypted document through constructor of WordDocument class
Dim document As New WordDocument(fileName, FormatTypeAutomatic, "password")
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".docx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
WordDocument document = new WordDocument();
await document.OpenAsync(inputStorageFile, FormatType.Docx, "password");
```

ASP.NET CORE

```
//DocIO supports Encryption in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms alone.
```

XAMARIN

```
//DocIO supports Encryption in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms alone.
```

C#

```
//Creates an empty Word document instance
WordDocument document = new WordDocument();
//Loads or opens an existing encrypted Word document through Open method of WordDocument class
document.Open(wordDocumentStream, FormatTypeAutomatic, "password");
```

VB.NET

```
'Creates an empty Word document instance
Dim document As New WordDocument()
'Loads or opens an existing encrypted Word document through Open method of WordDocument class
document.Open(wordDocumentStream, FormatTypeAutomatic, "password")
```

UWP

```
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    //Loads or opens an existing Word document from stream
    Stream inputStream =
    assembly.GetManifestResourceStream("CreateWordSample.Assets.Test.docx");
    //Loads or opens an existing encrypted Word document through Open method of WordDocument class
    document.Open(inputStream, FormatType.Docx, "password");
}
```

```
}
```

ASP.NET CORE

```
//DocIO supports Encryption in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms alone.
```

XAMARIN

```
//DocIO supports Encryption in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms alone.
```

Opening the read only Word document

You can open the ready only documents or read only streams using the OpenReadOnly method. If the Word document for reading is opened by any other application such as Microsoft Word, then the same document can be opened using DocIO in ReadOnly mode. The following code sample demonstrates the same.

C#

```
//Creates an empty WordDocument instance
WordDocument document = new WordDocument();
//Loads or opens an existing word document using read only stream
document.OpenReadOnly("Template.docx", Syncfusion.DocIO.FormatType.Docx);
```

VB.NET

```
'Creates an empty WordDocument instance
Dim document As WordDocument = New WordDocument
'Loads or opens an existing word document using read only stream
document.OpenReadOnly("Template.docx", Syncfusion.DocIO.FormatType.Docx)
```

UWP

```
//DocIO supports OpenReadOnly Word documents in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms alone.
```

ASP.NET CORE

```
//DocIO supports OpenReadOnly Word documents in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms alone.
```

XAMARIN

```
//DocIO supports OpenReadOnly Word documents in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms alone.
```

You can also open an existing encrypted document in read only mode using the overloads as mentioned below.

C#

```
//Creates an empty WordDocument instance
WordDocument document = new WordDocument();
//Loads or opens an existing encrypted word document using read only stream
document.OpenReadOnly("Template.docx", Syncfusion.DocIO.FormatType.Docx,
"password");
```

VB.NET

```
'Creates an empty WordDocument instance
Dim document As WordDocument = New WordDocument
'Loads or opens an existing encrypted word document using read only stream
document.OpenReadOnly("Template.docx", Syncfusion.DocIO.FormatType.Docx,
"password")
```

UWP

```
//DocIO supports OpenReadOnly Word documents in Windows Forms, WPF, ASP.NET,
and ASP.NET MVC platforms alone.
```

ASP.NET CORE

```
//DocIO supports OpenReadOnly Word documents in Windows Forms, WPF, ASP.NET,
and ASP.NET MVC platforms alone.
```

XAMARIN

```
//DocIO supports OpenReadOnly Word documents in Windows Forms, WPF, ASP.NET,
and ASP.NET MVC platforms alone.
```

Saving a Word document to file system

You can save the created or manipulated Word document to file system using **Save** method of **WordDocument** class. When you do not provide the format type, then the document is saved in Word 97-2003 (*.doc) format.

C#

```
//Creates an empty WordDocument instance
WordDocument document = new WordDocument();
//opens an existing Word document through Open method of WordDocument class
document.Open(fileName);
//To-Do some manipulation
//To-Do some manipulation
//Saves the document in file system
document.Save(outputFileName, FormatType.Docx);
```

VB.NET

```
'Creates an empty WordDocument instance
Dim document As New WordDocument()
'opens an existing Word document through Open method of WordDocument class
document.Open(fileName)
'To-Do some manipulation
'To-Do some manipulation
```

```
'Saves the document in file system
document.Save(outputFileName, FormatType.Docx)
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".docx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
WordDocument document = new WordDocument();
await document.OpenAsync(inputStorageFile);
//To-Do some manipulation
//To-Do some manipulation
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = OutputFileName;
savePicker.FileTypeChoices.Add("Word Documents", new List<string>() {
".docx" });
//Creates a storage file from FileSavePicker
StorageFile outputStorageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await document.SaveAsAsync(outputStorageFile, FormatType.Docx);
```

ASP.NET CORE

```
//Open an existing WordDocument
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
WordDocument document = new WordDocument(inputStream, FormatType.Docx);
//To-Do some manipulation
//To-Do some manipulation
//Saving the Word document
FileStream outputStream = new FileStream("Sample.docx", FileMode.Create,
FileAccess.ReadWrite, FileShare.ReadWrite);
document.Save(outputStream, FormatType.Docx);
document.Close();
outputStream.Flush();
outputStream.Dispose();
```

XAMARIN

```
/"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
WordDocument document = new WordDocument(inputStream, FormatType.Docx);
//To-Do some manipulation
//To-Do some manipulation
//Saving the Word document
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
stream.Position = 0;
//Save the stream as a file in the device and invoke it for viewing
```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Closes the document
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Saving a Word document to Stream

You can also save the created or manipulated word document to stream by using overloads of **Save** methods

C#

```
//Creates an empty WordDocument instance
WordDocument document = new WordDocument();
//Opens an existing Word document through Open method of WordDocument class
document.Open(fileName);
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Saves the document to stream
document.Save(stream, FormatType.Docx);
```

VB.NET

```
'Creates an empty WordDocument instance
Dim document As New WordDocument()
'Opens an existing Word document through Open method of WordDocument class
document.Open(fileName)
'To-Do some manipulation
'To-Do some manipulation
'Creates an instance of memory stream
Dim stream As New MemoryStream()
'Saves the document to stream
document.Save(stream, FormatType.Docx)
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".docx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
WordDocument document = new WordDocument();
await document.OpenAsync(inputStorageFile);
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
```

```
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    //Loads or opens an existing Word document from stream
    FileStream fileStreamPath = new FileStream(@"Data/Hello World.docx",
    FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
    //Loads or opens an existing Word document through Open method of
    WordDocument class
    document.Open(fileStreamPath, FormatType.Automatic);
    //To-Do some manipulation
    //To-Do some manipulation
    //Creates an instance of memory stream
    MemoryStream stream = new MemoryStream();
    //Saves the document to stream
    document.Save(stream, FormatType.Docx);
    //Closes the document
    document.Close();
    stream.Position = 0;
    //Download Word document in the browser
    return File(stream, "application/msword", "Result.docx");
}
```

XAMARIN

```
///"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
///Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    ///Loads or opens an existing Word document from stream
    Stream inputStream =
    assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello
    World.docx");
    ///Loads or opens an existing Word document through Open method of
    WordDocument class
    document.Open(inputStream, FormatType.Automatic);
    ///To-Do some manipulation
    ///To-Do some manipulation
    ///Creates an instance of memory stream
    MemoryStream stream = new MemoryStream();
    ///Saves the document to stream
    document.Save(stream, FormatType.Docx);
    ///Closes the document
    document.Close();
    ///Save the stream as a file in the device and invoke it for viewing
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
    "application/msword", stream);
}
```

```
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Sending to a client browser

You can save and send the document to a client browser from a web site or web application by invoking the following shown overload of **Save** method. This method explicitly makes use of an instance of [HttpResponse](#) as its parameter in order to stream the document to client browser. So this overload is suitable for web application that references System.Web assembly.

C#

```
//Creates an empty WordDocument instance
WordDocument document = new WordDocument();
//Opens an existing Word document through Open method of WordDocument class
document.Open(fileName);
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Saves the document to stream
document.Save(outputFileName, FormatType.Docx, Response,
HttpContentDisposition.Attachment);
```

VB.NET

```
'Creates an empty WordDocument instance
Dim document As New WordDocument()
'Opens an existing Word document through Open method of WordDocument class
document.Open(fileName)
'To-Do some manipulation
'To-Do some manipulation
'Creates an instance of memory stream
Dim stream As New MemoryStream()
'Saves the document to stream
document.Save(outputFileName, FormatType.Docx, Response,
HttpContentDisposition.Attachment)
```

UWP

```
//Saving and sending the Word document to a client browser from a web site
is suitable for web applications alone.
```

ASP.NET CORE

```
//Creates a new instance of WordDocument (Empty Word Document)
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
```

```
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Saving and sending the Word document to a client browser from a web site
is suitable for web applications alone.
```

Closing a document

Once the document manipulation and save operation are completed, you should close the instance of **WordDocument**, in order to release all the memory consumed by DocIO's DOM. The following code example illustrates how to close a **WordDocument** instance.

C#

```
//Creates an empty WordDocument instance
WordDocument document = new WordDocument();
//opens an existing word document through Open method of WordDocument class
document.Open(fileName);
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Saves the document to stream
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'creates an empty WordDocument instance
Dim document As New WordDocument()
'opens an existing word document through Open method of WordDocument class
document.Open(fileName)
'To-Do some manipulation
'To-Do some manipulation
'Creates an instance of memory stream
Dim stream As New MemoryStream()
'Saves the document to stream
document.Save(stream, FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
//Instantiates the File Picker
```

```

FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".docx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
WordDocument document = new WordDocument();
await document.OpenAsync(inputStorageFile);
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    //Loads or opens an existing Word document from stream
    FileStream fileStreamPath = new FileStream(@"Data/Hello World.docx",
    FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
    //Loads or opens an existing Word document through Open method of
    WordDocument class
    document.Open(fileStreamPath, FormatTypeAutomatic);
    //To-Do some manipulation
    //To-Do some manipulation
    //Creates an instance of memory stream
    MemoryStream stream = new MemoryStream();
    //Saves the document to stream
    document.Save(stream, FormatType.Docx);
    //Closes the document
    document.Close();
    stream.Position = 0;
    //Download Word document in the browser
    return File(stream, "application/msword", "Result.docx");
}

```

XAMARIN

```

// "App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates an empty WordDocument instance
using (WordDocument document = new WordDocument())
{
    //Loads or opens an existing Word document from stream
    Stream inputStream =
    assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello
    World.docx");
}

```

```
//Loads or opens an existing Word document through Open method of
WordDocument class
document.Open(inputStream, FormatType.Automatic);
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Saves the document to stream
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Closes the document
document.Close();
}
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Working with Word document

Iterating through document elements

The following are the important points to be remembered while iterating the document elements

- Document consists of one or more sections.
- Section contains the contents present in Headers, Footers and main document through the instances of **WTextBody**.
- **WTextBody** contains two type of elements – either paragraph or table

The following code example shows how to iterate throughout the Word document and remove the paragraph with a particular style.

C#

```
//Opens an existing document from file system through constructor of
WordDocument class
WordDocument document = new WordDocument(@"TestDocument.docx");
//Processes the body contents for each section in the Word document
foreach (WSection section in document.Sections)
{
    //Accesses the Body of section where all the contents in document are apart
    WTextBody sectionBody = section.Body;
    IterateTextBody(sectionBody);
    WHeadersFooters headersFooters = section.HeadersFooters;
    //Consider that OddHeader and OddFooter are applied to this document
    //Iterates through the TextBody of OddHeader and OddFooter
    IterateTextBody(headersFooters.OddHeader);
    IterateTextBody(headersFooters.OddFooter);
}
//Saves and closes the document instance
document.Save("Result.docx");
document.Close();
```

VB.NET

```

'Opens an existing document from file system through constructor of WordDocument class
Dim document As New WordDocument("TestDocument.docx")
'Processes the body contents for each section in the Word document
For Each section As WSection In document.Sections
'Accesses the Body of section where all the contents in document are apart
Dim sectionBody As WTextBody = section.Body
IterateTextBody(sectionBody)
Dim headersFooters As WHeadersFooters = section.HeadersFooters
'Consider that OddHeader and OddFooter are applied to this document
'Iterates through the text body of OddHeader and OddFooter
IterateTextBody(headersFooters.OddHeader)
IterateTextBody(headersFooters.OddFooter)
Next
'Saves and closes the document instance
document.Save("Result.docx")
document.Close()

```

UWP

```

///"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of WordDocument class
using (WordDocument document = new
WordDocument((assembly.GetManifestResourceStream("CreateWordSample.Assets.Test.docx")), FormatType.Docx))
{
    foreach (WSection section in document.Sections)
    {
//Accesses the Body of section where all the contents in document are apart
WTextBody sectionBody = section.Body;
IterateTextBody(sectionBody);
WHeadersFooters headersFooters = section.HeadersFooters;
//Consider that OddHeader and OddFooter are applied to this document
//Iterates through the TextBody of OddHeader and OddFooter
IterateTextBody(headersFooters.OddHeader);
IterateTextBody(headersFooters.OddFooter);
    }
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
//Closes the Word document
document.Close();
}

```

ASP.NET CORE

```

FileStream fileStreamPath = new FileStream(@"Data>Hello World.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);

```

```
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(fileStreamPath,
FormatType.Automatic))
{
    foreach (WSection section in document.Sections)
    {
        //Accesses the Body of section where all the contents in document are apart
        WTextBody sectionBody = section.Body;
        IterateTextBody(sectionBody);
        WHeadersFooters headersFooters = section.HeadersFooters;
        //Consider that OddHeader and OddFooter are applied to this document
        //Iterates through the TextBody of OddHeader and OddFooter
        IterateTextBody(headersFooters.OddHeader);
        IterateTextBody(headersFooters.OddFooter);
    }
    MemoryStream stream = new MemoryStream();
    document.Save(stream, FormatType.Docx);
    //Closes the Word document
    document.Close();
    stream.Position = 0;
    //Download Word document in the browser
    return File(stream, "application/msword", "Result.docx");
}
```

XAMARIN

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new
WordDocument((assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.He
llo World.docx")), FormatType.Automatic))
{
    foreach (WSection section in document.Sections)
    {
        //Accesses the Body of section where all the contents in document are apart
        WTextBody sectionBody = section.Body;
        IterateTextBody(sectionBody);
        WHeadersFooters headersFooters = section.HeadersFooters;
        //Consider that OddHeader and OddFooter are applied to this document
        //Iterates through the TextBody of OddHeader and OddFooter
        IterateTextBody(headersFooters.OddHeader);
        IterateTextBody(headersFooters.OddFooter);
    }
    MemoryStream stream = new MemoryStream();
    document.Save(stream, FormatType.Docx);
    //Save the stream as a file in the device and invoke it for viewing
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
    //Closes the Word document
    document.Close();
    //Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

```
}

```

The following code example provides supporting methods for the above code.

C#

```
private static void IterateTextBody(WTextBody textBody)
{
    //Iterates through each of the child items of WTextBody
    for (int i = 0; i < textBody.ChildEntities.Count; i++)
    {
        //IEntity is the basic unit in DocIO DOM.
        //Accesses the body items (should be either paragraph or table) as IEntity
        IEntity bodyItemEntity = textBody.ChildEntities[i];
        //A Text body has 2 types of elements - Paragraph and Table
        //Decides the element type by using EntityType
        switch (bodyItemEntity.EntityType)
        {
            case EntityType.Paragraph:
                WParagraph paragraph = bodyItemEntity as WParagraph;
                //Checks for particular style name and removes the paragraph from DOM
                if (paragraph.StyleName == "MyStyle")
                {
                    int index = textBody.ChildEntities.IndexOf(paragraph);
                    textBody.ChildEntities.RemoveAt(index);
                }
                break;
            case EntityType.Table:
                //Table is a collection of rows and cells
                //Iterates through table's DOM
                IterateTable(bodyItemEntity as WTable);
                break;
        }
    }
}
```

VB.NET

```
Private Shared Sub IterateTextBody(textBody As WTextBody)
    'Iterates through the each of the child items of WTextBody
    For i As Integer = 0 To textBody.ChildEntities.Count - 1
        'IEntity is the basic unit in DocIO DOM.
        'Accesses the body items (should be either paragraph or table) as IEntity
        Dim bodyItemEntity As IEntity = textBody.ChildEntities(i)
        'A Text body has 2 types of elements - Paragraph and Table
        'decide the element type using EntityType
        Select Case bodyItemEntity.EntityType
            Case EntityType.Paragraph
                Dim paragraph As WParagraph = TryCast(bodyItemEntity, WParagraph)
                'Checks for a particular style name and removes the paragraph from DOM
                If paragraph.StyleName = "MyStyle" Then
                    Dim index As Integer = textBody.ChildEntities.IndexOf(paragraph)
                    textBody.ChildEntities.RemoveAt(index)
                End If
            Exit Select
            Case EntityType.Table

XAMARIN

```
private static void IterateTable(WTable table)
{
    //Iterates the row collection in a table
    foreach (WTableRow row in table.Rows)
    {
        //Iterates the cell collection in a table row
        foreach (WTableCell cell in row.Cells)
        {
            //Table cell is derived from (also a) TextBody
            //Reusing the code meant for iterating TextBody
            IterateTextBody(cell);
        }
    }
}
```

The following code example shows how to iterate throughout the paragraph and modify the hyperlink (Hyperlink)Uri and specific text (WTextRange)with another.

C#

```
//Opens an existing document from file system through constructor of
WordDocument class
WordDocument document = new WordDocument(@"TestDocument.docx");
//Processes the body contents for each section in the Word document
foreach (WSection section in document.Sections)
{
    //Accesses the Body of section where all the contents in document are apart
    WTextBody sectionBody = section.Body;
    IterateTextBody(sectionBody);
    WHeadersFooters headersFooters = section.HeadersFooters;
    //consider that OddHeader & OddFooter are applied to this document
    //Iterates through the TextBody of OddHeader and OddFooter
    IterateTextBody(headersFooters.OddHeader);
    IterateTextBody(headersFooters.OddFooter);
}
//Saves and closes the document instance
document.Save("Result.docx");
document.Close();
```

VB.NET

```
Dim document As New WordDocument("TestDocument.docx")
'Processes the body contents for each section in the Word document
For Each section As WSection In document.Sections
'Accesses the Body of section where all the contents in document are apart
Dim sectionBody As WTextBody = section.Body
IterateTextBody(sectionBody)
Dim headersFooters As WHeadersFooters = section.HeadersFooters
'Considers that OddHeader and OddFooter are applied to this document
```

```
'Iterates through the TextBody of OddHeader and
OddFooterIterateTextBody(headersFooters.OddHeader)
IterateTextBody(headersFooters.OddFooter)
Next
'Saves and closes the document instance
document.Save("Result.docx")
document.Close()
```

UWP

```
///"App" is the class of Portable project.

```

Cloning a Word document

You can create a deep copy of a Word document by using `Clone` method of `WordDocument` class. You can read the template document from file system or stream and create multiple document copies by cloning it. This improves the performance of document generation, as there is no need to read the Word document each time.

C#

```

//Opens an existing document
WordDocument inputTemplateDoc = new WordDocument(fileName);
//Creates a clone of Input Template
WordDocument clonedDocument = inputTemplateDoc.Clone();
//Saves and closes the cloned document instance
clonedDocument.Save("ClonedDocument.docx");
clonedDocument.Close();
//Closes the input template document instance
sourceDocument.Close();

```

VB.NET

```

'Opens an existing document
Dim inputTemplateDoc As New WordDocument(fileName)
'Creates a clone of Input Template
Dim clonedDocument As WordDocument = inputTemplateDoc.Clone()
'Saves and closes the cloned document instance
clonedDocument.Save("ClonedDocument.docx")
clonedDocument.Close()
'Closes the input template document instance
sourceDocument.Close()

```

UWP

```

//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
WordDocument clonedDocument = document.Clone();
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream

```

```
await clonedDocument.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
document.Close();
clonedDocument.Close();
}
```

ASP.NET CORE

```
FileStream fileStreamPath = new FileStream(@"Data/Hello World.docx",
    FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(fileStreamPath,
    FormatTypeAutomatic))
{
    //Creates a clone of Input Template
    WordDocument clonedDocument = document.Clone();
    MemoryStream stream = new MemoryStream();
    //Saves and closes the cloned document instance
    clonedDocument.Save(stream, FormatType.Docx);
    //Closes the document
    document.Close();
    clonedDocument.Close();
    stream.Position = 0;
    //Download Word document in the browser
    return File(stream, "application/msword", "Result.docx");
}
```

XAMARIN

```
///"App" is the class of Portable project.

    //Closes the document
    clonedDocument.Close();
    document.Close();
    //Please download the helper files from the below link to save the stream as
    file and open the file for viewing in Xamarin platform
    //https://help.syncfusion.com/file-formats/docio/create-word-document-in-
    xamarin#helper-files-for-xamarin
}
```

You can also create a deep copy of document elements such as sections, paragraphs, Tables, Text, Image, OleObject, Shapes, TextBoxes and etc., The following code example illustrates how to clone the section and save each cloned section as a Word document.

C#

```
//Opens a source document
WordDocument sourceDocument = new WordDocument("SourceDocument.docx");
//Processes the each section in the Word document
for (int i = 0; i < sourceDocument.Sections.Count;i++)
{
    //Creates new WordDocument instance to add cloned section
    WordDocument destinationDocument = new WordDocument();
    //Clones and adds source document sections to the destination document
    destinationDocument.Sections.Add(sourceDocument.Sections[i].Clone());
    //Saves and closes the document instance
    destinationDocument.Save("Section_" + i + ".docx");
    destinationDocument.Close();
}
//Closes the source document instance
sourceDocument.Close();
```

VB.NET

```
'Opens a source document
Dim sourceDocument As New WordDocument("SourceDocument.docx")
'Processes the each section in the Word document
For i As Integer = 0 To sourceDocument.Sections.Count - 1
    'Creates new WordDocument instance to add cloned section
    Dim destinationDocument As New WordDocument()
    'Clones and adds source document sections to the destination document
    destinationDocument.Sections.Add(sourceDocument.Sections(i).Clone())
    'Saves and closes the document instance
    destinationDocument.Save("Section_" + i + ".docx")
    destinationDocument.Close()
Next
'Closes the source document instance
sourceDocument.Close()
```

UWP

```
//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument sourceDocument = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.SourceDocumen
t.docx"), FormatType.Docx);
//Processes the each section in the Word document
for (int i = 0; i < sourceDocument.Sections.Count;i++)
{
    //Creates new WordDocument instance to add cloned section
    WordDocument destinationDocument = new WordDocument();
    //Clones and adds source document sections to the destination document
    destinationDocument.Sections.Add(sourceDocument.Sections[i].Clone());
    //Saves the Word file to MemoryStream
    MemoryStream stream = new MemoryStream();
    await destinationDocument.SaveAsync(stream, FormatType.Docx);
}
```

```
//Saves the stream as Word file in local machine.Please find Save method in
[link] (https://help.syncfusion.com/file-formats/docio/create-word-document-
in-uwp#save-word-document-in-uwp)
Save(stream, "Section_" + i + ".docx");
destinationDocument.Close();
}
//Closes the source document instance
sourceDocument.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates an instance of WordDocument class
FileStream fileStreamPath = new FileStream("SourceDocument.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
WordDocument sourceDocument = new WordDocument(fileStreamPath);
//Processes the each section in the Word document
for (int i = 0; i < sourceDocument.Sections.Count; i++)
{
//Creates new WordDocument instance to add cloned section
WordDocument destinationDocument = new WordDocument();
//Clones and adds source document sections to the destination document
destinationDocument.Sections.Add(sourceDocument.Sections[i].Clone());
//Saves and closes the document instance
FileStream outputStream = new FileStream("Section_" + i + ".docx",
FileMode.Create, FileAccess.ReadWrite, FileShare.ReadWrite);
destinationDocument.Save(outputStream, FormatType.Docx);
destinationDocument.Close();
outputStream.Flush();
outputStream.Dispose();
}
//Closes the source document instance
sourceDocument.Close();
```

XAMARIN

```
//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument sourceDocument = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Assets.Sourc
eDocument.docx"), FormatType.Docx);
//Processes the each section in the Word document
for (int i = 0; i < sourceDocument.Sections.Count; i++)
{
//Creates new WordDocument instance to add cloned section
WordDocument destinationDocument = new WordDocument();
//Clones and adds source document sections to the destination document
destinationDocument.Sections.Add(sourceDocument.Sections[i].Clone());
//Saves and closes the document instance
MemoryStream stream = new MemoryStream();
destinationDocument.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Section_" + i +
".docx", "application/msword", stream);
```

```
destinationDocument.Close();
//Please download the helper files from the below link to save the stream as
//file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
//xamarin#helper-files-for-xamarin
}
//Closes the source document instance
sourceDocument.Close();
```

Merging Word documents

You can merge multiple Word documents into single Word document by using DocIO's capability of importing contents from one document to another. The imported contents are appended at the end of document. The following code example illustrates how to import the contents from source document into destination document where the contents are appended.

C#

```
//Opens the source document
WordDocument sourceDocument = new WordDocument(sourceFileName);
//Opens the destination document
WordDocument destinationDocument = new WordDocument(targetFileName);
//Imports the contents of source document at the end of destination document
destinationDocument.ImportContent(sourceDocument,
ImportOptions.UseDestinationStyles);
//Saves the destination document
destinationDocument.Save(outputFileName, FormatType.Docx);
//closes the document instances
sourceDocument.Close();
destinationDocument.Close();
```

VB.NET

```
'Opens the source document
Dim sourceDocument As New WordDocument(sourceFileName)
'Opens the destination document
Dim destinationDocument As New WordDocument(targetFileName)
'Imports the contents of source document at the end of destination document
destinationDocument.ImportContent(sourceDocument,
ImportOptions.UseDestinationStyles)
'Saves the destination document
destinationDocument.Save(outputFileName, FormatType.Docx)
'closes the document instances
sourceDocument.Close()
destinationDocument.Close()
```

UWP

```
///"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
    //Opens the destination document
```

```

WordDocument destinationDocument = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Letter
Formatting.docx"), FormatType.Docx);
//Imports the contents of source document at the end of destination document
destinationDocument.ImportContent(document,
ImportOptions.UseDestinationStyles);
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await destinationDocument.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine. Please find Save method in
[link](https://help.syncfusion.com/file-formats/docio/create-word-document-
in-uwp#save-word-document-in-uwp)
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
document.Close();
destinationDocument.Close();
}

```

ASP.NET CORE

```

FileStream sourceStreamPath = new FileStream(sourceFileName, FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
FileStream destinationStreamPath = new FileStream(destinationFileName,
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Opens an source document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(sourceStreamPath,
FormatType.Automatic))
{
//Opens the destination document
WordDocument destinationDocument = new WordDocument(destinationStreamPath,
FormatType.Docx);
//Imports the contents of source document at the end of destination document
destinationDocument.ImportContent(document,
ImportOptions.UseDestinationStyles);
MemoryStream stream = new MemoryStream();
//Saves and closes the destination document to MemoryStream
destinationDocument.Save(stream, FormatType.Docx);
destinationDocument.Close();
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
}

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello
World.docx"), FormatType.Docx))
{
//Opens the destination document

```

```

WordDocument destinationDocument = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.Let
ter Formatting.docx"), FormatType.Docx);
//Imports the contents of source document at the end of destination document
destinationDocument.ImportContent(document,
ImportOptions.UseDestinationStyles);
MemoryStream stream = new MemoryStream();
destinationDocument.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWordDoc.doc
x", "application/msword", stream);
//Closes the documents
document.Close();
destinationDocument.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
}

```

In the resultant document, the imported contents start from a new page followed by existing contents in a destination document. This is the default behavior.

When your requirement is to append the contents from the same page instead of starting from a new page, you need to set the break code of first section of Source document as NoBreak. The following code example illustrates the importing contents from the same page.

C#

```

//Opens the source document
WordDocument sourceDocument = new WordDocument(sourceFileName);
//Opens the destination document
WordDocument destinationDocument = new WordDocument(targetFileName);
//Sets the break-code of First section of source document as NoBreak to
avoid imported from a new page
sourceDocument.Sections[0].BreakCode = SectionBreakCode.NoBreak;
//Imports the contents of source document at the end of destination document
destinationDocument.ImportContent(sourceDocument,
ImportOptions.UseDestinationStyles);
//Saves the destination document
destinationDocument.Save(outputFileName, FormatType.Docx);
//Closes the document instances
sourceDocument.Close();
destinationDocument.Close();

```

VB.NET

```

'Opens the source document
Dim sourceDocument As New WordDocument(sourceFileName)
'Opens the destination document
Dim destinationDocument As New WordDocument(targetFileName)
'Sets the break-code of first section of source document as NoBreak to avoid
imported from a new page
sourceDocument.Sections(0).BreakCode = SectionBreakCode.NoBreak
'Imports the contents of source document at the end of destination document

```

```

destinationDocument.ImportContent(sourceDocument,
ImportOptions.UseDestinationStyles)
'Saves the destination document
destinationDocument.Save(outputFileName, FormatType.Docx)
'Closes the document instances
sourceDocument.Close()
destinationDocument.Close()

```

UWP

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
    // Opens the destination document
    WordDocument destinationDocument = new
    WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Let
ter Formatting.docx"), FormatType.Docx);
    // Sets the break-code of First section of source document as NoBreak to
    avoid imported from a new page
    document.Sections[0].BreakCode = SectionBreakCode.NoBreak;
    // Imports the contents of source document at the end of destination document
    destinationDocument.ImportContent(document,
    ImportOptions.UseDestinationStyles);
    MemoryStream stream = new MemoryStream();
    // Saves the Word file to MemoryStream
    await destinationDocument.SaveAsync(stream, FormatType.Docx);
    // Saves the stream as Word file in local machine
    Save(stream, "Result.docx");
    // Please refer the below link to save Word document in UWP platform
    // https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
    document.Close();
    destinationDocument.Close();
}

```

ASP.NET CORE

```

destinationDocument.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin
}

```

Maintain Imported List style information

The following code example shows how to maintain information about imported list styles in a Word document while cloning and merging multiple Word documents.

C#

```

//Opens the source document
WordDocument sourceDocument = new WordDocument(sourceFileName);
//Opens the destination document
WordDocument destinationDocument = new WordDocument(targetFileName);

```

```

//Sets true value to maintain imported list style cache to destination document
destinationDocument.Settings.MaintainImportedListCache = true;
//Processes the body contents for each section in the Word document
foreach (WSection section in sourceDocument.Sections)
{
    //Accesses the body of section where all the contents in document are apart
    foreach (TextBodyItem bodyItem in section.Body.ChildEntities)
    {
        destinationDocument.LastSection.Body.ChildEntities.Add(bodyItem.Clone());
    }
}
//Closes the source document
sourceDocument.Close();
//Sets false value to exclude imported list style cache to destination document
destinationDocument.Settings.MaintainImportedListCache = false;
//Saves the destination document
destinationDocument.Save(outputFileName, FormatType.Docx);
//Closes the destination document
destinationDocument.Close();

```

VB.NET

```

'Opens the source document
Dim sourceDocument As New WordDocument(sourceFileName)
'Opens the destination document
Dim destinationDocument As New WordDocument(targetFileName)
'Sets true value to maintain imported list style cache to destination document
destinationDocument.Settings.MaintainImportedListCache = True
'Processes the body contents for each section in the Word document
For Each section As WSection In sourceDocument.Sections
    'Accesses the body of section where all the contents in document are apart
    For Each bodyItem As TextBodyItem In section.Body.ChildEntities
        destinationDocument.LastSection.Body.ChildEntities.Add(bodyItem.Clone())
    Next
Next
'Closes the source document
sourceDocument.Close()
'Sets false value to exclude imported list style cache to destination document
destinationDocument.Settings.MaintainImportedListCache = False
'Saves the destination document
destinationDocument.Save(outputFileName, FormatType.Docx)
'Closes the destination document
destinationDocument.Close()

```

UWP

```

//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument sourceDocument = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Source.docx"),
FormatType.Docx);

```

```

WordDocument destinationDocument = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Destination.d
ocx"), FormatType.Docx);
//Sets true value to maintain imported list style cache to destination
document
destinationDocument.Settings.MaintainImportedListCache = true;
//Processes the body contents for each section in the Word document
foreach (WSection section in sourceDocument.Sections)
{
//Accesses the body of section where all the contents in document are apart
foreach (TextBodyItem bodyItem in section.Body.ChildEntities)
{
destinationDocument.LastSection.Body.ChildEntities.Add(bodyItem.Clone());
}
}
//Closes the source document
sourceDocument.Close();
//Sets false value to exclude imported list style cache to destination
document
destinationDocument.Settings.MaintainImportedListCache = false;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await destinationDocument.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
destinationDocument.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Opens the source document

destinationDocument.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Printing a Word document

You can print a Word document by utilizing DocIO's capability to convert the document into images and .NET framework's [PrintDocument](#) class

Initially you have to render the pages as images as shown below

C#

```
//Opens the Word document
WordDocument document = new WordDocument((string) this.textBox.Tag);
//Renders the Word document as image
Image[] images = document.RenderAsImages(ImageType.Metafile);
//Closes the Word Document
document.Close();
```

VB.NET

```
'Opens the Word document
Dim document As New WordDocument(DirectCast(Me.textBox.Tag, String))
'Renders the Word document as image
Dim images As Image() = document.RenderAsImages(ImageType.Metafile)
'Closes the Word Document
document.Close()
```

UWP

```
//DocIO supports Word to Image conversion in Windows forms, WPF, ASP.NET and ASP.NET MVC platforms only.
```

ASP.NET CORE

```
//DocIO supports Word to Image conversion in Windows forms, WPF, ASP.NET and ASP.NET MVC platforms only.
```

XAMARIN

```
//DocIO supports Word to Image conversion in Windows forms, WPF, ASP.NET and ASP.NET MVC platforms only.
```

You can specify the printer settings and page settings through the [PrintDocument](#) class. The [PrintDocument.PrintPage](#) event should be handled to layout the document for printing.

The following code example demonstrates how to print the Word document pages that have been rendered as an image:

C#

```
int endPageIndex = images.Length;
//Creates new PrintDialog instance
System.Windows.Forms.PrintDialog printDialog = new
System.Windows.Forms.PrintDialog();
//Sets new PrintDocument instance to print dialog
printDialog.Document = new PrintDocument();
//Enables the print current page option
printDialog.AllowCurrentPage = true;
```

```

//Enables the print selected pages option
printDialog.AllowSomePages = true;
//Sets the start and end page index
printDialog.PrinterSettings.FromPage = 1;
printDialog.PrinterSettings.ToPage = images.Length;
//Opens the print dialog box
if (printDialog.ShowDialog() == System.Windows.Forms.DialogResult.OK)
{
    //Checks whether the selected page range is valid
    if (printDialog.PrinterSettings.FromPage > 0 &&
        printDialog.PrinterSettings.ToPage <= images.Length)
    {
        //Updates the start page of the document to print
        startPageIndex = printDialog.PrinterSettings.FromPage - 1;
        //Updates the end page of the document to print
        endPageIndex = printDialog.PrinterSettings.ToPage;
        //Hooks the PrintPage event to handle the drawing pages for printing
        printDialog.Document.PrintPage += new
        PrintPageEventHandler(PrintPageMethod);
        //Print the document
        printDialog.Document.Print();
    }
}

```

VB.NET

```

Dim endPageIndex As Integer = images.Length
'Creates new PrintDialog instance
Dim printDialog As New System.Windows.Forms.PrintDialog()
'Sets new PrintDocument instance to print dialog
printDialog.Document = New PrintDocument()
'Enables the print current page option
printDialog.AllowCurrentPage = True
'Enables the print selected pages option
printDialog.AllowSomePages = True
'Sets the start and end page index
printDialog.PrinterSettings.FromPage = 1
printDialog.PrinterSettings.ToPage = images.Length
'Opens the print dialog box
If printDialog.ShowDialog() = System.Windows.Forms.DialogResult.OK Then
    'Checks whether the selected page range is valid or not
    If printDialog.PrinterSettings.FromPage > 0 AndAlso
    printDialog.PrinterSettings.ToPage <= images.Length Then
        'Updates the start page of the document to print
        startPageIndex = printDialog.PrinterSettings.FromPage - 1
        'Updates the end page of the document to print
        endPageIndex = printDialog.PrinterSettings.ToPage
        'Hooks the PrintPage event to handle the drawing pages for printing
        printDialog.Document.PrintPage += New PrintPageEventHandler(PrintPageMethod)
        'Prints the document
        printDialog.Document.Print()
    End If
End If

```

UWP

```
//DocIO supports Word to Image conversion in Windows forms, WPF, ASP.NET and ASP.NET MVC platforms only.
```

ASP.NET CORE

```
//DocIO supports Word to Image conversion in Windows forms, WPF, ASP.NET and ASP.NET MVC platforms only.
```

XAMARIN

```
//DocIO supports Word to Image conversion in Windows forms, WPF, ASP.NET and ASP.NET MVC platforms only.
```

The following code example provides supporting methods for the above code.

C#

```
private void PrintPageMethod(object sender, PrintPageEventArgs e)
{
    //Gets the print start page width
    int currentPageWidth = images[startPageIndex].Width;
    //Gets the print start page height
    int currentPageHeight = images[startPageIndex].Height;
    //Gets the visible bounds width for print
    int visibleClipBoundsWidth = (int)e.Graphics.VisibleClipBounds.Width;
    //Gets the visible bounds height for print
    int visibleClipBoundsHeight = (int)e.Graphics.VisibleClipBounds.Height;
    //Checks whether the page layout is landscape or portrait
    if (currentPageWidth > currentPageHeight)
    {
        //Translates the position
        e.Graphics.TranslateTransform(0, visibleClipBoundsHeight);
        //Rotates the object at 270 degrees
        e.Graphics.RotateTransform(270.0f);
        //Draws the current page image
        e.Graphics.DrawImage(images[startPageIndex], new System.Drawing.Rectangle(0, 0, currentPageWidth, currentPageHeight));
    }
    else
    {
        //Draws the current page image
        e.Graphics.DrawImage(images[startPageIndex], new System.Drawing.Rectangle(0, 0, visibleClipBoundsWidth, visibleClipBoundsHeight));
    }
    //Disposes the current page image after drawing
    images[startPageIndex].Dispose();
    //Increments the start page index
    startPageIndex++;
    //Updates whether the document contains some more pages to print
    if (startPageIndex < endPageIndex)
        e.HasMorePages = true;
    else
        startPageIndex = 0;
}
```

VB.NET

```

Private Sub PrintPageMethod(sender As Object, e As PrintPageEventArgs)
    'Gets the print start page width
    Dim currentPageWidth As Integer = images(startPageIndex).Width
    'Gets the print start page height
    Dim currentPageHeight As Integer = images(startPageIndex).Height
    'Gets the visible bounds width for print
    Dim visibleClipBoundsWidth As Integer =
    CInt(e.Graphics.VisibleClipBounds.Width)
    'Gets the visible bounds height for print
    Dim visibleClipBoundsHeight As Integer =
    CInt(e.Graphics.VisibleClipBounds.Height)
    'Checks whether the page layout is landscape or portrait
    If currentPageWidth > currentPageHeight Then
        'Translates the position
        e.Graphics.TranslateTransform(0, visibleClipBoundsHeight)
        'Rotates the object at 270 degrees
        e.Graphics.RotateTransform(270.0F)
        'Draws the current page image
        e.Graphics.DrawImage(images(startPageIndex), New System.Drawing.Rectangle(0,
        0, currentPageWidth, currentPageHeight))
    Else
        'Draws the current page image
        e.Graphics.DrawImage(images(startPageIndex), New System.Drawing.Rectangle(0,
        0, visibleClipBoundsWidth, visibleClipBoundsHeight))
    End If
    'Disposes the current page image after drawing
    images(startPageIndex).Dispose()
    'Increments the start page index
    startPageIndex += 1
    'Updates whether the document contains some more pages to print
    If startPageIndex < endPageIndex Then
        e.HasMorePages = True
    Else
        startPageIndex = 0
    End If
End Sub

//DocIO supports Word to Image conversion in Windows forms, WPF, ASP.NET and
ASP.NET MVC platforms only.

```

You can download the complete working samples of the code from [here](#).

Working with Styles

A style is a predefined set of table, numbering, paragraph, and character properties that can be applied to regions within a document. DocIO provides the following functionalities related with styles.

- Access and modify the existing styles in the word document
- Create new paragraph style.
- Apply built-in styles.

Access Styles

Paragraph and character styles present in the existing document are accessible through the **Styles** property of **WordDocument** class.

This following code example demonstrates how a style can be accessed and style properties like text color and first line indent can be updated.

C#

```
//Opens an input Word template
WordDocument document = new WordDocument(inputFileName);
//Accesses the styles collection that contains paragraph and character
styles in Word document
IStyleCollection styleCollection = document.Styles;
//Finds the style with the name "Heading 1"
WParagraphStyle heading1ParagraphStyle = styleCollection.FindByName("Heading
1") as WParagraphStyle;
//Changes the text color of style "Heading 1" as DarkBlue
heading1ParagraphStyle.CharacterFormat.TextColor = Color.DarkBlue;
//Changes the first line indent of Paragraph as 36 points
heading1ParagraphStyle.ParagraphFormat.FirstLineIndent = 36;
//Saves and closes the document instance
document.Save(outputFileName, FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an input Word template
Dim document As New WordDocument(inputFileName)
'Accesses the styles collection that contains paragraph and character styles
in Word document
Dim styleCollection As IStyleCollection = document.Styles
'Finds the style with the name "Heading 1"
Dim heading1ParagraphStyle As WParagraphStyle =
TryCast(styleCollection.FindByName("Heading 1"), WParagraphStyle)
'Changes the text color of style "Heading 1" as DarkBlue
heading1ParagraphStyle.CharacterFormat.TextColor = Color.DarkBlue
'Changes the first line indent of paragraph as 36 points
heading1ParagraphStyle.ParagraphFormat.FirstLineIndent = 36
'Saves and closes the document instance
document.Save(outputFileName, FormatType.Docx)
document.Close()
```

UWP

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
//Accesses the styles collection that contains paragraph and character
styles in Word document
IStyleCollection styleCollection = document.Styles;
//Finds the style with the name "Heading 1"
WParagraphStyle heading1ParagraphStyle = styleCollection.FindByName("Heading
1") as WParagraphStyle;
//Changes the text color of style "Heading 1" as DarkBlue
heading1ParagraphStyle.CharacterFormat.TextColor =
Syncfusion.DocIO.DLS.Color.DarkBlue;
//Changes the first line indent of Paragraph as 36 points
heading1ParagraphStyle.ParagraphFormat.FirstLineIndent = 36;
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
document.Close();
}
```

ASP.NET CORE

```
FileStream sourceStreamPath = new FileStream(sourceFileName, FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
//Opens an source document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(sourceStreamPath,
FormatType.Automatic))
{
//Accesses the styles collection that contains paragraph and character
styles in Word document
IStyleCollection styleCollection = document.Styles;
//Finds the style with the name "Heading 1"
WParagraphStyle heading1ParagraphStyle = styleCollection.FindByName("Heading
1") as WParagraphStyle;
//Changes the text color of style "Heading 1" as DarkBlue
heading1ParagraphStyle.CharacterFormat.TextColor =
Syncfusion.Drawing.Color.DarkBlue;
//Changes the first line indent of Paragraph as 36 points
heading1ParagraphStyle.ParagraphFormat.FirstLineIndent = 36;
MemoryStream stream = new MemoryStream();
//Saves and closes the destination document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
}
```

XAMARIN

```

//Finds the style with the name "Heading 1"
WParagraphStyle heading1ParagraphStyle = styleCollection.FindByName("Heading 1") as WParagraphStyle;
//Changes the text color of style "Heading 1" as DarkBlue
heading1ParagraphStyle.CharacterFormat.TextColor = Syncfusion.Drawing.Color.DarkBlue;
//Changes the first line indent of Paragraph as 36 points
heading1ParagraphStyle.ParagraphFormat.FirstLineIndent = 36;
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWordDoc.docx", "application/msword", stream);
//Closes the document
document.Close();
//Please download the helper files from the below link to save the stream as file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin
}

```

Creating a new Paragraph Style

You can create a new paragraph style by using `WordDocument.AddParagraphStyle` method and apply it by using `ApplyStyle` method of `WParagraph` class.

C#

```

//Opens an input Word template
WordDocument document = new WordDocument();
//This method adds a section and a paragraph in the document
document.EnsureMinimal();
//Adds a new paragraph style named "MyStyle"
IWParagraphStyle myStyle = document.AddParagraphStyle("MyStyle");
//Sets the formatting of the style
myStyle.CharacterFormat.FontSize = 16f;
myStyle.CharacterFormat.TextColor = Color.DarkBlue;
myStyle.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right;
//Appends the contents into the paragraph
document.LastParagraph.AppendText("AdventureWorks Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company.");
//Applies the style to paragraph
document.LastParagraph.ApplyStyle("MyStyle");

```

```
document.Save(outputFileName, FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an input Word template
Dim document As New WordDocument()
'This method adds a section and a paragraph in the document
document.EnsureMinimal()
'Adds a new paragraph style named "MyStyle"
Dim myStyle As IWPParagraphStyle = document.AddParagraphStyle("MyStyle")
'Sets the formatting of the style
myStyle.CharacterFormat.FontSize = 16.0F
myStyle.CharacterFormat.TextColor = Color.DarkBlue
myStyle.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right
'Appends the content into the paragraph
document.LastParagraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.")
'Applies the style to paragraph
document.LastParagraph.ApplyStyle("MyStyle")
document.Save(outputFileName, FormatType.Docx)
document.Close()
```

UWP

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
IWPParagraphStyle myStyle = document.AddParagraphStyle("MyStyle");
//Sets the formatting of the style
myStyle.CharacterFormat.FontSize = 16f;
myStyle.CharacterFormat.TextColor = Syncfusion.DocIO.DLS.Color.DarkBlue;
myStyle.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Right;
//Appends the contents into the paragraph
document.LastParagraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
//Applies the style to paragraph
document.LastParagraph.ApplyStyle("MyStyle");
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
document.Close();
}
```

ASP.NET CORE

```

FileStream sourceStreamPath = new FileStream(sourceFileName, FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
//Opens an source document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(sourceStreamPath,
FormatType.Automatic))
{
IWParagraphStyle myStyle = document.AddParagraphStyle("MyStyle");
//Sets the formatting of the style
myStyle.CharacterFormat.FontSize = 16f;
myStyle.CharacterFormat.TextColor = Syncfusion.Drawing.Color.DarkBlue;
myStyle.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right;
//Appends the contents into the paragraph
document.LastParagraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
//Applies the style to paragraph
document.LastParagraph.ApplyStyle("MyStyle");
MemoryStream stream = new MemoryStream();
//Saves and closes the destination document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
}

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello
World.docx"), FormatType.Docx))
{
IWParagraphStyle myStyle = document.AddParagraphStyle("MyStyle");
//Sets the formatting of the style
myStyle.CharacterFormat.FontSize = 16f;
myStyle.CharacterFormat.TextColor = Syncfusion.Drawing.Color.DarkBlue;
myStyle.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right;
//Appends the contents into the paragraph
document.LastParagraph.AppendText("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
//Applies the style to paragraph
document.LastParagraph.ApplyStyle("MyStyle");
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWordDoc.doc
x", "application/msword", stream);
//Closes the document
document.Close();
}

```

```
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
}
```

Applying built-in styles

DocIO provides a set of predefined styles. You can apply those predefined styles as shown in the following code example.

C#

```
//Opens an input Word template
WordDocument document = new WordDocument();
//This method adds a section and a paragraph in the document
document.EnsureMinimal();
IWParagraph paragraph = document.LastParagraph;
//Appends the content into the paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Applies the style to paragraph
paragraph.ApplyStyle(BuiltinStyle.Emphasis);
document.Save(outputFileName, FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an input Word template
Dim document As New WordDocument()
'This method adds a section and a paragraph in the document
document.EnsureMinimal()
Dim paragraph As IWParagraph = document.LastParagraph
'Appends the content into the paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Applies the style to paragraph
paragraph.ApplyStyle(BuiltinStyle.Emphasis)
document.Save(outputFileName, FormatType.Docx)
document.Close()
```

UWP

```
/"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
//Applies the style to paragraph
document.LastParagraph.ApplyStyle(BuiltinStyle.Emphasis);
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
```

```
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
document.Close();
}
```

ASP.NET CORE

```
FileStream sourceStreamPath = new FileStream(sourceFileName, FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
//Opens an source document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(sourceStreamPath,
FormatType.Automatic))
{
//Applies the style to paragraph
document.LastParagraph.ApplyStyle(BuiltinStyle.Emphasis);
MemoryStream stream = new MemoryStream();
//Saves and closes the destination document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
}
```

XAMARIN

```
///"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.Hello World.docx"), FormatType.Docx))
{
//Applies the style to paragraph
document.LastParagraph.ApplyStyle(BuiltinStyle.Emphasis);
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWordDoc.docx", "application/msword", stream);
//Closes the document
document.Close();
//Please download the helper files from the below link to save the stream as file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin
}
```

Working with Word document properties

Document properties, also known as metadata, are details about a file that describe or identify it. You can also define the additional custom document properties for the documents by using DocIO

Document properties that are classified as two categories.

- Built-in document properties - includes details such as title, author name, subject, and keywords that identify the document's topic or contents.
- Custom document properties - defines the user-defined document properties.

Built-in document properties

The Built-in document properties of a word document is represented by `BuiltinDocumentProperties` property of `WordDocument` class. The following code example illustrates how to access and modify the Built-in document properties of the document.

C#

```
//Opens an existing Word document
WordDocument document = new WordDocument(inputFileName);
//Accesses the built-in document properties
Console.WriteLine("Title - {0}", document.BuiltinDocumentProperties.Title);
Console.WriteLine("Author - {0}",
document.BuiltinDocumentProperties.Author);
//Modifies or sets the category and company Built-in document properties
document.BuiltinDocumentProperties.Category = "Sales reports";
document.BuiltinDocumentProperties.Company = "Northwind traders";
document.Save(outputFileName, FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an existing Word document
Dim document As New WordDocument(inputFileName)
'Accesses the built-in document properties
Console.WriteLine("Title - {0}", document.BuiltinDocumentProperties.Title)
Console.WriteLine("Author - {0}", document.BuiltinDocumentProperties.Author)
'Modifies or sets the category and company Built-in document properties
document.BuiltinDocumentProperties.Category = "Sales reports"
document.BuiltinDocumentProperties.Company = "Northwind traders"
'Saves and closes the document
document.Save(outputFileName, FormatType.Docx)
document.Close()
```

UWP

```
///"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
    ///Accesses the built-in document properties
    Console.WriteLine("Title - {0}", document.BuiltinDocumentProperties.Title);
```

```

Console.WriteLine("Author - {0}",
document.BuiltinDocumentProperties.Author);
//Modifies or sets the category and company Built-in document properties
document.BuiltinDocumentProperties.Category = "Sales reports";
document.BuiltinDocumentProperties.Company = "Northwind traders";
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
document.Close();
}

```

ASP.NET CORE

```

FileStream sourceStreamPath = new FileStream(sourceFileName, FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
//Opens an source document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(sourceStreamPath,
FormatTypeAutomatic))
{
//Accesses the built-in document properties
Console.WriteLine("Title - {0}", document.BuiltinDocumentProperties.Title);
Console.WriteLine("Author - {0}",
document.BuiltinDocumentProperties.Author);
//Modifies or sets the category and company Built-in document properties
document.BuiltinDocumentProperties.Category = "Sales reports";
document.BuiltinDocumentProperties.Company = "Northwind traders";
MemoryStream stream = new MemoryStream();
//Saves and closes the destination document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
}

```

XAMARIN

```

//App is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello World.docx"), FormatType.Docx))
{
//Accesses the built-in document properties
Console.WriteLine("Title - {0}", document.BuiltinDocumentProperties.Title);
Console.WriteLine("Author - {0}",
document.BuiltinDocumentProperties.Author);
//Modifies or sets the category and company Built-in document properties
document.BuiltinDocumentProperties.Category = "Sales reports";
document.BuiltinDocumentProperties.Company = "Northwind traders";
}

```

```

MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWordDoc.doc
x", "application/msword", stream);
//Closes the document
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
}

```

Adding Custom Document properties

You add a new custom document properties through **Add** method of **CustomProperties** class. The following code example illustrates how to add a new custom document properties.

C#

```

//Opens an input word template
WordDocument document = new WordDocument(inputFileName);
//Adds the custom document properties of various data types
document.CustomDocumentProperties.Add("PropertyA", "Value of A");
document.CustomDocumentProperties.Add("PropertyB", 12.5);
document.CustomDocumentProperties.Add("PropertyC", true);
document.CustomDocumentProperties.Add("PropertyD", new DateTime(2015, 7, 20));
//Saves and closes the document
document.Save(outputFileName, FormatType.Docx);
document.Close();

```

VB.NET

```

'Opens an existing document from file system through constructor of
WordDocument class
Dim document As New WordDocument(inputFileName)
'Adds the custom document properties of various data types
document.CustomDocumentProperties.Add("PropertyA", "Value of A")
document.CustomDocumentProperties.Add("PropertyB", 12.5)
document.CustomDocumentProperties.Add("PropertyC", True)
document.CustomDocumentProperties.Add("PropertyD", New DateTime(2015, 7,
20))
'Saves and closes the document
document.Save(outputFileName, FormatType.Docx)
document.Close()

```

UWP

```

//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
//Adds the custom document properties of various data types
document.CustomDocumentProperties.Add("PropertyA", "Value of A");
}

```

```

document.CustomDocumentProperties.Add("PropertyB", 12.5);
document.CustomDocumentProperties.Add("PropertyC", true);
document.CustomDocumentProperties.Add("PropertyD", new DateTime(2015, 7, 20));
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
document.Close();
}

```

ASP.NET CORE

```

FileStream sourceStreamPath = new FileStream(sourceFileName, FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
//Opens an source document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(sourceStreamPath,
FormatType.Automatic))
{
//Adds the custom document properties of various data types
document.CustomDocumentProperties.Add("PropertyA", "Value of A");
document.CustomDocumentProperties.Add("PropertyB", 12.5);
document.CustomDocumentProperties.Add("PropertyC", true);
document.CustomDocumentProperties.Add("PropertyD", new DateTime(2015, 7, 20));
MemoryStream stream = new MemoryStream();
//Saves and closes the destination document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
}

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.Hello World.docx"), FormatType.Docx))
{
//Adds the custom document properties of various data types
document.CustomDocumentProperties.Add("PropertyA", "Value of A");
document.CustomDocumentProperties.Add("PropertyB", 12.5);
document.CustomDocumentProperties.Add("PropertyC", true);
document.CustomDocumentProperties.Add("PropertyD", new DateTime(2015, 7, 20));
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWordDoc.docx", "application/msword", stream);
//Closes the document
}

```

```
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
}
```

Accessing & Modifying Custom Document Properties

You can access and modify an existing document property as shown in the following code example.

C#

```
WordDocument document = new WordDocument(inputFileName);
//Accesses an existing custom document property
DocumentProperty property = document.CustomDocumentProperties["PropertyA"];
//Modifies the value of DocumentProperty instance
property.Value = "Hello world";
document.Save(outputFileName, FormatType.Docx);
document.Close();
```

VB.NET

```
Dim document As New WordDocument(inputFileName)
'Accesses an existing custom document property
Dim [property] As DocumentProperty =
document.CustomDocumentProperties("PropertyA")
'Modifies the value of DocumentProperty instance
[property].Value = "Hello world"
document.Save(outputFileName, FormatType.Docx)
document.Close()
```

UWP

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
//Accesses an existing custom document property
DocumentProperty property = document.CustomDocumentProperties["PropertyA"];
//Modifies the value of DocumentProperty instance
property.Value = "Hello world";
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
document.Close();
}
```

ASP.NET CORE

```

FileStream sourceStreamPath = new FileStream(sourceFileName, FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
//Opens an source document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(sourceStreamPath,
FormatType.Automatic))
{
    //Accesses an existing custom document property
    DocumentProperty property = document.CustomDocumentProperties["PropertyA"];
    //Modifies the value of DocumentProperty instance
    property.Value = "Hello world";
    MemoryStream stream = new MemoryStream();
    //Saves and closes the destination document to MemoryStream
    document.Save(stream, FormatType.Docx);
    document.Close();
    stream.Position = 0;
    //Download Word document in the browser
    return File(stream, "application/msword", "Result.docx");
}

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("XamarinFormsApp1.Assets.Hello World.docx"), FormatType.Docx))
{
    //Accesses an existing custom document property
    DocumentProperty property = document.CustomDocumentProperties["PropertyA"];
    //Modifies the value of DocumentProperty instance
    property.Value = "Hello world";
    MemoryStream stream = new MemoryStream();
    document.Save(stream, FormatType.Docx);
    //Save the stream as a file in the device and invoke it for viewing
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWordDoc.docx", "application/msword", stream);
    //Closes the document
    document.Close();
    //Please download the helper files from the below link to save the stream as file and open the file for viewing in Xamarin platform

}

```

Setting the Background for a Word document

Essential DocIO allows to apply background such as color, gradient and picture to the Word document. A background of a Word document is represented by **Background** property of 'WordDocument' class.

The following code illustrates how to apply gradient as background to the document.

C#

```

//Creates a new Word document

```

```

WordDocument document = new WordDocument();
//Adds new section to the document
WSection section = document.AddSection() as WSection;
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph() as WParagraph;
//Appends text to the paragraph
paragraph.AppendText("Sample for applying document background");
//Sets the background type as gradient
document.Background.Type = BackgroundType.Gradient;
//Sets color for gradient
document.Background.Gradient.Color1 = Color.LightGray;
document.Background.Gradient.Color2 = Color.LightGreen;
//Sets the shading style
document.Background.Gradient.ShadingStyle = GradientShadingStyle.DiagonalUp;
document.Background.Gradient.ShadingVariant =
GradientShadingVariant.ShadingDown;
//Saves the document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As WSection = TryCast(document.AddSection(), WSection)
'Adds new paragraph to the section
Dim paragraph As IWParagraph = TryCast(section.AddParagraph(), WParagraph)
'Appends text to the paragraph
paragraph.AppendText("Sample for applying document background")
'Sets the background type as gradient
document.Background.Type = BackgroundType.Gradient
'Sets color for gradient
document.Background.Gradient.Color1 = Color.LightGray
document.Background.Gradient.Color2 = Color.LightGreen
'Sets the shading style
document.Background.Gradient.ShadingStyle = GradientShadingStyle.DiagonalUp
document.Background.Gradient.ShadingVariant =
GradientShadingVariant.ShadingDown
'Saves the document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("CreateWordSample.Assets.Tes
t.docx"), FormatType.Docx))
{
document.Background.Type = BackgroundType.Picture;
//Sets color for gradient
document.Background.Gradient.Color1 = Syncfusion.DocIO.DLS.Color.LightGray;

```

```

document.Background.Gradient.Color2 = Syncfusion.DocIO.DLS.Color.LightGreen;
//Sets the shading style
document.Background.Gradient.ShadingStyle = GradientShadingStyle.DiagonalUp;
document.Background.Gradient.ShadingVariant =
GradientShadingVariant.ShadingDown;
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-

}

```

Working with Sections

A section contains the contents present in Headers, Footers and main document through the instances of **WTextBody**. A section also has a specific set of properties used to define the page settings, number of columns, headers and footers and so on that decide how the text appears. **WTextBody** represents group of paragraphs and tables etc.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company.");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to created section
Dim paragraph As IWParagraph = section.AddParagraph()
'Appends the text to the created paragraph

```

```
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new instance of WordDocument (Empty Word Document)
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Creates a new instance of WordDocument (Empty Word Document)
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
```

```
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

You can add the multiple sections into the document. When you add more than one section into the word document, the section starts from the next page by default.

You can also add a new section that starts on a same page by specifying the **BreakCode** as shown in following code example.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Adds the new section to the document
section = document.AddSection();
//Sets a section break
section.BreakCode = SectionBreakCode.NoBreak;
//Adds a paragraph to created section
paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds the section into Word document
Dim section As IWSection = document.AddSection()
'Adds a paragraph to created section
```

```

Dim paragraph As IParagraph = section.AddParagraph()
Dim paraText As String = "AdventureWorks Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company."
'Appends the text to the created paragraph
paragraph.AppendText(paraText)
'Adds the new section to the document
section = document.AddSection()
'Sets a section break
section.BreakCode = SectionBreakCode.NoBreak
'Adds a paragraph to created section
paragraph = section.AddParagraph()
'Appends the text to the created paragraph
paragraph.AppendText(paraText)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds a paragraph to created section
IParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Adds the new section to the document
section = document.AddSection();
//Sets a section break
section.BreakCode = SectionBreakCode.NoBreak;
//Adds a paragraph to created section
paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");

paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Specifying Page Properties

Each section has its own page setup properties such as page size, orientation, margins, borders, etc.

The following code example shows how to set the page setup properties

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
//Sets page setup options
section.PageSetup.Orientation = PageOrientation.Landscape;
section.PageSetup.Margins.All = 72;
section.PageSetup.Borders.LineWidth = 2;
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
Dim section As IWSection = document.AddSection()
'Sets page setup options
section.PageSetup.Orientation = PageOrientation.Landscape
section.PageSetup.Margins.All = 72
section.PageSetup.Borders.LineWidth = 2
'Adds a paragraph to created section
Dim paragraph As IWParagraph = section.AddParagraph()
'Appends the text to the created paragraph.
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
//Sets page setup options
section.PageSetup.Orientation = PageOrientation.Landscape;
section.PageSetup.Margins.All = 72;
section.PageSetup.Borders.LineWidth = 2;
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
```

```

paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
//Sets page setup options
section.PageSetup.Orientation = PageOrientation.Landscape;
section.PageSetup.Margins.All = 72;
section.PageSetup.Borders.LineWidth = 2;
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
//Sets page setup options
section.PageSetup.Orientation = PageOrientation.Landscape;
section.PageSetup.Margins.All = 72;
section.PageSetup.Borders.LineWidth = 2;
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream

```

```
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Creating Multi-column document

You can split the contents into two or more columns by specifying the column width and spacing between columns.

The following code example shows how to display contents in multiple columns.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds the section into Word document
IWSection section = document.AddSection();
//Adds the column into the section
section.AddColumn(150, 20);
//Adds the column into the section
section.AddColumn(150, 20);
//Adds the column into the section
section.AddColumn(150, 20);
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
//Adds a paragraph to created section
paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Adds the column break
paragraph.AppendBreak(BreakType.ColumnBreak);
//Adds a paragraph to created section
paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Adds the column break
paragraph.AppendBreak(BreakType.ColumnBreak);
//Adds a paragraph to created section
paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
```

```

Dim document As New WordDocument()
'Adds the section into Word document
Dim section As IWSection = document.AddSection()
'Adds the column into the section
section.AddColumn(150, 20)
'Adds the column into the section
section.AddColumn(150, 20)
'Adds the column into the section
section.AddColumn(150, 20)
'Adds a paragraph to created section
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds a paragraph to created section
paragraph = section.AddParagraph()
Dim paraText As String = "AdventureWorks Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company."
'Appends the text to the created paragraph
paragraph.AppendText(paraText)
'Adds the column break
paragraph.AppendBreak(BreakType.ColumnBreak)
'Adds a paragraph to created section
paragraph = section.AddParagraph()
'Appends the text to the created paragraph
paragraph.AppendText(paraText)
'Adds the column break
paragraph.AppendBreak(BreakType.ColumnBreak)
'Adds a paragraph to created section
paragraph = section.AddParagraph()
'Appends the text to the created paragraph
paragraph.AppendText(paraText)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds the section into Word document
IWSection section = document.AddSection();
//Adds the column into the section
section.AddColumn(150, 20);
//Adds the column into the section
section.AddColumn(150, 20);
//Adds the column into the section
section.AddColumn(150, 20);
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
//Adds a paragraph to created section
paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Adds the column break

```

```

paragraph.AppendBreak(BreakType.ColumnBreak);
//Adds a paragraph to created section
paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Adds the column break
paragraph.AppendBreak(BreakType.ColumnBreak);
//Adds a paragraph to created section
paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds the section into Word document
IWSection section = document.AddSection();
//Adds the column into the section
section.AddColumn(150, 20);
//Adds the column into the section
section.AddColumn(150, 20);
//Adds the column into the section
section.AddColumn(150, 20);

```

Creating document with different page settings

You can prefer to have more sections in a Word document when you need to have different page settings or headers and footers for a specific set of contents. The following code example illustrates how to create a Word document with multiple sections whose page orientation are portrait and landscape respectively.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds the section into Word document
IWSection section = document.AddSection();
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Sets the page orientation as portrait
section.PageSetup.Orientation = PageOrientation.Portrait;
//Adds the new section to the document
section = document.AddSection();
//Sets the section break
section.BreakCode = SectionBreakCode.NewPage;
paragraph = section.AddParagraph();
//Sets the page orientation as land scape
section.PageSetup.Orientation = PageOrientation.Landscape;
//Appends the text to the paragraph
paragraph.AppendText(paraText);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds the section into Word document
Dim section As IWSection = document.AddSection()
'Adds a paragraph to created section
Dim paragraph As IWParagraph = section.AddParagraph()
Dim paraText As String = "AdventureWorks Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company."
'Appends the text to the created paragraph
paragraph.AppendText(paraText)
'Sets the page orientation as portrait
section.PageSetup.Orientation = PageOrientation.Portrait
'Adds the new section to the document
section = document.AddSection()
'Sets the section break
section.BreakCode = SectionBreakCode.NewPage
paragraph = section.AddParagraph()
'Sets the page orientation as landscape
section.PageSetup.Orientation = PageOrientation.Landscape
```

```
'Appends the text to the paragraph
paragraph.AppendText(paraText)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds the section into Word document
IWSection section = document.AddSection();
//Adds a paragraph to created section
IWParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends the text to the created paragraph
paragraph.AppendText(paraText);
//Sets the page orientation as portrait
section.PageSetup.Orientation = PageOrientation.Portrait;
//Adds the new section to the document
section = document.AddSection();
//Sets the section break
section.BreakCode = SectionBreakCode.NewPage;
paragraph = section.AddParagraph();
//Sets the page orientation as land scape
section.PageSetup.Orientation = PageOrientation.Landscape;
//Appends the text to the paragraph
paragraph.AppendText(paraText);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Please refer the below link to save Word document in UWP platform

xamarin#helper-files-for-xamarin
```

Working with Headers and Footers

Header and footer also represent the group of paragraphs and tables that occur at the top and bottom of the page respectively. Header and footer may vary for each section. The following are the types of Headers/Footers:

- FirstPageHeader – Represents the first page header of the document.
- FirstPageFooter – Represents the first page footer of the document.
- OddHeader – Represents the odd page header of the document and it is the default header for the section.
- OddFooter – Represents the odd page footer of the document and it is the default footer for the section.
- EvenHeader – Represents the even page header of the document.
- Even Footer - Represents the even page footer of the document.

The following code example illustrates how to add simple header and footer into a Word document.

C#

```
//Creates a new document
WordDocument document = new WordDocument();
//Adds the first section to the document
IWSection section = document.AddSection();
//Adds a paragraph to the section
IWParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends some text to the first page in document
paragraph.AppendText("\r\r[ First Page ] \r\r" + paraText);
paragraph.ParagraphFormat.PageBreakAfter = true;
//Appends some text to the second page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Second Page ] \r\r" + paraText);
paragraph.ParagraphFormat.PageBreakAfter = true;
//Appends some text to the third page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Third Page ] \r\r" + paraText);
//Inserts the default page header
paragraph = section.HeadersFooters.OddHeader.AddParagraph();
paragraph.AppendText("[ Default Page Header ]");
//Inserts the default page footer
paragraph = section.HeadersFooters.OddFooter.AddParagraph();
paragraph.AppendText("[ Default Page Footer ]");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new document
Dim document As New WordDocument()
'Adds the first section to the document
Dim section As IWSection = document.AddSection()
'Adds a paragraph to the section
```

```

Dim paragraph As IParagraph = section.AddParagraph()
Dim paraText As String = "AdventureWorks Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company."
'Appends some text to the first page in document
paragraph.AppendText(Convert.ToString(vbCr & vbCr & "[ First Page ] " & vbCr
& vbCr) & paraText)
paragraph.ParagraphFormat.PageBreakAfter = True
'Appends some text to the second page in document
paragraph = section.AddParagraph()
paragraph.AppendText(Convert.ToString(vbCr & vbCr & "[ Second Page ] " &
vbCr & vbCr) & paraText)
paragraph.ParagraphFormat.PageBreakAfter = True
'Appends some text to the third page in document
paragraph = section.AddParagraph()
paragraph.AppendText(Convert.ToString(vbCr & vbCr & "[ Third Page ] " & vbCr
& vbCr) & paraText)
'Inserts the default page header
paragraph = section.HeadersFooters.OddHeader.AddParagraph()
paragraph.AppendText("[ Default Page Header ]")
'Inserts the default Page footer
paragraph = section.HeadersFooters.OddFooter.AddParagraph()
paragraph.AppendText("[ Default Page Footer ]")
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new document
WordDocument document = new WordDocument();
//Adds the first section to the document
IWSection section = document.AddSection();
//Adds a paragraph to the section
IParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational

```

You can have a specific header and footer contents for the first page in a Word document. The following code illustrates the same.

C#

```

//Creates a new document
WordDocument document = new WordDocument();
//Adds the first section to the document
IWSection section = document.AddSection();
//Sets DifferentFirstPage as true for inserting header and footer text
section.PageSetup.DifferentFirstPage = true;
//Adds a paragraph to the section
IWParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends some text to the first page in document
paragraph.AppendText("\r\r[ First Page ] \r\r" + paraText);
paragraph.ParagraphFormat.PageBreakAfter = true;
//Appends some text to the second page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Second Page ] \r\r" + paraText);
paragraph.ParagraphFormat.PageBreakAfter = true;
//Appends some text to the third page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Third Page ] \r\r" + paraText);
//Inserts the first page header

```

```

paragraph = section.HeadersFooters.FirstPageHeader.AddParagraph();
paragraph.AppendText("[First Page Header ]");
//Inserts the first page footer
paragraph = section.HeadersFooters.FirstPageFooter.AddParagraph();
paragraph.AppendText("[ First Page Footer ]");
//Inserts the default page header
paragraph = section.HeadersFooters.OddHeader.AddParagraph();
paragraph.AppendText("[ Default Page Header ]");
//Inserts the default page footer
paragraph = section.HeadersFooters.OddFooter.AddParagraph();
paragraph.AppendText("[ Default Page Footer ]");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new document
Dim document As New WordDocument()

```

A Word document can have different header and footer for odd and even pages.

The following code example shows how to set different header and footer for the odd and even pages of the document.

C#

```

//Creates a new document
WordDocument document = new WordDocument();
//Adds the first section to the document
IWSection section = document.AddSection();
//Sets DifferentOddAndEvenPages as true for inserting header and footer text
section.PageSetup.DifferentOddAndEvenPages = true;
//Adds a paragraph to the section
IWParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends some text to the first page in document
paragraph.AppendText("\r\r[ First Page ] \r\r" + paraText);
paragraph.ParagraphFormat.PageBreakAfter = true;
//Appends some text to the second page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Second Page ] \r\r" + paraText);
paragraph.ParagraphFormat.PageBreakAfter = true;
//Appends some text to the third page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Third Page ] \r\r" + paraText);
//Inserts the odd page header

```

```

paragraph = section.HeadersFooters.OddHeader.AddParagraph();
paragraph.AppendText("[ Odd Page Header ]");
//Inserts the default page footer
paragraph = section.HeadersFooters.OddFooter.AddParagraph();
paragraph.AppendText("[ Odd Page Footer ]");
//Inserts the even page header
paragraph = section.HeadersFooters.EvenHeader.AddParagraph();
paragraph.AppendText("[Even Page Header ]");
//Inserts the even page footer
paragraph = section.HeadersFooters.EvenFooter.AddParagraph();
paragraph.AppendText("[ Even Page Footer ]");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new document
Dim document As New WordDocument()
'Adds the first section to the document
Dim section As IWSection = document.AddSection()
'Sets DifferentOddAndEvenPages as true for inserting header and footer text
section.PageSetup.DifferentOddAndEvenPages = True
'Adds a paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()

```

You can use the previous section header and footer for the current section by using `LinkToPrevious` property.

The following code example shows how to link the previous section header and footer for the current section.

C#

```

//Creates a new document
WordDocument document = new WordDocument();
//Adds the first section to the document
IWSection section = document.AddSection();
//Inserts the first section header
section.HeadersFooters.Header.AddParagraph().AppendText("[ First Section
Header ]");
//Inserts the first section footer
section.HeadersFooters.Footer.AddParagraph().AppendText("[ First Section
Footer ]");
//Adds a paragraph to the section
IWParagraph paragraph = section.AddParagraph();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Appends some text to the first page in document
paragraph.AppendText("\r\r[ First Page ] \r\r" + paraText);
//Adds the second section to the document
section = document.AddSection();
//Inserts the second section header

```

```

section.HeadersFooters.Header.AddParagraph().AppendText("[ Second Section
Header ]");
//Inserts the second section footer.
section.HeadersFooters.Footer.AddParagraph().AppendText("[ Second Section
Footer ]");
//Sets LinkToPrevious as true for retrieve the header and footer from
previous section
section.HeadersFooters.LinkToPrevious = true;
//Appends some text to the second page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Second Page ] \r\r" + paraText);
//Adds the third section to the document
section = document.AddSection();
//Inserts the third section header
section.HeadersFooters.Header.AddParagraph().AppendText("[ Third Section
Header ]");
//Inserts the third section footer
section.HeadersFooters.Footer.AddParagraph().AppendText("[ Third Section
Footer ]");
//Appends some text to the third page in document
paragraph = section.AddParagraph();
paragraph.AppendText("\r\r[ Third Page ] \r\r" + paraText);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new document

Adding Page Numbers

You can insert the current page number within the document contents. The following code example illustrates how to insert current page number within footer.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds the section into Word document
IWSection section = document.AddSection();
section.PageSetup.PageStartingNumber = 1;
section.PageSetup.RestartPageNumbering = true;
section.PageSetup.PageNumberStyle = PageNumberStyle.Arabic;
//Adds a footer paragraph text to the document
IWParagraph paragraph = section.HeadersFooters.Footer.AddParagraph();
paragraph.ParagraphFormat.Tabs.AddTab(523f, TabJustification.Right,
TabLeader.NoLeader);
//Adds text for the footer paragraph
paragraph.AppendText("Copyright Northwind Inc. 2001 - 2015");
//Adds page number field to the document
paragraph.AppendText("\tPage ");
paragraph.AppendField("Page", FieldType.FieldPage);
//Adds the paragraph
paragraph = section.AddParagraph();
//Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds the section into Word document

```

```

Dim section As IWSection = document.AddSection()
section.PageSetup.PageStartingNumber = 1
section.PageSetup.RestartPageNumbering = True
section.PageSetup.PageNumberStyle = PageNumberStyle.Arabic
'Adds a footer paragraph text to the document
Dim paragraph As IWParagraph = section.HeadersFooters.Footer.AddParagraph()
paragraph.ParagraphFormat.Tabs.AddTab(523.0F, TabJustification.Right,
TabLeader.NoLeader)
'Adds text for the footer paragraph
paragraph.AppendText("Copyright Northwind Inc. 2001 - 2015")
'Adds page number field to the document
paragraph.AppendText(vbTab & "Page ")
paragraph.AppendField("Page", FieldType.FieldPage)
'Adds the paragraph
paragraph = section.AddParagraph()
'Appends the text to the created paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document

Removing a Section

The following code example illustrates how to remove a particular section from the Word document

C#

```
//Opens an input Word template
WordDocument document = new WordDocument(inputFileName);
//Removes the second section from the collection
document.Sections.RemoveAt(1);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an input Word template
Dim document As New WordDocument(inputFileName)
'Removes the second section from the collection
document.Sections.RemoveAt(1)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
/"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputFileStream = assembly.GetManifestResourceStream(inputFileName);
//Opens an input Word template
WordDocument document = new WordDocument(inputFileStream);
//Removes the second section from the collection
document.Sections.RemoveAt(1);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
```

```

```

Working with Paragraph

Paragraph is the basic element in a Word document that contains a textual and graphical contents. Each paragraph has its own formatting such as line spacing, alignment, indentation, and more. Within a paragraph, the contents are represented by one or more child elements such as **WTextRange**, **WPicture**, and **Hyperlink** and more. The **ParagraphItem** is the base class for the child elements of paragraph. The following elements can be the child elements of a paragraph:

- Text: Represented by an instance of **WTextRange**.

- Image: Represented by an instance of `WPicture`.
- Comments: Represented by an instance of `WComment`.
- Hyperlink: Represented by an instance of `Hyperlink`.
- Symbols: Represented by an instance of `WSymbol`.
- Breaks: Represented by an instance of `Break`.
- OLE Object: Represented by an instance of `WOleObject`.
- Shapes: Represented by an instance of `Shape`.
- TextBox: Represented by an instance of `WTextBox`.
- Chart: Represented by an instance of `WChart`.
- Fields: Represented by an instance of `WField`.
- Form Fields: Represented by an instance of `WFormField`.
- Bookmarks: Represented by instances of `BookmarkStart` and `BookmarkEnd`.
- Absolute Tab: Represented by an instance of `WAbsoluteTab`.
- Footnotes and Endnotes: Represented by an instance of `WFootnote`.

The following code example explains how to add a new paragraph.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
paragraph.AppendText("Adding new paragraph to the document");
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds new text to the paragraph
paragraph.AppendText("Adding new paragraph to the document")
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
```

```

IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
paragraph.AppendText("Adding new paragraph to the document");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
paragraph.AppendText("Adding new paragraph to the document");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
paragraph.AppendText("Adding new paragraph to the document");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as

```

[//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin](https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin)

The following code example illustrates how to modify an existing paragraph.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the text body of first section
WTextBody textBody = document.Sections[0].Body;
//Gets the paragraph at index 1
WParagraph paragraph = textBody.Paragraphs[1];
//Iterates through the child elements of paragraph
foreach (ParagraphItem item in paragraph.ChildEntities)
{
    if (item is WTextRange)
    {
        WTextRange text = item as WTextRange;
        //Modifies the character format of the text
        text.CharacterFormat.Bold = true;
        break;
    }
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As New WordDocument("Template.docx")
'Gets the text body of first section
Dim textBody As WTextBody = document.Sections(0).Body
'Gets the paragraph at index 1
Dim paragraph As WParagraph = textBody.Paragraphs(1)
'Iterates through the child elements of paragraph
For Each item As ParagraphItem In paragraph.ChildEntities
    If TypeOf item Is WTextRange Then
        Dim text As WTextRange = TryCast(item, WTextRange)
        'Modifies the character format of the text
        text.CharacterFormat.Bold = True
    Exit For
    End If
Next
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
```

```

Stream fileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Template.docx");
//Loads the template document
WordDocument document = new WordDocument(fileStream);
//Gets the text body of first section
WTextBody textBody = document.Sections[0].Body;
//Gets the paragraph at index 1
WParagraph paragraph = textBody.Paragraphs[1];
//Iterates through the child elements of paragraph
foreach (ParagraphItem item in paragraph.ChildEntities)
{
    if (item is WTextRange)
    {
        WTextRange text = item as WTextRange;
        //Modifies the character format of the text
        text.CharacterFormat.Bold = true;
        break;
    }
}
//Saves and closes the Word document instance

```

Applying paragraph formatting

As in the Microsoft Word, DocIO provides support for all the paragraph formatting options such as line spacing, indentation, spacing before and after, keep follow, and more. The following code example explains how to apply formatting to a paragraph.

Note: The `FirstLineIndent` can be used to update or retrieve both hanging and first line indents. Negative value for this property denotes the hanging indent and positive value denotes the first line indent of the paragraph.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
```

```

IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = paragraph.AppendText("Paragraphs are the basic
elements of the Word document. It can contain text and images.");
//Applies paragraph formatting
paragraph.ParagraphFormat.AfterSpacing = 18f;
paragraph.ParagraphFormat.BeforeSpacing = 18f;
paragraph.ParagraphFormat.BackColor = Color.LightGray;
paragraph.ParagraphFormat.FirstLineIndent = 10f;
paragraph.ParagraphFormat.LineSpacing = 10f;
paragraph.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds new text to the paragraph
Dim firstText As IWTextRange = paragraph.AppendText("Paragraphs are the
basic elements of the Word document. It can contain text and images.")
'Applies paragraph formatting
paragraph.ParagraphFormat.AfterSpacing = 18.0F
paragraph.ParagraphFormat.BeforeSpacing = 18.0F
paragraph.ParagraphFormat.BackColor = Color.LightGray
paragraph.ParagraphFormat.FirstLineIndent = 10.0F
paragraph.ParagraphFormat.LineSpacing = 10.0F
paragraph.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = paragraph.AppendText("Paragraphs are the basic
elements of the Word document. It can contain text and images.");
//Applies paragraph formatting
paragraph.ParagraphFormat.AfterSpacing = 18f;
paragraph.ParagraphFormat.BeforeSpacing = 18f;
paragraph.ParagraphFormat.BackColor = Color.LightGray;
paragraph.ParagraphFormat.FirstLineIndent = 10f;
paragraph.ParagraphFormat.LineSpacing = 10f;

```

```

paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Right;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = paragraph.AppendText("Paragraphs are the basic
elements of the Word document. It can contain text and images.");
//Applies paragraph formatting
paragraph.ParagraphFormat.AfterSpacing = 18f;
paragraph.ParagraphFormat.BeforeSpacing = 18f;
paragraph.ParagraphFormat.BackColor = Color.LightGray;
paragraph.ParagraphFormat.FirstLineIndent = 10f;
paragraph.ParagraphFormat.LineSpacing = 10f;
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Right;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = paragraph.AppendText("Paragraphs are the basic
elements of the Word document. It can contain text and images.");
//Applies paragraph formatting
paragraph.ParagraphFormat.AfterSpacing = 18f;
paragraph.ParagraphFormat.BeforeSpacing = 18f;
paragraph.ParagraphFormat.BackColor = Syncfusion.Drawing.Color.LightGray;

```

```

paragraph.ParagraphFormat.FirstLineIndent = 10f;
paragraph.ParagraphFormat.LineSpacing = 10f;
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Right;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Paragraph style

Paragraph style contains definition for both font (text) and paragraph formatting that can be applied to the contents of an entire paragraph. DocIO supports various pre-defined styles and also provides ability to create custom paragraph styles.

Tips: You can define a custom style or modify any built-in style to the required formatting, and apply this style to the part of Word document to be formatted. You can reduce the file size and code length by using styles instead of formatting each element explicitly.

The following code example explains how to use the predefined styles.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = firstParagraph.AppendText("Built-in styles can be
applied to the paragraph. Heading1 style is applied to this paragraph.");
//Applies built-in style for the paragraph
firstParagraph.ApplyStyle(BuiltinStyle.Heading1);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim firstParagraph As IWParagraph = section.AddParagraph()
'Adds new text to the paragraph

```

```

Dim firstText As ITextRange = firstParagraph.AppendText("Built-in styles
can be applied to the paragraph. Heading1 style is applied to this
paragraph.")
'Applies built-in style for the paragraph
firstParagraph.ApplyStyle(BuiltinStyle.Heading1)
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
ITextRange firstText = firstParagraph.AppendText("Built-in styles can be
applied to the paragraph. Heading1 style is applied to this paragraph.");
//Applies built-in style for the paragraph
firstParagraph.ApplyStyle(BuiltinStyle.Heading1);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
ITextRange firstText = firstParagraph.AppendText("Built-in styles can be
applied to the paragraph. Heading1 style is applied to this paragraph.");
//Applies built-in style for the paragraph
firstParagraph.ApplyStyle(BuiltinStyle.Heading1);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```
//Creates a new Word document

```

Custom paragraph style

The following code example explains how to create a custom paragraph style and apply it to a paragraph.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Creates user defined style
IWParagraphStyle style = document.AddParagraphStyle("User_defined_style");
style.ParagraphFormat.BackColor = Color.LightGray;
style.ParagraphFormat.AfterSpacing = 18f;
style.ParagraphFormat.BeforeSpacing = 18f;
style.ParagraphFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.DotDash;
style.ParagraphFormat.Borders.LineWidth = 0.5f;
style.ParagraphFormat.LineSpacing = 15f;
style.CharacterFormat.FontName = "Calibri";
style.CharacterFormat.Italic = true;
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
IWTextRange text = paragraph.AppendText("A new paragraph style is created
and is applied to this paragraph.");
//Applies the new style to paragraph
paragraph.ApplyStyle("User_defined_style");
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
```

```
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Creates user defined style
Dim style As IWParagraphStyle =
document.AddParagraphStyle("User_defined_style")
style.ParagraphFormat.BackColor = Color.LightGray
style.ParagraphFormat.AfterSpacing = 18.0F
style.ParagraphFormat.BeforeSpacing = 18.0F
style.ParagraphFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.DotDash
style.ParagraphFormat.Borders.LineWidth = 0.5F
style.ParagraphFormat.LineSpacing = 15.0F
style.CharacterFormat.FontName = "Calibri"
style.CharacterFormat.Italic = True
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
Dim text As IWTextRange = paragraph.AppendText("A new paragraph style is
created and is applied to this paragraph.")
'Applies the new style to paragraph
paragraph.ApplyStyle("User_defined_style")
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Creates user defined style
IWParagraphStyle style = document.AddParagraphStyle("User_defined_style");
style.ParagraphFormat.BackColor = Color.LightGray;
style.ParagraphFormat.AfterSpacing = 18f;
style.ParagraphFormat.BeforeSpacing = 18f;
style.ParagraphFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.DotDash;
style.ParagraphFormat.Borders.LineWidth = 0.5f;
style.ParagraphFormat.LineSpacing = 15f;
style.CharacterFormat.FontName = "Calibri";
style.CharacterFormat.Italic = true;
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
IWTextRange text = paragraph.AppendText("A new paragraph style is created
and is applied to this paragraph.");
//Applies the new style to paragraph
paragraph.ApplyStyle("User_defined_style");
//Saves and closes the Word document instance
```

```

MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Creates user defined style
IWParagraphStyle style = document.AddParagraphStyle("User_defined_style");
style.ParagraphFormat.BackColor = Color.LightGray;

style.ParagraphFormat.BeforeSpacing = 18f;
style.ParagraphFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.DotDash;
style.ParagraphFormat.Borders.LineWidth = 0.5f;
style.ParagraphFormat.LineSpacing = 15f;
style.CharacterFormat.FontName = "Calibri";
style.CharacterFormat.Italic = true;
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
IWTextRange text = paragraph.AppendText("A new paragraph style is created
and is applied to this paragraph.");
//Applies the new style to paragraph
paragraph.ApplyStyle("User_defined_style");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Creates user defined style
IWParagraphStyle style = document.AddParagraphStyle("User_defined_style");
style.ParagraphFormat.BackColor = Syncfusion.Drawing.Color.LightGray;
style.ParagraphFormat.AfterSpacing = 18f;
style.ParagraphFormat.BeforeSpacing = 18f;
style.ParagraphFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.DotDash;
style.ParagraphFormat.Borders.LineWidth = 0.5f;

```

```

style.ParagraphFormat.LineSpacing = 15f;
style.CharacterFormat.FontName = "Calibri";
style.CharacterFormat.Italic = true;
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
IWTextRange text = paragraph.AppendText("A new paragraph style is created
and is applied to this paragraph.");
//Applies the new style to paragraph
paragraph.ApplyStyle("User_defined_style");
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Tab stop

A tab stop is a horizontal position that is set for aligning text of the paragraph. A tab character causes the carriage to go to the next tab stop.

Each paragraph has its own tab stop collection where the new tab stop can be added and existing tab stop can be removed.

The following code example explains how to add tab stops to the paragraph.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds tab stop at position 11
Tab firstTab = paragraph.ParagraphFormat.Tabs.AddTab(11,
TabJustification.Left, TabLeader.Dotted);
//Adds tab stop at position 62
paragraph.ParagraphFormat.Tabs.AddTab(62, TabJustification.Left,
TabLeader.Single);
paragraph.AppendText("This sample\t illustrates the use of tabs in the
paragraph. Tabs\t can be inserted or removed from the paragraph.");
//Removes tab stop from the collection
paragraph.ParagraphFormat.Tabs.RemoveByTabPosition(11);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds tab stop at position 11
Dim firstTab As Tab = paragraph.ParagraphFormat.Tabs.AddTab(11,
TabJustification.Left, TabLeader.Dotted)
'Adds tab stop at position 62
paragraph.ParagraphFormat.Tabs.AddTab(62, TabJustification.Left,
TabLeader.[Single])
paragraph.AppendText("This sample" & vbTab & " illustrates the use of tabs
in the paragraph. Tabs" & vbTab & " can be inserted or removed from the
paragraph.")
'Removes tab stop from the collection
paragraph.ParagraphFormat.Tabs.RemoveByTabPosition(11)
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds tab stop at position 11
Tab firstTab = paragraph.ParagraphFormat.Tabs.AddTab(11,
TabJustification.Left, TabLeader.Dotted);
//Adds tab stop at position 62
paragraph.ParagraphFormat.Tabs.AddTab(62, TabJustification.Left,
TabLeader.Single);
paragraph.AppendText("This sample\t illustrates the use of tabs in the
paragraph. Tabs\t can be inserted or removed from the paragraph.");
//Removes tab stop from the collection
paragraph.ParagraphFormat.Tabs.RemoveByTabPosition(11);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document

```

```

IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds tab stop at position 11
Tab firstTab = paragraph.ParagraphFormat.Tabs.AddTab(11,

//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

RTL paragraph

You can set RTL (Right-to-left) direction to the paragraph in a Word document. The following code example shows how to set RTL (Right-to-left) for a paragraph in Word document.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the text body of first section
WTextBody textBody = document.Sections[0].Body;
//Gets the paragraph at index 1
WParagraph paragraph = textBody.Paragraphs[1];
//Gets a value indicating whether the paragraph is right-to-left. True
indicates the paragraph direction is RTL
bool isRTL = paragraph.ParagraphFormat.Bidi;
//Sets RTL direction for a paragraph
if(!isRTL)
paragraph.ParagraphFormat.Bidi = true;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As WordDocument = New WordDocument("Template.docx")
'Gets the text body of first section
Dim textBody As WTextBody = document.Sections(0).Body
'Gets the paragraph at index 1
Dim paragraph As WParagraph = textBody.Paragraphs(1)
'Gets a value indicating whether the paragraph is right-to-left. True
indicates the paragraph direction is RTL
Dim isRTL As Boolean = paragraph.ParagraphFormat.Bidi
'Sets RTL direction for a paragraph
If Not isRTL Then
paragraph.ParagraphFormat.Bidi = True
End If
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
///"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Loads the template document
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx
"), FormatType.Docx);
//Gets the text body of first section
WTextBody textBody = document.Sections[0].Body;
//Gets the paragraph at index 1
WParagraph paragraph = textBody.Paragraphs[1];
```

```

//Gets a value indicating whether the paragraph is right-to-left. True indicates the paragraph direction is RTL
bool isRTL = paragraph.ParagraphFormat.Bidi;
//Sets RTL direction for a paragraph
if(!isRTL)
    paragraph.ParagraphFormat.Bidi = true;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Loads or opens an existing Word document through Open method of
WordDocument class
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Gets the text body of first section
WTextBody textBody = document.Sections[0].Body;
//Gets the paragraph at index 1
WParagraph paragraph = textBody.Paragraphs[1];
//Gets a value indicating whether the paragraph is right-to-left. True indicates the paragraph direction is RTL
bool isRTL = paragraph.ParagraphFormat.Bidi;
//Sets RTL direction for a paragraph
if(!isRTL)
    paragraph.ParagraphFormat.Bidi = true;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");

```

XAMARIN

```

//"App" is the class of Portable project

//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Working with text

Text within a paragraph is represented by one or more instances of the `WTextRange`. Each `WTextRange` instance can have its own font (text) formatting.

The following code example explains how to append text to the paragraph.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = firstParagraph.AppendText("A new text is added to
the paragraph.");
firstText.CharacterFormat.FontSize = 14;
firstText.CharacterFormat.Bold = true;
firstText.CharacterFormat.TextColor = Color.Green;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim firstParagraph As IWParagraph = section.AddParagraph()
'Adds new text to the paragraph
Dim text As IWTextRange = firstParagraph.AppendText("A new text is added to
the paragraph.")
```

```

text.CharacterFormat.FontSize = 14
text.CharacterFormat.Bold = True
text.CharacterFormat.TextColor = Color.Green
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = firstParagraph.AppendText("A new text is added to
the paragraph.");
firstText.CharacterFormat.FontSize = 14;
firstText.CharacterFormat.Bold = true;
firstText.CharacterFormat.TextColor = Color.Green;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = firstParagraph.AppendText("A new text is added to
the paragraph.");
firstText.CharacterFormat.FontSize = 14;
firstText.CharacterFormat.Bold = true;
firstText.CharacterFormat.TextColor = Color.Green;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = firstParagraph.AppendText("A new text is added to
the paragraph.");
firstText.CharacterFormat.FontSize = 14;
firstText.CharacterFormat.Bold = true;
firstText.CharacterFormat.TextColor = Syncfusion.Drawing.Color.Green;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Text in the paragraph can be modified or replaced with a new text. This can be achieved by iterating through the paragraph items.

The following code example explains how to replace the text of a text range.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the last paragraph

```

Text formatting enhances the appearance of text in the document. Text formatting includes font size, font color, font name, bold, italic, underline, etc.

The following code example explains how to apply formatting to the text.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph
IWTextRange firstText = firstParagraph.AppendText("This is the first text
range. ");
//Applies formatting for first text range
firstText.CharacterFormat.Bold = true;
firstText.CharacterFormat.FontSize = 14;
firstText.CharacterFormat.Shadow = true;
firstText.CharacterFormat.SmallCaps = true;
IWTextRange secondText = firstParagraph.AppendText("This the second text
range");
//Applies formatting for second text range
secondText.CharacterFormat.HighlightColor = Color.GreenYellow;
secondText.CharacterFormat.UnderlineStyle = UnderlineStyle.DotDash;
secondText.CharacterFormat.Italic = true;
secondText.CharacterFormat.FontName = "Times New Roman";
secondText.CharacterFormat.TextColor = Color.Green;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim firstParagraph As IWParagraph = section.AddParagraph()
'Adds new text to the paragraph
Dim firstText As IWTextRange = firstParagraph.AppendText("This is the first
text range. ")
'Applies formatting for first text range
firstText.CharacterFormat.Bold = True
firstText.CharacterFormat.FontSize = 14
firstText.CharacterFormat.Shadow = True
firstText.CharacterFormat.SmallCaps = True
```

```

Dim secondText As ITextRange = firstParagraph.AppendText("This the second
text range")
'Applies formatting for second text range
secondText.CharacterFormat.HighlightColor = Color.GreenYellow
secondText.CharacterFormat.UnderlineStyle = UnderlineStyle.DotDash
secondText.CharacterFormat.Italic = True
secondText.CharacterFormat.FontName = "Times New Roman"
secondText.CharacterFormat.TextColor = Color.Green
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds new text to the paragraph

```

Working with Images

DocIO provides support for both inline and absolute positioned images.

- Inline images: The position of the image is constrained to the lines of text on the page.
- Absolute positioned images: The images can be positioned anywhere irrespective of the lines of text.

The following code example explains how to add image to the paragraph.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds image to the paragraph
IWPicture picture =
firstParagraph.AppendPicture(Image.FromFile("Image.png"));
//Sets height and width for the image
picture.Height = 100;
picture.Width = 100;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim firstParagraph As IWParagraph = section.AddParagraph()
'Adds image to the paragraph
Dim picture As IWPicture =
firstParagraph.AppendPicture(Image.FromFile("Image.png"))
'Sets height and width for the image
picture.Height = 100
picture.Width = 100
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds image to the paragraph
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream imageStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Image.png");
IWPicture picture = firstParagraph.AppendPicture(imageStream);
//Sets height and width for the image
picture.Height = 100;
picture.Width = 100;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph firstParagraph = section.AddParagraph();
//Adds image to the paragraph
FileStream imageStream = new FileStream(@"Image.png", FileMode.Open,
FileAccess.ReadWrite);
IWPicture picture = firstParagraph.AppendPicture(imageStream);
//Sets height and width for the image
picture.Height = 100;
picture.Width = 100;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Creates a new Word document
```

xamarin#helper-files-for-xamarin

```

Image present in the document can be replaced with a new image. This can be achieved by iterating through the paragraph items.

The following code example explains how to replace an existing image.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
WTextBody textbody = document.Sections[0].Body;
//Iterates through the paragraphs of the textbody
foreach (WParagraph paragraph in textbody.Paragraphs)
{
    //Iterates through the child elements of paragraph
    foreach (ParagraphItem item in paragraph.ChildEntities)
    {
        if (item is WPicture)
        {
            WPicture picture = item as WPicture;
            //Replaces the image
            if (picture.Title == "Bookmark")
                picture.LoadImage(Image.FromFile("Image.png"));
        }
    }
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx")
Dim textbody As WTextBody = document.Sections(0).Body
'Iterates through the paragraphs of the textbody
For Each paragraph As WParagraph In textbody.Paragraphs
'Iterates through the child elements of paragraph
For Each item As ParagraphItem In paragraph.ChildEntities
If TypeOf item Is WPicture Then
Dim picture As WPicture = TryCast(item, WPicture)
'Replaces the image
If picture.Title = "Bookmark" Then
picture.LoadImage(Image.FromFile("Image.png"))
End If
End If
Next
Next
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream fileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Template.docx");
//Loads the template document
WordDocument document = new WordDocument(fileStream);
WTextBody textbody = document.Sections[0].Body;
//Iterates through the paragraphs of the textbody
foreach (WParagraph paragraph in textbody.Paragraphs)
{
//Iterates through the child elements of paragraph
foreach (ParagraphItem item in paragraph.ChildEntities)
{
if (item is WPicture)
{
WPicture picture = item as WPicture;
//Replaces the image
if (picture.Title == "Bookmark")
{

xamarin#helper-files-for-xamarin

```

Images can be removed from the document by removing it from the paragraph items.

The following code example explains how to remove the image from the paragraph items.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
WTextBody textbody = document.Sections[0].Body;
//Iterates through the paragraphs of the textbody
foreach (WParagraph paragraph in textbody.Paragraphs)
{
    //Iterates through the child elements of paragraph
    for (int i = 0; i < paragraph.ChildEntities.Count; i++)
    {
        //Removes images from the paragraph
        if (paragraph.ChildEntities[i] is WPicture)
        {
            paragraph.Items.RemoveAt(i);
            i--;
        }
    }
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```
'Loads the template document
```

```

Dim document As New WordDocument("Template.docx")
Dim textbody As WTextBody = document.Sections(0).Body
'Iterates through the paragraphs of the textbody
For Each paragraph As WParagraph In textbody.Paragraphs
'Iterates through the child elements of paragraph
For i As Integer = 0 To paragraph.ChildEntities.Count - 1
'Removes images from the paragraph
If TypeOf paragraph.ChildEntities(i) Is WPicture Then
    paragraph.Items.RemoveAt(i)
    i -= 1
End If
Next
Next
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)

Format and rotate images

Absolute positioned images have properties such as position, wrap formats, and alignments. These properties are not applicable when the text wrapping style is inline. You can also rotate an image and apply flipping (horizontal and vertical) to it.

The following code example explains how various picture formats can be applied to the picture.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("This paragraph has picture. ");
//Appends new picture to the paragraph
WPicture picture = paragraph.AppendPicture(Image.FromFile("Image.png")) as
WPicture;
//Sets text wrapping style - When the wrapping style is inline, the images
are not absolutely positioned. It is added next to the text range.
picture.TextWrappingStyle = TextWrappingStyle.Square;
//Sets horizontal and vertical origin
picture.HorizontalOrigin = HorizontalOrigin.Page;
picture.VerticalOrigin = VerticalOrigin.Paragraph;
//Sets width and height for the paragraph
picture.Width = 150;
picture.Height = 100;
//Sets horizontal and vertical position for the picture
picture.HorizontalPosition = 200;
picture.VerticalPosition = 150;
picture.Name = "PictureName";
//Sets horizontal and vertical alignments
picture.HorizontalAlignment = ShapeHorizontalAlignment.Center;
picture.VerticalAlignment = ShapeVerticalAlignment.Bottom;
//Sets 90 degree rotation
picture.Rotation = 90;
//Sets horizontal flip
picture.FlipHorizontal = true;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
```

```

Dim paragraph As IWPParagraph = section.AddParagraph()
paragraph.AppendText("This paragraph has picture. ")
'Appends new picture to the paragraph
Dim picture As WPicture =
TryCast(paragraph.AppendPicture(Image.FromFile("Image.png")), WPicture)
'Sets text wrapping style - When the wrapping style is inline, the images
are not absolutely positioned. It is added next to the text range.
picture.TextWrappingStyle = TextWrappingStyle.Square
'Sets horizontal and vertical origin
picture.HorizontalOrigin = HorizontalOrigin.Page
picture.VerticalOrigin = VerticalOrigin.Paragraph
'Sets width and height for the paragraph
picture.Width = 150
picture.Height = 100
'Sets horizontal and vertical position for the picture
picture.HorizontalPosition = 200
picture.VerticalPosition = 150
picture.Name = "PictureName"
'Sets horizontal and vertical alignments
picture.HorizontalAlignment = ShapeHorizontalAlignment.Center
picture.VerticalAlignment = ShapeVerticalAlignment.Bottom
'Sets 90 degree rotation
picture.Rotation = 90
'Sets horizontal flip
picture.FlipHorizontal = true
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document

xamarin#helper-files-for-xamarin
```

An Image with a specific title can be retrieved by iterating the paragraph items that can be used for further manipulations.

The following code example explains how images can be iterated from the document elements.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument("Template.docx");
//Gets textbody content
WTextBody textBody = document.Sections[0].Body;
//Iterates through the textbody child entities
foreach (TextBodyItem item in textBody.ChildEntities)
{
    if (item is WParagraph)
    {
        WParagraph paragraph = item as WParagraph;
        foreach (ParagraphItem paraItem in paragraph.ChildEntities)
        {
            //Gets the image from its title and modifies its width and height
            if (paraItem is WPicture)
            {
                WPicture picture = paraItem as WPicture;
                if (picture.Title == "Bookmark")
                {
                    picture.Width = 150;
                    picture.Height = 100;
                }
            }
        }
    }
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument("Template.docx")
'Gets textbody content
Dim textBody As WTextBody = document.Sections(0).Body
'Iterates through the textbody child entities
For Each item As TextBodyItem In textBody.ChildEntities
    If TypeOf item Is WParagraph Then
        Dim paragraph As WParagraph = TryCast(item, WParagraph)
        For Each paraItem As ParagraphItem In paragraph.ChildEntities
            'Gets the image from its title and modifies its width and height
            If TypeOf paraItem Is WPicture Then
                Dim picture As WPicture = TryCast(paraItem, WPicture)
                If picture.Title = "Bookmark" Then
                    picture.Width = 150
                    picture.Height = 100
                End If
            End If
        Next
    End If
Next
'Saves the Word document

```

Working with lists

Lists can organize and format the contents of a document in hierarchical way. There are nine levels in the list, starting from level 0 to level 8. DocIO supports both built-in list styles and custom list styles. The following are the types of list supported in DocIO:

- Numbered list
- Bulleted list

The following code example explains how to create a simple bulleted list.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Applies default numbered list style
paragraph.ListFormat.ApplyDefBulletStyle();
//Adds text to the paragraph
paragraph.AppendText("List item 1");
//Continues the list defined
paragraph.ListFormat.ContinueListNumbering();
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 2");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Adds new paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 3");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Applies default numbered list style
paragraph.ListFormat.ApplyDefBulletStyle()
'Adds text to the paragraph
paragraph.AppendText("List item 1")
'Continues the list defined
paragraph.ListFormat.ContinueListNumbering()
'Adds second paragraph
paragraph = section.AddParagraph()
paragraph.AppendText("List item 2")
'Continues last defined list
paragraph.ListFormat.ContinueListNumbering()
'Adds new paragraph
paragraph = section.AddParagraph()
paragraph.AppendText("List item 3")
'Continues last defined list
paragraph.ListFormat.ContinueListNumbering()
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section

//Adds new paragraph to the section
IWPParagraph paragraph = section.AddParagraph();
//Applies default numbered list style
paragraph.ListFormat.ApplyDefNumberedStyle();
//Adds text to the paragraph
paragraph.AppendText("List item 1");
//Continues the list defined
paragraph.ListFormat.ContinueListNumbering();
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 2");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Adds new paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 3");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform

```

```
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Applies default numbered list style
paragraph.ListFormat.ApplyDefNumberedStyle();
//Adds text to the paragraph
paragraph.AppendText("List item 1");
//Continues the list defined
paragraph.ListFormat.ContinueListNumbering();
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 2");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Adds new paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 3");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Applies default numbered list style
paragraph.ListFormat.ApplyDefNumberedStyle();
//Adds text to the paragraph
paragraph.AppendText("List item 1");
//Continues the list defined
paragraph.ListFormat.ContinueListNumbering();
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 2");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Adds new paragraph
```

```

paragraph = section.AddParagraph();
paragraph.AppendText("List item 3");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

The following code example explains how to create a multilevel bulleted list.

C#

```

//Creates a new Word document

The following code example explains how to create multilevel numbered list.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Applies default numbered list style
paragraph.ListFormat.ApplyDefNumberedStyle();
//Adds text to the paragraph
paragraph.AppendText("List item 1 - Level 0");
//Continues the list defined
paragraph.ListFormat.ContinueListNumbering();
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 2 - Level 1");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent

```

```

paragraph.ListFormat.IncreaseIndentLevel();
//Adds new paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("List item 3 - Level 2");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent
paragraph.ListFormat.IncreaseIndentLevel();
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Applies default numbered list style
paragraph.ListFormat.ApplyDefNumberedStyle()
'Adds text to the paragraph
paragraph.AppendText("List item 1 - Level 0")
'Continues the list defined
paragraph.ListFormat.ContinueListNumbering()

```

The list levels can be incremented or decremented by using the `IncreaseIndentLevel` and `DecreaseIndentLevel` methods respectively. The following code example explains how to increase or decrease the list indent levels.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Applies default numbered list style
paragraph.ListFormat.ApplyDefNumberedStyle();
//Adds text to the paragraph
paragraph.AppendText("Multilevel numbered list - Level 0");
//Continues the list defined
paragraph.ListFormat.ContinueListNumbering();
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("Multilevel numbered list - Level 1");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent
paragraph.ListFormat.IncreaseIndentLevel();
//Adds new paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("Multilevel numbered list - Level 0");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent
paragraph.ListFormat.DecreaseIndentLevel();
//Adds new paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("Multilevel numbered list - Level 1");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent
paragraph.ListFormat.IncreaseIndentLevel();
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document

//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("User defined list - Level 1");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent
paragraph.ListFormat.IncreaseIndentLevel();
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

The following code example explains how to create numbered list with prefix from previous level.

Note: The `NumberPrefix` value for the numbered list should meet the syntax "`\u000N`" to update the previous list level value as prefix to the current list level. For example, it should be represented as ("`\u0000.`" or "`\u0000.\u0001.`").

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new list style to the document
ListStyle listStyle = document.AddListStyle(ListType.Numbered,
"UserDefinedList");
WListLevel levelOne = listStyle.Levels[0];
//Defines the follow character, prefix from previous level, start index for
level 0
levelOne.FollowCharacter = FollowCharacterType.Nothing;
levelOne.PatternType = ListPatternType.Arabic;
levelOne.StartAt = 1;
WListLevel levelTwo = listStyle.Levels[1];
//Defines the follow character, prefix from previous level, pattern, start
index for level 1
levelTwo.FollowCharacter = FollowCharacterType.Nothing;
levelTwo.NumberPrefix = "\u0000.";
levelTwo.PatternType = ListPatternType.Arabic;
levelTwo.StartAt = 1;
WListLevel levelThree = listStyle.Levels[2];
//Defines the follow character, prefix from previous level, pattern, start
index for level 1
levelThree.FollowCharacter = FollowCharacterType.Nothing;
levelThree.NumberPrefix = "\u0000.\u0001.";
levelThree.PatternType = ListPatternType.Arabic;
levelThree.StartAt = 1;
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds text to the paragraph
paragraph.AppendText("User defined list - Level 0");
//Applies default numbered list style
paragraph.ListFormat.ApplyStyle("UserDefinedList");
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("User defined list - Level 1");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent
paragraph.ListFormat.IncreaseIndentLevel();
//Adds second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText("User defined list - Level 2");
//Continues last defined list
paragraph.ListFormat.ContinueListNumbering();
//Increases the level indent
paragraph.ListFormat.IncreaseIndentLevel();
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
```

```
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new list style to the document
Dim listStyle As ListStyle = document.AddListStyle(ListType.Numbered,

xamarin#helper-files-for-xamarin
```

Get list value

You can get the string that represents the appearance of **list value of the paragraph** in the Word document using the `ListString` API.

This API holds the static string of the list value recently calculated while saving the document as Text. It is not updated automatically for each modification done in the Word document. Hence, you should either invoke the `GetText()` method of `WordDocument` or save the Word document as Text to get the actual list value from this API.

The following example shows how to **get a string that represents the appearance of list value of the paragraph**.

C#

```
//Loads an existing Word document
WordDocument document = new WordDocument("Template.docx");
//Gets the document text
document.GetText();
//Gets the string that represents the appearance of list value of the
paragraph
String listString = document.LastParagraph.ListString;
//Saves and closes the WordDocument instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads an existing Word document
Dim document As WordDocument = New WordDocument("Template.docx")
' Gets the document text
document.GetText()
'Gets the string that represents the appearance of list value of the
paragraph
Dim listString As String = document.LastParagraph.ListString
'Saves and closes the WordDocument instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates an instance of a WordDocument
```

```

WordDocument document = new WordDocument();
//Loads an existing Word document
document.Open(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"), FormatType.Docx);
//Gets the document text
document.GetText();
//Gets the string that represents the appearance of list value of the paragraph
String listString = document.LastParagraph.ListString;
// Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Closes the Word document
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Refer to the following link to save Word document in UWP platform.
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads an existing Word document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Gets the document text
document.GetText();
//Gets the string that represents the appearance of list value of the paragraph
String listString = document.LastParagraph.ListString;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");

```

XAMARIN

```

//Loads an existing Word document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"), FormatType.Docx);
//Gets the document text
document.GetText();
//Gets the string that represents the appearance of list value of the paragraph
String listString = document.LastParagraph.ListString;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the Word document

```

```
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform.
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Note: For a picture bulleted list, the `ListString` API is not valid and it will return an empty string.

Working with hyperlinks

Hyperlink is a reference to data that can link to external contents like images, files, webpage, and more. In Word document, a hyperlink may target to any one of the following sources:

- Webpage: Represents the web content.
- File: Represents the file in some location.
- Email: Represents an Email.
- Bookmark: Represents the bookmarks in the document.

Hyperlinks have two parts: the address and display content.

The following code example explains how to insert a web link.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Web Hyperlink: ");
paragraph = section.AddParagraph();
//Appends web hyperlink to the paragraph
IWField field = paragraph.AppendHyperlink("http://www.syncfusion.com",
"Syncfusion", HyperlinkType.WebLink);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("Web Hyperlink: ")
paragraph = section.AddParagraph()
'Appends web hyperlink to the paragraph
```

```

Dim field As IField =
paragraph.AppendHyperlink("http://www.syncfusion.com", "Syncfusion",
HyperlinkType.WebLink)
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Web Hyperlink: ");
paragraph = section.AddParagraph();
//Appends web hyperlink to the paragraph
IField field = paragraph.AppendHyperlink("http://www.syncfusion.com",
"Syncfusion", HyperlinkType.WebLink);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Web Hyperlink: ");
paragraph = section.AddParagraph();
//Appends web hyperlink to the paragraph
IField field = paragraph.AppendHyperlink("http://www.syncfusion.com",
"Syncfusion", HyperlinkType.WebLink);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Web Hyperlink: ");
paragraph = section.AddParagraph();
//Appends web hyperlink to the paragraph

//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

The following code example illustrates how to add an email link.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Email hyperlink: ");
paragraph = section.AddParagraph();
//Appends Email hyperlink to the paragraph
paragraph.AppendHyperlink("mailto:sales@syncfusion.com", "Sales" ,
HyperlinkType.EmailLink);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("Email hyperlink: ")
paragraph = section.AddParagraph()
'Appends Email hyperlink to the paragraph

```

```

paragraph.AppendHyperlink("mailto:sales@syncfusion.com", "Sales" ,
HyperlinkType.EmailLink)
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Email hyperlink: ");
paragraph = section.AddParagraph();
//Appends Email hyperlink to the paragraph
paragraph.AppendHyperlink("mailto:sales@syncfusion.com", "Sales",
HyperlinkType.EmailLink);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform

Working with symbols

Symbols are used to add contents such as currencies, numbers, punctuations, etc. DocIO represents symbols with **WSymbol** instance. Each symbol can be identified with their character codes.

The following code example explains how to add new symbol to the document.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Example of adding symbols to the paragraph: ");
//Inserts symbol with character code 100
paragraph.AppendSymbol(100);
//Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("Example of adding symbols to the paragraph: ")
'Inserts symbol with character code 100

```

```
paragraph.AppendSymbol(100)
'Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Example of adding symbols to the paragraph: ");
//Inserts symbol with character code 100
paragraph.AppendSymbol(100);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Example of adding symbols to the paragraph: ");
//Inserts symbol with character code 100
paragraph.AppendSymbol(100);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream

```

Appending breaks

Breaks allows the document contents to split into multiple parts to customize the appearance of the contents. The following are the types of breaks supported in the DocIO:

- Page break: Starts the content in the next page.
- Line break: Starts the content in new line.
- Column break: Starts the content in the next column.

The following code example explains how various types of breaks can be appended to the paragraphs.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Before line break");
//Adds line break to the paragraph
paragraph.AppendBreak(BreakType.LineBreak);
paragraph.AppendText("After line break");
IWParagraph pageBreakPara = section.AddParagraph();
pageBreakPara.AppendText("Before page break");
//Adds page break to the paragraph
pageBreakPara.AppendBreak(BreakType.PageBreak);
pageBreakPara.AppendText("After page break");
IWSection secondSection = document.AddSection();
//Adds columns to the section
secondSection.AddColumn(100, 2);
secondSection.AddColumn(100, 2);
IWParagraph columnBreakPara = secondSection.AddParagraph();
columnBreakPara.AppendText("Before column break");
//Adds column break to the paragraph
columnBreakPara.AppendBreak(BreakType.ColumnBreak);
columnBreakPara.AppendText("After column break");
//Saves and closes the document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

```

Appending OLE objects

OLE (Object Linking and Embedding) objects allow embedding and linking to documents and other objects. It allows the content of one program to be used in a Word document. The Objects can be inserted in the following two ways:

- Linked: The content is linked to the source file
- Embedded: The content is copied to the Word document and is not linked to the source file

You can create and manipulate the OLE Objects of both Linked and Embedded types in the Word document by using **WOleObject** instance.

The following code example explains how to add OLE objects to the document.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Opens the file to be embedded
FileStream stream = new FileStream("Book1.xlsx", FileMode.Open);
//Loads the picture instance with the image need to be displayed
WPicture picture = new WPicture(document);
picture.LoadImage(Image.FromFile("Image.png"));

```

```
//Appends the OLE object to the paragraph
WoleObject object = paragraph.AppendOleObject(stream, picture,
OleObjectType.ExcelWorksheet);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Opens the file to be embedded
Dim stream As New FileStream("Book1.xlsx", FileMode.Open)
'Loads the picture instance with the image need to be displayed
Dim picture As New WPicture(document)
picture.LoadImage(Image.FromFile("Image.png"))
'Appends the OLE object to the paragraph
Dim object As WoleObject = paragraph.AppendOleObject(stream, picture,
OleObjectType.ExcelWorksheet)
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Opens the file to be embedded
Stream fileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Book1.xlsx");
//Loads the picture instance with the image need to be displayed
WPicture picture = new WPicture(document);
Stream imageStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Image.png");
picture.LoadImage(imageStream);
//Appends the OLE object to the paragraph
WoleObject oleObject = paragraph.AppendOleObject(fileStream, picture,
OleObjectType.ExcelWorksheet);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
```

*//Refer to the following link to save Word document in UWP platform

```

Working with Text Box

Text box contains a group of textual and graphical contents. DocIO supports to create and manipulate the text box and its formatting by using the `WTextBox` instance.

The following code example explains how to add new text box to the paragraph.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends new textbox to the paragraph
IWTextBox textbox = paragraph.AppendTextBox(150, 75);
//Adds new text to the textbox body
IWParagraph textboxParagraph = textbox.TextBoxBody.AddParagraph();
textboxParagraph.AppendText("Text inside text box");
textboxParagraph = textbox.TextBoxBody.AddParagraph();
//Adds new picture to textbox body
IWPicture picture =
textboxParagraph.AppendPicture(Image.FromFile(@"Image.png"));
picture.Height = 75;
picture.Width = 50;
//Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Appends new textbox to the paragraph
Dim textbox As IWTextBox = paragraph.AppendTextBox(150, 75)
'Adds new text to the textbox body
Dim textboxParagraph As IWParagraph = textbox.TextBoxBody.AddParagraph()
textboxParagraph.AppendText("Text inside text box")
textboxParagraph = textbox.TextBoxBody.AddParagraph()
'Adds new picture to textbox body
Dim picture As IWPicture =
textboxParagraph.AppendPicture(Image.FromFile("Image.png"))
picture.Height = 75
picture.Width = 50
```

```
'Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends new textbox to the paragraph
IWTextBox textbox = paragraph.AppendTextBox(150, 75);
//Adds new text to the textbox body
IWParagraph textboxParagraph = textbox.TextBoxBody.AddParagraph();
textboxParagraph.AppendText("Text inside text box");
textboxParagraph = textbox.TextBoxBody.AddParagraph();
//Adds new picture to textbox body
Stream imageStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Dummy-
Images.jpg");
IWPicture picture = textboxParagraph.AppendPicture(imageStream);
picture.Height = 75;
picture.Width = 50;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");

```

Format and rotate text box

Text box has its own formatting such as outline color, fill effects, text direction, wrap formats, and more. You can also rotate the text box and apply flipping (horizontal and vertical) to it.

The following code example explains how to apply formatting and rotation for text box.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document

```

```

IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends new textbox to the paragraph
IWTextBox textbox = paragraph.AppendTextBox(150, 75);
//Adds new text to the textbox body
IWParagraph textboxParagraph = textbox.TextBoxBody.AddParagraph();
textboxParagraph.AppendText("Text inside text box");
//Sets fill color and line width for textbox
textbox.TextBoxFormat.FillColor = Color.LightGreen;
textbox.TextBoxFormat.LineWidth = 2;
//Applies textbox text direction
textbox.TextBoxFormat.TextDirection =
Syncfusion.DocIO.DLS.TextDirection.VerticalTopToBottom;
//Sets text wrapping style
textbox.TextBoxFormat.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets horizontal and vertical position
textbox.TextBoxFormat.HorizontalPosition = 200;
textbox.TextBoxFormat.VerticalPosition = 200;
//Sets horizontal and vertical origin
textbox.TextBoxFormat.VerticalOrigin = VerticalOrigin.Margin;
textbox.TextBoxFormat.HorizontalOrigin = HorizontalOrigin.Page;
//Sets top and bottom margin values
textbox.TextBoxFormat.InternalMargin.Bottom = 5f;
textbox.TextBoxFormat.InternalMargin.Top = 5f;
//Sets 90 degree rotation
textbox.TextBoxFormat.Rotation = 90;
//Sets horizontal flip
textbox.TextBoxFormat.FlipHorizontal = true;
//Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Appends new textbox to the paragraph
Dim textbox As IWTextBox = paragraph.AppendTextBox(150, 75)
'Adds new text to the textbox body
Dim textboxParagraph As IWParagraph = textbox.TextBoxBody.AddParagraph()
textboxParagraph.AppendText("Text inside text box")
'Sets fill color and line width for textbox
textbox.TextBoxFormat.FillColor = Color.LightGreen
textbox.TextBoxFormat.LineWidth = 2
'Applies textbox text direction
textbox.TextBoxFormat.TextDirection =
Syncfusion.DocIO.DLS.TextDirection.VerticalTopToBottom
'Sets text wrapping style
textbox.TextBoxFormat.TextWrappingStyle = TextWrappingStyle.InFrontOfText
'Sets horizontal and vertical position
textbox.TextBoxFormat.HorizontalPosition = 200

```

```

textbox.TextBoxFormat.VerticalPosition = 200
'Sets horizontal and vertical origin
textbox.TextBoxFormat.VerticalOrigin = VerticalOrigin.Margin
textbox.TextBoxFormat.HorizontalOrigin = HorizontalOrigin.Page
'Sets top and bottom margin values
textbox.TextBoxFormat.InternalMargin.Bottom = 5.0F
textbox.TextBoxFormat.InternalMargin.Top = 5.0F
'Sets 90 degree rotation
textbox.TextBoxFormat.Rotation = 90
'Sets horizontal flip
textbox.TextBoxFormat.FlipHorizontal = true
'Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document

```

Working with Tables

A table in Word document is used to arrange document content in rows and columns. **WTable** instance represents a table in Word document. A table must contain at least one row.

1. A row is a collection of cells and it is represented by an instance of **WTableRow**. Each row must contain at least one cell.
2. A cell can contain one or more paragraphs and tables. An instance of **WTableCell** represents a table cell. Each table cell must contain at least one paragraph.

Note: Adding more than 63 columns not supported in Word document using Microsoft Word application. It shows alert when you attempt to insert table with more than 64 columns, which is a one of the behaviors of Microsoft Word and Essential DocIO does the same.

The following image illustrates how a table in Word document is organized in EssentialDocIO's DOM:

The following code example illustrates how to create a simple table with predefined number of rows and cells.

C#

```

//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
//Adds a section into Word document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document and appends text into paragraph
IWTextRange textRange = section.AddParagraph().AppendText("Price Details");
textRange.CharacterFormat.FontName = "Arial";
textRange.CharacterFormat.FontSize = 12;
textRange.CharacterFormat.Bold = true;
section.AddParagraph();
//Adds a new table into Word document
IWTable table = section.AddTable();
//Specifies the total number of rows & columns
table.ResetCells(3, 2);
//Accesses the instance of the cell (first row, first cell) and adds the
content into cell
textRange = table[0, 0].AddParagraph().AppendText("Item");
textRange.CharacterFormat.FontName = "Arial";
textRange.CharacterFormat.FontSize = 12;
textRange.CharacterFormat.Bold = true;
//Accesses the instance of the cell (first row, second cell) and adds the
content into cell
textRange = table[0, 1].AddParagraph().AppendText("Price($)");
textRange.CharacterFormat.FontName = "Arial";
textRange.CharacterFormat.FontSize = 12;
textRange.CharacterFormat.Bold = true;
//Accesses the instance of the cell (second row, first cell) and adds the
content into cell
textRange = table[1, 0].AddParagraph().AppendText("Apple");
textRange.CharacterFormat.FontName = "Arial";
textRange.CharacterFormat.FontSize = 10;
//Accesses the instance of the cell (second row, second cell) and adds the
content into cell
textRange = table[1, 1].AddParagraph().AppendText("50");
  
```

```

textRange.CharacterFormat.FontName = "Arial";
textRange.CharacterFormat.FontSize = 10;
//Accesses the instance of the cell (third row, first cell) and adds the content into cell
textRange = table[2, 0].AddParagraph().AppendText("Orange");
textRange.CharacterFormat.FontName = "Arial";
textRange.CharacterFormat.FontSize = 10;
//Accesses the instance of the cell (third row, second cell) and adds the content into cell
textRange = table[2, 1].AddParagraph().AppendText("30");
textRange.CharacterFormat.FontName = "Arial";
textRange.CharacterFormat.FontSize = 10;
//Saves the document in the given name and format
document.Save("Table.docx", FormatType.Docx);
//Releases the resources occupied by WordDocument instance

The following code example illustrates how to create a simple table by dynamically adding rows.

C#

```

//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
section.AddParagraph().AppendText("Price Details");
section.AddParagraph();
//Adds a new table into Word document
IWTable table = section.AddTable();
//Adds the first row into table
WTableRow row = table.AddRow();
//Adds the first cell into first row
WTableCell cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("Item");
//Adds the second cell into first row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("Price($)");
//Adds the second row into table
row = table.AddRow(true, false);
//Adds the first cell into second row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("Apple");
//Adds the second cell into second row
cell = row.AddCell();

```

```

//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("50");
//Adds the third row into table
row = table.AddRow(true, false);
//Adds the first cell into third row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("Orange");
//Adds the second cell into third row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("30");
//Adds the fourth row into table
row = table.AddRow(true, false);
//Adds the first cell into fourth row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("Banana");
//Adds the second cell into fourth row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("20");
//Adds the fifth row to table
row = table.AddRow(true, false);
//Adds the first cell into fifth row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("Grapes");
//Adds the second cell into fifth row
cell = row.AddCell();
//Specifies the cell width
cell.Width = 200;
cell.AddParagraph().AppendText("70");
//Saves and closes the document instance
document.Save("Table.docx", FormatType.Docx);
document.Close();

```

Nested Table

You can create a nested table by adding a new table into a cell. The following code example illustrates how to add a table into a cell.

C#

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
section.AddParagraph().AppendText("Price Details");
IWTable table = section.AddTable();
table.ResetCells(3, 2);
table[0, 0].AddParagraph().AppendText("Item");
table[0, 1].AddParagraph().AppendText("Price($)");
table[1, 0].AddParagraph().AppendText("Items with same price");
//Adds a nested table into the cell (second row, first cell).
IWTable nestTable = table[1, 0].AddTable();
//Creates the specified number of rows and columns to nested table
nestTable.ResetCells(3, 1);
//Accesses the instance of the nested table cell (first row, first cell)
WTableCell nestedCell = nestTable.Rows[0].Cells[0];
//Specifies the width of the nested cell
nestedCell.Width = 200;
//Adds the content into nested cell
nestedCell.AddParagraph().AppendText("Apple");
//Accesses the instance of the nested table cell (second row, first cell)
nestedCell = nestTable.Rows[1].Cells[0];
//Specifies the width of the nested cell
nestedCell.Width = 200;
//Adds the content into nested cell
nestedCell.AddParagraph().AppendText("Orange");
//Accesses the instance of the nested table cell (third row, first cell)
nestedCell = nestTable.Rows[2].Cells[0];
//Specifies the width of the nested cell
nestedCell.Width = 200;
//Adds the content into nested cell
nestedCell.AddParagraph().AppendText("Mango");
//Accesses the instance of the cell (second row, second cell)
```

```
nestedCell = table.Rows[1].Cells[1];
table[1, 1].AddParagraph().AppendText("85");
table[2, 0].AddParagraph().AppendText("Pomegranate");
table[2, 1].AddParagraph().AppendText("70");
//Saves and closes the document instance
document.Save("NestedTable.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates an instance of WordDocument class
Dim document As New WordDocument()
Dim section As IWSection = document.AddSection()
section.AddParagraph().AppendText("Price Details")
Dim table As ITable = section.AddTable()
table.ResetCells(3, 2)
table(0, 0).AddParagraph().AppendText("Item")
table(0, 1).AddParagraph().AppendText("Price($)")
table(1, 0).AddParagraph().AppendText("Items with same price")
'Adds a nested table into the cell (second row, first cell).
Dim nestTable As ITable = table(1, 0).AddTable()
'Creates the specified number of rows and columns to nested table
nestTable.ResetCells(3, 1)
'Accesses the instance of the nested table cell (first row, first cell)
Dim nestedCell As WTableCell = nestTable.Rows(0).Cells(0)
'Specifies the width of the nested cell
nestedCell.Width = 200
'Adds the content into nested cell
nestedCell.AddParagraph().AppendText("Apple")
'Accesses the instance of the nested table cell (second row, first cell)
nestedCell = nestTable.Rows(1).Cells(0)
'Specifies the width of the nested cell
nestedCell.Width = 200
'Adds the content into nested cell
nestedCell.AddParagraph().AppendText("Orange")
'Accesses the instance of the nested table cell (third row, first cell)
nestedCell = nestTable.Rows(2).Cells(0)
'Specifies the width of the nested cell
nestedCell.Width = 200
'Adds the content into nested cell
nestedCell.AddParagraph().AppendText("Mango")
'Accesses the instance of the cell (second row, second cell)
nestedCell = table.Rows(1).Cells(1)
table(1, 1).AddParagraph().AppendText("85")
table(2, 0).AddParagraph().AppendText("Pomegranate")
table(2, 1).AddParagraph().AppendText("70")
'Saves and closes the document instance

Align text within a table

You can iterate the cells within a table and align text for each cell. Find more information about iterating the cells from [here](#)

The following code example illustrates how to align text within a table.

C#

```

private void AlignCellContent(WTableCell tableCell, VerticalAlignment
verticalAlignment, HorizontalAlignment horizontalAlignment)
{
    //Sets vertical alignment to the cell.
    tableCell.CellFormat.VerticalAlignment = verticalAlignment;
    //Iterates body items in table cell and set horizontal alignment.
    AlignCellContentForTextBody(tableCell, horizontalAlignment);
}
private void AlignCellContentForTextBody(WTextBody textBody,
HorizontalAlignment horizontalAlignment)
{
    for (int i = 0; i < textBody.ChildEntities.Count; i++)
    {
        //IEntity is the basic unit in DocIO DOM.
        //Accesses the body items as IEntity
        IEntity bodyItemEntity = textBody.ChildEntities[i];
        //A Text body has 3 types of elements - Paragraph, Table and Block Content
        Control
        //Decides the element type by using EntityType
    }
}

```

```

switch (bodyItemEntity.EntityType)
{
    case EntityType.Paragraph:
        WParagraph paragraph = bodyItemEntity as WParagraph;
        //Sets horizontal alignment for paragraph.
        paragraph.ParagraphFormat.HorizontalAlignment = horizontalAlignment;
        break;
    case EntityType.Table:
        //Table is a collection of rows and cells
        //Iterates through table's DOM and set horizontal alignment.
        AlignCellContentForTable(bodyItemEntity as WTable, horizontalAlignment);
        break;
    case EntityType.BlockContentControl:
        BlockContentControl blockContentControl = bodyItemEntity as
        BlockContentControl;
        //Iterates to the body items of Block Content Control and set horizontal
        alignment.
        AlignCellContentForTextBody(blockContentControl.TextBody,
        horizontalAlignment);
        break;
}
}
}

private void AlignCellContentForTable(WTable table,
Syncfusion.DocIO.DLS.HorizontalAlignment horizontalAlignment)
{
    //Iterates the row collection in a table
    foreach (WTableRow row in table.Rows)
    {
        //Iterates the cell collection in a table row
        foreach (WTableCell cell in row.Cells)
        {
            //Iterate items in cell and set horizontal alignment
            AlignCellContentForTextBody(cell, horizontalAlignment);
        }
    }
}

```

Apply formatting to Table, Row and Cell

The following code example illustrates how to load an existing document and apply table formatting options such as Borders, LeftIndent, Paddings, IsAutoResize, etc.

Note: 1. `BorderStyle.None` is the default value of `BorderType` property in `Borders` class which will not show borders for the table or cell. It is equivalent to border style not defined and borders can be inherited from style or parent formats.

2. To hide border for a table or cell in the Word Document, you can set `BorderType` property with `BorderStyle.Cleared`. It means border style defined as no border (Don't show border) and shouldn't inherit from style or parent formats.

3. To show/display border for a table or cell in the Word Document, you can set `BorderType` property with `BorderStyle` values (except `BorderStyle.None` and `BorderStyle.Cleared`).

4. As in the Microsoft Word, DocIO supports `RowFormat.Borders` in DOC format alone.

C#

```

//Creates an instance of WordDocument class (Empty Word Document)
WordDocument document = new WordDocument();
//Opens an existing Word document into DocIO instance
document.Open("Table.docx", FormatType.Docx);
//Accesses the instance of the first section in the Word document
WSection section = document.Sections[0];
//Accesses the instance of the first table in the section
WTable table = section.Tables[0] as WTable;
//Specifies the title for the table
table.Title = "PriceDetails";
//Specifies the description of the table
table.Description = "This table shows the price details of various fruits";
//Specifies the left indent of the table
table.IndentFromLeft = 50;
//Specifies the background color of the table
table.TableFormat.BackColor = Color.FromArgb(192, 192, 192);
//Specifies the horizontal alignment of the table
table.TableFormat.HorizontalAlignment = RowAlignment.Left;
//Specifies the left, right, top and bottom padding of all the cells in the table
table.TableFormat.Paddings.All = 10;
//Specifies the auto resize of table to automatically resize all cell width based on its content
table.TableFormat.IsAutoResized = true;
//Specifies the table top, bottom, left and right border line width
table.TableFormat.Borders.LineWidth = 2f;
//Specifies the table horizontal border line width
table.TableFormat.Borders.Horizontal.LineWidth = 2f;
//Specifies the table vertical border line width
table.TableFormat.Borders.Vertical.LineWidth = 2f;
//Specifies the tables top, bottom, left and right border color
table.TableFormat.Borders.Color = Color.Red;
//Specifies the table Horizontal border color
table.TableFormat.Borders.Horizontal.Color = Color.Red;
//Specifies the table vertical border color
table.TableFormat.Borders.Vertical.Color = Color.Red;
//Specifies the table borders border type

```

Resize table

You can automatically resize the table cell to fit its contents based on the given **autofit options** such as **FitToContent**, **FitToWindow**, **FixedColumnWidth**.

The following code example shows how to resize the table in a Word document.

C#

```
//Creates an instance of WordDocument class (Empty Word Document)*'|
markdownify }}
WordDocument document = new WordDocument();
//Opens an existing Word document into DocIO instance
document.Open("Template", FormatType.Docx);
//Accesses the instance of the first section in the Word document
WSection section = document.Sections[0];
//Accesses the instance of the first table in the section
WTable table = section.Tables[0] as WTable;
//Resizes the table to fit the contents respect to the contents
table.AutoFit(AutoFitType.FitToContent);
//Accesses the instance of the second table in the section
table = section.Tables[1] as WTable;
//Resizes the table to fit the contents respect to window/page width
table.AutoFit(AutoFitType.FitToWindow);
//Accesses the instance of the third table in the section
table = section.Tables[2] as WTable;
//Resizes the table to fit the contents respect to fixed column width
table.AutoFit(AutoFitType.FixedColumnWidth);
//Saves and closes the document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```

'Creates an instance of WordDocument class (Empty Word Document)
Dim document As WordDocument = New WordDocument
'Opens an existing Word document into DocIO instance
document.Open("Template", FormatType.Docx)
Dim section As WSection = document.Sections(0)
Dim table As WTable = CType(section.Tables(0), WTable)
'Resizes the table to fit the contents respect to the contents
table.AutoFit(AutoFitType.FitToContent)
'Accesses the instance of the second table in the section
table = CType(section.Tables(1), WTable)
'Resizes the table to fit the contents respect to window/page width
table.AutoFit(AutoFitType.FitToWindow)
'Accesses the instance of the third table in the section
table = CType(section.Tables(2), WTable)
'Resizes the table to fit the contents respect to fixed column width
table.AutoFit(AutoFitType.FixedColumnWidth)
'Saves and closes the document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates an instance of WordDocument class (Empty Word Document)
WordDocument document = new WordDocument();
//Opens an existing Word document into DocIO instance
document.Open(assembly.GetManifestResourceStream("Sample.Assets.Template.doc
x"), FormatType.Docx);
//Accesses the instance of the first section in the Word document
WSection section = document.Sections[0];
//Accesses the instance of the first table in the section
WTable table = section.Tables[0] as WTable;
//Resizes the table to fit the contents respect to the contents
table.AutoFit(AutoFitType.FitToContent);
//Accesses the instance of the second table in the section
table = section.Tables[1] as WTable;
//Resizes the table to fit the contents respect to window/page width
table.AutoFit(AutoFitType.FitToWindow);
//Accesses the instance of the third table in the section
table = section.Tables[2] as WTable;
//Resizes the table to fit the contents respect to fixed column width
table.AutoFit(AutoFitType.FixedColumnWidth);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document instance
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```
//Creates an instance of WordDocument class (Empty Word Document)
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument();
//Opens an existing Word document into DocIO instance
document.Open(fileStreamPath, FormatType.Docx);
//Accesses the instance of the first section in the Word document
WSection section = document.Sections[0];
//Accesses the instance of the first table in the section
WTable table = section.Tables[0] as WTable;
//Resizes the table to fit the contents respect to the contents
table.AutoFit(AutoFitType.FitToContent);
//Accesses the instance of the second table in the section
table = section.Tables[1] as WTable;
//Resizes the table to fit the contents respect to window/page width
table.AutoFit(AutoFitType.FitToWindow);
//Accesses the instance of the third table in the section
table = section.Tables[2] as WTable;
//Resizes the table to fit the contents respect to fixed column width
table.AutoFit(AutoFitType.FixedColumnWidth);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");
```

XAMARIN

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Creates an instance of WordDocument class (Empty Word Document)
WordDocument document = new WordDocument();
//Opens an existing Word document into DocIO instance
document.Open(assembly.GetManifestResourceStream("Sample.Assets.Template.doc
x"), FormatType.Docx);
//Accesses the instance of the first section in the Word document
WSection section = document.Sections[0];
//Accesses the instance of the first table in the section
WTable table = section.Tables[0] as WTable;
//Resizes the table to fit the contents respect to the contents
table.AutoFit(AutoFitType.FitToContent);
//Accesses the instance of the second table in the section
table = section.Tables[1] as WTable;
//Resizes the table to fit the contents respect to window/page width
table.AutoFit(AutoFitType.FitToWindow);
//Accesses the instance of the third table in the section
table = section.Tables[2] as WTable;
//Resizes the table to fit the contents respect to fixed column width
table.AutoFit(AutoFitType.FixedColumnWidth);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
```

```
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Closes the document instance
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Note: In ASP.NET Core, UWP, and Xamarin platforms, to apply autofit for table in a Word document we recommend you to use Word to PDF [assemblies](#) or [NuGet](#) packages as a reference in your application.

Working with Table Style

A table style defines a set of table, row, cell and paragraph level formatting that can be applied to a table. `WTableStyle` instance represents table style in a Word document.

Note: Essential DocIO currently provides support for table styles in DOCX and WordML formats alone. The visual appearance is also preserved in Word to PDF, Word to Image, and Word to HTML conversions.

The following code example illustrates how to apply the built-in table styles to the table.

C#

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument("Table.docx", FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltinTableStyle.LightShading);
//Saves and closes the document instance
document.Save("TableStyle.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates an instance of WordDocument class
Dim document As New WordDocument("Table.docx", FormatType.Docx)
Dim section As WSection = document.Sections(0)
Dim table As WTable = TryCast(section.Tables(0), WTable)
'Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltinTableStyle.LightShading)
'Saves and closes the document instance
document.Save("TableStyle.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Table.docx"),
FormatType.Docx);
```

```

WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltinTableStyle.LightShading);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "TableStyle.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates an instance of WordDocument class
FileStream filePath = new FileStream("Table.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(filePath, FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltinTableStyle.LightShading);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "TableStyle.docx");

```

XAMARIN

```

//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Table.d
ocx"), FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltinTableStyle.LightShading);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("TableStyle.docx",
"application/msword", stream);
//Closes the document instance
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin

```

Table style options

Once you have applied a table style, you can enable or disable the special formatting of the table. There are six options: first column, last column, banded rows, banded columns, header row and last row.

The following code example illustrates how to enable and disable the special table formatting options of the table styles

C#

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument("Table.docx", FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltinTableStyle.LightShading);
//Enables special formatting for banded columns of the table
table.ApplyStyleForBandedColumns = true;
//Enables special formatting for banded rows of the table
table.ApplyStyleForBandedRows = true;
//Disables special formatting for first column of the table
table.ApplyStyleForFirstColumn = false;
//Enables special formatting for header row of the table
table.ApplyStyleForHeaderRow = true;
//Enables special formatting for last column of the table
table.ApplyStyleForLastColumn = true;
//Disables special formatting for last row of the table
table.ApplyStyleForLastRow = false;
//Saves and closes the document instance
document.Save("TableStyle.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates an instance of WordDocument class
Dim document As New WordDocument("Table.docx", FormatType.Docx)
Dim section As WSection = document.Sections(0)
Dim table As WTable = TryCast(section.Tables(0), WTable)
'Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltinTableStyle.LightShading)
'Enables special formatting for banded columns of the table
table.ApplyStyleForBandedColumns = True
'Enables special formatting for banded rows of the table
table.ApplyStyleForBandedRows = True
'Disables special formatting for first column of the table
table.ApplyStyleForFirstColumn = False
'Enables special formatting for header row of the table
table.ApplyStyleForHeaderRow = True
'Enables special formatting for last column of the table
table.ApplyStyleForLastColumn = True
'Disables special formatting for last row of the table
table.ApplyStyleForLastRow = False
'Saves and closes the document instance
document.Save("TableStyle.docx", FormatType.Docx)
document.Close()
```

UWP

```

//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Table.docx"),
FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Applies "LightShading" built-in style to table
table.ApplyStyle(BuiltInTableStyle.LightShading);
//Enables special formatting for banded columns of the table
table.ApplyStyleForBandedColumns = true;
//Enables special formatting for banded rows of the table
table.ApplyStyleForBandedRows = true;
//Disables special formatting for first column of the table
table.ApplyStyleForFirstColumn = false;
//Enables special formatting for header row of the table
table.ApplyStyleForHeaderRow = true;
//Enables special formatting for last column of the table
table.ApplyStyleForLastColumn = true;
//Disables special formatting for last row of the table
table.ApplyStyleForLastRow = false;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "TableStyle.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform

"application/msword", stream);
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Custom table style

The following code example illustrates how to apply a custom table style to table.

C#

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument("Table.docx", FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Adds a new custom table style
WTableStyle tableStyle = document.AddTableStyle("CustomStyle") as
WTableStyle;
```

```

//Applies formatting for whole table
tableStyle.TableProperties.RowStripe = 1;
tableStyle.TableProperties.ColumnStripe = 1;
tableStyle.TableProperties.Paddings.Top = 0;
tableStyle.TableProperties.Paddings.Bottom = 0;
tableStyle.TableProperties.Paddings.Left = 5.4f;
tableStyle.TableProperties.Paddings.Right = 5.4f;
//Applies conditional formatting for first row
ConditionalFormattingStyle firstRowStyle =
tableStyle.ConditionalFormattingStyles.Add(ConditionalFormattingType.FirstRow);
firstRowStyle.CharacterFormat.Bold = true;
firstRowStyle.CharacterFormat.TextColor = Color.FromArgb(255, 255, 255, 255);
firstRowStyle.CellProperties.BackColor = Color.Blue;
//Applies conditional formatting for first column
ConditionalFormattingStyle firstColumnStyle =
tableStyle.ConditionalFormattingStyles.Add(ConditionalFormattingType.FirstColumn);
firstColumnStyle.CharacterFormat.Bold = true;
//Applies conditional formatting for odd row
ConditionalFormattingStyle oddRowBandingStyle =
tableStyle.ConditionalFormattingStyles.Add(ConditionalFormattingType.OddRowBanding);
oddRowBandingStyle.CellProperties.BackColor = Color.WhiteSmoke;
//Applies the custom table style to the table
table.ApplyStyle("CustomStyle");
//Saves and closes the document instance
document.Save("TableStyle.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates an instance of WordDocument class
Dim document As New WordDocument("Table.docx", FormatType.Docx)
Dim section As WSection = document.Sections(0)

```

Merging cells vertically and horizontally

You can combine two or more table cells located in the same row or column into a single cell.

The following code example illustrates how to apply horizontal merge to specified range of cells in a specified row.

C#

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
section.AddParagraph().AppendText("Horizontal merging of Table cells");
IWTable table = section.AddTable();
table.ResetCells(5, 5);
//Specifies the horizontal merge from second cell to fifth cell in third row
table.ApplyHorizontalMerge(2, 1, 4);
//Saves and closes the document instance
document.Save("HorizontalMerge.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates an instance of WordDocument class
Dim document As New WordDocument()
Dim section As IWSection = document.AddSection()
section.AddParagraph().AppendText("Horizontal merging of Table cells")
Dim table As IWTable = section.AddTable()
table.ResetCells(5, 5)
'Specifies the horizontal merge from second cell to fifth cell in third row
table.ApplyHorizontalMerge(2, 1, 4)
'Saves and closes the document instance
document.Save("HorizontalMerge.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
section.AddParagraph().AppendText("Horizontal merging of Table cells");
IWTable table = section.AddTable();
table.ResetCells(5, 5);
//Specifies the horizontal merge from second cell to fifth cell in third row
table.ApplyHorizontalMerge(2, 1, 4);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "HorizontalMerge.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```

Specifying table header row to repeat on each page

You can specify one or more rows in a table to be repeated as header row at the top of each page, when the table spans across multiple pages.

- In the case of a single header row, it must be the first row in the table.
- In the case of multiple header rows, then header rows must be consecutive from the first row of the table.

Note: Heading rows do not have any effect with nested tables in Microsoft Word as well as DocIO

The following code example illustrates how to create a table with a single header row.

C#

```

//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
IWTable table = section.AddTable();
table.ResetCells(50, 1);
WTableRow row = table.Rows[0];
//Specifies the first row as a header row of the table
row.IsHeader = true;
row.Height = 20;
row.HeightType = TableRowHeightType.AtLeast;
row.Cells[0].AddParagraph().AppendText("Header Row");
for (int i = 1; i < 50; i++)
{
    row = table.Rows[i];
    row.Height = 20;
    row.HeightType = TableRowHeightType.AtLeast;
    row.Cells[0].AddParagraph().AppendText("Text in Row" + i.ToString());
}
//Saves and closes the document instance
document.Save("TableWithHeaderRow.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates an instance of WordDocument class
Dim document As New WordDocument()
Dim section As IWSection = document.AddSection()

```

```

Dim table As ITable = section.AddTable()
table.ResetCells(50, 1)
Dim row As WTableRow = table.Rows(0)
'Specifies the first row as a header row of the table
row.IsHeader = True
row.Height = 20
row.HeightType = TableRowHeightType.AtLeast
row.Cells(0).AddParagraph().AppendText("Header Row")
For i As Integer = 1 To 49
row = table.Rows(i)
row.Height = 20
row.HeightType = TableRowHeightType.AtLeast
row.Cells(0).AddParagraph().AppendText("Text in Row" + i.ToString())
Next
'Saves and closes the document instance
document.Save("TableWithHeaderRow.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
ITable table = section.AddTable();
table.ResetCells(50, 1);
WTableRow row = table.Rows[0];
//Specifies the first row as a header row of the table
row.IsHeader = true;
row.Height = 20;
row.HeightType = TableRowHeightType.AtLeast;
row.Cells[0].AddParagraph().AppendText("Header Row");
for (int i = 1; i < 50; i++)
{
row = table.Rows[i];
row.Height = 20;
row.HeightType = TableRowHeightType.AtLeast;
row.Cells[0].AddParagraph().AppendText("Text in Row" + i.ToString());
}
//Saves the Word file to MemoryStream

```

Keeping rows from breaking across pages

You can enable or disable the table row content to split across multiple pages, when the row contents do not fit in a previous page.

The following code example illustrates how to disable all the table rows from splitting across multiple pages.

C#

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument("Template.docx");
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Disables breaking across pages for all rows in the table.
foreach (WTableRow row in table.Rows)
    row.RowFormat.IsBreakAcrossPages = false;
//Saves and closes the document instance
document.Save("Result.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates an instance of WordDocument class
Dim document As New WordDocument("Template.docx")
Dim section As WSection = document.Sections(0)
Dim table As WTable = TryCast(section.Tables(0), WTable)
'Disables breaking across pages for all rows in the table.
For Each row As WTableRow In table.Rows
    row.RowFormat.IsBreakAcrossPages = False
Next
'Saves and closes the document instance
document.Save("Result.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"), FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Disables breaking across pages for all rows in the table.
foreach (WTableRow row in table.Rows)
    row.RowFormat.IsBreakAcrossPages = false;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates an instance of WordDocument class
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Disables breaking across pages for all rows in the table.
foreach (WTableRow row in table.Rows)
row.RowFormat.IsBreakAcrossPages = false;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Templat
e.docx"), FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Disables breaking across pages for all rows in the table.
foreach (WTableRow row in table.Rows)
row.RowFormat.IsBreakAcrossPages = false;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Iterating through table elements

The following code example illustrates how to iterate through the table and apply back color to a particular cell.

C#

```
//Creates an instance of WordDocument class
WordDocument document = new WordDocument("Template.docx");
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Iterates the rows of the table
foreach (WTableRow row in table.Rows)
```

```

{
    //Iterates through the cells of rows
    foreach (WTableCell cell in row.Cells)
    {
        //Iterates through the paragraphs of the cell
        foreach (WParagraph paragraph in cell.Paragraphs)
        {
            //When the paragraph contains text Panda then apply green as back color to cell
            if (paragraph.Text.Contains("panda"))
            {
                cell.CellFormat.BackColor = Color.Green;
            }
        }
    }
    //Saves and closes the document instance
    document.Save("Sample.docx", FormatType.Docx);
    document.Close();
}

```

VB.NET

```

'Creates an instance of WordDocument class
Dim document As New WordDocument("Template.docx")
Dim section As WSection = document.Sections(0)
Dim table As WTable = TryCast(section.Tables(0), WTable)
'Iterates the rows of the table
For Each row As WTableRow In table.Rows
    'Iterates through the cells of rows
    For Each cell As WTableCell In row.Cells
        'Iterates through the paragraphs of the cell
        For Each paragraph As WParagraph In cell.Paragraphs
            'When the paragraph contains text Panda then apply green as back color to cell
            If paragraph.Text.Contains("panda") Then
                cell.CellFormat.BackColor = Color.Green
            End If
        Next
    Next
Next
'Saves and closes the document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"),
FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Iterates the rows of the table
foreach (WTableRow row in table.Rows)
{
    //Iterates through the cells of rows
    foreach (WTableCell cell in row.Cells)

```

```

{
    //Iterates through the paragraphs of the cell
    foreach (WParagraph paragraph in cell.Paragraphs)
    {
        //When the paragraph contains text Panda then apply green as back color to cell
        if (paragraph.Text.Contains("panda"))
            cell.CellFormat.BackColor = Color.Green;
    }
}

//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates an instance of WordDocument class
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Iterates the rows of the table
foreach (WTableRow row in table.Rows)
{
    //Iterates through the cells of rows
    foreach (WTableCell cell in row.Cells)
    {
        //Iterates through the paragraphs of the cell
        foreach (WParagraph paragraph in cell.Paragraphs)
        {
            //When the paragraph contains text Panda then apply green as back color to cell
            if (paragraph.Text.Contains("panda"))
                cell.CellFormat.BackColor = Color.Green;
        }
    }
}

//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");

```

XAMARIN

```

//Creates an instance of WordDocument class
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Assets.Template.docx"), FormatType.Docx);
WSection section = document.Sections[0];
WTable table = section.Tables[0] as WTable;
//Iterates the rows of the table
foreach (WTableRow row in table.Rows)
{
    //Iterates through the cells of rows
    foreach (WTableCell cell in row.Cells)
    {
        //Iterates through the paragraphs of the cell
        foreach (WParagraph paragraph in cell.Paragraphs)
        {
            //When the paragraph contains text Panda then apply green as back color to cell
            if (paragraph.Text.Contains("panda"))
            cell.CellFormat.BackColor = Color.Green;
        }
    }
}
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
document.Close();

```

Working with Bookmarks

A bookmark identifies a location or a selection of text within a document that you can name and identify for future reference.

In Essential DocIO, bookmark is represented by Bookmark instance that is a pair of BookmarkStart and BookmarkEnd. BookmarkStart represents start point of a bookmark and BookmarkEnd represents end point of a bookmark. Every Word document contains a collection of bookmarks that are accessible through the Bookmarks property of WordDocument class.

Adding a bookmark

The following code example shows how to add a bookmark in Word document.

C#

```

//Creates an instance of WordDocument class (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a new section into the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Northwind Database");

```

```

paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center;
//Adds a paragraph into section
paragraph = section.AddParagraph();
//Adds a new bookmark start into paragraph with name "Northwind"
paragraph.AppendBookmarkStart("Northwind");
//Adds a text between the bookmark start and end into paragraph
paragraph.AppendText("The Northwind sample database (Northwind.mdb) is
included with all versions of Access. It provides data you can experiment
with and database objects that demonstrate features you might want to
implement in your own databases.");
//Adds a new bookmark end into paragraph with name " Northwind "
paragraph.AppendBookmarkEnd("Northwind");
//Adds a text after the bookmark end
paragraph.AppendText(" Using Northwind, you can become familiar with how a
relational database is structured and how the database objects work together
to help you enter, store, manipulate, and print your data.");
//Saves the document in the given name and format
document.Save("Bookmarks.docx", FormatType.Docx);
//Releases the resources occupied by WordDocument instance
document.Close();

```

VB.NET

```

'Creates an instance of WordDocument class (Empty Word Document)
Dim document As New WordDocument()
'Adds a new section into the Word Document
Dim section As IWSection = document.AddSection()
'Adds a new paragraph into Word document and appends text into paragraph
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("Northwind Database")
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center
'Adds a paragraph into section
paragraph = section.AddParagraph()
'Adds a new bookmark start into paragraph with name "Northwind"
paragraph.AppendBookmarkStart("Northwind")
'Adds a text between the bookmark start and end into paragraph
paragraph.AppendText("The Northwind sample database (Northwind.mdb) is
included with all versions of Access. It provides data you can experiment
with and database objects that demonstrate features you might want to
implement in your own databases.")
'Adds a new bookmark end into paragraph with name " Northwind "
paragraph.AppendBookmarkEnd("Northwind")
'Adds a text after the bookmark end
paragraph.AppendText(" Using Northwind, you can become familiar with how a
relational database is structured and how the database objects work together
to help you enter, store, manipulate, and print your data.")
'Saves the document in the given name and format
document.Save("Bookmarks.docx", FormatType.Docx)
'Releases the resources occupied by WordDocument instance
document.Close()

```

UWP

```

//Creates an instance of WordDocument class (Empty Word Document)

```

```

WordDocument document = new WordDocument();
//Adds a new section into the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document and appends text into paragraph

```

Obtaining a bookmark instance

The following code example shows how to retrieve an instance of bookmark from a Word document.

C#

```
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument("Bookmarks.docx", FormatType.Docx);
//Gets the bookmark instance by using FindByName method of
BookmarkCollection with bookmark name
Syncfusion.DocIO.DLS.Bookmark bookmark =
document.Bookmarks.FindByName("Northwind");
//Accesses the bookmark start's owner paragraph by using bookmark and
changes its back color
bookmark.BookmarkStart.OwnerParagraph.ParagraphFormat.BackColor =
Color.AliceBlue;
document.Save("Result.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads an existing Word document into DocIO instance
Dim document As New WordDocument("Bookmarks.docx", FormatType.Docx)
'Gets the bookmark instance by using FindByName method of BookmarkCollection
with bookmark name
Dim bookmark As Syncfusion.DocIO.DLS.Bookmark =
document.Bookmarks.FindByName("Northwind")
'Accesses the bookmark start's owner paragraph by using bookmark and changes
its back color
bookmark.BookmarkStart.OwnerParagraph.ParagraphFormat.BackColor =
Color.AliceBlue
document.Save("Result.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new WordDocument("Sample.Assets.Bookmarks.docx",
FormatType.Docx);
//Gets the bookmark instance by using FindByName method of
BookmarkCollection with bookmark name
Syncfusion.DocIO.DLS.Bookmark bookmark =
document.Bookmarks.FindByName("Northwind");
//Accesses the bookmark start's owner paragraph by using bookmark and
changes its back color
bookmark.BookmarkStart.OwnerParagraph.ParagraphFormat.BackColor =
Color.AliceBlue;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Loads an existing Word document into DocIO instance
FileStream fileStreamPath = new FileStream(@"Bookmarks.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Gets the bookmark instance by using FindByName method of
BookmarkCollection with bookmark name
Syncfusion.DocIO.DLS.Bookmark bookmark =
document.Bookmarks.FindByName("Northwind");
//Accesses the bookmark start's owner paragraph by using bookmark and
changes its back color
bookmark.BookmarkStart.OwnerParagraph.ParagraphFormat.BackColor =
Color.AliceBlue;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Bookmar
ks.docx"), FormatType.Docx);
//Gets the bookmark instance by using FindByName method of
BookmarkCollection with bookmark name
Syncfusion.DocIO.DLS.Bookmark bookmark =
document.Bookmarks.FindByName("Northwind");
//Accesses the bookmark start's owner paragraph by using bookmark and
changes its back color
bookmark.BookmarkStart.OwnerParagraph.ParagraphFormat.BackColor =
Color.AliceBlue;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();

file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Removing a Bookmark from Word document

The following code example shows how to remove a bookmark from Word document.

C#

```
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument("Bookmarks.docx", FormatType.Docx);
//Gets the bookmark instance by using FindByName method of
BookmarkCollection with bookmark name
Bookmark bookmark = document.Bookmarks.FindByName("Northwind");
//Removes the bookmark named "Northwind" from Word document.
document.Bookmarks.Remove(bookmark);
document.Save("Result.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads an existing Word document into DocIO instance
Dim document As New WordDocument("Bookmarks.docx", FormatType.Docx)
'Gets the bookmark instance by using FindByName method of BookmarkCollection
with bookmark name
Dim bookmark As Bookmark = document.Bookmarks.FindByName("Northwind")
'Removes the bookmark named "Northwind" from Word document.
document.Bookmarks.Remove(bookmark)
document.Save("Result.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Bookmarks.doc
x"), FormatType.Docx);
//Gets the bookmark instance by using FindByName method of
BookmarkCollection with bookmark name
Bookmark bookmark = document.Bookmarks.FindByName("Northwind");
//Removes the bookmark named "Northwind" from Word document.
document.Bookmarks.Remove(bookmark);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Loads an existing Word document into DocIO instance
FileStream filePath = new FileStream(@"Bookmarks.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(filePath, FormatType.Docx);
//Gets the bookmark instance by using FindByName method of
BookmarkCollection with bookmark name
Bookmark bookmark = document.Bookmarks.FindByName("Northwind");
//Removes the bookmark named "Northwind" from Word document.
```

```
document.Bookmarks.Remove(bookmark);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Bookmarks.docx"), FormatType.Docx);
//Gets the bookmark instance by using FindByName method of

```

Retrieving contents within a bookmark

BookmarkNavigator is used for navigating to a bookmark in a Word document. You can retrieve, replace and delete the content of a specified bookmark by using BookmarkNavigator.

You can get the content between bookmark start and bookmark end of the specified bookmark in two ways:

1. You can use `GetBookmarkContent` method for retrieving content as collection of body items when the bookmark start and bookmark end are preserved in a single section.
2. You can use `GetContent` method for retrieving content as collection of sections when the bookmark start and bookmark end are preserved in different sections.

The following code example shows how to retrieve the specified bookmark content by using `GetBookmarkContent` method in a Word document.

C#

```
WordDocument document = new WordDocument("Bookmarks.docx", FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
```

```

BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Gets the bookmark content
TextBodyPart part = bookmarkNavigator.GetBookmarkContent();
//Adds the retrieved content into another new section
document.AddSection();
for (int i = 0; i < part.BodyItems.Count; i++)
document.LastSection.Body.ChildEntities.Add(part.BodyItems[i]);
document.Save("Result.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

Dim document As New WordDocument("Bookmarks.docx", FormatType.Docx)
'Creates the bookmark navigator instance to access the bookmark
Dim bookmarkNavigator As New BookmarksNavigator(document)
'Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind")
'Gets the bookmark content
Dim part As TextBodyPart = bookmarkNavigator.GetBookmarkContent()
'Adds the retrieved content into another new section
document.AddSection()
For i As Integer = 0 To part.BodyItems.Count - 1
document.LastSection.Body.ChildEntities.Add(part.BodyItems(i))
Next
document.Save("Result.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Bookmarks.doc
x"), FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Gets the bookmark content
TextBodyPart part = bookmarkNavigator.GetBookmarkContent();
//Adds the retrieved content into another new section
document.AddSection();
for (int i = 0; i < part.BodyItems.Count; i++)
document.LastSection.Body.ChildEntities.Add(part.BodyItems[i]);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();

```

The following code example shows how to retrieve the specified bookmark content by using `GetContent` method in a Word document.

C#

```
//Loads the template document with bookmark "Northwind" whose start and end
are preserved in different section.
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Gets the bookmark content as WordDocumentPart
WordDocumentPart wordDocumentPart = bookmarkNavigator.GetContent();
//Saves the WordDocumentPart as separate Word document
WordDocument newDocument = wordDocumentPart.GetAsWordDocument();
//Close the WordDocumentPart instance
wordDocumentPart.Close();
//Close the template Word document
document.Close();
newDocument.Save("Result.docx", FormatType.Docx);
//Releases the resources hold by WordDocument instance
newDocument.Close();
```

VB.NET

```
'Loads the template document with bookmark "Northwind" whose start and end
are preserved in different section
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Creates the bookmark navigator instance to access the bookmark
Dim bookmarkNavigator As New BookmarksNavigator(document)
'Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind")
'Gets the bookmark content as WordDocumentPart
Dim wordDocumentPart As WordDocumentPart = bookmarkNavigator.GetContent()
'Saves the WordDocumentPart as separate Word document
Dim newDocument As WordDocument = wordDocumentPart.GetAsWordDocument()
'Close the WordDocumentPart instance
wordDocumentPart.Close()
'Close the template Word document
document.Close()
newDocument.Save("Result.docx", FormatType.Docx)
'Releases the resources hold by WordDocument instance
newDocument.Close()
```

UWP

```

```

Inserting content into a bookmark

You can insert table, paragraph, simple text and paragraph item at the start or end location of the current bookmark by using bookmark navigator.

The following code example shows how to insert a simple text by using BookmarkNavigator.

C#

```

WordDocument document = new WordDocument("Bookmarks.docx", FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark "Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Inserts a new text before the bookmark end of the bookmark
bookmarkNavigator.InsertText(" Northwind Database is a set of tables containing data fitted into predefined categories.");
document.Save("Result.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

Dim document As New WordDocument("Bookmarks.docx", FormatType.Docx)
'Creates the bookmark navigator instance to access the bookmark
Dim bookmarkNavigator As New BookmarksNavigator(document)
'Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind")
'Inserts a new text before the bookmark end of the bookmark
bookmarkNavigator.InsertText(" Northwind Database is a set of tables
containing data fitted into predefined categories.")
document.Save("Result.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Bookmarks.doc
x"), FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Inserts a new text before the bookmark end of the bookmark
bookmarkNavigator.InsertText(" Northwind Database is a set of tables
containing data fitted into predefined categories.");
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads the template document
FileStream fileStreamPath = new FileStream(@"Bookmarks.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Inserts a new text before the bookmark end of the bookmark
bookmarkNavigator.InsertText(" Northwind Database is a set of tables
containing data fitted into predefined categories.");
//Saves the Word document to MemoryStream

table[2, 1].AddParagraph().AppendText("3");
bookmarkNavigator.InsertTable(table);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close();

```

The following code example shows how to insert a TextBodyPart by using BookmarkNavigator.

C#

```

WordDocument document = new WordDocument("Bookmarks.docx", FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Gets the bookmark content
TextBodyPart textBodyPart = bookmarkNavigator.GetBookmarkContent();
document.AddSection();
IWParagraph paragraph = document.LastSection.AddParagraph();
paragraph.AppendText("Northwind Database is a set of tables containing data
fitted into predefined categories.");
//Adds the new bookmark into Word document
paragraph.AppendBookmarkStart("bookmark_empty");
paragraph.AppendBookmarkEnd("bookmark_empty");
//Moves the virtual cursor to the location after the start of the bookmark
"bookmark_empty"
bookmarkNavigator.MoveToBookmark("bookmark_empty", true, true);
//Inserts the text body part after the bookmark start
bookmarkNavigator.InsertTextBodyPart(textBodyPart);
document.Save("Result.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

Dim document As New WordDocument("Bookmarks.docx", FormatType.Docx)
'Creates the bookmark navigator instance to access the bookmark
Dim bookmarkNavigator As New BookmarksNavigator(document)
'Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind")
'Gets the bookmark content
Dim textBodyPart As TextBodyPart = bookmarkNavigator.GetBookmarkContent()
document.AddSection()
Dim paragraph As IWParagraph = document.LastSection.AddParagraph()
paragraph.AppendText("Northwind Database is a set of tables containing data
fitted into predefined categories.")
'Adds the new bookmark into Word document
paragraph.AppendBookmarkStart("bookmark_empty")
paragraph.AppendBookmarkEnd("bookmark_empty")
'Moves the virtual cursor to the location after the start of the bookmark
"bookmark_empty"
bookmarkNavigator.MoveToBookmark("bookmark_empty", True, True)
'Inserts the text body part after the bookmark start
bookmarkNavigator.InsertTextBodyPart(textBodyPart)
document.Save("Result.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Bookmarks.doc
x"), FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark

```

```

BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Gets the bookmark content
TextBodyPart textBodyPart = bookmarkNavigator.GetBookmarkContent();
document.AddSection();
IWParagraph paragraph = document.LastSection.AddParagraph();
paragraph.AppendText("Northwind Database is a set of tables containing data
fitted into predefined categories.");
//Adds the new bookmark into Word document
paragraph.AppendBookmarkStart("bookmark_empty");
paragraph.AppendBookmarkEnd("bookmark_empty");
//Moves the virtual cursor to the location after the start of the bookmark
"bookmark_empty"
bookmarkNavigator.MoveToBookmark("bookmark_empty", true, true);
//Inserts the text body part after the bookmark start
bookmarkNavigator.InsertTextBodyPart(textBodyPart);
//Saves the Word file to MemoryStream

```

Deleting content from a bookmark

You can delete the contents between bookmark start and end of the specified bookmark in a Word document.

The following code example shows how to remove the contents of a specified bookmark from Word document.

C#

```
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument("Bookmarks.docx", FormatType.Docx);
```

```
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind "
bookmarkNavigator.MoveToBookmark("Northwind");
//Deletes bookmark content without deleting the format in the target
document.
bookmarkNavigator.DeleteBookmarkContent(false);
document.Save("Result.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads an existing Word document into DocIO instance
Dim document As New WordDocument("Bookmarks.docx", FormatType.Docx)
'Creates the bookmark navigator instance to access the bookmark
Dim bookmarkNavigator As New BookmarksNavigator(document)
'Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind")
'Deletes bookmark content without deleting the format in the target
document.
bookmarkNavigator.DeleteBookmarkContent(False)
document.Save("Result.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Bookmarks.doc
x"), FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind "
bookmarkNavigator.MoveToBookmark("Northwind");
//Deletes bookmark content without deleting the format in the target
document.
bookmarkNavigator.DeleteBookmarkContent(false);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Loads an existing Word document into DocIO instance
```

```

FileStream filePath = new FileStream("Bookmarks.docx", FileMode.Open,
    FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(filePath, FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind "
bookmarkNavigator.MoveToBookmark("Northwind");
//Deletes bookmark content without deleting the format in the target
document.
bookmarkNavigator.DeleteBookmarkContent(false);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Bookmar
ks.docx"), FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind "
bookmarkNavigator.MoveToBookmark("Northwind");
//Deletes bookmark content without deleting the format in the target
document.
bookmarkNavigator.DeleteBookmarkContent(false);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform

xamarin#helper-files-for-xamarin

```

Replacing content in a bookmark

You can replace the contents of an existing bookmark with simple text, TextBodyPart, WordDocumentPart.

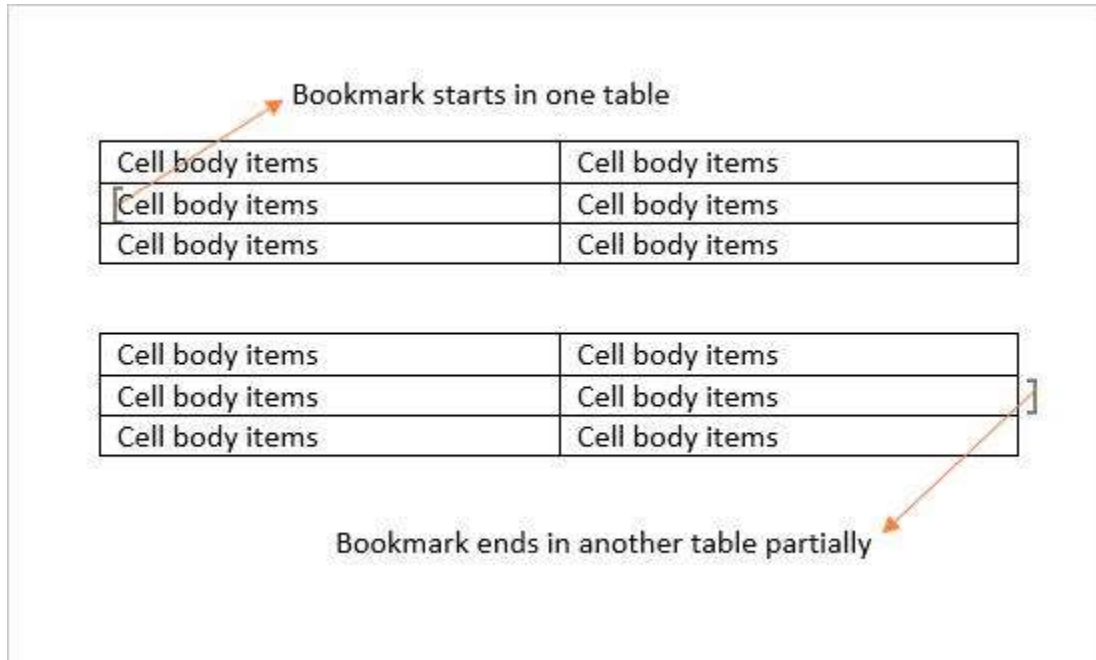

Note:

You cannot replace the multi section contents into a bookmark within table in Word documents. Use "for loop" instead of "foreach loop" to iterate through document elements when replacing the

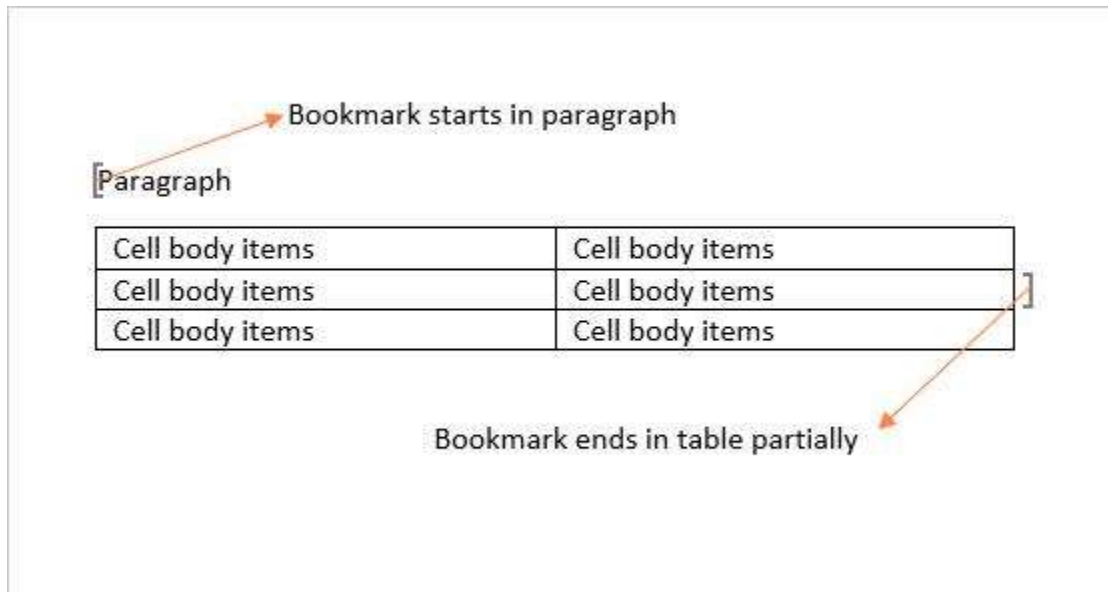

bookmark contents to avoid “collection modified exception”, as there is a chance for modification in the document elements on replacing the bookmark contents.

As per Microsoft Word behavior, you cannot replace the bookmark contents when the bookmark start and end is not in a same table as following cases:

Case 1

Case 2

The following code example shows how to replace a specified bookmark content by using `ReplaceBookmarkContent` method in Word document.

C#

```

WordDocument document = new WordDocument("Bookmarks.docx", FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark
BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Gets the bookmark content
TextBodyPart textBodyPart = bookmarkNavigator.GetBookmarkContent();
document.AddSection();
IWParagraph paragraph = document.LastSection.AddParagraph();
paragraph.AppendText("Northwind Database is a set of tables containing data
fitted into predefined categories.");
//Adds the new bookmark into Word document
paragraph.AppendBookmarkStart("bookmark_empty");
paragraph.AppendBookmarkEnd("bookmark_empty");
//Moves the virtual cursor to the location before the end of the bookmark
"bookmark_empty"
bookmarkNavigator.MoveToBookmark("bookmark_empty");
//Replaces the bookmark content with text body part
bookmarkNavigator.ReplaceBookmarkContent(textBodyPart);
document.Save("Result.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

Dim document As New WordDocument("Bookmarks.docx", FormatType.Docx)
'Creates the bookmark navigator instance to access the bookmark
Dim bookmarkNavigator As New BookmarksNavigator(document)
'Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind")
'Gets the bookmark content
Dim textBodyPart As TextBodyPart = bookmarkNavigator.GetBookmarkContent()
document.AddSection()
Dim paragraph As IWParagraph = document.LastSection.AddParagraph()
paragraph.AppendText("Northwind Database is a set of tables containing data
fitted into predefined categories.")
'Adds the new bookmark into Word document
paragraph.AppendBookmarkStart("bookmark_empty")
paragraph.AppendBookmarkEnd("bookmark_empty")
'Moves the virtual cursor to the location before the end of the bookmark
"bookmark_empty"
bookmarkNavigator.MoveToBookmark("bookmark_empty")
'Replaces the bookmark content with text body part
bookmarkNavigator.ReplaceBookmarkContent(textBodyPart)
document.Save("Result.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Bookmarks.doc
x"), FormatType.Docx);
//Creates the bookmark navigator instance to access the bookmark

```

```

BookmarksNavigator bookmarkNavigator = new BookmarksNavigator(document);
//Moves the virtual cursor to the location before the end of the bookmark
"Northwind"
bookmarkNavigator.MoveToBookmark("Northwind");
//Gets the bookmark content
TextBodyPart textBodyPart = bookmarkNavigator.GetBookmarkContent();
document.AddSection();
IWParagraph paragraph = document.LastSection.AddParagraph();
paragraph.AppendText("Northwind Database is a set of tables containing data
fitted into predefined categories.");
//Adds the new bookmark into Word document
paragraph.AppendBookmarkStart("bookmark_empty");
paragraph.AppendBookmarkEnd("bookmark_empty");
//Moves the virtual cursor to the location before the end of the bookmark

file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Working with document Fields

Fields in a Word document are placeholders for data that might change on field update. Fields are represented by the `WField` and `WFieldMark` instances in DocIO. A field in a Word document contains field codes, field separator, field result, and field end.

To learn various types of Microsoft Word supported fields and their syntax, refer to the [MSDN article](#)

From v16.1.0.24, the entire field code is included in Document Object Model(DOM). Hence, adding a field will automatically include the following elements in DOM:

1. `WField`: Represents the starting of a Field.
2. `ParagraphItem`: Represents the Field code.
3. `WFieldMark`: Represents the Field separator.
4. `ParagraphItem`: Represents the Field result.
5. `WFieldMark`: Represents the end of a Field.

Find more information about migration changes [here](#).

Adding fields

You can add a field to a Word document by using the `AppendField` method of `WParagraph` class.

The following code example explains how to add a field to the Word document.

C#

```
//Creates an instance of WordDocument class (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a new section to the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph to Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Today's Date: ");
//Adds the new Date field to Word document with field name and its type
WField field = paragraph.AppendField("Date", FieldType.FieldDate) as WField;
//Field code used to describe how to display the date
field.FieldCode = @"DATE \@\" + "\"MMMM d, yyyy\"";
//Saves the document in the given name and format
document.Save("Sample.docx", FormatType.Docx);
//Releases the resources occupied by WordDocument instance
document.Close();
```

VB.NET

```
'Creates an instance of WordDocument class (Empty Word Document)
Dim document As New WordDocument()
```

```

'Adds a new section to the Word Document
Dim section As IWSection = document.AddSection()
'Adds a new paragraph to Word document and appends text into paragraph
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("Today's Date: ")
'Adds the new Date field to Word document with field name and its type
Dim field As WField = TryCast(paragraph.AppendField("Date",
FieldType.FieldDate), WField)
'Field code used to describe how to display the date
field.FieldCode = "DATE \@ + \"\"MMMM d, yyyy\"\"
'Saves the document in the given name and format
document.Save("Sample.docx", FormatType.Docx)
'Releases the resources occupied by WordDocument instance
document.Close()

```

UWP

```

//Creates an instance of WordDocument class (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a new section to the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph to Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Today's Date: ");
//Adds the new Date field to Word document with field name and its type
WField field = paragraph.AppendField("Date", FieldType.FieldDate) as WField;
//Field code used to describe how to display the date
field.FieldCode = @"DATE \@ + \"\"MMMM d, yyyy\"\";
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Refer to the following link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates an instance of WordDocument class (Empty Word Document)
WordDocument document = new WordDocument();
//Adds a new section to the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph to Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Today's Date: ");
//Adds the new Date field to Word document with field name and its type
WField field = paragraph.AppendField("Date", FieldType.FieldDate) as WField;
//Field code used to describe how to display the date
field.FieldCode = @"DATE \@ + \"\"MMMM d, yyyy\"\";
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document

```

```
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");
```

XAMARIN

```
//Creates an instance of WordDocument class (Empty Word Document)

xamarin#helper-files-for-xamarin
```

Formatting fields

You can format the field instances added to the Word document by iterating the items from field start to end.

The following code example explains how to format the field in Word document.

C#

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Adds the new Page field to Word document with field name and its type
IWField field = document.LastParagraph.AppendField("Page",
FieldType.FieldPage);
IEntity entity = field;
//Iterates to sibling items until Field End
while (entity.NextSibling != null)
{
    if (entity is WTextRange)
    //Sets character format for text ranges
    (entity as WTextRange).CharacterFormat.FontSize = 6;
    else if ((entity is WFieldMark) && (entity as WFieldMark).Type ==
FieldMarkType.FieldEnd)
    break;
```

```
//Gets next sibling item
entity = entity.NextSibling;
}
//Saves and closes the WordDocument instance
document.Save("Template.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates an instance of a WordDocument
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds the new Page field in Word document with field name and its type
Dim field As IField = document.LastParagraph.AppendField("Page",
FieldType.FieldPage)
Dim entity As IEntity = field
'Iterates to sibling items until Field End
While (Not (entity.NextSibling) Is Nothing)
'Sets character format for text ranges
If (TypeOf entity Is WTextRange) Then
CType(entity, WTextRange).CharacterFormat.FontSize = 6
ElseIf ((TypeOf entity Is WFieldMark) AndAlso (CType(entity,
WFieldMark).Type = FieldMarkType.FieldEnd)) Then
Exit While
End If
'Gets next sibling item
entity = entity.NextSibling
End While
'Saves and closes the WordDocument instance
document.Save("Template.docx", FormatType.Docx)
document.Close
```

UWP

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Adds the new Page field to Word document with field name and its type
IField field = document.LastParagraph.AppendField("Page",
FieldType.FieldPage);
IEntity entity = field;
//Iterates to sibling items until Field End
while (entity.NextSibling != null)
{
if (entity is WTextRange)
//Sets character format for text ranges
(entity as WTextRange).CharacterFormat.FontSize = 6;
else if ((entity is WFieldMark) && (entity as WFieldMark).Type ==
FieldMarkType.FieldEnd)
break;
//Gets next sibling item.
entity = entity.NextSibling;
}
//Saves the Word file to MemoryStream
```

```

MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Template.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

xamarin#helper-files-for-xamarin

```

Updating fields

Field updating engine calculates the resultant value based on the field code information and updates the field result with a new value. You can update the following fields by using DocIO:

- = (formula field)
- DATE
- TIME
- DOCVARIABLE
- DOCPROPERTY
- COMPARE
- IF
- NEXTIF
- MERGEREC
- MERGESEQ
- SECTION
- NUMPAGES
- TITLE
- Cross-Reference

The following are the known limitations:

- Updating of NUMPAGES field and Cross Reference field with Page number and Paragraph number options are not supported in Silverlight, WinRT, Universal, Windows Phone, and Xamarin applications.
- Currently group shapes, drawing canvas, and table auto resizing are not supported in Word to PDF layouting, and this may lead to update incorrect page number and total number of pages.

The following code example explains how to update the fields present in Word document.

C#

```
//Loads an existing Word document into DocIO instance
WordDocument document = new WordDocument("Input.docx", FormatType.Docx);
//Updates the fields present in a document
document.UpdateDocumentFields();
document.Save("Result.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads an existing Word document into DocIO instance
Dim document As New WordDocument("Input.docx", FormatType.Docx)
'Updates the fields present in a document
document.UpdateDocumentFields()
document.Save("Result.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Input.docx"),
FormatType.Docx);
//Updates the fields present in a document
document.UpdateDocumentFields();
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Loads an existing Word document into DocIO instance
FileStream fileStreamPath = new FileStream("Input.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Updates the fields present in a document
document.UpdateDocumentFields();
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
//Loads an existing Word document into DocIO instance
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Input.docx"), FormatType.Docx);
//Updates the fields present in a document
document.UpdateDocumentFields();
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as

```

IF field

IF field compares two values and updates the field result with true text, when comparison succeeds otherwise false text.

To learn more about IF field and its syntax in Microsoft Word, refer to the [MSDN article](#)

The following code example explains how to add an If field to a Word document.

C#

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("If field which uses string of characters in
expression");
paragraph = section.AddParagraph();
//Creates the new instance of IF field
WIfField field = paragraph.AppendField("If", FieldType.FieldIf) as WIfField;
//Specifies the expression, true and false statement in field code
field.FieldCode = "IF \"True\" = \"True\" \"The given statement is Correct\"
\"The given statement is Wrong\"";
paragraph = section.AddParagraph();
paragraph.AppendText("If field which uses numbers in expression");
paragraph = section.AddParagraph();
//Creates the new instance of IF field
field = paragraph.AppendField("If", FieldType.FieldIf) as WIfField;
//Specifies the expression, true and false statement in field code
field.FieldCode = "IF 100 >= 1000 \"The given statement is Correct\" \"The
given statement is Wrong\"";
//Updates the document fields
document.UpdateDocumentFields();
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```

'Creates an instance of a WordDocument
Dim document As New WordDocument()
Dim section As IWSection = document.AddSection()
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("If field which uses string of characters in
expression")
paragraph = section.AddParagraph()
'Creates the new instance of IF field
Dim field As WIfField = TryCast(paragraph.AppendField("If",
FieldType.FieldIf), WIfField)
'Specifies the expression, true and false statement in field code
field.FieldCode = "IF ""True"" = ""True"" ""The given statement is Correct""
""The given statement is Wrong"""
paragraph = section.AddParagraph()
paragraph.AppendText("If field which uses numbers in expression")
paragraph = section.AddParagraph()
'Creates the new instance of IF field
field = TryCast(paragraph.AppendField("If", FieldType.FieldIf), WIfField)
'Specify the expression, true and false statement in field code
field.FieldCode = "IF 100 >= 1000 ""The given statement is Correct"" ""The
given statement is Wrong"""
'Updates the document fields
document.UpdateDocumentFields()
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds a new section into the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("If field which uses string of characters in
expression");
paragraph = section.AddParagraph();
//Creates the new instance of IF field
WIfField field = paragraph.AppendField("If", FieldType.FieldIf) as WIfField;
//Specifies the expression, true and false statement in field code
field.FieldCode = "IF \"True\" = \"True\" \"The given statement is Correct\"
\"The given statement is Wrong\"";
paragraph = section.AddParagraph();
paragraph.AppendText("If field which uses numbers in expression");
paragraph = section.AddParagraph();
//Creates the new instance of IF field
field = paragraph.AppendField("If", FieldType.FieldIf) as WIfField;
//Specifies the expression, true and false statement in field code
field.FieldCode = "IF 100 >= 1000 \"The given statement is Correct\" \"The
given statement is Wrong\"";
//Updates the document fields
document.UpdateDocumentFields();
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine

```

```
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform

```

Document variables

The DocVariable field displays the value of a specified document variable in the Word document. The document variables can be added or modified using the **Variables** property of **WordDocument** class.

The following code example explains how to add a DocVariable field to a Word document.

C#

```

//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("First Name of the customer: ");
//Adds the DocVariable field with Variable name and its type
paragraph.AppendField("FirstName", FieldType.FieldDocVariable);
paragraph = section.AddParagraph();
paragraph.AppendText("Last Name of the customer: ");
//Adds the DocVariable field with Variable name and its type
paragraph.AppendField("LastName", FieldType.FieldDocVariable);
//Adds the value for variable in WordDocument.Variable collection
document.Variables.Add("FirstName", "Jeff");
document.Variables.Add("LastName", "Smith");
//Updates the document fields
document.UpdateDocumentFields();
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates an instance of a WordDocument
Dim document As New WordDocument()

```

```

Dim section As IWSection = document.AddSection()
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("First Name of the customer: ")
'Adds the DocVariable field with Variable name and its type
paragraph.AppendField("FirstName", FieldType.FieldDocVariable)
paragraph = section.AddParagraph()
paragraph.AppendText("Last Name of the customer: ")
'Adds the DocVariable field with Variable name and its type
paragraph.AppendField("LastName", FieldType.FieldDocVariable)
'Adds the value for variable in WordDocument.Variable collection
document.Variables.Add("FirstName", "Jeff")
document.Variables.Add("LastName", "Smith")
'Updates the document fields
document.UpdateDocumentFields()
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds a new section into the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("First Name of the customer: ");
//Adds the DocVariable field with Variable name and its type
paragraph.AppendField("FirstName", FieldType.FieldDocVariable);
paragraph = section.AddParagraph();
paragraph.AppendText("Last Name of the customer: ");
//Adds the DocVariable field with Variable name and its type
paragraph.AppendField("LastName", FieldType.FieldDocVariable);
//Adds the value for variable in WordDocument.Variable collection
document.Variables.Add("FirstName", "Jeff");
document.Variables.Add("LastName", "Smith");
//Updates the document fields
document.UpdateDocumentFields();
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document

xamarin#helper-files-for-xamarin

```

Cross reference

A cross-reference refers to an item that appears in another location in a document. You can create cross-reference to bookmarks in a document by using the `AppendCrossReference` method of `WParagraph` class.

Note: The Essential DocIO supports creating and updating the cross-reference fields only for bookmarks in a document.

The following code example explains how to append cross reference for bookmark in a Word document.

C#

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
IWParagraph paragraph = section.AddParagraph();
//Adds text, bookmark start and end in the paragraph
paragraph.AppendBookmarkStart("Title");
paragraph.AppendText("Northwind Database");
paragraph.AppendBookmarkEnd("Title");
paragraph = section.AddParagraph();
paragraph.AppendText("The Northwind sample database (Northwind.mdb) is
included with all versions of Access. It provides data you can experiment
with and database objects that demonstrate features you might want to
implement in your own databases.");
section = document.AddSection();
section.AddParagraph();
paragraph = section.AddParagraph() as WParagraph;
//Gets the collection of bookmark start in the word document
List<Entity> items =
document.GetCrossReferenceItems(ReferenceType.Bookmark);
paragraph.AppendText("Bookmark Cross Reference starts here ");
//Appends the cross reference for bookmark "Title" with ContentText as
reference kind
paragraph.AppendCrossReference(ReferenceType.Bookmark,
ReferenceKind.ContentText, items[0], true, false, false, string.Empty);
//Updates the document Fields
document.UpdateDocumentFields();
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates an instance of a WordDocument
Dim document As New WordDocument()
Dim section As IWSection = document.AddSection()
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds text, bookmark start and end in the paragraph
paragraph.AppendBookmarkStart("Title")
paragraph.AppendText("Northwind Database")
paragraph.AppendBookmarkEnd("Title")
paragraph = section.AddParagraph()
paragraph.AppendText("The Northwind sample database (Northwind.mdb) is
included with all versions of Access. It provides data you can experiment
with and database objects that demonstrate features you might want to
implement in your own databases.")
```

```

section = document.AddSection()
section.AddParagraph()
paragraph = TryCast(section.AddParagraph(), WParagraph)
'Gets the collection of bookmark start in the word document
Dim items As List(Of Entity) =
document.GetCrossReferenceItems(ReferenceType.Bookmark)
paragraph.AppendText("Bookmark Cross Reference starts here ")
'Appends the cross reference for bookmark "Title" with ContentText as
reference kind
paragraph.AppendCrossReference(ReferenceType.Bookmark,
ReferenceKind.ContentText, items(0), True, False, False, String.Empty)
'Updates the document Fields
document.UpdateDocumentFields()
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds a new section into the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document
IWParagraph paragraph = section.AddParagraph();
//Adds text, bookmark start and end in the paragraph
paragraph.AppendBookmarkStart("Title");
paragraph.AppendText("Northwind Database");
paragraph.AppendBookmarkEnd("Title");
paragraph = section.AddParagraph();
paragraph.AppendText("The Northwind sample database (Northwind.mdb) is
included with all versions of Access. It provides data you can experiment
with and database objects that demonstrate features you might want to

```

Unlink fields

You can replace the field with its most recent result in the Word document by unlinking the field using the **Unlink** API. When you unlink a field, its current result is converted to text or a graphic and can no longer be updated automatically.

The following code example shows how to unlink the fields in Word document.

C#

```

//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
//Adds a new section into the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Today's Date: ");
//Adds the new Date field in Word document with field name and its type
WField field = paragraph.AppendField("Date", FieldType.FieldDate) as WField;
//Updates the field
field.Update();
//Unlink the field
field.Unlink();
//Saves the document in the given name and format
document.Save("Sample.docx", FormatType.Docx);
//Releases the resources occupied by WordDocument instance
document.Close();

```

VB.NET

```

'Creates an instance of WordDocument class
Dim document As WordDocument = New WordDocument()
'Adds a new section into the Word Document
Dim section As IWSection = document.AddSection()
'Adds a new paragraph into Word document and appends text into paragraph
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("Today's Date: ")
'Adds the new Date field in Word document with field name and its type
Dim field As WField = CType(paragraph.AppendField("Date",
FieldType.FieldDate), WField)
'Updates the field
field.Update()
'Unlink the field
field.Unlink()
'Saves the document in the given name and format
document.Save("Sample.docx", FormatType.Docx)
'Releases the resources occupied by WordDocument instance
document.Close()

```

UWP

```

//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
//Adds a new section into the Word Document
IWSection section = document.AddSection();
//Adds a new paragraph into Word document and appends text into paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Today's Date: ");
//Adds the new Date field in Word document with field name and its type
WField field = paragraph.AppendField("Date", FieldType.FieldDate) as WField;
//Updates the field
field.Update();
//Unlink the field
field.Unlink();
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
document.Close();
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates an instance of WordDocument class
WordDocument document = new WordDocument();
//Adds a new section into the Word Document

file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Note: Fields such as XE (Index Entry) fields and SEQ (Sequence) fields cannot be unlinked.

Working with Shapes

Shapes are drawing objects that include lines, curves, circles, rectangles, etc. It can be preset or custom geometry. You can create and manipulate the pre-defined shape in DOCX and WordML format documents.

Adding shapes

The following code example illustrates how to add pre-defined shape to the document.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
//Adds new shape to the document
Shape rectangle = paragraph.AppendShape(AutoShapeType.RoundedRectangle, 150,
100);
//Sets position for shape
rectangle.VerticalPosition = 72;
rectangle.HorizontalPosition = 72;
paragraph = section.AddParagraph() as WParagraph;
//Adds textbody contents to the shape
paragraph = rectangle.TextBody.AddParagraph() as WParagraph;
IWTextRange text = paragraph.AppendText("This text is in rounded rectangle
shape");
text.CharacterFormat.TextColor = Color.Green;
text.CharacterFormat.Bold = true;
//Adds another shape to the document
paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendBreak(BreakType.LineBreak);
Shape pentagon = paragraph.AppendShape(AutoShapeType.Pentagon, 100, 100);
paragraph = pentagon.TextBody.AddParagraph() as WParagraph;
paragraph.AppendText("This text is in pentagon shape");
pentagon.HorizontalPosition = 72;
pentagon.VerticalPosition = 200;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As WParagraph = TryCast(section.AddParagraph(), WParagraph)
'Adds new shape to the document
Dim rectangle As Shape =
paragraph.AppendShape(AutoShapeType.RoundedRectangle, 150, 100)
'Sets position for shape
rectangle.VerticalPosition = 72
rectangle.HorizontalPosition = 72
paragraph = TryCast(section.AddParagraph(), WParagraph)
'Adds textbody contents to the shape
paragraph = TryCast(rectangle.TextBody.AddParagraph(), WParagraph)
Dim text As IWTextRange = paragraph.AppendText("This text is in rounded
rectangle shape")
text.CharacterFormat.TextColor = Color.Green
text.CharacterFormat.Bold = True
'Adds another shape to the document
paragraph = TryCast(section.AddParagraph(), WParagraph)
paragraph.AppendBreak(BreakType.LineBreak)

```

```

Dim pentagon As Shape = paragraph.AppendShape(AutoShapeType.Pentagon, 100,
100)
paragraph = TryCast(pentagon.TextBody.AddParagraph(), WParagraph)
paragraph.AppendText("This text is in pentagon shape")
pentagon.HorizontalPosition = 72
pentagon.VerticalPosition = 200
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
//Adds new shape to the document
Shape rectangle = paragraph.AppendShape(AutoShapeType.RoundedRectangle, 150,
100);
//Sets position for shape
rectangle.VerticalPosition = 72;
rectangle.HorizontalPosition = 72;
paragraph = section.AddParagraph() as WParagraph;
//Adds textbox contents to the shape
paragraph = rectangle.TextBody.AddParagraph() as WParagraph;
IWTextRange text = paragraph.AppendText("This text is in rounded rectangle
shape");
text.CharacterFormat.TextColor = Color.Green;
text.CharacterFormat.Bold = true;
//Adds another shape to the document

```

Format shapes

Shape can have formatting such as line color, fill color, positioning, wrap formats, etc. The following code example illustrates how to apply formatting options for shape.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
Shape rectangle = paragraph.AppendShape(AutoShapeType.RoundedRectangle, 150,
100);
rectangle.VerticalPosition = 72;
rectangle.HorizontalPosition = 72;
paragraph = section.AddParagraph() as WParagraph;
paragraph = rectangle.TextBody.AddParagraph() as WParagraph;
IWTextRange text = paragraph.AppendText("This text is in rounded rectangle
shape");
text.CharacterFormat.TextColor = Color.Green;
text.CharacterFormat.Bold = true;
//Applies fill color for shape
rectangle.FillFormat.Fill = true;
rectangle.FillFormat.Color = Color.LightGray;
//Applies wrap formats
rectangle.WrapFormat.TextWrappingStyle = TextWrappingStyle.Square;
rectangle.WrapFormat.TextWrappingType = TextWrappingType.Right;
//Sets horizontal and vertical origin
rectangle.HorizontalOrigin = HorizontalOrigin.Margin;
rectangle.VerticalOrigin = VerticalOrigin.Page;
//Sets line format
rectangle.LineFormat.DashStyle = LineDashing.Dot;
rectangle.LineFormat.Color = Color.DarkGray;
//Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As WParagraph = TryCast(section.AddParagraph(), WParagraph)
Dim rectangle As Shape =
paragraph.AppendShape(AutoShapeType.RoundedRectangle, 150, 100)
rectangle.VerticalPosition = 72
rectangle.HorizontalPosition = 72
paragraph = TryCast(section.AddParagraph(), WParagraph)
paragraph = TryCast(rectangle.TextBody.AddParagraph(), WParagraph)
Dim text As ITextRange = paragraph.AppendText("This text is in rounded
rectangle shape")
text.CharacterFormat.TextColor = Color.Green
text.CharacterFormat.Bold = True
'Applies fill color for shape
rectangle.FillFormat.Fill = True
rectangle.FillFormat.Color = Color.LightGray
'Applies wrap formats
rectangle.WrapFormat.TextWrappingStyle = TextWrappingStyle.Square
rectangle.WrapFormat.TextWrappingType = TextWrappingType.Right
'Sets horizontal and vertical origin
rectangle.HorizontalOrigin = HorizontalOrigin.Margin
rectangle.VerticalOrigin = VerticalOrigin.Page
'Sets line format
rectangle.LineFormat.DashStyle = LineDashing.Dot
rectangle.LineFormat.Color = Color.DarkGray
'Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section

Rotate shapes

You can rotate the shape and also apply flipping (horizontal and vertical) to it. The following code example explains how to rotate and flip the shape.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
```

```

IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
Shape rectangle = paragraph.AppendShape(AutoShapeType.RoundedRectangle, 150,
100);
//Sets position for shape
rectangle.VerticalPosition = 72;
rectangle.HorizontalPosition = 72;
//Sets 90 degree rotation
rectangle.Rotation = 90;
//Sets horizontal flip
rectangle.FlipHorizontal = true;
paragraph = section.AddParagraph() as WParagraph;
paragraph = rectangle.TextBody.AddParagraph() as WParagraph;
IWTextRange text = paragraph.AppendText("This text is in rounded rectangle
shape");
//Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As WParagraph = TryCast(section.AddParagraph(), WParagraph)
Dim rectangle As Shape =
paragraph.AppendShape(AutoShapeType.RoundedRectangle, 150, 100)
'Sets position for shape
rectangle.VerticalPosition = 72
rectangle.HorizontalPosition = 72
'Sets 90 degree rotation
rectangle.Rotation = 90
'Sets horizontal flip
rectangle.FlipHorizontal = true
paragraph = TryCast(section.AddParagraph(), WParagraph)
paragraph = TryCast(rectangle.TextBody.AddParagraph(), WParagraph)
Dim text As IWTextRange = paragraph.AppendText("This text is in rounded
rectangle shape")
'Saves and closes the Word document
document.Save("Sample.docx", FormatType.Docx)
document.Close

```

UWP

```

//Creates a new Word document

```

Grouping shapes

Word library now allows you to create or group multiple shapes, pictures, text boxes, and charts as a group shape in Word document (DOCX) and preserve it as in DOCX and WordML format conversions.

You can create a document with group shapes by using Microsoft Word. It provides an option to group a set of shapes and images as a single shape and a group shape as individual item.

Key Features:

1. You can easily manage group of shapes, pictures, text boxes, or charts as a group shape.
2. You can move several shapes or images simultaneously and apply the same formatting properties for children of group shapes.

Note: 1. While grouping the shapes or other objects, the shapes should be positioned relative to the "Page".

2. While grouping the shapes or other objects, the wrapping style should not be "In Line with Text".

The following code example illustrates how to create group shape in Word document.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
//Creates new group shape
GroupShape groupShape = new GroupShape(document);
//Adds group shape to the paragraph.
paragraph.ChildEntities.Add(groupShape);
//Creates new shape
Shape shape = new Shape(document, AutoShapeType.RoundedRectangle);
//Sets height and width for shape
shape.Height = 100;
shape.Width = 150;
//Sets horizontal and vertical position
shape.HorizontalPosition = 72;
```

```

shape.VerticalPosition = 72;
//Set wrapping style for shape
shape.WrapFormat.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets horizontal and vertical origin
shape.HorizontalOrigin = HorizontalOrigin.Page;
shape.VerticalOrigin = VerticalOrigin.Page;
//Adds the specified shape to group shape
groupShape.Add(shape);
//Creates new picture
WPicture picture = new WPicture(document);
picture.LoadImage(Image.FromFile("Image.png"));
//Sets wrapping style for picture
picture.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets height and width for the image
picture.Height = 100;
picture.Width = 100;
//Sets horizontal and vertical position
picture.HorizontalPosition = 400;
picture.VerticalPosition = 150;
//Sets horizontal and vertical origin
picture.HorizontalOrigin = HorizontalOrigin.Page;
picture.VerticalOrigin = VerticalOrigin.Page;
//Adds the specified picture to group shape
groupShape.Add(picture);
//Creates new textbox
WTextBox textbox = new WTextBox(document);
textbox.TextBoxFormat.Width = 150;
textbox.TextBoxFormat.Height = 75;
//Adds new text to the textbox body
IWParagraph textboxParagraph = textbox.TextBoxBody.AddParagraph();
textboxParagraph.AppendText("Text inside text box");
//Sets wrapping style for textbox
textbox.TextBoxFormat.TextWrappingStyle = TextWrappingStyle.Behind;
//Sets horizontal and vertical position
textbox.TextBoxFormat.HorizontalPosition = 200;
textbox.TextBoxFormat.VerticalPosition = 200;
//Sets horizontal and vertical origin
textbox.TextBoxFormat.VerticalOrigin = VerticalOrigin.Page;
textbox.TextBoxFormat.HorizontalOrigin = HorizontalOrigin.Page;
//Adds the specified textbox to group shape
groupShape.Add(textbox);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As WParagraph = TryCast(section.AddParagraph(), WParagraph)
'Creates new group shape
Dim groupShape As GroupShape = New GroupShape(document)

```

```

`Adds group shape to the paragraph
paragraph.ChildEntities.Add(groupShape)
`Creates new shape
Dim shape As Shape = New Shape(document, AutoShapeType.RoundedRectangle)
`Sets height and width for shape
shape.Height = 100
shape.Width = 150
`Sets horizontal and vertical position
shape.HorizontalPosition = 72
shape.VerticalPosition = 72
`Sets wrapping style for shape

```

The following code example illustrates how to add collection of shapes or images as a group shape in Word document.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
//Creates paragraph item collections to add child shapes
ParagraphItem[] paragraphItems = new ParagraphItem[3];
//Creates new shape
Shape shape = new Shape(document, AutoShapeType.RoundedRectangle);
//Sets height and width for shape
shape.Height = 100;
shape.Width = 150;
//Sets Wrapping style for shape
shape.WrapFormat.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets horizontal and vertical position for shape
shape.HorizontalPosition = 7;
shape.VerticalPosition = 72;
//Sets horizontal and vertical origin for shape
shape.HorizontalOrigin = HorizontalOrigin.Page;
shape.VerticalOrigin = VerticalOrigin.Page;
//Sets the shape as paragraph item
paragraphItems[0] = shape;
//Appends new textbox to the document
WTextBox textbox = new WTextBox(document);
//Sets height and width for textbox
textbox.TextBoxFormat.Width = 150;
textbox.TextBoxFormat.Height = 75;
//Adds new text to the textbox body
IWParagraph textboxParagraph = textbox.TextBoxBody.AddParagraph();
//Adds new text to the textbox paragraph
textboxParagraph.AppendText("Text inside text box");
//Sets wrapping style for textbox
textbox.TextBoxFormat.TextWrappingStyle = TextWrappingStyle.Behind;
//Sets horizontal and vertical position for textbox
textbox.TextBoxFormat.HorizontalPosition = 200;
textbox.TextBoxFormat.VerticalPosition = 200;
//Sets horizontal and vertical origin for textbox
textbox.TextBoxFormat.VerticalOrigin = VerticalOrigin.Page;
textbox.TextBoxFormat.HorizontalOrigin = HorizontalOrigin.Page;
//Sets the textbox as paragraph item
paragraphItems[1] = textbox;
//Appends new chart to the document
WChart chart = new WChart(document);
//Sets height and width for chart
chart.Height = 270;
chart.Width = 446;
//Sets wrapping style for chart
chart.WrapFormat.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets chart type
chart.ChartType = OfficeChartType.Pie;
chart.VerticalPosition = 350;
//Sets chart title
chart.ChartTitle = "Best Selling Products";
//Sets font and size for chart title
chart.ChartTitleArea.FontName = "Calibri";
chart.ChartTitleArea.Size = 14;

```

```

//Sets data for chart
chart.ChartData.SetValue(1, 1, "");
chart.ChartData.SetValue(1, 2, "Sales");

```

Nested group shapes

The following code example illustrates how to group the nested group shapes as a group shape in Word document.

C#

```
//Creates a new Word document
```

```
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
//Creates new group shape
GroupShape groupShape = new GroupShape(document);
//Adds group shape to the paragraph
paragraph.ChildEntities.Add(groupShape);
//Appends new shape to the document
Shape shape = new Shape(document, AutoShapeType.RoundedRectangle);
//Sets height and width for shape
shape.Height = 100;
shape.Width = 150;
//Sets Wrapping style for shape
shape.WrapFormat.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets horizontal and vertical position for shape
shape.HorizontalPosition = 72;
shape.VerticalPosition = 72;
//Sets horizontal and vertical origin for shape
shape.HorizontalOrigin = HorizontalOrigin.Page;
shape.VerticalOrigin = VerticalOrigin.Page;
//Adds the specified shape to group shape
groupShape.Add(shape);
//Appends new picture to the document
WPicture picture = new WPicture(document);
//Loads image from the file
picture.LoadImage(Image.FromFile("Image.png"));
//Sets wrapping style for picture
picture.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets height and width for the picture
picture.Height = 100;
picture.Width = 100;
//Sets horizontal and vertical position for the picture
picture.HorizontalPosition = 400;
picture.VerticalPosition = 150;
//Sets horizontal and vertical origin for the picture
picture.HorizontalOrigin = HorizontalOrigin.Page;
picture.VerticalOrigin = VerticalOrigin.Page;
//Adds specified picture to the group shape
groupShape.Add(picture);
//Creates new nested group shape
GroupShape nestedGroupShape = new GroupShape(document);
//Appends new textbox to the document
WTextBox textbox = new WTextBox(document);
//Sets width and height for the textbox
textbox.TextBoxFormat.Width = 150;
textbox.TextBoxFormat.Height = 75;
//Adds new text to the textbox body
IWParagraph textboxParagraph = textbox.TextBoxBody.AddParagraph();
//Adds new text to the textbox paragraph
textboxParagraph.AppendText("Text inside text box");
//Sets wrapping style for the textbox
textbox.TextBoxFormat.TextWrappingStyle = TextWrappingStyle.Behind;
//Sets horizontal and vertical position for the textbox
textbox.TextBoxFormat.HorizontalPosition = 200;
textbox.TextBoxFormat.VerticalPosition = 200;
```

```

//Sets horizontal and vertical origin for the textbox
textbox.TextBoxFormat.VerticalOrigin = VerticalOrigin.Page;
textbox.TextBoxFormat.HorizontalOrigin = HorizontalOrigin.Page;
//Adds specified textbox to the nested group shape
nestedGroupShape.Add(textbox);
//Appends new shape to the document
shape = new Shape(document, AutoShapeType.Oval);
//Sets height and width for the new shape
shape.Height = 100;
shape.Width = 150;
//Sets horizontal and vertical position for the shape
shape.HorizontalPosition = 200;
shape.VerticalPosition = 72;
//Sets horizontal and vertical origin for the shape
shape.HorizontalOrigin = HorizontalOrigin.Page;
shape.VerticalOrigin = VerticalOrigin.Page;
//Sets horizontal and vertical position for the nested group shape
nestedGroupShape.HorizontalPosition = 72;
nestedGroupShape.VerticalPosition = 72;
//Adds specified shape to the nested group shape
nestedGroupShape.Add(shape);
//Adds nested group shape to the group shape of the paragraph
groupShape.Add(nestedGroupShape);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

//Loads image from the file
picture.LoadImage(imageStream);
//Sets wrapping style for picture
picture.TextWrappingStyle = TextWrappingStyle.InFrontOfText;
//Sets height and width for the picture
picture.Height = 100;
picture.Width = 100;
//Sets horizontal and vertical position for the picture
picture.HorizontalPosition = 400;
picture.VerticalPosition = 150;
//Sets horizontal and vertical origin for the picture
picture.HorizontalOrigin = HorizontalOrigin.Page;
picture.VerticalOrigin = VerticalOrigin.Page;
//Adds specified picture to the group shape
groupShape.Add(picture);
//Creates new nested group shape
GroupShape nestedGroupShape = new GroupShape(document);
//Appends new textbox to the document
WTextBox textbox = new WTextBox(document);
//Sets width and height for the textbox
textbox.TextBoxFormat.Width = 150;
textbox.TextBoxFormat.Height = 75;
//Adds new text to the textbox body
IWParagraph textboxParagraph = textbox.TextBoxBody.AddParagraph();
//Adds new text to the textbox paragraph
textboxParagraph.AppendText("Text inside text box");
//Sets wrapping style for the textbox
textbox.TextBoxFormat.TextWrappingStyle = TextWrappingStyle.Behind;
//Sets horizontal and vertical position for the textbox
textbox.TextBoxFormat.HorizontalPosition = 200;
textbox.TextBoxFormat.VerticalPosition = 200;
//Sets horizontal and vertical origin for the textbox
textbox.TextBoxFormat.VerticalOrigin = VerticalOrigin.Page;
textbox.TextBoxFormat.HorizontalOrigin = HorizontalOrigin.Page;
//Adds specified textbox to the nested group shape
nestedGroupShape.Add(textbox);
//Appends new shape to the document
shape = new Shape(document, AutoShapeType.Oval);
//Sets height and width for the new shape
shape.Height = 100;
shape.Width = 150;
//Sets horizontal and vertical position for the shape
shape.HorizontalPosition = 200;
shape.VerticalPosition = 72;
//Sets horizontal and vertical origin for the shape
shape.HorizontalOrigin = HorizontalOrigin.Page;
shape.VerticalOrigin = VerticalOrigin.Page;
//Sets horizontal and vertical position for the nested group shape
nestedGroupShape.HorizontalPosition = 72;
nestedGroupShape.VerticalPosition = 72;

```

```
//Adds specified shape to the nested group shape
nestedGroupShape.Add(shape);
//Adds nested group shape to the group shape of the paragraph
groupShape.Add(nestedGroupShape);
groupShape.HorizontalPosition = 142;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Ungrouping shapes

You can ungroup the group shapes in the Word document to preserve each shape as individual item.

The following code example illustrates how to ungroup the group shape in Word document.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the last paragraph
WParagraph lastParagraph = document.LastParagraph;
//Iterates through the paragraph items to get the group shape
for (int i = 0; i < lastParagraph.ChildEntities.Count; i++)
{
    if (lastParagraph.ChildEntities[i] is GroupShape)
    {
        GroupShape groupShape = lastParagraph.ChildEntities[i] as GroupShape;
        //Ungroup the child shapes in the group shape
        groupShape.Ungroup();
        break;
    }
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As WordDocument = New WordDocument("Template.docx")
'Gets the last paragraph
Dim lastParagraph As WParagraph = document.LastParagraph
'Iterates through the paragraph items to get the group shape
For i As Integer = 0 To lastParagraph.ChildEntities.Count - 1
    If TypeOf lastParagraph.ChildEntities(i) Is GroupShape Then
        Dim groupShape As GroupShape = TryCast(lastParagraph.ChildEntities(i),
        GroupShape)
```

```

groupShape.Ungroup()
Exit For
End If
Next
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

///"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream fileStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Template.docx");
//Loads the template document
WordDocument document = new WordDocument(fileStream);
//Gets the last paragraph
WParagraph lastParagraph = document.LastParagraph;
//Iterates through the paragraph items to get the group shape
for (int i = 0; i < lastParagraph.ChildEntities.Count; i++)
{
    if (lastParagraph.ChildEntities[i] is GroupShape)
    {
        GroupShape groupShape = lastParagraph.ChildEntities[i] as GroupShape;
        //Ungroup the child shapes in the group shape
        groupShape.Ungroup();
        break;
    }
}
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word document file in local machine
Save(stream, "GroupShape.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

FileStream fileStream = new FileStream(@"Template.docx", FileMode.Open,
    FileAccess.ReadWrite);
//Loads the template document
WordDocument document = new WordDocument(fileStream, FormatTypeAutomatic);
//Gets the last paragraph
WParagraph lastParagraph = document.LastParagraph;
//Iterates through the paragraph items to get the group shape
for (int i = 0; i < lastParagraph.ChildEntities.Count; i++)
{
    if (lastParagraph.ChildEntities[i] is GroupShape)
    {
        GroupShape groupShape = lastParagraph.ChildEntities[i] as GroupShape;
        //Ungroup the child shapes in the group shape
    }
}

```

```

groupShape.Ungroup();
break;
}
}
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

//App is the class of Portable project

    {
        GroupShape groupShape = lastParagraph.ChildEntities[i] as GroupShape;
        //Ungroup the child shapes in the group shape
        groupShape.Ungroup();
        break;
    }
}
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Working with Mail merge

Mail merge is a process of merging data from data source to a Word template document. The **WMergeField** class provides support to bind template document and data source. The **WMergeField** instance is replaced with the actual data retrieved from data source for the given merge field name in a template document.

The following data sources are supported by Essential DocIO for performing Mail merge:

- String Arrays
- ADO.NET objects
- Dynamic objects
- .NET objects

Mail merge process

The mail merge process involves three documents:

1. **Template Word document:** This document contains the static or templated text and graphics along with the merge fields (that are placeholders) for replacing dynamic data.
2. **Data source:** This represents file or database containing data to replace the merge fields in template Word document.
3. **Final merged document:** This resultant document is a combination of the template Word document and the data from data source.

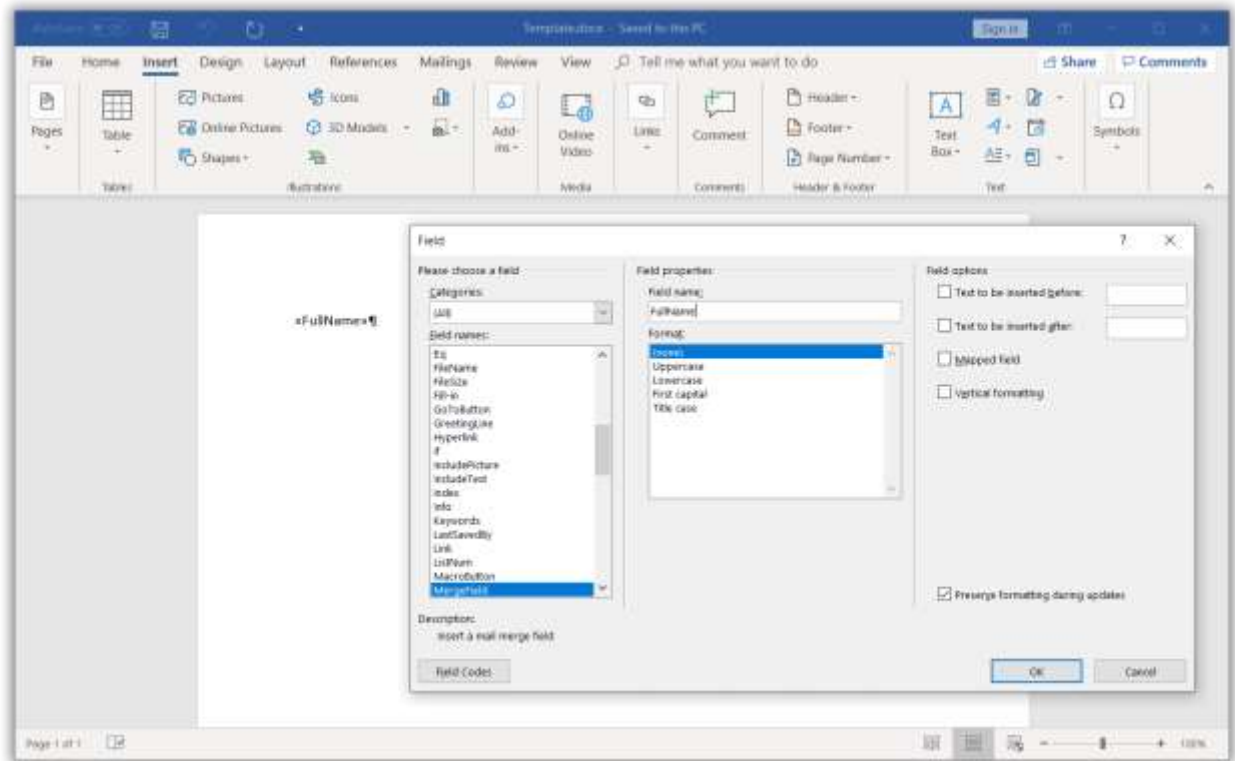

Tips: 1. You can use conditional fields ([IF](#), [Formula](#)) combined with merge fields, when you require intelligent decisions in addition to simple mail merge (replace merge fields with result text). To use conditional fields, execute mail merge and then update fields in the Word document using `UpdateDocumentFields` API.

Tips: 2. You can replace the fields ([IF](#), [Formula](#)) combined with merge fields, with its most recent result and **generates the plain Word document** by unlinking the fields. Refer to this [link](#) for more information.

Create Word document template

You can create a template document with merge fields by using any Word editor application, like Microsoft Word. By using Word editor application, you can take the advantage of the visual interface to design unique layout, formatting, and more for your Word document template interactively.

The following screenshot shows how to insert a merge field in the Word document by **using the Microsoft Word**.

You need to add a prefix ("Image:") to the merge field name for merging an image in the place of a merge field.

For example: The merge field name should be like "Image:Photo" (<<Image:MergeFieldName>>)

You can **create Word document template programmatically** by adding merge fields to the Word document using Essential DocIO.

The following code example shows how to create a merge field in the Word document.

C#

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
//Appends merge field to the last paragraph.
document.LastParagraph.AppendField("FullName", FieldType.FieldMergeField);
//Saves and closes the WordDocument instance.
document.Save("Template.docx");
document.Close();
```

VB.NET

```
'Creates an instance of a WordDocument
Dim document As WordDocument = New WordDocument
'Adds a section and a paragraph in the document
document.EnsureMinimal()
'Appends merge field to the last paragraph.
document.LastParagraph.AppendField("FullName", FieldType.FieldMergeField)
'Saves and closes the WordDocument instance.
```

```
document.Save("Template.docx")
document.Close()
```

UWP

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
//Appends merge field to the last paragraph.
document.LastParagraph.AppendField("FullName", FieldType.FieldMergeField);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Template.docx");
document.Close();
//Refer to the following link to save Word document in UWP platform.
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
//Appends merge field to the last paragraph.
document.LastParagraph.AppendField("FullName", FieldType.FieldMergeField);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the Word document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Template.docx");
```

XAMARIN

```
//Creates an instance of a WordDocument
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
//Appends merge field to the last paragraph.
document.LastParagraph.AppendField("FullName", FieldType.FieldMergeField);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the Word document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Template.docx",
"application/msword", stream);
```

```
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform.
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Execute mail merge

The following code example shows how to perform mail merge in above Word document template using string arrays as data source.

C#

```
//Opens the template document
WordDocument document = new WordDocument("Template.docx");
string[] fieldNames = new string[] { "FullName" };
string[] fieldValues = new string[] { "Nancy Davolio" };
//Performs the mail merge
document.MailMerge.Execute(fieldNames, fieldValues);
//Saves and closes the WordDocument instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens the template document
Dim document As New WordDocument("Template.docx")
Dim fieldNames As String() = New String() {"FullName"}
Dim fieldValues As String() = New String() {"Nancy Davolio"}
'Performs the mail merge
document.MailMerge.Execute(fieldNames, fieldValues)
'Saves and closes the WordDocument instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates an instance of a WordDocument
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new WordDocument();
document.Open(assembly.GetManifestResourceStream("Sample.Assets.Template.doc
x"), FormatType.Docx);
string[] fieldNames = new string[] { "FullName" };
string[] fieldValues = new string[] { "Nancy Davolio" };
//Performs the mail merge
document.MailMerge.Execute(fieldNames, fieldValues);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Refer to the following link to save Word document in UWP platform.
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

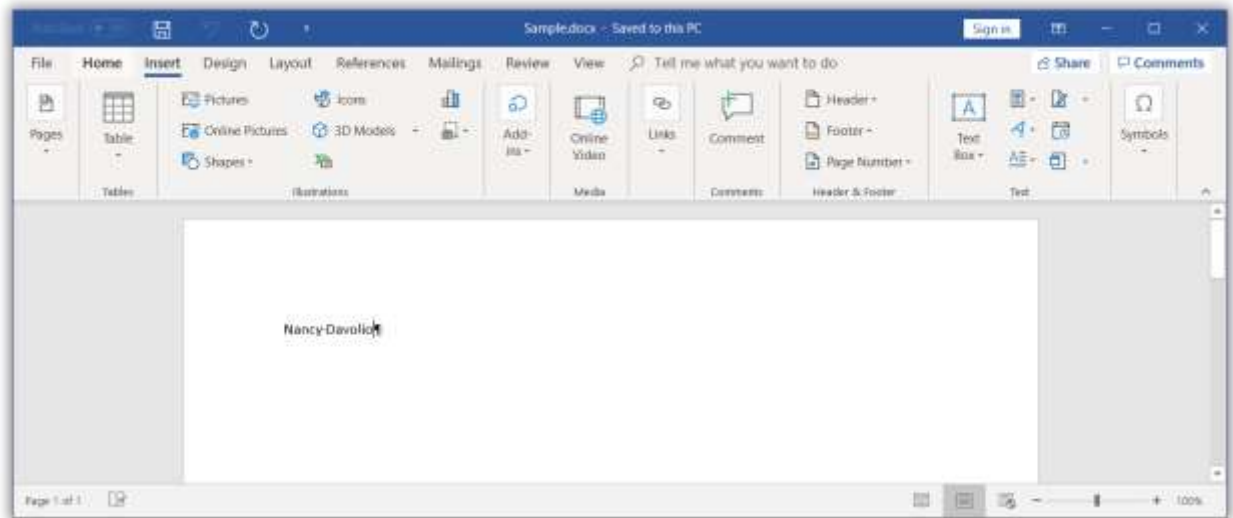

ASP.NET CORE

```
//Opens the template document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
string[] fieldNames = new string[] { "FullName" };
string[] fieldValues = new string[] { "Nancy Davolio" };
//Performs the mail merge
document.MailMerge.Execute(fieldNames, fieldValues);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the Word document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");
```

XAMARIN

```
//Opens the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"),
FormatType.Docx);
string[] fieldNames = new string[] { "FullName" };
string[] fieldValues = new string[] { "Nancy Davolio" };
//Performs the mail merge
document.MailMerge.Execute(fieldNames, fieldValues);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Closes the document
document.Close();
//Download the helper files from the following link to save the stream as
file and open the file for viewing in Xamarin platform.
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

By executing the previous code example, it generates the resultant Word document as follows.

Simple Mail merge

The `MailMerge` class provides various overloads for the `Execute` method to perform Mail merge from various data sources. For further information, click [here](#).

Performing Mail merge for a group

You can perform Mail merge and append multiple records from data source within a specified region to a template document. For further information, click [here](#).

Performing Nested Mail merge for group

You can perform nested Mail merge with relational or hierarchical data source and independent data tables in a template document. For further information, click [here](#).

Performing Mail merge with dynamic objects

Essential DocIO allows you to perform Mail merge with the dynamic objects. For further information, click [here](#).

Performing Mail merge with business objects

You can perform Mail merge with business objects in a template document. For further information, click [here](#).

Performing Nested Mail merge with relational data objects

Essential DocIO supports performing nested Mail merge with implicit relational data objects without any explicit relational commands by using the `ExecuteNestedGroup` overload method. For further information, click [here](#).

Event support for mail merge

The `MailMerge` class provides event support to customize the document contents and merging image data during the Mail merge process. The following events are supported by Essential DocIO in Mail merge process:

- `MergeField`: Occurs when a **Mail merge field** except image Mail merge field is encountered.
- `MergeImageField`: Occurs when an **image Mail merge field** is encountered.
- `BeforeClearField`: Occurs when an **unmerged field** is encountered.
- `BeforeClearGroupField`: Occurs when an **unmerged group field** is encountered.

MergeField event

You can customize the merging text during Mail merge process by using the `MergeField` event. For further information, click [here](#).

MergeImageField event

You can customize the merging image during Mail merge process by using the `MergeImageField` event. For further information, click [here](#).

BeforeClearField event

You can get the unmerged fields during Mail merge process by using the `BeforeClearField` event. For further information, click [here](#).

BeforeClearGroupField event

You can get the unmerged groups during Mail merge process by using the `BeforeClearGroupField` event. For further information, click [here](#).

Mail merge options

The `MailMerge` class allows you to customize the Mail merge process with the following options:

Field mapping

You can automatically map the merge field names with data source column names during Mail merge process. For further information, click [here](#).

Retrieving the merge field names

You can retrieve the merge field names and also merge field group names in the Word document. For further information, click [here](#).

Removing empty paragraphs

You can remove the empty paragraphs when the paragraph has a merge field item without any data during Mail merge process. For further information, click [here](#).

Removing empty merge fields

You can remove or keep the unmerged merge fields in the output document based on the `ClearFields` property on each mail merge execution. For further information, click [here](#).

Restart numbering in lists

You can restart the list numbering in a Word document during Mail merge. For further information, click [here](#).

Find and Replace

You can search a particular text you like to change and replace it with another text or part of the document.

Finding contents in a Word document

You can find the first occurrence of a particular text within a single paragraph in the document by using `Find` method and its next occurrence by using `FindNext` method. You can also find a particular text pattern in the document.

The following code example illustrates how to find a particular text and its next occurrence in the document.

C#

```
//Loads the template document  
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
```

```

//Finds the first occurrence of a particular text in the document
TextSelection textSelection = document.Find("as graphical contents", false,
true);
//Gets the found text as single text range
WTextRange textRange = textSelection.GetAsOneRange();
//Modifies the text
textRange.Text = "Replaced text";
//Sets highlight color
textRange.CharacterFormat.HighlightColor = Color.Yellow;
//Finds the next occurrence of a particular text from the previous paragraph
textSelection = document.FindNext(textRange.OwnerParagraph, "paragraph",
true, false);
//Gets the found text as single text range
WTextRange range = textSelection.GetAsOneRange();
//Sets bold formatting
range.CharacterFormat.Bold = true;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Find the first occurrence of a particular text in the document
Dim textSelection As TextSelection = document.Find("as graphical contents",
False, True)
'Gets the found text as single text range
Dim textRange As WTextRange = textSelection.GetAsOneRange()
'Modifies the text
textRange.Text = "Replaced text"
'Sets highlight color
textRange.CharacterFormat.HighlightColor = Color.Yellow
'Finds the next occurrence of a particular text from the previous paragraph
textSelection = document.FindNext(textRange.OwnerParagraph, "paragraph",
True, False)
'Gets the found text as single text range
Dim range As WTextRange = textSelection.GetAsOneRange()
'Sets bold formatting
range.CharacterFormat.Bold = True
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx
"), FormatType.Docx);
//Finds the first occurrence of a particular text in the document
TextSelection textSelection = document.Find("as graphical contents", false,
true);
//Gets the found text as single text range
WTextRange textRange = textSelection.GetAsOneRange();

```

```

//Modifies the text
textRange.Text = "Replaced text";
//Sets highlight color
textRange.CharacterFormat.HighlightColor = Color.Yellow;
//Finds the next occurrence of a particular text from the previous paragraph
textSelection = document.FindNext(textRange.OwnerParagraph, "paragraph",
true, false);
//Gets the found text as single text range
WTextRange range = textSelection.GetAsOneRange();
//Sets bold formatting
range.CharacterFormat.Bold = true;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads the template document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Finds the first occurrence of a particular text in the document
TextSelection textSelection = document.Find("as graphical contents", false,
true);
//Gets the found text as single text range
WTextRange textRange = textSelection.GetAsOneRange();
//Modifies the text
textRange.Text = "Replaced text";
//Sets highlight color
textRange.CharacterFormat.HighlightColor = Color.Yellow;
//Finds the next occurrence of a particular text from the previous paragraph
textSelection = document.FindNext(textRange.OwnerParagraph, "paragraph",
true, false);
//Gets the found text as single text range
WTextRange range = textSelection.GetAsOneRange();
//Sets bold formatting
range.CharacterFormat.Bold = true;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");

```

XAMARIN

```

//Loads the template document

```

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Templat
e.docx"), FormatType.Docx);
//Finds the first occurrence of a particular text in the document
TextSelection textSelection = document.Find("as graphical contents", false,
true);
//Gets the found text as single text range
WTextRange textRange = textSelection.GetAsOneRange();
//Modifies the text
textRange.Text = "Replaced text";
//Sets highlight color
textRange.CharacterFormat.HighlightColor = Color.Yellow;
//Finds the next occurrence of a particular text from the previous paragraph
textSelection = document.FindNext(textRange.OwnerParagraph, "paragraph",
true, false);
//Gets the found text as single text range
WTextRange range = textSelection.GetAsOneRange();
//Sets bold formatting
range.CharacterFormat.Bold = true;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

You can find all the occurrence of a particular text within a single paragraph in the document by using `FindAll` method.

The following code example illustrates how to find all the occurrences of a particular text in the document.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Finds all the occurrences of a particular text
TextSelection[] textSelections = document.FindAll("paragraph", false, true);
foreach (TextSelection textSelection in textSelections)
{
//Gets the found text as single text range and sets highlight color
WTextRange textRange = textSelection.GetAsOneRange();
textRange.CharacterFormat.HighlightColor = Color.YellowGreen;
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Finds all the occurrences of a particular text
Dim textSelections As TextSelection() = document.FindAll("paragraph", False,
True)
For Each textSelection As TextSelection In textSelections
'Gets the found text as single text range and sets highlight color
Dim textRange As WTextRange = textSelection.GetAsOneRange()
textRange.CharacterFormat.HighlightColor = Color.YellowGreen
Next
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx
"), FormatType.Docx);
//Finds all the occurrences of a particular text
TextSelection[] textSelections = document.FindAll("paragraph", false, true);
foreach (TextSelection textSelection in textSelections)
{
//Gets the found text as single text range and sets highlight color
WTextRange textRange = textSelection.GetAsOneRange();
textRange.CharacterFormat.HighlightColor = Color.YellowGreen;
}
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads the template document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Finds all the occurrences of a particular text
TextSelection[] textSelections = document.FindAll("paragraph", false, true);
foreach (TextSelection textSelection in textSelections)
{
//Gets the found text as single text range and sets highlight color
WTextRange textRange = textSelection.GetAsOneRange();
textRange.CharacterFormat.HighlightColor = Color.YellowGreen;
}

```

```
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");
```

```

You can find the first occurrence of a particular text extended to several paragraphs in the document by using `FindSingleLine` method and its next occurrence by using `FindNextSingleLine` method.

The following code example illustrates how to find a particular text extended to several paragraphs in the Word document.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Finds the first occurrence of a particular text extended to several
paragraphs in the document
TextSelection[] textSelections = document.FindSingleLine("First paragraph
Second paragraph", true, false);
WParagraph paragraph = null;
foreach (TextSelection textSelection in textSelections)
{
//Gets the found text as single text range and set highlight color
WTextRange textRange = textSelection.GetAsOneRange();
```

```

textRange.CharacterFormat.HighlightColor = Color.YellowGreen;
paragraph = textRange.OwnerParagraph;
}
//Finds the next occurrence of a particular text extended to several paragraphs in the document
textSelections = document.FindNextSingleLine(paragraph, "First paragraph Second paragraph", true, false);
foreach (TextSelection textSelection in textSelections)
{
//Gets the found text as single text range and sets italic formatting
WTextRange text = textSelection.GetAsOneRange();
text.CharacterFormat.Italic = true;
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Finds the first occurrence of a particular text extended to several paragraphs in the document
Dim textSelections As TextSelection() = document.FindSingleLine("First paragraph Second paragraph", True, False)
Dim paragraph As WParagraph = Nothing
For Each textSelection As TextSelection In textSelections
'Gets the found text as single text range and sets highlight color
Dim textRange As WTextRange = textSelection.GetAsOneRange()
textRange.CharacterFormat.HighlightColor = Color.YellowGreen
paragraph = textRange.OwnerParagraph
Next
'Finds the next occurrence of a particular text extended to several paragraphs in the document
textSelections = document.FindNextSingleLine(paragraph, "First paragraph Second paragraph", True, False)
For Each textSelection As TextSelection In textSelections
'Gets the found text as single text range and sets italic formatting
Dim text As WTextRange = textSelection.GetAsOneRange()
text.CharacterFormat.Italic = True
Next
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;

Replacing the Search results

You can replace a particular text with another text, part of a document or entire document by using **Replace** method.

The following code example illustrates how to replace a particular text.

C#

```
//Loads a template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Finds the first occurrence of a particular text in the document
TextSelection selection = document.Find("contents", false, false);
//Initializes text body part
TextBodyPart bodyPart = new TextBodyPart(selection);
//Replaces a particular text with the text body part
document.Replace("paragraph", bodyPart, false, true, true);
//Saves and closes the document
document.Save("Replace.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads a template document
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Finds the first occurrence of a particular text in the document
Dim selection As TextSelection = document.Find("contents", False, False)
'Initializes text body part
Dim bodyPart As New TextBodyPart(selection)
'Replaces a particular text with the text body part
document.Replace("paragraph", bodyPart, False, True, True)
'Saves and closes the document
document.Save("Replace.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Loads a template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"),
FormatType.Docx);
//Finds the first occurrence of a particular text in the document
TextSelection selection = document.Find("contents", false, false);
//Initializes text body part
TextBodyPart bodyPart = new TextBodyPart(selection);
//Replaces a particular text with the text body part
document.Replace("paragraph", bodyPart, false, true, true);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Replace.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Loads a template document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
    FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Finds the first occurrence of a particular text in the document
TextSelection selection = document.Find("contents", false, false);
//Initializes text body part

```

You can specify to replace only the first occurrence of the specified text by setting `ReplaceFirst` property of `WordDocument` class to true.

The following code example illustrates how to replace the first occurrence of a particular text.

C#

```
//Loads a template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Sets to replace only the first occurrence of a particular text
document.ReplaceFirst = true;
```

```
//Finds the first occurrence of a particular text in the document
TextSelection selection = document.Find("contents", false, false);
//Initializes text body part
TextBodyPart bodyPart = new TextBodyPart(selection);
//Replaces a particular text with the text body part
document.Replace("paragraph", bodyPart, false, true, true);
//Saves and closes the document
document.Save("Replace.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads a template document
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Sets to replace only the first occurrence of a particular text
document.ReplaceFirst = True
'Finds the first occurrence of a particular text in the document
Dim selection As TextSelection = document.Find("contents", False, False)
'Initializes text body part
Dim bodyPart As New TextBodyPart(selection)
'Replaces a particular text with the text body part
document.Replace("paragraph", bodyPart, False, True, True)
'Saves and closes the document
document.Save("Replace.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Loads a template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"),
FormatType.Docx);
//Sets to replace only the first occurrence of a particular text
document.ReplaceFirst = true;
//Finds the first occurrence of a particular text in the document
TextSelection selection = document.Find("contents", false, false);
//Initializes text body part
TextBodyPart bodyPart = new TextBodyPart(selection);
//Replaces a particular text with the text body part
document.Replace("paragraph", bodyPart, false, true, true);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Replace.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```

```

You can replace a particular text extended to several paragraphs in a document with another text or part of a document by using `ReplaceSingleLine` method.

The following code example illustrates how to replace the text extended to several paragraphs with simple text.

C#

```
//Loads a template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Replaces the text extended to two paragraphs with simple text
document.ReplaceSingleLine("First paragraph Second paragraph", "Replaced
paragraph", true, false);
//Saves and closes the document
document.Save("Replace.docx", FormatType.Docx);
document.Close();
```

VB.NET

```

'Loads a template document
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Replaces the text extended to two paragraphs with simple text
document.ReplaceSingleLine("First paragraph Second paragraph", "Replaced
paragraph", True, False)
'Saves and closes the document
document.Save("Replace.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads a template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx
"), FormatType.Docx);
//Replaces the text extended to two paragraphs with simple text
document.ReplaceSingleLine("First paragraph Second paragraph", "Replaced
paragraph", true, false);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Replace.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads a template document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);

```

Working with Table Of Contents

[Table of contents](#) (TOC) is used to provide an outline of the Word document. By default table of contents will be created automatically from heading styles.

You can add the TOC into the paragraph by specifying the `LowerHeadingLevel` and `UpperHeadingLevel`. The heading level range must be from 1 to 9.

Basically TOC determines the TOC entries based on the TOC switches.

S.No	Switches	Description
1	\o	Builds a table of contents from paragraphs formatted with built-in heading styles.
2	\h	Inserts TOC entries as hyperlinks.
3	\n	Omits page numbers from the table of contents.
4	\p	Specifies the characters that separate a TOC entry and its page number. The default is a tab with leader dots.
5	\t	Builds a table of contents from paragraphs formatted with specified styles other than the built-in heading styles

Adding a TOC field

The following code example shows how to add a table of contents (TOC) in Word document.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds the section into the Word document
IWSection section = document.AddSection();
string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
```

```

//Adds the paragraph into the created section
IWParagraph paragraph = section.AddParagraph();
//Appends the TOC field with LowerHeadingLevel and UpperHeadingLevel to
determines the TOC entries
paragraph.AppendTOC(1, 3);
//Adds the section into the Word document
section = document.AddSection();
//Adds the paragraph into the created section
paragraph = section.AddParagraph();
//Adds the text for the headings
paragraph.AppendText("First Chapter");
//Sets a built-in heading style.
paragraph.ApplyStyle(BuiltinStyle.Heading1);
//Adds the text into the paragraph
section.AddParagraph().AppendText(paraText);
//Adds the section into the Word document
section = document.AddSection();
//Adds the paragraph into the created section
paragraph = section.AddParagraph();
//Adds the text for the headings
paragraph.AppendText("Second Chapter");
//Sets a built-in heading style.
paragraph.ApplyStyle(BuiltinStyle.Heading2);
//Adds the text into the paragraph
section.AddParagraph().AppendText(paraText);
//Adds the section into the Word document
section = document.AddSection();
//Adds the paragraph into the created section
paragraph = section.AddParagraph();
//Adds the text into the headings
paragraph.AppendText("Third Chapter");
//Sets a built-in heading style
paragraph.ApplyStyle(BuiltinStyle.Heading3);
//Adds the text into the paragraph.
section.AddParagraph().AppendText(paraText);
//Updates the table of contents
document.UpdateTableOfContents();
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds the section into the Word document
Dim section As IWSection = document.AddSection()
Dim paraText As String = "AdventureWorks Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company."
'Adds the paragraph into the created section
Dim paragraph As IWParagraph = section.AddParagraph()
'Appends the TOC field with LowerHeadingLevel and UpperHeadingLevel to
determines the TOC entries
paragraph.AppendTOC(1, 3)
'Adds the section into the Word document

```

```

section = document.AddSection()
'Adds the paragraph into the created section
paragraph = section.AddParagraph()
'Adds the text for the headings
paragraph.AppendText("First Chapter")
'Sets a built-in heading style
paragraph.ApplyStyle(BuiltinStyle.Heading1)
'Adds the text into the paragraph.
section.AddParagraph().AppendText(paraText)
'Adds the section into the Word document
section = document.AddSection()
'Adds the paragraph into the created section
paragraph = section.AddParagraph()
'Adds the text for the headings
paragraph.AppendText("Second Chapter")
'Sets a built-in heading style
paragraph.ApplyStyle(BuiltinStyle.Heading2)
'Adds the text into the paragraph
section.AddParagraph().AppendText(paraText)
'Adds the section into the Word document
section = document.AddSection()
'Adds the paragraph into the created section
paragraph = section.AddParagraph()
'Adds the text into the headings
paragraph.AppendText("Third Chapter")
'Sets a built-in heading style
paragraph.ApplyStyle(BuiltinStyle.Heading3)
'Adds the text into the paragraph
section.AddParagraph().AppendText(paraText)
'Updates the table of contents
document.UpdateTableOfContents()
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

Updating table of contents

You can also update or re-build the TOC in an existing document or document created from the scratch.

Note: 1. Updating of TOC is not supported in Silverlight, WinRT, Universal, Xamarin, ASP.NET Core, Blazor and Windows Phone applications.

2. Updating TOC makes use of the Word to PDF layout engine that may lead to update incorrect page number due to its limitations.

The following code example shows how to update a TOC in an existing word document.

C#

```
//Opens an input word template
WordDocument document = new WordDocument(@"Template.docx");
//Updates the table of contents.
document.UpdateTableOfContents();
//Saves and closes the Word document instance.
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an input word template
Dim document As New WordDocument("Template.docx")
'Updates the table of contents.
document.UpdateTableOfContents()
'Saves and closes the Word document instance.
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//DocIO supports Table of contents in WPF, Windows Forms platforms alone
```

ASP.NET CORE

```
//DocIO supports Table of contents in WPF, Windows Forms platforms alone
```

XAMARIN

```
//DocIO supports Table of contents in WPF, Windows Forms platforms alone
```

Creating table of contents with user-defined styles

The following code example shows how to create table of contents with user-defined styles instead of heading styles.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Creates a new custom styles
Style style = (WParagraphStyle)document.AddParagraphStyle("MyStyle");
style.CharacterFormat.Bold = true;
style.CharacterFormat.FontName = "Verdana";
style.CharacterFormat.FontSize = 25;
//Adds the section into the Word document
IWSection section = document.AddSection();
```

```

string paraText = "AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.";
//Adds the paragraph into the created section
IWParagraph paragraph = section.AddParagraph();
//Appends the TOC field with LowerHeadingLevel and UpperHeadingLevel to
determines the TOC entries
TableOfContent tableOfContents = paragraph.AppendTOC(1, 3);
tableOfContents.UseHeadingStyles = false;
//Sets the TOC level style based on the created TOC
tableOfContents.SetTOCLevelStyle(2, "MyStyle");
//Adds the section into the Word document
section = document.AddSection();
//Adds the paragraph into the created section
paragraph = section.AddParagraph();
//Adds the text for the headings
paragraph.AppendText("First Chapter");
//Sets the built-in heading style
paragraph.ApplyStyle("MyStyle");
//Adds the text into the paragraph
section.AddParagraph().AppendText(paraText);
//Adds the section into the Word document
section = document.AddSection();
//Adds the paragraph into the created section
paragraph = section.AddParagraph();
//Adds the text for the headings
paragraph.AppendText("Second Chapter");
//Sets the built-in heading style
paragraph.ApplyStyle(BuiltinStyle.Heading1);
//Adds the text to the paragraph
section.AddParagraph().AppendText(paraText);
//Adds the section into Word document
section = document.AddSection();
//Adds a paragraph to a created section
paragraph = section.AddParagraph();
//Adds the text for the headings
paragraph.AppendText("Third Chapter");
//Sets the built-in heading style
paragraph.ApplyStyle("MyStyle");
//Adds the text to the paragraph
section.AddParagraph().AppendText(paraText);
//Updates the table of contents
document.UpdateTableOfContents();
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Creates a new custom styles
Dim style As Style = DirectCast(document.AddParagraphStyle("MyStyle"),
WParagraphStyle)
style.CharacterFormat.Bold = True
style.CharacterFormat.FontName = "Verdana"

```

```

style.CharacterFormat.FontSize = 25
'Adds the section into the Word document
Dim section As IWSection = document.AddSection()
Dim paraText As String = "AdventureWorks Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company."
'Adds the paragraph into the created section
Dim paragraph As IWParagraph = section.AddParagraph()
'Appends the TOC field with LowerHeadingLevel and UpperHeadingLevel to
determine the TOC entries
Dim tableOfContents As TableOfContent = paragraph.AppendTOC(1, 3)
tableOfContents.UseHeadingStyles = False
'Sets the TOC level style based on the created TOC
tableOfContents.SetTOCLevelStyle(2, "MyStyle")
'Adds the section into the Word document
section = document.AddSection()
'Adds the paragraph into the created section
paragraph = section.AddParagraph()
'Adds the text for the headings
paragraph.AppendText("First Chapter")
'Sets the built-in heading style
paragraph.ApplyStyle("MyStyle")
'Adds the text into the paragraph
section.AddParagraph().AppendText(paraText)
'Adds the section into the Word document
section = document.AddSection()
'Adds the paragraph into the created section
paragraph = section.AddParagraph()
'Adds the text for the headings
paragraph.AppendText("Second Chapter")
'Sets the built-in heading style
paragraph.ApplyStyle(BuiltinStyle.Heading1)
'Adds the text to the paragraph
section.AddParagraph().AppendText(paraText)
'Adds the section into Word document
section = document.AddSection()
'Adds a paragraph to created section
paragraph = section.AddParagraph()
'Adds the text for the headings

Applying Watermark

Watermarks are text or pictures that appear behind the document text. You can access the watermark in the document by using the **Watermark** property of **WordDocument** class.

There are two types of watermarks: Text and Picture.

Text Watermark

You can add or modify text watermark in the Word document. **TextWatermark** class represents text watermark in the Word document.

The following code example illustrates how to add a text watermark to the Word document.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IWParagraph paragraph = document.LastParagraph;
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Creates a new text watermark
TextWatermark textWatermark = new TextWatermark();
//Sets the created watermark to the document
document.Watermark = textWatermark;
//Sets the text watermark font size
textWatermark.Size = 72;
//Sets the text watermark layout to Horizontal
textWatermark.Layout = WatermarkLayout.Horizontal;
textWatermark.Semitransparent = false;
//Sets the text watermark text color
textWatermark.Color = Color.Black;
//Sets the text to text watermark text
textWatermark.Text = "TextWatermark";
document.Save("TextWatermark.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds a section and a paragraph in the document
document.EnsureMinimal()
Dim paragraph As IWParagraph = document.LastParagraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Creates a new text watermark
```

```

Dim textWatermark As New TextWatermark()
'Sets the text watermark to the document
document.Watermark = textWatermark
'Sets the text watermark font size
textWatermark.Size = 72
'Sets the text watermark layout to Horizontal
textWatermark.Layout = WatermarkLayout.Horizontal
textWatermark.Semitransparent = False
'Sets the text watermark text color
textWatermark.Color = Color.Black
'Sets the text to the text watermark
textWatermark.Text = "TextWatermark"
document.Save("TextWatermark.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IWParagraph paragraph = document.LastParagraph;
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Creates a new text watermark
TextWatermark textWatermark = new TextWatermark();
//Sets the created watermark to the document
document.Watermark = textWatermark;
//Sets the text watermark font size
textWatermark.Size = 72;
//Sets the text watermark layout to Horizontal
textWatermark.Layout = WatermarkLayout.Horizontal;
textWatermark.Semitransparent = false;
//Sets the text watermark text color
textWatermark.Color = Color.Black;
//Sets the text to text watermark text
textWatermark.Text = "TextWatermark";
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "TextWatermark.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IWParagraph paragraph = document.LastParagraph;

```

```

paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Creates a new text watermark
TextWatermark textWatermark = new TextWatermark("TextWatermark", "", 250,
100);
//Sets the created watermark to the document
document.Watermark = textWatermark;
//Sets the text watermark font size
textWatermark.Size = 72;
//Sets the text watermark layout to Horizontal
textWatermark.Layout = WatermarkLayout.Horizontal;
textWatermark.Semitransparent = false;
//Sets the text watermark text color
textWatermark.Color = Color.Black;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result_watermark1.docx");

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IWParagraph paragraph = document.LastParagraph;
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Creates a new text watermark
TextWatermark textWatermark = new TextWatermark("TextWatermark", "", 250,
100);
//Sets the created watermark to the document
document.Watermark = textWatermark;
//Sets the text watermark font size
textWatermark.Size = 72;
//Sets the text watermark layout to Horizontal
textWatermark.Layout = WatermarkLayout.Horizontal;
textWatermark.Semitransparent = false;
//Sets the text watermark text color
textWatermark.Color = Syncfusion.Drawing.Color.Black;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("TextWatermark.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform

```

[//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin](https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin)

Picture Watermark

You can add or modify picture watermark in the Word document. **PictureWatermark** class represents picture watermark in the Word document.

The following code example illustrates how to add a picture watermark to the Word document.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IWParagraph paragraph = document.LastParagraph;
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Creates a new picture watermark
PictureWatermark picWatermark = new PictureWatermark();
//Sets the scaling to picture
picWatermark.Scaling = 120f;
picWatermark.Washout = true;
//Sets the picture watermark to document
document.Watermark = picWatermark;
//Sets the image to the picture watermark
picWatermark.Picture = Image.FromFile(ImagesPath + "Water lilies.jpg");
document.Save("PictureWatermark.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds a section and a paragraph in the document
document.EnsureMinimal()
Dim paragraph As IWParagraph = document.LastParagraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Creates a new picture watermark
Dim picWatermark As New PictureWatermark()
'Sets the scaling to picture
picWatermark.Scaling = 120.0F
picWatermark.Washout = True
Set the picture watermark to document
document.Watermark = picWatermark
Set the image to the picture watermark
picWatermark.Picture = Image.FromFile(ImagesPath + "Water lilies.jpg")
document.Save("PictureWatermark.docx", FormatType.Docx)
document.Close()
```

UWP

```
//DocIO supports picture watermark in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

ASP.NET CORE

```
//DocIO supports picture watermark in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

XAMARIN

```
//DocIO supports picture watermark in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

Working with Comments

A comment is a note or annotation that an author or reviewer can add to a document. DocIO represents comment with **WComment** instance.

Note: The comment start and end ranges and dates can be preserved only on processing an existing document that already contains these information for each comment.

Adding a Comment

You can add a new comment to the Word document by using **AppendComment** method of **WParagraph** class.

The following code illustrates how to add a new comment to the document:

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IWParagraph paragraph = document.LastParagraph;
//Appends text to the paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Adds comment to a paragraph
WComment comment = paragraph.AppendComment("comment test");
//Specifies the author of the comment
comment.Format.User = "Peter";
//Specifies the initial of the author
comment.Format.UserInitials = "St";
//Set the date and time for comment
comment.Format.DateTime = DateTime.Now;
//Saves and closes the Word document
document.Save("Comment.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds a section and a paragraph in the document
```

```

document.EnsureMinimal()
Dim paragraph As IParagraph = document.LastParagraph
'Appends text to the paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Adds comment to a paragraph
Dim comment As WComment = paragraph.AppendComment("comment test")
'Specifies the author of the comment
comment.Format.User = "Peter"
'Specifies the initial of the author
comment.Format.UserInitials = "St"
'Saves and closes the Word document
document.Save("Comment.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IParagraph paragraph = document.LastParagraph;
//Appends text to the paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Adds comment to a paragraph
WComment comment = paragraph.AppendComment("comment test");
//Specifies the author of the comment
comment.Format.User = "Peter";
//Specifies the initial of the author
comment.Format.UserInitials = "St";
//Set the date and time for comment
comment.Format.DateTime = DateTime.Now;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Comment.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();
IParagraph paragraph = document.LastParagraph;
//Appends text to the paragraph

```

```

paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Adds comment to a paragraph
WComment comment = paragraph.AppendComment("comment test");
//Specifies the author of the comment
comment.Format.User = "Peter";
//Specifies the initial of the author
comment.Format.UserInitials = "St";
//Set the date and time for comment
comment.Format.DateTime = DateTime.Now;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Comment.docx");

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds a section and a paragraph in the document
document.EnsureMinimal();

//Appends text to the paragraph
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Adds comment to a paragraph
WComment comment = paragraph.AppendComment("comment test");
//Specifies the author of the comment
comment.Format.User = "Peter";
//Specifies the initial of the author
comment.Format.UserInitials = "St";
//Set the date and time for comment
comment.Format.DateTime = DateTime.Now;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Modifying a Comment

The following code illustrates how to modify the text of an existing comment in the Word document:

C#

```

WordDocument document = new WordDocument("Comment.docx");
//Iterates the comments in the Word document
foreach (WComment comment in document.Comments)
{
    //Modifies the last paragraph text of an existing comment when it is added
    by "Peter"
    if (comment.Format.User == "Peter")
        comment.TextBody.LastParagraph.Text = "Modified Comment Content";
}
document.Save("ModifiedComment.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

Dim document As New WordDocument("Comment.docx")
'Iterates the comments in the Word document
For Each comment As WComment In document.Comments
    'Modifies the last paragraph text of an existing comment when it is added by
    "Peter"
    If comment.Format.User = "Peter" Then
        comment.TextBody.LastParagraph.Text = "Modified Comment Content"
    End If
Next
document.Save("ModifiedComment.docx", FormatType.Docx)
document.Close()

```

UWP

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Comment.docx"
), FormatType.Docx);
//Iterates the comments in the Word document
foreach (WComment comment in document.Comments)
{
    //Modifies the last paragraph text of an existing comment when it is added
    by "Peter"
    if (comment.Format.User == "Peter")
        comment.TextBody.LastParagraph.Text = "Modified Comment Content";
}
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "ModifiedComment.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

FileStream fileStreamPath = new FileStream("Comment.docx", FileMode.Open,
    FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Iterates the comments in the Word document
foreach (WComment comment in document.Comments)
{
    //Modifies the last paragraph text of an existing comment when it is added
    by "Peter"
    if (comment.Format.User == "Peter")
        comment.TextBody.LastParagraph.Text = "Modified Comment Content";
}
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document

```

Removing Comments

You can either remove all the comments or a particular comment from the Word document.

The following code illustrates how to remove all the comments in Word document.

C#

```

WordDocument document = new WordDocument("Comment.docx");
//Removes all the comments in a Word document

```

```
document.Comments.Clear();
document.Save("Result.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
Dim document As New WordDocument("Comment.docx")
'Removes all the comments in a Word document
document.Comments.Clear()
document.Save("Result.docx", FormatType.Docx)
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Comment.docx"),
FormatType.Docx);
//Removes all the comments in a Word document
document.Comments.Clear();
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
FileStream filePath = new FileStream("Comment.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(filePath, FormatType.Docx);
//Removes all the comments in a Word document
document.Comments.Clear();
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
```

XAMARIN

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Comment
.docx"), FormatType.Docx)
//Removes all the comments in a Word document
document.Comments.Clear();
```

```
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

The following code illustrates how to remove a particular comment from Word document.

C#

```
WordDocument document = new WordDocument("Comment.docx");
//Removes second comments from a document.
document.Comments.RemoveAt(1);
//Saves and closes the Word document
document.Save("Result.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
Dim document As New WordDocument("Comment.docx")
'Removes second comments from a document.
document.Comments.RemoveAt(1)
'Saves and closes the Word document
document.Save("Result.docx", FormatType.Docx)
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Comment.docx"
), FormatType.Docx);
//Removes second comments from a document.
document.Comments.RemoveAt(1);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```

FileStream filePath = new FileStream("Comment.docx", FileMode.Open,
    FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(filePath, FormatType.Docx);
//Removes second comments from a document.
document.Comments.RemoveAt(1);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");

```

XAMARIN

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Comment
.docx"), FormatType.Docx)
//Removes second comments from a document
document.Comments.RemoveAt(1);
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Working with Form Fields

You can create template document with form fields such as Text, Checkbox and Drop-Down. You can also open an existing template document and fill the form fields with the specified data.

The following are the types of form field in the Word document

- Checkbox – represented by an instance of WCheckBox
- Drop-down – represented by an instance of WDropDownFormField
- Text input – represented by an instance of WTextFormField

Check Box

You can add new Checkbox form field to a Word document by using `AppendCheckBox` method of `WParagraph` class.

The following code illustrates how to add new checkbox form field.

C#

```

//Creates a new Word document

```

```

WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("Gender\t");
//Appends new Checkbox
WCheckBox checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
//Sets Checkbox size
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
//Sets help text
checkbox.Help = "Help text";
paragraph.AppendText("Male\t");
checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
paragraph.AppendText("Female");
//Saves the Word document
document.Save("Checkbox.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As WParagraph = TryCast(section.AddParagraph(), WParagraph)
paragraph.AppendText("Gender" & vbTab)
'Appends new Checkbox
Dim checkbox As WCheckBox = paragraph.AppendCheckBox()
checkbox.Checked = False
'Sets Checkbox size
checkbox.CheckBoxSize = 10
checkbox.CalculateOnExit = True
'Sets help text
checkbox.Help = "Help text"
paragraph.AppendText("Male" & vbTab)
checkbox = paragraph.AppendCheckBox()
checkbox.Checked = False
checkbox.CheckBoxSize = 10
checkbox.CalculateOnExit = True
paragraph.AppendText("Female")
'Saves the Word document
document.Save("Checkbox.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document

```

```

WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("Gender\t");
//Appends new Checkbox
WCheckBox checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
//Sets Checkbox size
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
//Sets help text
checkbox.Help = "Help text";
paragraph.AppendText("Male\t");
checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
paragraph.AppendText("Female");
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Checkbox.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("Gender\t");
//Appends new Checkbox
WCheckBox checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
//Sets Checkbox size
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
//Sets help text
checkbox.Help = "Help text";
paragraph.AppendText("Male\t");
checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
paragraph.AppendText("Female");
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();

```

```
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Checkbox.docx");
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("Gender\t");
//Appends new Checkbox
WCheckBox checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
//Sets Checkbox size
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
//Sets help text
checkbox.Help = "Help text";
paragraph.AppendText("Male\t");
checkbox = paragraph.AppendCheckBox();
checkbox.Checked = false;
checkbox.CheckBoxSize = 10;
checkbox.CalculateOnExit = true;
paragraph.AppendText("Female");
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Checkbox.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

You can modify the checkbox properties such as checked state, size, help text in a Word document. The following code illustrates how to modify the checkbox form field properties.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Checkbox.docx");
//Iterates through paragraph items
foreach (ParagraphItem item in document.LastParagraph.ChildEntities)
{
    if (item is WCheckBox)
    {
        WCheckBox checkbox = item as WCheckBox;
```

```

//Modifies check box properties
if (checkbox.Checked)
checkbox.Checked = false;
checkbox.SizeType = CheckBoxSizeType.Exactly;
}
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Checkbox.docx")
'Iterates through paragraph items
For Each item As ParagraphItem In document.LastParagraph.ChildEntities
If TypeOf item Is WCheckBox Then
Dim checkbox As WCheckBox = TryCast(item, WCheckBox)
'Modifies check box properties
If checkbox.Checked Then
checkbox.Checked = False
End If
checkbox.SizeType = CheckBoxSizeType.Exactly
End If
Next
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Checkbox.docx"),
FormatType.Docx);
//Iterates through paragraph items
foreach (ParagraphItem item in document.LastParagraph.ChildEntities)
{
if (item is WCheckBox)
{
WCheckBox checkbox = item as WCheckBox;
//Modifies check box properties
if (checkbox.Checked)
checkbox.Checked = false;
checkbox.SizeType = CheckBoxSizeType.Exactly;
}
}
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document

```

```
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Loads the template document
FileStream fileStreamPath = new FileStream("Checkbox.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Iterates through paragraph items
foreach (ParagraphItem item in document.LastParagraph.ChildEntities)
{
    if (item is WCheckBox)
    {
        WCheckBox checkbox = item as WCheckBox;
        //Modifies check box properties
        if (checkbox.Checked)
            checkbox.Checked = false;
        checkbox.SizeType = CheckBoxSizeType.Exactly;
    }
}
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");
```

XAMARIN

```
//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Checkbo
x.docx"), FormatType.Docx);
//Iterates through paragraph items
foreach (ParagraphItem item in document.LastParagraph.ChildEntities)
{
    if (item is WCheckBox)
    {
        WCheckBox checkbox = item as WCheckBox;
        //Modifies check box properties
        if (checkbox.Checked)
            checkbox.Checked = false;
        checkbox.SizeType = CheckBoxSizeType.Exactly;
    }
}
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
```

```
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Drop-Down

You can add new Dropdown form field to a Word document by using `AppendDropDownFormField` method of `WParagraph` class.

The following code illustrates how to add a new dropdown field.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("Educational Qualification\t");
//Appends Dropdown field
WDropDownFormField dropDownField = paragraph.AppendDropDownFormField();
//Adds items to the Dropdown items collection
dropDownField.DropDownItems.Add("Higher");
dropDownField.DropDownItems.Add("Vocational");
dropDownField.DropDownItems.Add("Universal");
dropDownField.Enabled = true;
//Sets the item index for default value
dropDownField.DropDownSelectedIndex = 1;
dropDownField.CalculateOnExit = true;
//Saves the Word document
document.Save("Dropdown.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As WParagraph = TryCast(section.AddParagraph(), WParagraph)
paragraph.AppendText("Educational Qualification" & vbTab)
'Appends Dropdown field
Dim dropDownField As WDropDownFormField =
paragraph.AppendDropDownFormField()
'Adds items to the Dropdown items collection
dropDownField.DropDownItems.Add("Higher")
dropDownField.DropDownItems.Add("Vocational")
dropDownField.DropDownItems.Add("Universal")
dropDownField.Enabled = True
```

```
'Sets the item index for default value
dropDownField.DropDownSelectedIndex = 1
dropDownField.CalculateOnExit = True
'Saves the Word document
document.Save("Dropdown.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("Educational Qualification\t");
//Appends Dropdown field
WDropDownFormField dropDownField = paragraph.AppendDropDownFormField();
//Adds items to the Dropdown items collection
dropDownField.DropDownItems.Add("Higher");
dropDownField.DropDownItems.Add("Vocational");
dropDownField.DropDownItems.Add("Universal");
dropDownField.Enabled = true;
//Sets the item index for default value
dropDownField.DropDownSelectedIndex = 1;
dropDownField.CalculateOnExit = true;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Dropdown.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("Educational Qualification\t");
//Appends Dropdown field
WDropDownFormField dropDownField = paragraph.AppendDropDownFormField();
//Adds items to the Dropdown items collection
dropDownField.DropDownItems.Add("Higher");
dropDownField.DropDownItems.Add("Vocational");
dropDownField.DropDownItems.Add("Universal");
dropDownField.Enabled = true;
//Sets the item index for default value
dropDownField.DropDownSelectedIndex = 1;
```

```

dropDownField.CalculateOnExit = true;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Dropdown.docx");

```

XAMARIN

```

//Creates a new Word document

```

You can add or modify list of items of a Dropdown form field in a Word document. The following code illustrates how to modify the dropdown list of a Dropdown form field.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Dropdown.docx");
//Iterates through paragraph items
foreach (ParagraphItem item in document.LastParagraph.ChildEntities)
{
    if (item is WDropDownFormField)
    {
        WDropDownFormField dropdown = item as WDropDownFormField;
        //Modifies the dropdown items
    }
}

```

```

dropdown.DropDownItems.Remove(1);
dropdown.DropDownSelectedIndex = 0;
dropdown.CharacterFormat.FontName = "Arial";
}
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Dropdown.docx")
'Iterates through paragraph items
For Each item As ParagraphItem In document.LastParagraph.ChildEntities
If TypeOf item Is WDropDownFormField Then
Dim dropdown As WDropDownFormField = TryCast(item, WDropDownFormField)
'Modifies the dropdown items
dropdown.DropDownItems.Remove(1)
dropdown.DropDownSelectedIndex = 0
dropdown.CharacterFormat.FontName = "Arial"
End If
Next
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Dropdown.docx"),
FormatType.Docx);
//Iterates through paragraph items
foreach (ParagraphItem item in document.LastParagraph.ChildEntities)
{
if (item is WDropDownFormField)
{
WDropDownFormField dropdown = item as WDropDownFormField;
//Modifies the dropdown items
dropdown.DropDownItems.Remove(1);
dropdown.DropDownSelectedIndex = 0;
dropdown.CharacterFormat.FontName = "Arial";
}
}
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform

```

```

Text Form field

You can add new text form field to a Word document by using `AppendTextFormField` method of `WParagraph` class.

The following code illustrates how to add new text form field.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("General Information");
section.AddParagraph();
paragraph = section.AddParagraph() as WParagraph;
IWTextRange text = paragraph.AppendText("Name\t");
text.CharacterFormat.Bold = true;
//Appends Text form field
WTextFormField textField = paragraph.AppendTextFormField(null);
//Sets type of Text form field
textField.Type = TextFormFieldType.RegularText;
textField.CharacterFormat.FontName = "Calibri";
textField.CalculateOnExit = true;
section.AddParagraph();
paragraph = section.AddParagraph() as WParagraph;
text = paragraph.AppendText("Date of Birth\t");
text.CharacterFormat.Bold = true;
//Appends Text form field
textField = paragraph.AppendTextFormField("Date field",
DateTime.Now.ToString("MM/DD/YY"));
textField.StringFormat = "MM/DD/YY";
//Sets Text form field type
textField.Type = TextFormFieldType.DateText;
textField.CalculateOnExit = true;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
section As IWSection = document.AddSection()
'Adds new paragraph to the section
```

```

Dim paragraph As WParagraph = TryCast(section.AddParagraph(), WParagraph)
paragraph.AppendText("General Information")
section.AddParagraph()
paragraph = TryCast(section.AddParagraph(), WParagraph)
Dim text As ITextRange = paragraph.AppendText("Name" & vbTab)
text.CharacterFormat.Bold = True
'Appends Text form field
Dim textField As WTextFormField = paragraph.AppendTextFormField(Nothing)
'Sets type of Text form field
textField.Type = TextFormFieldType.RegularText
textField.CharacterFormat.FontName = "Calibri"
textField.CalculateOnExit = True
section.AddParagraph()
paragraph = TryCast(section.AddParagraph(), WParagraph)
text = paragraph.AppendText("Date of Birth" & vbTab)
text.CharacterFormat.Bold = True
'Appends Text form field
textField = paragraph.AppendTextFormField("Date field",
DateTime.Now.ToString("MM/DD/YY"))
textField.StringFormat = "MM/DD/YY"
'Sets Text form field type
textField.Type = TextFormFieldType.DateText
textField.CalculateOnExit = True
'Saves the Word document
document.Save("textField.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
paragraph.AppendText("General Information");
section.AddParagraph();
paragraph = section.AddParagraph() as WParagraph;
ITextRange text = paragraph.AppendText("Name\t");
text.CharacterFormat.Bold = true;
//Appends Text form field
WTextFormField textField = paragraph.AppendTextFormField(null);
//Sets type of Text form field
textField.Type = TextFormFieldType.RegularText;
textField.CharacterFormat.FontName = "Calibri";
textField.CalculateOnExit = true;
section.AddParagraph();
paragraph = section.AddParagraph() as WParagraph;
text = paragraph.AppendText("Date of Birth\t");

xamarin#helper-files-for-xamarin

```

You can add or modify text form field properties such as default text, type in a Word document. The following code illustrates how to modify the text form field

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Iterates through section
foreach (WSection section in document.Sections)
//Iterates through section child elements
foreach (WTextBody textBody in section.ChildEntities)
{
    //Iterates through form fields
    foreach (WFormField formField in textBody.FormFields)
    {
        switch (formField.FormFieldType)
        {

```

```

case FormFieldType.TextInput:
WTextFormField textField = formField as WTextFormField;
if (textField.Type == TextFormFieldType.DateText)
{
    //Modifies the text form field
    textField.Type = TextFormFieldType.RegularText;
    textField.StringFormat = "";
    textField.DefaultText = "Default text";
    textField.Text = "Default text";
    textField.CalculateOnExit = false;
}
break;
}
}
}
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx")
'Iterates through section
For Each section As WSection In document.Sections
'Iterates through section child elements
For Each textBody As WTextBody In section.ChildEntities
'Iterates through form fields
For Each formField As WFormField In textBody.FormFields
Select Case formField.FormFieldType
Case FormFieldType.TextInput
Dim textField As WTextFormField = TryCast(formField, WTextFormField)
If textField.Type == TextFormFieldType.DateText Then
    'Modifies the text form field
    textField.Type = TextFormFieldType.RegularText
    textField.StringFormat = ""
    textField.DefaultText = "Default text"
    textField.Text = "Default text"
    textField.CalculateOnExit = False
End If
Exit Select
End Select
Next
Next
Next
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;

```

```

WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx
"), FormatType.Docx);
//Iterates through section
foreach (WSection section in document.Sections)
//Iterates through section child elements
foreach (WTextBody textBody in section.ChildEntities)
{
//Iterates through form fields
foreach (WFormField formField in textBody.FormFields)
{
switch (formField.FormFieldType)
{
case FormFieldType.TextInput:
WTextFormField textField = formField as WTextFormField;
if (textField.Type == TextFormFieldType.DateText)
{
//Modifies the text form field
textField.Type = TextFormFieldType.RegularText;
textField.StringFormat = "";
textField.DefaultText = "Default text";
textField.Text = "Default text";
textField.CalculateOnExit = false;
}
break;
}
}
}
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads the template document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Iterates through section
foreach (WSection section in document.Sections)
//Iterates through section child elements
foreach (WTextBody textBody in section.ChildEntities)
{
//Iterates through form fields
foreach (WFormField formField in textBody.FormFields)
{
switch (formField.FormFieldType)
{
case FormFieldType.TextInput:

```

```

WTextFormField textField = formField as WTextFormField;
if (textField.Type == TextFormFieldType.DateText)
{
    //Modifies the text form field
    textField.Type = TextFormFieldType.RegularText;
    textField.StringFormat = "";
    textField.DefaultText = "Default text";
    textField.Text = "Default text";
    textField.CalculateOnExit = false;
}
break;
}
}
}
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");

```

XAMARIN

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Templat
e.docx"), FormatType.Docx);
//Iterates through section
foreach (WSection section in document.Sections)
//Iterates through section child elements
foreach (WTextBody textBody in section.ChildEntities)
{
    //Iterates through form fields
    foreach (WFormField formField in textBody.FormFields)
    {
        switch (formField.FormFieldType)
        {
            case FormFieldType.TextInput:
                WTextFormField textField = formField as WTextFormField;
                if (textField.Type == TextFormFieldType.DateText)
                {
                    //Modifies the text form field
                    textField.Type = TextFormFieldType.RegularText;
                    textField.StringFormat = "";
                    textField.DefaultText = "Default text";
                    textField.Text = "Default text";
                    textField.CalculateOnExit = false;
                }
                break;
            }
        }
    }
    //Saves the Word document to MemoryStream

```

```

MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin

```

Working with Charts

A Chart is a graphical representation of data where the data is represented as symbols such as bars, lines etc. Charts can represent numerical data, functions or some kinds of qualitative structures. DocIO supports the following chart types:

- Bar chart
- Line chart
- Pie chart
- Area chart
- Column chart
- Scatter chart
- Surface chart
- Stock chart
- Radar chart

Note: DocIO provides chart support in following platforms – Windows, ASP.NET, WPF, ASP.NET MVC

DocIO supports chart only in DOCX and WordML format documents.

Creating a simple Chart from scratch

A new chart can be created or an existing chart can be modified by using the WChart instance. The following code example illustrates how to create a new chart.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds section to the document
IWSection sec = document.AddSection();
//Adds paragraph to the section
IWParagraph paragraph = sec.AddParagraph();
//Creates and Appends chart to the paragraph
WChart chart = paragraph.AppendChart(446, 270);
//Sets chart type
chart.ChartType = OfficeChartType.Pie;
//Sets chart title
chart.ChartTitle = "Best Selling Products";
chart.ChartTitleArea.FontName = "Calibri";
chart.ChartTitleArea.Size = 14;
//Sets data for chart
chart.ChartData.SetValue(1, 1, "");

```

```

chart.ChartData.SetValue(1, 2, "Sales");
chart.ChartData.SetValue(2, 1, "Phyllis Lapin");
chart.ChartData.SetValue(2, 2, 141.396);
chart.ChartData.SetValue(3, 1, "Stanley Hudson");
chart.ChartData.SetValue(3, 2, 80.368);
chart.ChartData.SetValue(4, 1, "Bernard Shah");
chart.ChartData.SetValue(4, 2, 71.155);
chart.ChartData.SetValue(5, 1, "Patricia Lincoln");
chart.ChartData.SetValue(5, 2, 47.234);
chart.ChartData.SetValue(6, 1, "Camembert Pierrot");
chart.ChartData.SetValue(6, 2, 46.825);
chart.ChartData.SetValue(7, 1, "Thomas Hardy");
chart.ChartData.SetValue(7, 2, 42.593);
chart.ChartData.SetValue(8, 1, "Hanna Moos");
chart.ChartData.SetValue(8, 2, 41.819);
chart.ChartData.SetValue(9, 1, "Alice Mutton");
chart.ChartData.SetValue(9, 2, 32.698);
chart.ChartData.SetValue(10, 1, "Christina Berglund");
chart.ChartData.SetValue(10, 2, 29.171);
chart.ChartData.SetValue(11, 1, "Elizabeth Lincoln");
chart.ChartData.SetValue(11, 2, 25.696);
//Creates a new chart series with the name "Sales"
IOfficeChartSerie pieSeries = chart.Series.Add("Sales");
pieSeries.Values = chart.ChartData[2, 2, 11, 2];
//Sets data label
pieSeries.DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
pieSeries.DataPoints.DefaultDataPoint.DataLabels.Position =
OfficeDataLabelPosition.Outside;
//Sets background color
chart.ChartArea.Fill.ForeColor = Color.FromArgb(242, 242, 242);
chart.PlotArea.Fill.ForeColor = Color.FromArgb(242, 242, 242);
chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None;
//Sets category labels
chart.PrimaryCategoryAxis.CategoryLabels = chart.ChartData[2, 1, 11, 1];
//Saves the document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds section to the document
Dim sec As IWSection = document.AddSection()
'Adds paragraph to the section
Dim paragraph As IWParagraph = sec.AddParagraph()
'Creates and Appends chart to the paragraph
Dim chart As WChart = paragraph.AppendChart(446, 270)
'Sets chart type

}
```

Creating a Chart from Excel file

The chart data can be set through the object array or can be loaded from the excel stream. The specific range of the data from the excel file can be used to set chart data.

The following code example illustrates the chart data loaded from the excel file.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds section to the document
IWSection sec = document.AddSection();
//Adds paragraph to the section
IWParagraph paragraph = sec.AddParagraph();
//Loads the excel file as stream
Stream excelStream = File.OpenRead("Excel_Template.xlsx");
//Creates and Appends chart to the paragraph with excel stream as parameter
WChart chart = paragraph.AppendChart(excelStream, 1, "B2:C6", 470, 300);
//Sets chart type and title
chart.ChartType = OfficeChartType.Column_Clustered;
chart.ChartTitle = "Purchase Details";
chart.ChartTitleArea.FontName = "Calibri";
chart.ChartTitleArea.Size = 14;
chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None;
//Sets name to chart series
chart.Series[0].Name = "Sum of Purchases";
chart.Series[1].Name = "Sum of Future Expenses";
chart.PrimaryCategoryAxis.Title = "Products";
chart.PrimaryValueAxis.Title = "In Dollars";
//Sets position of legend
chart.Legend.Position = OfficeLegendPosition.Bottom;
//Saves the document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds section to the document
Dim sec As IWSection = document.AddSection()
'Adds paragraph to the section
Dim paragraph As IWParagraph = sec.AddParagraph()
```

```

'Loads the excel file as stream
Dim excelStream As Stream = File.OpenRead("Excel_Template.xlsx")
'Creates and Appends chart to the paragraph with excel stream as parameter
Dim chart As WChart = paragraph.AppendChart(excelStream, 1, "B2:C6", 470,
300)
'Sets chart type and title
chart.ChartType = OfficeChartType.Column_Clustered
chart.ChartTitle = "Purchase Details"
chart.ChartTitleArea.FontName = "Calibri"
chart.ChartTitleArea.Size = 14
chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None
'Sets name to chart series
chart.Series(0).Name = "Sum of Purchases"
chart.Series(1).Name = "Sum of Future Expenses"
chart.PrimaryCategoryAxis.Title = "Products"
chart.PrimaryValueAxis.Title = "In Dollars"
'Sets position of legend
chart.Legend.Position = OfficeLegendPosition.Bottom
'Saves the document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

using (WordDocument document = new WordDocument())
{
    //Adds section to the document
    IWSection sec = document.AddSection();
    //Adds paragraph to the section
    IWParagraph paragraph = sec.AddParagraph();
    //Loads the excel file as stream
    Stream excelStream = File.OpenRead("Excel_Template.xlsx");
    //Creates and Appends chart to the paragraph with excel stream as parameter
    WChart chart = paragraph.AppendChart(excelStream, 1, "B2:C6", 470, 300);
    //Sets chart type and title

}

```

Creating Custom Charts

A chart is composed of data series. Each data series is represented by a series object. When creating a custom chart, you can specify different series types for each data series.

The following code example illustrates how to create custom charts.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds section to the document
IWSection sec = document.AddSection();
//Adds paragraph to the section
IWParagraph paragraph = sec.AddParagraph();
//Inputs data for chart
object[][] data = new object[6][];
for (int i = 0; i < 6; i++)
data[i] = new object[3];
data[0][0] = "";
data[1][0] = "Camembert Pierrot";
data[2][0] = "Alice Mutton";
data[3][0] = "Roasted Tigers";
data[4][0] = "Orange Shake";
data[5][0] = "Dried Apples";
data[0][1] = "Sum of Purchases";
data[1][1] = 286;
data[2][1] = 680;
data[3][1] = 288;
data[4][1] = 200;
data[5][1] = 731;
data[0][2] = "Sum of Future Expenses";
data[1][2] = 1300;
data[2][2] = 700;
data[3][2] = 1280;
data[4][2] = 1200;

```

```

data[5][2] = 2660;
//Creates and Appends chart to the paragraph
WChart chart = paragraph.AppendChart(data, 470, 300);
//Sets chart type and title
chart.ChartTitle = "Purchase Details";
chart.ChartTitleArea.FontName = "Calibri";
chart.ChartTitleArea.Size = 14;
chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None;
//Sets series type
chart.Series[0].SeriesType = OfficeChartType.Line_Markers;
chart.Series[1].SeriesType = OfficeChartType.Bar_Clustered;
chart.PrimaryCategoryAxis.Title = "Products";
chart.PrimaryValueAxis.Title = "In Dollars";
//Sets position of legend
chart.Legend.Position = OfficeLegendPosition.Bottom;
//Saves the document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds section to the document
Dim sec As IWSection = document.AddSection()
'Adds paragraph to the section
Dim paragraph As IWParagraph = sec.AddParagraph()
'Inputs data for chart
Dim data As Object()() = New Object(5)() {}
For i As Integer = 0 To 5
    data(i) = New Object(2) {}
Next
data(0)(0) = ""
data(1)(0) = "Camembert Pierrot"
data(2)(0) = "Alice Mutton"
data(3)(0) = "Roasted Tigers"
data(4)(0) = "Orange Shake"
data(5)(0) = "Dried Apples"
data(0)(1) = "Sum of Purchases"
data(1)(1) = 286
data(2)(1) = 680
data(3)(1) = 288
data(4)(1) = 200
data(5)(1) = 731
data(0)(2) = "Sum of Future Expenses"
data(1)(2) = 1300
data(2)(2) = 700
data(3)(2) = 1280
data(4)(2) = 1200
data(5)(2) = 2660
'Creates and Appends chart to the paragraph
Dim chart As WChart = paragraph.AppendChart(data, 470, 300)
'Sets chart type and title
chart.ChartTitle = "Purchase Details"
chart.ChartTitleArea.FontName = "Calibri"

```

```

chart.ChartTitleArea.Size = 14
chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None
'Sets series type
chart.Series(0).SerieType = OfficeChartType.Line_Markers
chart.Series(1).SerieType = OfficeChartType.Bar_Clustered
chart.PrimaryCategoryAxis.Title = "Products"
chart.PrimaryValueAxis.Title = "In Dollars"
'Sets position of legend
chart.Legend.Position = OfficeLegendPosition.Bottom
'Saves the document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

using (WordDocument document = new WordDocument())
{
    //Adds section to the document
    IWSection sec = document.AddSection();
    //Adds paragraph to the section
    IWParagraph paragraph = sec.AddParagraph();

    data[4][2] = 1200;
    data[5][2] = 2660;
    //Creates and Appends chart to the paragraph
    WChart chart = paragraph.AppendChart(data, 470, 300);
    //Sets chart type and title
    chart.ChartTitle = "Purchase Details";
    chart.ChartTitleArea.FontName = "Calibri";
    chart.ChartTitleArea.Size = 14;
    chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None;
    //Sets series type
    chart.Series[0].SerieType = OfficeChartType.Line_Markers;
    chart.Series[1].SerieType = OfficeChartType.Bar_Clustered;
    chart.PrimaryCategoryAxis.Title = "Products";
    chart.PrimaryValueAxis.Title = "In Dollars";
    //Sets position of legend
    chart.Legend.Position = OfficeLegendPosition.Bottom;
    MemoryStream stream = new MemoryStream();
}
```

```
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWorddoc.doc
x", "application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
//Closes the documents
document.Close();
}
```

Refreshing the Chart

The chart may not have the data in the referred excel file instead it may represent some other data. For those charts to have the excel data, it should be refreshed.

The following code example illustrates how to refresh the chart.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity from the paragraph items
WChart chart = paragraph.ChildEntities[1] as WChart;
//Refreshes chart data
chart.Refresh();
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As New WordDocument("Template.docx")
'Gets the last paragraph
Dim paragraph As WParagraph = document.LastParagraph
'Gets the chart entity from the paragraph items
Dim chart As WChart = TryCast(paragraph.ChildEntities(1), WChart)
'Refreshes chart data
chart.Refresh()
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new
WordDocument((assembly.GetManifestResourceStream("CreateWordSample.Assets.Te
st.docx"))),
```

```

FormatType.Docx))
{
    //Gets the last paragraph
    WParagraph paragraph = document.LastParagraph;
    //Gets the chart entity from the paragraph items
    WChart chart = paragraph.ChildEntities[1] as WChart;
    //Refreshes chart data
    chart.Refresh();
    MemoryStream stream = new MemoryStream();
    await document.SaveAsync(stream, FormatType.Docx);
    //Saves the stream as Word file in local machine
    Save(stream, "Protection.docx");
    //Closes the Word document
    document.Close();
    //Please refer the below link to save Word document in UWP platform
    //https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
}

```

ASP.NET CORE

```

FileStream fileStreamPath = new FileStream(@"Data/Template.docx",
    FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(fileStreamPath,
    FormatType.Docx))
{
    //Gets the last paragraph
    WParagraph paragraph = document.LastParagraph;
    //Gets the chart entity from the paragraph items
    WChart chart = paragraph.ChildEntities[1] as WChart;
    //Refreshes chart data
    chart.Refresh();
    MemoryStream stream = new MemoryStream();
    document.Save(stream, FormatType.docx);
    //Closes the Word document
    document.Close();
    stream.Position = 0;
    //Download Word document in the browser
    return File(stream, "application/msword", "Protection.docx");
}

```

XAMARIN

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new
    WordDocument((assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.He
llo World.docx")),
    FormatType.Docx))
{
    //Gets the last paragraph
    WParagraph paragraph = document.LastParagraph;
    //Gets the chart entity from the paragraph items

```

```

WChart chart = paragraph.ChildEntities[1] as WChart;
//Refreshes chart data
chart.Refresh();
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Protection.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
//Closes the Word document
document.Close();
}

```

Modifying the Chart data

The following code example illustrates how to modify an existing chart data.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity from the paragraph items
WChart chart = paragraph.ChildEntities[0] as WChart;
//Modifies the data values of chart
chart.ChartData.SetValue(2, 2, 120);
chart.ChartData.SetValue(3, 2, 60);
chart.ChartData.SetValue(4, 2, 70);
//Refreshes chart data to set the modified values
chart.Refresh();
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx")
'Gets the last paragraph
Dim paragraph As WParagraph = document.LastParagraph
'Gets the chart entity from the paragraph items
Dim chart As WChart = TryCast(paragraph.ChildEntities(0), WChart)
'Modifies the data values of chart
chart.ChartData.SetValue(2, 2, 120)
chart.ChartData.SetValue(3, 2, 60)
chart.ChartData.SetValue(4, 2, 70)
'Refreshes chart data to set the modified values
chart.Refresh()
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new
WordDocument((assembly.GetManifestResourceStream("CreateWordSample.Assets.Te
st.docx")),
FormatType.Docx))
{
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity from the paragraph items
WChart chart = paragraph.ChildEntities[0] as WChart;
//Modifies the data values of chart
chart.ChartData.SetValue(2, 2, 120);
chart.ChartData.SetValue(3, 2, 60);
chart.ChartData.SetValue(4, 2, 70);
//Refreshes chart data to set the modified values
chart.Refresh();
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
//Closes the Word document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
}
```

ASP.NET CORE

```
FileStream fileStreamPath = new FileStream(@"Data/Template.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(fileStreamPath,
FormatType.Docx))
{
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity from the paragraph items
WChart chart = paragraph.ChildEntities[0] as WChart;
//Modifies the data values of chart
chart.ChartData.SetValue(2, 2, 120);
chart.ChartData.SetValue(3, 2, 60);
chart.ChartData.SetValue(4, 2, 70);
//Refreshes chart data to set the modified values
chart.Refresh();
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.docx);
//Closes the Word document
document.Close();
stream.Position = 0;
```

```
//Download Word document in the browser
return File(stream, "application/msword", "Result.docx");
}
```

XAMARIN

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new
WordDocument((assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.He
llo World.docx")),
FormatType.Docx))
{
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity from the paragraph items
WChart chart = paragraph.ChildEntities[0] as WChart;
//Modifies the data values of chart
chart.ChartData.SetValue(2, 2, 120);
chart.ChartData.SetValue(3, 2, 60);
chart.ChartData.SetValue(4, 2, 70);
//Refreshes chart data to set the modified values
chart.Refresh();
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
//Closes the Word document
document.Close();
}
```

Customizing the Chart & its elements

A Chart is composed of various elements such as plot area, chart area, title area, legend, data labels, axis etc. The following screenshot illustrates the various elements of chart.

1. The chart area of the chart.
2. The plot area of the chart.
3. The data points of the data series that are plotted in the chart.
4. The horizontal (category) and vertical (value) axis along where the data is plotted in the chart.
5. The legend of the chart.
6. The chart title and axis.
7. A data label that you can use to identify the details of a data point in a data series.

Modifying Chart Appearance

The following code example illustrates how to modify the appearance of an existing chart in the document.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Gets the paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity
WChart chart = paragraph.ChildEntities[0] as WChart;
//Modifies the chart height and width
chart.Height = 300;
chart.Width = 500;
//Changes the title
chart.ChartTitle = "New title";
//Changes the series name of first chart series
chart.Series[0].Name = "Modified series name";
//Hides the category labels
chart.CategoryLabelLevel =
OfficeCategoriesLabelLevel.CategoriesLabelLevelNone;
//Shows data Table.
chart.HasDataTable = true;
//Formats the chart area.
IOfficeChartFrameFormat chartArea = chart.ChartArea;
```

```

//Sets border line pattern, color, line weight
chartArea.Border.LinePattern = OfficeChartLinePattern.Solid;
chartArea.Border.LineColor = Color.Blue;
chartArea.Border.LineWeight = OfficeChartLineWeight.Hairline;
//Sets fill type and fill colors
chartArea.Fill.FillType = OfficeFillType.Gradient;
chartArea.Fill.GradientColorType = OfficeGradientColor.TwoColor;
chartArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartArea.Fill.ForeColor = Color.White;
//Plots Area
IOfficeChartFrameFormat chartPlotArea = chart.PlotArea;
//Plots area border settings - line pattern, color, weight

Modifying Plot Area and Legend

The following code example illustrates how to modify the plot area and legend of the chart.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity
WChart chart = paragraph.ChildEntities[0] as WChart;
//Sets border settings - line color, pattern, weight, transparency
chart.PlotArea.Border.AutoFormat = false;
chart.PlotArea.Border.IsAutoLineColor = false;
chart.PlotArea.Border.LineColor = Color.Blue;
chart.PlotArea.Border.LinePattern = OfficeChartLinePattern.DashDot;
chart.PlotArea.Border.LineWeight = OfficeChartLineWeight.Wide;
chart.PlotArea.Border.Transparency = 0.6;
//Sets the plot area's fill type, color
chart.PlotArea.Fill.FillType = OfficeFillType.SolidColor;
chart.PlotArea.Fill.ForeColor = Color.LightPink;
//Sets the plot area shadow presence
chart.PlotArea.Shadow.ShadowInnerPresets =
Office2007ChartPresetsInner.InsideDiagonalTopLeft;
//Sets the legend position
chart.Legend.Position = OfficeLegendPosition.Left;
//Sets the layout inclusion
chart.Legend.IncludeInLayout = true;
//Sets the legend border format - color, pattern, weight
chart.Legend.FrameFormat.Border.AutoFormat = false;
chart.Legend.FrameFormat.Border.IsAutoLineColor = false;

```

```

chart.Legend.FrameFormat.Border.LineColor = Color.Blue;
chart.Legend.FrameFormat.Border.LinePattern =
OfficeChartLinePattern.DashDot;
chart.Legend.FrameFormat.Border.LineWeight = OfficeChartLineWeight.Wide;
//Sets the legend's text area formatting - font name, weight, color, size
chart.Legend.TextArea.Bold = true;
chart.Legend.TextArea.Color = OfficeKnownColors.Bright_green;
chart.Legend.TextArea.FontName = "Times New Roman";

Positioning Chart Elements

The following code example illustrates how to specify the position of the chart elements.

C#

```

//Creates a new word document
WordDocument document = new WordDocument();
//Adds section to the document
IWSection sec = document.AddSection();
//Adds paragraph to the section
IWParagraph paragraph = sec.AddParagraph();
//Creates and Appends chart to the paragraph
WChart chart = paragraph.AppendChart(470, 300);
//Inputs data for chart
List<BarChartData> dataList = new List<BarChartData>();
BarChartData column1 = new BarChartData("P1", 286, 1300);
BarChartData column2 = new BarChartData("P2", 680, 700);
BarChartData column3 = new BarChartData("P3", 288, 1280);
BarChartData column4 = new BarChartData("P4", 200, 1200);
BarChartData column5 = new BarChartData("P5", 731, 2660);
dataList.Add(column1);
dataList.Add(column2);
dataList.Add(column3);
dataList.Add(column4);
dataList.Add(column5);
//Sets chart data by using IEnumerable overload
chart.SetDataRange(dataList, 1, 1);
//Sets chart type and title
chart.ChartTitle = "Purchase Details";
chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None;
//Axis titles
chart.PrimaryCategoryAxis.Title = "Products";
chart.PrimaryValueAxis.Title = "In Dollars";
//Sets position for plot area
chart.PlotArea.Layout.LeftMode = LayoutModes.auto;
chart.PlotArea.Layout.TopMode = LayoutModes.factor;
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.outer;
//Sets position for title area
chart.ChartTitleArea.Layout.Left = 10;
chart.ChartTitleArea.Layout.Top = 8;
//Sets position for chart legend
chart.Legend.Layout.LeftMode = LayoutModes.factor;
chart.Legend.Layout.TopMode = LayoutModes.edge;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new word document
Dim document As New WordDocument()
'Adds section to the document
Dim sec As IWSection = document.AddSection()
'Adds paragraph to the section
Dim paragraph As IWParagraph = sec.AddParagraph()
'Creates and Appends chart to the paragraph
Dim chart As WChart = paragraph.AppendChart(470, 300)
'Inputs data for chart

The following code example describes the BarChartData class.

C#

```
public class BarChartData
{
    string name;
    int purchase;
    int expense;
    public string Name
    {
        get
        {
            return name;
        }
        set
        {
            name = value;
        }
    }
    public int Purchase
    {
        get
        {
            return purchase;
        }
        set
        {
            purchase = value;
        }
    }
    public int Expense
    {
        get
        {
            return expense;
        }
        set
        {
            expense = value;
        }
    }
}
```

```
public BarChartData(string name, int purchase, int expense)
{
    Name = name;
    Purchase = purchase;
    Expense = expense;
}
```

VB.NET

```
Public Class BarChartData

```

Applying 3D Formats

Essential DocIO allows to modify the side wall, back wall, floor of the 3D chart. The following code snippet illustrates how to apply properties for side wall, floor and back wall of a 3D chart.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds section to the document
IWSection sec = document.AddSection();
//Adds paragraph to the section
IWParagraph paragraph = sec.AddParagraph();
//Loads the excel file as stream
Stream excelStream = File.OpenRead("Excel_Template.xlsx");
//Creates and Appends chart to the paragraph with excel stream as parameter
WChart chart = paragraph.AppendChart(excelStream, 1, "B2:C6", 470, 300);
//Sets chart type and title
chart.ChartType = OfficeChartType.Column_Clustered_3D;
chart.ChartTitle = "PurchaseDetails";
chart.ChartTitleArea.FontName = "Calibri";
chart.ChartTitleArea.Size = 14;
chart.ChartArea.Border.LinePattern = OfficeChartLinePattern.None;
//Sets name to chart series
chart.Series[0].Name = "Sum of Purchases";
chart.Series[1].Name = "Sum of Future Expenses";
chart.PrimaryCategoryAxis.Title = "Products";
chart.PrimaryValueAxis.Title = "In Dollars";
//Sets position of legend
chart.Legend.Position = OfficeLegendPosition.Bottom;
//Sets rotation and elevation values
chart.Rotation = 20;
chart.Elevation = 15;
//Sets side wall properties
chart.SideWall.Fill.FillType = OfficeFillType.SolidColor;

```

```

chart.SideWall.Fill.ForeColor = Color.White;
chart.SideWall.Fill.BackColor = Color.White;
chart.SideWall.Border.LineColor = System.Drawing.Color.Beige;
//Sets floor fill option.
chart.Floor.Fill.FillType = OfficeFillType.Pattern;
//Sets the floor pattern Type.
chart.Floor.Fill.Pattern = OfficeGradientPattern.Pat_Divot;
//Sets the floor fore and Back ground color.
chart.Floor.Fill.ForeColor = System.Drawing.Color.Blue;
chart.Floor.Fill.BackColor = System.Drawing.Color.White;
//Sets the floor thickness.
chart.Floor.Thickness = 3;
//Sets the back wall fill option.
chart.BackWall.Fill.FillType = OfficeFillType.Gradient;
//Sets the Texture Type.
chart.BackWall.Fill.GradientColorType = OfficeGradientColor.TwoColor;
chart.BackWall.Fill.GradientStyle = OfficeGradientStyle.Diagonal_Down;
chart.BackWall.Fill.ForeColor = Color.WhiteSmoke;
chart.BackWall.Fill.BackColor = Color.LightBlue;
//Sets the Border Line color.
chart.BackWall.Border.LineColor = System.Drawing.Color.Wheat;
//Sets the Picture Type.
chart.BackWall.PictureUnit = OfficeChartPictureType.stretch;
//Sets the back wall thickness.
chart.BackWall.Thickness = 10;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds section to the document
Dim sec As IWSection = document.AddSection()
'Adds paragraph to the section
Dim paragraph As IWParagraph = sec.AddParagraph()
'Loads the excel file as stream
Dim excelStream As Stream = File.OpenRead("Excel_Template.xlsx")
'Creates and Appends chart to the paragraph with excel stream as parameter
Dim chart As WChart = paragraph.AppendChart(excelStream, 1, "B2:C6", 470,
300)
'Sets chart type and title
chart.ChartType = OfficeChartType.Column_Clustered_3D

'Sets side wall properties
chart.SideWall.Fill.FillType = OfficeFillType.SolidColor
chart.SideWall.Fill.ForeColor = Color.White
chart.SideWall.Fill.BackColor = Color.White
chart.SideWall.Border.LineColor = System.Drawing.Color.Beige
'Sets floor fill option.
chart.Floor.Fill.FillType = OfficeFillType.Pattern
'Sets the floor pattern Type.
chart.Floor.Fill.Pattern = OfficeGradientPattern.Pat_Divot
'Sets the floor fore and Back ground color.
chart.Floor.Fill.ForeColor = System.Drawing.Color.Blue
chart.Floor.Fill.BackColor = System.Drawing.Color.White
'Sets the floor thickness.
chart.Floor.Thickness = 3
'Sets the back wall fill option.
chart.BackWall.Fill.FillType = OfficeFillType.Gradient
'Sets the Texture Type.
chart.BackWall.Fill.GradientColorType = OfficeGradientColor.TwoColor
chart.BackWall.Fill.GradientStyle = OfficeGradientStyle.Diagonal_Down
chart.BackWall.Fill.ForeColor = Color.WhiteSmoke
chart.BackWall.Fill.BackColor = Color.LightBlue
'Sets the Border Line color.
chart.BackWall.Border.LineColor = System.Drawing.Color.Wheat
'Sets the Picture Type.
chart.BackWall.PictureUnit = OfficeChartPictureType.stretch
'Sets the back wall thickness.
chart.BackWall.Thickness = 10
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

Removing Chart

The following code example illustrates how to remove the chart from the document.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity and remove it from paragraph
foreach (ParagraphItem item in paragraph.ChildEntities)
{
    if (item is WChart)
    {
        paragraph.ChildEntities.Remove(item);
        break;
    }
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx")
'Gets the last paragraph
Dim paragraph As WParagraph = document.LastParagraph
'Gets the chart entity and removes it from paragraph
For Each item As ParagraphItem In paragraph.ChildEntities
If TypeOf item Is WChart Then
paragraph.ChildEntities.Remove(item)
Exit For
End If
Next
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"),
FormatType.Docx);
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity and remove it from paragraph
foreach (ParagraphItem item in paragraph.ChildEntities)
{
if (item is WChart)
{
paragraph.ChildEntities.Remove(item);
break;
}
}
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads the template document
FileStream fileStreamPath = new FileStream("Template.docx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity and remove it from paragraph
foreach (ParagraphItem item in paragraph.ChildEntities)

```

```

{
    if (item is WChart)
    {
        paragraph.ChildEntities.Remove(item);
        break;
    }
}
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
stream.Position = 0;
//Closes the document
document.Close();
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");

```

XAMARIN

```

//Loads the template document
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Templat
e.docx"), FormatType.Docx);
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Gets the chart entity and remove it from paragraph
foreach (ParagraphItem item in paragraph.ChildEntities)
{
    if (item is WChart)
    {
        paragraph.ChildEntities.Remove(item);
        break;
    }
}
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing

```

Supported Chart Types

The following chart types are supported in DocIO.

- Area
- Area_3D
- Area_Stacked
- AreaStacked100

- *AreaStacked100_3D*
- *AreaStacked3D*
- *Bar_Clustered*
- *BarClustered3D*
- *Bar_Stacked*
- *BarStacked100*
- *BarStacked100_3D*
- *BarStacked3D*
- *Bubble*
- *Bubble_3D*
- *Column_3D*
- *Column_Clustered*
- *ColumnClustered3D*
- *Column_Stacked*
- *ColumnStacked100*
- *ColumnStacked100_3D*
- *ColumnStacked3D*
- *Combination_Chart*
- *ConeBarClustered*
- *ConeBarStacked*
- *ConeBarStacked_100*
- *Cone_Clustered*
- *ConeClustered3D*
- *Cone_Stacked*
- *ConeStacked100*
- *CylinderBarClustered*
- *CylinderBarStacked*
- *CylinderBarStacked_100*
- *Cylinder_Clustered*
- *CylinderClustered3D*
- *Cylinder_Stacked*
- *CylinderStacked100*
- *Doughnut*
- *Doughnut_Exploded*
- *Line*
- *Line_3D*
- *Line_Markers*
- *LineMarkersStacked*
- *LineMarkersStacked_100*
- *Line_Stacked*
- *LineStacked100*
- *Pie*
- *Pie_3D*
- *Pie_Bar*
- *Pie_Exploded*
- *PieExploded3D*
- *PieOfPie*
- *PyramidBarClustered*

- `PyramidBarStacked`
- `PyramidBarStacked_100`
- `Pyramid_Clustered`
- `PyramidClustered3D`
- `Pyramid_Stacked`
- `PyramidStacked100`
- `Radar`
- `Radar_Filled`
- `Radar_Markers`
- `Scatter_Line`
- `ScatterLineMarkers`
- `Scatter_Markers`
- `Scatter_SmoothedLine`
- `ScatterSmoothedLineMarkers`
- `Stock_HighLowClose`
- `Stock_OpenHighLowClose`
- `Stock_VolumeHighLowClose`
- `Stock_VolumeOpenHighLowClose`
- `Surface_3D`
- `Surface_Contour`
- `SurfaceNoColor3D`
- `SurfaceNoColorContour`

Security

You can encrypt a Word document with password to restrict unauthorized access. You can also control the types of changes you make to this document.

Encrypting with password

The following code example shows how to encrypt the Word document with password.

C#

```
//Opens an input Word document
WordDocument document = new WordDocument("Template.docx");
//Encrypts the Word document with a password
document.EncryptDocument("password");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an input Word document
Dim document As New WordDocument("Template.docx")
'Encrypts the Word document with a password
document.EncryptDocument("password")
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates an instance of a WordDocument
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new WordDocument();
document.Open(assembly.GetManifestResourceStream("Sample.Assets.Template.docx"), FormatType.Docx);
//Encrypts the Word document with a password
document.EncryptDocument("password");
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//DocIO supports encryption in Windows Forms, WPF, ASP.NET, UWP, and ASP.NET MVC platforms alone.
```

XAMARIN

```
//DocIO supports encryption in Windows Forms, WPF, ASP.NET, UWP, and ASP.NET MVC platforms alone.
```

Opening the encrypted Word document

The following code example shows how to open the encrypted Word document.

C#

```
//Opens an encrypted Word document
WordDocument document = new WordDocument("Template.docx", "password");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an encrypted Word document
Dim document As New WordDocument("Template.docx", "password")
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
using (WordDocument document = new WordDocument())
{
    //Loads or opens an existing Word document from stream
}
```

```

Stream inputStream =
assembly.GetManifestResourceStream("CreateWordSample.Assets.Test.doc");
//Loads or opens an existing Word document through Open method of
WordDocument class
document.Open(inputStream, FormatType.Automatic, "password");
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Doc);
//Saves the stream as Word file in local machine
Save(stream, "Result.doc");
document.Close();
}
//Saves the Word document
async void Save(MemoryStream streams, string filename)
{
streams.Position = 0;
StorageFile stFile;
if
(! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.U
I.Input.HardwareButtons")))
{
FileSavePicker savePicker = new FileSavePicker();
savePicker.DefaultFileExtension = ".doc";
savePicker.SuggestedFileName = filename;
savePicker.FileTypeChoices.Add("Word Documents", new List<string>()
{ ".doc" });
stFile = await savePicker.PickSaveFileAsync();
}
else
{
StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
stFile = await local.CreateFileAsync(filename,
CreationCollisionOption.ReplaceExisting);
}
if (stFile != null)
{
using (IRandomAccessStream zipStream = await
stFile.OpenAsync(FileAccessMode.ReadWrite))
{
//Write compressed data from memory to file
using (Stream ostream = zipStream.AsStreamForWrite())
{
byte[] buffer = streams.ToArray();
ostream.Write(buffer, 0, buffer.Length);
ostream.Flush();
}
}
}
//Launch the saved Word file
await Windows.System.Launcher.LaunchFileAsync(stFile);
}

ASP.NET CORE

```

//DocIO supports encryption in Windows Forms, WPF, ASP.NET, UWP, and ASP.NET
MVC platforms alone.

```

XAMARIN

//DocIO supports encryption in Windows Forms, WPF, ASP.NET, UWP, and ASP.NET MVC platforms alone.

Remove encryption

You can open the encrypted Word document and remove the encryption from the document. The following code example shows how to remove the encryption from encrypted Word document.

C#

```
//Opens an encrypted Word document
WordDocument document = new WordDocument ("Template.docx", "password");
//Remove encryption in Word document
document.RemoveEncryption();
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens an encrypted Word document
Dim document As New WordDocument("Template.docx", "password")
'Remove encryption in Word document
document.RemoveEncryption()
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Create new Word document instance
using (WordDocument document = new WordDocument())
{
    //Loads or opens an existing Word document from stream
    Stream inputStream =
    assembly.GetManifestResourceStream("Sample.Assets.Template.docx");
    //Loads or opens an existing Word document using the Open method of
WordDocument class
    document.Open(inputStream, FormatType.Docx, "password");
    //Remove encryption in Word document
    document.RemoveEncryption();
    MemoryStream stream = new MemoryStream();
    //Saves the Word file to MemoryStream
    document.Save(stream, FormatType.Docx);
    //Closes the Word document instance
    document.Close();
    //Saves the stream as Word file in local machine
    Save(stream, "Sample.Docx");
}
//Refer to the following link to save Word document in UWP platform
```

```
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//DocIO supports encryption in Windows Forms, WPF, ASP.NET, UWP, and ASP.NET MVC platforms alone.
```

XAMARIN

```
//DocIO supports encryption in Windows Forms, WPF, ASP.NET, UWP, and ASP.NET MVC platforms alone.
```

Protecting Word document from editing

You can restrict a Word document from editing either by providing a password or without password.

The following are the types of protection:

1. **AllowOnlyComments**: You can add/modify only the comments in the Word document.
2. **AllowOnlyFormFields**: You can modify the form field values in the Word document.
3. **AllowOnlyRevisions**: You can accept or reject the revisions in the Word document.
4. **AllowOnlyReading**: You can only view the content in the Word document.
5. **NoProtection**: You can access/edit the Word document contents as normally.

The following code example shows how to restrict editing to modify only form fields in a Word document.

C#

```
//Opens a Word document
WordDocument document = new WordDocument(@"Template.docx");
//Sets the protection with password and it allows only to modify the form fields type
document.Protect(ProtectionType.AllowOnlyFormFields, "password");
//Saves the Word document
document.Save("Protection.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Opens a Word document
Dim document As New WordDocument("Template.docx")
'Sets the protection with password and it allows only to modify the form fields type
document.Protect(ProtectionType.AllowOnlyFormFields, "password")
'Saves the Word document
document.Save("Protection.docx", FormatType.Docx)
document.Close()
```

UWP

```
//"App" is the class of Portable project
```

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new
WordDocument((assembly.GetManifestResourceStream("CreateWordSample.Assets.Te
st.docx")), FormatType.Docx))
{
//Sets the protection with password and it allows only to modify the form
fields type
document.Protect(ProtectionType.AllowOnlyFormFields, "password");
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Protection.docx");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
//Closes the Word document
document.Close();
}

```

ASP.NET CORE

```

FileStream fileStreamPath = new FileStream(@"Data/Template.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new WordDocument(fileStreamPath,
FormatType.Docx))
{
//Sets the protection with password and it allows only to modify the form
fields type
document.Protect(ProtectionType.AllowOnlyFormFields, "password");
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.docx);
//Closes the Word document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Protection.docx");
}

```

XAMARIN

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Opens an existing document from file system through constructor of
WordDocument class
using (WordDocument document = new
WordDocument((assembly.GetManifestResourceStream("XamarinFormsAppl.Assets.He
llo World.docx")), FormatType.Docx))
{
//Sets the protection with password and it allows only to modify the form
fields type
document.Protect(ProtectionType.AllowOnlyFormFields, "password");
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
}

```

```
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Protection.docx",
"application/msword", stream);
//Closes the Word document
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
}
```

Footnotes and endnotes

Footnotes and endnotes are separate text body contents used in documents to show the source of supplementary information that does not interrupt the normal body text of the Word document. Footnotes are typically located at the bottom of a page or beneath text being referenced, and endnotes are typically placed at the end of a document or at the end of a section. When document has been divided up into one or more sections, each section of a document can contain endnotes.

Both footnotes and endnotes consist of two parts:

- A note reference mark with numbering value in the body text to indicate that additional information is in a footnote or endnote at the end of the page or the end of the document or section.
- The footnote or endnote text body content.

Adding a Footnotes

The following code example shows how to insert the footnotes into the Word document.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Creates a section
IWSection section = document.AddSection();
//Adds a paragraph to a section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to paragraph
paragraph.AppendText("Working with footnotes");
//Formats the text
paragraph.ApplyStyle(BuiltinStyle.Heading1);
//Adds a paragraph to a section
paragraph = section.AddParagraph();
//Appends the footnotes
WFootnote footnote = (WFootnote)
paragraph.AppendFootnote(Syncfusion.DocIO.FootnoteType.Footnote);
//Sets the footnote character format
footnote.MarkerCharacterFormat.SubSuperScript = SubSuperScript.SuperScript;
//Inserts the text into the paragraph
paragraph.AppendText("Sample content for footnotes").CharacterFormat.Bold =
true;
//Adds footnote text
paragraph = footnote.TextBody.AddParagraph();
```

```

paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Creates a section
Dim section As ISection = document.AddSection()
'Adds a paragraph to a section
Dim paragraph As IParagraph = section.AddParagraph()
'Appends the text to paragraph
paragraph.AppendText("Working with footnotes")
'Formats the text
paragraph.ApplyStyle(BuiltinStyle.Heading1)
'Adds a paragraph to a section
paragraph = section.AddParagraph()
'Appends the footnotes
Dim footnote As WFootnote =
DirectCast(paragraph.AppendFootnote(Syncfusion.DocIO.FootnoteType.Footnote),
WFootnote)
'Sets the footnote character format
footnote.MarkerCharacterFormat.SubSuperScript = SubSuperScript.SuperScript
'Inserts the text into the paragraph
paragraph.AppendText("Sample content for footnotes").CharacterFormat.Bold =
True
'Adds footnote text
paragraph = footnote.TextBody.AddParagraph()
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.")
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

using (WordDocument document = new WordDocument())
{
    //Creates a section
    ISection section = document.AddSection();
    //Adds a paragraph to a section
    IParagraph paragraph = section.AddParagraph();
    //Appends the text to paragraph
    paragraph.AppendText("Working with footnotes");
    //Formats the text
    paragraph.ApplyStyle(BuiltinStyle.Heading1);
    //Adds a paragraph to a section
    paragraph = section.AddParagraph();
    //Appends the footnotes
    WFootnote footnote =
(WFootnote)paragraph.AppendFootnote(Syncfusion.DocIO.FootnoteType.Footnote);

```

```
//Sets the footnote character format
footnote.MarkerCharacterFormat.SubSuperScript = SubSuperScript.SuperScript;
//Inserts the text into the paragraph
paragraph.AppendText("Sample content for footnotes").CharacterFormat.Bold =
true;
//Adds footnote text
paragraph = footnote.TextBody.AddParagraph();
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-

}

```

Footnote and Endnote separators

Footnote/Endnote separator is used to separate the text body content and footnote/endnote by a small line.

A footnote/endnote continuation separator is used to indicate the footnote/endnote is carried over from the previous page by a line running across the top section.

A footnote/endnote continuation notice is used to indicate the footnote/endnote is continued to the next page by special character or word preserved at the bottom of the footer.

The following code example shows how to change the default footnote separator.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Creates a section
IWSection section = document.AddSection();
//Adds a paragraph to a section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to paragraph
paragraph.AppendText("Working with footnotes");
//Formats the text
paragraph.ApplyStyle(BuiltinStyle.Heading1);
//Adds a paragraph to a section
paragraph = section.AddParagraph();
//Appends the footnotes
WFootnote footnote =
(WFootnote)paragraph.AppendFootnote(Syncfusion.DocIO.FootnoteType.Footnote);
WTextBody separator = document.Footnotes.Separator;
//Replaces the default footnote separated by text
separator.Paragraphs[0].Text = "Footnote separator";
//Sets the footnote character format
footnote.MarkerCharacterFormat.SubSuperScript = SubSuperScript.SuperScript;
//Inserts the text into the paragraph
paragraph.AppendText("Sample content for footnotes").CharacterFormat.Bold =
true;
//Adds footnote text
paragraph = footnote.TextBody.AddParagraph();
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()

//Formats the text
paragraph.ApplyStyle(BuiltinStyle.Heading1);
//Adds a paragraph to a section
paragraph = section.AddParagraph();
//Appends the footnotes
WFootnote footnote =
(WFootnote)paragraph.AppendFootnote(Syncfusion.DocIO.FootnoteType.Footnote);
WTextBody separator = document.Footnotes.Separator;
//Replaces the default footnote separated by text
separator.Paragraphs[0].Text = "Footnote separator";
//Sets the footnote character format
footnote.MarkerCharacterFormat.SubSuperScript = SubSuperScript.SuperScript;
//Inserts the text into the paragraph
paragraph.AppendText("Sample content for endnotes").CharacterFormat.Bold =
true;
//Adds footnote text
paragraph = footnote.TextBody.AddParagraph();
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WorkingWorddoc.doc
x", "application/msword", stream);
//Closes the documents
document.Close();
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
}

```

The following code example shows how to change the default endnote separator.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Creates a section
IWSection section = document.AddSection();
//Adds a paragraph to a section
IWParagraph paragraph = section.AddParagraph();
//Appends the text to paragraph
paragraph.AppendText("Working with footnotes");
//Formats the text
paragraph.ApplyStyle(BuiltinStyle.Heading1);
//Adds a paragraph to section
paragraph = section.AddParagraph();
//Appends the endnote
WFootnote endnote =
(WFootnote)paragraph.AppendFootnote(Syncfusion.DocIO.FootnoteType.Endnote);
WTextBody separator = document.Endnotes.Separator;

```

```

//Replaces the default foot note separate by text
separator.Paragraphs[0].Text = "Endnote separator";
//Sets the endnote character format
endnote.MarkerCharacterFormat.SubSuperScript = SubSuperScript.SuperScript;
//Inserts the text into the paragraph
paragraph.AppendText("Sample content for endnotes").CharacterFormat.Bold =
true;
//Adds the footnote text
paragraph = endnote.TextBody.AddParagraph();
paragraph.AppendText("AdventureWorks Cycles, the fictitious company on which
the AdventureWorks sample databases are based, is a large, multinational
manufacturing company.");
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document

```

Working with Macros

Macro is a way to automate the tasks that you perform repeatedly. It is a saved sequence of commands or keyboard strokes that can be recalled with a single command or keyboard stroke.

The following link shows how to create a macro in the Word document.

<https://support.office.com/en-in/article/Create-or-run-a-macro-c6b99036-905c-49a6-818a-dfb98b7c3c9c>

The following code illustrates how to load and save a macro enabled document.

C#

```
//Loads the macro-enabled template
WordDocument document = new WordDocument("Template.dotm");
//Gets the table
DataTable table = GetDataTable();
//Executes Mail Merge with groups
document.MailMerge.ExecuteGroup(table);
//Saves and closes the document
document.Save("Sample.docm", FormatType.Word2013Docm);
document.Close();
```

VB.NET

```
'Loads the macro-enabled template
Dim document As New WordDocument("Template.dotm")
'Gets the table
Dim table As DataTable = GetDataTable()
'Executes Mail Merge with groups
document.MailMerge.ExecuteGroup(table)
'Saves and closes the document
document.Save("Sample.docm", FormatType.Word2013Docm)
document.Close()
```

UWP

```
//DocIO supports mail merge operation in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

ASP.NET CORE

```
//DocIO supports mail merge operation in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

XAMARIN

//DocIO supports mail merge operation in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms alone.

The following code example illustrates the method used to get the tables from data set.

C#

```
private DataTable GetDataTable()  
{  
    //List of syncfusion products name  
    string[] products = { "DocIO", "PDF", "XlsIO" };  
    //Adds new Tables to the data set  
    DataRow row;  
    DataTable table = new DataTable();  
    //Adds fields to the Products table  
    table.TableName = "Products";  
    table.Columns.Add("ProductName");  
    table.Columns.Add("Binary");  
    table.Columns.Add("Source");  
    //Inserts values to the tables  
    foreach (string product in products)  
    {  
        row = table.NewRow();  
        row["ProductName"] = string.Concat("Essential ", product);  
        row["Binary"] = "$895.00";  
        row["Source"] = "$1,295.00";  
        table.Rows.Add(row);  
    }  
    return table;  
}
```

VB.NET

```
Private Function GetDataTable() As DataTable  
    'List of syncfusion products name  
    Dim products As String() = {"DocIO", "PDF", "XlsIO"}  
    'Adds new Tables to the data set  
    Dim row As DataRow  
    Dim table As New DataTable()  
    'Adds fields to the Products table  
    table.TableName = "Products"  
    table.Columns.Add("ProductName")  
    table.Columns.Add("Binary")  
    table.Columns.Add("Source")  
    'Inserts values to the tables  
    For Each product As String In products  
        row = table.NewRow()  
        row("ProductName") = String.Concat("Essential ", product)  
        row("Binary") = "$895.00"  
        row("Source") = "$1,295.00"  
        table.Rows.Add(row)  
    Next  
    Return table  
End Function
```

UWP

```
//DocIO supports mail merge operation in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

ASP.NET CORE

```
//DocIO supports mail merge operation in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

XAMARIN

```
//DocIO supports mail merge operation in Windows Forms, WPF, ASP.NET and
ASP.NET MVC platforms alone.
```

The following code example illustrates how to remove the macros present in the document by using RemoveMacros method.

C#

```
//Loads the document with macros
WordDocument document = new WordDocument("Sample.docm");
//Checks whether the document has macros and then removes them
if (document.HasMacros)
document.RemoveMacros();
//Saves the document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Loads the document with macros
Dim document As New WordDocument("Sample.docm")
'Checks whether the document has macros and then removes them
If document.HasMacros Then
document.RemoveMacros()
End If
'Saves the document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
//Loads the document with macros
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.Sample.docm"),
FormatType.Docx);
//Checks whether the document has macros and then removes them
if (document.HasMacros)
document.RemoveMacros();
//Saves the Word file to MemoryStream
```

```

MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
//Closes the document
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Loads the document with macros
FileStream fileStreamPath = new FileStream("Sample.docm", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Checks whether the document has macros and then removes them
if (document.HasMacros)
document.RemoveMacros();
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");

```

XAMARIN

```

//Loads the document with macros
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("GettingStarted.Data.Sample.
docm"), FormatType.Docx);
//Checks whether the document has macros and then removes them
if (document.HasMacros)
document.RemoveMacros();
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing

```

Working with Content Controls

What is Content Control?

Content controls are individual controls that you can add and customize to use in templates, forms, and documents. For example, many online forms are designed with a drop-down list control that provides a restricted set of choices.

Note: You can use content controls only in documents that are saved in the Open XML Format and cannot be used in the Word 97-2003 document (.doc) format.

Content controls can be categorized based on its occurrence in a document as follows,

- **InlineContentControl:** Among inline content inside, as a child of a paragraph.
- **BlockContentControl:** Among paragraphs and tables, as a child of a Body, HeaderFooter, Comment, Footnote, or a Shape node.

Block Content Control

You can add content control to a text body of the Word document using block content control. You can add text, tables, pictures, or other items into the block content control. Refer to the following code.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
WTextBody textBody = section.Body;
//Adds block content control into Word document
BlockContentControl blockContentControl =
textBody.AddBlockContentControl(ContentControlType.RichText) as
BlockContentControl;
//Adds new paragraph in the block content control
WParagraph paragraph = blockContentControl.TextBody.AddParagraph() as
WParagraph;
//Adds new text to the paragraph
paragraph.AppendText("Block content control");
//Adds new table to the block content control
WTable table = blockContentControl.TextBody.AddTable() as WTable;
//Specifies the total number of rows and columns
table.ResetCells(2, 3);
//Adds new paragraph to the block content control
paragraph = blockContentControl.TextBody.AddParagraph() as WParagraph;
//Adds image to the paragraph
paragraph.AppendPicture(Image.FromFile("Image.png"));
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds new section to the document
Dim section As IWSection = document.AddSection
Dim textBody As WTextBody = section.Body
```

```

'Adds block content control into Word document
Dim blockContentControl As BlockContentControl =
CType(textBody.AddBlockContentControl(ContentControlType.RichText),
BlockContentControl)
'Adds new paragraph in the block content control
Dim paragraph As WParagraph =
CType(blockContentControl.TextBody.AddParagraph, WParagraph)
'Adds new text to the paragraph
paragraph.AppendText("Block content control")
'Adds new table to the block content control
Dim table As WTable = CType(blockContentControl.TextBody.AddTable, WTable)
'Specifies the total number of rows and columns
table.ResetCells(2, 3)
'Adds new paragraph to the block content control
paragraph = CType(blockContentControl.TextBody.AddParagraph, WParagraph)
'Adds image to the paragraph
paragraph.AppendPicture(Image.FromFile("Image.png"))
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
WTextBody textBody = section.Body;
//Adds block content control into Word document
BlockContentControl blockContentControl =
textBody.AddBlockContentControl(ContentControlType.RichText) as
BlockContentControl;
//Adds new paragraph in the block content control
WParagraph paragraph = blockContentControl.TextBody.AddParagraph() as
WParagraph;
//Adds new text to the paragraph
paragraph.AppendText("Block content control");
//Adds new table to the block content control
WTable table = blockContentControl.TextBody.AddTable() as WTable;
//Specifies the total number of rows and columns
table.ResetCells(2, 3);
//Adds new paragraph to the block content control
paragraph = blockContentControl.TextBody.AddParagraph() as WParagraph;
//Adds image to the paragraph
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream pictureStream =
assembly.GetManifestResourceStream("Sample.Assets.Image.png");
paragraph.AppendPicture(pictureStream);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
Save(stream, "Result.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
WTextBody textBody = section.Body;
//Adds block content control into Word document
BlockContentControl blockContentControl =
textBody.AddBlockContentControl(ContentControlType.RichText) as
BlockContentControl;
//Adds new paragraph in the block content control
WParagraph paragraph = blockContentControl.TextBody.AddParagraph() as
WParagraph;
//Adds new text to the paragraph
paragraph.AppendText("Block content control");
//Adds new table to the block content control
WTable table = blockContentControl.TextBody.AddTable() as WTable;
//Specifies the total number of rows and columns
table.ResetCells(2, 3);
//Adds new paragraph to the block content control
paragraph = blockContentControl.TextBody.AddParagraph() as WParagraph;
//Gets the image stream
FileStream imageStream = new FileStream(@"D:\Image.png", FileMode.Open,
FileAccess.Read);
//Adds image to the paragraph
paragraph.AppendPicture(imageStream);
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
document.Close();
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
WTextBody textBody = section.Body;
//Adds block content control into Word document
BlockContentControl blockContentControl =
textBody.AddBlockContentControl(ContentControlType.RichText) as
BlockContentControl;
//Adds new paragraph in the block content control
WParagraph paragraph = blockContentControl.TextBody.AddParagraph() as
WParagraph;
//Adds new text to the paragraph
paragraph.AppendText("Block content control");
//Adds new table to the block content control
WTable table = blockContentControl.TextBody.AddTable() as WTable;
//Specifies the total number of rows and columns
table.ResetCells(2, 3);
//Adds new paragraph to the block content control
paragraph = blockContentControl.TextBody.AddParagraph() as WParagraph;
```

```
//Adds image to the paragraph
Stream imageStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Image.png");
//Adds image from stream
paragraph.AppendPicture(imageStream);
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", outputStream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close();
```

Inline Content Control

You can add content control as a child to a paragraph using the inline content control. You can add text, pictures, fields or other paragraph items into the inline content control. Refer to the following code.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends inline content control to the paragraph
InlineContentControl inlineContentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Inline content control ";
//Adds new text to the inline content control
inlineContentControl.ParagraphItems.Add(textRange);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ")
```

```
'Appends inline content control to the paragraph
Dim inlineContentControl As InlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.RichText),
InlineContentControl)
Dim textRange As WTextRange = New WTextRange(document)
textRange.Text = "Inline content control "
'Adds new text to the inline content control
inlineContentControl.ParagraphItems.Add(textRange)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends inline content control to the paragraph
InlineContentControl inlineContentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Inline content control ";
//Adds new text to the inline content control
inlineContentControl.ParagraphItems.Add(textRange);
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Result.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends inline content control to the paragraph
InlineContentControl inlineContentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Inline content control ";
```

```
//Adds new text to the inline content control
inlineContentControl.ParagraphItems.Add(textRange);
//Creates memory stream.
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
document.Close();
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends inline content control to the paragraph
InlineContentControl inlineContentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Inline content control ";
//Adds new text to the inline content control
inlineContentControl.ParagraphItems.Add(textRange);
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", outputStream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close();
```

Note: Currently, DocIO does not support RowContentControl and CellContentControl.

Common properties of Content Control

You can set formatting options for the content control in the Word document. The following are the common properties of a content control.

Title

The title of the content control.

Tag

The tag value to identify the content control.

Appearance

This property allows you to define the appearance of the content controls. The appearance can be any one of the following:

- **BoundingBox:** Displays the contents of content control within a box.
- **Tags:** Displays the contents of content control within tags.
- **Hidden:** Displays the contents of content control without any box or tags.

Color

Defines the color of the content control.

Temporary

This property defines whether to remove a content control from the Word document when you edit the contents of the content control.

Lock Contents

Locking the contents of the content control. It restricts to modify the contents of the content control.

Lock Content Control

It restricts to remove or delete the content control.

Example – Content Control Common properties

The following code sample illustrates the content control properties usage.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text";
//Sets the color for the content control
contentControl.ContentControlProperties.Color = Color.Magenta;
//Gets the type of content control
ContentControlType controlType =
contentControl.ContentControlProperties.Type;
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
```

```
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ")
'Appends rich text content control to the paragraph
Dim contentControl As IInlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.RichText),
InlineContentControl)
Dim textRange As WTextRange = New WTextRange(document)
textRange.Text = "Rich text content control."
'Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange)
'Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags
'Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text"
'Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text"
'Sets the color for the content control
contentControl.ContentControlProperties.Color = Color.Magenta
'Gets the type of content control
Dim controlType As ContentControlType =
contentControl.ContentControlProperties.Type
'Enables content control lock
contentControl.ContentControlProperties.LockContentControl = True
'Protects the contents of content control
contentControl.ContentControlProperties.LockContents = True
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
```

```

//Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text";
//Sets the color for the content control
contentControl.ContentControlProperties.Color = Color.Magenta;
//Gets the type of content control
ContentControlType controlType =
contentControl.ContentControlProperties.Type;
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text";
//Sets the color for the content control
contentControl.ContentControlProperties.Color =
Syncfusion.Drawing.Color.Magenta;

```

```
//Gets the type of content control
ContentControlType controlType =
contentControl.ContentControlProperties.Type;
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
document.Close();
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text";
//Sets the color for the content control
contentControl.ContentControlProperties.Color =
Syncfusion.Drawing.Color.Magenta;
//Gets the type of content control
ContentControlType controlType =
contentControl.ContentControlProperties.Type;
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", outputStream);
```

```
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close();
```

Why Content Control?

The content controls have the following three major use cases:

- Protection
- Form Filling
- Data Binding with Content Controls (XML Mapping)

Protection

Content controls provides options to prevent users from editing or deleting parts of a Word document contents. This is useful if you have information in a Word document or template that you should be able to read but not edit, or if you want to be able to edit content controls but not delete them.

To protect contents inside a content control, you can use properties of the content control to prevent editing or deleting the content control:

- The **LockContents** property prevents from editing the contents of the content control.
- The **LockContentControl** property prevents from deleting the content control.

The following code sample shows how to protect the content control and its contents.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text Protected";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text Protected";
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
```

```
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ")
'Appends rich text content control to the paragraph
Dim contentControl As IInlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.RichText),
InlineContentControl)
Dim textRange As WTextRange = New WTextRange(document)
textRange.Text = "Rich text content control."
'Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange)
'Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags
'Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text Protected"
'Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text Protected"
'Enables content control lock
contentControl.ContentControlProperties.LockContentControl = True
'Protects the contents of content control
contentControl.ContentControlProperties.LockContents = True
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
```

```

contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text Protected";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text Protected";
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text Protected";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text Protected";
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
document.Close();

```

XAMARIN

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
IInlineContentControl contentControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
contentControl.ParagraphItems.Add(textRange);
//Sets tag appearance for the content control
contentControl.ContentControlProperties.Appearance =
ContentControlAppearance.Tags;
//Sets a tag property to identify the content control
contentControl.ContentControlProperties.Tag = "Rich Text Protected";
//Sets a title for the content control
contentControl.ContentControlProperties.Title = "Text Protected";
//Enables content control lock
contentControl.ContentControlProperties.LockContentControl = true;
//Protects the contents of content control
contentControl.ContentControlProperties.LockContents = true;
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", outputStream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close();

```

Form Filling

Another major use case is to create the forms. You can design your own forms for various stages using the text box, check box, and list box. Refer to the following code example.

Form creation:

C#

```

//Create a new document
WordDocument document = new WordDocument();
//Adding a new section to the document
IWSection section = document.AddSection();
//Adding a new paragraph to the section

```

```

IWParagraph paragraph = section.AddParagraph();
#region Document formatting
//Sets background color for document
document.Background.Gradient.Color1 = System.Drawing.Color.FromArgb(232,
232, 232);
document.Background.Gradient.Color2 = System.Drawing.Color.FromArgb(255,
255, 255);
document.Background.Type = BackgroundType.Gradient;
document.Background.Gradient.ShadingStyle = GradientShadingStyle.Horizontal;
document.Background.Gradient.ShadingVariant =
GradientShadingVariant.ShadingDown;
//Sets page size for document
section.PageSetup.Margins.All = 30f;
section.PageSetup.PageSize = new System.Drawing.SizeF(600, 600f);
#endregion
#region Title Section
//Adds a new table to the section
IWTable table = section.Body.AddTable();
table.ResetCells(1, 2);
//Gets the table first row
WTableRow row = table.Rows[0];
row.Height = 25f;
//Adds a new paragraph to the cell
IWParagraph cellPara = row.Cells[0].AddParagraph();
//Appends a new picture
IWPicture pic =
cellPara.AppendPicture(System.Drawing.Image.FromFile(@"D:\image.jpg"));
pic.Height = 80;
pic.Width = 180;
//Adds a new paragraph to the next cell
cellPara = row.Cells[1].AddParagraph();
row.Cells[1].CellFormat.VerticalAlignment =
Syncfusion.DocIO.DLS.VerticalAlignment.Middle;
row.Cells[1].CellFormat.BackColor = System.Drawing.Color.FromArgb(173, 215,
255);
//Appends the text
IWTextRange txt = cellPara.AppendText("Job Application Form");
cellPara.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center;
//Sets the formats
txt.CharacterFormat.Bold = true;
txt.CharacterFormat.FontName = "Arial";
txt.CharacterFormat.FontSize = 18f;
//Sets the width and border type
row.Cells[0].Width = 200;
row.Cells[1].Width = 300;
row.Cells[1].CellFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.Hairline;
#endregion
//Adds a new paragraph
section.AddParagraph();
#region General Information
//Adds a new table
table = section.Body.AddTable();
table.ResetCells(2, 1);
row = table.Rows[0];
row.Height = 20;

```

```

row.Cells[0].Width = 500;
//Adds a new paragraph
cellPara = row.Cells[0].AddParagraph();
//Sets a border type, color, background, and vertical alignment for cell
row.Cells[0].CellFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.Thick;
row.Cells[0].CellFormat.Borders.Color = System.Drawing.Color.FromArgb(155,
205, 255);
row.Cells[0].CellFormat.BackColor = System.Drawing.Color.FromArgb(198, 227,
255);
row.Cells[0].CellFormat.VerticalAlignment =
Syncfusion.DocIO.DLS.VerticalAlignment.Middle;
txt = cellPara.AppendText(" General Information");
txt.CharacterFormat.FontName = "Arial";
txt.CharacterFormat.Bold = true;
txt.CharacterFormat.FontSize = 11f;
row = table.Rows[1];
cellPara = row.Cells[0].AddParagraph();
//Sets a width, border type, color and background for cell
row.Cells[0].Width = 500;
row.Cells[0].CellFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.Hairline;
row.Cells[0].CellFormat.Borders.Color = System.Drawing.Color.FromArgb(155,
205, 255);
row.Cells[0].CellFormat.BackColor = System.Drawing.Color.FromArgb(222, 239,
255);
//Appends a text to paragraph of cell
txt = cellPara.AppendText("\n Full Name:\t\t\t\t");
txt.CharacterFormat.FontName = "Arial";
txt.CharacterFormat.FontSize = 11f;
//Appends a new inline content control to enter the value
InlineContentControl txtField =
cellPara.AppendInlineContentControl(ContentControlType.Text) as
InlineContentControl;

document.Close();

```

You can also fill the forms using the DocIO. Refer to the following code example.

Form filling:

C#

```

//Open the created form document.
WordDocument document1 = new WordDocument("Form_Template.docx");
IWSection sec = document1.LastSection;
InlineContentControl inlineCC;
InlineContentControl dropDownCC;
WTable table1 = sec.Tables[1] as WTable;
WTableRow row1 = table1.Rows[1];
#region General Information
//Fill the name
WParagraph cellPara1 = row1.Cells[0].ChildEntities[1] as WParagraph;
inlineCC = cellPara1.ChildEntities.LastItem as InlineContentControl;
WTextRange text = new WTextRange(document1);
text.ApplyCharacterFormat(inlineCC.BreakCharacterFormat);
text.Text = "Steve Jobs";
inlineCC.ParagraphItems.Add(text);
//Fill the date of birth
cellPara1 = row1.Cells[0].ChildEntities[3] as WParagraph;
inlineCC = cellPara1.ChildEntities.LastItem as InlineContentControl;
text = new WTextRange(document1);
text.ApplyCharacterFormat(inlineCC.BreakCharacterFormat);
text.Text = "06/01/1994";

```

```

inlineCC.ParagraphItems.Add(text);
//Fill the address
cellPara1 = row1.Cells[0].ChildEntities[5] as WParagraph;
inlineCC = cellPara1.ChildEntities.LastItem as InlineContentControl;
text = new WTextRange(document1);
text.ApplyCharacterFormat(inlineCC.BreakCharacterFormat);
text.Text = "2501 Aerial Center Parkway.";
inlineCC.ParagraphItems.Add(text);
text = new WTextRange(document1);

Data Binding with Content Controls (XML Mapping)

Word allows you to store XML data, named *custom XML parts*, in a Word document. You can control the display of this data by binding content controls to elements in a custom XML part. When you open the Word document, the content controls display the values of the XML elements. Any changes that you make to the text in the content controls are saved in the custom XML part (two-way data binding). Refer to the following code sample to map custom XML parts to content control.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new XmlPart to the document
CustomXMLPart xmlPart = new CustomXMLPart(document);
//Loads the xml code
xmlPart.LoadXML(@"<books><book><author>Matt Hank</author><title>New
Migration Paths of the Red Breasted Robin</title><genre>New non-
fiction</genre><price>29.95</price><pub_date>12/1/2007</pub_date>
<abstract>New You see them in the spring outside your
windows.</abstract></book></books>");
//Adds the text
paragraph.AppendText("Book author name : ");
//Adds new content control to the paragraph
InlineContentControl control =
paragraph.AppendInlineContentControl(ContentControlType.Text) as
InlineContentControl;
//Creates the XML mapping on a content control for specified XPath
control.ContentControlProperties.XmlMapping.SetMapping("/books/book/author",
"", xmlPart);
//Selects the single node
CustomXMLNode node = xmlPart.SelectSingleNode("/books/book/title");
//Adds another paragraph
paragraph = section.AddParagraph();
//Adds text
paragraph.AppendText("Book title: ");
//Appends content control to second paragraph
control = paragraph.AppendInlineContentControl(ContentControlType.Text) as
InlineContentControl;

```

```
//Creates the XML data mapping on a content control for specified node
control.ContentControlProperties.XmlMapping.SetMappingByNode (node);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

Types of Content Controls

The following types of content controls can be created by using the Essential DocIO.

- Rich Text
- Plain Text
- Check Box
- Date picker
- Drop-Down List and Combo Box
- Picture

Rich Text

A rich text content control contains text or other items, such as tables, pictures, or other content controls. The following code illustrates how to add new rich text content control.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph.
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
InlineContentControl richTextControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
richTextControl.ParagraphItems.Add(textRange);
WPicture picture = new WPicture(document);
picture.LoadImage(Image.FromFile("Image.png"));
picture.Height = 100;
picture.Width = 100;
//Adds new picture to the rich text content control
richTextControl.ParagraphItems.Add(picture);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
```

```
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ")
'Appends rich text content control to the paragraph
Dim richTextControl As InlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.RichText),
InlineContentControl)
Dim textRange As WTextRange = New WTextRange(document)
textRange.Text = "Rich text content control."
'Adds new text to the rich text content control
richTextControl.ParagraphItems.Add(textRange)
Dim picture As WPicture = New WPicture(document)
picture.LoadImage(Image.FromFile("Image.png"))
picture.Height = 100
picture.Width = 100
'Adds new picture to the rich text content control
richTextControl.ParagraphItems.Add(picture)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
InlineContentControl richTextControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
richTextControl.ParagraphItems.Add(textRange);
WPicture picture = new WPicture(document);
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream pictureStream =
assembly.GetManifestResourceStream("Sample.Assets.Image.png");
picture.LoadImage(pictureStream);
picture.Height = 100;
picture.Width = 100;
//Adds new picture to the rich text content control
```

```
richTextControl.ParagraphItems.Add(picture);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
InlineContentControl richTextControl =
paragraph.AppendInlineContentControl(ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
richTextControl.ParagraphItems.Add(textRange);
WPicture picture = new WPicture(document);
Stream imageStream = new FileStream(@"D:\Image.png", FileMode.Open,
FileAccess.Read);
//Adds image from stream
picture.LoadImage(imageStream);
picture.Height = 100;
picture.Width = 100;
//Adds new picture to the rich text content control
richTextControl.ParagraphItems.Add(picture);
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
document.Close();
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends rich text content control to the paragraph
```

```

InlineContentControl richTextControl =
paragraph.AppendInlineContentControl (ContentControlType.RichText) as
InlineContentControl;
WTextRange textRange = new WTextRange (document);
textRange.Text = "Rich text content control.";
//Adds new text to the rich text content control
richTextControl.ParagraphItems.Add (textRange);
WPicture picture = new WPicture (document);
Stream imageStream =
typeof (App).GetTypeInfo().Assembly.GetManifestResourceStream ("Sample.Assets.
Image.png");
//Adds image from stream
picture.LoadImage (imageStream);
picture.Height = 100;
picture.Width = 100;
//Adds new picture to the rich text content control
richTextControl.ParagraphItems.Add (picture);
//Creates memory stream
MemoryStream outputStream = new MemoryStream ();
//Saves and closes the Word document instance
document.Save (outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView ("Result.docx",
"application/msword", outputStream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close ();

```

Plain Text

A plain text content control contains text and cannot contain other items, such as tables, pictures, or other content controls. Refer to the following code to add plain text content control.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument ();
//Adds one section and one paragraph to the document
document.EnsureMinimal ();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText ("A new text is added to the paragraph. ");
//Appends plain text content control to the paragraph
InlineContentControl plainTextControl =
paragraph.AppendInlineContentControl (ContentControlType.Text) as
InlineContentControl;
WTextRange textRange = new WTextRange (document);
textRange.Text = "Plain text content control.";
//Adds new text to the plain text content control
plainTextControl.ParagraphItems.Add (textRange);
//Saves and closes the Word document instance
document.Save ("Sample.docx", FormatType.Docx);
document.Close ();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ")
'Appends plain text content control to the paragraph
Dim plainTextControl As InlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.Text),
InlineContentControl)
Dim textRange As WTextRange = New WTextRange(document)
textRange.Text = "Plain text content control."
'Adds new text to the plain text content control
plainTextControl.ParagraphItems.Add(textRange)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends plain text content control to the paragraph
InlineContentControl plainTextControl =
paragraph.AppendInlineContentControl(ContentControlType.Text) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Plain text content control.";
//Adds new text to the plain text content control
plainTextControl.ParagraphItems.Add(textRange);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close(); //Please refer the below link to save Word document in UWP

//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();

```

```
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends plain text content control to the paragraph
InlineContentControl plainTextControl =
paragraph.AppendInlineContentControl(ContentControlType.Text) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Plain text content control.";
//Adds new text to the plain text content control
plainTextControl.ParagraphItems.Add(textRange);
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
document.Close();
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends plain text content control to the paragraph
InlineContentControl plainTextControl =
paragraph.AppendInlineContentControl(ContentControlType.Text) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
textRange.Text = "Plain text content control.";
//Adds new text to the plain text content control
plainTextControl.ParagraphItems.Add(textRange);
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", outputStream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close();
```

Check Box

A check box content control provides a UI that represents a binary state: checked or unchecked. Default state for check box is unchecked. Refer to the following code to add check box content control.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph.
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends checkbox content control to the paragraph
InlineContentControl checkBox =
paragraph.AppendInlineContentControl(ContentControlType.CheckBox) as
InlineContentControl;
checkBox.ContentControlProperties.IsChecked = true;
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ")
'Appends checkbox content control to the paragraph
Dim checkBox As InlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.CheckBox),
InlineContentControl)
checkBox.ContentControlProperties.IsChecked = True
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends checkbox content control to the paragraph
InlineContentControl checkBox =
paragraph.AppendInlineContentControl(ContentControlType.CheckBox) as
InlineContentControl;
checkBox.ContentControlProperties.IsChecked = true;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");

```

```
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends picture content control to the paragraph
InlineContentControl checkBox =
paragraph.AppendInlineContentControl(ContentControlType.CheckBox) as
InlineContentControl;
checkBox.ContentControlProperties.IsChecked = true;
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
document.Close();
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends picture content control to the paragraph
InlineContentControl checkBox =
paragraph.AppendInlineContentControl(ContentControlType.CheckBox) as
InlineContentControl;
checkBox.ContentControlProperties.IsChecked = true;
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing

file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-xamarin#helper-files-for-xamarin
document.Close();
```

Date picker

A date picker content control provides a calendar UI for selecting a date. The calendar appears when you click the drop-down arrow in the content control. You can use regional calendars and different date formats. Refer to the following code to add date picker content control.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("Select Date: ");
//Appends date picker content control to the paragraph
InlineContentControl datePicker =
paragraph.AppendInlineContentControl(ContentControlType.Date) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
//Sets today's date to display
textRange.Text = DateTime.Now.ToShortDateString();
datePicker.ParagraphItems.Add(textRange);
//Sets calendar type for the date picker content control
datePicker.ContentControlProperties.DateCalendarType =
CalendarType.Gregorian;
//Sets the format for date to display
datePicker.ContentControlProperties.DateDisplayFormat = "M/d/yyyy";
//Sets the language format for the date
datePicker.ContentControlProperties.DateDisplayLocale = LocaleIDs.en_US;
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("Select Date: ")
'Appends date picker content control to the paragraph
Dim datePicker As InlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.Date),
InlineContentControl)
Dim textRange As WTextRange = New WTextRange(document)
'Sets today's date to display
textRange.Text = DateTime.Now.ToShortDateString()
datePicker.ParagraphItems.Add(textRange)
'Sets calendar type for the date picker content control
datePicker.ContentControlProperties.DateCalendarType =
CalendarType.Gregorian
'Sets the format for date to display
```

```

datePicker.ContentControlProperties.DateDisplayFormat = "M/d/yyyy"
'Sets the language format for the date
datePicker.ContentControlProperties.DateDisplayLocale = LocaleIDs.en_US
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("Select Date: ");
//Appends date picker content control to the paragraph
InlineContentControl datePicker =
paragraph.AppendInlineContentControl(ContentControlType.Date) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
//Sets today's date to display
textRange.Text = DateTime.Now.ToShortDateString();
datePicker.ParagraphItems.Add(textRange);
//Sets calendar type for the date picker content control
datePicker.ContentControlProperties.DateCalendarType =
CalendarType.Gregorian;
//Sets the format for date to display
datePicker.ContentControlProperties.DateDisplayFormat = "M/d/yyyy";
//Sets the language format for the date
datePicker.ContentControlProperties.DateDisplayLocale = LocaleIDs.en_US;
//Saves the Word file to MemoryStream

Drop-Down List and Combo Box

A drop-down list content control and combo box content control displays a list of items you can select. Unlike a drop-down list, the combo box allows to add your own items. Refer to the following code to add drop-down list and combo box content controls.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
WParagraph paragraph = section.AddParagraph() as WParagraph;
//Appends dropdown list content control to the paragraph
InlineContentControl dropdown =
paragraph.AppendInlineContentControl(ContentControlType.DropDownList) as
InlineContentControl;
WTextRange textRange = new WTextRange(document);
//Sets default option to display
textRange.Text = "Choose an item from drop down list";
dropdown.ParagraphItems.Add(textRange);
//Creates an item for dropdown list
ContentControlListItem item = new ContentControlListItem();
//Sets the text to be displayed as list item
item.DisplayText = "ASP.NET MVC";
//Sets the value to the list item
item.Value = "1";
//Adds item to the dropdown list
dropdown.ContentControlProperties.ContentControlListItems.Add(item);
item = new ContentControlListItem();
item.DisplayText = "Windows Forms";
item.Value = "2";
dropdown.ContentControlProperties.ContentControlListItems.Add(item);
item = new ContentControlListItem();
item.DisplayText = "WPF";
item.Value = "3";
dropdown.ContentControlProperties.ContentControlListItems.Add(item);
//Adds new paragraph to the section
paragraph = section.AddParagraph() as WParagraph;
//Appends combo box content control to the paragraph
InlineContentControl comboBox =
paragraph.AppendInlineContentControl(ContentControlType.ComboBox) as
InlineContentControl;
textRange = new WTextRange(document);
//Sets default option to display
textRange.Text = "Choose an item from combo box";
comboBox.ParagraphItems.Add(textRange);
//Creates an item for combo box
item = new ContentControlListItem();
//Sets the text to be displayed as list item
item.DisplayText = "Word to HTML";
//Sets the value to the list item
item.Value = "1";
comboBox.ContentControlProperties.ContentControlListItems.Add(item);
item = new ContentControlListItem();
item.DisplayText = "Word to Image";
item.Value = "2";
```

```

comboBox.ContentControlProperties.ContentControlListItems.Add(item);
item = new ContentControlListItem();
item.DisplayText = "Word to PDF";
item.Value = "3";
comboBox.ContentControlProperties.ContentControlListItems.Add(item);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds new section to the document
Dim section As IWSection = document.AddSection
'Adds new paragraph to the section
Dim paragraph As WParagraph = CType(section.AddParagraph, WParagraph)

document.Close();

```

Picture

A picture content control displays an image. Refer to the following code to add new picture content control.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph.
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends picture content control to the paragraph
InlineContentControl pictureContentControl =
paragraph.AppendInlineContentControl(ContentControlType.Picture) as
InlineContentControl;
//Creates a new image instance and load image
WPicture picture = new WPicture(document);
picture.LoadImage(Image.FromFile("Image.png"));
//Adds picture to the picture content control
pictureContentControl.ParagraphItems.Add(picture);
//Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Adds new paragraph to the section
Dim paragraph As WParagraph = document.LastParagraph
'Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ")
'Appends picture content control to the paragraph
Dim pictureContentControl As InlineContentControl =
CType(paragraph.AppendInlineContentControl(ContentControlType.Picture),
InlineContentControl)
'Creates a new image instance and load image
Dim picture As WPicture = New WPicture(document)
picture.LoadImage(Image.FromFile("Image.png"))
'Adds picture to the picture content control
pictureContentControl.ParagraphItems.Add(picture)
'Saves and closes the Word document instance
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
```

```

//Gets the last paragraph
WParagraph paragraph = document.LastParagraph;
//Adds text to the paragraph
paragraph.AppendText("A new text is added to the paragraph. ");
//Appends picture content control to the paragraph
InlineContentControl pictureContentControl =
paragraph.AppendInlineContentControl(ContentControlType.Picture) as
InlineContentControl;
//Creates a new image instance and load image
WPicture picture = new WPicture(document);
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream pictureStream =
assembly.GetManifestResourceStream("Sample.Assets.Image.png");
picture.LoadImage(pictureStream);
//Adds picture to the picture content control
pictureContentControl.ParagraphItems.Add(picture);
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Gets the last paragraph

Stream imageStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Image.png");
//Adds image from stream
picture.LoadImage(imageStream);
//Adds picture to the picture content control
pictureContentControl.ParagraphItems.Add(picture);
//Creates memory stream
MemoryStream outputStream = new MemoryStream();
//Saves and closes the Word document instance
document.Save(outputStream, FormatType.Docx);
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Result.docx",
"application/msword", outputStream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
document.Close();
```

Note: In the above-mentioned code samples, for Xamarin platforms the document is saved as stream only. To save the stream to file kindly refer code sample [here](#).

Working with Mathematical Equation

Equations in Word document are combination of mathematical symbols or text. For example, you can create a Fourier series equation in Word document.

![Mathematical equation in Microsoft Word document](WorkingwithMathematicalEquation_images/Mathematical Equation.png)

Note: You can use mathematical equation only in documents that are saved in the Open XML Format and cannot be used in the Word 97-2003 document (.doc) format.

Types of equation

The following different structures of equation can be created by using the Essential DocIO.

- Accent
- Bar
- Box
- Border box
- Delimiter
- Equation array
- Fraction
- Function
- Group character
- Limit
- Matrix
- N-Array
- Radical
- Phantom
- SubSuperscript
- Left SubSuperscript
- Right SubSuperscript

Accent

You can add an accent mark to the equation. The following code example shows how to add an accent mark to the equation.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds an accent equation
IOfficeMathAccent mathAccent =
officeMath.Functions.Add(MathFunctionType.Accent) as IOfficeMathAccent;
//Sets the accent character
mathAccent.AccentCharacter = "~";
//Adds the run element for accent
IOfficeMathRunElement officeMathRunElement =
mathAccent.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
WTextRange textRange = officeMathRunElement.Item as WTextRange;
//Sets text for accent equation
textRange.Text = "a";
//Applies character formatting for text range
textRange.CharacterFormat.Bold = true;
textRange.CharacterFormat.Italic = true;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOfficeMath = math.MathParagraph.Maths.Add
'Adds an accent equation
Dim mathAccent As IOfficeMathAccent =
CType(officeMath.Functions.Add(MathFunctionType.Accent), IOfficeMathAccent)
'Sets the accent character
mathAccent.AccentCharacter = ""
Dim officeMathRunElement As IOfficeMathRunElement =
CType(mathAccent.Equation.Functions.Add(MathFunctionType.RunElement),
IOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange(document)
Dim textRange As WTextRange = CType(officeMathRunElement.Item, WTextRange)
'Sets text for accent equation
textRange.Text = "a"
'Applies character formatting for text range
textRange.CharacterFormat.Bold = True
textRange.CharacterFormat.Italic = True
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds an accent equation
IOfficeMathAccent mathAccent =
officeMath.Functions.Add(MathFunctionType.Accent) as IOfficeMathAccent;
//Sets the accent character
mathAccent.AccentCharacter = "°";
//Adds the run element for accent
IOfficeMathRunElement officeMathRunElement =
mathAccent.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
WTextRange textRange = officeMathRunElement.Item as WTextRange;
//Sets text for accent equation
textRange.Text = "a";
//Applies character formatting for text range
textRange.CharacterFormat.Bold = true;
textRange.CharacterFormat.Italic = true;

```

```
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word document file in local machine
Save(stream, "Sample.docx ");
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds an accent equation
IOfficeMathAccent mathAccent =
officeMath.Functions.Add(MathFunctionType.Accent) as IOfficeMathAccent;
//Sets the accent character

//Adds the run element for accent
IOfficeMathRunElement officeMathRunElement =
mathAccent.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
WTextRange textRange = officeMathRunElement.Item as WTextRange;
//Sets text for accent equation
textRange.Text = "a";
//Applies character formatting for text range
textRange.CharacterFormat.Bold = true;
textRange.CharacterFormat.Italic = true;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds an accent equation
```

```

IOfficeMathAccent mathAccent =
officeMath.Functions.Add(MathFunctionType.Accent) as IOfficeMathAccent;
//Sets the accent character
mathAccent.AccentCharacter = "˘";
//Adds the run element for accent
IOfficeMathRunElement officeMathRunElement =
mathAccent.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
WTextRange textRange = officeMathRunElement.Item as WTextRange;
//Sets text for accent equation
textRange.Text = "a";
//Applies character formatting for text range
textRange.CharacterFormat.Bold = true;
textRange.CharacterFormat.Italic = true;
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
XAMARIN#helper-files-for-XAMARIN

```

Bar

You can add a bar (which adds horizontal line on top or bottom) to the equation. The following code example shows how to add a bar to the equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Add a section and a paragraph in the empty document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds a bar equation
IOfficeMathBar mathBar = officeMath.Functions.Add(0, MathFunctionType.Bar)
as IOfficeMathBar;
//Sets the position of bar
mathBar.BarTop = true;
//Adds the run element for bar
IOfficeMathRunElement officeMathRunElement =
mathBar.Equation.Functions.Add(0, MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for bar equation
(officeMathRunElement.Item as WTextRange).Text = "a";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);

```

```
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOOfficeMath = math.MathParagraph.Maths.Add
Dim mathBar As IOOfficeMathBar = CType(officeMath.Functions.Add(0,
MathFunctionType.Bar), IOOfficeMathBar)
'Sets the position of bar
mathBar.BarTop = True
Dim officeMathRunElement As IOOfficeMathRunElement =
CType(mathBar.Equation.Functions.Add(0, MathFunctionType.RunElement),
IOOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange(document)
'Sets text for bar equation
CType(officeMathRunElement.Item, WTextRange).Text = "a"
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()
```

UWP

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds an bar equation
IOOfficeMathBar mathBar = officeMath.Functions.Add(0, MathFunctionType.Bar)
as IOOfficeMathBar;
//Sets the position of bar
mathBar.BarTop = true;
//Adds the run element for bar
IOOfficeMathRunElement officeMathRunElement =
mathBar.Equation.Functions.Add(0, MathFunctionType.RunElement) as
IOOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for bar equation
(officeMathRunElement.Item as WTextRange).Text = "a";
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word document file in local machine
Save(stream, "Sample.docx");
```

```
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds an bar function
IOfficeMathBar mathBar = officeMath.Functions.Add(0, MathFunctionType.Bar)

document.Close();

```

Box

You can add a box to the equation. The following code example shows how to add a box to the equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds a box equation
IOfficeMathBox mathBox = officeMath.Functions.Add(0, MathFunctionType.Box)
as IOfficeMathBox;
//Adds the run element for box
IOfficeMathRunElement officeMathRunElement =
officeMath.Functions.Add(0, MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for math
(officeMathRunElement.Item as WTextRange).Text = "a+b";
//Enables the flag, to behave the box and its contents as a single operator
mathBox.OperatorEmulator = true;
//Enables the flag, to act box as the mathematical differential
mathBox.EnableDifferential = true;
//Adds a break in box equation
mathBox.Break = officeMath.Breaks.Add(0);
//Adds the run element for box
officeMathRunElement =
mathBox.Equation.Functions.Add(0, MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for box equation
(officeMathRunElement.Item as WTextRange).Text = "==" ;
//Adds the run element for box
officeMathRunElement =
mathBox.Equation.Functions.Add(1, MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for box equation
(officeMathRunElement.Item as WTextRange).Text = "adx";
//Saves the Word document

```

```
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```

Border box

You can add a box with the borders on four sides and strikethrough on horizontal, vertical, and diagonal directions to the equation. The following code example shows how to add a border box to the equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds a border box equation
IOfficeMathBorderBox mathBorderBox =
officeMath.Functions.Add(0, MathFunctionType.BorderBox) as
IOfficeMathBorderBox;
//Sets the diagonal strikethrough from lower left to upper right
mathBorderBox.StrikeDiagonalUp = true;
//Sets the diagonal strikethrough from upper left to lower right
mathBorderBox.StrikeDiagonalDown = true;
//Sets the horizontal strikethrough
mathBorderBox.StrikeHorizontal = true;
//Sets the vertical strikethrough

```

```

mathBorderBox.StrikeVertical = true;
//Enables the flag, to hide the bottom border of an equation
mathBorderBox.HideBottom = true;
//Enables the flag, to hide the left border of an equation
mathBorderBox.HideLeft = true;
//Sets false to show the right border of an equation
mathBorderBox.HideRight = false;
//Sets false to show the top border of an equation
mathBorderBox.HideTop = false;
//Adds the run element for border box
IOfficeMathRunElement officeMathRunElement =
mathBorderBox.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for border box equation
(officeMathRunElement.Item as WTextRange).Text = "a+b-c";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document

```

Delimiter

You can add a delimiter (parenthesis, square brackets and other characters) to the equation. The following code example shows how to add a delimiter to the equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds a delimiter equation
IOfficeMathDelimiter mathDelimiter =
officeMath.Functions.Add(0, MathFunctionType.Delimiter) as
IOfficeMathDelimiter;
//Sets the begin character
mathDelimiter.BeginCharacter = "[";

```

```

//Sets the end character
mathDelimiter.EndCharacter = "]"";
//Enables the flag, to grow delimiter characters to full height of the arguments
mathDelimiter.IsGrow = true;
//Sets the appearance of delimiters
mathDelimiter.DelimiterShape = MathDelimiterShapeType.Match;
//Adds the run element for delimiter
IOfficeMathRunElement officeMathRunElement =
mathDelimiter.Equation.Add(0).Functions.Add(0, MathFunctionType.RunElement)
as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for delimiter equation
(officeMathRunElement.Item as WTextRange).Text = "a+b";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOfficeMath = math.MathParagraph.Maths.Add
Dim mathDelimiter As IOfficeMathDelimiter =
CType(officeMath.Functions.Add(0, MathFunctionType.Delimiter),
IOfficeMathDelimiter)
'Sets the begin character
mathDelimiter.BeginCharacter = "["
'Sets the end character
mathDelimiter.EndCharacter = "]"
'Enables the flag, to grow delimiter characters to full height of the arguments
mathDelimiter.IsGrow = True
'Sets the appearance of delimiters
mathDelimiter.DelimiterShape = MathDelimiterShapeType.Match
Dim officeMathRunElement As IOfficeMathRunElement =
CType(mathDelimiter.Equation.Add(0).Functions.Add(0,
MathFunctionType.RunElement), IOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange(document)
'Sets text for delimiter equation
CType(officeMathRunElement.Item, WTextRange).Text = "a+b"

```

Equation array

You can create a one dimensional array of equations in Word document. The following code example shows how to create an array of equations.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds an equation array
IOfficeMathEquationArray mathEquationArray =
officeMath.Functions.Add(0, MathFunctionType.EquationArray) as
IOfficeMathEquationArray;
//Sets the vertical alignment for equation array
mathEquationArray.VerticalAlignment = MathVerticalAlignment.Center;
//Enables the flag, to distribute the equation array equally within the
container
mathEquationArray.ExpandEquationContainer = true;
//Enables the flag, to expand the equations in an equation array to the
maximum width
mathEquationArray.ExpandEquationContent = true;
//Sets the row spacing rule
mathEquationArray.RowSpacingRule = SpacingRule.Multiple;
//Adds the run element for equation array
IOfficeMathRunElement officeMathRunElement =
mathEquationArray.Equation.Add(0).Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for equation array
(officeMathRunElement.Item as WTextRange).Text = "x+y+z=0";
//Adds the run element for equation array
officeMathRunElement =
mathEquationArray.Equation.Add(1).Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for equation array
(officeMathRunElement.Item as WTextRange).Text = "x+y-z=1";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph

Fraction

You can create a fraction equation with a numerator and denominator in Word document. The following code example shows how to create a fraction equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds a fraction equation
IOfficeMathFraction mathFraction =
officeMath.Functions.Add(0, MathFunctionType.Fraction) as
IOfficeMathFraction;
//Sets the denominator for fraction
IOfficeMathRunElement officeMathRunElement =
mathFraction.Numerator.Functions.Add(0, MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "a";
//Sets the numerator for fraction
officeMathRunElement =
mathFraction.Denominator.Functions.Add(0, MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "b";
//Sets the fraction type
mathFraction.FractionType = MathFractionType.NormalFractionBar;
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math

Function

You can create trigonometric functions in a Word document. The following code example shows how to create a function.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds a function
IOfficeMathFunction mathFunction =
officeMath.Functions.Add(0, MathFunctionType.Function) as
IOfficeMathFunction;
//Sets the function name
IOfficeMathRunElement officeMathRunElement =
mathFunction.FunctionName.Functions.Add(0, MathFunctionType.RunElement) as
IOfficeMathRunElement;

```

```

officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "sin";
//Adds the run element for function
officeMathRunElement =
mathFunction.Equation.Functions.Add(0, MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for function
(officeMathRunElement.Item as WTextRange).Text = "90";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOfficeMath = math.MathParagraph.Maths.Add
Dim mathFunction As IOfficeMathFunction = CType(officeMath.Functions.Add(0,
MathFunctionType.Function), IOfficeMathFunction)

```

Group character

You can group mathematical equations by adding a grouping character at above or below to the corresponding equations. The following code example shows how to create an equation with grouping character.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
```

```

document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath math = document.LastParagraph.AppendMath();
//Adds a new math
IOfficeMath officeMath = math.MathParagraph.Maths.Add();
//Adds a group character equation
IOfficeMathGroupCharacter officeMathGroupCharacter =
officeMath.Functions.Add(0, MathFunctionType.GroupCharacter) as
IOfficeMathGroupCharacter;
//Sets the group character
officeMathGroupCharacter.GroupCharacter = "⌘";
//Enables the flag to align group character at top
officeMathGroupCharacter.HasAlignTop = true;
//Enables the flag to align the text and group character
officeMathGroupCharacter.HasCharacterTop = true;
//Adds the run element for group character
IOfficeMathRunElement officeMathRunElement =
officeMathGroupCharacter.Equation.Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for group character equation
(officeMathRunElement.Item as WTextRange).Text = "a-b";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOfficeMath = math.MathParagraph.Maths.Add
Dim officeMathGroupCharacter As IOfficeMathGroupCharacter =
CType(officeMath.Functions.Add(0, MathFunctionType.GroupCharacter),
IOfficeMathGroupCharacter)
'Sets the group character
officeMathGroupCharacter.GroupCharacter = "⌘"
'Enables the flag to align group character at top
officeMathGroupCharacter.HasAlignTop = True
'Enables the flag to align the text and group character
officeMathGroupCharacter.HasCharacterTop = True
Dim officeMathRunElement As IOfficeMathRunElement =
CType(officeMathGroupCharacter.Equation.Functions.Add(0,

Limit

You can add upper limit or lower limit to the mathematical equation. The following code example shows how to create limit equation.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wMath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wMath.MathParagraph.Maths.Add();
//Adds function to the math
IOfficeMathFunction officeMathFunction =
officeMath.Functions.Add(0, MathFunctionType.Function) as
IOfficeMathFunction;
//Adds a mathematical limit equation
IOfficeMathLimit officeMathLimit =
officeMathFunction.FunctionName.Functions.Add(0, MathFunctionType.Limit) as
IOfficeMathLimit;
IOfficeMathRunElement officeMathRunElement =
officeMathLimit.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for limit equation.
(officeMathRunElement.Item as WTextRange).Text = "lim";
//Sets the type of the limit.
officeMathLimit.LimitType = MathLimitType.LowerLimit;
IOfficeMathRunElement officeMathRunElement_limit =
officeMathLimit.Limit.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement_limit.Item = new WTextRange(document);
//Sets the limit value.
(officeMathRunElement_limit.Item as WTextRange).Text = "n=0";
officeMathLimit.LimitType = MathLimitType.LowerLimit;
officeMathRunElement =
officeMathFunction.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for base of the specified equation
(officeMathRunElement.Item as WTextRange).Text = "x";
//Saves the Word document
document.Save("Sample.docx");
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
```

```

document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOOfficeMath = math.MathParagraph.Maths.Add
Dim officeMathFunction As IOOfficeMathFunction =

Matrix

You can create a matrix equation in a Word document. The following code example shows how to create a matrix equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
///Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add();
//Adds matrix equation
IOfficeMathMatrix mathMatrix =
officeMath.Functions.Add(MathFunctionType.Matrix) as IOfficeMathMatrix;
//Sets vertical alignment for matrix
mathMatrix.VerticalAlignment = MathVerticalAlignment.Center;
//Sets width for matrix columns
mathMatrix.ColumnWidth = 1;
//Sets column spacing rule
mathMatrix.ColumnSpacingRule = SpacingRule.OneAndHalf;
//Sets column spacing value
mathMatrix.ColumnSpacing = 3;
//Enables the flag to hide place holders
mathMatrix.HidePlaceHolders = true;
//Sets row spacing rule.
mathMatrix.RowSpacingRule = SpacingRule.Double;
//Sets row spacing value.
mathMatrix.RowSpacing = 2;
//Adds a new column
mathMatrix.Columns.Add();
//Adds a new row
mathMatrix.Rows.Add();
//Sets horizontal alignment for column
mathMatrix.Columns[0].HorizontalAlignment = MathHorizontalAlignment.Left;
//Gets an argument in first cell in first row
officeMath = mathMatrix.Rows[0].Arguments[0];
//Sets text for argument in first cell in first row

```

```

IOfficeMathRunElement officeMathRunElement =
officeMath.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "1";
//Adds a new column
mathMatrix.Columns.Add();
//Adds a new row
mathMatrix.Rows.Add();
//Gets an argument in second cell in first row
officeMath = mathMatrix.Rows[0].Arguments[1];
//Sets text for argument in second cell in first row
officeMathRunElement = officeMath.Functions.Add(MathFunctionType.RunElement)
as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "2";
//Gets an argument in first cell in second row
officeMath = mathMatrix.Rows[1].Arguments[0];
//Sets text for argument in first cell in second row
officeMathRunElement = officeMath.Functions.Add(MathFunctionType.RunElement)
as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "3";
//Gets an argument in second cell in second row
officeMath = mathMatrix.Rows[1].Arguments[1];
//Sets text for argument in second cell in second row
officeMathRunElement = officeMath.Functions.Add(MathFunctionType.RunElement)
as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "4";
//Saves the Word document.
document.Save("Sample.docx");
//Closes the document
document.Close();

```

```

N-Array

You can create an equation with common large operators such as summation, integrals, union, intersection, logical OR, logical AND, products and co-products. The following code example shows how to create a summation with limits.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wMath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wMath.MathParagraph.Maths.Add();
//Adds a N-Array equation.
IOfficeMathNArray officeMathNArray = officeMath.Functions.Add(0,
MathFunctionType.NArray) as IOfficeMathNArray;
//Sets N-Array character.
officeMathNArray.NArrayCharacter = "Σ";
//Enables the flag, to grow N-array character to full height of the
arguments
officeMathNArray.HasGrow = false;
//Enables the flag to hide lower limit
officeMathNArray.HideLowerLimit = false;
//Enables the flag to hide upper limit
officeMathNArray.HideUpperLimit = false;
//Sets false to set limit position on above the summation
officeMathNArray.SubSuperscriptLimit = false;
IOfficeMathRunElement officeMathRunElement =
officeMathNArray.Subscript.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for superscript property of NArray equation.
(officeMathRunElement.Item as WTextRange).Text = "n=1";
officeMathRunElement =
officeMathNArray.Superscript.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "10";
officeMathRunElement =
officeMathNArray.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for NArray equation.
(officeMathRunElement.Item as WTextRange).Text = "x";
//Saves the Word document.
document.Save("Sample.docx");
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
```

```

'Appends a new mathematical equation to the paragraph

```

Radical

You can create a radical equation in Word document. The following example shows how to create a radical equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add();
//Adds a radical equation
IOfficeMathRadical officeMathRadical = officeMath.Functions.Add(0,
MathFunctionType.Radical) as IOfficeMathRadical;
//Sets false to show degree in radical
officeMathRadical.HideDegree = false;
//Adds a degree for radical equation
IOfficeMathRunElement officeMathRunElement =
officeMathRadical.Degree.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "2";
//Adds an run element for radical
officeMathRunElement =
officeMathRadical.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets the radicand text for radical equation.
(officeMathRunElement.Item as WTextRange).Text = "x";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);

```

```
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOOfficeMath = math.MathParagraph.Maths.Add
Dim officeMathRadical As IOOfficeMathRadical =
CType(officeMath.Functions.Add(0, MathFunctionType.Radical),
IOOfficeMathRadical)
'Sets false to show degree in radical

```

Phantom

You can create a phantom equation to add the spacing of the phantom

without displaying that base and suppressing part of the glyph from spacing considerations. The following code example shows how to create a phantom equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add();
//Adds a radical equation
IOfficeMathRadical officeMathRadical = officeMath.Functions.Add(0,
MathFunctionType.Radical) as IOfficeMathRadical;
//Adds a degree for radical

```

```

IOfficeMathRunElement officeMathRunElement =
officeMathRadical.Degree.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "2";
//Adds a phantom equation in radical.
IOfficeMathPhantom officeMathPhantom =
officeMathRadical.Equation.Functions.Add(0, MathFunctionType.Phantom) as
IOfficeMathPhantom;
//Enables the flag, to show the contents of phantom
officeMathPhantom.Show = true;
//Enables the flag, to transparent the phantom
officeMathPhantom.Transparent = true;
//Enables the flag, to ignore the ascent of the phantom contents in spacing
officeMathPhantom.ZeroAscent = true;
//Enables the flag, to ignore the descent of the phantom contents in spacing
officeMathPhantom.ZeroDescent = true;
//Enables the flag, to ignore the width of a phantom contents in spacing
officeMathPhantom.ZeroWidth = true;
//Adds a run element for phantom
officeMathRunElement =
officeMathPhantom.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for phantom equation
(officeMathRunElement.Item as WTextRange).Text = "a-b";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add();
//Adds a radical equation
IOfficeMathRadical officeMathRadical = officeMath.Functions.Add(0,
MathFunctionType.Radical) as IOfficeMathRadical;
IOfficeMathRunElement officeMathRunElement =
officeMathRadical.Degree.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
(officeMathRunElement.Item as WTextRange).Text = "2";
//Adds a phantom equation in radical.
IOfficeMathPhantom officeMathPhantom =
officeMathRadical.Equation.Functions.Add(0, MathFunctionType.Pantom) as
IOfficeMathPhantom;
//Enables the flag, to show the contents of phantom
officeMathPhantom.Show = true;
//Enables the flag, to transparent the phantom
officeMathPhantom.Transparent = true;
//Enables the flag, to ignore the ascent of the phantom contents in spacing
officeMathPhantom.ZeroAscent = true;
//Enables the flag, to ignore the descent of the phantom contents in spacing
officeMathPhantom.ZeroDescent = true;
//Enables the flag, to ignore the width of a phantom contents in spacing
officeMathPhantom.ZeroWidth = true;
//Adds a run element for math phantom
officeMathRunElement =
officeMathPhantom.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for phantom equation
(officeMathRunElement.Item as WTextRange).Text = "a-b";
//Saves and closes the Word document instance
MemoryStream stream = new MemoryStream();
//Saves the Word file to MemoryStream
document.Save(stream, FormatType.Docx);
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as

XAMARIN#helper-files-for-XAMARIN

```

SubSuperscript

You can add a superscript or subscript equation in a Word document. The following code shows how to create a superscript equation.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add();
//Adds a superscript equation
IOfficeMathScript officeMathScript = officeMath.Functions.Add(0,
MathFunctionType.SubSuperscript) as IOfficeMathScript;
//Sets the type of the script as superscript.
officeMathScript.ScriptType = MathScriptType.Superscript;
//Adds a run element for superscript.
IOfficeMathRunElement officeMathRunElement =
officeMathScript.Script.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
WTextRange textRange = officeMathRunElement.Item as WTextRange;
//Sets text for superscript.
textRange.Text = "2";
//Adds run element for equation
officeMathRunElement =
officeMathScript.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for equation
(officeMathRunElement.Item as WTextRange).Text = "x";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
Dim officeMath As IOfficeMath = math.MathParagraph.Maths.Add
Dim officeMathScript As IOfficeMathScript =
CType(officeMath.Functions.Add(0, MathFunctionType.SubSuperscript),
IOfficeMathScript)
'Sets the type of the script.
officeMathScript.ScriptType = MathScriptType.Superscript
'Adds a run element for script.
Dim officeMathRunElement As IOfficeMathRunElement =
CType(officeMathScript.Script.Functions.Add(MathFunctionType.RunElement),
IOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange(document)
Dim textRange As WTextRange = CType(officeMathRunElement.Item, WTextRange)
'Sets text for script.

```

```

textRange.Text = "2"
'Adds run element for equation
officeMathRunElement =
CType (officeMathScript.Equation.Functions.Add (MathFunctionType.RunElement),
IOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange (document)
'Sets text
CType (officeMathRunElement.Item, WTextRange).Text = "x"
'Saves the Word document
document.Save ("Sample.docx", FormatType.Docx)
'Closes the document
document.Close ()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument ();
//Adds one section and one paragraph to the document
document.EnsureMinimal ();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath ();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add ();
//Adds a subsuperscript equation
IOfficeMathScript officeMathScript = officeMath.Functions.Add (0,
MathFunctionType.SubSuperscript) as IOfficeMathScript;

```

Left SubSuperscript

You can add superscript and subscript on the left side of mathematical equation. The following code example shows how to add superscript and subscript on the left side of the equation.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add();
//Adds a left subsuperscript equation.
IOfficeMathLeftScript officeMathLeftSubScript = officeMath.Functions.Add(0,
MathFunctionType.LeftSubSuperscript) as IOfficeMathLeftScript;
//Adds run element for left subscript
IOfficeMathRunElement officeMathRunElement =
officeMathLeftSubScript.Subscript.Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for subscript
(officeMathRunElement.Item as WTextRange).Text = "1";
//Adds a run element for left superscript
officeMathRunElement =
officeMathLeftSubScript.Superscript.Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for left superscript.
(officeMathRunElement.Item as WTextRange).Text = "n";
officeMathRunElement =
officeMathLeftSubScript.Equation.Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for equation.
(officeMathRunElement.Item as WTextRange).Text = "Y";
```

```
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
Dim officeMath As IOOfficeMath = math.MathParagraph.Maths.Add
'Adds a left subsuperscript equation.
Dim officeMathLeftSubScript As IOOfficeMathLeftScript =
CType(officeMath.Functions.Add(0, MathFunctionType.LeftSubSuperscript),
IOOfficeMathLeftScript)
'Adds run element for left subsuperscript
Dim officeMathRunElement As IOOfficeMathRunElement =
CType(officeMathLeftSubScript.Subscript.Functions.Add(0,
MathFunctionType.RunElement), IOOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange(document)
CType(officeMathRunElement.Item, WTextRange).Text = "1"
officeMathRunElement =
CType(officeMathLeftSubScript.Superscript.Functions.Add(0,
MathFunctionType.RunElement), IOOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange(document)

Right SubSuperscript

You can add superscript and subscript on the right side of mathematical equation. The following code example shows how to add superscript and subscript on the right side of the equation.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds one section and one paragraph to the document
document.EnsureMinimal();
//Appends a new mathematical equation to the paragraph
WMath wmath = document.LastParagraph.AppendMath();
IOfficeMath officeMath = wmath.MathParagraph.Maths.Add();
//Adds a right subsuperscript equation
IOfficeMathRightScript officeMathRightScript = officeMath.Functions.Add(0,
MathFunctionType.RightSubSuperscript) as IOfficeMathRightScript;
//Sets false to align subscript and superscript horizontally
officeMathRightScript.IsSkipAlign = true;
//Adds run element for right subscript.
IOfficeMathRunElement officeMathRunElement =
officeMathRightScript.Subscript.Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for right subscript
(officeMathRunElement.Item as WTextRange).Text = "1";
//Adds run element for right superscript
officeMathRunElement =
officeMathRightScript.Superscript.Functions.Add(0,
MathFunctionType.RunElement) as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for right superscript.
(officeMathRunElement.Item as WTextRange).Text = "n";
officeMathRunElement =
officeMathRightScript.Equation.Functions.Add(0, MathFunctionType.RunElement)
as IOfficeMathRunElement;
officeMathRunElement.Item = new WTextRange(document);
//Sets text for equation.
(officeMathRunElement.Item as WTextRange).Text = "Y";
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As WordDocument = New WordDocument
'Adds one section and one paragraph to the document
document.EnsureMinimal()
'Appends a new mathematical equation to the paragraph
Dim math As WMath = document.LastParagraph.AppendMath
'Adds a new math
```

```

Dim officeMath As IOOfficeMath = math.MathParagraph.Maths.Add
Dim officeMathRightScript As IOOfficeMathRightScript =
CType(officeMath.Functions.Add(0, MathFunctionType.RightSubSuperscript),
IOOfficeMathRightScript)
'Sets false to align subscripts and superscripts horizontally
officeMathRightScript.IsSkipAlign = True
'Adds run element for right subscript equation.
Dim officeMathRunElement As IOOfficeMathRunElement =
CType(officeMathRightScript.Subscript.Functions.Add(0,
MathFunctionType.RunElement), IOOfficeMathRunElement)
officeMathRunElement.Item = New WTextRange(document)

```

Modify existing equation

You can add or modify the text and formatting of existing mathematical equation in Word document. The following screenshots shows an existing mathematical equation in the input Word document.

The following code example shows how to modify an existing mathematical equation in the Word document.

C#

```
//Opens an existing Word document
WordDocument document = new WordDocument("Template.docx");
//Access the paragraph from Word document
WParagraph paragraph = document.LastSection.Body.ChildEntities[0] as
WParagraph;
//Access the mathematical equation from the paragraph
WMath math = paragraph.ChildEntities[2] as WMath;
//Access the radical equation
IOfficeMathRadical mathRadical = math.MathParagraph.Maths[0].Functions[1] as
IOfficeMathRadical;
//Access the fraction equation in radical
IOfficeMathFraction mathFraction = mathRadical.Equation.Functions[0] as
IOfficeMathFraction;
//Access the n-array equation in fraction
IOfficeMathNArray mathNArray = mathFraction.Numerator.Functions[0] as
IOfficeMathNArray;
//Access the math script in n-array
IOfficeMathScript mathScript = mathNArray.Equation.Functions[0] as
IOfficeMathScript;
//Access the delimiter in math script
IOfficeMathDelimiter mathDelimiter = mathScript.Equation.Functions[0] as
IOfficeMathDelimiter;
//Removes the delimiter
mathScript.Equation.Functions.Remove(mathDelimiter);
//Modifies the run element in math script
IOfficeMathRunElement MathParagraphItem =
mathScript.Equation.Functions.Add(MathFunctionType.RunElement) as
IOfficeMathRunElement;
MathParagraphItem.Item = new WTextRange(document);
//Sets the text value
(MathParagraphItem.Item as WTextRange).Text = "x";
```

```
//Applies character format to the text
(MathParagraphItem.Item as WTextRange).CharacterFormat.Italic = true;
(MathParagraphItem.Item as WTextRange).CharacterFormat.FontSize = 20;
//Applies math format to the text
MathParagraphItem.MathFormat.Style = MathStyleType.Italic;
//Saves the word document
document.Save("Sample.docx");
//Close the word document
document.Close();
```

VB.NET

```
'Opens an existing Word document
Dim document As WordDocument = New WordDocument("Template.docx")
'Access the paragraph from Word document
Dim paragraph As WParagraph =
CType(document.LastSection.Body.ChildEntities(0), WParagraph)
'Access the mathematical equation from the paragraph
Dim math As WMath = CType(paragraph.ChildEntities(2), WMath)
'Access the radical equation
Dim mathRadical As IOOfficeMathRadical =
CType(math.MathParagraph.Maths(0).Functions(1), IOOfficeMathRadical)
'Access the fraction equation in radical
Dim mathFraction As IOOfficeMathFraction =
CType(mathRadical.Equation.Functions(0), IOOfficeMathFraction)
'Access the n-array equation in fraction
Dim mathNary As IOOfficeMathNArray =

XAMARIN#helper-files-for-XAMARIN

```

By executing the above code example, it generates output Word document as follows.

Accepting or Rejecting Track Changes

It is used to keep track of the changes made to a Word document. It helps to maintain the record of author, name and time for every insertion, deletion, or modification in a document. This can be enabled by using the TrackChanges property of the Word document.

Note:

With this support, the changes made in the Word document by DocIO library cannot be tracked.

The following code example illustrates how to enable track changes of the document.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends text to the paragraph
IWTextRange text = paragraph.AppendText("This sample illustrates how to
track the changes made to the word document. ");
//Sets font name and size for text
text.CharacterFormat.FontName = "Times New Roman";
text.CharacterFormat.FontSize = 14;
text = paragraph.AppendText("This track changes is useful in shared
environment.");
text.CharacterFormat.FontSize = 12;
//Turns on the track changes option
document.TrackChanges = true;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Appends text to the paragraph
Dim text As IWTextRange = paragraph.AppendText("This sample illustrates how
to track the changes made to the word document. ")
'Sets font name and size for text
text.CharacterFormat.FontName = "Times New Roman"
text.CharacterFormat.FontSize = 14
text = paragraph.AppendText("This track changes is useful in shared
environment.")
text.CharacterFormat.FontSize = 12
'Turns on the track changes option
document.TrackChanges = True
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

UWP

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends text to the paragraph
IWTextRange text = paragraph.AppendText("This sample illustrates how to
track the changes made to the word document. ");
//Sets font name and size for text
text.CharacterFormat.FontName = "Times New Roman";
text.CharacterFormat.FontSize = 14;
text = paragraph.AppendText("This track changes is useful in shared
environment.");
text.CharacterFormat.FontSize = 12;
//Turns on the track changes option
document.TrackChanges = true;
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp

```

ASP.NET CORE

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();

```

```
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends text to the paragraph
IWTextRange text = paragraph.AppendText("This sample illustrates how to
track the changes made to the word document. ");
//Sets font name and size for text
text.CharacterFormat.FontName = "Times New Roman";
text.CharacterFormat.FontSize = 14;
text = paragraph.AppendText("This track changes is useful in shared
environment.");
text.CharacterFormat.FontSize = 12;
//Turns on the track changes option
document.TrackChanges = true;
//Saves the Word document to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "Sample.docx");
```

XAMARIN

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Appends text to the paragraph
IWTextRange text = paragraph.AppendText("This sample illustrates how to
track the changes made to the word document. ");
//Sets font name and size for text
text.CharacterFormat.FontName = "Times New Roman";
text.CharacterFormat.FontSize = 14;
text = paragraph.AppendText("This track changes is useful in shared
environment.");
text.CharacterFormat.FontSize = 12;
//Turns on the track changes option
document.TrackChanges = true;
MemoryStream stream = new MemoryStream();
//Saves the Word document to MemoryStream
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
//Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.docx",
"application/msword", stream);
//Please download the helper files from the below link to save the stream as
file and open the file for viewing in Xamarin platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

The changes made to the document can be accepted or rejected. The following code example illustrates how to accept or reject the changes made to the document.

C#

```
//Loads the template document
WordDocument document = new WordDocument("TrackChanges.docx",
FormatType.Docx);
//Accepts track changes of the document
if (document.HasChanges)
document.AcceptChanges();
//Saves and closes the document
document.Save("TrackChanges_Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As New WordDocument("TrackChanges.docx", FormatType.Docx)
'Accepts track changes of the document
If document.HasChanges Then
document.AcceptChanges()
End If
'Saves and closes the document
document.Save("TrackChanges_Sample.docx", FormatType.Docx)
document.Close()
```

UWP

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Loads the template document
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Assets.TrackChanges.
docx"), FormatType.Docx);
//Accepts track changes of the document
if (document.HasChanges)
document.AcceptChanges();
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream, FormatType.Docx);
//Saves the stream as Word file in local machine
Save(stream, "TrackChanges_Sample.docx");
document.Close();
//Please refer the below link to save Word document in UWP platform
//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
uwp#save-word-document-in-uwp
```

ASP.NET CORE

```
FileStream fileStreamPath = new FileStream(@"Data/TrackChanges.docx",
FileMode.Open, FileAccess.Read, FileShare.ReadWrite);
//Loads the template document
WordDocument document = new WordDocument(fileStreamPath, FormatType.Docx);
//Accepts track changes of the document
if (document.HasChanges)
```

```
document.AcceptChanges();
//Saves the Word file to MemoryStream
MemoryStream stream = new MemoryStream();
document.Save(stream, FormatType.Docx);
//Closes the document
document.Close();
stream.Position = 0;
//Download Word document in the browser
return File(stream, "application/msword", "TrackChanges_Sample.docx");
```

XAMARIN

```
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Loads the template document
WordDocument document = new
WordDocument(assembly.GetManifestResourceStream("Sample.Data.TrackChanges.do
cx"), FormatType.Docx);
//Accepts track changes of the document
if (document.HasChanges)
document.AcceptChanges();

//https://help.syncfusion.com/file-formats/docio/create-word-document-in-
xamarin#helper-files-for-xamarin
```

Conversion

Working with Document Conversions

The Essential DocIO converts documents from one format to another format. Each file format document can be categorized as flow layout document or fixed layout document.

Flow layout document

- A flow document is designed to "reflow content" depending on the application.
- Does not contain any information about the position of its content.
- Dynamically renders the content by application at run time.
- Example: DOC, DOCX, HTML, EPUB, RTF, and TEXT file formats.

Fixed layout document

- This format of fixed document is like "what you see is what you get".
- Maintains the fixed position for each content.
- Statically preserves the content in specified position.
- Example: Image and PDF.

Essential DocIO can convert various flow document as fixed document by using our layout engine. Following conversions are supported by Essential DocIO.

- Microsoft Word file format Conversions
- Word document to PDF
- Word document to Image
- RTF Conversions
- Text Conversions
- HTML Conversions
- Word document to ODT
- Word document to EPUB

Converting Word document to PDF

Essential DocIO allows you to convert a Word document into PDF with a few lines of code. For further information kindly refer [here](#).

Customizing the Word document to PDF conversion

Essential DocIO allows you to customize the Word to PDF conversion with the following options:

- Allows to embed the TrueType fonts used in the converted PDF
- Allows to determine the quality of the charts in the converted PDF
- Allows to determine the quality of the JPEG images in the converted PDF
- Allows to reduce the Main Memory usage in Word to PDF conversion by reusing the identical images.

For further information kindly refer [here](#).

Unsupported elements in Word to PDF conversion

Kindly refer the [here](#) for list of Unsupported elements in Word to PDF conversion

Rendering / Converting Word document to Image

Essential DocIO supports to convert the Word document to images using `RenderAsImages` method. For further information kindly refer [here](#).

RTF conversion

Essential DocIO supports to convert the RTF document into Word document and vice versa. For further information kindly refer [here](#).

HTML conversion

Essential DocIO supports converting the HTML file into Word document and vice versa. It supports only the HTML files that meet the validation either against XHTML 1.0 strict or XHTML 1.0 Transitional schema.

For further information kindly refer [here](#).

Customizing the HTML to Word conversion

You can customize the HTML to Word conversion with the following options:

- Validate the HTML string against XHTML 1.0 Strict and Transitional schema
- Insert the HTML string at the specified position of the document body contents
- Append HTML string to the specified paragraph

For further information kindly refer [here](#).

Customizing the Word to HTML conversion

You can customize the Word to HTML conversion with the following options:

- Extract the images used in the HTML document at the specified file directory
- Specify to export the header and footer of the Word document in the HTML
- Specify to consider Text Input field as a editable fields or text
- Specify the CSS style sheet type and its name

Note:

While exporting header and footer, DocIO exports the first section header content at the top of the HTML file and first section footer content at the end of the HTML file

For further information kindly refer [here](#).

Supported Document elements

Kindly refer the [here](#) for the document elements and attributes are supported by DocIO in Word to HTML and HTML to Word conversions.

Text file

Essential DocIO supports to convert the Word document into Text file and vice versa. For further information kindly refer [here](#).

Word to EPUB

Essential DocIO supports to convert the Word document into EPUB v2.0. It only supports in Windows Forms, UWP, WPF, ASP.NET Web and MVC platforms. For further information kindly refer [here](#).

Supported and Unsupported Features

This section describes the support and unsupported elements in the DocIO.

Word document features

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM, WordML		RTF	
	Read	Write	Read	Write	Read	Write
Built-in document properties	Yes	Yes	Yes	Yes	Yes	No
Custom document properties	Yes	Yes	Yes	Yes	No	No
Mail merge	Yes	Yes	Yes	Yes	Yes	Yes

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM, WordML		RTF	
Encryption and Decryption	Yes	Yes	Yesâ€™limited [except Word 2013]	Yesâ€™limited [except Word 2013]	N/A	N/A
View setup	Yes	Yes	Yes	Yes	Yes	No
Watermark	Yes	Yes	Yes	Yes	No	Yes
Font substitution table	Yes	Yes	Yes	Yes	Yes	No

Chart	No	No	Yes	Yes	No	No
Fields	Yes	Yes	Yes	Yes	Yes	Yes
Form Fields- TextInput, CheckBox & DropDown	Yes	Yes	Yes	Yes	Yes	Yes

Paragraph features

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM		RTF	
	Read	Write	Read	Write	Read	Write
Paragraph style	Yes	Yes	Yes	Yes	Yes	Yes
Alignment “ left, right, center and justify	Yes	Yes	Yes	Yes	Yes	Yes
Right to left paragraph	Yes	Yes	Yes	Yes	Yes	Yes

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM		RTF	
Lists - bullets and numbers	Yes	Yes	Yes	Yes	Yes	Yes
Run properties for the paragraph mark	Yes	Yes	Yes	Yes	Yes	Yes
Suppress hyphenation	No	No	No	No	No	No
Indents “ left, right, first line & hanging	Yes	Yes	Yes	Yes	Yes	Yes
Spacing “ before, after & auto	Yes	Yes	Yes	Yes	Yes	Yes
Keeps and breaks	Yes	Yes	Yes	Yes	Yes	Yes
Text frames	Yes	Yes	Yes	Yes	Yes	Yes
Tabs	Yes	Yes	Yes	Yes	Yes	Yes
Borders	Yes	Yes	Yes	Yes	Yes	Yes
Shading	Yes	Yes	Yes	Yes	Yes	Yes

Style features

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM, WordML		RTF	
	Read	Write	Read	Write	Read	Write
Built-in paragraph style	Yes	Yes	Yes	Yes	Yes	Yes
Custom paragraph style	Yes	Yes	Yes	Yes	Yes	Yes

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM, WordML		RTF	
Built-in character style	Yes	Yes	Yes	Yes	Yes	Yes
Custom character style	Yes	Yes	Yes	Yes	Yes	Yes
Built-in list style	Yes	Yes	Yes	Yes	Yes	Yes
Custom list style	Yes	Yes	Yes	Yes	Yes	Yes
Built-in table style	No	No	Yes	Yes	No	No
Custom table style	No	No	Yes	Yes	No	No

Table features

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM, WordML		RTF	
	Read	Write	Read	Write	Read	Write
Nested tables	Yes	Yes	Yes	Yes	Yes	Yes
Right to left tables	Yes	Yes	Yes	Yes	Yes	Yes
Table style	No	No	Yes	Yes	No	No
Conditional formatting style	No	No	Yes	Yes	No	No
Table alignment	Yes	Yes	Yes	Yes	Yes	Yes
Table indent	Yes	Yes	Yes	Yes	Yes	Yes
Allow AutoFit	Yes	Yes	Yes	Yes	Yes	Yes
Cell margins	Yes	Yes	Yes	Yes	Yes	Yes
Cell spacing	Yes	Yes	Yes	Yes	Yes	Yes

Element	DOC, DOT		DOCX, DOTX, DOTM, DOCM, WordML		RTF	
Preferred table width	Yes	Yes	Yes	Yes	Yes	Yes
Table shading	Yes	Yes	Yes	Yes	Yes	Yes
Table borders	Yes	Yes	Yes	Yes	Yes	Yes
Floating tables	Yes	Yes	Yes	Yes	Yes	Yes
Allow row to break across pages	Yes	Yes	Yes	Yes	Yes	Yes
Repeat as header row	Yes	Yes	Yes	Yes	Yes	Yes
Height	Yes	Yes	Yes	Yes	Yes	Yes
Height type	Yes	Yes	Yes	Yes	Yes	Yes
Cell borders	Yes	Yes	Yes	Yes	Yes	Yes
Cell shading	Yes	Yes	Yes	Yes	Yes	Yes
Wrap text	Yes	Yes	Yes	Yes	Yes	Yes

FAQ/How to

How to modify an existing style?

The following code illustrates how to modify the built-in style while creating new Word document.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Creates built-in style and modifies its properties
Style style = Style.CreateBuiltinStyle(BuiltinStyle.Heading1, document) as
Style;
style.CharacterFormat.Italic = true;
style.CharacterFormat.TextColor = Color.DarkGreen;
//Adds it to the styles collection
document.Styles.Add(style);
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
IWTextRange text = paragraph.AppendText("A built-in style is modified and is
applied to this paragraph.");
//Applies the new style to paragraph
paragraph.ApplyStyle(style.Name);
//Saves the Word document
document.Save("Sample.docx", FormatType.Docx);
//Closes the document
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Creates built-in style and modifies its properties
Dim style__1 As Style =
TryCast(Style.CreateBuiltinStyle(BuiltinStyle.Heading1, document), Style)
style__1.CharacterFormat.Italic = True
style__1.CharacterFormat.TextColor = Color.DarkGreen
'Adds it to the styles collection
document.Styles.Add(style__1)
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
```

```

Dim text As ITextRange = paragraph.AppendText("A built-in style is modified
and is applied to this paragraph.")
'Applies the new style to paragraph
paragraph.ApplyStyle(style__1.Name)
'Saves the Word document
document.Save("Sample.docx", FormatType.Docx)
'Closes the document
document.Close()

```

How to open a document from stream using DocIO?

A document can be opened as stream by using `HttpWebResponse`. This stream does not support seek operation and so the contents should be read manually to get the position and length of the stream. The following code illustrates how to load the document from stream.

C#

```

//Gets the document as stream
HttpRequest request =
(HttpRequest)WebRequest.Create("https://www.swiftview.com/tech/letterlega
15.doc");
HttpWebResponse response = (HttpWebResponse)request.GetResponse();
Stream stream = response.GetResponseStream();
//Converts it to byte array
byte[] buffer = ReadFully(stream, 32768);
//Stores bytes into the memory stream.
MemoryStream ms = new MemoryStream();
ms.Write(buffer, 0, buffer.Length);
ms.Seek(0, SeekOrigin.Begin);
stream.Close();
//Creates a new document.
WordDocument document = new WordDocument();
//Opens the template document from the MemoryStream.
document.Open(ms, FormatType.Doc);
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Gets the document as stream
Dim request As HttpRequest =
DirectCast(WebRequest.Create("https://www.swiftview.com/tech/letterlegal5.do
c"), HttpRequest)
Dim response As HttpWebResponse = DirectCast(request.GetResponse(),
HttpWebResponse)
Dim stream As Stream = response.GetResponseStream()
'Converts it to byte array
Dim buffer As Byte() = ReadFully(stream, 32768)
'Stores bytes into the memory stream.
Dim ms As New MemoryStream()
ms.Write(buffer, 0, buffer.Length)
ms.Seek(0, SeekOrigin.Begin)
stream.Close()
'Creates a new document.
Dim document As New WordDocument ()

```

```
'Opens the template document from the MemoryStream.
document.Open(ms, FormatType.Doc)
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

The following code illustrates the method used to read the stream and convert the stream to bytes.

C#

```
public static byte[] ReadFully(Stream stream, int initialLength)
{
    //When an unhelpful initial length has been passed, just use 32K.
    if (initialLength < 1)
    {
        initialLength = 32768;
    }
    byte[] buffer = new byte[initialLength];
    int read = 0;
    int chunk;
    while ((chunk = stream.Read(buffer, read, buffer.Length - read)) > 0)
    {
        read += chunk;
        //After reaching the end of the buffer, check and see whether you can find
        //any information.
        if (read == buffer.Length)
        {
            int nextByte = stream.ReadByte();
            //End of stream? Then, you are done.
            if (nextByte == -1)
            {
                return buffer;
            }
            //Resize the buffer, put in the byte you have just read, and continue.
            byte[] newBuffer = new byte[buffer.Length * 2];
            Array.Copy(buffer, newBuffer, buffer.Length);
            newBuffer[read] = (byte)nextByte;
            buffer = newBuffer;
            read++;
        }
    }
    //Buffer is now too big. Shrink it.
    byte[] ret = new byte[read];
    Array.Copy(buffer, ret, read);
    return ret;
}
```

VB.NET

```
Public Shared Function ReadFully(stream As Stream, initialLength As Integer)
    As Byte()
    'When an unhelpful initial length has been passed, just use 32K.
    If initialLength < 1 Then
        initialLength = 32768
    End If
    Dim buffer As Byte() = New Byte(initialLength - 1) {}
```

```

Dim read As Integer = 0
Dim chunk As Integer
chunk = stream.Read(buffer, read, buffer.Length - read)
While (chunk > 0)
    read += chunk
    'After reaching the end of the buffer, check and see whether you can find
    any information.
    If read = buffer.Length Then
        Dim nextByte As Integer = stream.ReadByte()
        'End of stream? Then, you are done.
        If nextByte = -1 Then
            Return buffer
        End If
        'Resize the buffer, put in the byte you have just read, and continue.
        Dim newBuffer As Byte() = New Byte(buffer.Length * 2 - 1) {}
        Array.Copy(buffer, newBuffer, buffer.Length)
        newBuffer(read) = CByte(nextByte)
        buffer = newBuffer
        read += 1
    End If
End While
'Buffer is now too big. Shrink it.
Dim ret As Byte() = New Byte(read - 1) {}
Array.Copy(buffer, ret, read)
Return ret
End Function

```

How to set OpenType Font Features?

The Open type features provide special effects for the text. This feature is specific to Word 2010 and later version documents. The OpenType features includes the following:

- Ligatures – combination of characters, written as glyph
- Use Contextual Alternates – combination of letters based on surrounding characters
- Number spacing – specifies number width
- Number forms – specifies number height
- Stylistic sets – specifies the look of the text, based on the font used

The following code illustrates how to set ligature types for text.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text
IWTextRange text = paragraph.AppendText("Text to describe discretionary
ligatures");
//Sets ligature type
text.CharacterFormat.Ligatures = LigatureType.Discretionary;
text.CharacterFormat.FontName = "Arial";
paragraph = section.AddParagraph();

```

```

text = paragraph.AppendText("Text to describe contextual ligatures");
text.CharacterFormat.Ligatures = LigatureType.Contextual;
text.CharacterFormat.FontName = "Arial";
paragraph = section.AddParagraph();
text = paragraph.AppendText("Text to describe historical ligatures");
text.CharacterFormat.Ligatures = LigatureType.Historical;
text.CharacterFormat.FontName = "Arial";
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds new text
Dim text As IWTextRange = paragraph.AppendText("Text to describe
discretional ligatures")
'Sets ligature type as Discretional
text.CharacterFormat.Ligatures = LigatureType.Discretional
text.CharacterFormat.FontName = "Arial"
paragraph = section.AddParagraph()
text = paragraph.AppendText("Text to describe contextual ligatures")
'Sets ligature type as Contextual
text.CharacterFormat.Ligatures = LigatureType.Contextual
text.CharacterFormat.FontName = "Arial"
paragraph = section.AddParagraph()
text = paragraph.AppendText("Text to describe historical ligatures")
'Sets ligature type as Historical
text.CharacterFormat.Ligatures = LigatureType.Historical
text.CharacterFormat.FontName = "Arial"
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

The following code example illustrates how to set contextual alternates.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text
IWTextRange text = paragraph.AppendText("Text to describe contextual
alternates");
text.CharacterFormat.FontName = "Segoe Script";
//Sets contextual alternates
text.CharacterFormat.UseContextualAlternates = true;
paragraph = section.AddParagraph();

```

```
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds new text
Dim text As IWTextRange = paragraph.AppendText("Text to describe contextual
alternates")
text.CharacterFormat.FontName = "Segoe Script"
'Sets contextual alternates
text.CharacterFormat.UseContextualAlternates = True
paragraph = section.AddParagraph()
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

The following code example illustrates how to set number spacing.

C#

```
//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text
IWTextRange text = paragraph.AppendText("Numbers to describe tabular number
spacing 0123456789");
text.CharacterFormat.FontName = "Calibri";
//Sets number spacing
text.CharacterFormat.NumberSpacing = NumberSpacingType.Tabular;
paragraph = section.AddParagraph();
text = paragraph.AppendText("Numbers to describe proportional number spacing
0123456789");
text.CharacterFormat.FontName = "Calibri";
//Sets number spacing
text.CharacterFormat.NumberSpacing = NumberSpacingType.Proportional;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
```

```

'Adds new paragraph to the section
Dim paragraph As IParagraph = section.AddParagraph()
'Adds new text
Dim text As ITextRange = paragraph.AppendText("Numbers to describe tabular
number spacing 0123456789")
text.CharacterFormat.FontName = "Calibri"
'Sets number spacing
text.CharacterFormat.NumberSpacing = NumberSpacingType.Tabular
paragraph = section.AddParagraph()
text = paragraph.AppendText("Numbers to describe proportional number spacing
0123456789")
text.CharacterFormat.FontName = "Calibri"
'Sets number spacing
text.CharacterFormat.NumberSpacing = NumberSpacingType.Proportional
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

The following code example illustrates how to set number style.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IParagraph paragraph = section.AddParagraph();
//Adds new text
ITextRange text = paragraph.AppendText("Numbers to describe oldstyle number
form 0123456789");
text.CharacterFormat.FontName = "Calibri";
//Sets number style
text.CharacterFormat.NumberForm = NumberFormType.OldStyle;
paragraph = section.AddParagraph();
text = paragraph.AppendText("Numbers to describe lining number form
0123456789");
text.CharacterFormat.FontName = "Calibri";
//Sets number style
text.CharacterFormat.NumberForm = NumberFormType.Lining;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IParagraph = section.AddParagraph()
'Adds new text
Dim text As ITextRange = paragraph.AppendText("Numbers to describe oldstyle
number form 0123456789")
text.CharacterFormat.FontName = "Calibri"

```

```

'Sets number style
text.CharacterFormat.NumberForm = NumberFormType.OldStyle
paragraph = section.AddParagraph()
text = paragraph.AppendText("Numbers to describe lining number form
0123456789")
text.CharacterFormat.FontName = "Calibri"
'Sets number style
text.CharacterFormat.NumberForm = NumberFormType.Lining
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

The following code example illustrates how to set different styles for the text.

C#

```

//Creates a new Word document
WordDocument document = new WordDocument();
//Adds new section to the document
IWSection section = document.AddSection();
//Adds new paragraph to the section
IWParagraph paragraph = section.AddParagraph();
//Adds new text
IWTextRange text = paragraph.AppendText("Text to describe stylistic sets");
text.CharacterFormat.FontName = "Gabriola";
//Sets stylistic set
text.CharacterFormat.StylisticSet = StylisticSetType.StylisticSet06;
paragraph = section.AddParagraph();
//Adds new text
text = paragraph.AppendText("Text to describe stylistic sets");
text.CharacterFormat.FontName = "Gabriola";
//Sets stylistic set
text.CharacterFormat.StylisticSet = StylisticSetType.StylisticSet15;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates a new Word document
Dim document As New WordDocument()
'Adds new section to the document
Dim section As IWSection = document.AddSection()
'Adds new paragraph to the section
Dim paragraph As IWParagraph = section.AddParagraph()
'Adds new text
Dim text As IWTextRange = paragraph.AppendText("Text to describe stylistic
sets")
text.CharacterFormat.FontName = "Gabriola"
'Sets stylistic set
text.CharacterFormat.StylisticSet = StylisticSetType.StylisticSet06
paragraph = section.AddParagraph()
'Adds new text
text = paragraph.AppendText("Text to describe stylistic sets")
text.CharacterFormat.FontName = "Gabriola"
'Sets stylistic set

```

```
text.CharacterFormat.StylisticSet = StylisticSetType.StylisticSet15
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

How to attach a Template to a Word document?

The following code illustrates how to set the template for the document.

C#

```
//Loads a source document
WordDocument document = new WordDocument("Template.docx");
//Attaches the template document to the source document
document.AttachedTemplate.Path = @"D:\Data\Template.docx";
//Updates the styles of the document from the attached template each time
the document is opened
document.UpdateStylesOnOpen = true;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads a source document
Dim document As New WordDocument("Template.docx")
'Attaches the template document to the source document
document.AttachedTemplate.Path = "D:\Data\Template.docx"
'Updates the styles of the document from the attached template each time the
document is opened
document.UpdateStylesOnOpen = True
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

How to insert a DataTable in a Word document?

You can create new table in a Word document and copy the contents from data table. The following code illustrates how to insert a data table as table in a Word document.

C#

```
//Creates new Word document
WordDocument document = new WordDocument();
//Creates new data set and data table
DataSet dataset = new DataSet();
GetDataTable(dataset);
DataTable datatable = new DataTable();
datatable = dataset.Tables[0];
//Adds new section
IWSection section = document.AddSection();
//Adds new table
IWTable table = section.AddTable();
//Adds new row to the table
WTableRow row = table.AddRow();
foreach (DataColumn datacolumn in datatable.Columns)
{
```

```

//Sets the column names for the table from the data table column names and cell width
WTableCell cell = row.AddCell();
cell.AddParagraph().AppendText(datacolumn.ColumnName);
cell.Width = 150;
}
//Iterates through data table rows
foreach (DataRow datarow in datatable.Rows)
{
    //Adds new row to the table
    row = table.AddRow(true, false);
    foreach (object datacolumn in datarow.ItemArray)
    {
        //Adds new cell
        WTableCell cell = row.AddCell();
        //Adds contents from the data table to the table cell
        cell.AddParagraph().AppendText(datacolumn.ToString());
    }
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates new Word document
Dim document As New WordDocument()
'Creates new data set and data table
Dim dataset As New DataSet()
GetDataTable(dataset)
Dim datatable As New DataTable()
datatable = dataset.Tables(0)
'Adds new section
Dim section As IWSection = document.AddSection()
'Adds new table
Dim table As IWTable = section.AddTable()
'Adds new row to the table
Dim row As WTableRow = table.AddRow()
For Each datacolumn As DataColumn In datatable.Columns
    'Sets the column names for the table from the data table column names and cell width
    Dim cell As WTableCell = row.AddCell()
    cell.AddParagraph().AppendText(datacolumn.ColumnName)
    cell.Width = 150
Next
'Iterates through data table rows
For Each datarow As DataRow In datatable.Rows
    'Adds new row to the table
    row = table.AddRow(True, False)
    For Each datacolumn As Object In datarow.ItemArray
        'Adds new cell
        Dim cell As WTableCell = row.AddCell()
        'Adds contents from the data table to the table cell
        cell.AddParagraph().AppendText(datacolumn.ToString())
    Next
Next

```

```
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

The following code illustrates the method to get data table.

C#

```
private void GetDataTable(DataSet dataset)
{
    // List of syncfusion products.
    string[] products = { "DocIO", "PDF", "XlsIO" };
    // Adds new Tables to the data set.
    DataRow row;
    dataset.Tables.Add();
    // Adds fields to the Products table.
    dataset.Tables[0].TableName = "Products";
    dataset.Tables[0].Columns.Add("ProductName");
    dataset.Tables[0].Columns.Add("Binary");
    dataset.Tables[0].Columns.Add("Source");
    // Inserts values to the tables.
    foreach (string product in products)
    {
        row = dataset.Tables["Products"].NewRow();
        row["ProductName"] = string.Concat("Essential ", product);
        row["Binary"] = "$895.00";
        row["Source"] = "$1,295.00";
        dataset.Tables["Products"].Rows.Add(row);
    }
}
```

VB.NET

```
Private Sub GetDataTable(dataset As DataSet)
    'List of syncfusion products.
    Dim products As String() = {"DocIO", "PDF", "XlsIO"}
    'Adds new Tables to the data set.
    Dim row As DataRow
    dataset.Tables.Add()
    'Adds fields to the Products table.
    dataset.Tables(0).TableName = "Products"
    dataset.Tables(0).Columns.Add("ProductName")
    dataset.Tables(0).Columns.Add("Binary")
    dataset.Tables(0).Columns.Add("Source")
    'Inserts values to the tables.
    For Each product As String In products
        row = dataset.Tables("Products").NewRow()
        row("ProductName") = String.Concat("Essential ", product)
        row("Binary") = "$895.00"
        row("Source") = "$1,295.00"
        dataset.Tables("Products").Rows.Add(row)
    Next
End Sub
```

How to insert a table from HTML string in Word document?

An HTML string can be inserted to the Word document at text body or paragraph. The following code illustrates how to insert a table to the document from the HTML string.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the text body
WTextBody textbody = document.Sections[0].Body;
//Html string that represents table with two rows and two columns
string htmlString = " <table border='1'><tr><td><p>First Row First Cell</p></td><td><p>First Row Second Cell</p></td></tr><tr><td><p>Second Row First Cell</p></td><td><p>Second Row Second Cell</p></td></tr></table> ";
//Inserts the string to the text body
textbody.InsertXHTML(htmlString);
//Saves and closes the document
document.Save("Sample.docx");
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As New WordDocument("Template.docx")
'Gets the text body
Dim textbody As WTextBody = document.Sections(0).Body
'Html string that represents table with two rows and two columns
Dim htmlString As String = " <table border='1'><tr><td><p>First Row First Cell</p></td><td><p>First Row Second Cell</p></td></tr><tr><td><p>Second Row First Cell</p></td><td><p>Second Row Second Cell</p></td></tr></table> "
'Inserts the string to the text body
textbody.InsertXHTML(htmlString)
'Saves and closes the document
document.Save("Sample.docx")
document.Close()
```

How to set table cell width?

Each cell in the table can have its own width. The following code illustrates how to set the width of the cell.

C#

```
//Creates new word document
WordDocument document = new WordDocument("Template.docx");
//Gets the text body of first section
WTextBody textbody = document.Sections[0].Body;
//Gets the table
IWTable table = textbody.Tables[0];
//Iterates through table rows
foreach (WTableRow row in table.Rows)
{
    //Sets width for cells
    for (int i = 0; i < row.Cells.Count; i++)
    {
        WTableCell cell = row.Cells[i];
```

```

if (i % 2 == 0)
    //Sets width as 100 for cells in even column
    cell.Width = 100;
else
    //Sets width as 150 for cell in odd column
    cell.Width = 150;
}
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Creates new word document
Dim document As New WordDocument("Template.docx")
'Gets the text body of first section
Dim textbody As WTextBody = document.Sections(0).Body
'Gets the table
Dim table As ITable = textbody.Tables(0)
'Iterates through table rows
For Each row As WTableRow In table.Rows
    'Sets width for cells
    For i As Integer = 0 To row.Cells.Count - 1
        Dim cell As WTableCell = row.Cells(i)
        If i Mod 2 = 0 Then
            'Sets width as 100 for cells in even column
            cell.Width = 100
        Else
            'Sets width as 150 for cell in odd column
            cell.Width = 150
        End If
    Next
Next
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

How to position a table in a Word document?

You can position a table in a Word document by setting position properties. The following code illustrates how to set position properties for a table.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the text body of first section
WTextBody textbody = document.Sections[0].Body;
//Gets the table
ITable table = textbody.Tables[0];
//Sets the horizontal and vertical position for table
table.TableFormat.Positioning.HorizPosition = 40;
table.TableFormat.Positioning.VertPosition = 100;
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);

```

```
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As New WordDocument("Template.docx")
'Gets the text body of first section
Dim textbody As WTextBody = document.Sections(0).Body
'Gets the table
Dim table As ITable = textbody.Tables(0)
'Sets the horizontal and vertical position for table
table.TableFormat.Positioning.HorizPosition = 40
table.TableFormat.Positioning.VertPosition = 100
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

How to set the text direction to a table in Word document?

The contents of the table cell can be in vertical or horizontal direction. Each cell content can have different text direction. The following code illustrates how to set the text direction for the text in the table.

C#

```
//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Gets the text body of first section
WTextBody textbody = document.Sections[0].Body;
//Gets the table
ITable table = textbody.Tables[0];
//Iterates through table rows
foreach (WTableRow row in table.Rows)
{
    foreach (WTableCell cell in row.Cells)
    {
        //Sets the text direction for the contents
        cell.CellFormat.TextDirection = Syncfusion.DocIO.DLS.TextDirection.Vertical;
    }
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads the template document
Dim document As New WordDocument("Template.docx")
'Gets the text body of first section
Dim textbody As WTextBody = document.Sections(0).Body
'Gets the table
Dim table As ITable = textbody.Tables(0)
'Iterates through table rows
For Each row As WTableRow In table.Rows
    For Each cell As WTableCell In row.Cells
        'Sets the text direction for the contents
```

```

cell.CellFormat.TextDirection = Syncfusion.DocIO.DLS.TextDirection.Vertical
Next
Next
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

How to extract the images in the document?

The following code illustrates how to extract the images in the document.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
WTextBody textbody = document.Sections[0].Body;
Image image;
int i = 1;
//Iterates through the paragraphs
foreach (WParagraph paragraph in textbody.Paragraphs)
{
    //Iterates through the paragraph items
    foreach (ParagraphItem item in paragraph.ChildEntities)
    {
        //Gets the picture and saves it into specified location
        switch (item.EntityType)
        {
            case EntityType.Picture:
                WPicture picture = item as WPicture;
                image = picture.Image;
                image.Save(@"D:\Data\Image" + i + ".jpeg", ImageFormat.Jpeg);
                i++;
                break;
            default:
                break;
        }
    }
}
//Closes the document
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx")
Dim textbody As WTextBody = document.Sections(0).Body
Dim image As Image
Dim i As Integer = 1
'Iterates through the paragraphs
For Each paragraph As WParagraph In textbody.Paragraphs
    'Iterates through the paragraph items
    For Each item As ParagraphItem In paragraph.ChildEntities
        'Gets the picture and saves it into specified location
        Select Case item.EntityType
            Case EntityType.Picture
                Dim picture As WPicture = TryCast(item, WPicture)
                image = picture.Image

```

```

image.Save("D:\Data\Image" & i & ".jpeg", ImageFormat.Jpeg)
i += 1
Exit Select
Case Else
Exit Select
End Select
Next
Next
'Close the document
document.Close()

```

The images in the document can be extracted into a specific location when exporting it to HTML file. The following code illustrates how to extract images.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Sets the location to extract images
document.SaveOptions.HtmlExportImagesFolder = @"D:\Data\";
//Saves the document as html file
HTMLExport export = new HTMLExport();
export.SaveAsXhtml(document, "Template.html");
//Closes the document
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx")
'Sets the location to extract images
document.SaveOptions.HtmlExportImagesFolder = "D:\Data\"
'Saves the document as html file
Dim export As New HTMLExport()
export.SaveAsXhtml(document, "Template.html")
'Closes the document
document.Close()

```

How to remove headers and footers from the document?

The following code illustrates how to remove the header contents from the document.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Iterates through the sections
foreach (WSection section in document.Sections)
{
HeaderFooter header;
//Gets even footer of current section
header = section.HeadersFooters[HeaderFooterType.EvenHeader];
//Removes even footer
header.ChildEntities.Clear();
//Gets odd footer of current section
header = section.HeadersFooters[HeaderFooterType.OddHeader];

```

```

//Removes odd footer
header.ChildEntities.Clear();
//Gets first page footer
header = section.HeadersFooters[HeaderFooterType.FirstPageHeader];
//Removes first page footer
header.ChildEntities.Clear();
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Iterates through the sections
For Each section As WSection In document.Sections
Dim header As HeaderFooter
'Gets even footer of current section
header = section.HeadersFooters(HeaderFooterType.EvenHeader)
'Removes even footer
header.ChildEntities.Clear()
'Gets odd footer of current section
header = section.HeadersFooters(HeaderFooterType.OddHeader)
'Removes odd footer
header.ChildEntities.Clear()
'Gets first page footer
header = section.HeadersFooters(HeaderFooterType.FirstPageHeader)
'Removes first page footer
header.ChildEntities.Clear()
Next
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

The following code illustrates how to remove the footer contents from the document.

C#

```

//Loads the template document
WordDocument document = new WordDocument("Template.docx");
//Iterates through the sections
foreach (WSection section in document.Sections)
{
HeaderFooter footer;
//Gets even footer of current section
footer = section.HeadersFooters[HeaderFooterType.EvenFooter];
//Removes even footer
footer.ChildEntities.Clear();
//Gets odd footer of current section
footer = section.HeadersFooters[HeaderFooterType.OddFooter];
//Removes odd footer
footer.ChildEntities.Clear();
//Gets first page footer
footer = section.HeadersFooters[HeaderFooterType.FirstPageFooter];
//Removes first page footer
}

```

```

footer.ChildEntities.Clear();
}
//Saves and closes the document
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```

'Loads the template document
Dim document As New WordDocument("Template.docx")
'Iterates through the sections
For Each section As WSection In document.Sections
Dim footer As HeaderFooter
'Gets even footer of current section
footer = section.HeadersFooters(HeaderFooterType.EvenFooter)
'Removes even footer
footer.ChildEntities.Clear()
'Gets odd footer of current section
footer = section.HeadersFooters(HeaderFooterType.OddFooter)
'Removes odd footer
footer.ChildEntities.Clear()
'Gets first page footer
footer = section.HeadersFooters(HeaderFooterType.FirstPageFooter)
'Removes first page footer
footer.ChildEntities.Clear()
Next
'Saves and closes the document
document.Save("Sample.docx", FormatType.Docx)
document.Close()

```

Which units does Essential DocIO uses for measurement properties such as size, margins, etc, in a Word document?

Essential DocIO library uses Points for measurement properties in a Word document.

Could not find Syncfusion.OfficeChartToImageConverter assembly in .NET 3.5 Framework, does it mean there is no support for chart conversion in this Framework?

Yes, OfficeChartToImageConverter assembly is not supported in .NET 3.5 Framework and it is available in .NET 4.0 Framework.

Can the chart data be refreshed?

Yes, Essential DocIO supports refreshing the chart data. For more details, refer [Working with charts](#)

Is it possible to convert 3D charts to PDF or image?

Current version of the DocIO library does not provide support for converting 3D charts to PDF or image format.

Is it possible to specify PDF conformance level in Word to PDF conversion?

Yes, you can specify the PDF conformance level in Word to PDF conversion. For more details, refer [PDF Conformance](#)

Migration from Microsoft Office Automation to Essential DocIO

Mail merge

The Mail merge feature can be used to generate reports and letters in Microsoft Word. The following code examples show how to generate an employee report from an MDB data source by using Office Automation and DocIO.

Using Microsoft Office Automation

Office Automation performs the Mail merge by executing a SQL query on the Word document. The output of the Mail merge can be sent to a new Word document. Alternatively, it can be sent to a printer, a fax machine, or forwarded to an e-mail address.

C#

```
using word = Microsoft.Office.Interop.Word;
-----
//Initializes objects.
object nullobject = Missing.Value;
object filepath = "Sample.docx";
object sqlStmt = "SELECT * FROM [Employees]";
string sDBPath = "Northwind.mdb";
//Starts the Word application.
word.Application wordApp = new word.Application();
//Opens the Word document.
word.Document document = wordApp.Documents.Open(ref filepath, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject);
wordApp.Visible = false;
//Performs Mail Merge.
document.MailMerge.OpenDataSource(sDBPath, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref sqlStmt, ref nullobject,
ref nullobject, ref nullobject);
document.MailMerge.Execute(ref nullobject);
//Sends output of Mail Merge to a new document.
document.MailMerge.Destination =
word.WdMailMergeDestination.wdSendToNewDocument;
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);
```

VB.NET

```
Imports word = Microsoft.Office.Interop.Word
-----
'Initializes objects.
Dim nullobject As Object = Missing.Value
Dim filepath As Object = "Sample.docx"
Dim sqlStmt As Object = "SELECT * FROM [Employees]"
Dim sDBPath As String = "Northwind.mdb"
'Starts the Word application.
Dim wordApp As New word.Application()
```

```

'Opens the Word document.
Dim document As Word.Document = wordApp.Documents.Open(filepath, nullobject,
nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject)
wordApp.Visible = False
'Performs Mail Merge.
document.MailMerge.OpenDataSource(sDBPath, nullobject, nullobject,
nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject, _
sqlStmt, nullobject, nullobject, nullobject)
document.MailMerge.Execute(nullobject)
'Sends output of Mail Merge to a new document.
document.MailMerge.Destination =
word.WdMailMergeDestination.wdSendToNewDocument
'Closes the document.
document.Close(nullobject, nullobject, nullobject)
'Quits the application.
wordApp.Quit(nullobject, nullobject, nullobject)

```

Using DocIO

DocIO performs Mail merge by using the following methods:

- Execute
- ExecuteGroup
- ExecuteNestedGroup

The following code example performs Mail merge by using the **Execute** method.

C#

```

string dataBase = "Northwind.mdb";
//Opens existing template.
WordDocument doc = new WordDocument("Template.docx", FormatType.Docx);
//Gets Data from the Database.
OleDbConnection conn = new
OleDbConnection("Provider=Microsoft.Jet.OLEDB.4.0;Data Source=" + dataBase);
conn.Open();
//Populates the data table.
DataTable table = new DataTable();
OleDbDataAdapter adapter = new OleDbDataAdapter("select * from employees",
conn);
adapter.Fill(table);
adapter.Dispose();
//Performs Mail Merge.
doc.MailMerge.Execute(table);
//Saves the document.
doc.Save("Sample.docx", FormatType.Docx);
//Closes the document.
doc.Close();

```

VB.NET

```

Dim dataBase As String = "Northwind.mdb"

```

```

'Opens the Word document.
Dim doc As WordDocument = New WordDocument("Template.docx")
'Creates database connection.
Dim conn As OleDbConnection = New
OleDbConnection("Provider=Microsoft.Jet.OLEDB.4.0;Data Source=" + dataBase)
conn.Open()
'Populates data table.
Dim table As DataTable = New DataTable()
Dim adapter As OleDbDataAdapter = New OleDbDataAdapter("select * from
employees", conn)
adapter.Fill(table)
adapter.Dispose()
'Performs Mail Merge.
doc.MailMerge.Execute(table)
'Saves the document.
doc.Save("Sample.docx", FormatType.Docx)
'Closes the document.
doc.Close()

```

Note:

For more information on Mail merge using DocIO, you can refer to online documentation link:

[MailMerge](#)

Find and Replace

This section illustrates how to perform a simple find and replace operation in a Word document by using Microsoft Office Automation and DocIO.

Using Microsoft Office Automation

The following code example illustrates how to search for a word in a Word document, replace it with another word and save the document under a new name.

C#

```

using word = Microsoft.Office.Interop.Word;
-----
//Initializes objects.
object nullobject = Missing.Value;
object filepath = "Template.docx";
object newFilePath = "Sample.docx";
object item = word.WdGoToItem.wdGoToPage;
object whichItem = word.WdGoToDirection.wdGoToFirst;
object replaceAll = word.WdReplace.wdReplaceAll;
object forward = true;
object matchAllWord = true;
object matchCase = false;
object originalText = "Hello";
object replaceText = "World";
object save = true;
//Starts the Word application.
word.Application wordApp = new word.Application();
//Opens the Word document.
word.Document document = wordApp.Documents.Open(ref filepath, ref
nullobject, ref nullobject,

```

```

ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject,
ref nullobject);
wordApp.Visible = false;
//Searches and replaces text.
document.GoTo(ref item, ref whichItem, ref nullobject, ref nullobject);
foreach (word.Range rng in document.StoryRanges)
{
    rng.Find.Execute(ref originalText, ref matchCase, ref matchAllWord, ref
    nullobject, ref nullobject,
    ref nullobject, ref forward, ref nullobject, ref nullobject, ref replaceText,
    ref replaceAll,
    ref nullobject, ref nullobject, ref nullobject, ref nullobject);
}
//Saves the document.
document.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref
nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject);
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);

```

VB.NET

```

Imports word = Microsoft.Office.Interop.Word
-----
'Initializes objects.
Dim nullobject As Object = Missing.Value
Dim filePath As Object = "Template.docx"
Dim newFilePath As Object = "Sample.docx"
Dim item As Object = word.WdGoToItem.wdGoToPage
Dim whichItem As Object = word.WdGoToDirection.wdGoToFirst
Dim replaceAll As Object = word.WdReplace.wdReplaceAll
Dim forward As Object = True
Dim matchAllWord As Object = True
Dim matchCase As Object = False
Dim originalText As Object = "Hello"
Dim replaceText As Object = "World"
Dim save As Object = True
Dim falseObj As Object = False
'Starts the Word application.
Dim wordApp As word.Application = New word.Application()
'Opens the Word document.
Dim doc As word.Document = wordApp.Documents.Open(filePath, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, falseObj, nullobject, nullobject,
nullobject, nullobject)
wordApp.Visible = False
'Searches and replaces text.
doc.GoTo(item, whichItem, nullobject, nullobject)

```

```

For Each rng As word.Range In doc.StoryRanges
rng.Find.Execute(originalText, matchCase, matchAllWord, nullobject,
nullobject, nullobject, forward, nullobject, nullobject, replaceText,
replaceAll, nullobject, nullobject, nullobject, nullobject)
Next
`Saves the document.
doc.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject)
`Closes the document.
doc.Close(nullobject, nullobject, nullobject)
`Quits the application.
wordApp.Quit(nullobject, nullobject, nullobject)

```

Using DocIO

The following code example illustrates how to perform a simple find and replace operation by using DocIO.

C#

```

//Opens the Word document.
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Defines replacement text.
string replaceText = "World";
//Performs replace.
document.Replace(new Regex("Hello"), replaceText);
//Saves the document.
document.Save("Sample.docx", FormatType.Docx);
//Closes the document.
document.Close();

```

VB.NET

```

`Opens the Word document.
Dim document As WordDocument = New WordDocument("Template.docx")
`Defines text to be replaced.
Dim replaceText As String = "World"
`Performs replace.
document.Replace(New Regex("Hello"), replaceText)
`Saves the document.
document.Save("Sample.docx", FormatType.Docx)
`Closes the document.
document.Close()

```

Note: For more information on performing the find and replace operation using DocIO, you can refer to online documentation link:

[Find and Replace](#)

Bookmarks

Bookmarks identify the location of text in a Word document that you can name and identify for future reference.

Using Microsoft Office Automation

The following code example illustrates how to insert a bookmark for a range of text by using Office Automation.

C#

```
using word = Microsoft.Office.Interop.Word;
-----
//Initializes objects.
object nullobject = Missing.Value;
object newFilePath = "Sample.docx";
//Starts a Word application.
Microsoft.Office.Interop.Word.Application wordApp = new
Microsoft.Office.Interop.Word.Application();
//Creates a new Word document.
wordApp.Documents.Add(ref nullobject, ref nullobject, ref nullobject, ref
nullobject);
Microsoft.Office.Interop.Word.Document document = wordApp.ActiveDocument;
//Adds a paragraph to the document.
Microsoft.Office.Interop.Word.Paragraph oPara1;
oPara1 = document.Content.Paragraphs.Add(ref nullobject);
oPara1.Range.Text = "Bookmark with one word selected";
//Defines start and end positions of bookmark range.
object start = oPara1.Range.Text.IndexOf("word");
object end = oPara1.Range.Text.LastIndexOf(" ");
object rng = document.Range(ref start, ref end);
//Adds bookmark.
document.Bookmarks.Add("one_word", ref rng);
//Saves document and quits application.
document.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject);
//Closes document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);
```

VB.NET

```
Imports word = Microsoft.Office.Interop.Word
-----
'Initializes objects.
Dim nullobject As Object = Missing.Value
Dim newFilePath As Object = "Sample.docx"
'Starts a Word application.
Dim wordApp As word.Application = New word.Application()
'Creates a new Word document.
wordApp.Documents.Add(nullobject, nullobject, nullobject, nullobject)
Dim doc As word.Document = wordApp.ActiveDocument
'Adds a paragraph to the document.
Dim oPara As word.Paragraph
oPara = doc.Content.Paragraphs.Add(nullobject)
oPara.Range.Text = "Bookmark with one word selected"
'Defines the start and end positions of bookmark range.
Dim startobj As Object = oPara.Range.Text.IndexOf("word")
```

```

Dim endobj As Object = oPara.Range.Text.LastIndexOf(" ")
Dim rng As Object = doc.Range(startobj, endobj)
'Adds bookmark.
doc.Bookmarks.Add("one_word", rng)
'Saves document.
doc.SaveAs(newFilePath)
'Closes document.
doc.Close(nullobject, nullobject, nullobject)
'Quits application.
wordApp.Quit()

```

Using DocIO

The following code example illustrates how to insert the bookmark by using DocIO. Here, the `AppendBookmarkStart()` and `AppendBookmarkEnd()` methods are used to add the bookmark.

C#

```

//Creates a new Word document.
WordDocument doc = new WordDocument();
//Adds new section
IWSection section = doc.AddSection();
//Adds new paragraph
IWParagraph paragraph = section.AddParagraph();
paragraph.AppendText("Simple Bookmark");
paragraph = section.AddParagraph();
paragraph.AppendText("Bookmark with one ");
//Inserts bookmark.
paragraph.AppendBookmarkStart("one_word");
paragraph.AppendText("word");
paragraph.AppendBookmarkEnd("one_word");
paragraph.AppendText(" selected");
//Saves the document.
doc.Save("Sample.docx", FormatType.Docx);
//Closes the document.
doc.Close();

```

VB.NET

```

'Creates a new Word document.
Dim doc As WordDocument = New WordDocument()
'Adds new section
Dim section As IWSection = doc.AddSection()
'Adds new paragraph
Dim paragraph As IWParagraph = section.AddParagraph()
paragraph.AppendText("Simple Bookmark")
paragraph = section.AddParagraph()
paragraph.AppendText("Bookmark with one ")
'Inserts bookmark.
paragraph.AppendBookmarkStart("one_word")
paragraph.AppendText("word")
paragraph.AppendBookmarkEnd("one_word")
paragraph.AppendText(" selected")
'Saves the document.
doc.Save("Sample.docx", FormatType.Docx)
'Closes the document.

```

```
doc.Close()
```

Page Numbers

Page numbers can be added to the Word document in headers or footers.

Using Microsoft Office Automation

The following code example illustrates how page numbers can be inserted to the footer of the Word document by adding a page number field.

C#

```
using word = Microsoft.Office.Interop.Word;
-----
//Initializes objects.
object filepath = "Sample.docx";
object nullobject = Missing.Value;
//Starts the Word application.
word.Application wordApp = new word.Application();
//Opens the Word document.
word.Document document = wordApp.Documents.Open(ref filepath, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject);
wordApp.Visible = false;
document.Activate();
//Seeks the page footer.
wordApp.ActiveWindow.ActivePane.View.SeekView =
Microsoft.Office.Interop.Word.WdSeekView.wdSeekCurrentPageFooter;
//Formats the footer.
wordApp.Selection.Paragraphs.Alignment =
word.WdParagraphAlignment.wdAlignParagraphCenter;
wordApp.ActiveWindow.Selection.Font.Name = "Arial";
wordApp.ActiveWindow.Selection.Font.Size = 8;
//Adds page numbers in the footer.
Object CurrentPage = word.WdFieldType.wdFieldPage;
wordApp.ActiveWindow.Selection.Fields.Add(wordApp.Selection.Range, ref
CurrentPage, ref nullobject, ref nullobject);
//Saves the document.
document.Save();
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);
```

VB.NET

```
Imports word = Microsoft.Office.Interop.Word
-----
'Initializes objects.
Dim nullobject As Object = Missing.Value
Dim filePath As Object = "Sample.docx"
Dim falseobj As Object = False
'Starts the application.
Dim wordApp As word.Application = New word.Application()
```

```

`Adds a new Word document.
Dim document As word.Document = wordApp.Documents.Open(filePath, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, falseobj, nullobject, nullobject,
nullobject, nullobject)
wordApp.Visible = False
document.Activate()
`Seeks the page footer.
wordApp.ActiveWindow.ActivePane.View.SeekView =
word.WdSeekView.wdSeekCurrentPageFooter
`Formats the footer.
wordApp.Selection.Paragraphs.Alignment =
word.WdParagraphAlignment.wdAlignParagraphCenter
wordApp.ActiveWindow.Selection.Font.Name = "Arial"
wordApp.ActiveWindow.Selection.Font.Size = 8
`Adds page numbers in the footer.
Dim CurrentPage As Object = word.WdFieldType.wdFieldPage
wordApp.ActiveWindow.Selection.Fields.Add(wordApp.Selection.Range,
CurrentPage, nullobject, nullobject)
`Saves the document.
document.Save()
`Closes the document.
document.Close(nullobject, nullobject, nullobject)
`Quits application.
wordApp.Quit()

```

Using DocIO

The following code example illustrates how page numbers are inserted to the footer of the Word document by using DocIO.

C#

```

//Opens the Word document.
WordDocument doc = new WordDocument("Template.docx", FormatType.Docx);
//Iterates through sections
foreach (WSection sec in doc.Sections)
{
    IWParagraph para = sec.AddParagraph();
    //Appends page field to the paragraph
    para.AppendField("footer", FieldType.FieldPage);
    para.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Center;
    sec.PageSetup.PageNumberStyle = PageNumberStyle.Arabic;
    //Adds paragraph to footer
    sec.HeadersFooters.Footer.Paragraphs.Add(para);
}
//Saves the document.
doc.Save("Sample.docx", FormatType.Docx);
//Closes the document.
doc.Close();

```

VB.NET

```

`Opens the Word document.
Dim doc As WordDocument = New WordDocument("Template.docx", FormatType.Docx)
`Iterates through sections

```

```

For Each sec As WSection In doc.Sections
Dim para As IWParagraph = sec.AddParagraph()
'Appends page field to the paragraph
para.AppendField("footer", FieldType.FieldPage)
para.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Center
sec.PageSetup.PageNumberStyle = PageNumberStyle.Arabic
'Adds paragraph to footer
sec.HeadersFooters.Footer.Paragraphs.Add(para)
Next
'Saves the document.
doc.Save("Sample.docx", FormatType.Docx)
'Closes the document.
doc.Close()

```

Document Watermarks

Watermarks are text or pictures that appear behind document text.

Using Microsoft Office Automation

The following code example illustrates how to insert a text watermark as a shape by using Office Automation.

C#

```

using word = Microsoft.Office.Interop.Word;
-----
//Initializes objects.
object nullobject = Missing.Value;
object newFilePath = "Sample.docx";
//Starts the Word application.
word.Application wordApp = new word.Application();
//Creates a new Word document.
wordApp.Documents.Add(ref nullobject, ref nullobject, ref nullobject, ref
nullobject);
word.Document document = wordApp.ActiveDocument;
//Seeks the current page header.
wordApp.ActiveWindow.ActivePane.View.SeekView =
word.WdSeekView.wdSeekCurrentPageHeader;
//Inserts watermark.
word.Shape watermark =
wordApp.Selection.HeaderFooter.Shapes.AddTextEffect(Microsoft.Office.Core.Ms
oPresetTextEffect.msoTextEffect1,
"Watermark", "Arial", (float)48, Microsoft.Office.Core.MsoTriState.msoTrue,
Microsoft.Office.Core.MsoTriState.msoFalse, 0, 0, ref nullobject);
//Sets watermark properties.
watermark.Fill.Visible = Microsoft.Office.Core.MsoTriState.msoTrue;
watermark.Line.Visible = Microsoft.Office.Core.MsoTriState.msoFalse;
watermark.Fill.Solid();
watermark.Fill.ForeColor.RGB = (Int32)word.WdColor.wdColorGray30;
//Sets focus back to the document.
wordApp.ActiveWindow.ActivePane.View.SeekView =
word.WdSeekView.wdSeekMainDocument;
//Saves the document.
document.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject,

```

```

ref nullobject);
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);

```

VB.NET

```

Imports word = Microsoft.Office.Interop.Word
-----
Initializes objects.
Dim nullobject As Object = Missing.Value
Dim newFilePath As Object = "Sample.docx"
`Starts the application.
Dim wordApp As word.Application = New word.Application()
`Creates a new Word document.
wordApp.Documents.Add(nullobject, nullobject, nullobject, nullobject)
Dim doc As word.Document = wordApp.ActiveDocument
`Seeks the current page header.
wordApp.ActiveWindow.ActivePane.View.SeekView =
word.WdSeekView.wdSeekCurrentPageHeader
`Adds text watermark to the document.
Dim watermark As word.Shape =
wordApp.Selection.HeaderFooter.Shapes.AddTextEffect(Microsoft.Office.Core.Ms
oPresetTextEffect.msoTextEffect1,"Watermark", "Arial", 48,
Microsoft.Office.Core.MsoTriState.msoTrue,
Microsoft.Office.Core.MsoTriState.msoFalse, 0, 0, nullobject)
`Sets watermark properties.
watermark.Fill.Visible = Microsoft.Office.Core.MsoTriState.msoTrue
watermark.Line.Visible = Microsoft.Office.Core.MsoTriState.msoFalse
watermark.Fill.Solid()
watermark.Fill.ForeColor.RGB = CType(word.WdColor.wdColorGray30, Integer)
`Saves the document.
doc.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject)
`Closes the document.
doc.Close(nullobject, nullobject, nullobject)
`Quits application.
wordApp.Quit()

```

Using DocIO

DocIO enables you to add a text watermark and a picture watermark to a Word document. The following code example shows how to insert the picture watermark to the Word document.

C#

```

//Creates a new Word document.
WordDocument doc = new WordDocument();
doc.EnsureMinimal();
//Adds picture watermark to the document.
PictureWatermark picWatermark = new PictureWatermark();
picWatermark.Scaling = 120f;
picWatermark.Washout = true;
doc.Watermark = picWatermark;

```

```

picWatermark.Picture = Image.FromFile(ImagesPath + "Water lilies.jpg");
//Saves the document.
doc.Save("Sample.docx", FormatType.Docx);
//Closes the document.
doc.Close();

```

VB.NET

```

'Creates a new Word document.
Dim doc As WordDocument = New WordDocument()
doc.EnsureMinimal()
'Adds picture watermark to the document.
Dim picWatermark As PictureWatermark = New PictureWatermark()
picWatermark.Scaling = 120f
picWatermark.Washout = True
doc.Watermark = picWatermark
picWatermark.Picture = Image.FromFile(ImagesPath and "Water lilies.jpg")
'Saves the document.
doc.Save("Sample.docx", FormatType.Docx)
'Closes the document.
doc.Close()

```

Note: For more information on adding watermarks to a Word document using DocIO, refer to the online documentation link:

[Applying Watermark](#)

Headers and Footers

The headers and footers can be inserted with text, graphics, and any other information that is contained in the document.

Using Microsoft Office Automation

The following code example illustrates how to add headers and footers to a Word document. In this example, page numbers are inserted to the header and a text is inserted to the footer.

C#

```

using word = Microsoft.Office.Interop.Word;
-----
//Initializes objects.
object nullobject = Missing.Value;
object filePath = "Template.docx";
object newFilePath = "Sample.docx";
//Starts the Word application.
word.Application wordApp = new word.Application();
//Opens the Word document.
word.Document document = wordApp.Documents.Open(ref filePath, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject);
wordApp.Visible = false;
//Adds header and footer to each section in the document.
foreach (word.Section section in document.Sections)
{

```

```

object fieldEmpty = word.WdFieldType.wdFieldPage;
object autoText = "AUTOTEXT \\"Page X of Y\\" ";
object preserveFormatting = true;
//Footer.
section.Footers[word.WdHeaderFooterIndex.wdHeaderFooterPrimary].Range.Text =
"Internal";
section.Footers[word.WdHeaderFooterIndex.wdHeaderFooterPrimary].Range.ParagraphFormat.Alignment =
word.WdParagraphAlignment.wdAlignParagraphLeft;
//Header.
section.Headers[word.WdHeaderFooterIndex.wdHeaderFooterPrimary].Range.Fields
.Add(section.Headers[
word.WdHeaderFooterIndex.wdHeaderFooterPrimary].Range,reffieldEmpty, ref
autoText, ref preserveFormatting);
section.Headers[word.WdHeaderFooterIndex.wdHeaderFooterPrimary].Range.ParagraphFormat.Alignment =
word.WdParagraphAlignment.wdAlignParagraphRight;
}
//Saves the document.
document.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject);
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);

```

VB.NET

```

Imports word = Microsoft.Office.Interop.Word
-----
'Initializes objects.
Dim nullobject As Object = System.Reflection.Missing.Value
Dim filePath As Object = "Template.docx"
Dim newFilePath As Object = "Sample.docx"
'Starts the application.
Dim wordApp As word.Application = New word.Application()
'Opens the document.
Dim document As word.Document = wordApp.Documents.Open(filePath, nullobject,
nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject)
wordApp.Visible = False
'Adds header and footer to each section in the document.
For Each section As word.Section In document.Sections
Dim fieldEmpty As Object = word.WdFieldType.wdFieldPage
'Footer.
section.Footers(word.WdHeaderFooterIndex.wdHeaderFooterPrimary).Range.Text =
"Internal"
section.Footers(word.WdHeaderFooterIndex.wdHeaderFooterPrimary).Range.ParagraphFormat.Alignment = word.WdParagraphAlignment.wdAlignParagraphLeft
'Header.

```

```

section.Headers(word.WdHeaderFooterIndex.wdHeaderFooterPrimary).Range.Fields
.Add(section.Headers(word.WdHeaderFooterIndex.wdHeaderFooterPrimary).Range,
fieldEmpty, nullobject, nullobject)
section.Headers(word.WdHeaderFooterIndex.wdHeaderFooterPrimary).Range.Paragr
aphFormat.Alignment = word.WdParagraphAlignment.wdAlignParagraphRight
Next
'Saves the document.
document.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject)
'Closes the document.
document.Close(nullobject, nullobject, nullobject)
'Quits the application.
wordApp.Quit()

```

Using DocIO

You can set the header and footer by using the HeadersFooters property in the Word document section. To access a particular header/footer, you can use the following properties of **WHeadersFooters** class:

- FirstPageHeader
- FirstPageFooter
- OddHeader
- OddFooter
- EvenHeader
- EvenFooter

C#

```

//Opens a Word document.
WordDocument doc = new WordDocument("Template.docx");
//Adds header and footer to each section in the document.
foreach (WSection sec in doc.Sections)
{
    //Header.
    WParagraph para = new WParagraph(doc);
    para.AppendField("page", FieldType.FieldPage);
    para.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right;
    sec.HeadersFooters.Header.Paragraphs.Add(para);
    //Footer.
    WParagraph para1 = new WParagraph(doc);
    para1.AppendText("Internal");
    para1.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Left;
    sec.HeadersFooters.Footer.Paragraphs.Add(para1);
}
//Saves the document.
doc.Save("Sample.docx", FormatType.Docx);
//Closes the document.
doc.Close();

```

VB.NET

```

'Opens the Word document.
Dim doc As WordDocument = New WordDocument("Template.docx")

```

```

`Adds header and footer to each section in the document.
For Each sec As WSection In doc.Sections
`Header.
Dim para As WParagraph = New WParagraph(doc)
para.AppendField("page", FieldType.FieldPage)
para.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right
sec.HeadersFooters.Header.Paragraphs.Add(para)
`Footer.
Dim para1 As WParagraph = New WParagraph(doc)
para1.AppendText("Internal")
para1.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Left
sec.HeadersFooters.Footer.Paragraphs.Add(para1)
Next
`Saves the document.
doc.Save("Sample.docx", FormatType.Docx)
`Closes the document.
doc.Close()

```

Character Formatting

Character formatting defines the appearance of the text in a Word document. This section illustrates how to apply character level formatting to the Word document.

Using Microsoft Office Automation

The following code example illustrates how to apply the character formatting to the Word document by using the Range properties.

C#

```

using word = Microsoft.Office.Interop.Word
-----
//Initializes objects.
object nullobject = System.Reflection.Missing.Value;
object newFilePath = "Sample.docx";
object falseObj = false;
//Starts the Word application.
word.Application wordApp = new word.Application();
//Creates a new Word document.
wordApp.Documents.Add(ref nullobject, ref nullobject, ref nullobject, ref
nullobject);
word.Document doc = wordApp.ActiveDocument;
//Defines the range for formatting.
object start = 0;
object end = 0;
word.Range rng = doc.Range(ref start, ref end);
rng.Text = "New Text";
rng.Font.Name = "Arial";
rng.Font.Size = 14;
//Saves the document.
doc.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject);
//Closes the document.
doc.Close(ref nullobject, ref nullobject, ref nullobject);

```

```
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);
```

VB.NET

```
Imports word = Microsoft.Office.Interop.Word
-----
'Initializes objects.
Dim nullobject As Object = System.Reflection.Missing.Value
Dim newFilePath As Object = "Sample.docx"
Dim falseObj As Object = False
'Starts the Word application.
Dim wordApp As word.Application = New word.Application()
'Creates a new Word document.
wordApp.Documents.Add(nullobject, nullobject, nullobject, nullobject)
Dim doc As word.Document = wordApp.ActiveDocument
'Defines the range for formatting.
Dim start As Object = 0
Dim endobj As Object = 0
Dim rng As word.Range = doc.Range(start, endobj)
rng.Text = "New Text"
rng.Font.Name = "Arial"
rng.Font.Size = 14
'Saves the document.
doc.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject)
'Closes the document.
doc.Close(nullobject, nullobject, nullobject)
'Quits the application.
wordApp.Quit()
```

Tables

Tables are used to organize information and to display the information in rows and columns. You can also add images or even other tables to the table.

Using Microsoft Office Automation

The following code example illustrates how to insert a table to a Word document, where the table contains three rows and two columns.

C#

```
using word = Microsoft.Office.Interop.Word;
-----
//Initializes the objects.
object nullobject = System.Reflection.Missing.Value;
object newFilePath = "Sample.docx";
//Starts the Word application.
word.Application wordApp = new word.Application();
//Creates a new document.
wordApp.Documents.Add(ref nullobject, ref nullobject, ref nullobject, ref
nullobject);
word.Document document = wordApp.ActiveDocument;
//Inserts the table.
object start = 0;
```

```

object end = 0;
word.Range tableLocation = document.Range(ref start, ref end);
document.Tables.Add(tableLocation, 3, 2, ref nullobject, ref nullobject);
//Saves the document.
document.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
ref nullobject);
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);

```

VB.NET

```

Imports word = Microsoft.Office.Interop.Word
-----
'Initializes the objects.
Dim nullobject As Object = System.Reflection.Missing.Value
Dim newFilePath As Object = "Sample.docx"
'Starts the Word application.
Dim wordApp As New word.Application()
'Creates a new document.
wordApp.Documents.Add(nullobject, nullobject, nullobject, nullobject)
Dim document As word.Document = wordApp.ActiveDocument
'Inserts the table.
Dim start As Object = 0
Dim [end] As Object = 0
Dim tableLocation As word.Range = document.Range(start, [end])
document.Tables.Add(tableLocation, 3, 2, nullobject, nullobject)
'Saves the document.
document.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, _
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject)
'Closes the document.
document.Close(nullobject, nullobject, nullobject)
'Quits the application.
wordApp.Quit(nullobject, nullobject, nullobject)

```

Using DocIO

The following code example shows how to insert an empty table to a Word document. The `ResetCells()` method is used to specify the number of rows and columns in a table.

C#

```

//Creates a new Word document.
WordDocument document = new WordDocument();
IWSection section = document.AddSection();
//Adds a table to the document.
IWTable table = section.AddTable();
table.ResetCells(3, 2);
//Saves the document.
document.Save("Sample.docx", FormatType.Docx);

```

```
//Closes the document.
document.Close();
```

VB.NET

```
'Creates a new Word document.
Dim document As New WordDocument()
Dim section As IWSection = document.AddSection()
'Adds a table to the document.
Dim table As IWTable = section.AddTable()
table.ResetCells(3, 2)
'Saves the document.
document.Save("Sample.docx", FormatType.Docx);
'Closes the document.
document.Close()
```

Note: For more information on creating tables using DocIO, refer to online documentation link:

[Working with Tables](#)

Comments

Comments are used to include additional information to a paragraph or text in a Word document. Comments can be added or modified whenever needed and deleted when the comment has served its purpose.

Adding Comments using Microsoft Office Automation

The following code example illustrates how to add comments to a Word document. You need to define the range of text where the comment is to be added.

C#

```
using word = Microsoft.Office.Interop.Word;
-----
//Initializes objects.
object nullobject = System.Reflection.Missing.Value;
object newFilePath = "Sample.docx";
//Starts the Word application.
word.Application wordApp = new word.Application();
//Creates a new document.
wordApp.Documents.Add(ref nullobject, ref nullobject, ref nullobject, ref
nullobject);
word.Document doc = wordApp.ActiveDocument;
//Inserts text to the Word document.
object start = 0;
object end = 0;
word.Range rng = doc.Range(ref start, ref end);
rng.Text = "New Text";
//Adds comment to the inserted text.
object text = "Comment goes here";
doc.Comments.Add(rng, ref text);
//Saves the document.
doc.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
```

```

ref nullobject);
//Closes the document.
doc.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);

```

VB.NET

```

Imports word = Microsoft.Office.Interop.Word
-----
'Initializes objects.
Dim nullobject As Object = System.Reflection.Missing.Value
Dim newFilePath As Object = "Sample.docx"
'Starts the Word application.
Dim wordApp As word.Application = New word.Application()
'Creates a new document.
wordApp.Documents.Add(nullobject, nullobject, nullobject, nullobject)
Dim doc As word.Document = wordApp.ActiveDocument
'Inserts text to the Word document.
Dim startobj As Object = 0
Dim endobj As Object = 0
Dim rng As word.Range = doc.Range(startobj, endobj)
rng.Text = "New Text"
'Adds comment to the inserted text.
Dim text As Object = "Comment goes here"
doc.Comments.Add(rng, text)
'Saves the document and quits application.
doc.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject,
nullobject, nullobject, nullobject, nullobject, nullobject)
'Closes the document.
doc.Close(nullobject, nullobject, nullobject)
'Quits the application.
wordApp.Quit()

```

Adding Comments Using DocIO

You can insert comments to a paragraph or text in a Word document by using DocIO. The following code example shows how to insert comments to a Word document.

C#

```

//Creates a new Word document.
WordDocument doc = new WordDocument();
IWSection section = doc.AddSection();
//Adds a paragraph to the document.
IWParagraph para = section.AddParagraph();
para.AppendText("New Text");
//Adds comment to the paragraph.
para.AppendComment("Comment goes here");
//Saves the document.
doc.Save("Sample.doc", FormatType.Doc);

```

VB.NET

```

'Creates a new Word document.

```

```

Dim doc As WordDocument = New WordDocument()
Dim section As IWSection = doc.AddSection()
'Adds a paragraph to the document.
Dim para As IWParagraph = section.AddParagraph()
para.AppendText("New Text")
para.AppendComment("Comment goes here")
'Saves the document.
doc.Save("Sample.doc", FormatType.Doc)

```

Note: For more information on working with the comments using DocIO, you can refer to the online documentation link:

[Working with Comments](#)

Document Protection

You can protect your Word documents with or without a password from anyone accidentally or deliberately modifying the Word documents. You can specify the protection type for preserving the Word documents.

Using Microsoft Office Automation

[WdProtectionType](#) is used to specify the protection type of the Word document.

C#

```

//Initializes objects.
object nullobject = System.Reflection.Missing.Value;
object filepath = "Template.docx";
object newFilePath = "Sample.docx";
object noReset = false;
object password = System.String.Empty;
object useIRM = false;
object enforceStyleLock = false;
//Starts the Word application.
word.Application wordApp = new word.Application();
//Opens the Word document to be protected.
word.Document document = wordApp.Documents.Open(ref filepath, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject);
wordApp.Visible = false;
//Sets "Allow only Comments" protection to Word document.
document.Protect(word.WdProtectionType.wdAllowOnlyComments, ref noReset, ref
password, ref useIRM, ref enforceStyleLock);
//Saves the document.
document.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject);
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);

```

VB.NET

```

'Initializes objects.
Dim nullobject As Object = System.Reflection.Missing.Value
Dim filepath As Object = "Template.docx"
Dim newFilePath As Object = "Sample.docx"
Dim noReset As Object = False
Dim password As Object = System.[String].Empty
Dim useIRM As Object = False
Dim enforceStyleLock As Object = False
'Starts the Word application.
Dim wordApp As New Word.Application()
'Opens the Word document that is to be protected.
Dim document As Word.Document = wordApp.Documents.Open(filepath, nullobject,
nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject)
wordApp.Visible = False
'Sets "Allow only Comments" protection to Word document.
document.Protect(Word.WdProtectionType.wdAllowOnlyComments, noReset,
password, useIRM, enforceStyleLock)
'Saves the document.
document.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, _
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject)
'Closes the document.
document.Close(nullobject, nullobject, nullobject)
'Quits the application.
wordApp.Quit(nullobject, nullobject, nullobject)

```

Using DocIO

DocIO uses ProtectionType property to specify the protection type of the Word document. This property uses the following values:

- AllowOnlyComments: Allows only comments to be added to the document.
- AllowOnlyFormFields: Allows content to be added to the document through form fields only.
- AllowOnlyRevisions: Allows only revisions to be made to the existing content.
- AllowOnlyReading: All kinds of editing are restricted here and it makes the Word document as read-only document.
- NoProtection: Does not protect the document.

C#

```

//Loads the existing Word document by using DocIO instance
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
//Sets "Allow only Comments" protection to Word document.
document.ProtectionType = Syncfusion.DocIO.ProtectionType.AllowOnlyComments;
//Saves and closes the document.
document.Save("Sample.docx", FormatType.Docx);
document.Close();

```

VB.NET

```
'Loads the existing Word document by using DocIO instance
Dim document As New WordDocument("Template.docx", FormatType.Docx)
'Sets "Allow only Comments" protection to Word document.
document.ProtectionType = Syncfusion.DocIO.ProtectionType.AllowOnlyComments
'Saves and closes the document.
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

Refer to the online documentation link for more details about the ways to protect the Word documents by using DocIO:

[Protecting word document from editing](#)

Table of Contents

Table of contents can be generated by applying the heading styles to text in a Word document. To create the table of contents in Microsoft Word, click Table of Contents from the Table of Contents group on the References tab.

Using Microsoft Office Automation

The following code example shows how to insert and update table of contents in a Word document.

C#

```
//Initializes objects.
object nullobject = System.Reflection.Missing.Value;
object filepath = "Template.docx";
object newFilePath = "Sample.docx";
object trueobj = true;
//Starts the Word application.
word.Application wordApp = new word.Application();
//Opens the Word document.
word.Document document = wordApp.Documents.Open(ref filepath, ref
nullobject, ref nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject);
wordApp.Visible = false;
//Defines the range for TOC in the document.
object tocstart = 0;
object tocend = 0;
word.Range rngToc = document.Range(ref tocstart, ref tocend);
//Adds TOC.
word.TableOfContents tableOfContents = document.TablesOfContents.Add(rngToc,
ref trueobj, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref trueobj, ref trueobj, ref trueobj, ref trueobj, ref
trueobj, ref trueobj);
//Updates TOC.
tableOfContents.Update();
//Saves the document.
document.SaveAs(ref newFilePath, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject, ref nullobject, ref nullobject, ref
nullobject, ref nullobject, ref nullobject,
ref nullobject, ref nullobject);
//Closes the document.
document.Close(ref nullobject, ref nullobject, ref nullobject);
```

```
//Quits the application.
wordApp.Quit(ref nullobject, ref nullobject, ref nullobject);
```

VB.NET

```
'Initializes objects.
Dim nullobject As Object = System.Reflection.Missing.Value
Dim filepath As Object = "Template.docx"
Dim newFilePath As Object = "Sample.docx"
Dim trueobj As Object = True
'Starts the Word application.
Dim wordApp As New Word.Application()
'Opens the Word document.
Dim document As Word.Document = wordApp.Documents.Open(filepath, nullobject,
nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject, _
nullobject, nullobject, nullobject, nullobject)
wordApp.Visible = False
'Defines the range for TOC in the document.
Dim tocstart As Object = 0
Dim tocend As Object = 0
Dim rngToc As Word.Range = document.Range(tocstart, tocend)
'Adds TOC.
Dim tableOfContents As Word.TableOfContents =
document.TablesOfContents.Add(rngToc, trueobj, nullobject, nullobject,
nullobject, nullobject, _
trueobj, trueobj, trueobj, trueobj, trueobj, trueobj)
'Updates TOC.
tableOfContents.Update()
'Saves the document.
document.SaveAs(newFilePath, nullobject, nullobject, nullobject, nullobject,
nullobject, _
nullobject, nullobject, nullobject, nullobject, nullobject, nullobject, _

wordApp.Quit(nullobject, nullobject, nullobject)
```

Using DocIO

The following code example illustrates how to insert and update the table of contents in a Word document by using DocIO.

C#

```
//Loads the existing Word document by using DocIO instance
WordDocument document = new WordDocument("Template.docx", FormatType.Docx);
IWSection section = document.Sections[0];
//Appends TOC to the first paragraph of the document.
WParagraph paragraph = new WParagraph(document);
TableOfContent tableOfContents = paragraph.AppendTOC(1, 3);
section.Paragraphs.Insert(0, paragraph);
//Updates table of contents.
document.UpdateTableOfContents();
//Saves and closes the document.
```

```
document.Save("Sample.docx", FormatType.Docx);
document.Close();
```

VB.NET

```
'Loads the existing Word document by using DocIO instance
Dim document As New WordDocument("Template.docx", FormatType.Docx)
Dim section As IWSection = document.Sections(0)
'Appends TOC to the first paragraph of the document.
Dim paragraph As New WParagraph(document)
Dim tableOfContents As TableOfContent = paragraph.AppendTOC(1, 3)
section.Paragraphs.Insert(0, paragraph)
'Updates table of contents.
document.UpdateTableOfContents()
'Saves and closes the document.
document.Save("Sample.docx", FormatType.Docx)
document.Close()
```

Refer to the online documentation link for more information about adding the table of contents to the Word document by using DocIO:

How to copy necessary fonts to Linux containers

The fonts present in the location(in Docker container) "/usr/local/share/fonts/" is used for conversion. By default, there will be limited number of fonts available in the container.

You should copy necessary fonts to this location "/usr/local/share/fonts/" before conversion.

Use the following code example to copy fonts to containers.

DOCKERFILE

PDF

C#

```
using Syncfusion.Pdf;
using Syncfusion.Pdf.Parsing;
using Syncfusion.Pdf.Graphics;
using Syncfusion.Pdf.Grid;
```

VB.NET

```
Imports Syncfusion.Pdf
Imports Syncfusion.Pdf.Parsing
Imports Syncfusion.Pdf.Graphics
Imports Syncfusion.Pdf.Grid
```

UWP

```
using Syncfusion.Pdf;
using Syncfusion.Pdf.Parsing;
```

```
using Syncfusion.Pdf.Graphics;  
using Syncfusion.Pdf.Grid;
```

ASP.NET CORE

```
using Syncfusion.Pdf;  
using Syncfusion.Pdf.Parsing;  
using Syncfusion.Pdf.Graphics;  
using Syncfusion.Pdf.Grid;
```

XAMARIN

```
using Syncfusion.Pdf;  
using Syncfusion.Pdf.Parsing;  
using Syncfusion.Pdf.Graphics;  
using Syncfusion.Pdf.Grid;

Creating a PDF document with simple text

The following code example shows how to create a PDF document with simple text.

C#

```
//Create a new PDF document.  
PdfDocument document = new PdfDocument();  
//Add a page to the document.  
PdfPage page = document.Pages.Add();  
//Create PDF graphics for the page.  
PdfGraphics graphics = page.Graphics;  
//Set the standard font.  
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);  
//Draw the text.  
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,  
0));  
//Save the document.  
document.Save("Output.pdf");  
//Close the document.  
document.Close(true);
```

VB.NET

```
'Create a new PDF document.  
Dim document As New PdfDocument()  
'Add a page to the document.  
Dim page As PdfPage = document.Pages.Add()  
'Create PDF graphics for the page.  
Dim graphics As PdfGraphics = page.Graphics  
'Set the standard font.  
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)  
'Draw the text.  
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,  
0))  
'Save the document.  
document.Save("Output.pdf")  
'Close the document.  
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.

Creating a PDF document with table

The following code example shows how to create a PDF document with a simple table.

C#

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page
PdfPage page = doc.Pages.Add();
//Create a PdfGrid
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable
```

```

DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ProductID");
dataTable.Columns.Add("ProductName");
dataTable.Columns.Add("Quantity");
dataTable.Columns.Add("UnitPrice");
dataTable.Columns.Add("Discount");
dataTable.Columns.Add("Price");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "CA-1098", "Queso Cabrales", "12", "14",
"1", "167" });
dataTable.Rows.Add(new object[] { "LJ-0192-M", "Singaporean Hokkien Fried
Mee", "10", "20", "3", "197" });
dataTable.Rows.Add(new object[] { "SO-B909-M", "Mozzarella di Giovanni",
"15", "65", "10", "956" });
//Assign data source
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document
pdfGrid.Draw(page, new PointF(10, 10));
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
'Create a PdfGrid.
Dim pdfGrid As New PdfGrid()
'Create a DataTable.
Dim dataTable As New DataTable()
'Add columns to the DataTable

Creating a simple PDF document with basic elements

The [PdfDocument](#) object represents an entire PDF document that is being created. The following code example shows how to create a PDF document and add a [PdfPage](#) to it along with the [PdfPageSettings](#).

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds page settings
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
document.PageSettings.Margins.All = 50;
//Adds a page to the document
PdfPage page = document.Pages.Add();
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Adds page settings
document.PageSettings.Orientation = PdfPageOrientation.Landscape
document.PageSettings.Margins.All = 50
'Adds a page to the document
Dim page As PdfPage = document.Pages.Add()
```

UWP

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds page settings
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
document.PageSettings.Margins.All = 50;
//Adds a page to the document
PdfPage page = document.Pages.Add();
```

ASP.NET CORE

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds page settings
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
document.PageSettings.Margins.All = 50;
//Adds a page to the document
PdfPage page = document.Pages.Add();
```

XAMARIN

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds page settings
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
document.PageSettings.Margins.All = 50;
//Adds a page to the document
PdfPage page = document.Pages.Add();
```

1. Essential PDF has APIs similar to the .NET GDI plus which helps to draw elements to the PDF page just like 2D drawing in .NET.
2. Unlike System.Drawing APIs all the units are measured in point instead of pixel.
3. In PDF, all the elements are placed in absolute positions and has the possibility for content overlapping if misplaced.
4. Essential PDF provides the rendered bounds for each and every elements added, through [PdfLayoutResult](#) objects. This can be used to add successive elements and prevent content overlap.

The following code example explains how to add an image from disk to a PDF document, by providing the rectangle coordinates.

C#

```
//Loads the image from disk
PdfImage image = PdfImage.FromFile("AdventureCycle.jpg");
//Draws the image to the PDF page
page.Graphics.DrawImage(image, new RectangleF(176, 0, 390, 130));
```

VB.NET

```
'Loads the image from disk
Dim image As PdfImage = PdfImage.FromFile("AdventureCycle.jpg")
'Draws the image to the PDF page
page.Graphics.DrawImage(image, New RectangleF(176, 0, 390, 130))
```

UWP

```
//Loads the image as stream
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.Data.AdventureCycle.jpg");
PdfImage image = PdfImage.FromStream(imageStream);
//Draws the image to the PDF page
```

```
page.Graphics.DrawImage(image, new RectangleF(176, 0, 390, 130));
```

ASP.NET CORE

```
//Loads the image as stream
FileStream imageStream = new FileStream("AdventureCycle.jpg", FileMode.Open,
FileAccess.Read);
PdfImage image = PdfImage.FromStream(imageStream);
//Draws the image to the PDF page
page.Graphics.DrawImage(image, new RectangleF(176, 0, 390, 130));
```

XAMARIN

```
//Loads the image as stream
Stream imageStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
AdventureCycle.jpg");
PdfImage image = PdfImage.FromStream(imageStream);
//Draws the image to the PDF page
page.Graphics.DrawImage(image, new RectangleF(176, 0, 390, 130));
```

The following methods can be used to add text to a PDF document:

1. [DrawString\(\)](#) method of the [PdfGraphics](#)
2. [PdfTextElement](#) class.

The [PdfTextElement](#) provides the layout result of the added text by using the location of the next element that decides to prevent content overlapping. This is not available in the [DrawString](#) method.

The following code example adds the necessary text such as address, invoice number and date to create a basic invoice application.

C#

```
PdfLayoutResult result = new PdfLayoutResult(page, new RectangleF(0, 0,
page.Graphics.ClientSize.Width / 2, 95));
PdfFont subHeadingFont = new PdfStandardFont(PdfFontFamily.TimesRoman, 14);
//Draw Rectangle place on location
g.DrawRectangle(new PdfSolidBrush(new PdfColor(126, 151, 173)), new
RectangleF(0, result.Bounds.Bottom + 40, g.ClientSize.Width, 30));
element = new PdfTextElement("INVOICE " + 10248, subHeadingFont);
element.Brush = PdfBrushes.White;
result = element.Draw(page, new PointF(10, result.Bounds.Bottom + 48));
string currentDate = "DATE " + DateTime.Now.ToString("MM/dd/yyyy");
SizeF textSize = subHeadingFont.MeasureString(currentDate);
g.DrawString(currentDate, subHeadingFont, element.Brush, new
PointF(g.ClientSize.Width - textSize.Width - 10, result.Bounds.Y));
//Draw Bill header
element = new PdfTextElement("BILL TO ", new
PdfStandardFont(PdfFontFamily.TimesRoman, 10));
element.Brush = new PdfSolidBrush(new PdfColor(126, 155, 203));
result = element.Draw(page, new PointF(10, result.Bounds.Bottom + 25));
//Draw Bill address
```

```

element = new PdfTextElement(string.Format("{0}, {1}, {2}", "Vin et alcohol
Chevalier", "\n59 rue deb l'Abbaye ", " Reims, France"), new
PdfStandardFont(PdfFontFamily.TimesRoman, 10));
element.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
result = element.Draw(page, new RectangleF(10, result.Bounds.Bottom + 3,
g.ClientSize.Width / 2, 100));
//Draw Bill line
g.DrawLine(new PdfPen(new PdfColor(126, 151, 173), 0.70f), new PointF(0,
result.Bounds.Bottom + 3), new PointF(g.ClientSize.Width,
result.Bounds.Bottom + 3));

```

VB.NET

```

Dim subHeadingFont As PdfFont = New
PdfStandardFont(PdfFontFamily.TimesRoman, 14)
'Draw Rectangle place on location
g.DrawRectangle(New PdfSolidBrush(New PdfColor(126, 151, 173)), New
RectangleF(0, (result.Bounds.Bottom + 40), g.ClientSize.Width, 30))
element = New PdfTextElement(("INVOICE " + 10248), subHeadingFont)
element.Brush = PdfBrushes.White
result = element.Draw(page, New PointF(10, (result.Bounds.Bottom + 48)))
Dim currentDate As String = ("DATE " + DateTime.Now.ToString("MM/dd/yyyy"))
Dim textSize As SizeF = subHeadingFont.MeasureString(currentDate)
g.DrawString(currentDate, subHeadingFont, element.Brush, New
PointF((g.ClientSize.Width - (textSize.Width - 10)), result.Bounds.Y))
'Draw Bill header
element = New PdfTextElement("BILL TO ", New
PdfStandardFont(PdfFontFamily.TimesRoman, 10))
element.Brush = New PdfSolidBrush(New PdfColor(126, 155, 203))
result = element.Draw(page, New PointF(10, (result.Bounds.Bottom + 25)))
'Draw Bill address
element = New PdfTextElement(String.Format("{0}, {1}, {2}", "Vin et alcohol
Chevalier", "" & vbLf & "59 rue deb l'Abbaye ", " Reims, France"), New
PdfStandardFont(PdfFontFamily.TimesRoman, 10))
element.Brush = New PdfSolidBrush(New PdfColor(89, 89, 93))
result = element.Draw(page, New RectangleF(10, (result.Bounds.Bottom + 3),
(g.ClientSize.Width / 2), 100))
'Draw Bill line
g.DrawLine(New PdfPen(New PdfColor(126, 151, 173), 0.7!), New PointF(0,
(result.Bounds.Bottom + 3)), New PointF(g.ClientSize.Width,
(result.Bounds.Bottom + 3)))

```

UWP

```

PdfLayoutResult result = new PdfLayoutResult(page, new RectangleF(0, 0,
page.Graphics.ClientSize.Width / 2, 95));
PdfFont subHeadingFont = new PdfStandardFont(PdfFontFamily.TimesRoman, 14);
//Draw Rectangle place on location
g.DrawRectangle(new PdfSolidBrush(new PdfColor(126, 151, 173)), new
RectangleF(0, result.Bounds.Bottom + 40, g.ClientSize.Width, 30));
element = new PdfTextElement("INVOICE " + 10248, subHeadingFont);
element.Brush = PdfBrushes.White;
result = element.Draw(page, new PointF(10, result.Bounds.Bottom + 48));
string currentDate = "DATE " + DateTime.Now.ToString("MM/dd/yyyy");
SizeF textSize = subHeadingFont.MeasureString(currentDate);

```

```

g.DrawString(currentDate, subHeadingFont, element.Brush, new

```

Essential PDF provides two types of table models. The difference between both the table models can be referred from the link

[Difference between PdfLightTable and PdfGrid](#)

Since the invoice document requires only simple cell customizations, the given code example explains how to create a simple invoice table by using [PdfGrid](#).

C#

```
//Creates the datasource for the table
DataTable invoiceDetails = GetProductDetailsAsDataTable();
//Creates a PDF grid
PdfGrid grid = new PdfGrid();
//Adds the data source
grid.DataSource = invoiceDetails;
//Creates the grid cell styles
PdfGridCellStyle cellStyle = new PdfGridCellStyle();
cellStyle.Borders.All = PdfPens.White;
PdfGridRow header = grid.Headers[0];
//Creates the header style
PdfGridCellStyle headerStyle = new PdfGridCellStyle();
headerStyle.Borders.All = new PdfPen(new PdfColor(126, 151, 173));
headerStyle.BackgroundBrush = new PdfSolidBrush(new PdfColor(126, 151,
173));
headerStyle.TextBrush = PdfBrushes.White;
headerStyle.Font = new PdfStandardFont(PdfFontFamily.TimesRoman, 14f,
PdfFontStyle.Regular);
//Adds cell customizations
for (int i = 0; i < header.Cells.Count; i++)
```

```

{
    if (i == 0 || i == 1)
        header.Cells[i].StringFormat = new PdfStringFormat(PdfTextAlignment.Left,
            PdfVerticalAlignment.Middle);
    else
        header.Cells[i].StringFormat = new PdfStringFormat(PdfTextAlignment.Right,
            PdfVerticalAlignment.Middle);
}
//Applies the header style
header.ApplyStyle(headerStyle);
cellStyle.Borders.Bottom = new PdfPen(new PdfColor(217, 217, 217), 0.70f);
cellStyle.Font = new PdfStandardFont(PdfFontFamily.TimesRoman, 12f);
cellStyle.TextBrush = new PdfSolidBrush(new PdfColor(131, 130, 136));
//Creates the layout format for grid
PdfGridLayoutFormat layoutFormat = new PdfGridLayoutFormat();
// Creates layout format settings to allow the table pagination
layoutFormat.Layout = PdfLayoutType.Paginate;
//Draws the grid to the PDF page.
PdfGridLayoutResult gridResult = grid.Draw(page, new RectangleF(new
    PointF(0, result.Bounds.Bottom + 40), new SizeF(g.ClientSize.Width,
        g.ClientSize.Height - 100)), layoutFormat);

```

VB.NET

```

'Creates the datasource for the table
Dim invoiceDetails As DataTable =
    GetProductDetails(Integer.Parse(invoiceNumber))
'Create a PDF grid
Dim grid As New PdfGrid()
'Adds the data source
grid.DataSource = invoiceDetails
'creates the grid cell styles
Dim cellStyle As New PdfGridCellStyle()
cellStyle.Borders.All = PdfPens.White

The following code example shows how to save the invoice document to disk and dispose the [PdfDocument](#) object.

C#

```

//Saves and closes the document.
document.Save("Sample.pdf");
document.Close(true);

```

VB.NET

```

'Saves and closes the document.
document.Save("Sample.pdf")

```

```
document.Close(True)
```

UWP

```
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Sample.pdf");
```

ASP.NET CORE

```
FileStream fileStream = new FileStream("Sample.pdf", FileMode.CreateNew,
FileAccess.ReadWrite);
//Save and close the PDF document
document.Save(fileStream);
document.Close(true);
```

XAMARIN

```
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pdf",
"application/pdf", stream);
}
```

The following screenshot shows the invoice PDF document created by using Essential PDF.

ADVENTURE WORKS cycles

INVOICE 10248 **DATE 08/08/2015**

BILL TO
 Vin et alcools Chevalier
 59 rue de Talmaye, Reims, France

ProductID	ProductName	Quantity	UnitPrice	Discount	Price
CA-1095	Queso Cabrales	12	\$14	\$1	\$167
LJ-0192-M	Singaporean Hokkien Fried Mee	10	\$20	\$3	\$197
SO-B909-M	Mozzarella di Giovanni	15	\$65	\$10	\$965
Total Due					1329

Thank you for your business!

Filling forms

An interactive form, sometimes referred to as an AcroForm is a collection of fields for gathering information interactively from the user. A PDF document can contain any number of fields appearing in any combination of pages, all of that make a single, globally interactive form spanning the entire document.

Essential PDF allows you to create and manipulate existing form in PDF document. To work with existing form documents, the following namespaces are required.

1. Syncfusion.Pdf
2. Syncfusion.Pdf.Parsing

The following guide shows how to fill a sample PDF form as shown.

The screenshot shows a PDF form titled "JOB APPLICATION FORM" open in Adobe Reader. The form has the following fields:

- First name:** A single-line text input field.
- Last Name:** A single-line text input field.
- Address:** A multi-line text input field.
- Gender:** Two radio button options labeled "Male" and "Female".
- Occupation:** Four checkbox options labeled "Student", "Administrative/Clerk", "Business", and "Retiree".

The Adobe Reader interface is visible at the top, showing the menu bar (File, Edit, View, Window, Help) and a toolbar with icons for opening, saving, printing, and commenting. A status bar at the bottom indicates the file is "JobApplication.pdf" and is at 115% zoom.

Essential PDF allows you to fill the form fields by using [PdfLoadedField](#) class. You can get the form field either by using its field name or field index.

C#

```
//Loads the PDF form.
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument(@"JobApplication.pdf");
//Loads the form
PdfLoadedForm form = loadedDocument.Form;
//Fills the textbox field by using index
(form.Fields[0] as PdfLoadedTextBoxField).Text = "John";
//Fills the textbox fields by using field name
(form.Fields["LastName"] as PdfLoadedTextBoxField).Text = "Doe";
(form.Fields["Address"] as PdfLoadedTextBoxField).Text = " John Doe \n 123
Main St \n Anytown, USA";
//Loads the radio button group
PdfLoadedRadioButtonItemCollection radioButtonCollection =
(form.Fields["Gender"] as PdfLoadedRadioButtonListField).Items;
//Checks the 'Male' option
radioButtonCollection[0].Checked = true;
//Checks the 'business' checkbox field
(form.Fields["Business"] as PdfLoadedCheckBoxField).Checked = true;
//Checks the 'retiree' checkbox field
(form.Fields["Retiree"] as PdfLoadedCheckBoxField).Checked = true;
//Saves and closes the document
loadedDocument.Save("output.pdf");
loadedDocument.Close(true);
```

VB.NET

```

'Loads the PDF form.
Dim loadedDocument As New PdfLoadedDocument("JobApplication.pdf")
'Load the form
Dim form As PdfLoadedForm = loadedDocument.Form
'Fills the textbox field by using index
TryCast(form.Fields(0), PdfLoadedTextBoxField).Text = "John"
'Fills the textbox fields by using field name
TryCast(form.Fields("LastName"), PdfLoadedTextBoxField).Text = "Doe"
TryCast(form.Fields("Address"), PdfLoadedTextBoxField).Text = " John Doe " &
vbLf & " 123 Main St " & vbLf & " Anytown, USA"
'Load the radio button group
Dim radioButtonCollection As PdfLoadedRadioButtonItemCollection =
TryCast(form.Fields("Gender"), PdfLoadedRadioButtonListField).Items
'Checks the 'Male' option
radioButtonCollection(0).Checked = True
'Checks the 'business' checkbox field
TryCast(form.Fields("Business"), PdfLoadedCheckBoxField).Checked = True
'Checks the 'retiree' checkbox field
TryCast(form.Fields("Retiree"), PdfLoadedCheckBoxField).Checked = True
'Saves and closes the document
loadedDocument.Save("output.pdf")
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);

}

```

The filled form is shown in adobe reader application as follows.

The screenshot shows a PDF document titled 'filledform.pdf' in Adobe Reader. The form is titled 'JOB APPLICATION FORM'. It has the following fields and values:

- First name: John
- Last Name: Doe
- Address: John Doe, 123 Main St, Anytown, USA
- Gender: Male (selected with a radio button)
- Occupation: Student (unchecked), Administrative/Clerk (unchecked), Business (checked), Retiree (checked)

Converting HTML contents to PDF

Essential PDF supports converting HTML contents to PDF. To add the HTML to PDF conversion functionality by using WebKit rendering engine, the following assemblies need to be added as reference to the project.

Assembly Name	Description
Syncfusion.Pdf.Base	This assembly contains the core feature for creating, manipulating and saving PDF documents.
Syncfusion.Compression.Base	This assembly is required for compressing the internal contents of a PDF document.
Syncfusion.HtmlConverter.Base.dll	This assembly is required for converting the HTML to PDF

The QtBinaries available in the WebKitHTMLConverter installed location (**\$System drive\Program Files(x86)\Syncfusion\WebKitHTMLConverter\xx.x.x.xx\QtBinaries**) should be placed in the local machine where the conversion takes place. The physical path of this folder has been set to the [WebKitPath](#) property of the [WebKitConverterSettings](#) class, as shown. By default it will search for WebKit assemblies in bin folder.

C#

```
//Create a WebKitConverterSettings instance
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
```

VB.NET

```
'Create a WebKitConverterSettings instance
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "/QtBinaries/"
```

UWP

```
//PDF supports converting HTML contents to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

ASP.NET CORE

```
//Create a WebKitConverterSettings instance
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"/QtBinaries/";
```

XAMARIN

```
//PDF supports converting HTML contents to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

For converting HTTPS sites, it requires OPENSSL libraries to be installed in the machine. You can install the OPENSSL library by downloading its setup from the following link,

[OpenSSL](#)

WebKit conversion also requires VC++ 2010 redistributable to be installed in the machine. You can use the below mentioned download link,

X86 - <https://www.microsoft.com/en-in/download/details.aspx?id=5555>

X64 - <https://www.microsoft.com/en-in/download/details.aspx?id=14632>

To convert website URL or local HTML file to PDF by using WebKit rendering engine, refer to the following code example.

C#

```
//Create an instance of HTML to PDF converter
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
//Create a WebKitConverterSettings instance
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"/QtBinaries/";
//Assign the WebKit settings to converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert the URL to PDF
PdfDocument document = htmlConverter.Convert("http://www.google.com");
//Save and close the document.
document.Save("Sample.pdf");
document.Close(true);
```

VB.NET

```
'Create an instance of HTML to PDF converter
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
'Create a WebKitConverterSettings instance
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "/QtBinaries/"
'Assign the WebKit settings to converter
htmlConverter.ConverterSettings = webKitSettings
'Convert the URL to PDF
Dim document As PdfDocument = htmlConverter.Convert("http://www.google.com")
'Save and close the document.
document.Save("Sample.pdf")
document.Close(True)
```

UWP

```
//PDF supports converting HTML contents to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

ASP.NET CORE

```
//Create an instance of HTML to PDF converter
HtmlToPdfConverter htmlConverter = new HtmlToPdfConverter();
//Create a WebKitConverterSettings instance
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"/QtBinaries/";
//Assign the WebKit settings to converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert the URL to PDF
PdfDocument document = htmlConverter.Convert("http://www.google.com");
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//PDF supports converting HTML contents to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

To convert the HTML string to PDF, use the following code example.

C#

```
//Create an instance of HTML to PDF converter
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
//Create a WebKitConverterSettings instance
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign the WebKit settings to converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert the HTML string to PDF
PdfDocument document =
htmlConverter.Convert("<html><head><title></title></head><body><div>Hello
World!!!</div></body></html>", "");
//Save and close the document.
document.Save("Sample.pdf");
document.Close(true);
```

VB.NET

```
'Create an instance of HTML to PDF converter
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
'Create a WebKitConverterSettings instance
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "QtBinaries/"
'Assign the WebKit settings to converter
htmlConverter.ConverterSettings = webKitSettings
'Convert the HTML string to PDF
Dim document As PdfDocument =
htmlConverter.Convert("<html><head><title></title></head><body><div>Hello
World!!!</div></body></html>", "")
'Save and close the document.
document.Save("Sample.pdf")
document.Close(True)
```

UWP

```
//PDF supports converting HTML contents to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

ASP.NET CORE

```
//Create an instance of HTML to PDF converter
HtmlToPdfConverter htmlConverter = new HtmlToPdfConverter();
//Create a WebKitConverterSettings instance
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign the WebKit settings to converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert the HTML string to PDF
PdfDocument document =
htmlConverter.Convert("<html><head><title></title></head><body><div>Hello
World!!!</div></body></html>", "");
//Save the document into stream
```

```
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//PDF supports converting HTML contents to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

Merge PDF Documents

Essential PDF supports merging multiple PDF documents from disk and stream using [Merge](#) method. You can merge the multiple PDF documents from disk by specifying the path of the documents in a string array.

Refer to the following code example to merge multiple documents from disk.

C#

```
//Creates the new PDF document
PdfDocument finalDoc = new PdfDocument();
// Creates a string array of source files to be merged.
string[] source = { "file1.pdf, file2.pdf" };
// Merges PDFDocument.
PdfDocument.Merge(finalDoc, source);
//Saves the final document
finalDoc.Save("Sample.pdf");
//closes the document
finalDoc.Close(true);
```

VB.NET

```
'Creates the new PDF document
Dim finalDoc As New PdfDocument()
' Creates a string array of source files to be merged.
Dim source As String() = {"file1.pdf, file2.pdf"}
' Merges PDFDocument.
PdfDocument.Merge(finalDoc, source)
'Saves the final document
finalDoc.Save("Sample.pdf")
'closes the document
finalDoc.Close(True)
```

UWP

```
//PDF supports merging multiple PDF documents from disk only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports merging multiple PDF documents from disk only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//PDF supports merging multiple PDF documents from disk only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

You can merge the PDF document streams by using the following code example.

C#

```
//Creates the destination document
PdfDocument finalDoc = new PdfDocument();
Stream stream1 = File.OpenRead("file1.pdf");
Stream stream2 = File.OpenRead("file2.pdf");
// Creates a PDF stream for merging.
Stream[] streams = { stream1, stream2 };
// Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams);
//Saves the document
finalDoc.Save("sample.pdf");
//closes the document
finalDoc.Close(true);
```

VB.NET

```
'creates the destination document
Dim finalDoc As New PdfDocument()
Dim stream1 As Stream = File.OpenRead("file1.pdf")
Dim stream2 As Stream = File.OpenRead("file2.pdf")
' Creates a PDF stream for merging.
Dim streams As Stream() = {stream1, stream2}
' Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams)
'Saves the document
finalDoc.Save("sample.pdf")
'closes the document
finalDoc.Close(True)
```

UWP

```
//PDF supports merging multiple PDF documents from stream only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

ASP.NET CORE

```
//Creates a PDF document
PdfDocument finalDoc = new PdfDocument();
```

```

FileStream stream1 = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
FileStream stream2 = new FileStream("file2.pdf", FileMode.Open,
FileAccess.Read);
// Creates a PDF stream for merging
Stream[] streams = { stream1, stream2 };
// Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
finalDoc.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
finalDoc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//PDF supports merging multiple PDF documents from stream only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core platforms.

```

Open and Save PDF file in C# and VB.NET

Opening an existing PDF document

You can open an existing PDF document by using the [PdfLoadedDocument](#) class. The following example shows how to load an existing document from physical path.

C#

```

//Open an existing document from file system
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");

```

VB.NET

```

'Open an existing document from file system
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")

```

UWP

```

//PDF supports opening an existing PDF document from physical path only in
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

```

ASP.NET CORE

```

//PDF supports opening an existing PDF document from physical path only in
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

```

XAMARIN

```
//PDF supports opening an existing PDF document from physical path only in  
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

Opening an existing PDF document from Stream

You can open an existing document from stream by using [PdfLoadedDocument](#) class as shown below.

C#

```
//Opens an existing document from stream  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream);
```

VB.NET

```
'Opens an existing document from stream  
Dim loadedDocument As New PdfLoadedDocument(stream)
```

UWP

```
//Opens an existing document from stream  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream);
```

ASP.NET CORE

```
//Opens an existing document from stream  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream);
```

XAMARIN

```
//Opens an existing document from stream  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream);
```

Opening an existing PDF document from byte array

You can open an existing document from byte array by using [PdfLoadedDocument](#) class as shown in the below code snippet.

C#

```
//Open an existing document from byte array  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray);
```

VB.NET

```
'Opens an existing document from byte array  
Dim loadedDocument As New PdfLoadedDocument(byteArray)
```

UWP

```
//Open an existing document from byte array  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray);
```

ASP.NET CORE

```
//Open an existing document from byte array  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray);
```

XAMARIN

```
//Open an existing document from byte array  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray);
```

Opening an Encrypted PDF document

You can open an existing encrypted PDF document from either the file system or the stream or the byte array using the following overloads as shown below

C#

```
//Open an existing encrypted document from disk.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf",  
"password");
```

VB.NET

```
'Open an existing encrypted document from disk.  
Dim loadedDocument As New PdfLoadedDocument("Input.pdf", "password")
```

UWP

```
//PDF supports opening an Encrypted PDF document from physical path only in  
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports opening an Encrypted PDF document from physical path only in  
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//PDF supports opening an Encrypted PDF document from physical path only in  
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

C#

```
//Open an existing encrypted document from stream.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream,  
"password");
```

VB.NET

```
'Open an existing encrypted document from stream.  
Dim loadedDocument As New PdfLoadedDocument(stream, "password")
```

UWP

```
//Open an existing encrypted document from stream.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream,
"password");
```

ASP.NET CORE

```
//Open an existing encrypted document from stream.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream,
"password");
```

XAMARIN

```
//Open an existing encrypted document from stream.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream,
"password");
```

C#

```
//Open an existing encrypted document from byte array.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray,
"password");
```

VB.NET

```
'Open an existing encrypted document from byte array.
Dim loadedDocument As New PdfLoadedDocument(byteArray, "password")
```

UWP

```
//Open an existing encrypted document from byte array.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray,
"password");
```

ASP.NET CORE

```
//Open an existing encrypted document from byte array.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray,
"password");
```

XAMARIN

```
//Open an existing encrypted document from byte array.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray,
"password");
```

Opening a corrupted PDF document

You can open a corrupted PDF document from either the file system or the stream or the byte array using the following overloads as shown below

C#

```
//Open an existing corrupted document from disk.
```

```
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf", true);
```

VB.NET

```
'Open an existing corrupted document from disk.  
Dim loadedDocument As New PdfLoadedDocument("Input.pdf", True)
```

UWP

```
//PDF supports opening a corrupted PDF document from physical path only in  
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports opening a corrupted PDF document from physical path only in  
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//PDF supports opening a corrupted PDF document from physical path only in  
Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

C#

```
//Open an existing corrupted document from stream.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream, true);
```

VB.NET

```
'Open an existing corrupted document from stream.  
Dim loadedDocument As New PdfLoadedDocument(stream, True)
```

UWP

```
//Open an existing corrupted document from stream.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream, true);
```

ASP.NET CORE

```
//Open an existing corrupted document from stream.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream, true);
```

XAMARIN

```
//Open an existing corrupted document from stream.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream, true);
```

C#

```
//Open an existing corrupted document from byte array.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray, true);
```

VB.NET

```
'Open an existing corrupted document from byte array.  
Dim loadedDocument As New PdfLoadedDocument(byteArray, True)
```

UWP

```
//Open an existing corrupted document from byte array.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray, true);
```

ASP.NET CORE

```
//Open an existing corrupted document from byte array.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray, true);
```

XAMARIN

```
//Open an existing corrupted document from byte array.  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(byteArray, true);
```

Note: 1. The OpenAndRepair overload is capable of resolving basic cross reference offset issues and cannot repair complex document corruption.

2. Using this overload may cause performance delay when compared with other overloads, due to the repairing process.

Saving a PDF document to file system

You can save the manipulated PDF document to file system using [Save](#) method of [PdfLoadedDocument](#) class.

C#

```
//Load an existing PDF document  
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");  
//To-Do some manipulation  
//To-Do some manipulation  
//Save the document in file system  
loadedDocument.Save("Output.pdf");
```

VB.NET

```
' Load an existing PDF document  
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")  
'To-Do some manipulation  
'To-Do some manipulation  
'Save the document in file system  
loadedDocument.Save("Output.pdf")
```

UWP

```
//Load the PDF document as stream
```

```

Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(pdfStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);

```

```
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Saving a PDF document to stream

You can also save the manipulated PDF document to stream using overloads of [Save](#) method.

C#

```
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Save the document stream
loadedDocument.Save(stream);
```

VB.NET

```
' Load an existing PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'To-Do some manipulation
'To-Do some manipulation
'Creates an instance of memory stream
Dim stream As New MemoryStream()
'Save the document to stream
loadedDocument.Save(stream)
```

UWP

```
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(pdfStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream.
```

```
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
```

Saving a PDF document into the same file or stream

You can also resave the manipulated PDF document to the same file using overloads of [Save](#) method.

C#

```
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//To-Do some manipulation
//To-Do some manipulation
//Resave the document to the same file
loadedDocument.Save();
```

VB.NET

```
' Load an existing PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'To-Do some manipulation
'To-Do some manipulation
'Resave the document to the same file
loadedDocument.Save()
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
```

```
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//To-Do some manipulation
//To-Do some manipulation
//Resave the document to the same file
await loadedDocument.Save();
```

ASP.NET CORE

```
//PDF supports saving a PDF document into the same file only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

XAMARIN

```
//PDF supports saving a PDF document into the same file only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

C#

```
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(stream);
//To-Do some manipulation
//To-Do some manipulation
//Resave the document to the same stream
loadedDocument.Save();
```

VB.NET

```
' Load an existing PDF document
Dim loadedDocument As New PdfLoadedDocument(stream)
'To-Do some manipulation
'To-Do some manipulation
'Resave the document to the same stream
loadedDocument.Save()
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//To-Do some manipulation
//To-Do some manipulation
```

```
//Resave the document to the same file
await loadedDocument.Save();
```

ASP.NET CORE

```
//PDF supports saving a PDF document into the same file only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

XAMARIN

```
//PDF supports saving a PDF document into the same file only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

Closing a document

After the document manipulation and save operation are completed, you should close the instance of [PdfLoadedDocument](#), in order to release all the memory consumed by PDF DOM. The following code snippet illustrates how to close a [PdfLoadedDocument](#) instance.

C#

```
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//To-Do some manipulation
//To-Do some manipulation
//Save the document in file system
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
' Load an existing PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'To-Do some manipulation
'To-Do some manipulation
'Save the document in file system
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(pdfStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream.
```

```
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
```

Note: Close() method will dispose all the memory consumed by PDF DOM.

Close(true) method will dispose all the memory consumed by PDF DOM as well as disposes its document stream

Working with Document

Adding the document settings

Essential PDF supports various page setting options to control the page display, through [PageSettings](#) property of [PdfDocument](#).

You can choose the standard or custom page size when you add a page to the PDF document. This below sample illustrates how to create a PDF document with standard page size.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Add a page to the document.
PdfPage page = document.Pages.Add();
```

```

//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Set the page size.
document.PageSettings.Size = PdfPageSize.A4
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

You can create a PDF document with custom page size by using the following code snippet.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the custom page size.
document.PageSettings.Size = new.SizeF(200,300);
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Set the custom page size.
document.PageSettings.Size = New.SizeF(200, 300)
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the custom page size.
document.PageSettings.Size = new SizeF(200, 300);
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the custom page size.
document.PageSettings.Size = new Syncfusion.Drawing.SizeF(200, 300);
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
```

```

PdfDocument document = new PdfDocument();
// Set the custom page size.
document.PageSettings.Size = new Syncfusion.Drawing.SizeF(200, 300);
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

You can change page orientation from portrait to landscape, through [PdfPageOrientation](#) Enum by using the following code snippet.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to landscape
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
document.Save("Output.pdf");
//Close the document.

```

```
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
' Set the page size.
document.PageSettings.Size = PdfPageSize.A4
'Change the page orientation to landscape
document.PageSettings.Orientation = PdfPageOrientation.Landscape
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to landscape
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
```

```

document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to landscape
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to landscape
document.PageSettings.Orientation = PdfPageOrientation.Landscape;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

```

```
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

You can also change orientation by setting the rotation angle using [PdfPageRotateAngle](#) Enum. The following code snippet illustrates the same.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to 90°
document.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Set the page size.
document.PageSettings.Size = PdfPageSize.A4
'Change the page orientation to 90°
document.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to 90°
document.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to 90°
document.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
```

```
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
// Set the page size.
document.PageSettings.Size = PdfPageSize.A4;
//Change the page orientation to 90°
document.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Creating sections in a PDF

PDF sections are parts of the PDF document, which may contain one or more pages with their unique page settings. The following code snippet illustrates how to create a [PdfSection](#) in a PDF document.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a section to PDF document.
PdfSection section = document.Sections.Add();
//Add pages to the section
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page
```

```

PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a section to PDF document.
Dim section As PdfSection = document.Sections.Add()
'Add pages to the section
Dim page As PdfPage = section.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0, 0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a section to PDF document.
PdfSection section = document.Sections.Add();
//Add pages to the section
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a section to PDF document.
PdfSection section = document.Sections.Add();
//Add pages to the section
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();

PdfSection section = document.Sections.Add();
//Add pages to the section
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Printing PDF document

To print a PDF document, the following assemblies have to be added as references to the project.

1. Syncfusion.Compression.Base.dll
2. Syncfusion.Pdf.Base.dll
3. Syncfusion.PdfViewer.Windows.dll

The following code snippet illustrates how to print a PDF document.

C#

```

PdfDocumentView viewer = new PdfDocumentView();
//Load the PDF document
viewer.Load("Input.pdf");
//Initialize print dialog.
PrintDialog dialog = new PrintDialog();
dialog.AllowPrintToFile = true;
dialog.AllowSomePages = true;
dialog.AllowCurrentPage = true;
dialog.Document = viewer.PrintDocument;
//Print the PDF document
dialog.Document.Print();
//Dispose the viewer
viewer.Dispose();

```

VB.NET

```

Dim viewer As New PdfDocumentView()
'Load the PDF document
viewer.Load("Input.pdf")
'Initialize print dialog.
Dim dialog As New PrintDialog()
dialog.AllowPrintToFile = True
dialog.AllowSomePages = True
dialog.AllowCurrentPage = True
dialog.Document = viewer.PrintDocument
'Print the PDF document
dialog.Document.Print()
'Dispose the viewer
viewer.Dispose()

```

Working with document properties

Essential PDF allows you to set, read and modify the document information of a PDF like Author, CreationDate, Subject, Title, and Producer etc. The [DocumentInformation](#) property of the [PdfDocument](#) or [PdfLoadedDocument](#) provides access to this information.

The following code snippet illustrates how to set PDF document information.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Set document information.
document.DocumentInformation.Author = "Syncfusion";
document.DocumentInformation.CreationDate = DateTime.Now;
document.DocumentInformation.Creator = "Essential PDF";
document.DocumentInformation.Keywords = "PDF";
document.DocumentInformation.Subject = "Document information DEMO";
document.DocumentInformation.Title = "Essential PDF Sample";
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Set document information.
document.DocumentInformation.Author = "Syncfusion"
document.DocumentInformation.CreationDate = DateTime.Now
document.DocumentInformation.Creator = "Essential PDF"
document.DocumentInformation.Keywords = "PDF"
document.DocumentInformation.Subject = "Document information DEMO"
document.DocumentInformation.Title = "Essential PDF Sample"
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0, 0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Set document information.
document.DocumentInformation.Author = "Syncfusion";
document.DocumentInformation.CreationDate = DateTime.Now;
document.DocumentInformation.Creator = "Essential PDF";
document.DocumentInformation.Keywords = "PDF";
document.DocumentInformation.Subject = "Document information DEMO";
document.DocumentInformation.Title = "Essential PDF Sample";
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Set document information.
document.DocumentInformation.Author = "Syncfusion";
document.DocumentInformation.CreationDate = DateTime.Now;
document.DocumentInformation.Creator = "Essential PDF";
document.DocumentInformation.Keywords = "PDF";
document.DocumentInformation.Subject = "Document information DEMO";
document.DocumentInformation.Title = "Essential PDF Sample";
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
```

```
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.

//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

The following code snippet shows how to read and modify the document properties of an existing PDF document.

C#

```
//Create a new PDF document.
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Modify document information.
document.DocumentInformation.Author = "Syncfusion";
document.DocumentInformation.CreationDate = DateTime.Now;
document.DocumentInformation.Creator = "Essential PDF";
document.DocumentInformation.Keywords = "PDF";
document.DocumentInformation.Subject = "Document information DEMO";
document.DocumentInformation.Title = "Essential PDF Sample";
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfLoadedDocument("Input.pdf")
'Modify document information.
document.DocumentInformation.Author = "Syncfusion"
document.DocumentInformation.CreationDate = DateTime.Now
document.DocumentInformation.Creator = "Essential PDF"
document.DocumentInformation.Keywords = "PDF"
document.DocumentInformation.Subject = "Document information DEMO"
document.DocumentInformation.Title = "Essential PDF Sample"
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await document.OpenAsync(file);
//Modify document information.
document.DocumentInformation.Author = "Syncfusion";
document.DocumentInformation.CreationDate = DateTime.Now;

"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Performing incremental update for PDF document

The Essential PDF supports incremental update for PDF document. The content of a PDF file can be updated incrementally without rewriting the entire file. Changes are appended to the end of the file, leaving its original contents intact. The main benefit is small changes to a large PDF document can be saved quickly but the resultant document size gets increased compared with the original PDF document. Disabling the [IncrementalUpdate](#) of [PdfFileStructure](#) will rewrite the entire file, which results in a smaller PDF. This is illustrated in the following code sample.

C#

```
//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = false;
//Set the compression level
loadedDocument.Compression = PdfCompressionLevel.Best;
//Save the document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = False
'Set the compression level
loadedDocument.Compression = PdfCompressionLevel.Best
'Save the document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
```

```

//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = false;
//Set the compression level
loadedDocument.Compression = PdfCompressionLevel.Best;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open, FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = false;
//Set the compression level
loadedDocument.Compression = PdfCompressionLevel.Best;
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = false;
//Set the compression level
loadedDocument.Compression = PdfCompressionLevel.Best;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);

```

```
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Choosing the viewer preferences

Essential PDF allows you to set various PDF viewer preferences to be used when the generated PDF document is displayed in a PDF reader application.

You can hide the menu bar and toolbar by enabling [HideMenubar](#) and [HideToolbar](#) properties of [PdfViewerPreferences](#) respectively. This is illustrated in the following code sample.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Hide viewer application's menu bar.
document.ViewerPreferences.HideMenubar = true;
//Hide viewer application's toolbar.
document.ViewerPreferences.HideToolbar = true;
//Shows user interface elements in the document's window (such as scroll
bars and navigation controls).
document.ViewerPreferences.HideWindowUI = false;
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
```

```

Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
'Hides viewer application's menu bar.
document.ViewerPreferences.HideMenubar = True
'Hides viewer application's toolbar.
document.ViewerPreferences.HideToolbar = True
'Shows user interface elements in the document's window (such as scroll bars
and navigation controls).
document.ViewerPreferences.HideWindowUI = False
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Hide viewer application's menu bar.
document.ViewerPreferences.HideMenubar = true;
//Hide viewer application's toolbar.
document.ViewerPreferences.HideToolbar = true;
//Shows user interface elements in the document's window (such as scroll
bars and navigation controls).
document.ViewerPreferences.HideWindowUI = false;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.

```

```

PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Hide viewer application's menu bar.
document.ViewerPreferences.HideMenubar = true;
//Hide viewer application's toolbar.
document.ViewerPreferences.HideToolbar = true;
//Shows user interface elements in the document's window (such as scroll
bars and navigation controls).
document.ViewerPreferences.HideWindowUI = false;
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Hide viewer application's menu bar.
document.ViewerPreferences.HideMenubar = true;
//Hide viewer application's toolbar.
document.ViewerPreferences.HideToolbar = true;
//Shows user interface elements in the document's window (such as scroll
bars and navigation controls).
document.ViewerPreferences.HideWindowUI = false;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file

```

```
//The operation in Save under Xamarin varies between Windows Phone, Android
//and iOS platforms. Please refer PDF/Xamarin section for respective code
//samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

You can also allow the reader application to initially display the bookmarks, thumbnails or attachments using [PdfPageMode](#) Enum.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Show the attachments panel.
document.ViewerPreferences.PageMode = PdfPageMode.UseAttachments;
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
'Show the attachments panel.
document.ViewerPreferences.PageMode = PdfPageMode.UseAttachments
'Save the document.
document.Save("Output.pdf")
'Close the document.
```

```
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Show the attachments panel.
document.ViewerPreferences.PageMode = PdfPageMode.UseAttachments;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.

PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Show the attachments panel.
document.ViewerPreferences.PageMode = PdfPageMode.UseAttachments;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adding document action

Please refer to the [actions](#) section for more document level operations using the PdfJavascript and PDF actions.

Working in Multi-Threading Environment

Essential PDF allows you to create or modify PDF documents simultaneously in multi-threading environment using [EnableThreadSafe](#) property of [PdfDocument](#) class.

The following code sample illustrates how to create a PDF document in multi-threading environment.

C#

```

IEnumerable<int> works = Enumerable.Range(0, 100);
Parallel.ForEach(works, index => GeneratePDF(index));
private void GeneratePDF(int index)
{
//Enable the thread safe in PDF document.
PdfDocument.EnableThreadSafe = true;
//Create a new PDF document.

```

```

PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
string name = Guid.NewGuid().ToString();
//Save the document.
document.Save(name+".pdf");
//Close the document.
document.Close(true);
}

```

VB.NET

```

Dim works As IEnumerable(Of Integer) = Enumerable.Range(0, 100)
Parallel.ForEach(works, Sub(index) GeneratePDF(index))
Private Sub GeneratePDF(ByVal index As Integer)
    'Enable the thread safe in PDF document.
    PdfDocument.EnableThreadSafe = True
    'Create a new PDF document.
    Dim document As PdfDocument = New PdfDocument()
    'Add a page to the document.
    Dim page As PdfPage = document.Pages.Add()
    'Create PDF graphics for the page.
    Dim graphics As PdfGraphics = page.Graphics
    'Set the standard font.
    Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
    'Draw the text.
    graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0, 0))
    Dim name As String = Guid.NewGuid().ToString()
    'Save the document.
    document.Save(name + ".pdf")
    'Close the document.
    document.Close(True)
End Sub

```

You can also modify the existing PDF document in multi-threading environment by using the following code snippet.

C#

```

IEnumerable<int> works = Enumerable.Range(0, 100);
Parallel.ForEach(works, index => GeneratePDF(index));
private void GeneratePDF(int index)
{
    //Enable the thread safe in PDF document.
    PdfDocument.EnableThreadSafe = true;
    //Load a PDF document.
    PdfLoadedDocument doc = new PdfLoadedDocument("input.pdf");
    //Get first page from document
}

```

```

PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
string name = Guid.NewGuid().ToString();
//Save the document.
doc.Save(name+".pdf");
//Close the document.
doc.Close(true);
}

```

VB.NET

```

Dim works As IEnumerable(Of Integer) = Enumerable.Range(0, 100)
Parallel.ForEach(works, Sub(index) GeneratePDF(index))
Private Sub GeneratePDF(ByVal index As Integer)
'Enable the thread safe in PDF document.
PdfDocument.EnableThreadSafe = True
'Load a PDF document.
Dim doc As PdfLoadedDocument = New PdfLoadedDocument("input.pdf")
'Get first page from document
Dim page As PdfLoadedPage = doc.Pages(0)
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Set the standard font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
Dim name As String = Guid.NewGuid().ToString()
'Save the document.
doc.Save(name + ".pdf")
'Close the document.
doc.Close(True)
End Sub

```

Uniform Resource Naming in PDF document

The Essential PDF allows you to create a PDF document with proper uniform resource naming by using the [EnableUniqueResourceNaming](#) property available in the [PdfDocument](#) instance. By default, the resource naming is added uniquely. Disabling the `EnableUniqueResourceNaming` property will create a PDF document with uniform resource names.

The following code snippet explains how to have uniform resource naming in a PDF document.

C#

```

//Disable unique resource naming
PdfDocument.EnableUniqueResourceNaming = false;
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document

```

```

PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new instance for PDF font
PdfFont font1 = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text
graphics.DrawString("Hello World!!!", font1, PdfBrushes.Blue, new PointF(50,
50));
//Create new instance for PDF font
PdfFont font2 = new PdfTrueTypeFont(new Font("Arial", 20), true);
//Draw the text
graphics.DrawString("Hello World!!!", font2, PdfBrushes.Blue, new PointF(50,
100));
//Create new instance for PDF font
PdfFont font3 = new PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20);
//Draw the text
graphics.DrawString("こんにちは世界", font3, PdfBrushes.Blue, new PointF(50,
150));
//Save and close the document
doc.Save("Output.pdf");
doc.Close(true);

```

VB.NET

```

'Disable unique resource naming
PdfDocument.EnableUniqueResourceNaming = False
'Create a new PDF document
Dim doc As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create new instance for PDF font
Dim font1 As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text
graphics.DrawString("Hello World!!!", font1, PdfBrushes.Blue, New PointF(50,
50))
'Create new instance for PDF font
Dim font2 As PdfFont = New PdfTrueTypeFont(New Font("Arial", 20), True)
'Draw the text
graphics.DrawString("Hello World!!!", font2, PdfBrushes.Blue, New PointF(50,
100))
'Create new instance for PDF font
Dim font3 As PdfFont = New
PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20)
'Draw the text
graphics.DrawString("こんにちは世界", font3, PdfBrushes.Blue, New PointF(50,
150))
'Save and close the document
doc.Save("Output.pdf")
doc.Close(True)

```

UWP

```
//Disable unique resource naming
```

```

PdfDocument.EnableUniqueResourceNaming = false;
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new instance for PDF font
PdfFont font1 = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text
graphics.DrawString("Hello World!!!", font1, PdfBrushes.Blue, new PointF(50,
50));
//Create new instance for PDF font
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Arial.ttf");
PdfFont font2 = new PdfTrueTypeFont(fontStream, 20);
//Draw the text
graphics.DrawString("Hello World!!!", font2, PdfBrushes.Blue, new PointF(50,
100));
//Create new instance for PDF font
PdfFont font3 = new PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20);
//Draw the text
graphics.DrawString("こんにちは世界", font3, PdfBrushes.Blue, new PointF(50,
150));
//Create memory stream
MemoryStream ms = new MemoryStream();
//Open the document in browser after saving it
doc.Save(ms);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respective code samples
Save(ms, "Output.pdf");

```

ASP.NET CORE

```

//Disable unique resource naming
PdfDocument.EnableUniqueResourceNaming = false;
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new instance for PDF font
PdfFont font1 = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text
graphics.DrawString("Hello World!!!", font1, PdfBrushes.Blue, new PointF(50,
50));
//Create new instance for PDF font
FileStream fontStream = new FileStream("Arial.ttf", FileMode.Open,
FileAccess.Read);
PdfFont font2 = new PdfTrueTypeFont(fontStream, 20);
//Draw the text

```

```

graphics.DrawString("Hello World!!!", font2, PdfBrushes.Blue, new PointF(50,
100));
//Create new instance for PDF font
PdfFont font3 = new PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20);
//Draw the text
graphics.DrawString("こんにちは世界", font3, PdfBrushes.Blue, new PointF(50,
150));
//Saving the PDF to the MemoryStream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Set the position as '0'
stream.Position = 0;
//Download the PDF document in the browser
FileStreamResult fileStreamResult = new FileStreamResult(stream,
"application/pdf");
fileStreamResult.FileName = "Output.pdf";
return fileStreamResult;

```

XAMARIN

```

//Disable unique resource naming

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Memory Optimization

Essential PDF provides support for optimization of memory using [EnableMemoryOptimization](#) property in [PdfDocument](#) instance. Optimization will be effective only with merge, append and import functions.

Enabling this property will optimize the memory but difference in time occurs based on the document size. This is illustrated in the following code sample.

C#

```

//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("file1.pdf");
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Enable memory optimization
document.EnableMemoryOptimization = true;
//Append the document with source document
document.Append(loadedDocument);
//Save the PDF document
document.Save("Output.pdf");
//Close the documents
document.Close(true);
loadedDocument.Close(true);

```

VB.NET

```

'Load an existing PDF document
Dim loadedDocument As New PdfLoadedDocument("file1.pdf")
'Create a new PDF document
Dim document As New PdfDocument()
'Enable memory optimization
document.EnableMemoryOptimization = True
'Append the document with source document
document.Append(loadedDocument)
'Save the PDF document
document.Save("Output.pdf")
'Close the documents
document.Close(True)
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();

```

```

picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Create an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Load an existing PDF document through Open method of PdfLoadedDocument
class
await loadedDocument.OpenAsync(file);
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Enable memory optimization
document.EnableMemoryOptimization = true;
//Append the document with source document
document.Append(loadedDocument);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
Await document.SaveAsync(stream);
//Close the documents
document.Close(true);
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load an existing PDF document
FileStream docStream = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Enable memory optimization
document.EnableMemoryOptimization = true;
//Append the document with source document
document.Append(loadedDocument);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents
document.Close(true);
loadedDocument.Close(true);
//Defining the content type for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream

```

```

Stream docStream =
    typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
    file1.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Enable memory optimization
document.EnableMemoryOptimization = true;
//Append the document with source document
document.Append(loadedDocument);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the documents
document.Close(true);
loadedDocument.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
    "application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
    "application/pdf", stream);
}

```

Find corrupted PDF document

Syncfusion PDF Library provides support to check whether the existing PDF document is corrupted or not with corruption details. The following code snippet explains how to find the corrupted PDF document.

C#

```

//Create a new instance for the PDF analyzer
PdfDocumentAnalyzer analyzer = new PdfDocumentAnalyzer("Input.pdf");
//Get the syntax errors
SyntaxAnalyzerResult result = analyzer.AnalyzeSyntax();
//Check whether the document is corrupted or not
if (result.IsCorrupted)
{
    //Get syntax error details from results.error
    StringBuilder builder = new StringBuilder();
    builder.AppendLine("The PDF document is corrupted.");
    int count = 1;
    foreach (PdfException exception in result.Errors)
    {
        builder.AppendLine(count++.ToString() + ": " + exception.Message);
    }
}
else
{

```

```
//No syntax error found in the provided PDF document
}
analyzer.Close();
```

VB.NET

```
'Create a new instance for the PDF analyzer
Dim analyzer As PdfDocumentAnalyzer = New PdfDocumentAnalyzer("Input.pdf")
'Get the syntax errors
Dim result As SyntaxAnalyzerResult = analyzer.AnalyzeSyntax
'Check whether the document is corrupted or not
If result.IsCorrupted Then
'Get syntax error details from results.error
builder = New StringBuilder
builder.AppendLine("The PDF document is corrupted.")
Dim count = 1
For Each exception As PdfException In result.Errors
builder.AppendLine(Math.Min(Threading.Interlocked.Increment(count), count -
1).ToString & ": " & exception.Message)
Next
Else
'No syntax error found in the provided PDF document.
End If
analyzer.Close()
```

UWP

```
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Create a new instance for the PDF analyzer
PdfDocumentAnalyzer analyzer = new PdfDocumentAnalyzer(pdfStream);
//Get the syntax errors.
SyntaxAnalyzerResult result = analyzer.AnalyzeSyntax();
//Check whether the document is corrupted or not
if (result.IsCorrupted)
{
//Get syntax error details from results.error
StringBuilder builder = new StringBuilder();
builder.AppendLine("The PDF document is corrupted.");
int count = 1;
foreach (PdfException exception in result.Errors)
{
builder.AppendLine(count++.ToString() + ": " + exception.Message);
}
}
else
{
//No syntax error found in the provided PDF document
}
analyzer.Close();
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
//Create a new instance for the PDF analyzer
PdfDocumentAnalyzer analyzer = new PdfDocumentAnalyzer(docStream);
//Get the syntax errors
SyntaxAnalyzerResult result = analyzer.AnalyzeSyntax();
//Check whether the document is corrupted or not
if (result.IsCorrupted)
{
//Get syntax error details from results.error
StringBuilder builder = new StringBuilder();
builder.AppendLine("The PDF document is corrupted.");
int count = 1;
foreach (PdfException exception in result.Errors)
{
builder.AppendLine(count++.ToString() + ": " + exception.Message);
}
}
else
{
//No syntax error found in the provided PDF document
}
analyzer.Close();
```

XAMARIN

```
//Load the PDF document as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
//Create a new instance for the PDF analyzer
PdfDocumentAnalyzer analyzer = new PdfDocumentAnalyzer(docStream);
//Get the syntax errors
SyntaxAnalyzerResult result = analyzer.AnalyzeSyntax();
//Check whether the document is corrupted or not
if (result.IsCorrupted)
{
//Get syntax error details from results.error
StringBuilder builder = new StringBuilder();
builder.AppendLine("The PDF document is corrupted.");
int count = 1;
foreach (PdfException exception in result.Errors)
{
builder.AppendLine(count++.ToString() + ": " + exception.Message);
}
}
else
{
//No syntax error found in the provided PDF document
}
analyzer.Close();
```

Working with Pages

Adding a new page to the document

The following code sample explains you on how to add a [PdfPage](#) in a PDF document. When multiple pages are added, the new page is always added to the end of the document.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Color.Black);
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draw the text.
graphics.DrawString("Hello world!", font, brush, new PointF(20, 20));
//Save the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Create a solid brush.
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 14)
'Draw the text.
graphics.DrawString("Hello world!", font, brush, New PointF(20, 20))
'Save the document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(new PdfColor(0, 0, 0));
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draw the text.
graphics.DrawString("Hello world!", font, brush, new PointF(20, 20));
```

```
//Save the document as stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Syncfusion.Drawing.Color.Black);
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draw the text.
graphics.DrawString("Hello world!", font, brush, new
Syncfusion.Drawing.PointF(20, 20));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Syncfusion.Drawing.Color.Black);
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draw the text.
graphics.DrawString("Hello world!", font, brush, new
Syncfusion.Drawing.PointF(20, 20));
//Save the document as stream.
```

```

MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
        "application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
        "application/pdf", stream);
}

```

Inserting pages in a document

You can insert an empty page at any location in the existing PDF document using [Insert](#) method. The below code snippet explains the same.

C#

```

//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Insert a new page in the beginning of the document
loadedDocument.Pages.Insert(0);
//Save and close the document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Insert a new page in the beginning of the document
loadedDocument.Pages.Insert(0)
'Save and close the document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class

```

```

await loadedDocument.OpenAsync(file);
//Insert a new page in the beginning of the document
loadedDocument.Pages.Insert(0);
//Save the document as stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Insert a new page in the beginning of the document
loadedDocument.Pages.Insert(0);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Insert a new page in the beginning of the document
loadedDocument.Pages.Insert(0);
//Save the document as stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

```

```
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Adding margin to the PDF pages

You can add margin to all the PDF pages of the PDF document using the [PageSettings](#) property. The following code snippet illustrates the same.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Set margin for all the pages
document.PageSettings.Margins.All = 10;
//Add a page.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Creates a solid brush.
PdfBrush brush = new PdfSolidBrush(Color.Black);
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draw the text.
graphics.DrawString("Hello world!", font, brush, new PointF(20, 20));
//Save and close the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Set margin for all the pages
document.PageSettings.Margins.All = 10
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Create a solid brush.
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 14)
'Draw the text.
graphics.DrawString("Hello world!", font, brush, New PointF(20, 20))
'Save the document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Set margin for all the pages
document.PageSettings.Margins.All = 10;
//Add a page.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Creates a solid brush.
PdfBrush brush = new PdfSolidBrush(new PdfColor(0, 0, 0));

Adding sections with different page settings

Essential PDF supports adding sections with different page settings like [Height](#), [Margins](#), [Orientation](#), [Rotate](#), [Size](#), [Transition](#) and [Width](#). You can add sections to a PDF document by using the [PdfSection](#) available in [PdfDocument](#) instance and create page settings to the PdfSection using the [PageSettings](#) property.

The following code snippet explains how to add more sections to a PDF document with different page settings.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create a solid brush and standard font
PdfBrush brush = new PdfSolidBrush(Color.Black);
```

```
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);  
//Section - 1  
//Add new section to the document  
PdfSection section = document.Sections.Add();  
//Create page settings to the section  
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle0;  
section.PageSettings.Size = PdfPageSize.A5;  
section.PageSettings.Width = 300;  
section.PageSettings.Height = 400;  
//Add page to the section and initialize graphics for the page  
PdfPage page = section.Pages.Add();  
PdfGraphics graphics = page.Graphics;  
//Draw simple text on the page  
graphics.DrawString("Rotated by 0 degrees", font, brush, new PointF(20,  
20));  
//Section - 2  
//Add new section to the document  
section = document.Sections.Add();  
//Create page settings to the section  
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;  
section.PageSettings.Width = 300;  
section.PageSettings.Height = 400;  
//Add page to the section and initialize graphics for the page  
page = section.Pages.Add();  
graphics = page.Graphics;  
//Draw simple text on the page  
graphics.DrawString("Rotated by 90 degrees", font, brush, new PointF(20,  
20));  
//Section - 3  
//Add new section to the document  
section = document.Sections.Add();  
//Create page settings to the section  
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle180;  
section.PageSettings.Width = 500;  
section.PageSettings.Height = 200;  
//Add page to the section and initialize graphics for the page  
page = section.Pages.Add();  
graphics = page.Graphics;  
//Draw simple text on the page  
graphics.DrawString("Rotated by 180 degrees", font, brush, new PointF(20,  
20));  
//Section - 4  
//Add new section to the document  
section = document.Sections.Add();  
//Create page settings to the section  
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle270;  
section.PageSettings.Width = 300;  
section.PageSettings.Height = 200;  
//Add page to the section and initialize graphics for the page  
page = section.Pages.Add();  
graphics = page.Graphics;  
//Draw simple text on the page  
graphics.DrawString("Rotated by 270 degrees", font, brush, new PointF(20,  
20));  
//Save the document  
document.Save("Output.pdf");  
//Close the instance of PdfDocument
```

```
document.Close(true);
```

Get number of pages from a PDF document

You can get page count from the existing PDF document as shown in the following code snippet.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Get the page count.
int pageCount = loadedDocument.Pages.Count;
//Close the document.
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get the page count.
Dim pageCount As Integer = loadedDocument.Pages.Count
'Close the document.
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the page count.
int pageCount = loadedDocument.Pages.Count;
//Close the document.
loadedDocument.Close(true);
```

ASP.NET CORE

```
//Load the PDF document.
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the page count.
int pageCount = loadedDocument.Pages.Count;
//Close the document.
loadedDocument.Close(true);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf ");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the page count.
int pageCount = loadedDocument.Pages.Count;
//Close the document.
loadedDocument.Close(true);
```

Importing pages from an existing document.

Essential PDF allows you to import a page or import a range of pages from one document to the other. The following code sample illustrates how to import a range of pages from an existing document using [ImportPageRange](#) method.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Create a new PDF document.
PdfDocument document = new PdfDocument();
int startIndex = 0;
int endIndex = loadedDocument.Pages.Count - 1;
//Import all the pages to the new PDF document.
document.ImportPageRange(loadedDocument, startIndex, endIndex);
//Save the document.
document.Save("Output.pdf");
//Close both document instances.
loadedDocument.Close(true);
document.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Create a new PDF document.
Dim document As New PdfDocument()
Dim startIndex As Integer = 0
Dim endIndex As Integer = loadedDocument.Pages.Count - 1
'Import all the pages to the new PDF document.
document.ImportPageRange(loadedDocument, startIndex, endIndex)
'Save the document.
document.Save("Output.pdf")
'Close both document instances.
loadedDocument.Close(True)
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
```

```

picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Create a new PDF document.
PdfDocument document = new PdfDocument();
int startIndex = 0;
int endIndex = loadedDocument.Pages.Count - 1;
//Import all the pages to the new PDF document.
document.ImportPageRange(loadedDocument, startIndex, endIndex);
//Save the document as stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document instances.
loadedDocument.Close(true);
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document.
FileStream docStream = new FileStream("Input.pdf", FileMode.Open, FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Create a new PDF document.
PdfDocument document = new PdfDocument();
int startIndex = 0;
int endIndex = loadedDocument.Pages.Count - 1;
//Import all the pages to the new PDF document.
document.ImportPageRange(loadedDocument, startIndex, endIndex);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document instances.
document.Close(true);
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Create a new PDF document.
PdfDocument document = new PdfDocument();
int startIndex = 0;
int endIndex = loadedDocument.Pages.Count - 1;
//Import all the pages to the new PDF document.
document.ImportPageRange(loadedDocument, startIndex, endIndex);
//Save the document as stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document instances.
document.Close(true);
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Importing pages from an existing document without bookmarks.

You can import a page or range of pages from one document to other without bookmarks. Refer to the following code sample.

Note: Performance will be effective only in the large PDF document.

C#

```

//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Create the new PDF document
PdfDocument document = new PdfDocument();
int startIndex = 0;
int endIndex = loadedDocument.Pages.Count - 1;
//Import all the pages to the new PDF document without bookmarks
document.ImportPageRange(loadedDocument, startIndex, endIndex, false);
//Save the document
document.Save("Output.pdf");
//Close both document instances
loadedDocument.Close(true);
document.Close(true);
System.Diagnostics.Process.Start("Output.pdf");

```

VB.NET

```

'Load the PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Create the new PDF document
Dim document As PdfDocument = New PdfDocument()
Dim startIndex As Integer = 0
Dim endIndex As Integer = loadedDocument.Pages.Count - 1
'Import all the pages to the new PDF document without bookmarks
document.ImportPageRange(loadedDocument, startIndex, endIndex, False)
'Save the document
document.Save("Output.pdf")
'Close both the document instances
loadedDocument.Close(True)
document.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Create the new PDF document
PdfDocument document = new PdfDocument();
int startIndex = 0;
int endIndex = loadedDocument.Pages.Count - 1;
//Import all the pages to the new PDF document
document.ImportPageRange(loadedDocument, startIndex, endIndex, false);
//Save the document as stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document instances
loadedDocument.Close(true);
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Create the new PDF document
PdfDocument document = new PdfDocument();
int startIndex = 0;
int endIndex = loadedDocument.Pages.Count - 1;
//Import all the pages to the new PDF document

```

```

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Rearranging pages in an existing document

You can rearrange the pages in an existing PDF document using [ReArrange](#) method. This method uses zero based start index. The following code snippet illustrates the same.

C#

```
//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Rearrange the page by index
loadedDocument.Pages.ReArrange(new int[] {1, 0});
//Save and close the document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Rearrange the page by index
loadedDocument.Pages.ReArrange(New Integer() {1, 0})
'Save and close the document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Rearrange the page by index
loadedDocument.Pages.ReArrange(new int[] { 1, 0 });
//Save the document as stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document.
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Rearrange the page by index
loadedDocument.Pages.ReArrange(new int[] { 1, 0 });
```

```
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Rearrange the page by index
loadedDocument.Pages.ReArrange(new int[] { 1, 0 });
//Save the document as stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Changing the page numbers in a PDF document

You can alter the page label for the existing PDF document using [PdfPageLabel](#) class. Refer to the following code snippet.

C#

```
//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Create a page label
```

```

PdfPageLabel pageLabel = new PdfPageLabel();
//Set the number style with upper case roman letters
pageLabel.NumberStyle = PdfNumberStyle.UpperRoman;
//Set the starting number as 1
pageLabel.StartNumber = 1;
loadedDocument.LoadedPageLabel = pageLabel;
//Save the document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Create a page label
Dim pageLabel As New PdfPageLabel()
'Set the number style with upper case roman letters
pageLabel.NumberStyle = PdfNumberStyle.UpperRoman
'Set the starting number as 1
pageLabel.StartNumber = 1
loadedDocument.LoadedPageLabel = pageLabel
'Save the document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose a file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of the
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
// Create a page label
PdfPageLabel pageLabel = new PdfPageLabel();
//Set the number style with upper case roman letters
pageLabel.NumberStyle = PdfNumberStyle.UpperRoman;
//Set the starting number as 1
pageLabel.StartNumber = 1;
loadedDocument.LoadedPageLabel = pageLabel;
//Save the document as stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document instances
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
// Create a page label
PdfPageLabel pageLabel = new PdfPageLabel();
//Set the number style with upper case roman letters
pageLabel.NumberStyle = PdfNumberStyle.UpperRoman;
//Set the starting number as 1
pageLabel.StartNumber = 1;
loadedDocument.LoadedPageLabel = pageLabel;
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
loadedDocument.Save(stream);
//If the position is not set to '0', then the PDF will be empty.
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
// Create a page label
PdfPageLabel pageLabel = new PdfPageLabel();
//Set the number style with upper case roman letters
pageLabel.NumberStyle = PdfNumberStyle.UpperRoman;
//Set the starting number as 1
pageLabel.StartNumber = 1;
loadedDocument.LoadedPageLabel = pageLabel;
//Save the document as stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document instances
loadedDocument.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Removing pages from a document

You can remove the pages from the existing PDF document using [RemoveAt](#) method as shown in the below code snippet.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Remove the first page in the PDF document
loadedDocument.Pages.RemoveAt(0);
//Save the document.
loadedDocument.Save("Output.pdf");
//Close the document.
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Remove the first page in the PDF document
loadedDocument.Pages.RemoveAt(0)
'Save the document.
loadedDocument.Save("Output.pdf")
'Close the document.
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Remove the first page in the PDF document
loadedDocument.Pages.RemoveAt(0);
//Save the document as stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document.
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Remove the first page in the PDF document
loadedDocument.Pages.RemoveAt(0);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Remove the first page in the PDF document
loadedDocument.Pages.RemoveAt(0);
//Save the document as stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
```

```
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Rotating a PDF page

You can rotate a particular PDF page in the PDF document using [PdfPageRotateAngle](#) Enum as shown the following code snippet.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a section.
PdfSection section = document.Sections.Add();
//Rotate a section/page
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Color.Black);
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draws the text.
graphics.DrawString("Rotated by 90 degree", font, brush, new PointF(20,
20));
//Save the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a section.
Dim section As PdfSection = document.Sections.Add()
'Rotate a section/page
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90
Dim page As PdfPage = section.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Create a solid brush.
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 14)
'Draw the text.
graphics.DrawString("Rotated by 90 degree", font, brush, New PointF(20, 20))
'Save the document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
```

```

//Add a section.
PdfSection section = document.Sections.Add();
//Rotate a section/page
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(new PdfColor(0, 0, 0));
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draws the text.
graphics.DrawString("Rotated by 90 degree", font, brush, new PointF(20,
20));
//Save the document as stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a section.
PdfSection section = document.Sections.Add();
//Rotate a section/page
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Syncfusion.Drawing.Color.Black);
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draws the text.
graphics.DrawString("Rotated by 90 degree", font, brush, new
Syncfusion.Drawing.PointF(20, 20));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a section.
PdfSection section = document.Sections.Add();
//Rotate a section/page
section.PageSettings.Rotate = PdfPageRotateAngle.RotateAngle90;
PdfPage page = section.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Syncfusion.Drawing.Color.Black);
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Draws the text.
graphics.DrawString("Rotated by 90 degree", font, brush, new
Syncfusion.Drawing.PointF(20, 20));
//Save the document as stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Rotating an existing PDF page

You can also rotate a PDF page in the existing PDF document using PdfPageRotateAngle(<https://help.syncfusion.com/cr/file-formats/Syncfusion.Pdf.Base~Syncfusion.Pdf.PdfPageRotateAngle.html>) as shown in the following code snippet.

C#

```

//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Gets the page.
PdfPageBase loadedPage = loadedDocument.Pages[0] as PdfPageBase;
//Set the rotation for loaded page.
loadedPage.Rotation = PdfPageRotateAngle.RotateAngle90;
// Save the Document

```

```
loadedDocument.Save("Output.pdf");
// Close the Document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument("input.pdf")
'Gets the page.
Dim page As PdfPageBase = TryCast(loadedDocument.Pages(0), PdfPageBase)
'Set the rotation for loaded page.
page.Rotation = PdfPageRotateAngle.RotateAngle90
'Save the document.
loadedDocument.Save("Output.pdf")
'Closes the document.
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Gets the page
PdfPageBase loadedPage = loadedDocument.Pages[0] as PdfPageBase;
//Set the rotation for loaded page.
loadedPage.Rotation = PdfPageRotateAngle.RotateAngle90;
//Save the document as stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document.
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Gets the page
PdfPageBase loadedPage = loadedDocument.Pages[0] as PdfPageBase;
//Set the rotation for loaded page.
loadedPage.Rotation = PdfPageRotateAngle.RotateAngle90;
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
```

```
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Gets the page
PdfPageBase loadedPage = loadedDocument.Pages[0] as PdfPageBase;
//Set the rotation for loaded page.
loadedPage.Rotation = PdfPageRotateAngle.RotateAngle90;
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
loadedDocument.Save(memoryStream);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

Splitting a PDF file to individual pages

Essential PDF allows to split the pages of an existing PDF document into multiple individual PDF documents using [Split](#) method of [PdfLoadedDocument](#) class. The following code snippet explains the same.

C#

```
//Load document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("OutputE.pdf");
//Sets pattern.
const string destinationFilePattern = "Output" + "{0}.pdf";
//Split the pages into separate documents.
loadedDocument.Split(destinationFilePattern);
```

```
//close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load document.
Dim loadedDocument As New PdfLoadedDocument("OutputE.pdf")
'Sets pattern.
Const destinationFilePattern As String = "Output" + "{0}.pdf"
'Split the pages into separate documents.
loadedDocument.Split(destinationFilePattern)
'close the document
loadedDocument.Close(True)
```

UWP

```
//Due to platform limitations, Essential PDF supports splitting a PDF file
into individual pages only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC
platforms. However this can be achieved by using the following code snippet.
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
for (int i = 0; i < loadedDocument.PageCount; i++)
{
    //Creates a new document
    PdfDocument document = new PdfDocument();
    //Imports the loaded document page index to the current document
    document.ImportPage(loadedDocument, i);
    //Save the PDF document to stream
    MemoryStream stream = new MemoryStream();
    document.Save(stream);
    //Close the document
    document.Close(true);
    //Save the stream as PDF document file in local machine. Refer to the
    PDF/UWP section for respective code samples
    Save(stream, "Output" + i + ".pdf");
}
```

ASP.NET CORE

```
//Due to platform limitations, Essential PDF supports splitting a PDF file
into individual pages only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC
platforms. However this can be achieved by using the following code snippet.
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
for (int i=0;i<loadedDocument.PageCount;i++)
```

```

{
    //Creates a new document
    PdfDocument document = new PdfDocument();
    //Imports the pages from the loaded document
    document.ImportPage(loadedDocument, i);
    //Create a memory stream
    MemoryStream stream = new MemoryStream();
    //Save the document to stream
    document.Save(stream);
    stream.Position = 0;
    //Close the document
    document.Close(true);
    //Create a file stream
    FileStream fileStream = new FileStream("Output" + i + ".pdf",
    FileMode.Create, FileAccess.Write);
    byte[] bytes = stream.ToArray();
    //Write bytes to file
    fileStream.Write(bytes, 0, (int)bytes.Length);
    //Dispose the streams
    stream.Dispose();
    fileStream.Dispose();
}

```

XAMARIN

```

//Due to platform limitations, Essential PDF supports splitting a PDF file
into individual pages only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC
platforms. However this can be achieved by using the following code snippet.
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
for (int i = 0; i < loadedDocument.Pages.Count; i++)
{
    //Creates a new document
    PdfDocument document = new PdfDocument();
    //Imports the pages from the loaded document
    document.ImportPage(loadedDocument, i);
    //Save the PDF document to stream
    MemoryStream stream = new MemoryStream();
    document.Save(stream);
    //Close the document
    document.Close(true);
    //Save the stream into PDF file
    //The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
    if (Device.RuntimePlatform == Device.UWP)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output"+ i+
        ".pdf", "application/pdf", stream);
    }
    else
    {

```

```
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output" + i + ".pdf",
"application/pdf", stream);
}
}
```

Working with Text

Drawing text in a new document

You can add text in the new PDF document by using [DrawString](#) method of [PdfGraphics](#) class as shown in the following code sample.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the standard font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0,
0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
```

```
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into memory stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
```

```
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Drawing text in an existing document

The following code snippet illustrates how to add text in the existing PDF document by using [DrawString](#) method.

C#

```
//Load a PDF document.
PdfLoadedDocument doc = new PdfLoadedDocument("input.pdf");
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
doc.Save("Output.pdf");
//Close the document.
doc.Close(true);
```

VB.NET

```
'Load a PDF document.
Dim doc As New PdfLoadedDocument("input.pdf")
'Get first page from document
Dim page As PdfLoadedPage = TryCast(doc.Pages(0), PdfLoadedPage)
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Set the standard font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
```

```
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0))
'Save the document.
doc.Save("Output.pdf")
'Close the document.
doc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument doc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await doc.OpenAsync(file);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document.
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open, FileAccess.Read);
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into memory stream
doc.Save(stream);
```

```
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf ");
//Load a PDF document.
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the document.
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Drawing text using different fonts

Essential PDF allows you to add text to the PDF document using the following types of fonts.

1. Standard fonts

2. TrueType fonts
3. Chinese, Japanese and Korean (CJK) fonts

Draw text using standard fonts

PDF has fourteen base fonts, also known as standard fonts which has special significance. The details can be referred from the link below.

Standard type 1 fonts

You can add text using the standard PDF fonts, by initializing [PdfFont](#) class as [PdfStandardFont](#) class. The following code snippet illustrates this.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the standard font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0, 0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
```

```
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into memory stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
```

```
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Draw text using TrueType fonts

You can add text using the TrueType fonts installed in the system, by initializing [PdfFont](#) class as [PdfTrueTypeFont](#) class. The following code snippet illustrates this.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Use the font installed in the machine
PdfFont font = new PdfTrueTypeFont(new Font("Arial", 14));
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Use the font installed in the machine
Dim font As PdfFont = New PdfTrueTypeFont(New Font("Arial", 14))
'Draw the text.
```

```
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0, 0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

You can add text using the font file from local file system by providing the path of the TrueType font location. The following code snippet explains the same.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Provide the path of the local *.ttf file
PdfFont font = new PdfTrueTypeFont(new Font("Arial.ttf", 14));
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0, 0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
' Provide the path of the local *.ttf file
Dim font As PdfFont = New PdfTrueTypeFont(New Font("Arial.ttf", 14))
'Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, New PointF(0, 0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Load the TrueType font from the local *.ttf file.
```

```

Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Arial.ttf");
//Initialize the PDF TrueType font.
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Load the TrueType font from the local *.ttf file.
FileStream fontStream = new FileStream("Arial.ttf", FileMode.Open,
FileAccess.Read);
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into memory stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;

```

```

//Load the TrueType font.
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Arial.ttf");
//Initialize the PDF TrueType font.
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Draw the text.
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Draw text using CJK fonts

You can add text using CJK fonts, initializing [PdfFont](#) class as [PdfCjkStandardFont](#) class. The following code sample illustrates this.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20);
//Draw the text.
graphics.DrawString("こんにちは世界", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```
'Create a new PDF document.
```

```

Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the standard font.
Dim font As PdfFont = New
PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20)
'Draw the text.
graphics.DrawString("こんにちは世界", font, PdfBrushes.Black, New PointF(0,
0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20);
//Draw the text.
graphics.DrawString("こんにちは世界", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20);
//Draw the text.
graphics.DrawString("こんにちは世界", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into memory stream
document.Save(stream);

```

```
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the standard font.
PdfFont font = new PdfCjkStandardFont(PdfCjkFontFamily.HeiseiMinchoW3, 20);
//Draw the text.
graphics.DrawString("こんにちは世界", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Measuring a string

The Essential PDF allows you to measure the size of a string which uses the PdfFont through [MeasureString](#) method of it and returns the size. Refer to the following code sample.

C#

```
//Create the new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
```

```

PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a new PDF font instance
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12);
string text = "Hello World!";
//Measure the text
SizeF size = font.MeasureString(text);
//Draw string to the PDF page
graphics.DrawString(text, font, PdfBrushes.Black, new
RectangleF(PointF.Empty, size));
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create the new PDF document
Dim document As New PdfDocument()
'Add a page to the document
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create a new PDF font instance
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 12)
Dim text As String = "Hello World!"
'Measure the text
Dim size As SizeF = font.MeasureString(text)
'Draw string to the PDF page
graphics.DrawString(text, font, PdfBrushes.Black, New
RectangleF(PointF.Empty, size))
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)

```

UWP

```

//Create the new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a new PDF font instance
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12);
string text = "Hello World!";
//Measure the text
SizeF size = font.MeasureString(text);
//Draw string to the PDF page
graphics.DrawString(text, font, PdfBrushes.Black, new
RectangleF(PointF.Empty, size));
//Save the document as stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);

```

```
//Close the document instances
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create the new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a new PDF font instance
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12);
string text = "Hello World!";
//Measure the text
SizeF size = font.MeasureString(text);
//Draw string to the PDF page
graphics.DrawString(text, font, PdfBrushes.Black, new
RectangleF(PointF.Empty, size));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
document.Save(stream);
//If the position is not set to '0', then the PDF will be empty.
stream.Position = 0;
//Close the document
document.Close(true);
//Defining the ContentType for PDF file.
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create the new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a new PDF font instance
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12);
string text = "Hello World!";
//Measure the text
SizeF size = font.MeasureString(text);
//Draw string to the PDF page
graphics.DrawString(text, font, PdfBrushes.Black, new
RectangleF(PointF.Empty, size));
//Save the document as stream
MemoryStream stream = new MemoryStream();
```

```
document.Save(stream);
//Close the document instances
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Embedding fonts and working with Unicode text

To embed a font or display Unicode text in the document, the 'Unicode' Boolean parameter of the [PdfTrueTypeFont](#) constructor has to be set to true. The following code illustrates the same.

Note: To render a Unicode text in the PDF document the chosen font should have the Unicode rendering capability.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//use the system installed font
PdfFont font = new PdfTrueTypeFont(new Font("Arial Unicode MS", 14), true);
//Read the unicode text from the text file.
StreamReader reader = new StreamReader(@"input.txt", Encoding.Unicode);
string text = reader.ReadToEnd();
reader.Close();
//Draw the text.
graphics.DrawString(text, font, PdfBrushes.Black, new PointF(0, 0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
```

```

'Use the system installed font
Dim font As PdfFont = New PdfTrueTypeFont(New Font("Arial Unicode MS", 14),
True)
'Read the unicode text from the text file.
Dim reader As New StreamReader("input.txt", Encoding.Unicode)
Dim text As String = reader.ReadToEnd()
reader.Close()
'Draw the text.
graphics.DrawString(text, font, PdfBrushes.Black, New PointF(0, 0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```

//PDF supports embedding fonts or displaying a Unicode text in the PDF
document by default in UWP platform.

```

XAMARIN

```

//PDF supports embedding fonts or displaying a Unicode text in the PDF
document by default in Xamarin platform.

```

ASP.NET CORE

```

//PDF supports embedding fonts or displaying a Unicode text in the PDF
document by default in ASP.NET Core platform.

```

Drawing Right-To-Left text

The Essential PDF allows you to draw the right-to-left language text in a PDF document. To draw RTL scripts such as Arabic, Hebrew, Persian, and Urdu, set the value of [TextDirection](#) property in the [PdfStringFormat](#) class to [RightToLeft](#) using [PdfTextDirection](#) Enum. The languages (e.g., Sindhi and Kurdish) that have more than one script and can be written in either right-to-left or left-to-right format. The [LeftToRight](#) value of the [TextDirection](#) property is used to draw RTL text in the left-to-right format. Refer to the following code sample.

C#

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create font
PdfFont font = new PdfTrueTypeFont(new Font("Arial", 14), true);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set right-to-left text direction for RTL text
format.TextDirection = PdfTextDirection.RightToLeft;
//Set the text alignment
format.Alignment = PdfTextAlignment.Right;
format.ParagraphIndent = 35f;

```

```

//Read the text from file
StreamReader reader = new StreamReader("Arabic.txt", Encoding.Unicode);
string text = reader.ReadToEnd();
reader.Close();
//Draw string with right-to-left format
graphics.DrawString(text, font, PdfBrushes.Black, new RectangleF(0, 0,
page.GetClientSize().Width, page.GetClientSize().Height), format);
//Set left-to-right text direction for RTL text
format.TextDirection = PdfTextDirection.LeftToRight;
//Set the text alignment
format.Alignment = PdfTextAlignment.Left;
//Draw string with left-to-right format
graphics.DrawString(text, font, PdfBrushes.Black, new RectangleF(0, 100,
page.GetClientSize().Width, page.GetClientSize().Height), format);
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim doc As PdfDocument = New PdfDocument()
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create font
Dim font As PdfFont = New PdfTrueTypeFont(New Font("Arial", 14), True)
'Set the format for string
Dim format As PdfStringFormat = New PdfStringFormat()
'Set right-to-left text direction for RTL text
format.TextDirection = PdfTextDirection.RightToLeft
'Set the alignment
format.Alignment = PdfTextAlignment.Right
format.ParagraphIndent = 35.0F
'Read the text from file
Dim reader As StreamReader = New StreamReader("Arabic.txt",
Encoding.Unicode)
Dim text As String = reader.ReadToEnd()
reader.Close()
'Draw string with right-to-left format
graphics.DrawString(text, font, PdfBrushes.Black, new RectangleF(0, 0,
page.GetClientSize().Width, page.GetClientSize().Height), format)
'Set left-to-right text direction for RTL text
format.TextDirection = PdfTextDirection.LeftToRight
'Set the text alignment
format.Alignment = PdfTextAlignment.Left
'Draw string with left-to-right format
graphics.DrawString(text, font, PdfBrushes.Black, new RectangleF(0, 100,
page.GetClientSize().Width, page.GetClientSize().Height), format)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)

```

UWP

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the TrueType font

"application/pdf", stream);
}

```

Adding a HTML Styled Text

Essential PDF provides support to render simple HTML string in a PDF document that can flow through multiple pages. This can be done by using the [PdfHTMLTextElement](#) class.

1. The PdfHTMLTextElement class provides support for a basic set of HTML tags, to render HTML format text in the PDF document.

Supported tags (Should be XHTML-compliant)

- Font
 - B
 - I
 - U
 - Sub
 - Sup
 - BR
2. The [PdfMetafileLayoutFormat](#) class enables to break the HTML text into multiple pages.
 3. Complex HTML with CSS are not supported in this class. Please use [HTML to PDF](#) section for complex HTML with CSS and URL's

The following code example illustrates how to render the HTML string in a PDF document.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page to the document.
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Courier, 14);
//Simple HTML content
string htmlText = "<font color='#0000F8'>Essential PDF</font> is a
<u><i>.NET</i></u> " +
"library with the capability to produce Adobe PDF files ";
//Render HtmlText.
PdfHTMLTextElement richTextElement = new PdfHTMLTextElement(htmlText, font,
PdfBrushes.Black);
richTextElement.TextAlign = TextAlign.Left;
//Format Layout.
PdfMetafileLayoutFormat format = new PdfMetafileLayoutFormat();
format.Layout = PdfLayoutType.Paginate;
format.Break = PdfLayoutBreakType.FitPage;
//Draw htmlString.
richTextElement.Draw(page, new RectangleF(0, 20, page.GetClientSize().Width,
page.GetClientSize().Height), format);
//Save the document.
doc.Save("Output.pdf");
//Close the document.
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = doc.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
```

```

Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Courier, 14)
'Simple HTML content
Dim htmlText As String = "<font color='#0000F8'>Essential PDF</font> is a
<u><i>.NET</i></u> " + "library with the capability to produce Adobe PDF
files "
'Render HtmlText.
Dim richTextElement As New PdfHTMLTextElement(htmlText, font,
PdfBrushes.Black)
richTextElement.TextAlign = TextAlign.Left
'Format Layout.
Dim format As New PdfMetafileLayoutFormat()
format.Layout = PdfLayoutType.Paginate
format.Break = PdfLayoutBreakType.FitPage
'Draw htmlString.
richTextElement.Draw(page, New RectangleF(0, 20, page.ClientSize().Width,
page.ClientSize().Height), format)
'Save the document.
doc.Save("Output.pdf")
'Close the document.
doc.Close(True)

```

UWP

```

//PDF supports Adding HTML Styled Text only in Windows Forms, WPF, ASP.NET
and ASP.NET MVC platforms.

```

ASP.NET CORE

//PDF supports Adding HTML Styled Text only in Windows Forms, WPF, ASP.NET
and ASP.NET MVC platforms.

```

XAMARIN

```

//PDF supports Adding HTML Styled Text only in Windows Forms, WPF, ASP.NET
and ASP.NET MVC platforms.

```

Creating a multicolumn PDF document

Essential PDF allows you to create multi-column text in PDF document by using [PdfTextElement](#) class.

The following code example illustrates the same.

C#

```

//Create a PDF document instance
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
string text = "Adventure Works Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Create a text element with the text and font

```

```

PdfTextElement textElement = new PdfTextElement(text, new
PdfStandardFont(PdfFontFamily.TimesRoman, 14));
//Draw the text in the first column
textElement.Draw(page, new RectangleF(0, 0, page.GetClientSize().Width / 2,
page.GetClientSize().Height));
textElement = new PdfTextElement(text, new
PdfStandardFont(PdfFontFamily.TimesRoman, 14));
//Draw the text in the second column
textElement.Draw(page, new RectangleF(page.GetClientSize().Width / 2, 0,
page.GetClientSize().Width / 2, page.GetClientSize().Height));
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Create a PDF document instance
Dim document As New PdfDocument()
'Add page to the document
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim text As String = "Adventure Works Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company. The company manufactures and sells
metal and composite bicycles to North American, European and Asian
commercial markets. While its base operation is located in Washington with
290 employees, several regional sales teams are located throughout their
market base."
'Create a text element with the text and font
Dim textElement As New PdfTextElement(text, New
PdfStandardFont(PdfFontFamily.TimesRoman, 14))
'Draw the text in the first column
textElement.Draw(page, New RectangleF(0, 0, page.GetClientSize().Width / 2,
page.GetClientSize().Height))
textElement = New PdfTextElement(text, New
PdfStandardFont(PdfFontFamily.TimesRoman, 14))
'Draw the text in the second column
textElement.Draw(page, New RectangleF(page.GetClientSize().Width / 2, 0,
page.GetClientSize().Width / 2, page.GetClientSize().Height))
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Create a PDF document instance
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
string text = "Adventure Works Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Create a text element with the text and font

```

```

PdfTextElement textElement = new PdfTextElement(text, new
PdfStandardFont(PdfFontFamily.TimesRoman, 14));
//Draw the text in the first column
textElement.Draw(page, new RectangleF(0, 0, page.GetClientSize().Width / 2,
page.GetClientSize().Height));
textElement = new PdfTextElement(text, new
PdfStandardFont(PdfFontFamily.TimesRoman, 14));
//Draw the text in the second column
textElement.Draw(page, new RectangleF(page.GetClientSize().Width / 2, 0,
page.GetClientSize().Width / 2, page.GetClientSize().Height));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a PDF document instance
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
string text = "Adventure Works Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.

"application/pdf", stream);
}
```

The [PdfLayoutFormat](#) class helps to allow the text to flow across pages. The [PdfLayoutResult](#) class provides the rendered bounds of the previously added text which can be used to place successive elements without overlapping.

The following code snippet illustrates how to add elements relatively and also allow the text to flow across multiple pages.

C#

```
//Create a PDF document instance
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Read the long text from the text file.
StreamReader reader = new StreamReader(@"input.txt", Encoding.ASCII);
string text = reader.ReadToEnd();
reader.Close();
const int paragraphGap = 10;
//Create a text element with the text and font
PdfTextElement textElement = new PdfTextElement(text, new
PdfStandardFont(PdfFontFamily.TimesRoman, 14));
PdfLayoutFormat layoutFormat = new PdfLayoutFormat();
layoutFormat.Layout = PdfLayoutType.Paginate;
layoutFormat.Break = PdfLayoutBreakType.FitPage;
//Draw the first paragraph
PdfLayoutResult result = textElement.Draw(page, new RectangleF(0, 0,
page.GetClientSize().Width / 2, page.GetClientSize().Height), layoutFormat);
//Draw the second paragraph from the first paragraph end position
result = textElement.Draw(page, new RectangleF(0, result.Bounds.Bottom +
paragraphGap, page.GetClientSize().Width / 2, page.GetClientSize().Height),
layoutFormat);
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a PDF document instance
Dim document As New PdfDocument()
'Add page to the document
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
'Read the RTL text from the text file.
Dim reader As New StreamReader("input.txt", Encoding.ASCII)
Dim text As String = reader.ReadToEnd()
reader.Close()
Const paragraphGap As Integer = 10
'Create a text element with the text and font
Dim textElement As New PdfTextElement(text, New
PdfStandardFont(PdfFontFamily.TimesRoman, 14))
Dim layoutFormat As New PdfLayoutFormat()
layoutFormat.Layout = PdfLayoutType.Paginate
layoutFormat.Break = PdfLayoutBreakType.FitPage
'Draw the first paragraph
Dim result As PdfLayoutResult = textElement.Draw(page, New RectangleF(0, 0,
page.GetClientSize().Width / 2, page.GetClientSize().Height), layoutFormat)
'Draw the second paragraph from the first paragraph end position
result = textElement.Draw(page, New RectangleF(0, result.Bounds.Bottom +
paragraphGap, page.GetClientSize().Width / 2, page.GetClientSize().Height),
layoutFormat)
```

```
document.Save("Output.pdf");
document.Close(True)
```

UWP

```
//Create a PDF document instance
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();

Inserting Rich Text Format contents

Essential PDF allows you to insert a RTF text into a PDF document by converting it as bitmap or metafile image and rendering it using [FromRtf](#) method of [PdfImage](#) class.

The following code example illustrates how to insert RTF text in PDF document.

C#

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
SizeF bounds = page.GetClientSize();
//Read RTF document.
StreamReader reader = new StreamReader(@"input.rtf", Encoding.ASCII);
string text = reader.ReadToEnd();
reader.Close();
//Convert it to Metafile.
PdfMetafile imageMetafile = (PdfMetafile)PdfImage.FromRtf(text,
bounds.Width, PdfImageType.Metafile);
PdfMetafileLayoutFormat format = new PdfMetafileLayoutFormat();
//Allow text to flow multiple pages without any break.
format.SplitTextLines = true;
//Draws image.
imageMetafile.Draw(page, 0, 0, format);
//Save the document.
doc.Save("Output.pdf");
doc.Close(true);

```

VB.NET

```

'Create a new PDF document.

```

```

Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
Dim bounds As.SizeF = page.GetClientSize()
'Read RTF document.
Dim reader As New StreamReader("input.rtf", Encoding.ASCII)
Dim text As String = reader.ReadToEnd()
reader.Close()
'Convert it to Metafile.
Dim imageMetafile As PdfMetafile = DirectCast(PdfImage.FromRtf(text,
bounds.Width, PdfImageType.Metafile), PdfMetafile)
Dim format As New PdfMetafileLayoutFormat()
'Allow text to flow multiple pages without any break.
format.SplitTextLines = True
'Draws image.
imageMetafile.Draw(page, 0, 0, format)
'Save the document.
doc.Save("Output.pdf")
doc.Close(True)

```

Note: For converting complex RTF content to PDF, refer the [RTF to PDF](#) section.

Adding an Ordered List

Essential PDF allows you to create an ordered list in the document. Ordered List is represented by the [PdfOrderedList](#) class and can be numerical or alphabetical. The following code snippet illustrates the same.

C#

```

//Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Add a new page to the document.
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
.SizeF size = page.Graphics.ClientSize;
//Create font
PdfFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 10,
PdfFontStyle.Italic);

```

```

string[] products = { "Tools", "Grid", "Chart", "Edit", "Diagram", "XlsIO",
    "Grouping", "Calculate", "PDF", "HTMLUI", "DocIO" };
//Create string format
PdfStringFormat format = new PdfStringFormat();
format.LineSpacing = 10f;
//Create Ordered list
PdfOrderedList pdfList = new PdfOrderedList();
pdfList.Marker.Brush = PdfBrushes.Black;
pdfList.Indent = 20;
//Set format for sub list
pdfList.Font = font;
pdfList.StringFormat = format;
foreach (string s in products)
{
    //Add items
    pdfList.Items.Add(string.Concat("Essential ", s));
}
pdfList.Draw(page, new RectangleF(0, 20, size.Width, size.Height));
// Save and close the document.
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Create a new instance of PdfDocument class.
Dim document As New PdfDocument()
'Add a new page to the document.
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim size As.SizeF = page.Graphics.ClientSize
'Create font
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.TimesRoman, 10,
    PdfFontStyle.Italic)
Dim products As String() = {"Tools", "Grid", "Chart", "Edit", "Diagram",
    "XlsIO",
    "Grouping", "Calculate", "PDF", "HTMLUI", "DocIO"}
'Create string format
Dim format As New PdfStringFormat()
format.LineSpacing = 10.0F
'Create Ordered list
Dim pdfList As New PdfOrderedList()
pdfList.Marker.Brush = PdfBrushes.Black
pdfList.Indent = 20
'Set format for sub list
pdfList.Font = font
pdfList.StringFormat = format
For Each s As String In products
    'Add items
    pdfList.Items.Add(String.Concat("Essential ", s))
Next
pdfList.Draw(page, New RectangleF(0, 20, size.Width, size.Height))
' Save and close the document.
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Add a new page to the document.
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
SizeF size = page.Graphics.ClientSize;
//Create font
PdfFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 10,
PdfFontStyle.Italic);
string[] products = { "Tools", "Grid", "Chart", "Edit", "Diagram", "XlsIO",
"Grouping", "Calculate", "PDF", "HTMLUI", "DocIO" };
//Create string format
PdfStringFormat format = new PdfStringFormat();
format.LineSpacing = 10f;
//Create Ordered list
PdfOrderedList pdfList = new PdfOrderedList();

}
```

Adding an Unordered List

Essential PDF also provides support to create an unordered List that is represented by the [PdfUnorderedList](#) class. An Unordered list can be bullets, circle or an image. The following code snippet illustrates the same.

C#

```
//Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Add a new page to the document.
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
SizeF size = page.Graphics.ClientSize;
//Create an unordered list
PdfUnorderedList list = new PdfUnorderedList();
//Set the marker style
list.Marker.Style = PdfUnorderedMarkerStyle.Disk;
//Create font and write title
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12,
PdfFontStyle.Regular);
//Create string format
PdfStringFormat format = new PdfStringFormat();
format.LineSpacing = 10f;
// Format list
list.Font = font;
list.StringFormat = format;
//Set list indent
list.Indent = 10;
//Add items to the list
list.Items.Add("PDF");
list.Items.Add("XlsIO");
list.Items.Add("DocIO");
list.Items.Add("PPT");
```

```
//Set text indent
list.TextIndent = 10;
//Draw list
list.Draw(page, new RectangleF(0, 10, size.Width, size.Height));
// Save and close the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new instance of PdfDocument class.
Dim document As New PdfDocument()
'Add a new page to the document.
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim size As SizeF = page.Graphics.ClientSize
'Create an unordered list
Dim list As New PdfUnorderedList()
'Set the marker style
list.Marker.Style = PdfUnorderedMarkerStyle.Disk
'Create font and write title
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Regular)
'Create string format
Dim format As New PdfStringFormat()
format.LineSpacing = 10.0F
' Format list
list.Font = font
list.StringFormat = format
'Set list indent
list.Indent = 10
'Add items to the list
list.Items.Add("PDF")
list.Items.Add("XlsIO")
list.Items.Add("DocIO")
list.Items.Add("PPT")
'Set text indent
list.TextIndent = 10
'Draw list
list.Draw(page, New RectangleF(0, 10, size.Width, size.Height))
'Save and close the document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Add a new page to the document.
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
SizeF size = page.Graphics.ClientSize;
//Create an unordered list
PdfUnorderedList list = new PdfUnorderedList();
//Set the marker style
list.Marker.Style = PdfUnorderedMarkerStyle.Disk;
```

```

//Create font and write title
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12,
PdfFontStyle.Regular);
//Create string format
PdfStringFormat format = new PdfStringFormat();
format.LineSpacing = 10f;
// Format list
list.Font = font;
list.StringFormat = format;
//Set list indent
list.Indent = 10;
//Add items to the list
list.Items.Add("PDF");
list.Items.Add("XlsIO");
list.Items.Add("DocIO");
list.Items.Add("PPT");
//Set text indent
list.TextIndent = 10;
//Draw list
list.Draw(page, new RectangleF(0, 10, size.Width, size.Height));
//Save the document into memory stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new instance of PdfDocument class.

}
```

Replace Fonts in an existing document

Essential PDF allows you to replace the fonts in an existing PDF document by using the [Replace](#) method. The following code snippet illustrates the same.

C#

```
//Creates a new PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Replace font
loadedDocument.UsedFonts[0].Replace(new
PdfStandardFont(PdfFontFamily.TimesRoman, 12));
//Save the document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Creates a new PDF document.
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Replace font
loadedDocument.UsedFonts(0).Replace(New
PdfStandardFont(PdfFontFamily.TimesRoman, 12))
'Save the document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

UWP

```
//PDF supports Replace fonts in an existing document only in Windows Forms,
WPF, ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports Replace fonts in an existing document only in Windows Forms,
WPF, ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

//PDF supports Replace fonts in an existing document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

Search and get the bounds of a text in a document

You can search for a particular text in a document and get the bounds using [FindText](#) method of [PdfViewerControl](#) class. To include this functionality, you need to add the below mentioned assemblies as reference to the project.

1. Syncfusion.Compression.Base.dll
2. Syncfusion.Pdf.Base.dll
3. Syncfusion.PdfViewer.Windows.dll

The following code snippet illustrates how to get the bound of a text from PDF document.

C#

```
PdfViewerControl documentViewer = new PdfViewerControl();
//Load the PDF document
documentViewer.Load("Input.pdf");
//Get the occurrences of the target text and location.
Dictionary<int, List<RectangleF>> textSearch = new Dictionary<int,
List<RectangleF>>();
bool IsMatchFound = documentViewer.FindText("hello", out textSearch);
documentViewer.Dispose();
```

VB.NET

```
Dim documentViewer As New PdfViewerControl()
'Load the PDF document
documentViewer.Load("Input.pdf")
'Get the occurrences of the target text and location.
Dim textSearch As New Dictionary(Of Integer, List(Of RectangleF))()
Dim IsMatchFound As Boolean = documentViewer.FindText("hello", textSearch)
documentViewer.Dispose()
```

Drawing complex script language text

Essential PDF allows you to add complex script language text in the PDF document by using the [ComplexScript](#) property available in [PdfStringFormat](#) class. The following code snippet illustrates this.

C#

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font with Unicode option
Font font = new Font("Tahoma", 14);
PdfFont pdfFont = new PdfTrueTypeFont(font, true);
```

```
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
//Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, new
RectangleF(0, 0, page.ClientSize().Width, page.ClientSize().Height),
format);
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim doc As New PdfDocument()
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Set the font with Unicode option
Dim font As New Font("Tahoma", 14)
Dim pdfFont As PdfFont = New PdfTrueTypeFont(font, True)
'Set the format for string
Dim format As New PdfStringFormat()
'Set the format as complex script layout type
format.ComplexScript = True
'Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, New
RectangleF(0, 0, page.ClientSize().Width, page.ClientSize().Height),
format)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font with Unicode option
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("ComplexSc
riptSample.Assets.tahoma.ttf");
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
```

```
//Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, new
RectangleF(0, 0, page.ClientSize().Width, page.ClientSize().Height),
format);
//Save the PDF document
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the PDF document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
FileStream fontStream = new FileStream("tahoma.ttf", FileMode.Open,
FileAccess.Read);
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
//Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, new
RectangleF(0, 0, page.ClientSize().Width, page.ClientSize().Height),
format);
//Save the PDF document
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the PDF document
doc.Close(true);
//Defining the content type for PDF file.
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the font as stream
```

```

Stream fontStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
tahoma.ttf");
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
//Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, new
RectangleF(0, 0, page.ClientSize().Width, page.ClientSize().Height),
format);
//Save the PDF document
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the PDF document
doc.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

You can add the complex script language text in an existing PDF document by using the following code sample.

C#

```

//Load a PDF document
PdfLoadedDocument doc = new PdfLoadedDocument("input.pdf");
//Get first page from the document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font with Unicode option
Font font = new Font("Tahoma", 14);
PdfFont pdfFont = new PdfTrueTypeFont(font, true);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
//Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, new
RectangleF(0, 0, page.Size.Width, page.Size.Height), format);
//Save the document

```

```
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Load a PDF document
Dim doc As New PdfLoadedDocument("input.pdf")
'Get first page from the document
Dim page As PdfLoadedPage = TryCast(doc.Pages(0), PdfLoadedPage)
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Set the font with Unicode option
Dim font As New Font("Tahoma", 14)
Dim pdfFont As PdfFont = New PdfTrueTypeFont(font, True)
'Set the format for string
Dim format As New PdfStringFormat()
'Set the format as complex script layout type
format.ComplexScript = True
'Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, New
RectangleF(0, 0, page.Size.Width, page.Size.Height), format)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```
Stream inputFileStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("input.pdf
");
//Load a PDF document
PdfLoadedDocument doc = new PdfLoadedDocument(inputFileStream);
//Get first page from the document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font with Unicode option
Font font = new Font("Tahoma", 14);
PdfFont pdfFont = new PdfTrueTypeFont(font, true);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
//Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, new
RectangleF(0, 0, page.Size.Width, page.Size.Height), format);
//Save the PDF document
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the PDF document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
```

```
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
FileStream inputFileStream = new FileStream("input.pdf", FileMode.Open,
    FileAccess.Read);
//Load a PDF document
PdfLoadedDocument doc = new PdfLoadedDocument(inputFileStream);
//Get first page from the document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font with Unicode option
Font font = new Font("Tahoma", 14);
PdfFont pdfFont = new PdfTrueTypeFont(font, true);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
//Draw the text
graphics.DrawString("สวัสดิ์ชาวโลก", pdfFont, PdfBrushes.Black, new
    RectangleF(0, 0, page.Size.Width, page.Size.Height), format);
//Save the PDF document
MemoryStream stream = new MemoryStream();
await doc.Save(stream);
//Close the PDF document
doc.Close(true);
//Defining the content type for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
Stream inputFileStream =
    typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
    input.pdf");
//Load a PDF document
PdfLoadedDocument doc = new PdfLoadedDocument(inputFileStream);
//Get first page from the document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Set the font with Unicode option
Font font = new Font("Tahoma", 14);
PdfFont pdfFont = new PdfTrueTypeFont(font, true);
//Set the format for string
PdfStringFormat format = new PdfStringFormat();
//Set the format as complex script layout type
format.ComplexScript = true;
//Draw the text
```

```

graphics.DrawString("สวัสดีชาวโลก", pdfFont, PdfBrushes.Black, new
RectangleF(0, 0, page.Size.Width, page.Size.Height), format);
//Save the PDF document

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Drawing text using OpenType font

Essential PDF supports drawing text on a PDF document with OpenType font using [PdfTrueTypeFont](#) class, by providing the path of font file from local file system. The following code snippet illustrates this.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Create font
Stream fontStream = System.IO.File.OpenRead("Font.otf");
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Text to draw
string text = "Syncfusion Essential PDF is a.NET PDF library used to create,
read, and edit PDF files in any application";
//Get page client size
SizeF clipBounds = page.Graphics.ClientSize;
RectangleF rect = new RectangleF(0, 0, clipBounds.Width, clipBounds.Height);
//Draw the text
page.Graphics.DrawString(text, font, PdfBrushes.Blue, rect);
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = document.Pages.Add

```

```

'Create font
Dim fontStream As Stream = System.IO.File.OpenRead("Font.otf")
Dim font As PdfFont = New PdfTrueTypeFont(fontStream, 14)
'Text to draw
Dim text As String = "Syncfusion Essential PDF is a.NET PDF library used to
create, read, and edit PDF files in any application"
'Get page client size
Dim clipBounds As SizeF = page.Graphics.ClientSize
Dim rect As RectangleF = New RectangleF(0, 0, clipBounds.Width,
clipBounds.Height)
'Draw the text
page.Graphics.DrawString(text, font, PdfBrushes.Blue, rect)
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(true)

```

UWP

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create font
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Font.otf");
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Text to draw
string text = @"Syncfusion Essential PDF is a.NET PDF library used to
create, read, and edit PDF files in any application";
//Create a brush
PdfBrush brush = new PdfSolidBrush(new PdfColor(0, 0, 0));
//Create a pen
PdfPen pen = new PdfPen(new PdfColor(0, 0, 0));
//Get page client size
SizeF clipBounds = page.Graphics.ClientSize;
RectangleF rect = new RectangleF(0, 0, clipBounds.Width, clipBounds.Height);
//Draw the text
page.Graphics.DrawString(text, font, brush, rect);
//Save the PDF document
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the PDF document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create font

```

```

FileStream fontFileStream = new FileStream("Font.otf", FileMode.Open,
    FileAccess.Read);
PdfFont font = new PdfTrueTypeFont(fontFileStream, 14);
//Text to draw
string text = "Syncfusion Essential PDF is a.NET Core PDF library used to
create, read, and edit PDF files in any application";
//Create a brush
PdfBrush brush = new PdfSolidBrush(new PdfColor(0, 0, 0));
//Create a pen
PdfPen pen = new PdfPen(new PdfColor(0, 0, 0));
//Get page client size
SizeF clipBounds = page.Graphics.ClientSize;
RectangleF rect = new RectangleF(0, 0, clipBounds.Width, clipBounds.Height);
//Draw the text
page.Graphics.DrawString(text, font, brush, rect);
//Save the PDF document
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the PDF document
document.Close(true);
//Defining the content type for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create font
Stream fontStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Font.otf");
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Text to draw
string text = @"Syncfusion Essential PDF is a.NET PDF library used to
create, read, and edit PDF files in any application";
//Create a brush
PdfBrush brush = new PdfSolidBrush(new PdfColor(0, 0, 0));
//Create a pen
PdfPen pen = new PdfPen(new PdfColor(0, 0, 0));
//Get page client size
SizeF clipBounds = page.Graphics.ClientSize;
RectangleF rect = new RectangleF(0, 0, clipBounds.Width, clipBounds.Height);
//Draw the text
page.Graphics.DrawString(text, font, brush, rect);
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the PDF document
document.Close(true);
//Save the stream into PDF file

```

```
//The operation in Save under Xamarin varies between Windows Phone, Android, and iOS platforms. Refer to the PDF/Xamarin section for respective code samples  
if (Device.RuntimePlatform == Device.UWP)  
{  
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf", stream);  
}  
else  
{  
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf", stream);  
}
```

Working with Images

Essential PDF supports both raster and vector images.

Images are supported through the [PdfImage](#) class, which is an abstract base class that provides the common functionality for [PdfBitmap](#) and [PdfMetafile](#) classes.

Inserting an image in a new document

The following raster images are supported in Essential PDF.

- BMP
- JPEG
- JPEG with Exif standard
- GIF
- PNG
- TIFF
- ICO and ICON

You can load image streams, files on disk, and use System.Drawing.Bitmap objects to draw the images through the [DrawImage](#) method of the [PdfGraphics](#) class.

The following code snippet shows how to add a file from disk to the PDF document.

C#

```
//Create a new PDF document  
PdfDocument doc = new PdfDocument();  
//Add a page to the document  
PdfPage page = doc.Pages.Add();  
//Create PDF graphics for the page  
PdfGraphics graphics = page.Graphics;  
//Load the image from the disk  
PdfBitmap image = new PdfBitmap("Autumn Leaves.jpg");  
//Draw the image  
graphics.DrawImage(image, 0, 0);  
//Save the document  
doc.Save("Output.pdf");  
//Close the document  
doc.Close(true);
```

VB.NET

```

'Create a new PDF document
Dim doc As New PdfDocument()
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Load the image from the disk
Dim image As New PdfBitmap("Autumn Leaves.jpg")
'Draw the image
graphics.DrawImage(image, 0, 0)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)

```

UWP

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image as stream from the disk
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Autumn Leaves.jpg");
PdfBitmap image = new PdfBitmap(imageStream);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document as stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image from the disk
FileStream imageStream = new FileStream("Autumn Leaves.jpg", FileMode.Open,
FileAccess.Read);
PdfBitmap image = new PdfBitmap(imageStream);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Creating the stream object

```

```

MemoryStream stream = new MemoryStream();
//Save the document as stream
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image as stream
Stream imageStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Autumn Leaves.jpg");
PdfBitmap image = new PdfBitmap(imageStream);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document as stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the document
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Inserting an image in an existing document

You can also add images into an existing PDF document using the below code snippet.

C#

```
//Load a PDF document
PdfLoadedDocument doc = new PdfLoadedDocument("input.pdf");
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image from the disk
PdfBitmap image = new PdfBitmap("Autumn Leaves.jpg");
//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Load a PDF document
Dim doc As New PdfLoadedDocument("input.pdf")
'Get first page from document
Dim page As PdfLoadedPage = TryCast(doc.Pages(0), PdfLoadedPage)
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Load the image from the disk
Dim image As New PdfBitmap("Autumn Leaves.jpg")
'Draw the image
graphics.DrawImage(image, 0, 0)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument doc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await doc.OpenAsync(file);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image as stream
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Autumn Leaves.jpg");
PdfBitmap image = new PdfBitmap(imageStream);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document as stream
```

```
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image from the disk
FileStream imageStream = new FileStream("Autumn Leaves.jpg", FileMode.Open,
FileAccess.Read);
PdfBitmap image = new PdfBitmap(imageStream);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image as stream
Stream imageStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Autumn Leaves.jpg");
PdfBitmap image = new PdfBitmap(imageStream);
```

```

//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document as stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the document
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

To add image from stream, use the below code snippet.

C#

```

//Load a PDF document
PdfLoadedDocument doc = new PdfLoadedDocument("input.pdf");
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image
Stream imageStream = File.OpenRead("Autumn Leaves.jpg");
//Load the image from the stream
PdfBitmap image = new PdfBitmap(imageStream);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);

```

VB.NET

```

'Load a PDF document
Dim doc As New PdfLoadedDocument("input.pdf")
'Get first page from document
Dim page As PdfLoadedPage = TryCast(doc.Pages(0), PdfLoadedPage)
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Load the image
Dim imageStream As Stream = File.OpenRead("Autumn Leaves.jpg")
'Load the image from the stream
Dim image As New PdfBitmap(imageStream)

```

```
'Draw the image
graphics.DrawImage(image, 0, 0)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument doc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await doc.OpenAsync(file);
//Get first page from document

{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Inserting a vector image

Essential PDF supports adding Metafile vector image. During the insertion, Metafile graphics will be transformed to native PDF graphics that supports text selection and searching. The following types of Metafiles are supported in Essential PDF.

- EMF only
- EMF plus
- EMF plus dual
- WMF

[PdfMetafile](#) class is used to load EMF images. Additionally the [PdfMetafileLayoutFormat](#) class allows you to prevent text and image split across pages in the PDF document.

The following code illustrate this,

C#

```
//Create a PDF Document
PdfDocument doc = new PdfDocument();
//Add pages to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create the layout format
PdfMetafileLayoutFormat format = new PdfMetafileLayoutFormat();
//Split text and image between pages
format.SplitImages = true;
format.SplitTextLines = true;
//Create a Metafile instance
PdfMetafile metaChart = new PdfMetafile("MetaChart.emf");
//Draw the Metafile in the page
metaChart.Draw(page, PointF.Empty, format);
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Create a PDF Document
Dim doc As New PdfDocument()
'Add pages to the document
Dim page As PdfPage = doc.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create the layout format
Dim format As New PdfMetafileLayoutFormat()
'Split text and image between pages
format.SplitImages = True
format.SplitTextLines = True
'Create a Metafile instance
Dim metaChart As New PdfMetafile("MetaChart.emf")
'Draw the Metafile in the page
metaChart.Draw(page, PointF.Empty, format)
'Save the document
```

```
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```
//PDF supports inserting a vector image only in Windows Forms, WPF, ASP.NET
and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports inserting a vector image only in Windows Forms, WPF, ASP.NET
and ASP.NET MVC platforms.
```

XAMARIN

```
//PDF supports inserting a vector image only in Windows Forms, WPF, ASP.NET
and ASP.NET MVC platforms.
```

Working with image masking

Essential PDF supports image masking through the [PdfImageMask](#) class.

The following code illustrate shows how to add a mask to TIFF image.

C#

```
//Create a PDF document
PdfDocument doc = new PdfDocument();
//Add pages to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the TIFF image
PdfBitmap image = new PdfBitmap("image.tif");
//Create masking image
PdfImageMask mask = new PdfImageMask(new PdfBitmap("mask.bmp"));
image.Mask = mask;
//Draw the image
graphics.DrawImage(image, 0, 0);
//Saves the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Create a PDF document
Dim doc As New PdfDocument()
'Add pages to the document
Dim page As PdfPage = doc.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Load the TIFF image
Dim image As New PdfBitmap("image.tif")
```

```

'Create masking image
Dim mask As New PdfImageMask(New PdfBitmap("mask.bmp"))
image.Mask = mask
'Draw the image
graphics.DrawImage(image, 0, 0)
'Saves the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)

```

UWP

```

//PDF supports image masking only in Windows Forms, WPF, ASP.NET and ASP.NET
MVC platforms

```

ASP.NET CORE

```

//Create a PDF document
PdfDocument doc = new PdfDocument();
//Add pages to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the TIFF image
FileStream imageStream = new FileStream("image.tif", FileMode.Open,
FileAccess.Read);
PdfTiffImage image = new PdfTiffImage(imageStream);
//Create masking image
FileStream maskStream = new FileStream("mask.bmp", FileMode.Open,
FileAccess.Read);
PdfImageMask mask = new PdfImageMask(new PdfTiffImage(maskStream));
image.Mask = mask;
//Draw the image
graphics.DrawImage(image, 0, 0);
///Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//PDF supports image masking only in Windows Forms, WPF, ASP.NET and ASP.NET
MVC platforms

```

Note: 1. Essential PDF supports image masking with [Syncfusion.Pdf.Imaging.Portable](#) assembly reference in ASP.NET Core.

Replacing Images in an existing PDF document

Essential PDF allows you to replace images in an existing document. The [ReplaceImage](#) method of the page collection allows you to replace an image.

C#

```
//Load the PDF document
PdfLoadedDocument doc = new PdfLoadedDocument(@"image.pdf");
//Create an image instance
PdfBitmap image = new PdfBitmap(@"Autumn Leaves.jpg");
//Replace the first image in the page
doc.Pages[0].ReplaceImage(0, image);
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Load the PDF document
Dim doc As New PdfLoadedDocument("image.pdf")
'Create an image instance
Dim image As New PdfBitmap("Autumn Leaves.jpg")
'Replace the first image in the page
doc.Pages(0).ReplaceImage(0, image)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

//PDF supports replacing image in an existing PDF document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

ASP.NET CORE

//PDF supports replacing image in an existing PDF document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

XAMARIN

//PDF supports replacing image in an existing PDF document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

Image Pagination

You can allow a large image to paginate across multiple pages in the PDF document. This can be done through the [PdfLayoutFormat](#) class as shown below.

C#

```

//Create Document
PdfDocument doc = new PdfDocument();
//Add new page
PdfPage page = doc.Pages.Add();
//Load a bitmap
PdfBitmap image = new PdfBitmap("input.jpg");
//Set layout property to make the element break across the pages
PdfLayoutFormat format = new PdfLayoutFormat();
format.Break = PdfLayoutBreakType.FitPage;
format.Layout = PdfLayoutType.Paginate;
//Draw image
image.Draw(page, 20, 400, format);
//Save the PDF
doc.Save("output.pdf");
doc.Close(true);

```

VB.NET

```

'Create Document
Dim doc As New PdfDocument()
'Add new page
Dim page As PdfPage = doc.Pages.Add()
'Load a bitmap
Dim image As New PdfBitmap("input.jpg")
'Set layout property to make the element break across the pages
Dim format As New PdfLayoutFormat()
format.Break = PdfLayoutBreakType.FitPage
format.Layout = PdfLayoutType.Paginate
'Draw image
image.Draw(page, 20, 400, format)
'Save the PDF
doc.Save("output.pdf")
doc.Close(True)

```

UWP

```

//Create Document
PdfDocument doc = new PdfDocument();
//Add new page
PdfPage page = doc.Pages.Add();
//Load the image as stream
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Data.Assets.Autumn Leaves.jpg");
//Load a bitmap
PdfBitmap image = new PdfBitmap(imageStream);
//Set layout property to make the element break across the pages
PdfLayoutFormat format = new PdfLayoutFormat();
format.Break = PdfLayoutBreakType.FitPage;
format.Layout = PdfLayoutType.Paginate;
//Draw image
image.Draw(page, 20, 400, format);
//Save the document as stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document

```

```
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create Document
PdfDocument doc = new PdfDocument();
//Add new page
PdfPage page = doc.Pages.Add();
//Load a bitmap
FileStream imageStream = new FileStream("Autumn Leaves.jpg", FileMode.Open,
FileAccess.Read);
PdfBitmap image = new PdfBitmap(imageStream);
//Set layout property to make the element break across the pages
PdfLayoutFormat format = new PdfLayoutFormat();
format.Break = PdfLayoutBreakType.FitPage;
format.Layout = PdfLayoutType.Paginate;
//Draw image
image.Draw(page, 20, 400, format);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create Document
PdfDocument doc = new PdfDocument();
//Add new page
PdfPage page = doc.Pages.Add();
//Load a bitmap
Stream imageStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Data.Autumn Leaves.jpg");
PdfBitmap image = new PdfBitmap(imageStream);
//Set layout property to make the element break across the pages
PdfLayoutFormat format = new PdfLayoutFormat();
format.Break = PdfLayoutBreakType.FitPage;
format.Layout = PdfLayoutType.Paginate;
//Draw image
image.Draw(page, 20, 400, format);
//Save the document as stream
MemoryStream stream = new MemoryStream();
```

```

doc.Save(stream);
//Close the document
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Applying transparency and rotation to the image

You can add transparency and rotation to the image using [SetTransparency](#) and [RotateTransform](#) methods of [PdfGraphics](#) respectively. This is explained in the below code snippet.

C#

```

//Create Document
PdfDocument doc = new PdfDocument();
//Add a new page
PdfPage page = doc.Pages.Add();
//Load a bitmap
PdfBitmap image = new PdfBitmap("input.jpg");
//save the current graphics state
PdfGraphicsState state = page.Graphics.Save();
//Translate the coordinate system to the required position
page.Graphics.TranslateTransform(20, 100);
//Apply transparency
page.Graphics.SetTransparency(0.5f);
//Rotate the coordinate system
page.Graphics.RotateTransform(-45);
//Draw image
image.Draw(page, 0, 0);
//Restore the graphics state
page.Graphics.Restore(state);
//Save the PDF
doc.Save("output.pdf");
doc.Close(true);

```

VB.NET

```

'Create Document
Dim doc As New PdfDocument()
'Add a new page
Dim page As PdfPage = doc.Pages.Add()
'Load a bitmap
Dim image As New PdfBitmap("input.jpg")

```

```

'save the current graphics state
Dim state As PdfGraphicsState = page.Graphics.Save()
'Translate the coordinate system to the required position
page.Graphics.TranslateTransform(20, 100)
'Apply transparency
page.Graphics.SetTransparency(0.5F)
'Rotate the coordinate system
page.Graphics.RotateTransform(-45)
' Draw image
image.Draw(page, 0, 0)
'Restore the graphics state
page.Graphics.Restore(state)
'Save the PDF
doc.Save("output.pdf")
doc.Close(True)

```

UWP

```

//Create Document
PdfDocument doc = new PdfDocument();
//Add new page
PdfPage page = doc.Pages.Add();
//Load the image as stream
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Data.Assets.input.jpg");
//Load a bitmap
PdfBitmap image = new PdfBitmap(imageStream);
//save the current graphics state
PdfGraphicsState state = page.Graphics.Save();
//Translate the coordinate system to the required position
page.Graphics.TranslateTransform(20, 100);
//Apply transparency
page.Graphics.SetTransparency(0.5f);
//Rotate the coordinate system
page.Graphics.RotateTransform(-45);
//Draw image
image.Draw(page, 0, 0);
//Restore the graphics state
page.Graphics.Restore(state);
//Save the document as stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create Document
PdfDocument doc = new PdfDocument();
//Add a new page
PdfPage page = doc.Pages.Add();
//Load a image as stream

```

```

FileStream imageStream = new FileStream("input.jpg", FileMode.Open,
    FileAccess.Read);
//Load a bitmap
PdfBitmap image = new PdfBitmap(imageStream);
//save the current graphics state
PdfGraphicsState state = page.Graphics.Save();
//Translate the coordinate system to the required position
page.Graphics.TranslateTransform(20, 100);
//Apply transparency
page.Graphics.SetTransparency(0.5f);
//Rotate the coordinate system
page.Graphics.RotateTransform(-45);
//Draw image
image.Draw(page, 0, 0);
//Restore the graphics state
page.Graphics.Restore(state);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create Document
PdfDocument doc = new PdfDocument();

{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Converting multi page TIFF to PDF

Multi frame TIFF image can be converted to PDF document. This can be done by accessing each frame of the multi frame TIFF image and rendering it in each page of the PDF document.

The code snippet to illustrate the same is given below.

C#

```

//Create a PDF document
PdfDocument pdfDocument = new PdfDocument();
//Set page margins
pdfDocument.PageSettings.Margins.All = 0;
//Load multi frame TIFF image
PdfBitmap tiffImage = new PdfBitmap("image.tiff");
//Get the frame count
int frameCount = tiffImage.FrameCount;
//Access each frame and draw into the page
for (int i = 0; i < frameCount; i++)
{
PdfPage page = pdfDocument.Pages.Add();
PdfGraphics graphics = page.Graphics;
tiffImage.ActiveFrame = i;
graphics.DrawImage(tiffImage, 0, 0, page.GetClientSize().Width,
page.GetClientSize().Height);
}
//Save and close the document
pdfDocument.Save("Sample.pdf");
pdfDocument.Close(true);

```

VB.NET

```

'Create a PDF document
Dim pdfDocument As New PdfDocument()
'Set page margins
pdfDocument.PageSettings.Margins.All = 0
'Load multi frame TIFF image

```

```

Dim tiffImage As New PdfBitmap("image.tiff")
'Get the frame count
Dim frameCount As Integer = tiffImage.FrameCount
'Access each frame and draw into the page
For i As Integer = 0 To frameCount - 1
Dim page As PdfPage = pdfDocument.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
tiffImage.ActiveFrame = i
graphics.DrawImage(tiffImage, 0, 0, page.GetClientSize().Width,
page.GetClientSize().Height)
Next
'Save and close the document
pdfDocument.Save("Sample.pdf")
pdfDocument.Close(True)

```

UWP

```

//Create a PDF document
PdfDocument pdfDocument = new PdfDocument();
//Set page margins
pdfDocument.PageSettings.Margins.All = 0;
//Load multi frame TIFF image
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.image.tiff");
PdfBitmap tiffImage = new PdfBitmap(imageStream);
//Get the frame count
int frameCount = tiffImage.FrameCount;
//Access each frame and draw into the page
for (int i = 0; i < frameCount; i++)
{
PdfPage page = pdfDocument.Pages.Add();
PdfGraphics graphics = page.Graphics;
tiffImage.ActiveFrame = i;
graphics.DrawImage(tiffImage, 0, 0, page.GetClientSize().Width,
page.GetClientSize().Height);
}
MemoryStream memoryStream = new MemoryStream();
//Save the document
await pdfDocument.SaveAsync(memoryStream);
//Close the documents
pdfDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(memoryStream, "Sample.pdf");

```

ASP.NET CORE

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Set page margins
doc.PageSettings.Margins.All = 0;
//Load the multi frame TIFF image from the disk
FileStream imageStream = new FileStream("image.tiff", FileMode.Open,
FileAccess.Read);
PdfTiffImage tiffImage = new PdfTiffImage(imageStream);

```

```
//Get the frame count
int frameCount = tiffImage.FrameCount;
//Access each frame and draw into the page
for (int i = 0; i < frameCount; i++)
{
    PdfPage page = doc.Pages.Add();
    PdfGraphics graphics = page.Graphics;
    tiffImage.ActiveFrame = i;
    graphics.DrawImage(tiffImage, 0, 0, page.GetClientSize().Width,
        page.GetClientSize().Height);
}
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Essential PDF supports converting multi page TIFF to PDF only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

Note: 1. Essential PDF supports converting TIFF to PDF with [Syncfusion.Pdf.Imaging.Portable](#) assembly reference in ASP.NET Core.

Working with Brushes

Brushes are used to draw the content on PDF document with specific color and style. Various brushes available in Syncfusion Essential PDF are,

1. Solid Brush
2. Gradient Brush
 - Linear Gradient Brush
 - Radial Gradient Brush
3. Tiling Brush

Solid Brush

The solid brush is used to fill an object with solid color. Essential PDF supports drawing shapes on PDF document with solid brush using the [PdfSolidBrush](#) class. The following code snippet illustrates this.

C#

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
```

```
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF solid brush
PdfSolidBrush brush = new PdfSolidBrush(Color.Red);
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document
doc.Save("SolidBrush.pdf");
//Close the instance of PdfDocument
doc.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim doc As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create new PDF solid brush
Dim brush As PdfSolidBrush = New PdfSolidBrush(Color.Red)
'Draw ellipse on the page
graphics.DrawEllipse(brush, New RectangleF(0, 0, 200, 100))
'Save the PDF document
doc.Save("SolidBrush.pdf")
'Close the instance of PdfDocument
doc.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF solid brush
PdfSolidBrush brush = new PdfSolidBrush(Color.FromArgb(255, 255, 0, 0));
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the instance of PdfDocument
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "SolidBrush.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
```

```
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF solid brush
PdfSolidBrush brush = new PdfSolidBrush(Color.Red);
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Set the position as '0'
stream.Position = 0;
//Download the PDF document in the browser
FileStreamResult fileStreamResult = new FileStreamResult(stream,
"application/pdf");
fileStreamResult.FileName = "SolidBrush.pdf";
return fileStreamResult;
```

XAMARIN

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF solid brush
PdfSolidBrush brush = new PdfSolidBrush(Syncfusion.Drawing.Color.Red);
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the instance of PdfDocument
doc.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("SolidBrush.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("SolidBrush.pdf", "application/pdf", stream);
}
```

Linear gradient brush

The gradient brush is used to fill an object with blend of two or more colors. Essential PDF supports drawing shapes on PDF document with linear gradient brush using [PdfLinearGradientBrush](#). The following code snippet illustrates this.

C#

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF linear gradient brush
PdfLinearGradientBrush brush = new PdfLinearGradientBrush(new PointF(0, 0),
new PointF(200, 100), Color.Red, Color.Blue);
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document
doc.Save("LinearGradientBrush.pdf");
//Close the instance of PdfDocument
doc.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim doc As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create new PDF linear gradient brush
Dim brush As PdfLinearGradientBrush = New PdfLinearGradientBrush(New
PointF(0, 0), New PointF(200, 100), Color.Red, Color.Blue)
'Draw ellipse on the page
graphics.DrawEllipse(brush, New RectangleF(0, 0, 200, 100))
'Save the PDF document
doc.Save("LinearGradientBrush.pdf")
'Close the instance of PdfDocument
doc.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF linear gradient brush
PdfLinearGradientBrush brush = new PdfLinearGradientBrush(new PointF(0, 0),
new PointF(200, 100), Color.FromArgb(255, 255, 0, 0), Color.FromArgb(255, 0,
0, 255));
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
```

```
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the instance of PdfDocument
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "LinearGradientBrush.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF linear gradient brush
PdfLinearGradientBrush brush = new PdfLinearGradientBrush(new PointF(0, 0),
new PointF(200, 100), Color.Red, Color.Blue);
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Set the position as '0'
stream.Position = 0;
//Download the PDF document in the browser
FileStreamResult fileStreamResult = new FileStreamResult(stream,
"application/pdf");
fileStreamResult.FileNameDownload = "LinearGradientBrush.pdf";
return fileStreamResult;
```

XAMARIN

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("LinearGradientBrush.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("LinearGradientBrush.pdf",
"application/pdf", stream);
}

```

Radial Gradient Brush

The gradient brush is used to fill an object with blend of two or more colors. You can draw any shape on PDF document with radial gradient brush using [PdfRadialGradientBrush](#). The following code snippet explains this.

C#

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF radial gradient brush
PdfRadialGradientBrush brush = new PdfRadialGradientBrush(new PointF(50,
50), 0, new PointF(50, 50), 50, Color.Red, Color.Blue);
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 100, 100));
//Save the PDF document
doc.Save("RadialGradientBrush.pdf");
//Close the instance of PdfDocument
doc.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim doc As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create new PDF radial gradient brush
Dim brush As PdfRadialGradientBrush = New PdfRadialGradientBrush(New
PointF(50, 50), 0, New PointF(50, 50), 50, Color.Red, Color.Blue)
'Draw ellipse on the page
graphics.DrawEllipse(brush, New RectangleF(0, 0, 100, 100))
'Save the PDF document
doc.Save("RadialGradientBrush.pdf")
'Close the instance of PdfDocument
doc.Close(True)

```

UWP

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF radial gradient brush
PdfRadialGradientBrush brush = new PdfRadialGradientBrush(new PointF(50,
50), 0, new PointF(50, 50), 50, Color.FromArgb(255, 255, 0, 0),
Color.FromArgb(255, 0, 0, 255));
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 100, 100));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the instance of PdfDocument
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "RadialGradientBrush.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF radial gradient brush
PdfRadialGradientBrush brush = new PdfRadialGradientBrush(new PointF(50,
50), 0, new PointF(50, 50), 50, Color.Red, Color.Blue);
//Draw ellipse on the page
graphics.DrawEllipse(brush, new RectangleF(0, 0, 100, 100));
//Save the PDF document stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Set the position as '0'
stream.Position = 0;
//Download the PDF document in the browser
FileStreamResult fileStreamResult = new FileStreamResult(stream,
"application/pdf");
fileStreamResult.FileNameDownload = "RadialGradientBrush.pdf";
return fileStreamResult;
```

samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("RadialGradientBrush.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("RadialGradientBrush.pdf", "application/pdf", stream);
}

```

Tiling Brush

The tiling brush is used to draw an object repeatedly. You can draw any shape on PDF page with tiling brush using [PdfTilingBrush](#). The following code snippet explains this.

C#

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF tiling brush
PdfTilingBrush brush = new PdfTilingBrush(new RectangleF(0, 0, 11, 11));
//Draw ellipse inside the tile
brush.Graphics.DrawEllipse(PdfPens.Red, new RectangleF(0, 0, 10, 10));
//Draw ellipse
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document
doc.Save("TilingBrush.pdf");
//Close the instance of PdfDocument
doc.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim doc As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add

```

```

'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create new PDF tiling brush
Dim brush As PdfTilingBrush = New PdfTilingBrush(New RectangleF(0, 0, 11,
11))
'Draw ellipse inside the tile
brush.Graphics.DrawEllipse(PdfPens.Red, New RectangleF(0, 0, 10, 10))
'Draw ellipse
graphics.DrawEllipse(brush, New RectangleF(0, 0, 200, 100))
'Save the PDF document
doc.Save("TilingBrush.pdf")
'Close the instance of PdfDocument
doc.Close(True)

```

UWP

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF tiling brush
PdfTilingBrush brush = new PdfTilingBrush(new RectangleF(0, 0, 11, 11));
//Draw ellipse inside the tile
brush.Graphics.DrawEllipse(PdfPens.Red, new RectangleF(0, 0, 10, 10));
//Draw ellipse
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document as stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the instance of PdfDocument
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "TilingBrush.pdf");

```

ASP.NET CORE

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create new PDF tiling brush
PdfTilingBrush brush = new PdfTilingBrush(new RectangleF(0, 0, 11, 11));
//Draw ellipse inside the tile
brush.Graphics.DrawEllipse(PdfPens.Red, new RectangleF(0, 0, 10, 10));
//Draw ellipse
graphics.DrawEllipse(brush, new RectangleF(0, 0, 200, 100));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Set the position as '0'
stream.Position = 0;

```

```
//Download the PDF document in the browser
FileStreamResult fileStreamResult = new FileStreamResult(stream,
"application/pdf");
fileStreamResult.FileName = "TilingBrush.pdf";
return fileStreamResult;
```

XAMARIN

df", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("TilingBrush.pdf",
"application/pdf", stream);
}
```

Working with Tables

Essential PDF provides support for two types of table models, both having a different levels of customization, which is explained below. The two types of table models are

1. [PdfGrid](#)
2. [PdfLightTable](#)

Creating a simple table

Creating a simple table using PdfLightTable in a new document

Essential PDF allows you to create the table with [DataSource](#) from DataSet, Data Table, arrays and IEnumerable objects using [PdfLightTable](#) class. It allows you to perform simple formatting.

Note: In Silverlight, Windows store apps and Xamarin only strongly typed IEnumerable objects are supported.

The below code snippet illustrates how to create a simple table from a data source using PdfLightTable.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
// Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
// Initialize DataTable to assign as DataSource to the light table.
DataTable table = new DataTable();
//Include columns to the DataTable.
table.Columns.Add("Name");
table.Columns.Add("Age");
table.Columns.Add("Sex");
//Include rows to the DataTable.
table.Rows.Add(new string[] { "abc", "21", "Male" });
//Assign data source.
pdfLightTable.DataSource = table;
//Draw PdfLightTable.
pdfLightTable.Draw(page, new PointF(0, 0));
//Save the document.
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
' Create a PdfLightTable.
Dim pdfLightTable As New PdfLightTable()
' Initialize DataTable to assign as DataSource to the light table.
Dim table As New DataTable()
'Include columns to the DataTable.
table.Columns.Add("Name")
table.Columns.Add("Age")
table.Columns.Add("Sex")
'Include rows to the DataTable.
table.Rows.Add(New String() { "abc", "21", "Male" })
'Assign data source.
pdfLightTable.DataSource = table
'Draw PdfLightTable.
pdfLightTable.Draw(page, New PointF(0, 0))
'Save the document.
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
// Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
//Add values to list
List<object> data = new List<object>();
object row = new { Name = "abc", Age = "21", Sex = "Male" };
data.Add(row);
//Add list to IEnumerable
IEnumerable<object> table = data;
//Assign data source.
pdfLightTable.DataSource = table;
//Draw PdfLightTable.
pdfLightTable.Draw(page, new PointF(0, 0));
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document.
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
// Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
//Add values to list
List<object> data = new List<object>();
object row = new { Name = "abc", Age = "21", Sex = "Male" };
data.Add(row);
//Add list to IEnumerable
IEnumerable<object> table = data;
//Assign data source.
pdfLightTable.DataSource = table;
//Draw PdfLightTable.
pdfLightTable.Draw(page, new Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the PDF document to stream.
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";

```

```
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
// Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
//Add values to list
List<object> data = new List<object>();
object row = new { Name = "abc", Age = "21", Sex = "Male" };
data.Add(row);
//Add list to IEnumerable
IEnumerable<object> table = data;
//Assign data source.
pdfLightTable.DataSource = table;
//Draw PdfLightTable.
pdfLightTable.Draw(page, new Syncfusion.Drawing.PointF(0, 0));
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the document.
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

You can directly add rows and columns instead of a data source, by setting [DataSourceType](#) property to **TableDirect** of [PdfLightTableDataSourceType](#) Enum.

The following code illustrates how to add the data directly into the [PdfLightTable](#).

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Acquire page's graphics.
PdfGraphics graphics = page.Graphics;
```

```
//Declare a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
//Set the Data source as direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect;
//Create columns.
pdfLightTable.Columns.Add(new PdfColumn("Roll Number"));
pdfLightTable.Columns.Add(new PdfColumn("Name"));
pdfLightTable.Columns.Add(new PdfColumn("Class"));
//Add rows.
pdfLightTable.Rows.Add(new object[] { "111", "Maxim", "III" });
//Draw the PdfLightTable.
pdfLightTable.Draw(page, PointF.Empty);
//Save the document.
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
'Acquire page's graphics.
Dim graphics As PdfGraphics = page.Graphics
'Declare a PdfLightTable.
Dim pdfLightTable As New PdfLightTable()
'Set the Data source type as direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect
'Create columns.
pdfLightTable.Columns.Add(New PdfColumn("Roll Number"))
pdfLightTable.Columns.Add(New PdfColumn("Name"))
pdfLightTable.Columns.Add(New PdfColumn("Class"))
'Add rows.
pdfLightTable.Rows.Add(New Object() {"111", "Maxim", "III"})
'Draw the PdfLightTable.
pdfLightTable.Draw(page, PointF.Empty)
'Save the document.
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Acquire page's graphics.
PdfGraphics graphics = page.Graphics;
//Declare a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
//Set the Data source as direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect;
//Create columns.
pdfLightTable.Columns.Add(new PdfColumn("Roll Number"));
```

```
pdfLightTable.Columns.Add(new PdfColumn("Name"));
pdfLightTable.Columns.Add(new PdfColumn("Class"));
//Add rows.
pdfLightTable.Rows.Add(new object[] { "111", "Maxim", "III" });
//Draw the PdfLightTable.
pdfLightTable.Draw(page, PointF.Empty);
//Save the PDF document into stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document.

Creating a simple table using PdfLightTable in an existing document

You can create table using [PdfLightTable](#) in the existing document by using the following code sample.

C#

```

//Load a PDF document.
PdfLoadedDocument doc = new PdfLoadedDocument("input.pdf");
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
// Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
// Initialize DataTable to assign as DataSource to the light table.
DataTable table = new DataTable();
//Include columns to the DataTable.
table.Columns.Add("Name");
table.Columns.Add("Age");
table.Columns.Add("Sex");
//Include rows to the DataTable.

```

```

table.Rows.Add(new string[] { "abc", "21", "Male" });
//Assign data source.
pdfLightTable.DataSource = table;
//Draw PdfLightTable.
pdfLightTable.Draw(graphics, new PointF(0, 0));
//Save the document.
doc.Save("Output.pdf");
//Close the document
doc.Close(true);

```

VB.NET

```

'Load a PDF document.
Dim doc As New PdfLoadedDocument("input.pdf")
'Get first page from document
Dim page As PdfLoadedPage = TryCast(doc.Pages(0), PdfLoadedPage)
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
' Create a PdfLightTable.
Dim pdfLightTable As New PdfLightTable()
' Initialize DataTable to assign as DataSource to the light table.
Dim table As New DataTable()
'Include columns to the DataTable.
table.Columns.Add("Name")
table.Columns.Add("Age")
table.Columns.Add("Sex")
'Include rows to the DataTable.
table.Rows.Add(New String() {"abc", "21", "Male"})
'Assign data source.
pdfLightTable.DataSource = table
'Draw PdfLightTable.
pdfLightTable.Draw(graphics, New PointF(0, 0))
'Save the document.
doc.Save("Output.pdf")
'Close the document
doc.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument doc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await doc.OpenAsync(file);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a PdfLightTable.

"application/pdf", stream);
}

```

Creating a simple table using PdfGrid in a new document

[PdfGrid](#) allows you to create table by entering the data manually or from an external data source. The [DataSource](#) can be a data set, data table, arrays or a IEnumerable object.

Note: In Silverlight, Windows store apps and Xamarin only strongly typed IEnumerable objects are supported.

The below code snippet illustrates how to create a simple table from a data source using PdfGrid.

C#

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();

```

```
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable.
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
//Add rows to the DataTable.
dataTable.Rows.Add(new object[] { "E01", "Clay" });
dataTable.Rows.Add(new object[] { "E02", "Thomas" });
//Assign data source.
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document.
pdfGrid.Draw(page, new PointF(10, 10));
//Save the document.
doc.Save("Output.pdf");
//close the document
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
' Create a PdfLightTable.
Dim pdfLightTable As New PdfLightTable()
' Initialize DataTable to assign as DataSource to the light table.
Dim table As New DataTable()
'Include columns to the DataTable.
table.Columns.Add("Name")
table.Columns.Add("Age")
table.Columns.Add("Sex")
'Include rows to the DataTable.//you can add multiple rows
table.Rows.Add(New String() {"abc", "21", "Male"})
'Set DataSourceType to the light table.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.External
'Assign data source.
pdfLightTable.DataSource = table
'Draw PdfLightTable.
pdfLightTable.Draw(page, New PointF(0, 0))
'Save the document.
doc.Save("Output.pdf")
'Close the document
doc.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
```

```
//Add values to list
List<object> data = new List<object>();
Object row1 = new { ID = "E01", Name = "Clay" };
Object row2 = new { ID = "E02", Name = "Thomas" };
data.Add(row1);
data.Add(row2);
//Add list to IEnumerable
IEnumerable<object> dataTable = data;
//Assign data source.
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document.
pdfGrid.Draw(page, new PointF(10, 10));
//Save the PDF document into stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document.
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Add values to list
List<object> data = new List<object>();
Object row1 = new { ID = "E01", Name = "Clay" };
Object row2 = new { ID = "E02", Name = "Thomas" };
data.Add(row1);
data.Add(row2);
//Add list to IEnumerable
IEnumerable<object> dataTable = data;
//Assign data source.
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document.
pdfGrid.Draw(page, new Syncfusion.Drawing.PointF(10, 10));
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the PDF document to stream.
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.

doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

You can set the data directly without setting any data source using [PdfGridRow](#) and [PdfGridColumn](#) classes.

The below code snippet illustrates how to create the simple table directly using [PdfGrid](#).

C#

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a new PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Add three columns.
pdfGrid.Columns.Add(3);

```

```
//Add header.
pdfGrid.Headers.Add(1);
PdfGridRow pdfGridHeader = pdfGrid.Headers[0];
pdfGridHeader.Cells[0].Value = "Employee ID";
pdfGridHeader.Cells[1].Value = "Employee Name";
pdfGridHeader.Cells[2].Value = "Salary";
//Add rows.
PdfGridRow pdfGridRow = pdfGrid.Rows.Add();
pdfGridRow.Cells[0].Value = "E01";
pdfGridRow.Cells[1].Value = "Clay";
pdfGridRow.Cells[2].Value = "$10,000";
//Draw the PdfGrid.
pdfGrid.Draw(pdfPage, PointF.Empty);
//Save the document.
pdfDocument.Save("Output.pdf");
//Close the document
pdfDocument.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim pdfDocument As New PdfDocument()
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
'Create a new PdfGrid.
Dim pdfGrid As New PdfGrid()
'Add three columns.
pdfGrid.Columns.Add(3)
'Add header.
pdfGrid.Headers.Add(1)
Dim pdfGridHeader As PdfGridRow = pdfGrid.Headers(0)
pdfGridHeader.Cells(0).Value = "Employee ID"
pdfGridHeader.Cells(1).Value = "Employee Name"
pdfGridHeader.Cells(2).Value = "Salary"
'Add rows.
Dim pdfGridRow As PdfGridRow = pdfGrid.Rows.Add()
pdfGridRow.Cells(0).Value = "E01"
pdfGridRow.Cells(1).Value = "Clay"
pdfGridRow.Cells(2).Value = "$10,000"
'Draw the PdfGrid.
pdfGrid.Draw(pdfPage, PointF.Empty)
'Save the document.
pdfDocument.Save("Output.pdf")
'Close the document
pdfDocument.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a new PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Add three columns.
pdfGrid.Columns.Add(3);
//Add header.
pdfGrid.Headers.Add(1);
```

```

PdfGridRow pdfGridHeader = pdfGrid.Headers[0];
pdfGridHeader.Cells[0].Value = "Employee ID";
pdfGridHeader.Cells[1].Value = "Employee Name";
pdfGridHeader.Cells[2].Value = "Salary";
//Add rows.
PdfGridRow pdfGridRow = pdfGrid.Rows.Add();
pdfGridRow.Cells[0].Value = "E01";
pdfGridRow.Cells[1].Value = "Clay";
pdfGridRow.Cells[2].Value = "$10,000";
//Draw the PdfGrid.
pdfGrid.Draw(pdfPage, PointF.Empty);
//Save the PDF document into stream
MemoryStream stream = new MemoryStream();
await pdfDocument.SaveAsync(stream);
//Close the document.
pdfDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

You can create table using [PdfGrid](#) by loading the IEnumerable data source. Refer to the following code.

C#

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page
PdfPage page = doc.Pages.Add();
//Create a PdfGrid
PdfGrid pdfGrid = new PdfGrid();
//Add values to list
```

```

List<object> data = new List<object>();
Object row1 = new { ID = "1", Name = "Clay" };
Object row2 = new { ID = "2", Name = "Gray" };
Object row3 = new { ID = "3", Name = "Ash" };
data.Add(row1);
data.Add(row2);
data.Add(row3);
//Add list to IEnumerable
IEnumerable<object> tableData = data;
//Assign data source
pdfGrid.DataSource = tableData;
//Draw grid to the page of PDF document
pdfGrid.Draw(page, new PointF(10, 10));
//Save the document
doc.Save("Sample.pdf");
//close the document
doc.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim doc As New PdfDocument()
'Add a page
Dim page As PdfPage = doc.Pages.Add()
'Create a PdfGrid
Dim pdfGrid As New PdfGrid()
'Add values to list
Dim data As New List(Of Object)()
Dim row1 As Object = New With {Key .ID = "1", Key .Name = "Clay"}
Dim row2 As Object = New With {Key .ID = "2", Key .Name = "Gray"}
Dim row3 As Object = New With {Key .ID = "3", Key .Name = "Ash"}
data.Add(row1)
data.Add(row2)
data.Add(row3)
'Add list to IEnumerable
Dim tableData As IEnumerable(Of Object) = data
'Assign data source
pdfGrid.DataSource = tableData
'Draw grid to the page of PDF document
pdfGrid.Draw(page, New PointF(10, 10))
'Save the document
doc.Save("Sample.pdf")
'close the document
doc.Close(True)

```

UWP

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page
PdfPage page = doc.Pages.Add();
//Create a PdfGrid

```

Creating a simple table using PdfGrid in an existing document

You can create a table using [PdfGrid](#) in the existing document by using the following code sample.

C#

```
//Load a PDF document.
PdfLoadedDocument doc = new PdfLoadedDocument("input.pdf");
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
```

```
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable.
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
//Add rows to the DataTable.
dataTable.Rows.Add(new object[] { "E01", "Clay" });
dataTable.Rows.Add(new object[] { "E02", "Thomas" });
//Assign data source.
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document.
pdfGrid.Draw(graphics, new PointF(10, 10));
//Save the document.
doc.Save("Output.pdf");
//close the document
doc.Close(true);
```

VB.NET

```
'Load a PDF document.
Dim doc As New PdfLoadedDocument("input.pdf")
'Get first page from document
Dim page As PdfLoadedPage = TryCast(doc.Pages(0), PdfLoadedPage)
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create a PdfGrid.
Dim pdfGrid As New PdfGrid()
'Create a DataTable.
Dim dataTable As New DataTable()
'Add columns to the DataTable
dataTable.Columns.Add("ID")
dataTable.Columns.Add("Name")
'Add rows to the DataTable.
dataTable.Rows.Add(New Object() {"E01", "Clay"})
dataTable.Rows.Add(New Object() {"E02", "Thomas"})
'Assign data source.
pdfGrid.DataSource = dataTable
'Draw grid to the page of PDF document.
pdfGrid.Draw(graphics, New PointF(10, 10))
'Save the document.
doc.Save("Output.pdf")
'close the document
doc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument doc = new PdfLoadedDocument();
```

```

//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await doc.OpenAsync(file);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Add values to list
List<object> data = new List<object>();
Object row1 = new { ID = "1", Name = "Clay" };
Object row2 = new { ID = "2", Name = "Thomas" };
data.Add(row1);
data.Add(row2);
//Add list to IEnumerable
IEnumerable<object> dataTable = data;
//Assign data source.
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document.
pdfGrid.Draw(graphics, new PointF(10, 10));
//Save the PDF document into stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document.
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples.
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open, FileAccess.Read);
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Add values to list
List<object> data = new List<object>();
Object row1 = new { ID = "1", Name = "Clay" };
Object row2 = new { ID = "2", Name = "Thomas" };
data.Add(row1);
data.Add(row2);
//Add list to IEnumerable
IEnumerable<object> dataTable = data;
//Assign data source.
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document.
pdfGrid.Draw(graphics, new Syncfusion.Drawing.PointF(10, 10));
//Creating the stream object
MemoryStream stream = new MemoryStream();

```

```
//Save the PDF document to stream.
doc.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
//Get first page from document
PdfLoadedPage page = doc.Pages[0] as PdfLoadedPage;
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Add values to list
List<object> data = new List<object>();
Object row1 = new { ID = "1", Name = "Clay" };

data.Add(row1);
data.Add(row2);
//Add list to IEnumerable
IEnumerable<object> dataTable = data;
//Assign data source.
pdfGrid.DataSource = dataTable;
//Draw grid to the page of PDF document.
pdfGrid.Draw(graphics, new Syncfusion.Drawing.PointF(10, 10));
//Save the PDF document into stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the document.
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
```

```
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Support for cell customization

Cell customization in PdfLightTable

[PdfLightTable](#) allows users to customize cell font, background, border, etc. using [PdfCellStyle](#) class.

The below code snippet illustrates how to customize the cell properties in PdfLightTable.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
//Set the DataSourceType as Direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect;
//Create columns.
pdfLightTable.Columns.Add(new PdfColumn("Roll Number"));
pdfLightTable.Columns.Add(new PdfColumn("Name"));
pdfLightTable.Columns.Add(new PdfColumn("Class"));
//Add Rows.
pdfLightTable.Rows.Add(new object[] { "111", "Maxim", "III" });
pdfLightTable.Rows.Add(new object[] { "112", "Minim", "III" });
//Create the font for setting the style.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
//Declare and define the alternate style.
PdfCellStyle altStyle = new PdfCellStyle(font, PdfBrushes.White,
PdfPens.Green);
altStyle.BackgroundBrush = PdfBrushes.DarkGray;
//Declare and define the header style.
PdfCellStyle headerStyle = new PdfCellStyle(font, PdfBrushes.White,
PdfPens.Brown);
headerStyle.BackgroundBrush = PdfBrushes.Red;
pdfLightTable.Style.AlternateStyle = altStyle;
pdfLightTable.Style.HeaderStyle = headerStyle;
//Show header in the table
pdfLightTable.Style.ShowHeader = true;
//Draw the PdfLightTable.
pdfLightTable.Draw(page, PointF.Empty);
//Save the document.
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
'Create a PdfLightTable.
```

```

Dim pdfLightTable As New PdfLightTable()
'Set the DataSourceType as Direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect
'Create columns.
pdfLightTable.Columns.Add(New PdfColumn("Roll Number"))
pdfLightTable.Columns.Add(New PdfColumn("Name"))
pdfLightTable.Columns.Add(New PdfColumn("Class"))
'Add Rows.
pdfLightTable.Rows.Add(New Object() {"111", "Maxim", "III"})
pdfLightTable.Rows.Add(New Object() {"112", "Minim", "III"})
'Create the font for setting the style.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 14)
'Declare and define the alternate style.

"application/pdf", stream);
}
```

```
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

You can set different styles for particular cell using [BeginCellLayout](#) and [EndCellLayout](#) events in [PdfLightTable](#) class.

The following code example illustrates how to draw the graphics elements in particular cell using these event handlers.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfLightTable
PdfLightTable pdfLightTable = new PdfLightTable();
//Set the DataSourceType as Direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect;
//Create columns.
pdfLightTable.Columns.Add(new PdfColumn("Roll Number"));
pdfLightTable.Columns.Add(new PdfColumn("Name"));
pdfLightTable.Columns.Add(new PdfColumn("Class"));
//Add rows.
pdfLightTable.Rows.Add(new object[] { "111", "Maxim", "III" });
pdfLightTable.Rows.Add(new object[] { "112", "Minim", "III" });
//Subscribing to events
pdfLightTable.BeginCellLayout += pdfLightTable_BeginCellLayout;
pdfLightTable.EndCellLayout += pdfLightTable_EndCellLayout;
//Show the header.
pdfLightTable.Style.ShowHeader = true;
//Draw the PdfLightTable.
pdfLightTable.Draw(page, PointF.Empty);
//Save the document.
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
private void pdfLightTable_EndCellLayout(object sender,
EndCellLayoutEventArgs args)
{
if(args.RowIndex==0 &&args.CellIndex==0)
{
args.Graphics.DrawImage(new PdfBitmap(imageFileName), args.Bounds);
}
}
private void pdfLightTable_BeginCellLayout(object sender,
BeginCellLayoutEventArgs args)
{
if (args.RowIndex == 0 && args.CellIndex == 1)
{
args.Graphics.DrawEllipse(PdfBrushes.Red, args.Bounds);
}
}
}
```

VB.NET

```

Cell customization in PdfGrid

[PdfGridCell](#) provides various direct options to customize cells like [ColumnSpan](#), [RowSpan](#), text color, background color, and etc.

The following code example illustrates you how to customize the cell in [PdfGrid](#).

C#

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Create the page
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create the parent grid
PdfGrid parentPdfGrid = new PdfGrid();
//Add the rows
PdfGridRow row1 = parentPdfGrid.Rows.Add();
PdfGridRow row2 = parentPdfGrid.Rows.Add();
row2.Height = 58;
//Add the columns
parentPdfGrid.Columns.Add(3);
//Set the value to the specific cell.
parentPdfGrid.Rows[0].Cells[0].Value = "Nested Table";
parentPdfGrid.Rows[0].Cells[1].RowSpan = 2;
parentPdfGrid.Rows[0].Cells[1].ColumnSpan = 2;
//Create the child table
PdfGrid childPdfGrid = new PdfGrid();
//Set the column and rows for child grid
childPdfGrid.Columns.Add(5);
for (int i = 0; i < 5; i++)
{
    PdfGridRow row = childPdfGrid.Rows.Add();
    for (int j = 0; j < 5; j++)
    {
        row.Cells[j].Value = String.Format("Cell [{0} {1}]", j, i);
    }
}
//Set the value as another PdfGrid in a cell.
parentPdfGrid.Rows[0].Cells[1].Value = childPdfGrid;
//Specify the style for the PdfGridCell.
PdfGridCellStyle pdfGridCellStyle = new PdfGridCellStyle();
pdfGridCellStyle.TextPen = PdfPens.Red;
pdfGridCellStyle.Borders.All = PdfPens.Red;
pdfGridCellStyle.BackgroundImage = new PdfBitmap(imagePath);
PdfGridCell pdfGridCell = parentPdfGrid.Rows[0].Cells[0];
//Apply style
pdfGridCell.Style = pdfGridCellStyle;
//Set image position for the background image in the style.
pdfGridCell.ImagePosition = PdfGridImagePosition.Fit;
//Draw the PdfGrid.
parentPdfGrid.Draw(pdfPage, PointF.Empty);
//Save the document.
pdfDocument.Save("Output.pdf");
//close the document
pdfDocument.Close(true);
```

VB.NET

```

'Create a new PDF document.
Dim pdfDocument As New PdfDocument()
'Create the page

Support for rows and columns customization

Row customization in PdfLightTable

[PdfLightTable](#) doesn't provide direct support for row customizations. However, this can be done through the event handlers. The following code snippet illustrates how to customize the row in PdfLightTable using [BeginRowLayout](#) and [EndRowLayout](#) event handlers.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfLightTable
PdfLightTable pdfLightTable = new PdfLightTable();
//Set the DataSourceType as Direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect;
//Create columns.
pdfLightTable.Columns.Add(new PdfColumn("Roll Number"));
pdfLightTable.Columns.Add(new PdfColumn("Name"));
pdfLightTable.Columns.Add(new PdfColumn("Class"));
//Add rows.
pdfLightTable.Rows.Add(new object[] { "111", "Maxim", "III" });
pdfLightTable.Rows.Add(new object[] { "112", "Minim", "III" });
pdfLightTable.Rows.Add(new object[] { "113", "john", "III" });
pdfLightTable.Rows.Add(new object[] { "114", "peter", "III" });
//Subscribing to events
pdfLightTable.BeginRowLayout+=pdfLightTable_BeginRowLayout;
pdfLightTable.EndRowLayout+=pdfLightTable_EndRowLayout;
//Draw the PdfLightTable.
pdfLightTable.Draw(page, PointF.Empty);
//Save the document.
doc.Save("Output.pdf");
//Close the document
doc.Close(true);
private void pdfLightTable_EndRowLayout(object sender, EndRowLayoutEventArgs
args)
{
//Customize the rows when row layout ends
if (args.RowIndex == 3)
args.Cancel = true;
}
private void pdfLightTable_BeginRowLayout(object sender,
BeginRowLayoutEventArgs args)
{
//Apply column span
if (args.RowIndex==1)
```

```

{
    PdfLightTable table = (PdfLightTable)sender;
    int count = table.Columns.Count;
    int[] spanMap = new int[count];
    // Set just spanned cells. Negative values are not allowed.
    spanMap[0] = 2;
    spanMap[1] = 3;
    args.ColumnSpanMap = spanMap;
}
}

```

VB.NET

```

'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
